2005. *Hypsugo musciculus:* Simmons, Order Chiroptera, 491. (Name Combination).
2025. *Afropipistrellus musciculus:* Torrent, Juste, Garin, Aihartza, Dalton, Mamba, Tanshi, Powell, Padidar, Garcia Mudarra, Richards, Monadjem, Zool. J. Linn. Soc., 204 (2): 1, 13. Publication date: 13 June 2025. (Current Combination).

TAXONOMY:
Mentioned in the genus *Pipistrellus* by Hutterer *et al.* (2019: 22) and the subgenus *Pipistrellus* by Koopman (1994: 113). However, Monadjem *et al.* (2020d: 562; 2020b: 1140) confirmed that *musciculus* might not be a member of the genus *Pipistrellus*, but rather of *Hypsugo* as was suggested by Simmons (2005: 491). A recent analysis by Torrent *et al.* (2025b: 1), however, showed this species to belong to the genus Afropipistrellus.

COMMON NAMES:
Czech: netopýr mechový. English: Mouse-like Pipistrelle Bat, Least Pipistrelle Bat, Mouselike Pipistrelle, Western Africa Pipistrelle. French: Vespère murin, Pipistrelle d'Afrique occidentale, Pipistrelle murine. German: Mäuschen-Zwergfledermaus, Mäuschen-Pipistrelle, Westafrikanische Zwergfledermaus.

CONSERVATION STATUS:
Global Justification
Listed as Data Deficient (DD ver 3.1 (2001)) in view of continuing problems with its taxonomy as well as absence of recent information on its extent of occurrence, status and ecological requirements (Jacobs *et al.*, 2008u; IUCN, 2009; Jacobs *et al.*, 2020b).

Assessment History
Global
2018: DD ver 3.1 (2001) (Jacobs *et al.*, 2020b). 2008: DD ver 3.1 (2001) [assessed as *Pipistrellus musciculus*] (Jacobs *et al.*, 2008u; IUCN, 2009). 2004: DD ver 3.1 (2001) (Jacobs *et al.*, 2004i; IUCN, 2004). 1996: LR/nt [assessed as *Pipistrellus musciculus*] (Baillie and Groombridge, 1996).

Regional
None known.

MAJOR THREATS:
The threats to this species are not known (Jacobs *et al.*, 2008u; IUCN, 2009; Jacobs *et al.*, 2020b).

CONSERVATION ACTIONS:
Jacobs *et al.* (2008u) [in IUCN (2009)] and Jacobs *et al.* (2020b) report that it is not known if the species is present within any protected area. Further studies are needed into the taxonomy,

distribution, natural history and threats to this species.

GENERAL DISTRIBUTION:
Hypsugo musciculus has been recorded from a few localities in Ghana, Sierra Leone, southern Cameroon, Gabon, the eastern tip of Congo, and the Democratic Republic of the Congo.

Native: Cameroon; Congo (The Democratic Republic of the); Gabon; Ghana; Sierra Leone.

Bates *et al.* (2013: 339) reject the occurrence of *H. musciculus* in the Republic of Congo as Malbrant and Maclatchy (1949) only suggested it to be 'likely' occurring in that country.

DIET:
Cabrera-Campos *et al.* (2021: Suppl.) estimated the food transit time for these bats to be about 62 minutes, and the digestibility rate about 82.3 %.

POPULATION:
Structure and Density
The abundance of this species is not well known (Jacobs *et al.*, 2008u; IUCN, 2009; Jacobs *et al.*, 2020b).

Trend
2018: Unknown (Jacobs *et al.*, 2020b). 2008: Unknown (Jacobs *et al.*, 2008u; IUCN, 2009).

PARASITES:
HEMIPTERA
Cimicidae
Cacodmus villosus (Stål) recorded from the Congo (Haeselbarth *et al.*, 1966: 11; Kock *et al.*, 1998b: 236).

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Cameroon, Congo (Democratic Republic of the), Gabon, Ghana, Sierra Leone.

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:

Figure 363. Clockwise from top lateral, ventral and dorsal skull images of NHMUK 1913.2.8.1, holotype of *Pipistrellus musciculus* Thomas, 1913.

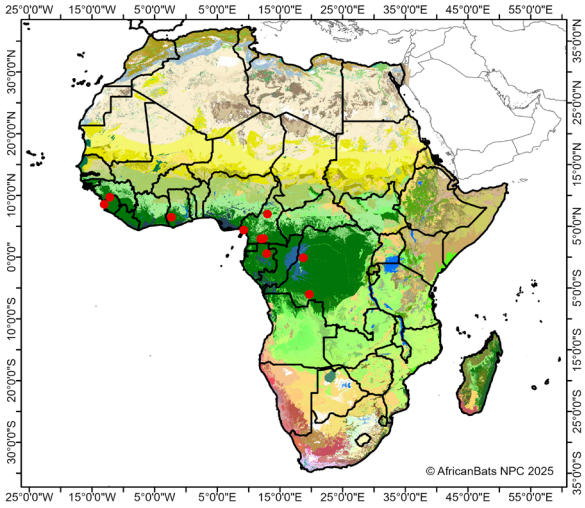

Figure 364. Distribution of *Afropipistrellus musciculus*.

Genus ***Hypsugo*** Kolenati, 1856

*1856. *Hypsugo* Kolenati, Allg. deutsche naturh. Zeitung, NF, 2 (2): 131. Publication date: 1856. - Comments: Type species: *Vespertilio savii* Bonaparte, 1837. - Etymology: From the Greek "*υψι*", (hýpsi) meaning "on high" or "aloft" and the ending -"ugo" (as in *Nannugo* and *Vesperugo*) (see Palmer, 1904: 343). Lanza *et al.* (2015: 380) suggest the following "From the neuter Greek substantive "*ύψος*" (hýpsos) "height" + the suffix *-ugo* of the feminine Latin substantive *vesperùgō* 'evening star', i.e. a bright planet (as Venus), seen in the western sky after sunset, corresponding to the Latin 'stella matutina', the planet Venus, appearing first in the nocturnal sky and disappearing first from the morning one. By extension *Vesperugo* has assumed also the meaning of 'bat'; hence *Hypsugo* means 'mountain bat' as *H. maurus* Kolenati, 1856 a synonym of *savii*, was collected in the central chain of Alps". (Current Combination).
1993. *Ypsugo:* Ariagno, Le Bièvre, 13: 118. (Lapsus).

2024. *Hipsugo:* Lelli, Moreno, Canziani, Soliani, Carrera, Castelli, Faccin, Trogu, Sozzi, Cavallari, Mauri, Ferrari, Salogni, Garbarino, Chiapponi, Farioli and Lavazza, Emerg. Inf. Dis., 30 (4): 1. Publication date: April 2024. (Lapsus).

TAXONOMY:
Meester *et al.* (1986: 50) mention *Vespertilio maurus* Blasius (= *Vespertiio savii* Bonaparte) and *Vesperugo kraschenininkovii* Eversmann as type species, but this was fixed to *Vespertilio savii* Bonaparte by Wallin (1969: 329), see Corbet and Hill (1992: 133).

Helbig *et al.* (2010: 168) suggest that *Hypsugo* is actually a para- or polyphyletic group, which would become monophyletic if the African forms are transferred to the genus *Nycticeinops*.

Currently (Simmons and Cirranello, 2024a) recognized species of the genus *Hypsugo*: *affinis* (Dobson, 1871) – Cambodia, NE Burma (= Myanmar), Yunnan, SE Tibet (China), N India, Nepal, Sri Lanka; *alashanicus* Bobrinskii, 1926 – Mongolia, China, Russian Far East to Korea and Tsushima Isl (Japan) (Simmons, 2005: 489); *arabicus* (Harrison, 1979) – Oman, Iran (Simmons, 2005: 489); ***ariel*** (Thomas, 1904); *cadornae* (Thomas, 1916) – northeastern India, Burma, Thailand, Vietnam, Laos (Simmons, 2005: 490); *dolichodon* Görföl, Csorba, Eger, Son and Francis, 2014 – Lao PDR, S Vietnam, Cambodia, Myanmar; *imbricatus* (Horsfield, 1824) – Java, Kangean Isl, Bali and Lesser Suda Isls, Borneo (Simmons, 2005: 490); *kitcheneri* (Thomas, 1915) – Borneo (Simmons, 2005: 491); *lanzai* Benda, Al-Jumaily, Reiter and Nasher, 2011 – Yemen; *lophurus* (Thomas, 1915) – Burma Peninsular (Simmons, 2005: 491); *macrotis* (Temminck, 1840) – western Malaysia, Sumatra, Bali and adjacent small islands (Simmons, 2005: 491); *mordax* (Peters, 1867) – Java, Philippines; ***musciculus*** (Thomas, 1913); *petersi* (A.B. Meyer, 1899) – Borneo, Sulawesi, Buru and Ambon (Molucca Islands), Philippines (Luzon, Mindanao); *pulveratus* (Peters, 1871) – Szechwan, Yunnan, Hunan, Kiangsu, Fukien (China), Hong Kong, Thailand, Laos, Vietnam (Simmons, 2005: 491); *savii* (Bonaparte, 1837) – France, Portugal, Spain, Italy, southern Switzerland, Austria, eastern Hungary, Balkan countries, Morocco, Crimea and Caucasus, Turkey, Lebanon, Syria, Israel, Iran, Kazakhstan, Turkmenistan, Uzbekistan, Kyrgyzstan, Tajikistan, Afghanistan to northern India and Burma (Simmons, 2005: 491); *stubbei* (Dolch, Batsaikhan, Stubbe and Steinhauser, 2021) – Mongolia; *vordermanni* (Jentink, 1890) – Belitung Isl (Indonesia), Borneo (Sarawak, Malaysia) (Simmons, 2005: 492).

COMMON NAMES:
Czech: skalní netopýři. English: Mountain Pipistrelle Bats. French: Vespères. Italian: Ipsùghi. Ukrainian: Гіпсуг [= Hipsuh].

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Equatorial Guinea, Kenya, Madagascar.

Hypsugo ariel (Thomas, 1904)

*1904. *Pipistrellus ariel* Thomas, Ann. Mag. nat. Hist., ser 7, 14 (80): 157. Publication date: 1 August 1904. Type locality: Sudan: Kassala province: Wadi Alagi [ca. 22 N 35 E, 2 000 ft]. [Goto Description]. Holotype: NHMUK 1904.11.4.7: ad ♀, skin and skull. Collected by: Arthur M. MacKilligan; collection date: 12 August 1903; original number: 28. See Qumsiyeh (1985: 54).
1966. *Pipistrellus (Pipistrellus) ariel:* Ellerman and Morrison-Scott, Checklist of Palaearctic and Indian Mammals 1758 to 1946. (Second Edition), 171. (Name Combination).
1987. *Pipistrellus (Hypsugo) ariel:* Hill and Harrison, Bull. Br. Mus. (nat. Hist.) Zool., 52 (7): 281. (Name Combination).
1991. *Pipistrellus ariel ariel:* Harrison and Bates, Mammals of Arabia, 92. (Name Combination).
2000. *Hypsugo ariel:* Horáček, Hanák and Gaisler, Bats of the Palearctic region, 126. (Current Combination).

TAXONOMY:
Mentioned in the subgenus *Pipistrellus* by Koopman (1994: 115). Harrison and Bates (1991: 93) assign the Arabian specimens to *P. a. ariel*, although they do not mention any other subspecies. Horáček *et al.* (2000: 126) mention it in the genus *Hypsugo*.

COMMON NAMES:
Arabian: Khaffash. Czech: netopýr pouštní. Dutch: Woestijndwergvleermuis. English: Pygmy Pipistrellus, Ariel Pipistrelle, Egyptian Desert Pipistrelle, Desert Pipistrelle, Fairy Pipistrelle. French: Vespère ariel, Pipistrelle ariel. German: Elfen-Zwergfledermaus, Elfen-Pipistrelle. Hebrew: Atalfon Ariel.

CONSERVATION STATUS:
Global Justification
Listed as Data Deficient (DD ver 3.1 (2001)) in view of the absence of recent information on its extent of occurrence, status and ecological requirements (Benda and Aulagnier, 2008; IUCN, 2009; Benda and Aulagnier, 2020).

Assessment History
Global
2018: DD ver. 3.1 (2001) (Benda and Aulagnier, 2020). 2008: DD ver 3.1 (2001) [assessed as *Pipistrellus ariel*] (Benda and Aulagnier, 2008; IUCN, 2009). 2004: DD ver 3.1 (2001) (Benda, 2004c; IUCN, 2004). 1996: LR/nt assessed as *Pipistrellus ariel* (Baillie and Groombridge, 1996).

Regional
None known.

MAJOR THREATS:
Loss of natural habitat because of agricultural intensification. The species is affected by pesticides, although this is not considered a major threat (Z. Amr *pers. comm.*, 2005 [in Benda and Aulagnier (2008) in IUCN (2009); Benda and Aulagnier, 2020)].

CONSERVATION ACTIONS:
Benda and Aulagnier (2008) [in IUCN (2009)] and Benda and Aulagnier (2020) report that no conservation actions are in place. Further research on the taxonomy, population ecology and trends is required and the extent of the range requires further clarification.

GENERAL DISTRIBUTION:
Hypsugo ariel has been recorded from Israel, Jordan and Egypt (including the Sinai) within the Mediterranean (Dietz, 2005). Outside the area the range extends to Saudi Arabia, and Yemen. In Africa it is recorded from northern Sudan (type locality, see Simmons, 2005). Approximately five localities known in northeast Africa, including Egypt and Sudan.

The specimens from Socotra (Yemen) are now considered to belong to a separate species: *Hypsugo lanzai* (see Benda *et al.*, 2011b: 37).

Native: Egypt (Sinai); Israel; Jordan; Palestinian Territory, Occupied; Saudi Arabia; Sudan; Yemen (South Yemen).

DETAILED MORPHOLOGY:
Baculum
Benda *et al.* (2011b: 38).

ECHOLOCATION:
From Jordan, Benda *et al.* (2010b: 204) reported the following parameters for 129 calls: F_{start}: 58.1 ± 4.1 (47.7 - 75.0) kHz, F_{end}: 43.0 ± 2.1 (30.0 - 47.4) kHz, F_{peak}: 46.4 ± 1.3 (43.4 - 49.0) kHz, Pulse duration: 4.1 ± 0.8 (2.4 - 7.2) ms., and Inter-pulse interval: 81.9 ± 18.9 (45.0 - 193.0) ms.

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:

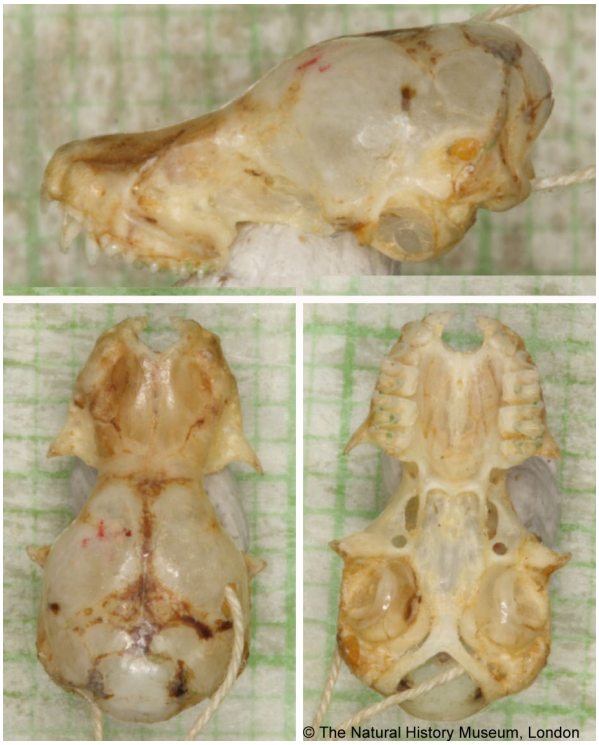

Figure 365. Clockwise from top lateral, ventral and dorsal skull images of NHMUK 1904.11.4.7, holotype of *Pipistrellus ariel* Thomas, 1904.

DIET:
Cabrera-Campos *et al.* (2021: Suppl.) estimated the food transit time for these bats to be about 62 minutes, and the digestibility rate about 82.3 %.

POPULATION:
Structure and Density
The population is apparently small but is probably stable (Z. Amr *pers. comm.*, 2005 in Benda and Aulagnier (2008) [in IUCN (2009)]; Benda and Aulagnier, 2020).

Trend
2018: Unknown (Benda and Aulagnier, 2020). 2008: Unknown (Benda and Aulagnier, 2008; IUCN, 2009). *P. ariel* populations within the Asia Minor and Levant region are unknown population trend, under predictive climate change scenarios (Bilgin *et al.*, 2012: 433).

REPRODUCTION AND ONTOGENY:
Garbino *et al.* (2021: Suppl.) mention that this species has more than one young per litter.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Egypt, Kenya, Sudan.

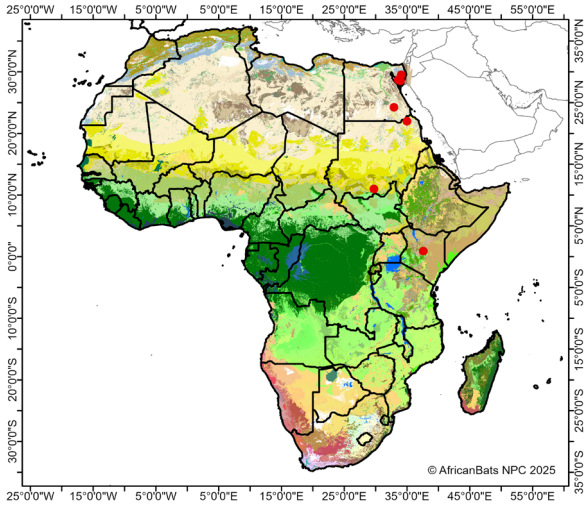

Figure 366. Distribution of *Hypsugo ariel*.

Hypsugo cf. eisentrauti Hill, 1968

*2013. *Hypsugo cf. eisentrauti:* Kerbis Peterhans, Fahr, Huhndorf, Kaleme, Plumptre, Marks and Kizungu, Bonn. Zool. Bull., 62 (2): 189. Publication date: November 2013. (Current Combination).

TAXONOMY:
As already indicated by Van Cakenberghe and Happold (2013i: 622) *eisentrauti* records from the DRC, Uganda, Kenya and Somalia do not resemble closely to the holotype and paratype of *P. eisentrauti* to be considered representatives of this species. Kerbis Peterhans *et al.* (2013: 189) therefore assigned these tentatively to *H.* cf. *eisentrauti*, indicating that they could represent a yet undescribed species. The specimens from the DRC and Rwanda have been assigned to *Parahypsugo macrocephalus* (Hutterer and Kerbis Peterhans, 2020).

CONSERVATION STATUS:
Global Justification
Currently not been globally assessed hence no justification.

Assessment History
Global
No assessment known, hence no history of assessment to report.

Regional
None known.

POPULATION:
Structure and Density
Unknown.

Trend
Not assessed.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Somalia.

Hypsugo savii (Bonaparte, 1837)

*1837. *Vespertilio Savii* Bonaparte, Iconografia Fauna italiana, 1, fasc 20 and pl. Publication date: 1837. Type locality: Italy: Tuscany: Pisa [43 43 N 10 24 E]. Holotype: NHMUK 1907.1.1.732: sad, partial skeleton. Collected by: Prince Charles Lucien ("Carlo") Jules Laurent Bonaparte. - Etymology: In honour of Gaetano Savi (1769 - 1844) (see Kozhurina, 2002: 17).
1839. *V[esperugo (Vesperus)] Savii:* Keyserling and Blasius, Arch. Naturgesch. Berlin, 5 (1): 316. (Name Combination).
1853. *V[esperugo] Savii:* Blasius, Arch. Naturgesch. Berlin, 19 (1): 46. (Name Combination).
1855. *Vespertilio (Vesperugo) Savii:* Wagner, in: Schreber, Die Säugethiere in Abbildungen nach der Natur mit Beschreibungen, Suppl 5: 734. (Name Combination).
1856. *Vesperus (Meteorus) Savii:* Kolenati, Allg. deutsche naturh. Zeitung, NF, 2 (5): 166. (Name Combination).
1856. *Vesperus Savii:* Kolenati, Allg. deutsche naturh. Zeitung, NF, 2 (4): 132. (Name Combination).
1859. *Scotophilus darwini* Tomes, Proc. zool. Soc. Lond., 1859, I (OS 27): 70. Publication date: February - June 1859. Type locality: Canary Islands (Spain): La Palma [28 40 N 17 50 W]. [Goto Description]. Holotype: NHMUK 1907.1.1.423: ad ♀, skull and alcoholic. Presented/Donated by: Charles Robert Darwin. Although Dobson (1878: 219) mentioned it was presented by Rev. R.T. Lowe. Formerly in Tomes collection.
1862. *Vespertilio (Meteorus) Savii:* Koch, Das Wesentliche der Chiroptern, 393. (Name Combination).
1871. *Vesperugo Savi:* Doderlein, Alcune generalita Intorno la Fauna Sicula de Vertebrati, ???. (Name Combination, Lapsus).
1885. *Vesperugo Savii:* Lataste, Act. Soc. Linn. Bordeaux, 39: 190?. (Name Combination).

1887. *Scotophilus darwinii:* Doria, Ann. Mus. civ. Stor. nat. Genova, 4 (2): 71. (Lapsus).
1904. *Vespertilio ochromixtus* Cabrera, Mem. Soc. espan. Hist. nat., 2 (5): 267, pl 3, fig 1 and 4. Type locality: Spain: Balearic Islands, Menorca Island. [Goto Description]. Holotype: MNCN 1.094: ♂. However, Ibáñez and Fernández (1989: 41) referred to this specimen as the holotype. However, Jelle Zijlstra (pers. comm., 26/02/2023) indicated that this specimen is a syntype as Cabrera mentioned two specimens and no lectotype has been designated since. Cabrera Latorre (1904: 268) explicitly mentions one male specimen and also refers to a second specimen, but concludes on this specimen as: "There are, however, between Mr. de Seabra's description and my *V. ochromixtus* some differences which make it impossible to decide the question without prior comparison of the specimens" Therefore, we agree with Ibáñez and Fernández (1989) and consider this specimen as a holotype. - Comments: Some authors, e.g. Ellerman and Morrison-Scott (1951: 170), Gharaibeh (1997: 95) mention "Sierra de Guadarrama, Madrid, Spain" as type locality, but Ibáñez and Fernández (1989: 41) - explicitly referring to the type specimen - mention Menorca as type locality.
1912. *Pipistrellus savii:* Miller, Catalogue of the mammals of western Europe (Europe exclusive of Russia) in the collection of the British Museum, 219. (Name Combination).
1956. *Pipistrellus savii savii:* Kahmann and Goerner, Mammalia, 20: 358. (Name Combination).
1964. *Pipistrellus savii sevii:* Hanák, Acta Soc. Zool. Bohem., 28 (1): 83. (Lapsus).
1966. *Pipistrellus (Pipistrellus) savii darwini:* Ellerman and Morrison-Scott, Checklist of Palaearctic and Indian Mammals 1758 to 1946. (Second Edition), 170. (Name Combination).
1966. *Pipistrellus (Pipistrellus) savii savii:* Ellerman and Morrison-Scott, Checklist of Palaearctic and Indian Mammals 1758 to 1946. (Second Edition), 169. (Name Combination).
1966. *Pipistrellus (Pipistrellus) savii:* Ellerman and Morrison-Scott, Checklist of Palaearctic and Indian Mammals 1758 to 1946. (Second Edition), 169. (Name Combination).
1971. *Pipistrellus (Hypsugo) savii savii:* Lanza and Azzaroli, Lav. Soc. ital. Biogeog., nov ser 1: 698 (for 1970). (Name Combination).
1986. *[Hypsugo] savii:* Horáček and Hanák, Myotis, 23-24: 9. (Current Combination).
1987. *Hypsugo savii:* Menu, Palaeovert., 17 (3): 127. (Name Combination).
1987. *Pipistrellus (Hypsugo) savii:* Hill and Harrison, Bull. Br. Mus. (nat. Hist.) Zool., 52 (7): 281. (Name Combination).
1997. *Pipistrellus savii ochromixus:* Gharaibeh, Systematics, distribution, and zoogeography of mammals of Tunisia, 95. Publication date: December 1997. (Lapsus).
2000. *Hypsugo savii savii:* Horáček, Hanák and Gaisler, Bats of the Palearctic region, 125. (Name Combination).
2002. *H[ypsugo] s[avii] darwini:* Trujillo, Ibáñez and Juste, Rev. suisse Zool., 109 (3): 549. (Name Combination).
2003. *H[ypsugo] savii darwinii:* Pestano, Brown, Suárez and Fajardo, Mol. Phylogenet. Evol., 26 (1): 57. (Lapsus).
2007. *Hypsugo cf. darwinii:* Mayer, Dietz and Kiefer, Front. Zool., 4: 4. (Name Combination).
? *Pipistrellus savi:* (Name Combination, Lapsus).

Taxonomy:

Koopman (1994: 114) considers this species to belong to the (sub)genus *Pipistrellus (Pipistrellus)*. Horáček *et al.* (2000: 125) and Volleth *et al.* (2001: 27) assigned this species to the genus *Hypsugo*.

Based on mitochondrial DNA, Veith *et al.* (2011: 95, 98) report the presence of "*H.* cf. *darwinii*" on Sardinia, Turkey, the Canary Islands, Morocco, and Sicily), but they also indicate that "taxonomic conclusions, which are solely based on mitochondrial genes, may be misleading due to effects such as incomplete lineage sort ing, introgression, and selection on mitochondrial loci". However, as indicated by Puechmaille *et al.* (2012: 226), the mitochondrial data suggest the presence of cryptic species within "*H. savii*", which led these authors to use "*H.* cf. *savii*" for the North African populations. However, Mayer *et al.* (2007: Suppl.) and Borloti *et al.* (2020: 2) use "*H.* cf. *darwinii*" for the bats from North African and the Canarian Islands. Gojznikar and Mayer (2024: 7) found that the mitochondrial DNA of specimens from Cape Verde, the Canary Islands and northern Africa belongs to the same lineage as that of the Italian specimens, and therefore "*H.* cf. *darwinii*" should be considered a synonym of "*H. savii savii*". However, they also indicate (p. 10) that analyses of nuclear DNA is necessary to confirm any subspecific division.

Common Names:

Albanian: Pipistrel i Savi-it. Arabian: Khaffash. Armenian: Մաշեղանման փոքրաչղջիկ. Azerbaijani: Savi şəbpərəsi. Basque: Savi saguzar, Savi saguzarra. Belarusian: Нетапыр Саві. Welsh: Ystlum lleiaf Savi.

CONSERVATION STATUS:
Global Justification
The species is widespread and abundant and there is no evidence of population decline. Consequently, it is assessed as Least Concern (LC ver 3.1 (2001)) (Hutson *et al.*, 2008p; IUCN, 2009; Juste and Paunović, 2016b).

Assessment History
Global
2016: LC ver 3.1 (2001) (Juste and Paunović, 2016b). 2008: LC ver 3.1 (2001) [assessed as *Pipistrellus savii*] (Hutson *et al.*, 2008p; IUCN, 2009).

Regional
None known.

MAJOR THREATS:
No major threats are known (Hutson *et al.*, 2008p; IUCN, 2009; Juste and Paunović, 2016b). Water stress and the aerial hawking feeding style are, however, identified as being major risk factors linked with climatic change (Sherwin *et al.*, 2012: 174). Bilgin *et al.* (2012: 434) predict that the range retraction for *H. savii* as a result of climatic change may pose severe threats to its survival as this species has the bulk of its range in the Mediterranean region.

CONSERVATION ACTIONS:
Hutson *et al.* (2008p) [in IUCN (2009)] report that it is protected by national legislation in some range states. There are also international legal obligations for its protection through the Bonn Convention (Eurobats) and Bern Convention in parts of its range where these apply. It is included in Annex IV of EU Habitats and Species Directive. It occurs in protected areas.

GENERAL DISTRIBUTION:
Hypsugo savii has a wide range in the Palaearctic (and marginally in Indomalaya), extending from southern Europe and north Africa (Morocco, Algeria, Tunisia, the Canary Islands of La Palma, Tenerife, La Gomera, Gran Canaria, and El Hierro, and the Cape Verde Islands of Santiago and San Vicente) through the Middle East and the Caucasus to Kazakhstan, Turkmenistan, Uzbekistan, Kyrgyzstan, Tajikistan, Afghanistan and northern India (Horáček and Benda, 2004; Simmons, 2005). It occurs from sea level to 3,000 m.

Bilgin *et al.* (2012) examining climate change scenarios within the Asia Minor and Levant region, predict *H. savii* to have a range contraction, which may pose severe threats to the survival of this species.

Native: Afghanistan; Albania; Algeria; Andorra; Austria; Azerbaijan; Bangladesh; Bosnia and Herzegovina; Bulgaria; Cape Verde Islands (Azzaroli Puccetti and Zava, 1988; Borloti *et al.*, 2020: 2); China; Croatia; Cyprus; Czech Republic; France [Corse]; Georgia; Gibraltar; Greece [East Aegean Is., Kriti]; Holy See [Vatican City State]; Hungary; India; Iran, Islamic Republic of; Iraq; Israel; Italy [Sardinia, Sicily]; Japan; Kazakhstan; Korea, Democratic People's Republic of; Korea, Republic of; Lebanon; Monaco; Mongolia; Montenegro; Morocco (Benda *et al.*, 2010a: 157; El Ibrahimi and Rguibi Idrissi, 2015: 362; Dbiba *et al.*, 2025: 8); Palestinian Territory, Occupied; Portugal; Russian Federation; San Marino; Serbia; Slovakia; Slovenia; Spain [Baleares, Canary Is.]; Switzerland; Syrian Arab Republic; Tunisia (Dalhoumi *et al.*, 2014: 53); Turkey; Turkmenistan; Ukraine.

Regionally extinct: Germany.

Vagrant: United Kingdom (Great Britain).

Presence uncertain: Armenia; Bhutan; Macedonia, the former Yugoslav Republic of.

DENTAL FORMULA:
Esquivel *et al.* (2021: Suppl.) reported that 3 out of 24 examined museum skulls showed oligodontia (missing teeth).

DETAILED MORPHOLOGY:
Baculum
Hill and Harrison (1987) and Benda *et al.* (2011b: 38).

Tongue
Park and Lee (2009: 267) found three types of lingual papillae in Korean specimens: filiform, fungiform, and circumvallate.

FUNCTIONAL MORPHOLOGY:
Amador *et al.* (2019: Suppl.) mention a wing loading value of 8.0 Pa, aspect ratio 5.8 for a wingspan of 22 cm and a wing area of 86 cm^2 and a body mass of 7 g.

SEXUAL DIMORPHISM:
In Italian *H. savii* specimens, Rughetti and Toffoli (2014: 149) found a seasonal variability in body conditions, which was sex dependent. In late spring equal sized (Fa) females were heavier than males, although these differences were small in late summer. Additionally, the female's body mass decreased during late spring and summer most probably as the result of higher energy requirements for lactation. The male's mass did not change during this period.

ECHOLOCATION:
Papadatou *et al.* (2008b: 133) report the following data for 53 Greek specimens: F_{start}: 55.5 ± 10.64 kHz, F_{end}: 33.7 ± 1.43 kHz, F_{peak}: 36.7 ± 1.23 kHz, bandwidth: 8.7 ± 2.18 kHz, duration 6.8 ± 1.57 ms and interpulse interval: 148.5 ± 59.63 ms.

For 32 calls from animals from France, Greece and Switzerland, Walters *et al.* (2012: suppl.) present the following numbers: duration: 8.23 ± 3.19 ms, F_{max}: 46.59 ± 12.95 kHz, F_{min}: 32.64 ± 2.26 kHz, bandwidth: 13.95 ± 11.88 kHz, F_{peak}: 34.87 ± 3.15 kHz.

Five calls of animals from Iran had the following values reported by Benda *et al.* (2012a: 182): F_{start}: 42.5 ± 2.1 (40.9 - 45.9) kHz, F_{end}: 36.1 ± 0.3 (35.7 - 36.3) kHz, F_{peak}: 37.4 ± 0.7 (36.7 - 38.4) kHz, duration: 9.4 ± 0.4 (8.8 - 9.7) ms, and interpulse interval: 185.6 ± 4.0 (182.1 - 191.3) ms.

In Morocco, Disca *et al.* (2014: 226) report the type of call for "*Hypsugo* cf. *savii*" as FM-QFC, with the following parameters: F_{start}: 52.7 ± 7.2 kHz, F_{end}: 32.3 ± 0.7 kHz, F_{peak}: 34.0 ± 1.0 kHz, bandwidth: 20.3 ± 6.8 kHz, duration: 6.8 ± 0.7 ms.

Ait-Abdesselam *et al.* (2025: 40) mentioned an F_{max} value of 32.40 ± 1.71 kHz for Algerian bats.

Luo *et al.* (2019a: Supp.) reported the following data (from two calls): F_{peak}: 36.7, 34.6 kHz, F_{start}: 55.5, 47.3 kHz, F_{end}: 33.7, 32.8 kHz, Band width: 21.8, 14.5 kHz, and duration: 6.8, 8.1 ms.

MOLECULAR BIOLOGY:
Karyotype
Capanna (1968), Zima (1982) and Volleth *et al.* (2001) reported 2*n* = 44, Fna = 50, BA = 8, a metacentric X and a submetacentric Y chromosome. Rushton (1970: 465) reported 2*n* = 44, FN = 50, X = metacentric, and Y = acrocentric. Arslan and Zima (2014: 13) added that the autosomal complement consists of three large and one small metacentrics, 15 acrocentrics and two dot-like pairs. Capanna and Manfredi Romanini (1971: 474) described the autosomal chromosomes as 3 pairs of metacentric, 1 submetacentric and 17 acrocentrics.

Genetics
See Hoofer and Van Den Bussche (2003), Mayer *et al.* (2007), and García-Mudarra *et al.* (2009).

Pestano *et al.* (2003b: 59) found a 6.3 to 7.2 % difference in (uncorrected) cyt b and 3.8 to 4.4 % difference in 16S rRNA between bats from Spain and the Canary Islands.

Mayer *et al.* (2007: Suppl. 5) reported that European and Moroccon bats differed by 9.6 % in their mtDNA (nd1) and 16S rRNA (see also Kipson *et al.*, 2023: 102).

16S rRNA from Maltese specimens examined by Batsleer *et al.* (2019: 172) indicated that these bats belonged to a mainly north African lineage.

Gojznikar and Mayer (2024:) reviewed published data for four mitochondrial genes (ND1, CytB, COI and 16 S) and assigned records from the Cape Verdian Islands through the Canary Islands and northern Africa, and the Apennine Peninsula to the Alps to Lineage B (previously referred to as *Hypsugo* cf. *darwinii*).

HABITAT:
In northern Algeria, Ait-Abdesselam *et al.* (2025: 45) reported this species to be primarily active in rural sites, especially at water bodies.

DIET:
Benda *et al.* (2012a: 402 - 403) report the following major food groups for different areas, indicating that this species is an opportunistic feeder: *Lepidoptera, Diptera, Hymenoptera and Neuroptera (Switzerland); * Homoptera, Heteroptera and smaller representatives of Lepidoptera (Balkans and West Turkestan); * Formicoidea, Heteroptera, Coleoptera and Lepidoptera (Syria); *Coleoptera and Formicoidea (Turkey); *Auchenorrhyncha, small Lepidoptera, Coleoptera (mainly Staphilinidae), nematoceran Diptera (Chironomidae, Culicidae), Sternorrhyncha (Aphididae), Neuroptera

(Chrysopidae, Hemerobiidae), Heteroptera, Hymenoptera (small Apocrita), and Trichoptera (Iran: Fars); *Small Lepidoptera, Neuroptera (Chrysopidae), Sternorrhyncha (Aphididae), Heteroptera, Coleoptera,and nematoceran Diptera (Culicidae) (Iran: Khorasan).

For these bats, Cabrera-Campos *et al.* (2021: Suppl.) estimated the food transit time to be about 69 minutes, and the digestibility rate about 81.1 %.

POPULATION:
Structure and Density
In the western part of its range it generally occurs at low densities and is restricted by its habitat requirements, but it is abundant in some European areas bordering the Mediterranean. Summer maternity colonies usually number 20 - 70 females. In the Canary Islands it is the commonest bat species. In the eastern part of its range population size and trends are not known (Molur *et al.*, 2002).

Trend
2016: Stable (Juste and Paunović, 2016b). 2008: Stable (Hutson *et al.*, 2008p; IUCN, 2009). *H. savii* populations within the Asia Minor and Levant region are predicted to have a stable population trend, under climate change scenarios (Bilgin *et al.*, 2012: 433).

REPRODUCTION AND ONTOGENY:
Garbino *et al.* (2021: Suppl.) report this species as being polytocous (more than one young per litter).

PARASITES:
In Italy, Voyron *et al.* (2011: 193) reported *Aspergillus sydowii* and *Cladosporium cladosporioides* (Fungi) from live *H. savii* specimens.

In Algeria, Bendjeddou *et al.* (2013: 325) found *Rhipicephalus sanguineus* (Latreille, 1806) (Arachnidae: Ixodida: Ixodidae). The following ectoparasites were reported by Bendjeddou *et al.* (2017: 15): Siphonaptera: *Ischnopsyllus octactenus* (Kolenati, 1856); Heteroptera: *Cimex pipistrelli* Jenyns, 1839; Arachnida: *Argas transgariepinus* White, 1846. Mechouk *et al.* (2022: 8) mentioned the ixodid mite *Rhipicephalus sanguineus* (Latreille, 1806).

In their checklist of arthropod parasites of North African bats, Bendjeddou *et al.* (2023: 4 - 7) mention the following species: Argasidae: *Secretargas transgariepinus* (White, 1846); Cimicidae: *Cimex pipistrelli* Jenyns, 1839; Ischnopsyllidae: *Ischnopsyllus octactenus* (Kolenati, 1856); and Macronyssidae: *Rhipicephalus sanguineus* s.l.

VIRUSES:
Adenoviridae
Mastadenovirus
Bat mastadenovirus wa reported by Nieto-Rabiela *et al.* (2019: Suppl.).

Coronaviridae
Alphacoronavirus
This virus was reported by Kohl and Kurth (2014: 3112) from Italy.

Betacoronavirus
Kohl and Kurth (2014: 3112) reported this virus from Spain and Italy.

Herpesviridae
Cytomegalovirus
Nieto-Rabiela *et al.* (2019: Supp;) reported this virus.

Orthomyxoviridae
Despite sampling and testing of 2 individuals of this species, no evidence of influenza A-like viruses (*Orthomyxoviridae*) were obtained (Fereidouni *et al.*, 2015).

Poxviridae
Lelli *et al.* (2019) described a new pox virus (Hypsugopoxvirus - HYPV) from (*Hypsugo savii* from Northern Italy.

Rhabdoviridae
"Various European bat lyssaviruses" were reported by Kohl and Kurth (2014: 3114) from various European countries.

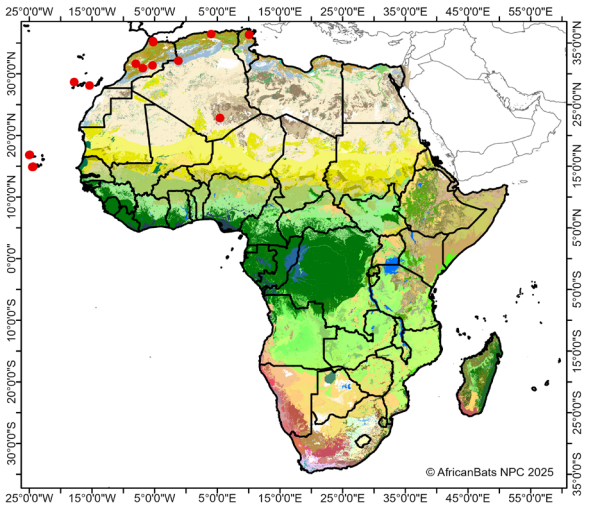

Figure 367. Distribution of *Hypsugo savii*.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Algeria, Canary Islands (Spain), Cape Verde, Italy, Morocco, Spain, Tunisia.

Genus ***Laephotis*** Thomas, 1901

1829. *Vespertilio:* A. Smith, Zool. Journ., 4 (16): 435. Publication date: May 1829. - Comments: In part. Not of Linnaeus, 1758 (see Monadjem *et al.*, 2020a: 1127).
1860. *Hypsugo:* Kolenati, Monographie der Europäischen Chiroptern, 20. - Comments: In part. Not of Kolenati, 1856 (see Monadjem *et al.*, 2020a: 1127, 1138).
1861. *Scotophilus:* Tomes, Proc. zool. Soc. Lond., 1861, I (old XXIX): 31. Publication date: May 1861. - Comments: In part. Not of Leach, 1821 (see Monadjem *et al.*, 2020a: 1127, who erroneously attributed the name to Thomas, 1861).
1878. *Vesperugo:* Dobson, Catalogue of the Chiroptera of the collection of the British Museum, 183. Publication date: 15 June 1878. - Comments: In part. Not of Keyserling and Blasius, 1839 (see Monadjem *et al.*, 2020a: 1127, 1138).
1887. *Vesperus:* Jentink, Notes Leyden Mus., 9 (2): 275. Publication date: April 1887. - Comments: In part. Not of Keyserling and Blasius, 1839 (see Monadjem *et al.*, 2020a: 1127).
1897. *Eptesicus:* Matschie, Arch. Naturg., 63 (1): 84. Publication date: October 1897. - Comments: In part. Not of Rafinesque, 1820 (see Monadjem *et al.*, 2020a: 1127).
*1901. *Læphotis* Thomas, Ann. Mag. nat. Hist., ser 7, 7 (41): 460. Publication date: 1 May 1901 [Goto Description]. - Comments: Type species: *Læphotis Wintoni* Thomas, 1901. - Etymology: From the Greek "*laephotis*" meaning cloaked, veiled. Although, a note in the description of the genus suggested the name meant "sail" in Greek (Thomas, 1901d: 460). Palmer (1904: 359) mentions it as from the Greek "*λαίφος*", meaning sail and "*oύς*" or "*ώτός*", meaning ear, referring to the large ears. Gardner (2005: 184) considers this name to be masculine (*Leaph* = sail + *ot* = ear(ed) + is (Latin third declension ending).
1908. *Scabrifer* G.M. Allen, Bull. Mus. comp. Zool., 52 (3): 46. Publication date: July 1908. - Comments: Type species: *Scabrifer notius* G.M. Allen, 1908. Originally described as substitute for *Rhinopterus* Miller, preoccupied by *Rhinoptera* Kuhl, 1841 (see Allen, 1908: 46; 1939a: 97).
1939. *Rhinopterus:* G. M. Allen, Bull. Mus. comp. Zool., 83: 97. Publication date: February 1939. - Comments: In part. Not of Miller, 1906 (see Monadjem *et al.*, 2020a: 1127).
1984. *Pipistrellus:* Heller and Volleth, Z. zool. Syst. Evolut.-forsch., 22:. - Comments: In part. Not of Kaup, 1829 (see Monadjem *et al.*, 2020a: 1127). However, the only name currently assigned to *Laephotis* by Heller and Volleth (1984) is *capensis*, of which they state: "*"Eptesicus" capensis* has to be placed here [in *Pipistrellus*] as well", but they never explicitly do so. The first explicit use of *Pipistrellus* in combination with names currently assigned to *Laephotis* seems to be Hill and Harrison (1987: 274).
1987. *Nycterikaupius* Menu, Palaeovert., 17 (3): 108, pl 4, fig 1. Publication date: 15 November 1987 [Goto Description]. - Comments: In part. The species assigned to this genus by Menu (1987: 109) are currently (sensu Monadjem *et al.*, 2020a: 1140) included in the genera *Laephotis, Neoromicia, Pipistrellus* and *Pseudoromicia*.
2001. *Neoromicia:* Volleth, Bronner, Göpfert, Heller, von Helversen and Yong, Chromosome Res., 9 (1): 26.
? *Laephotis:* (Current Spelling).
? *Neoromicia sp. DMR-2017*

TAXONOMY:
The genus *Laephotis* was considered monotypic with two subspecies (Hayman and Hill, 1971). But Peterson (1971b) introduced *wintoni* and *angolensis* as distinct species, while Setzer (1971) described two further species, *namibensis* and *botswanae*. However, inter-specific relations remain unresolved largely because specimens are few and in scattered collections (Kock and Howell, 1988, Stanley and Kock, 2004). Several specimens from South Africa were assigned to *L. wintoni* and *L.* cf. *wintoni* on the basis of multivariate analyses (Rautenbach and Nel, 1978b, Watson, 1990a, Kearney and Taylor, 1997). Given the distance of South African localities from other populations of *L. wintoni* in Kenya and Ethiopia, this identification was considered with some scepticism and not followed by Honacki *et al.* (1982) or Andrianaivoarivelo *et al.* (2007). Specimens described by Rautenbach and Nel (1978b) were subsequently provisionally placed with *L. namibensis* (Skinner and Smithers, 1990: 105). Kock and Howell (1988) and Stanley and Kock (2004) identified several cases where specimens identified as *L. angolensis* have been re-identified as *L. botswanae* or *L.* cf. *angolensis*. Morphometric analyses that included palatal and post-palatal measurements (Kearney and Seamark, 2005) allowed the distinction of *L. botswanae* and *L.* cf. *angolensis* from other species of *Laephotis*, and suggested the assignment of specimens from KwaZulu Natal previously identified as *L.* cf. *wintoni* to *L. botswanae*. However, the distinction between *L. wintoni* and *L. namibensis* was not confirmed and still remains to be clarified (Kearney and Seamark, 2005).

In his initial description of the genus *Laephotis*, Thomas (1901d) suggested the genus was most closely allied to *Vespertilio*. Tate (1942) considered *Laephotis* the closest relative of the Neotropical big-eared genus, *Histiotus*, which in turn was considered an offshoot of *Eptesicus*. However, the ears in *Laephotis* are not as greatly enlarged as in *Histiotus*, nor are they connected across the forehead (Hayman and Hill, 1971). On geographic grounds, Williams and Mares (1978) doubted the association with *Histiotus*. Hill (1974a) considered *Laephotis* an independent offshoot of *Eptesicus*.

Placed in tribe Vespertilionini by Hill and Harrison (1987) on basis of baculum morphology and retained in that tribe by Simmons (2005).

In a cladistic analysis of bacular morphology *Laephotis* nested within *Neoromicia* (Kearney *et al.*, 2002). The molecular results of Stadelmann *et al.* (2004b) support this, and those of Hoofer and Van Den Bussche (2003) would be similar, if the suggestion that *nanus* is moved to the genus *Neoromicia*, as indicated by chromosomal analysis and bacular morphology (Kearney *et al.*, 2002), had been followed.

Although considered monotypic by Hayman and Hill (1971), four species are currently recognised (Simmons, 2005); *L. angolensis* Monard, 1935, *L. botswanae* Setzer, 1971, *L. namibensis* Setzer, 1971, and *L. wintoni* Thomas, 1901, see review by Jobling (1939). Specimens of this rarely caught bat, from the Western Cape Province in South Africa, were initially identified as *Laephotis wintoni* (Rautenbach and Nel, 1978b), and then later as *Laephotis namibensis* (Skinner and Smithers, 1990). This change in species identification has led to considerable confusion in the literature (Honacki *et al.*, 1982; Corbet and Hill, 1991; Koopman, 1994; Bronner *et al.*, 2003; Jacobs *et al.*, 2005; Simmons, 2005). Separation of *L. namibensis* and *L. wintoni* using morphometric analyses of cranial and dental characters, which include Hill (1974a)'s palatal and post-palatal measurements, that Stanley and Kock (2004) found useful in the separation of *L. botswanae* and *L. wintoni*, remains problematic (Kearney and Seamark, 2005).

Bacular studies have also failed to show differences between some species of *Laephotis* (Kearney *et al.*, 2002). Monadjem *et al.* (2010d: 430) suggests that molecular studies may be necessary to sort out the current confusion over species limits within this genus.

Without mentioning a reason, Taylor (2019a: 282, 283) - followed by Simmons and Cirranello (2020) - transferred all of the *Neoromicia* species (as well as *Hypsugo anchietae*) to the genus *Laephotis*. This was undone by Monadjem *et al.* (2020a: 1114, 1140).

Taylor *et al.* (2024: 7) mention the crown age for this genus as 3.46 (0.6 - 11.9) Mya, and 1.46 (0.19 - 4.43) Mya for the long-eared clade.

Traditionally recognized species of the genus *Laephotis*: ***angolensis*** Monard, 1935; ***botswanae*** Setzer, 1971; ***namibensis*** Setzer, 1971; ***wintoni*** Thomas, 1901.

Currently (Simmons and Cirranello, 2024a) recognized species within this genus: ***angolensis*** Monard, 1935; ***capensis*** (A. Smith, 1829); ***kirinyaga*** Monadjem, Patterson, Webala and Demos, 2020; ***malagasyensis*** (Peterson, Eger and Mitchell, 1995); ***matroka*** (Thomas and Schwann, 1905); ***namibensis*** Setzer, 1971; ***robertsi*** (Goodman, Taylor, Ratrimomanarivo and Hoofer, 2021); ***stanleyi*** (Goodman, Kearney, Ratsimbazafy and Hassanin, 2017); ***wintoni*** Thomas, 1901.

COMMON NAMES:
Czech: de Wintonovi netopýři. English: Long-eared Bats, African Long-eared Bats, Tropical Long-eared Bats. French: Oreillards d'Afrique, Noctophiles, Chauves-souris à longues oreilles. German: Afrikanische Langohrfledermäuse. Italian: Lefòti.

GENERAL DISTRIBUTION:
A small genus with four species, endemic to Africa south of the Sahara (Kearney, 2013a: 578).

BIOGEOGRAPHY:
A fairly wide range of biotic zones and habitats are exploited by this genus: the Somalia Masai Bushland, Zambezian Woodland, the Southern Rainforest—Savanna Mosaic (marginally), Afromontane Afroalpine, Highveld, South West Arid and South West Cape BZs (Kearney, 2013a: 579).

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
The genus *Laephotis* is distinguished from all other African vespertilionid in part by the relatively long ears (> 16.5 mm, almost half the length of the FA) and large triangular tragus (Monadjem *et al.*, 2010d: 430). Distinguishing the four species of *Laephotis* from each other is not currently possible on external features (Monadjem *et al.*, 2010d: 430). There is a slight difference in mean size between *L. botswanae* and *L. angolensis*, with the former being larger, but this difference may be due to the very small sample size of measured *L. angolensis* (Monadjem *et al.*, 2010d: 430).

DENTAL FORMULA:
The permanent dental formula is as follows: $I^2/_3$, $C^1/_1$, $PM^1/_2$, $M^3/_3$ = 32 (like *Otonycteris* but as in *Glauconycteris*, *Eptesicus*, some *Pipistrellus* and *Mimitellus*) (Kearney, 2013a: 578).

The upper and lower premolars are tall teeth, almost the same height as the canines, and this, together with toothwear on the canines, might account for the suggestion that the canines are

extremely reduced (Hayman and Hill, 1971, Kingdon, 1974).

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:
Kearney and Seamark (2005) identified four cranial measurements based on a multivariate morphometric analysis to separate *L. botswanae* from the other three congeners. The post-palatal measurement of the distance from a line across the rear margins of the third upper molar to the anterior edge of the mesopterygoid fossa is shorter than the distance from the anterior edge of the mesopterygoid fossa to the tips of the pterygoid hamulars in the *L. botswanae*/*L. angolensis* group, but longer in the *L. namibensis*/*L. wintoni* group (Hill, 1974a,Stanley and Kock, 2004, Kearney and Seamark, 2005).

DETAILED MORPHOLOGY:
Baculum
Bacular studies have also failed to show differences between some species of *Laephotis* (Kearney *et al.*, 2002). Monadjem *et al.* (2010d: 430) suggests that molecular studies may be necessary to sort out the current confusion over species limits within this genus.

ECHOLOCATION:
In Benin, the call of a non-specified *Laephotis* was categorized as a FMd (Frequency modulation downward) sonotype by Roemer *et al.* (2021: Suppl.).

HABITAT:
Marsden *et al.* (2023: 7) indicate that bats of the genus *Laephotis* are generally urban avoiders. This can probably be attributed to their roost specificity and the rarity of these species.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Angola, Burundi, Cameroon, Central African Republic, Congo, Congo (Democratic Republic of the), Gabon, Ghana, Kenya, Liberia, Mozambique, Rwanda, Somalia, South Africa, South Sudan, Tanzania, Uganda, Zambia, Zimbabwe.

Laephotis 'incertae-sedis'

1857. *Vespertilio pusillus* Leconte, Proc. Acad. nat. Sci. Philad., 10. Publication date: 25 February 1857. Type locality: "Africa": "Western Africa". - Comments: Kock (1969a: 228) indicates that this paper was published in 1858.
1897. *Vesperugo (Vesperus) pusillus:* Trouessart, Catalogus Mammalium tam viventium quam fossilium, fasc I: 110. (Name Combination).
1929. *Eptesicus pusillus:* Thomas, Proc. zool. Soc. Lond., 101. - Comments: Thomas (1929: 101) assigned this name to Noack. (Name Combination).
1953. *Eptesicus (Eptesicus) pusillus:* Ellerman, Morrison-Scott and Hayman, Southern African mammals 1758 to 1951, 76. (Name Combination).
2013. *Neoromicia cf. nana:* Koubínová, Irwin, Hulva, Koubek and Zima, Front. Zool., 10: 5. - Comments: Koubínová *et al.* (2013: 7) found found differences in diploid chromosome number and/or in chromosome morphology between the populations from Senegal and other regions in Africa. (Name Combination).
2013. *Neoromicia cf. somalica:* Koubínová, Irwin, Hulva, Koubek and Zima, Front. Zool., 10: 5. - Comments: Koubínová *et al.* (2013: 7) found found differences in diploid chromosome number and/or in chromosome morphology between the populations from Senegal and other regions in Africa. (Name Combination).
? *Neoromicia "incertae-sedis"*
? *Neoromicia capensis B:*

TAXONOMY:
Allen (1939a: 86) indicates that *Vespertilo pusillus* might possibly be the same form as *Vesperugo pusillus* Noack, 1887, but that the description is insufficient to identify the species. Ansell (1978: 25) - referring to Rosevear (1962) and Hayman and Hill (1971) - indicates that the status of *pusillus* Leconte is uncertain in relation to *Eptesicus minuta* Temminck, *"Eptesicus" somalicus* and *"Eptesicus" capensis*. Crawford-Cabral (1989) also points out that in southern Africa, *"Eptesicus" zuluensis* might be involved too.

Koopman (1965) and Kock (1969a: 138) consider this name to be indeterminable, and they suggest placing the small northern African *Eptesicus* specimens in the species *guineensis* Bocage, 1889.

According to Kock it is even uncertain that *pusillus* Leconte represents *Eptesicus* [= *Neoromicia/Laephotis* in the current context].

Kock (1969a: 159) also pointed out that the skull of the type of *Vesperugo pusillus* Noack, 1887 actually represents a non-adult "*Pipistrellus nanus*".

The fact that *pusillus* Leconte and *pusillus* Noack have been considered synonyms throughout the literature, also render much of the literature data indeterminable, unless these are supported by voucher specimens.

CONSERVATION STATUS:
Global Justification
Currently not been globally assessed hence no justification.

Assessment History
Global
No assessment known, hence no history of assessment to report.

Regional
None known.

POPULATION:
Structure and Density
Unknown.

Trend
Not assessed.

PARASITES:
In their description of the Nematode parasite *Molinostrongylus richardae*, Durette-Desset and Chabaud (1975: 312) also mention an "*Eptesicus pusillus* from Tananarive, Madagascar as an additional host. From the same host (species) and locality, Richard (1966: 413, 419) reported the Trematode *Plagiorchis (Plagiochis) vespertilionis* (Müller, 1784) Braun, 1900 and described another one: *Papillatrium (Papillatrium) inversum*.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Angola, Burkina Faso.

Laephotis angolensis Monard, 1935

*1935. *Laephotis angolensis* Monard, Arq. Mus. Bocage, 6: 45. Type locality: Angola: 15 km W Dala: Tyihumbwe [=Tschiumbe / Tyiumbwe / Tyhumbwe / Chiu [11 02 S 20 04 E]. [Goto Description]. Holotype: MHNC 32-4-816: ♀. Collection date: September 1932. - Etymology: Referring to the country where the type specimen was collected. (Current Combination).
1953. *Laephotis wintoni angolensis:* Ellerman, Morrison-Scott and Hayman, Southern African Mammals 1758 to 1951: a reclassification, 78. Publication date: 23 December 1953. (Name Combination).
1971. *Laephotis botswanae* Setzer, Proc. Biol. Soc. Wash., 84 (32): 260, fig 1b, 1d. Publication date: 4 November 1971. Type locality: Botswana: 50 mi (80 km) W and 12 mi (19 km) S Shakawe [18 21 S 21 52 E]. [Goto Description]. Holotype: USNM 425349: ad ♀, skin and skull. Collected by: S.W. Goussard; collection date: 24 May 1967; original number: 691. - Comments: Although Schmidt *et al.* (2008: 35) mention the coordinates of the type locality as 18 32 S 21 05 E. - Etymology: The specimen from which the species was described originated near Shakawe in north-western Botswana (Taylor, 2005).
1974. *Laephotis wintoni:* Hill, Bull. Br. Mus. (nat. Hist.) Zool., 27 (2): 75. Publication date: 18 July 1974. - Comments: Not of Thomas, 1901. (Name Combination).
1999. *Laephotis cf. wintoni:* Taylor, S. Afr. J. Zool., 34 (1): 22. (Name Combination).
2005. *Laephotis cf. angolensis:* Kearney and Seamark, Ann. Transv. Mus., 42: 71. (Name Combination).
2024. *Laephotis cf. botswanae:* Taylor, Kearney, Clark, Howard, Mdluli, Markotter, Geldenhuys, Richards, Rakotoarivelo, Watson, Balona, and Monadjem, Glob. Ch. Biol., 30 (6):4. Publication date: 5 June 2024. (Name Combination).
? *Laephotis cf. botswanae:* (Name Combination).

TAXONOMY:
Described, as a distinct species, from a single specimen, ♀ with damaged skull, but subsequently considered a subspecies of *L. wintoni* (Ellerman *et al.*, 1953, Hayman and Hill, 1971). Although currently treated as a distinct species, the relationship between *L. angolensis* and *L. botswanae* is obscure, partly because specimens of *L. angolensis* are so scarce that variation within this form cannot be assessed (Kearney, 2013b: 580). Peterson (1973) suggests that *L. botswanae* may prove to be a larger, southern race of *L. angolensis*. However, both species occur together in S DR Congo (Setzer, 1971). Several specimens originally considered to represent *L. w. angolensis* were later reassigned to *L. botswanae* (Smithers, 1971, Hill, 1974a).

Laephotis botswanae and *L. angolensis* are currently considered to be conspecific, which makes the former a larger race of the latter (Peterson, 1971b, Kearney and Seamark, 2005). This is reflected in records of both taxa from southeastern Katanga, DRC (Monadjem *et al.*, 2010d: 430).

Stanley and Kock (2004), being concerned about the correct assignment of the species that is known from very few specimens, referred to specimens in the Natural History Museum, London collection, as cf. *angolensis*. In a morphometric analysis with specimens of the other *Laephotis* taxa, these specimens were distinct from *L. botswanae*, and *L. wintoni* / *L. namibensis*, however, it was suggested this small difference, based on two specimens of *angolensis*, may disappear with the addition of more specimens of both *angolensis* and *botswanae* (Kearney and Seamark, 2005: 85). Peterson (1973: 602) had suggested that "*L. bostwanae* may prove to be a larger, southern race of *L. angolensis*".

No subspecies currently recognized.

COMMON NAMES:
Czech: netopýr angolský. English: Angolan Long-eared Bat. French: Oreillard d'Angola, Chauve-souris à longues oreilles d'Angola, Noctophile d'Angola. German: Angola-Langohrfledermaus.

SIMILAR SPECIES:
Not easily distinguished from other *Laephotis* (Monadjem *et al.*, 2010d: 430, Kearney, 2013b: 580).

L. wintoni - Forearm longer (37 - 41 mm). Ears longer (21 - 24 mm) and broader. Skull longer and broader (GLS: 15.6 - 16.3 mm, GWS: 8.8 - 9.5 mm, C-M3: 5.1 - 5.3 mm).
L. namibensis - Forearm usually longer 37.8 (36 - 40 mm). Ears longer (22 - 25 mm). Skull larger (GLS: 16.1 - 17.0 mm, GWS: 8.4 - 9.2 mm, C-M3: 4.8 - 5.4 mm).

CONSERVATION STATUS:
Global Justification
Listed as Data Deficient (DD ver 3.1 (2001)) in view of continuing doubts as to its taxonomic validity as well as absence of recent information on its extent of occurrence, status, ecological requirements and threats (Jacobs *et al.*, 2008m; IUCN, 2009; Jacobs *et al.*, 2019e).

Assessment History
Global
2018: DD ver 3.1 (2001) (Jacobs *et al.*, 2019e). 2008: DD ver 3.1 (2001) (Jacobs *et al.*, 2008m; IUCN, 2009). 2004: NT ver 3.1 (2001) (Jacobs *et al.*, 2004c; IUCN, 2004). 1996: LR/nt (Baillie and Groombridge, 1996).

Regional
None known.

MAJOR THREATS:
The threats to this species are not known (Jacobs *et al.*, 2008m; IUCN, 2009; Jacobs *et al.*, 2019e).

CONSERVATION ACTIONS:
Jacobs *et al.* (2008m) [in IUCN (2009)] and Jacobs *et al.* (2019e) report that there appear to be no direct conservation measures in place, and it is not known if the species is present within any protected areas. Further studies are needed into the taxonomy, distribution, natural history and potential threats to this poorly known species.

GENERAL DISTRIBUTION:
Laephotis angolensis is known from two localities in Angola (including the type locality of Tyihumbwe [Chiumbe], 15 km west of Dala) and a single locality in the Democratic Republic of the Congo (Mumeme, East of Likasi, Shaba Province). Hill and Carter (1941) suggest that the species may occur throughout eastern Angola, but more sampling is needed here.

Laephotis angolensis is endemic to southern Africa (Kearney and Seamark, 2005). Apparently restricted to the Zambezian Woodland BZ and the southern fringe of the Southern Rainforest Savanna Mosaic (Kearney, 2013b: 580). *Laephotis angolensis* is known from just four specimens collected at three localities (Kearney and Seamark, 2005) in Angola and SE DR Congo (Peterson, 1973, Setzer, 1971, Hill, 1974a).

Native: Angola (Monard, 1935; Hill and Carter, 1941; Kearney and Seamark, 2005: 87; Monadjem *et al.*, 2010d: 563; Taylor *et al.*, 2018b: 60); Congo (The Democratic Republic of the) (Hayman *et al.*, 1966; Stanley and Kock, 2004; Kearney and Seamark, 2005: 87 as *L.* cf. *angolensis*); Kearney and Seamark, 2005: 85; Simmons, 2005; Monadjem *et al.*, 2010d: 563).
As *Laephotis botswanae*, it was reported from: Angola (Kearney and Seamark, 2005: 87; Monadjem *et al.*, 2010d: 563); Botswana (Kearney and Seamark, 2005: 87; Monadjem *et al.*, 2010d: 563); Congo (The Democratic Republic of the) (Kearney and Seamark, 2005: 87; Monadjem *et al.*, 2010d: 564); Malawi (Ansell and Dowsett, 1988; Happold and Happold, 1997a; Kearney and Seamark, 2005: 87; Monadjem *et al.*, 2010d: 564); Mozambique (Monadjem *et al.*, 2010c: 383); Namibia (Cotterill, 2004a: 261; Monadjem *et al.*, 2010d: 564); South Africa (Kearney and Seamark, 2005: 87; Simmons, 2005; Monadjem *et al.*, 2010d: 564); Tanzania (Kock and Howell, 1988; Bauer, 1992; Stanley and Kock, 2004: 176; Kearney and Seamark, 2005: 87); Zambia (Ansell, 1960a, Kearney and Seamark, 2005: 87; Monadjem *et al.*, 2010d: 564); Zimbabwe (Cotterill, 1996a; Kearney and Seamark, 2005: 87; Monadjem *et al.*, 2010d: 564).

GEOGRAPHIC VARIATION:
None (Kearney, 2013b: 580).

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Laephotis angolensis is a small bat with an estimated mass of around 5 - 6 g (Monadjem *et al.*, 2010d: 430), it is very similar in size and appearance to the slightly larger *L. botswanae*, from which it cannot be reliably separated on external characters (Kearney and Seamark, 2005, Monadjem *et al.*, 2010d: 430).

The face is plain, without noseleaf and with tail more or less fully enclosed in interfemoral membrane.

Dorsal pelage yellowish-brown to reddish-brown; hairs distinctly bicoloured (Monadjem *et al.*, 2010d: 430), mid-dorsal hairs ca. 7 mm: basal 5 mm blackish-brown, terminal 2 mm yellowish-brown or reddish-brown (Kearney, 2013b: 580). Ventral pelage pale grey on chin, paler on throat, becoming cream or white in pelvic region; hairs (except pelvic region) blackish-brown with pale grey, cream or white tip. Ventral hairs in pelvic region pure white (Kearney, 2013b: 580).

The naked skin on muzzle and around eyes is dark brown.

The long ears are dark brown, roughly triangular but very elongated; tip rounded; inner margins almost meeting on forehead but not joined at base. Ears may he held erect above head or (when resting) held sideways at right angles to head (Kearney, 2013b: 580). Ears separated, of medium length for a vespertilionid (15 – 18 mm) and of medium relative length (45 - 46 % of FA, n = 2) (Kearney, 2013b: 580).

Tragus with notch at base of posterior margin as in *L. botswanae*, but diagnostic differences between the tragi of these species, if present, are not known (Kearney, 2013b: 580).

Wings dark brown (Monard, 1935); arm-wing with whitish hind border. Interfemoral membrane medium-brown, more translucent.

DENTAL FORMULA:
The permanent dental formula is as follows: $I^2/_3$, $C^1/_1$, $PM^1/_2$, $M^3/_3$ = 32.

Four upper and five lower cheekteeth and two upper incisors on each side.

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:
In lateral profile the braincase is slightly flattened, but raises slightly above the rostrum (Monadjem *et al.*, 2010d: 430); rostrum rather narrow; zygomatic arches slender; no sagittal crest; lambdoid crest weakly developed. Skull apparently shorter and usually narrower than in other *Laephotis* but data very limited (GLS: 13.7 13.8 mm; GWS: 6.7, 8.1 mm, n 2). Palatal length 6.1, 6.2 mm (n 2) (cf. > 6.4 mm in *L. botswanae* and *L. wintoni*) (Hill 1974a).

The upper premolar is sharply pointed and rises above the molars (Monadjem *et al.*, 2010d: 430).

DETAILED MORPHOLOGY:
Karyotype
Not recorded (Monadjem *et al.*, 2010d: 430, Kearney, 2013b). Monadjem *et al.* (2010d: 430) suggests the diploid number is likely to be 2n = 34 as in other species of *Laephotis*.

FUNCTIONAL MORPHOLOGY:
For *Laephotis botswanae*: Aspect ratio low; wing-loading very low (Malawi; M. Happold *pers. comm.* in Kearney (2013c: 582)). Flight highly manoeuvrable; turns by banking (minimum radius < 25 cm) and by stalling-and-twisting; individuals were able to sustain flight in a 1 x 1 x 1 m enclosure for up to three circuits/flight (6 bats, 10 flights each; M. Happold *pers. comm.* in Kearney (2013c: 582)). Can take off from ground. Not easily able to climb or scuttle.

SEXUAL DIMORPHISM:
No information (Kearney, 2013b: 580).

ECHOLOCATION:
Weier *et al.* (2020: Suppl.) reported on nine calls from the Okavango River Basin with the following characteristics: F_{max}: 74.79 ± 11.44 kHz, F_{min}: 42.51 ± 1.93 kHz, F_{knee}: 47.75 ± 4.49 kHz, F_{char}: 43.72 ± 3.23 kHz, slope: 165.40 ± 83.15 OPS, duration: 2.77 ± 0.57 ms.

For "*L. botswanae*", Pierce *et al.* (2012: 41) reported a mean peak frequency of 37.13 ± 2.37 kHz, and a mean bandwidth of 26.43 ± 11.49 kHz, with a duration of 2.68 ± 1.09 ms. Hand-released specimens from Malawi produced slightly longer FM-QCF (quasi-constant frequency) calls that had similar frequency parameters: duration: 4.73 ± 1.10 ms, mean peak frequency: 32.34 ± 1.42 kHz, and mean bandwidth of 29.72 ± 9.62 kHz. The maximum frequency in cluttered space was found to be 48.94 ± 4.6 kHz, as compared with 60.78 ± 9.33 kHz in open space. "*Laephotis botswanae*" produces LD-FM echolocation calls with an intermediate peak frequency (33 kHz), broad bandwidth (22 kHz), and intermediate duration (5 ms). Besides the fundamental, the second and third harmonics are often present on the spectrogram (Fenton and Bell, 1981; also see Fenton and Thomas (1980).

Search-phase call-shape (Malawi) (a) steep FM/ QCF and (b) smooth steep/shallow FM (six bats recorded as released, one tethered; M. Happold *pers. comm.* in Kearney (2013c: 582). Start-frequency 60 - 72 kHz; end-frequency 29 - 33 kHz; peak- frequency 29 - 33 kHz; call-duration ca. 3 - 5 ms (155 calls). (b) Start- frequency 47 - 49 kHz; end-frequency 32 - 33 kHz; call-duration 15 ms (12 calls). Fenton and Bell (1981) reported

calls from *Laephotis* of uncertain identity from Zimbabwe (see above) for which call-shape (based on one illustrated call) was angular steep/shallow FM; start- frequency 55 kHz; end-frequency 32 kHz; peak-frequency 33 kHz; maximum call-duration 5 ms. Although call shapes differed, the peak-frequency was the same in calls from Malawi and Zimbabwe, suggesting that the bats in both localities represent "*L. botswanae*" (Kearney, 2013c: 582).

Taylor *et al.* (2013b: 17) recorded two "*L. botswanae*" calls in Waterberg, South Africa, with the following parameters: F_{max}: 51.6 (50.3 - 53.0) kHz, F_{min}: 32.0 (31.8 - 32.2) kHz, F_{knee}: 35.6 (35.3 - 35.8) kHz, F_{char}: 33.0 (32.8 - 33.3) kHz, duration: 3.0 (2.9 - 3.1) ms. In the Mapungubwe National Park (RSA), Parker and Bernard (2018: 57) recorded 20 calls with F_{char}: 31.46 ± 1.47 kHz, F_{max}: 53.20 ± 7.20 kHz, F_{min}: 30.75 ± 1.28 kHz, F_{knee}: 37.38 ± 1.77 kHz, duration: 6.49 ± 2.68 ms and 6.79 ± 2.71 calls/sec.

3 "*L. botswanae*" calls recorded by Adams and Kwiecinski (2018: 4) had the following characteristics: F_{char}: 38.8 ± 0.7 kHz, F_{max}: 68.5 ± 0.5 kHz, F_{min}: 37.9 ± 0.9 kHz, duration: 2.2 ± 0.3 ms.

Moir (2020: 30) and Moir *et al.* (2021a: 371) reported 269 calls of 10 "*L. botswanae*" bats from southern KwaZulu-Natal and Eastern Cape (RSA): F_{max}: 59.63 ± 3.62 (53.43 - 62.9) kHz, F_{min}: 33.25 ± 0.66 (32.02 - 34.00) kHz, F_{char}: 33.73 ± 0.75 (32.88 - 35.38) kHz, F_{knee}: 38.85 ± 2.43 (35.54 - 44.38) kHz, and duration: 1.54 ± 0.21 (1.07 - 1.72) ms.

In the Limpopo province (RSA), Weier *et al.* (2021: 7) reported the following characteristics for 99 calls of 6 *L. botswanae*" bats: F_{max}: 45.58 ± 10.03 kHz, F_{min}: 30.24 ± 1.16 kHz, F_{knee}: 33.66 ± 1.14 kHz, F_{char}: 30.73 ± 1.21 kHz, slope: 309.65 ± 145.86 OPS, duration: 4.92 ± 1.98 ms.

Brinkley *et al.* (2021: Table S1) mention the following parameters for 4 "*Laephotis botswanae*" calls from the Kruger Park (RSA): F_{min}: 32.9 ± 1.1 (31.7 - 34.2) kHz, Duration: 2.1 ± 0.1 (2.0 - 2.2) ms, F_{max}: 66.3 ± 1.6 (64.5 - 68.4) kHz, F_{knee}: 35.7 ± 1.1 (34.5 - 37.2) kHz, F_{char}: 33.3 ± 0.7 (32.5 - 34.2) kHz,

2 pulses of "*L. botswanae*" recorded by Taylor *et al.* (2020a: 77) at Venetia Limpopo Nature Reserve and Mapungubwe National Park (RSA) had F_{min}: 31 - 32 kHz, F_{max}: 50 - 53 kHz, F_{char}: 32 - 33 kHz, F_{knee}: 35 kHz and duration 2 - 34 ms.

Taylor-Boyd *et al.* (2025: 116) report the following values for 11 calls from Zambia: Interpulse interval: (70.8 ± 16.7 (44.3 - 94.9) ms; F_{max}: 40.8 ± 3.4 (36.9 - 46.4) kHz; Start slope: -16.0 ± 3.3 (-11.0 - -21.6) kHz/ms; End slope: -7.9 ± 2.6 (-11.0 - -9.3) kHz/ms; Ledge duration: 0.4 ± 0.1 (0.3 - 0.6) ms.

Molecular Biology:

Karyotype

Rautenbach *et al.* (1993) reported 2*n* = 34, FN = 50, BA = 18, a submetacentric X chromosome, and an acrocentric Y chromosome, for specimens from South Africa (as *Laephotis botswanae*).

Habitat:

Nothing is currently known on the habitat of *L. angolensis* (Monadjem *et al.*, 2010d: 430, Kearney, 2013b: 580). All records have come from the savanna biome (Kearney and Seamark, 2005: 85).

Most specimens of "*Laephotis botswanae*" have been caught in mist-nets, usually over or close to water, in riverine woodland or woodland savanna (Monadjem *et al.*, 2010d: 435, Kearney, 2013c: 582). Their association with rocky outcrops has been noted in some localities (Herholdt, 1989, Cotterill, 1996a). In Malawi, recorded near streams, and lakes in montane and sub montane evergreen forest at 1520 - 1700 m, from miombo woodland near sub-montane rainforest at 1350 - 1500 m, from mosaic of miombo woodland, farmland and riverine woodland near rocky hills, dams, streams and marshes at 1000 m, and in ornamental gardens in the town of Zomba (800 900 m), with rocky hills nearby (Happold and Happold, 1997b).

Furthermore, "*L. botswanae*" was reported occurring in both savanna (75 % of specimen records) and grassland biomes (25 % of specimen records) (Kearney and Seamark, 2005: 85). However, since all the grassland biome records are from high altitude localities in Malawi (Happold and Happold, 1997b), it was suggested the identification of the specimens from Malawi should be confirmed using palatal and post-palatal measurements (Kearney and Seamark, 2005: 85). Cooper-Bohannon *et al.* (2016: Table S2) mention its habitat preferences as Savanna (83 %) and Afromontane (16 %).

Habits:

For "*Laephotis botswanae*" the following was reported: Becomes torpid during day at ambient temperatures 21 - 24 °C. Predicted mean maximum urine concentration is medium (3745 mOsmol/kg); captive bats drank regularly every night (Kearney, 2013c: 582).

Forages by slow hawking. A light-tagged individual, released in an area with marshland, a large dam, some woodland and farmland, observed for 53 min, foraged mainly between 1 - 3 m over the marsh, making straight level traverses to and fro with some jerky zig-zagging and some wide circling, but no diving or swooping upwards or any other acrobatic manoeuvres; also foraged over tall grass in spaces between trees, and flew over a banana plantation; did not fly above other trees and did not forage over the open water (M. Happold *pers. comm.* in Kearney (2013c: 582)).

Of 20 individuals sampled in Malawi, one post-lactating ♀ and one sub adult ♂ were mist netted together; one reproductively inactive ♀, one lactating ♀ and one ♂ with abdominal testes were caught in one mist-net at intervals of 15 mm and 5 mm respectively; and all others were caught singly on different dates and at different localities (M. Happold *pers. comm.* in Kearney (2013c: 582). All of four individuals mist-netted by Herholdt (1989) in the Waterberg area in the Limpopo Province of South Africa were caught singly.

ROOST:
A pair of "*Laephotis botswanae*" was found roosting under the bark of a broken limb of a tree (HZM specimen label written by W F. H. Ansell); no other roosts known (Kearney, 2013c: 582).

DIET:
There is no information on the diet of this species (Monadjem *et al.*, 2010d: 430), but in Zimbabwe, "*Laephotis botswanae*" has been recorded feeding on Coleoptera, Lepidoptera and Trichoptera (Fenton *et al.*, 1977a, Fenton and Thomas, 1980). Fenton (1985) reported Coleoptera, Lepidoptera and Trichoptera in cool season diet of *Laephotis* in Zimbabwe, and Lepidoptera only in wet season; however, he was not sure if the bats represented *L. botswanae* or *L. angolensis* and this is still unresolved.

For these bats, Cabrera-Campos *et al.* (2021: Suppl.) estimated the food transit time to be about 76 minutes, and the digestibility rate about 80.1 %. For "*L. botswanae*, the reported numbers were slightly different: 74 minutes and about 80.4 %.

PREDATORS:
Mikula *et al.* (2016: Supplemental data) mention the Bat hawk (*Macheiramphus alcinus* Bonaparte, 1850) as diurnal avian predator.

POPULATION:
Structure and Density
The populations abundance is not well known, however, 25 specimens were collected at one locality (Jacobs *et al.*, 2008m; IUCN, 2009; Jacobs *et al.*, 2019e). Rare (Kearney, 2013b: 580).

As *Laephotis botswanae* it seems to be rarely collected, and may be naturally rare (Schlitter, 2008e; IUCN, 2009; Monadjem and Schlitter, 2017a). Rare in some parts of their distribution, although Herholdt (1989) and Happold and Happold (1997b) have suggested it is not uncommon, but seldom caught at other localities (Kearney, 2013c: 582). There was a marked change in numbers recorded in Malawi between a survey in 1984 - 85 with three specimens (Happold *et al.*, 1988), and 1993 - 94 with 17 specimens (Happold and Happold, 1997b). Herholdt (1989) suggested that their being caught singly might indicate they are not easily captured in mist-nets.

Numbers in museum collections are growing (Kearney, 2013c:582).

Trend
2018: Unknown (Jacobs *et al.*, 2019e). 2008: Unknown (Jacobs *et al.*, 2008m; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
Data for *Laephotis botswanae* indicate that the litter-size not known (Kearney, 2013c: 582), nor is the reproductive chronology (data inconclusive) (Monadjem *et al.*, 2010d: 435, Kearney, 2013c: 582). At 15° 31' 5 (near Namadzi, Malawi), 2 of 3 adult ♀♀ were lactating and one was reproductively inactive in Dec; 2 of 2 were reproductively inactive in Jan; 2 of 2 were post-lactating in Feb; no data for other months (M. Happold *pers. comm.* in Kearney (2013c: 582)). Two subadults were captured in Jan and Feb. These data suggest that ♀♀ might not reach sexual maturity until second year.

PARASITES:
ACARI
Ixodidae
Rhipicephalus simus, (Anciaux de Faveaux, 1984), although the information is uncertain because the identity of the host still needs to be confirmed (Kearney, 2013b: 580).

Spinturnicidae
Spinturnix walkei, (Anciaux de Faveaux, 1984), although the information is uncertain because the identity of the host still needs to be confirmed (Kearney, 2013b: 580).

Macronyssidae
Steatonyssus sp., (Anciaux de Faveaux, 1984), although the information is uncertain because the identity of the host still needs to be confirmed (Kearney, 2013b: 580).

HEMIPTERA
Cimicidae
Cacodmus villosus (Stâl, 1855) (Kock and Aellen, 1987: 876; Kock *et al.*, 1998b: 236; Kearney, 2013b: 580).

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Angola, Botswana, Congo (Democratic Republic of the), Malawi, Mozambique, Namibia, South Africa, Tanzania, Zambia, Zimbabwe.

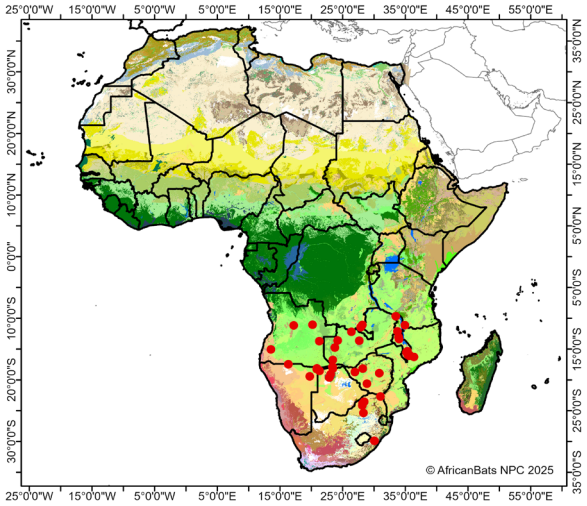

Figure 368. Distribution of *Laephotis angolensis*.

Laephotis capensis (A. Smith, 1829)

*1829. *Vespertilio Capensis* A. Smith, Zool. Journ., 4 (16): 435. Publication date: May 1829. Type locality: South Africa: Cape province: Grahamstown [33 18 S 26 32 E]. [Goto Description]. Lectotype: NHMUK 1848.6.12.18: ad, skin only. Collected by: Dr. J.A. Smith. This skin should match skull NHMUK 1848.6.12.21. Lectotype: NHMUK 1849.8.16.21: ad, skull only. Collected by: Dr. J.A. Smith. This skull should match skin NHMUK 1849.8.16.18. - Comments: Thorn *et al.* (2009: 56) mention that the "Lectotype (Thomas 1926) probably does not match the Grahamstown type-locality selected by Roberts (1951), see Thorn (1988a).". - Etymology: The name *capensis* refers to the Cape, where the type specimen was collected.
1840. *Vespertilio minuta* Temminck, Monographies de mammalogie ou description de quelques genres de mammifères, dont les espèces ont été observées dans les différens musées de l'Europe. Tome Seconde, 2 (13): 209. Publication date: 1840. Type locality: South Africa: Cape of Good Hope [ca. 33 56 S 18 28 E]. [Goto Description]. - Comments: Preoccupied by *Vespertilio minutus* Montagu, 1808.
1855. *Vespertilio (Vesperus) minutus:* Wagner, in: Schreber, Die Säugethiere in Abbildungen nach der Natur mit Beschreibungen, Suppl 5: 747.
1860. *Hypsugo minutus:* Kolenati, Monographie der Europäischen Chiroptern, 20.
1861. *Scotophilus capensis:* Tomes, Proc. zool. Soc. Lond., 1861, I: 36. (Name Combination).
1861. *Scotophilus minutus:* Tomes, Proc. zool. Soc. Lond., 1861, I: 32.
1878. *Vesperugo (Vesperus) capensis:* Dobson, Catalogue of the Chiroptera of the collection of the British Museum, 198. Publication date: 15 June 1878. (Name Combination).
1878. *Vesperugo (Vesperus) minutus:* Dobson, Catalogue of the Chiroptera of the collection of the British Museum, 197. Publication date: 15 June 1878.
1886. *Vesperugo capensis?:* Nehring, Katalog der Säugethiere, 5. (Name Combination).
1887. *Vesperus minutus:* Jentink, Mus. Hist. nat. Pays-Bas, Leyden, 275.
1889. *Vesperus damarensis* Noack, Zool. Jb. Syst., 4: 213, pl 5, fig 59. Publication date: 28 February 1889. Type locality: Namibia: Damaraland: Omburu and Golabie. [Goto Description]. Syntype: ZMB 86231: ad ♀, skin and skull. Collected by: Heinrich Rudolph Schinz; collection date: August 1886. Formerly A4902; see Turni and Kock (2008: 65). Syntype: ZMB A.4903: ad ♀, alcoholic (skull missing). Collected by: Heinrich Rudolph Schinz; collection date: August 1886. From Omburo; see Turni and Kock (2008: 65) [missing]. Syntype: ZMZ |TS389|: ad ♀, skin and skull. Collected by: Heinrich Rudolph Schinz. Locality Golabie, see Turni and Kock (2008: 65).
1897. *Eptesicus minutus:* Matschie, Arch. Naturgesch. Berlin, 63 (1): 84.
1897. *Vesperugo (Vesperus) damarensis:* Trouessart, Catalogus Mammalium tam viventium quam fossilium, fasc I: 110.
1901. *Vespertilio (Eptesicus) capensis:* Sclater, Mammals of South Africa, 123, 125. (Name Combination).
1901. *Vespertilio (Eptesicus) damarensis:* Sclater, Mammals of South Africa, 123, 128.
1901. *Vespertilio (Eptesicus) minutus:* Sclater, Mammals of South Africa, 123, 124.
1905. *Vespertilio capensis gracilior* Thomas and Schwann, Proc. zool. Soc. Lond., 1905, I, II: 257. Publication date: 10 August 1905. Type locality: South Africa: KwaZulu-Natal: Eshowe [28 54 S 31 28 E]. Holotype: NHMUK 1904.8.31.3: ad? ♂, skin and skull. Collected by: Captain Claude Henry Baxter Grant and C.D. Rudd; collection date: 15 February 1904; original number: 678.
1907. *Vespertilio (Vespertilio) minutus:* Elliot, Field Columbian Mus., Zool. Ser., 115 (8): 512.
1908. *Scabrifer notius* G.M. Allen, Bull. Mus. comp. Zool., 52 (3): 46. Publication date: July 1908. Type locality: South Africa: SW Cape province: [=Western Cape]: Cape Town [33 56 S 18 28 E]. [Goto Description]. Holotype: MCZ 4555: ad ♂, skull and alcoholic. Collected by: Edgar Leopold Layard; collection date: August 1864. Presented/Donated by: Edgar Leopold Layard. See Allen (1908: 46); Helgen and McFadden (2001: 147).
1917. *Eptesicus garambæ* J.A. Allen, Bull. Am. Mus. Nat. Hist., 37 (18): 445. Publication date: 29 September 1917. Type locality: Congo (Democratic Republic of the): Garamba [04 11 N 30 00 E]. [Goto Description]. Holotype: AMNH 49340: ad ♂, skull and alcoholic. Collected by: Herbert Lang, James Paul Chapin and The American Museum Congo Expedition; collection date: 14 March 1912; original number: 1888.

1917. *Eptesicus minutus minutus:* J.A. Allen, Bull. Am. Mus. Nat. Hist., 37 (18): 410, 445.
1919. *Eptesicus melckorum* Roberts, Ann. Transv. Mus., 6(3): 113. Type locality: South Africa: SW Cape province: Berg River: Kersfontein [32 51 S 18 42 E]. [Goto Description]. Holotype: TM 2283: ad ♀, skin and skull. Collected by: Austin Roberts and Adendorff; collection date: 21 November 1917; original number: 533. Note: In loft, under eaves of house. - Etymology: In honour of R. Melck of Kersfontein, Berg River, Cape Province, on whose property the original specimen was taken (Smithers, 1983: 102).
1923. *Eptesicus capensis:* Kershaw, Rev. Zool. afr., 11 (4): 358. (Name Combination).
1924. *Eptesicus capensis gracilior:* Roberts, Ann. Transv. Mus., 10: 60. (Name Combination).
1926. *Eptesicus damarensis:* Thomas, Proc. zool. Soc. Lond., 1926, I: 286.
1932. *Eptesicus capensis nkatiensis* Roberts, Ann. Transv. Mus., 15 (1): 16. Publication date: 1 October 1932. Type locality: Botswana: N Bechuanaland: Nkate [20 00 S 26 10 E]. [Goto Description]. Holotype: TM 6549: ad ♀, skin and skull. Collected by: The Vernay-Lang Kalahari Expedition 1930; collection date: 18 August 1930; original number: 999.
1934. *Eptesicus capensis capensis:* Shortridge, Mammals of South West Africa, 61. (Name Combination).
1939. *Rhinopterus notius:* G.M. Allen, Bull. Mus. comp. Zool., 83: 97.
1953. *Eptesicus (Eptesicus) capensis capensis:* Ellerman, Morrison-Scott and Hayman, Southern African mammals 1758 to 1951, 75. (Name Combination).
1953. *Eptesicus (Eptesicus) capensis damarensis:* Ellerman, Morrison-Scott and Hayman, Southern African mammals 1758 to 1951, 75. (Name Combination).
1953. *Eptesicus (Eptesicus) capensis gracilior:* Ellerman, Morrison-Scott and Hayman, Southern African mammals 1758 to 1951, 75. (Name Combination).
1953. *Eptesicus (Eptesicus) capensis:* Ellerman, Morrison-Scott and Hayman, Southern African mammals 1758 to 1951, 75. (Name Combination).
1953. *Eptesicus (Rhinopterus) notius:* Ellerman, Morrison-Scott and Hayman, Southern African mammals 1758 to 1951, 78. (Name Combination).
1961. *Eptesicus notius:* Bateman, Koedoe, 4: 82. (Name Combination).
1965. *Eptesicus capensis garambae:* Koopman, Am. Mus. Novit., 2219: 15. (Name Combination).
1975. *Eptiscus capensis:* Dean, Zool. Afr., 10: 218. (Lapsus).
1984. *[Pipistrellus] capensis:* Heller and Volleth, Z. zool. Syst. Evolut.-forsch., 22: 72. (Name Combination).
1984. *Eptesicus (Eptesicus) capensis garambae:* Anciaux de Faveaux, Ann. Kon. Mus. Mid. Afr., Zool. Wetensch. (Name Combination).
1984. *Eptesicus (Eptesicus) capensis grandidieri:* Anciaux de Faveaux, Ann. Kon. Mus. Mid. Afr., Zool. Wetensch. (Name Combination).
1987. *Nycterikaupius capensis:* Menu, Palaeovert., 17 (3): 109. Publication date: 15 November 1987. (Name Combination).
1987. *Pipistrellus (Neoromicia) capensis:* Hill and Harrison, Bull. Br. Mus. (nat. Hist.) Zool., 52 (7): 282. (Name Combination).
1988. *P[ipistrellu]s c[apensis] notius:* Thorn, Mammalia, 52 (2): 202. (Name Combination).
1988. *Pipistrellus (Neoromicia) capensis capensis:* Ansell and Dowsett, Mammals of Malawi, 41. (Name Combination).
1988. *Pipistrellus (Neoromicia) capensis gracilior:* Ansell and Dowsett, Mammals of Malawi, 41. (Name Combination).
1988. *Pipistrellus capensis capensis:* Thorn, Mammalia, 52 (2): 199. (Name Combination).
1988. *Pipistrellus capensis gracilior:* Thorn, Mammalia, 52 (2): 204. (Name Combination).
1988. *Pipistrellus capensis:* Thorn, Mammalia, 52 (2): 199. (Name Combination).
1993. *Eptesicus (Neoromicia) capensis:* Koopman, in: Wilson and Reeder, Mammal species of the World (2nd Edition): Chiroptera, 201. (Name Combination).
1994. *P[ipistrellus (Neoromicia)] c[apensis] damarensis:* Koopman, in: Niethammer, Schliemann and Starck, Handbook of Zoology, volume II (Mammalia) Chiroptera, (60) 55. (Name Combination).
1994. *P[ipistrellus (Neoromicia)] c[apensis] garambae:* Koopman, in: Niethammer, Schliemann and Starck, Handbook of Zoology, volume II (Mammalia) Chiroptera, (60) 55. (Name Combination).
1994. *P[ipistrellus (Neoromicia)] c[apensis] grandidieri:* Koopman, in: Niethammer, Schliemann and Starck, Handbook of Zoology, volume II (Mammalia) Chiroptera, (60) 55. (Name Combination).
1994. *P[ipistrellus (Neoromicia)] c[apensis] matroka:* Koopman, in: Niethammer, Schliemann and Starck, Handbook of Zoology, volume II (Mammalia) Chiroptera, (60) 55. (Name Combination).
1994. *P[ipistrellus (Neoromicia)] c[apensis] notius:* Koopman, in: Niethammer, Schliemann and Starck, Handbook of Zoology, volume II (Mammalia) Chiroptera, (60) 55. (Name Combination).
2001. *Hypsugo capensis:* Volleth, Bronner, Göpfert, Heller, von Helversen and Yong, Chromosome Res., 9 (1): 25. - Comments: Possibly a lapsus since this combination is only mentioned once in the abstract, as is *Pipistrellus (Neoromicia) capensis*. All other references to this taxon refer to it as *Neoromicia capensis*. (Name Combination, Lapsus).
2001. *Neoromicia capensis:* Volleth, Bronner, Göpfert, Heller, von Helversen and Yong, Chromosome Res., 9 (1): 26. (Name Combination).
2006. *Neuromicia capensis:* Watson, Koedoe, 49 (1): 114. Publication date: 18 December 2006. (Lapsus).
2010. *Neromicia capensis:* Traylor-Holzer, Tawes, Bayless, Valenta, Rayman and Songsasen, N., Insectivorous Bat Captive Population Feasibility Workshop Report, 49. (Lapsus).
2019. *L[aephotis] capensis:* M. Taylor, Bats: An illustrated guide to all species, 283. Publication date: 11 April 2019. (Name Combination).
2019. *Laephotis capensis:* M. Taylor, Bats: An illustrated guide to all species, 285. Publication date: 11 April 2019. (Current Combination).

TAXONOMY:

Figure 369. *Laephotis capensis* (SMG-15768) caught at Marloth Park, Mpumalanga, South Africa.

Includes *notius*; see Koopman (1975: 405). Mentioned in the genus *Pipistrellus* by Koopman (1994: 117). Most of the West African populations have not been allocated to subspecies. Volleth *et al.* (2001: 27) assigned this species to the genus *Neoromicia*. Koopman (1993a: 201) included *matroka*, but see Peterson *et al.* (1995: 104).

Thorn *et al.* (2007: 70) removed *grandidieri* Dobson, 1876.

Helbig *et al.* (2010: 168) suggest transferring *capensis* to the genus *Laephotis*.

COMMON NAMES:

Afrikaans: Kaapse dakvlermuis. Chinese: 南非伏翼. Czech: netopýr kapský, netopýr hnědý, netopýr damarský. English: Cape bat, Cape Serotine, Cape Pipistrelle Bat, Cape Serotine Bat, Cape House Bat. French: Sérotine du Cap. German: Kap-Zwergfledermaus, Kap-Pipistrelle, Capische Abendfledermaus. Italian: Pipistrèllo capènse. Kiluba (DRC): Kasusu. Portuguese: Morcego caseiro do cabo.

ETYMOLOGY OF COMMON NAME:

The colloquial name serotine is derived from the Latin *serotinus*, late in the evening (*serus*) (Taylor, 2005). The name serotine is referring to *Eptesicus serotinus* and was in general use when the current species was still considered to belong to that genus.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:

This species has been recovered from the upper Pleistocene at Border Cave (Avery, 1991: 6) and Wonderwerk (Avery and Avery, 2011: 19), South Africa, as well as from Holocene deposits at Blinkklipkop, Limerock, Wonderwerk (Avery and Avery, 2011: 19).

CONSERVATION STATUS:

Global Justification

Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Jacobs *et al.*, 2008r; IUCN, IUCN, 2009; Monadjem *et al.*, 2017cs).

Assessment History

Global

2016: LC ver 3.1 (2001) [assessed as *Neoromicia capensis*] (Monadjem *et al.*, 2017cs). 2008: LC ver 3.1 (2001) [assessed as "*Pipistrellus capensis*"] (Jacobs *et al.*, 2008r; IUCN, 2009). 2004: LC ver 3.1 (2001) (Jacobs *et al.*, 2004t; IUCN, 2004). 1996: LR/lc [assessed as "*Eptesicus capensis*"] (Baillie and Groombridge, 1996).

Regional

South Africa: 2016: LC ver 3.1 (2001) (Monadjem *et al.*, 2016w). 2004: LC ver 3.1 (2001) (Friedmann and Daly, 2004).

MAJOR THREATS:

There appear to be no major threats to this species as a whole (Jacobs *et al.*, 2008r; IUCN, 2009; Monadjem *et al.*, 2017cs), although Doty and Martin (2012: 75) report on fatalities due to wind turbines in the Eastern Cape, South Africa. Aronson (2022: 225) indicated that this species accounted for 18.9 % of the carcasses he found during his study on the impact of wind energy facilities in the RSA.

CONSERVATION ACTIONS:

Jacobs *et al.* (2008r) [in IUCN (2009)] and Monadjem *et al.* (2017cs) report that in view of the species wide range and adaptability it is expected to occur in many protected areas (such as the Udzungwa Mountains National Park (Stanley *et al.*, 2005b)). There are no direct conservation measures currently needed for this species as a whole.

GENERAL DISTRIBUTION:

Laephotis capensis is widespread over much of sub-Saharan Africa. It has been recorded from Guinea Bissau in the west, to Somalia, southern Sudan and Eritrea in the east, ranging south to

most of South Africa. In South Africa, the species' distribution is linked with land use/land cover (Babiker Salata, 2012: 50).

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 1,719,255 km^2.

Benda *et al.* (2025: 98) [referring to Monadjem *et al.* (2024)] indicate that the distribution of Laephotis capensis is restricted to the southern half of the continent, from central DRC, Burundi, central Tanzania to the Cape. West African records represent *Laephotis* cf. *capensis*. The records from Kenya should be referred to referred to *Laephotis kirinyaga*. However, they do report a new *capensis* specimen from Hells Gate National Park, which confirms the occurrence of the species in Kenya. They also suggest that some of the records currently assigned to *kirinyaga* might actually represent *capensis*.

Native: Angola (Crawford-Cabral, 1989; Monadjem *et al.*, 2010d: 565; Taylor *et al.*, 2018b: 60); Botswana (Archer, 1975; Cotterill, 2004a: 261; Monadjem *et al.*, 2010d: 565); Burundi; Congo (The Democratic Republic of the) (Hayman *et al.*, 1966; Monadjem *et al.*, 2010d: 565); Eswatini (Monadjem *et al.*, 2010d: 567, Monadjem *et al.*, 2021: 5); Kenya (Benda *et al.*, 2025: 31, 98); Lesotho (Lynch, 1994: 195; Monadjem *et al.*, 2010d: 565); Malawi (Happold *et al.*, 1988; Monadjem *et al.*, 2010d: 565); Mozambique (Smithers and Lobão Tello, 1976; Monadjem *et al.*, 2010d: 565; Monadjem *et al.*, 2010c: 384); Namibia (Monadjem *et al.*, 2010d: 565); South Africa (Seamark and Kearney, 2007; Monadjem *et al.*, 2010d: 566); Tanzania; Zambia (Ansell, 1967; Ansell, 1969; Ansell, 1973; Monadjem *et al.*, 2010d: 567); Zimbabwe (Monadjem *et al.*, 2010d: 567).

Presence uncertain (might tentavively need to be assigned to *Laephotis* cf. *capensis* or another form): Benin (Capo-Chichi *et al.*, 2004: 163); Burkina Faso (Kangoyé *et al.*, 2012: 6026; 2015a: 619); Cameroon; Central African Republic; Côte d'Ivoire; Djibouti; Equatorial Guinea; Eritrea; Ethiopia (Largen *et al.*, 1974; Yalden *et al.*, 1996; Lavrenchenko *et al.*, 2004b: 142); Gabon; Ghana (Decher and Fahr, 2007: 16 as "*N.* cf. *capensis*"); Guinea (Ziegler *et al.*, 2002: 78); Guinea-Bissau (Veiga-Ferreira, 1949; Lopes and Crawford-Cabral, 1992; Rainho and Ranco, 2001: 63); Liberia (Fahr, 2007a: 104); Nigeria; Sierra Leone; Somalia; Sudan; Togo; Uganda (Kityo and Kerbis, 1996: 62);

Bates *et al.* (2013: 339) reject the presence of *L. capensis* in the Republic of Congo as the data presented by Lavrenchenko *et al.* (2004b: 142) are actually from the DRC.

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Fisk (1890: 97) reported on an albino specimen shot at Broadlands farm (Somerset West, South Africa), see also Allen (1939b), Lucati and López-Baucells (2016: Suppl.) and Zortéa and Silva (2017: 80).

Schoeman and Jacobs (2002: 157) mention the following parameters for 10 specimens from the Algeria Forestry Station (RSA): Fa: 35.9 ± 1.2 mm, Wing area: 87.6 ± 7.4 cm^2, Wing span: 24.0 ± 0.8 cm, Wing loading: 7.3 ± 1.0 N/m^2, and aspect ratio: 6.6 ± 0.4.

DETAILED MORPHOLOGY:
Penis
Fasel *et al.* (2020: 1394) described the penis as having a medial ridge widening toward its distal extremity, which separates it from the five other pipistrelloid species they examined. The hairs on the prepuce are shorter than in the other species.

Baculum
Hill and Harrison (1987) and Kearney *et al.* (2002).

Other
van der Weyden *et al.* (2024: 2) reported the first case of a tumor (plasmacytoma) on the skin over the left lateral chest area in a Cape serotine bat.

FUNCTIONAL MORPHOLOGY:
Amador *et al.* (2019: Suppl.) [referring to Norberg and Rayner (1987)] mention a wing loading value of 7.1 Pa, aspect ratio 6.4 for a wingspan of 25 cm and a wing area of 97 cm^2 and a body mass of 7 g.

ECHOLOCATION:
See Jacobs (1996), Taylor (1999b) and Taylor *et al.* (2005).

For the Algeria Forest Station (RSA), Schoeman and Jacobs (2002: 157) reported the call type to be a low duty echolocation dominated by frequency modulated calls, with a F_{peak}: 41.9 ± 1.4 kHz.

Schoeman and Waddington (2011: 291) and Luo *et al.* (2019a: Supp.) mention a peak frequency of 39.4 ± 1.1 kHz and duration of 5.1 ± 1.2 ms for specimens from Durban, South Africa.

Taylor *et al.* (2013b: 17) recorded the following parameters for 7 calls from Soutpansberg, South Africa: F_{max}: 48.9 ± 6.15 (41.4 - 61.4) kHz, F_{min}: 37.6 ± 1.86 (34.7 - 40.9) kHz, F_{knee}: 40.0 ± 1.92

(37.0 - 42.4) kHz, F_{char}: 38.2 ± 1.68 (35.8 - 41.2) kHz, duration: 3.6 ± 1.05 (2.1 - 5.0) ms.

Linden *et al.* (2014: 40) reported the following parameters from the Soutpansberg (RSA): F_{min}: 34 - 39 kHz, F_{char}: 36 - 41 kHz, F_{knee}: 37 - 42 kHz, slope: 254 - 509 OPS, duration: 2 - 5 ms.

At Farm Welgevonden, South Africa, Taylor *et al.* (2013a: 556) report a F_{knee} value of 40 (37 - 42) kHz. 10 calls from the Kalahari Desert, recorded by Adams and Kwiecinski (2018: 4), had the following values: F_{char}: 36.9 ± 0.6 kHz, F_{max}: 39.6 ± 4.3 kHz, F_{min}: 36.7 ± 0.6 kHz, duration: 3.5 ± 0.5 ms. 20 calls from the Mapungubwe National Park (RSA) recorded by Parker and Bernard (2018: 57) had the following features: F_{char}: 39.54 ± 1.17 kHz, F_{max}: 63.06 ± 5.75, F_{min}: 38.59 ± 1.21 kHz, F_{knee}: 46.16 ± 3.94 kHz, duration: 5.18 ± 1.45 ms and 7.36 ± 2.31 calls/sec.

In the Telperion Nature Reserve (RSA), Kearney *et al.* (2019: 37) recorded the release calls of 37 bats (559 pulses) with the following characteristics: F_{char}: 37.10 ± 1.42 (32.65 - 42.11) kHz, slope at start of call: 53.67 ± 42.21 (-42.66 - 261.53), time from start of call to F_{char}: 4.25 ± 1.14 (1.66 - 7.64) ms and duration: 4.61 ± 1.12 (3.01 - 8.19). Subdivided according to sex, these data were respectively: ♂♂:37.26 ± 1.46 (32.65 - 42.11) kHz, 58.29 ± 46.30 (-18.07 - 261.53), 4.24 ± 1.09 (1.66–6.99) ms, 4.63 ± 1.07 (3.01 - 7.74) ms;♀♀: 36.93 ± 1.36 (33.20 - 40.20) kHz, 48.68 ± 36.75 (-42.66 - 205.01), 4.26 ± 1.19 (1.76–7.64) ms, 4.59 ± 1.18 (3.02 -8.19) ms. As February is probably in the mating season of *N. capensis*, this dimorphism in calls might be playing a social role within the reproductive context (Kearney *et al.* (2019: 41). This dimorphism was also reported by De Jong *et al.* (2025: 322) for 135 calls from 27 females: F_{char}: 37.93 ± 1.32 kHz, F_{knee}: 40.47 ± 2.05 kHz, F_{min}: 37.61 ± 1.32 kHz, F_{max}: 73.11 ± 9.73 kHz, Bandwidth: 35.50 ± 9.97 kHz, Duration: 3.94 ± 1.08 ms; and 125 calls from 25 males: F_{char}: 38.45 ± 1.34 kHz, F_{knee}: 42.57 ± 2.10 kHz, F_{min}: 38.06 ± 1.29 kHz, F_{max}: 74.80 ± 11.47 kHz, Bandwidth: 36.74 ± 11.51 kHz, Duration: 3.64 ± 1.08 ms. De Jong *et al.* (2025: 324) therefore state that the sexe of the bat needs to be taken into account when identifying bats based on their echolocation calls.

From the MalaMala Game Reserve (KNP, RSA), Gumede *et al.* (2025: Appendix S1) reported F_{char}: 39.54 ± 1.17 kHz, F_{max}: 63.06 ± 5.75 kHz, F_{min}: 38.59 ± 1.21 kHz.

Weier *et al.* (2020: Suppl.) reported on 12 calls from the Okavango River Basin with the following characteristics: F_{max}: 48.36 ± 7.29 kHz, F_{min}: 37.18 ± 1.79 kHz, F_{knee}: 40.26 ± 2.23 kHz, F_{char}: 37.55 ± 1.93 kHz, slope: 41.91 ± 24.41 OPS, duration: 5.15 ± 2.13 ms.

2384 calls of 78 bats recorded by Moir (2020: 30) and Moir *et al.* (2021a: 371) from southern KwaZulu-Natal and Eastern Cape (RSA) had the following parameters: F_{max}: 68.15 ± 9.29 (46.23 - 82.68) kHz, F_{min}: 39.2 ± 1.36 (35.64 - 42.26) kHz, F_{char}: 39.63 ± 1.35 (35.85 - 43.09) kHz, F_{knee}: 42.5 ± 2.20 (36.79 - 48.17) kHz, and duration: 3.09 ± 0.65 (1.93 - 4.87) ms.

In the Limpopo province (RSA), Weier *et al.* (2021: 7) reported the following characteristics for 99 calls of 9 bats: F_{max}: 50.69 ± 4.25 kHz, F_{min}: 33.67 ± 6.67 kHz, F_{knee}: 39.85 ± 1.03 kHz, F_{char}: 35.9 ± 1.34 kHz, slope: -864.75 ± 7241.84 OPS, duration: 2.47 ± 0.56 ms.

Brinkley *et al.* (2021: Table S1) mention the following parameters for 12 "*Neoromicia capensis*" calls from the Kruger Park (RSA): F_{min}: 39.4 ± 4.9 (36.2 54.2) kHz, Duration: 4.1 ± 1.1 (2.3 5.7) ms, F_{max}: 53.1 ± 8.0 (40.1 65.1) kHz, F_{knee}: 40.2 ± 2.0 (36.7 43.5) kHz, F_{char}: 38.7 ± 1.5 (36.2 41.2) kHz.

Roemer *et al.* (2021: Suppl.) categorized the bat's call as a FMd-QCF (Frequency modulation downward - quasi-constant frequency) sonotype [as "*Neoromicia capensis*"].

112 pulses from "*Neoromicia capensis*" recorded by Taylor *et al.* (2020a: 77) at Venetia Limpopo Nature Reserve and Mapungubwe National Park (RSA) had F_{min}: 35 - 41 kHz, F_{max}: 41 - 61 kHz, F_{char}: 35 - 41 kHz, F_{knee}: 37 - 42 kHz and duration 5 - 5 ms.

In the Mountain Zebra National Park, RSA, Parker (2022: 20) recorded 41 passes with: F_{min}: 36.25 ± 4.80 kHz, F_{char}: 39.25 ± 3.51 kHz and F_{max}: 45.09 ± 10.21 kHz.

Along the Chobe River (Botswana/Namibia), Parker and Bernard (2023: 54) reported F_{char}: 39.54 ± 1.17 kHz, F_{max}: 63.06 ± 5.75 kHz and F_{min}: 38.59 ± 1.21 kHz.

Taylor-Boyd *et al.* (2025: 116) report the following values for 46 calls from Zambian bats: Interpulse interval: 71.3 ± 17.6 (29.4 - 132.0) ms; F_{max}: 46.0 ± 4.3 (41.1 - 58.7) kHz; Start slope: -23.0 ± 3.9 (-15.4 - -31.5) kHz/ms; End slope: -8.2 ± 3.3 (-1.4 - -9.9) kHz/ms; Ledge duration: 0.4 ± 0.1 (0.3 - 0.6) ms.

MOLECULAR BIOLOGY:
Karyotype
Peterson and Nagorsen (1975), Rautenbach *et al.* (1993), Volleth *et al.* (2001), and Kearney *et al.* (2002) all reported 2*n* = 32, FN = 50, BA = 20. While Rautenbach *et al.*, 1993) and Kearney *et al.* (2002) reported a metacentric X chromosome, Peterson and Nagorsen (1975) reported a submetacentric X chromosome. Peterson and Nagorsen (1975) and Rautenbach *et al.* (1993) both reported an acrocentric Y chromosome. GTG-bands identified three Robertsonian fusion chromosomes (7/11, 8/9, 10,12), considered as distinguishing characters for the genus *Neoromicia* Kearney *et al.* (2002).

Protein / allozyme
See Morales *et al.* (1991) for results from seven specimens from South Africa.

HABITAT:
Sirami *et al.* (2013: 34) recorded in the Western Cape Province, South Africa that *N. capensis* activity was significantly and positively influenced by size of wetland, while habitats 100 m surrounding wetlands were also significantly and positively influenced by the water body. *L. capensis* favoured open habitats surrounding wetlands (Sirami *et al.*, 2013: 35).

Minnaar *et al.* (2014a: 522) found that moth consumption by *L. capensis* was low under unlit conditions (mean percentage volume ± SD: 5.91 ± 6.25 %), while moth consumption increased six fold (35.42 ± 17.90 %) under artificially lit conditions despite a decrease in relative moth abundance. They conclude (p. 529) that the "introduction of artificial lights into previously unlit environments may allow syntonic bats [such as *N. capensis*, which are audible to eared moths] access to an historically unavailable resource in eared moths".

ROOST:
Taylor *et al.* (1999: 69) reported on a single roost found in the Durban area, which was located in the roof and spaces between wooden shutters and the outer wall of a school building in the Kloof suburb.

Kearney *et al.* (2019: 30) indicate that there seems to be a shift in roosting sites from natural crevice and vegetation types to man-made structures, which seems to be accompanied by a change in roosting group size. Vegetation roosts were usually inhabited by two or three individuals, whereas buildings can house groups of over 50 animals.

Czenze *et al.* (2021: 3) classified these bats as hot-roosting species as they preferred to roost at sites where the temperature approached the bat's normothermic body temperature.

DIET:
From the Algeria Forestry Station (RSA), Schoeman and Jacobs (2002: 157) reported the following prey groups based on 89 faecal pellets from 10 bats (in volume percent): Hemiptera (46.6 ± 33.7), Diptera (37.6 ± 28.4), Coleoptera (12.5 ± 21.5), Ephemeroptera (2.3 ± 5.5), and unknown (1 ± 3.2).

Cabrera-Campos *et al.* (2021: Suppl.) estimated the food transit time for these bats to be about 67 minutes, and the digestibility rate about 81.4 %.

PREDATORS:
Thomas and Jacobs (2013: 127) [referring to Avery *et al.* (2005)] indicate that *L. capensis* is more often taken by owls due to its clutter-edge foraging style, which combines slow flight with foraging at the edge of the vegetation.

Dean (1975: 218) reports on one specimen being found in a barn owl (*Tyto alba* (Scopoli, 1769) pellet in South Africa (see also Avery *et al.*, 2005: 1054). Avery *et al.* (2003: 7) found *L. capensis* to be the best represented prey in barn owl pellets collected in the Free State during the summer.

Mikula *et al.* (2016: Supplemental data) mention the Bat hawk (*Macheiramphus alcinus* Bonaparte, 1850), the Pied crow (*Corvus albus* Statius Muller, 1776) and the Southern fiscal (*Lanius collaris* Linnaeus, 1766) as diurnal avian predators of "*Eptesicus capensis*".

Based on Fenton *et al.* (1983), Gual-Suárez and Medellín (2021: Suppl.) reported that this species was part of the food items taken by *Nycteris grandis*.

POPULATION:
Structure and Density
In general, this is a locally common species (Jacobs *et al.*, 2008r; IUCN, 2009; Monadjem *et al.*, 2017cs).

Trend
2016: Stable (Monadjem *et al.*, 2017cs). 2008: Stable (Jacobs *et al.*, 2008r; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
van der Merwe and Rautenbach (1990: 540) reported that "*Eptesicus capensis*" commonly gives birth to twins and occasionally even triplets (= polytocy, see Garbino *et al.*, 2021: Suppl.). van der Merwe (1990: 202) examined five

pregnant females and found three of them having two foetuses (one in each uterine horn), one had three foetuses (two in the right and one in the left uterine horn) and one even four foetuses.

Happold and Happold (1990b: 567) reported births early in the wet season in Malawi.

Monadjem *et al.* (2010d) [in Weier *et al.* (2018: Suppl.)] mentioned births from late October to November.

PARASITES:
Genov *et al.* (1992) reported the Nematode *Molinostrongylus omatus* (Mönnig, 1927) from an "*Eptesicus capensis*" specimen from South Africa.

Schaer *et al.* (2013a: 17416) report the presence of hemosporidian parasites of the genus *Polychromophilus* in one out of three investigated bats.

Clément *et al.* (2019a: 5) refer to four southern African bats, of which two were infected by *Trypanosoma dionisii*_AF5 and *Trypanosoma vespertilionis*_AF2.

BACTERIA
Dietrich *et al.* (2016a: 4) found *Rickettsia* in the faeces of bats from South Africa. Federici *et al.* (2022: 5) [referring to Dietrich *et al.* (2016a)] mentions Proteobacteria *Burkholderia, Helicobacter* and *Bartonella*.

ACARI
Myobiidae
Bochkov and Fain (2003: 12) reported three female and one tritonymph of *Acanthophthirius capensis* (de Meillon and Lavoipierre, 1944) from Tanzanian bats.

HEMIPTERA
Cimicidae
Kock *et al.* (1998b: 236, 137) reported the presence of *Cacodmus sparsilis* Rothschild, 1914 and *Cacodmus villosus* (Stål, 1855) on bats from South Africa and Malawi; and Haeselbarth *et al.* (1966: 11) reported *Cacodmus villosus* (Stål, 1855) in the Transvaal, South Africa. Haeselbarth *et al.* (1966: 11) suggests that Bedford (1932)'s record of *Cimex pipistrelli* Jenyns from Cape Town most probably refers to *Cacodmus villosus* (Stål, 1855) (see also Reinhardt and Jacobs, 2006).
Szentiványi *et al.* (2022: 12) reported *Aphrania barys* Ferris and Usinger, 1957 from Namibia and South Africa, and *Cacodmus villosus* (Stål, 1855) from Namibia.

DIPTERA
Nycteribiidae
Nycteribia schmidlii Schiner, 1853 (Haeselbarth *et al.*, 1966: 108). Dick *et al.* (2023) mentioned that the nycteribiid flies *Basilia (Basilia) robusta* Theodor, 1956, *Nycteribia latitergum* Theodor, 1957 and *Nycteribia schmidlii scotti* Falcoz, 1923 have been found on this bat species.

SIPHONAPTERA
Ischnopsyllidae
Ischopsyllus emminus Jordan and Rothschild, 1921 only known from the type series collected at Greenwood Park, Natal, South Africa (Haeselbarth *et al.*, 1966: 187). *Dampfia grahami* (Waterston, 1915) from Malawi (Beaucournu and Kock, 1996); *Araeopsylla scitula* (Rothschild, 1909) a single record from Kanye, Botswana (Haeselbarth *et al.*, 1966: 189).

Brennan *et al.* (2015: 145) found no antibodies against *Pseudogymnoascus destructans* (White-nose syndrome) in blood samples from bats from Botswana.

VIRUSES:
Bunyaviridae
Hantavirus
Těšíková *et al.* (2017: 279) found Hantavirus RNA in dried blood samples of *L. capensis* from the Dhati Walel National Park in Ethiopia. Arai and Yanagihara (2020: 7) assigned this virus to the genus *Loanvirus* (Mouyassué virus).

Coronaviridae - Coronaviruses
Geldenhuys *et al.* (2013: 516) found one *L. capensis* specimen (out of 10) testing positive for CoV RNA in Taung, RSA. Ithete *et al.* (2013: 1697) reported on a new virus from a *L.* cf. *capensis* (incorrectly identified as *L.* cf. *zuluensis*) from South Africa, which is related to Middle East respiratory syndrome (MERS)-CoV. Corman *et al.* (2014) determined the full genome sequence of the MERS-related CoV identified in Ithete *et al.* (2013: 1697) and found that 85 % of its genome was identical to Middle East respiratory syndrome (MERS)-CoV (subgenus *Merbecovirus*; see Markotter *et al.*, 2020: 5).

In South Africa, Cronjé *et al.* (2019: 2) found that female *N. capensis* [and bats trapped at low altitude sites with low body condition scores] were most likely to be infected with coronaviruses.
Joffrin *et al.* (2020: 6) reported Beta-C coronaviruses from RSA bats.

Phenuiviridae
Phlebovirus
Rift Valley Fever Virus (RVFV)

Oelofsen and Van der Ryst (1999) tested 28 individuals from four localities in the Free State Province, South Africa for RVFV antigen using an enzyme linked immunosorbet assay (ELISA), none tested positive.

Rhabdoviridae
Lyssavirus - Rabies related viruses
Rabies
Oelofsen and Smith (1993) tested 101 individuals from 5 localities using "Trousse Platelia Rage" ELISA kit (Diagnostic Pasteur), none tested positive for antibodies to rabies virus glycoprotein G. Oelofsen and Smith (1993) tested 145 individual brains, from 12 localities by means of the "Rapid rabies enzyme immunodiagnosis" (RREID) test (Diagnostic Pasteur), none were tested positive.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Angola, Benin, Botswana, Burundi, Cameroon, Congo (Democratic Republic of the), Eritrea, Eswatini, Ethiopia, Ghana, Guinea, Kenya, Lesotho, Liberia, Malawi, Mozambique, Namibia, Nigeria, Sierra Leone, South Africa, South Sudan, Sudan, Tanzania, Togo, Uganda, Zambia, Zimbabwe.

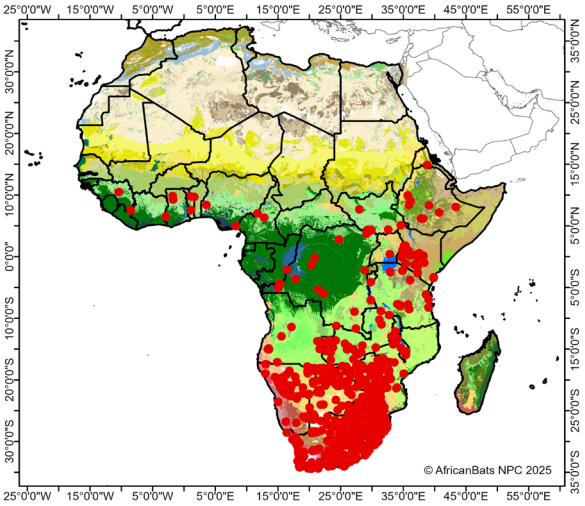

Figure 370. Distribution of *Laephotis capensis*.

Laephotis kirinyaga Monadjem, Patterson, Webala and Demos, 2020

1974. *Eptesicus capensis:* Kingdon, East African Mammals. - Comments: Not of A. Smith, 1829 (see Monadjem *et al.*, 2020a: 1128).
2008. *Pipistrellus capensis garambae:* Thorn and Kerbis Peterhans, Small mammals of Uganda, 56. - Comments: In part (see Monadjem *et al.*, 2020a: 1128).. (Name Combination).
2012. *Neoromicia capensis:* Patterson and Webala, Field. Life Earth Sc., 6: 42. Publication date: 29 November 2012. - Comments: Not of A. Smith, 1829 (see Monadjem *et al.*, 2020a: 1128).
2016. *Neoromicia somalica:* Benda, Reiter, Uhrin and Varadínová, Acta Chiropt., 18 (2): 323. Publication date: October 2016. - Comments: In part (see Monadjem *et al.*, 2020a: 1128, 1132).
2020. *Laephotis cf. kirinyaga:* Monadjem, Patterson, Webala and Demos, Zool. J. Linn. Soc., 191 (4):1120. Publication date: 10 September 2020. (Name Combination).
*2020. *Laephotis kirinyaga* Monadjem, Patterson, Webala and Demos, in: Monadjem et al., Zool. J. Linn. Soc., 191 (4): 1120, 1128, figs 5A, 7, 8. Publication date: 10 September 2020. Type locality: Kenya: Marsabit county: Marsabit Nat. Park, 1.3 km SE campsite, near HQ [02 18 32 N 38 00 00 E, 1250 m]. Holotype: FMNH 234558: ad ♂, skull and alcoholic and tissue. Collected by: Bruce D. Patterson, Paul W. Webala, Carl W. Dick and Beryl Makori; collection date: 27 July 2015; original number: BDP-7516. Paratype: FMNH 234546: ♂. Collected by: Bruce D. Patterson; collection date: 16 July 2015; original number: BDP-7291. Paratype: FMNH 234549: ♀. Collected by: Bruce D. Patterson; collection date: 22 July 2015; original number: BDP-7382. Paratype: FMNH 234550: ♂. Collected by: Bruce D. Patterson; collection date: 22 July 2015; original number: BDP-7388. Paratype: FMNH 234551: ♂. Collected by: Bruce D. Patterson; collection date: 22 July 2015; original number: BDP-7391. Paratype: FMNH 234552: ♀. Collected by: Bruce D. Patterson; collection date: 22 July 2015; original number: BDP-7393. Patterson; collection date: 25 July 2015; original number: BDP-7441. Paratype: FMNH 234557: ♂. Collected by: Bruce D. Patterson; collection date: 26 July 2015; original number: BDP-7454. Paratype: FMNH 234559: ad ♂. Collected by: Bruce D. Patterson; collection date: 27 July 2015; original number: BDP-7517. - Etymology: *kirinyaga* is a Kikuyu word for Mount Kenya and refers to the distribution of this species (Monadjem *et al.*, 2020a 1129). (Current Combination).
2022. *Neoromicia kirinyaga:* Benda, Uvizl, Šklíba, Mazoch and Červený, Lynx, ns 53 (1): 317. (Name Combination).
? *Laephotis cf. kirinyaga TD-2020*
? *Pipistrellus capensis garambe:* Monadjem, Demos, Dalton, Webala, Musila, Kerbis Peterhans and Patterson, Zool. J. Linn. Soc., 191 (4): 1128. (Lapsus).

COMMON NAMES:
English: East African Serotine

CONSERVATION STATUS:
Monadjem *et al.* (2020a: 1132) suggest that this species should be listed as "Least Concern".

GENERAL DISTRIBUTION:
This species occurs infrequently across the highlands of Kenya on both sides of the Rift Valley, as well as in Murchison Falls National Park (Uganda), Ethiopia, and Senegal (Monadjem *et al.*, 2020a: 1131).

The single record on the border of Senegal and Guinea (IVB S1787) seems aberrant, but that specimen is explicitly mentioned by Monadjem *et al.* (2020a) so it is assumed to be correct (or possibly might represent an undescribed species).

Native: Ethiopia, Kenya, Senegal, Uganda.

ECHOLOCATION:
Monadjem *et al.* (2020a: 1132) reported the following echolocation parameters for the type specimen: F_{peak}: 44.9 kHz, F_{start}: 74.3 kHz, F_{end}: 41.6 kHz. The peak frequency for 14 additional specimens was 43.9 ± 0.91 kHz (73.9 ± 9.43 to 41.8 ± 1.64 kHz).

MOLECULAR BIOLOGY:
Karyotype:
Volleth *et al.* (2023c: 39) reported 2*n*=32, Fna=50 and nine large-to-medium-sized meta- to submetacentric, one small metacentric and five small acrocentric autosomal chromosome pairs. The X chromosome is a medium-sized metacentric chromosome and the Y chromosome is about of the same size as chromosome 23.

HABITAT:
Monadjem *et al.* (2020a: 1131) indicate that this species occurs in in wet tropical forest (e.g., Kakamega forest, with ~1900 mm of rainfall per annum), less mesic montane forest (Marsabit National Park) and relatively dry savanna woodlands (e.g., Lolldaiga Hills conservancy ~600 mm).

PARASITES:
Babyesiza *et al.* (2025: 4) found *Trypanosoma dionisii* and *T. vespertilionis* in *Laephotis kirinyaga* specimens from the CAR.

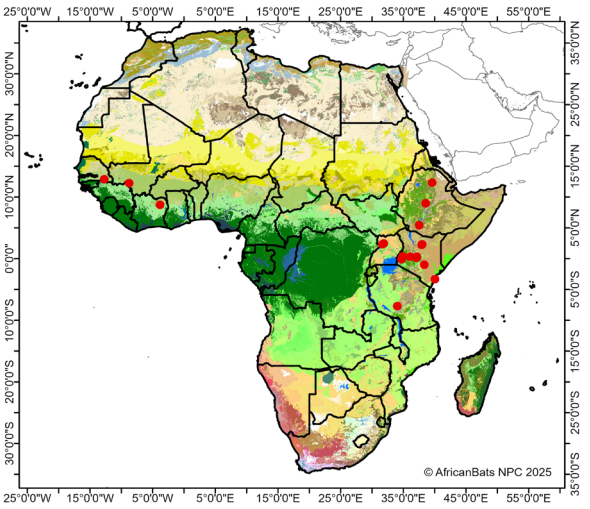

Figure 371. Distribution of *Laephotis kirinyaga*.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Côte d'Ivoire, Ethiopia, Kenya, Mali, Senegal, Tanzania, Uganda.

Laephotis malagasyensis (Peterson, Eger and Mitchell, 1995)

*1995. *Eptesicus somalicus malagasyensis* Peterson, Eger and Mitchell, Faune de Madagascar, Chiroptères, 84: 100, fig 49. Type locality: Madagascar: Sakaraha sous-prefecture: 220 km NE Tuléar [=Toleara]: Ilakaka, East of [22 41 S 45 13 E]. [Goto Description]. Holotype: ROM 42713: ad ♀, skin and skull. Collected by: Randolph Lee Peterson, John George Williams and Robert M. Glen; collection date: 13 May 1967. See Peterson *et al.* (1995: 100), Goodman and Ranivo (2004: 434). - Comments: Bates *et al.* (2006: 313) situated the type locality at Maninday [22 47 S 44 48 E].
2004. *N[eoromicia] malagasyensis:* Goodman and Ranivo, Mamm. biol., 69 (6): 436. (Name Combination).

2020. *Laephotis malagasyiensis:* Monadjem, Demos, Dalton, Webala, Musila, Kerbis Peterhans and Patterson, Zool. J. Linn. Soc., 191 (1): 1140. Publication date: 10 September 2020. (Lapsus).
2020. *Neoromicia somalicus malagasyiensis:* Monadjem, Demos, Dalton, Webala, Musila, Kerbis Peterhans and Patterson, Zool. J. Linn. Soc., 191 (1): 1140. Publication date: 10 September 2020. (Lapsus).
? *Eptesicus malagasyensis:* (Name Combination).
? *Neoromicia malagasyensis:* (Name Combination).

TAXONOMY:
Only known from a very limited number of specimens. Originally considered a subspecies of *somalicus* Thomas, 1901 by Peterson *et al.* (1995), but see Goodman and Ranivo (2004: 438), who elevate it to species rank, which is supported by Bates *et al.* (2006). However, they did not discuss the relation of this form with *humbloti* A. Milne-Edwards, 1881.

COMMON NAMES:
English: Isalo Serotine. French: Sérotine de Sakahara, Sérotine de l'Isalo. German: Madagaskar-Zwergfledermaus, Madagaskar Pipistrelle.

CONSERVATION STATUS:
Global Justification
This species is listed as Vulnerable (VU B1ab(iii)+2ab(iii) ver 3.1 (2001)) because it has an extent of occurrence (EOO) of only 7,301 km², and is currently known only from the area around the Isalo Massif (likely having a maximum area of occupancy (AOO) of <2,000 km²), where it is presumed to be at risk of habitat loss (Monadjem *et al.*, 2019b).

Assessment History
Global
2016: VU B1ab(iii)+2ab(iii) ver 3.1 (2001) assessed as *Neoromicia malagasyensis* (Monadjem *et al.*, 2019b). 2008: EN B1ab(iii) ver 3.1 (2001) [as "*Eptesicus malagasyensis*"] (Andriafidison *et al.*, 2008c; IUCN, 2009).

Regional
None known.

MAJOR THREATS:
The threats to this species are not known, but its habitat is presumably undergoing some decline. It has yet to be recorded from synanthropic settings and probably relies on natural roost sites in trees and other vegetation (Andriafidison *et al.*, 2008c; IUCN, 2009; Monadjem *et al.*, 2019b).

CONSERVATION ACTIONS:
Andriafidison *et al.* (2008c) [in IUCN (2009)] and Monadjem *et al.* (2019b) report that this species is present in Parc National d'Isalo. Future conservation measures should focus on roosting sites, but further research is needed to investigate the roosting and foraging habitats of this species.

GENERAL DISTRIBUTION:
Laephotis malagasyensis is endemic to Madagascar, where it is restricted to an area of 1,905 km² around the Isalo Massif (Bates *et al.*, 2006). It has been recorded between 450 and 700 m above sea level (Goodman and Ranivo, 2004) and is currently known from four localities in the centre-south (Bates *et al.*, 2006; Garbutt, 2022: 100).

Native: Madagascar (Peterson *et al.*, 1995; Goodman and Ranivo, 2004: 438; Bates *et al.*, 2006).

ECHOLOCATION:
Kofoky *et al.* (2009: 382) reported the calls of six individuals which consisted of FM/QCF components produced at low duty cycle, with maximum energy in the fundamental at about 45.8 kHz.

POPULATION:
Structure and Density
There is no information on the population status of this species (Monadjem *et al.*, 2019b).

Trend
2016: Unknown (Monadjem *et al.*, 2019b).

PARASITES:
Ramasindrazana *et al.* (2016: 7) report the presence of an unnamed filarial Nematode.

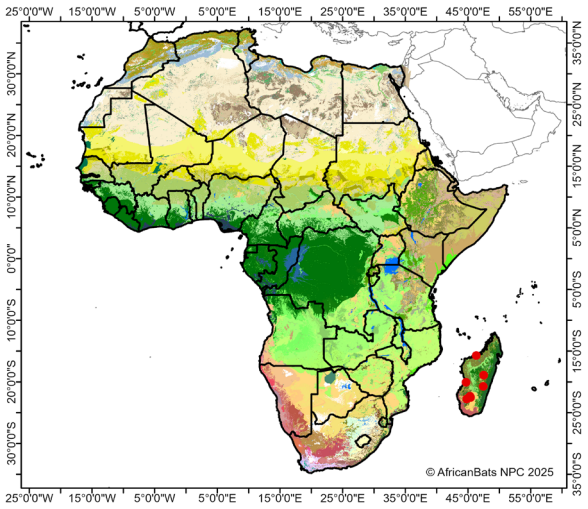

Figure 372. Distribution of *Laephotis malagasyensis*.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Madagascar.

Laephotis matroka (Thomas and Schwann, 1905)

*1905. *Vespertilio matroka* Thomas and Schwann, Proc. zool. Soc. Lond., 1905, I, II: 258. Publication date: 10 August 1905. Type locality: Madagascar: Betsileo: Ambositra [20 31 S 47 15 E, 1 100 m]. Holotype: NHMUK 1897.9.1.32: ad ♂, skull and alcoholic. Collected by: Dr. Charles Immanuel Forsyth-Major; collection date: 2 February 1875; original number: 177. See Peterson *et al.* (1995: 104).
1939. *Eptesicus matroka:* G.M. Allen, Bull. Mus. comp. Zool., 83: 86. (Name Combination).
1987. *Nycterikaupius matroka:* Menu, Palaeovert., 17 (3): 109. Publication date: 15 November 1987. (Name Combination, Lapsus).
2006. *Neoromicia matroka:* Van Cakenberghe, Kearney and Seamark, African Chiroptera Project, Pretoria, 136. (Name Combination).
2019. *L[aephotis] matroka:* M. Taylor, Bats: An illustrated guide to all species, 283. Publication date: 11 April 2019. (Name Combination).
2019. *Laephotis matroka:* M. Taylor, Bats: An illustrated guide to all species, 391. (Name Combination).

TAXONOMY:
Considered a synonym of *capensis* by Hayman and Hill (1971) and Koopman (1993a: 201), but see Peterson *et al.* (1995: 104), Russ *et al.* (2001), Simmons (2005: 456) who consider it a valid species.

Simmons (2005: 456) placed *matroka* within the genus and subgenus *Eptesicus*.

COMMON NAMES:
Czech: netopýr malgašský. English: Madagascar serotine, Matroka Bat, Malagasy Serotine. French: Sérotine de Madagascar. German: Matroka-Zwergfledermaus, Matroka-Pipistrelle.

CONSERVATION STATUS:
Global Justification
This species is listed as Least Concern (LC ver 3.1 (2001)) because there is no evidence of a severe decline in habitat or population size and it occurs across a wide range of habitats which includes built-up areas (Andriafidison *et al.*, 2008r; IUCN, 2009; Monadjem *et al.*, 2017bt).

Assessment History
Global
2016: LC ver 3.1 (2001) [as *Neoromicia matroka*] (Monadjem *et al.*, 2017bt). 2008: LC ver 3.1 (2001) [as "*Eptesicus matroka*"] (Andriafidison *et al.*, 2008r; IUCN, 2009). 2000: Data Deficient.

Regional
None known.

MAJOR THREATS:
There are no known major threats to this species (Andriafidison *et al.*, 2008r; IUCN, 2009; Monadjem *et al.*, 2017bt).

CONSERVATION ACTIONS:
Andriafidison *et al.* (2008r) [in IUCN (2009)] and Monadjem *et al.* (2017bt) report that this species has yet to be recorded from inside protected areas, but is known to use agricultural land adjacent to Parc National de Mantadia (Randrianandriananina *et al.*, 2006).

GENERAL DISTRIBUTION:
Laephotis matroka is endemic to Madagascar and appears to be largely restricted to an area in the eastern highlands (approximately Ambohitantely / Zahamena in the north, to Andringitra / Zazafotsy in the south) between 970 and 1,300 m above sea level, where it occurs in humid montane forest, degraded forest and anthropogenic grassland areas (Bates *et al.*, 2006; Garbutt, 2022: 101).

Native: Madagascar (Peterson *et al.*, 1995: 105; Bates *et al.*, 2006; Randrianandriananina *et al.*, 2006).

GEOGRAPHIC VARIATION:
Goodman *et al.* (2012b: 3) found geographical variation in the cranio-dental measurements, which lead them to divide this species into geographical units or Operational Taxonomic Units (OTUs): OTU 1 - the Central Highlands above 1,000 m, which includes the type locality near Ambositra (Thomas and Schwann, 1905b: 258); OTU 2 - areas in central western Madagascar less than 900 m; OTU 3 - eastern lowlands from sea-level to 200 m; and OTU 4 - eastern lowlands from 201 - 900 m.

DETAILED MORPHOLOGY:
Baculum
See Bates *et al.* (2006).

HABITAT:
It is found alongside humid forests and has also been recorded from open anthropogenic agricultural and grassland areas (Bates *et al.*, 2006; Randrianandriananina *et al.*, 2006).

ROOST:
It has been netted emerging from buildings (Bates *et al.*, 2006).

DIET:
On Madagascar, Rakotondramanana *et al.* (2015: 74) report the following volume percentages for: Coleoptera: 49.7 ± 22.44; Hymenoptera: 18.7 ± 17.57; Lepidoptera: 16.3 ± 16.34; Trichoptera: 9.2 ± 8.74; Homoptera: 5.5 ± 6.93; Arachnida: 0,2 ± 0,80. The frequencies for these groups were: Coleoptera: 97.6 ± 6.63; Hymenoptera: 64.0 ± 37.86; Lepidoptera: 55.2 ± 42.54, Trichoptera: 48.0 ± 40.82; Homoptera: 25.6 ± 28.0, and Arachnida: 0.8 ± 4.00. Rasoanoro *et al.* (2015: 64) mention the following volume percentages: Coleoptera: 53.4, Diptera: 11.0, Hemiptera: 17.6, and Hymenoptera: 18.0.

Cabrera-Campos *et al.* (2021: Suppl.) estimated the food transit time for these bats to be about 71 minutes, and a digestibility rate of about 81 %.

POPULATION:
Structure and Density
The population and local abundance of this species are not known, but it is thought to be locally common (Bates *et al.*, 2006).

Trend
2016: Unknown (Monadjem *et al.*, 2017bt). 2008: Unknown (Andriafidison *et al.*, 2008r; IUCN, 2009).

PARASITES:
Zhu *et al.* (2014: 2160) report the presence of the flea *Dampfia grahami grahami* (Waterston, 1915) (Ischnopsyllidae), which is a carrier of *Bartonella* bacteria. This flea was also reported by Hastriter (2016: 16) and Duchemin *et al.* (2022: 1076)..

Ramasindrazana *et al.* (2016: 6) report the presence of an unnamed filariod in this bat species.

Richard (1966: 413) reported the Trematode *Plagiorchis (Plagiochis) vespertilionis* (Müller, 1784) Braun, 1900.

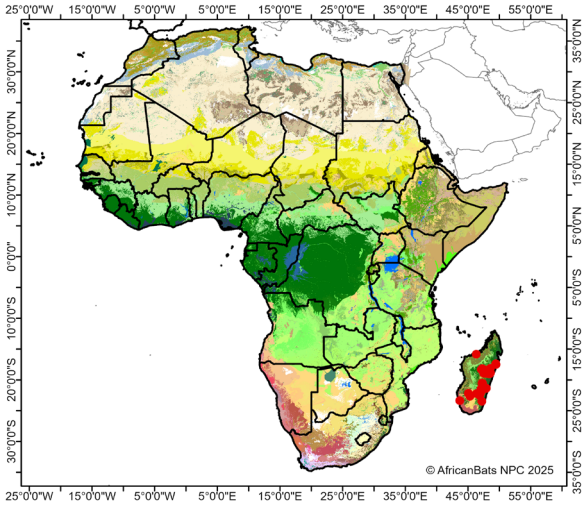

Figure 373. Distribution of *Laephotis matroka*.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Madagascar.

Laephotis namibensis Setzer, 1971

*1971. *Laephotis namibensis* Setzer, Proc. Biol. Soc. Wash., 84 (32): 259, fig 1a, 1c. Publication date: 4 November 1971. Type locality: Namibia: Namib Desert, Kuiseb River: Gobabeb (Namib Desert Research Station) [23 30 S 15 03 E, 407 m]. [Goto Description]. Holotype: USNM 342152: ad ♀, skin and skull. Collected by: Ronald E. Cole; collection date: 22 November 1963; original number: 270. Paratype: USNM 342153: ♀. See Setzer (1971: 259). - Etymology: Referring to the country where the type specimen was collected. (Current Combination).
2024. *Laephotis cf. namibensis:* Taylor, Kearney, Clark, Howard, Mdluli, Markotter, Geldenhuys, Richards, Rakotoarivelo, Watson, Balona and Monadjem, Glob. Ch. Biol., 30 (6): 4. Publication date: 5 June 2024. (Name Combination).
? *Laephotis cf. wintoni:*

TAXONOMY:
In a morphometric analysis with specimens of the other *Laephotis* taxa, specimens of *L. wintoni* and *L. namibensis* were not clearly separated (Kearney and Seamark, 2005: 85). Additional characters, or other systematic techniques will be required to clarify the species distinction. Unfortunately, specimens from the Western Cape province in South Africa have been identified as both *L. wintoni* (Rautenbach and Nel, 1978b) and *L. namibensis* (Skinner and Smithers, 1990). Hence, see also the account for *L. wintoni* for the results of a study based in the Western Cape province of South Africa that identified the specimens as *L. wintoni* (Jacobs *et al.*, 2005).

Laephotis namibensis and *L. wintoni* may be conspecific, which would make the former a paler, western race of *L. wintoni* (Kearney and Seamark, 2005).

Bacular studies have also failed to show differences between selected species of *Laephotis* (Kearney *et al.*, 2002). Kearney and Seamark (2005) could not find a clear distinction between *L. namibensis* and *L. wintoni* and echoed the suggestion that they might be geographic races of the same species (Peterson, 1973). These results endorse the use of molecular studies to clarify the current confusion over species limits within this genus (Monadjem *et al.*, 2010d).

No subspecies are currently recognized.

COMMON NAMES:
Afrikaans: Namib-langoorvlermuis. Czech: netopýr namibský. English: Namibian Long-eared Bat, Namib Long-eared Bat. French: Oreillard de Namibie, Oreillard du Namib, Chauve-souris à longues oreilles de Namibie, Noctophile du Namib. German: Namibia-Langohrfledermaus.

SIMILAR SPECIES:
Not easily distinguished from other *Laephotis*:
Laephotis angolensis - FA shorter (34.3 (32 - 36) mm). Ears shorter, 15 -18 mm and narrower. Skull smaller, GLS: 13.7 - 13.8 mm; GWS: 6.7 - 8.1 mm; C-M^3: 4.3 mm.

L. botswanae - Skull shorter, GLS: 14.1 - 15.5 mm.

L. wintoni - Skull usually shorter, GLS: 15.6 - 16.3 mm. Dorsal pelage and wings apparently never creamy-brown (as far as is known).

CONSERVATION STATUS:
Global Justification
Although this species is known mainly from isolated records from a relatively large area, it is listed as Least Concern (LC ver 3.1 (2001)), as most of the range is within well protected areas, where there are no significant threats, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Schlitter, 2008f; IUCN, 2009; Monadjem and Schlitter, 2017b). Type locality (Gobabeb) is close to Namib Naukluft Park, which includes some of the Naukluftberge where this species probably roosts (Kearney, 2013d: 583).

Assessment History
Global
2016: LC ver 3.1 (2001) (Monadjem and Schlitter, 2017b). 2008: LC ver 3.1 (2001) (Schlitter, 2008f; IUCN, 2009). 2004: LC ver 3.1 (2001) (Schlitter, 2004b; IUCN, 2004). 1996: EN (Baillie and Groombridge, 1996).

Regional
South Africa: 2016: VU D2 ver 3.1 (2001) (Jacobs *et al.*, 2016a). 2004: considered a vagrant not assessed, not recorded in SA, Cederberg specimens considered to be *L. wintoni* (Friedmann and Daly, 2004). 1986: Indeterminate, assessed as *L. wintoni* (Smithers, 1986).

MAJOR THREATS:
There appear to be no major threats to this species as a whole (Schlitter, 2008f; IUCN, 2009; Monadjem and Schlitter, 2017b).

CONSERVATION ACTIONS:
Schlitter (2008f) [in IUCN (2009)] and Monadjem and Schlitter (2017b) reports that much of the range of this species is protected within the Namib-Naukluft National Park, Namibia. Further studies are needed into the distribution and general natural history of this species.

GENERAL DISTRIBUTION:
Laephotis namibensis has been recorded from a few localities in Namibia (Kuiseb River, Gobabeb, Zwartmodder, Klein Aus and Helmeringshausen), and a single area in South Africa (Algeria in the Cedarberg Mountains of the Western Cape) (Skinner and Chimimba, 2005).

Found in the South West Arid BZ (Namib Desert) and in the South West Cape BZ. Recorded from Namibia (Gobabeb, Zwartmodder, Klein Aus, Helmeringshausen) and South Africa (Algeria Forest) (Setzer, 1971, Kearney, 2013d: 583).

Although, specimens from South Africa have also been identified as *L. wintoni*, see the discussion in the generic account.

Native: Namibia (Setzer, 1971; Kearney and Seamark, 2005: 87; Simmons, 2005; Monadjem *et al.*, 2010d: 564); South Africa (Kearney and Seamark, 2005: 87; Simmons, 2005; Monadjem *et al.*, 2010d: 564).

GEOGRAPHIC VARIATION:
Specimens from Namibia have much paler pelage and flight-membranes than those from South Africa (Kearney, 2013d: 583).

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Laephotis namibensis is a small bat with a mass of around 10 g, without noseleaf and with tail more or less fully enclosed in interfemoral membrane; ears separated, of medium length for a vespertilionid (22 - 25 mm) and of medium relative length (54 - 65 % of FA, n= 11).

Pelage soft, slightly shaggy on rump; mid-dorsal hairs ca. 7 mm. Dorsal pelage creamy-brown or yellowish-brown, varies geographically: the upper parts are pale brown in the Namib, but buffy-brown in the Western Cape; hairs distinctly bicoloured, basal 4 mm dark brown, terminal 3 mm creamy-brown or yellowish-brown. Ventral pelage (except in pelvic region) pale cream to whitish; hairs with basal 4 mm blackish-brown, terminal 3 mm pale cream or white (Kearney, 2013d: 583). Hairs in pelvic region pure white. The naked skin on muzzle and around eyes is pale brown. Ears pale to medium-brown, roughly triangular but elongated; tip rounded; inner margins almost meeting on forehead but not joined. Ears may be held erect above the head or (when resting) held horizontally at right-angles to head. Tragus shape much like that of *L. botswanae* except that in *L. namibensis* the bulge above the basal, posterior notch extends further out, making the tragus much wider at that point (Kearney, 2013d: 583). Wings pale creamy-brown (when dorsal pelage is pale) or dark brown (when dorsal pelage is yellowish- brown); arm-wing usually with whitish hind-border. Interfemoral membrane paler and more translucent (Kearney, 2013d: 583).

DENTAL FORMULA:
The permanent dental formula is as follows: $I^2/_3$, $C^1/_1$, $PM^1/_2$, $M^3/_3$ = 32.

Four upper and five lower cheekteeth and two upper incisors on each side. The upper premolar is sharply pointed and rises above the molars.

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:
As in all *Laephotis* spp. with braincase slightly flattened (rises slightly above the rostrum); rostrum rather narrow; zygomatic arches slender; no sagittal crest; lambdoid crest weakly developed. Skull on average long and wide for the genus (GLS: 16.1 - 17.0 mm; GWS: 8.4 - 9.2 mm). Palatal length: 8.0 (7.6 - 8.7) mm, n = 10 (Kearney and Seamark, 2005).

DETAILED MORPHOLOGY:
Baculum
See Kearney *et al.* (2002), which showed no difference to *L. botswanae*.

FUNCTIONAL MORPHOLOGY:
Laephotis namibensis has relatively broad wings with intermediate wing loading (7.0 N/m^2) and low aspect ratio (5.7) (Jacobs *et al.*, 2005; Monadjem *et al.*, 2010d; Amador *et al.*, 2019;also see Schoeman and Jacobs (2008). It is a clutter-edge forager.

SEXUAL DIMORPHISM:
Sexes similar (Monadjem *et al.*, 2010d, Kearney, 2013d: 583).

ECHOLOCATION:
Laephotis namibensis produces low- intensity LD-FM echolocation calls with a low peak frequency (22 ± 0.6 kHz, n = 5), narrow bandwidth (13.5 ± 2.9 kHz, n = 5), and short duration (2.6 ± 0.8 ms, n = 5) (Jacobs *et al.*, 2005; also see Schoeman and Jacobs (2008). Besides the fundamental, the second harmonic is often present on the spectrogram (Monadjem *et al.*, 2010d).

MOLECULAR BIOLOGY:
Karyotype
Rautenbach *et al.* (1993) reported 2*n* = 34, FN = 50, BA = 18, a submetacentric X chromosome, and an acrocentric Y chromosome, for specimens from Namibia. Rautenbach *et al.* (1993) also obtained the same results for specimens from the Western Cape, which were identified as *L. wintoni*, but reassigned to *L. namibensis* (Skinner and Smithers, 1990).

Genetics
See Hoofer and Van Den Bussche (2001) for the results of a specimen from Namibia. See Stadelmann *et al.* (2004b) for the results of a specimen from the Western Cape in South Africa identified as *L. wintoni*, but from a locality where the species identification has also been assigned to *L. namibensis* (Skinner and Smithers, 1990).

HABITAT:
Found in desert (60 % of specimen records), fynbos (20 % of specimen records), and savanna (20 % of specimen records) biomes (Kearney and Seamark, 2005: 85). Arid, mountainous habitat, in close proximity to open water (Kearney, 2013d: 583). Sirami *et al.* (2013: 35) recorded in the Western Cape Province, South Africa that *L. namibensis* activity was not significantly, nor positively influenced by size of wetland or habitats located 100 m from surrounding these wetlands. *L. namibensis* preferentially near trees, orchards surrounding wetlands and over these wetlands (Sirami *et al.*, 2013: 35).

HABITS:
The holotype and paratype were mist-netted over a waterhole in the bed of the Kuiseb R. near Namib Desert Research Station (Setzer, 1971). Individuals from Algeria Forest were mist netted as they flew along a water course, close to the water surface, between 20:30 and 21:00h.

ROOST:
Roosts not known, but the association of this bat with cliffs (in South Africa) indicates that it might roost in cracks and crevices of cliff faces (Jacobs *et al.*, 2005, Kearney, 2013e: 585). Specimens have been caught while foraging for insects from early to mid-evening (18h30 - 21h40).

Three radio tagged females in the Western Cape province of South Africa roosted in different crevices or narrow fissures in a cliff face above the valley where they foraged (Jacobs *et al.*, 2005). They also moved roost from one day to the next (Jacobs *et al.*, 2005).

DIET:
In the Cedarberg, Western Cape, its diet comprised mainly Lepidoptera and Coleoptera (Jacobs *et al.*, 2005, Schoeman 2006).

For these bats, Cabrera-Campos *et al.* (2021: Suppl.) estimated the food transit time to be about 76 minutes, and the digestibility rate about 80.1 %.

POPULATION:
Structure and Density
Although the species appears to be naturally rare in the Namib desert, it is rather commonly captured in mist-nets set around water tanks outside of the Namib (Schlitter, 2008f; IUCN, 2009; Monadjem and Schlitter, 2017b). Rare (Kearney, 2013d: 583).

Trend
2016: Stable (Monadjem and Schlitter, 2017b).
2008: Stable (Schlitter, 2008f; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
In the Cedarberg, Western Cape, a pregnant ♀ was caught in November (Jacobs *et al.*, 2005) and a post-lactating ♀ was collected in late January (Seamark and Brand, 2005).

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Namibia, South Africa.

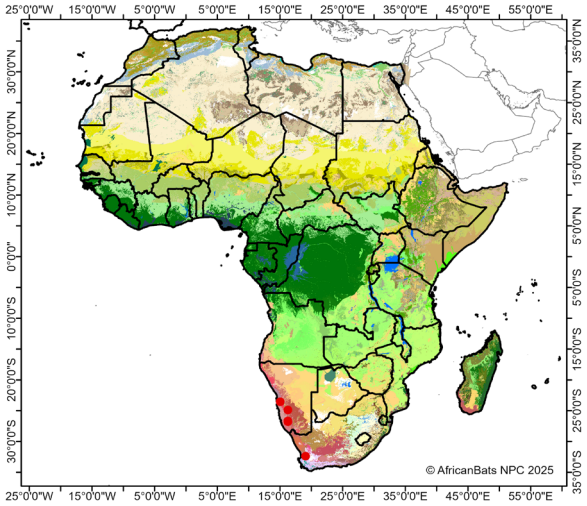

Figure 374. Distribution of *Laephotis namibensis*.

Laephotis robertsi (Goodman, Taylor, Ratrimomanarivo and Hoofer, 2012)

*2012. *Neoromicia robertsi* Goodman, Taylor, Ratrimomanarivo and Hoofer, Zootaxa, 3250: 1, 11, figs 3A, 4, 5A, 6A. Publication date: 29 March 2012. Type locality: Madagascar: Province d'Antananarivo, Anjozorobe, Amboasary [18 24.295 S 47 56.699 E]. Holotype: UADBA 43677: ad ♂, skull and alcoholic. Collected by: Richard K.B. Jenkins; collection date: 25 September 2002; original number: RBJ 105. Paratype: FMNH 213931: ad ♂, skull and alcoholic. Collected by: Richard K.B. Jenkins; original number: RBJ 119. Formerly UADBA 43679. Madagascar: Province de Toamasina, Parc National de Mantadia, between PK 9 and PK 10, 18 48.941 S, 48 25.633 E (see Goodman *et al.*, 2012b: 11). Paratype: UADBA 43678: ad ♀, skull and alcoholic. Collected by: Richard K.B. Jenkins; original number: RBJ 118. Madagascar: Province de Toamasina, Parc National de Mantadia, between PK 9 and PK 10, 18 48.941 S, 48 25.633 E (see Goodman *et al.*, 2012b: 11). - Etymology: In honour of Austin Roberts, who conducted systematic research on African mammals at the Transvaal Museum in Pretoria, and studied southern Africa bats, including small vespertilionids, during which he provided important insights into sorting out their generic affiliations (see Goodman *et al.*, 2012b: 11).
2017. *N[eoromicia] roberti:* Goodman, Kearney, Ratsimbazafy and Hassanin, Zootaxa, 4236 (2): 358. Publication date: 23 February 2017. (Lapsus).
2019. *L[aephotis] robertsi:* M. Taylor, Bats: An illustrated guide to all species, 283. Publication date: 11 April 2019. (Name Combination).
2019. *Laephotis robertsi:* M. Taylor, Bats: An illustrated guide to all species, 391. (Name Combination).

TAXONOMY:
Bates *et al.* (2006: 303) previously assigned these Madagascan specimens to *Laephotis melckorum*, but see Goodman *et al.* (2012b: 2).

Goodman *et al.* (2012b: 7) indicate that *L. robertsi* forms a sister-species pair with *L. malagasyensis*.

COMMON NAMES:
English: Robert's serotine. French: Sérotine de Robert. German: Roberts Zwergfledermaus.

CONSERVATION STATUS:
Global
Goodman (2017d) report that this species is known from two regions of the eastern portion of Madagascar, both within or at the edge of existing protected areas. As it is apparently not forest-dependent, few bat surveys have been conducted in the general region it is known to occur, and it is not uncommon where it has been captured, we await further field data to properly assess this taxon.

Assessment History
Global
2016: DD ver. 3.1 (2001) [assessed as *Neoromicia robertsi*] (Goodman, 2017d).

Regional
None known.

MAJOR THREATS:
Current threats to this species are not known (Goodman, 2017d).

CONSERVATION ACTIONS:
Goodman (2017d) report this species is known to occur in the Anjozorobe-Angavo and Mantadia-Analamazaotra protected areas.

GENERAL DISTRIBUTION:
Eastern Madagascar, where it is known from two localities (Anjozorobe-Angavo and Andasibe-Mantadia National Park). It occurs between 900

and 1,300 m in forests and partially degraded habitats (Garbutt, 2022: 101).

BIOGEOGRAPHY:
Only known from two localities in eastern Madagascar, at altitudes between 900 and 1,300 m (see Goodman *et al.*, 2012b: 20).

MOLECULAR BIOLOGY:
Genetics
L. robertsi is separated from its sister-species (*L. malagasyensis*) by a 1.8 % (12S rRNA) and 2.3 % (16S rRNA) sequence divergence. It is separated by a 3.3 % (12S rRNA) and 5.1 % (16S rRNA) sequence divergence from the other sister-species pair: *L. matroka* and *L. capensis*. The divergence between *L. robertsi* and other related taxa is greater than 6.0 % (12S rRNA) and 8.0 % (16S rRNA) (see Goodman *et al.* (2012b: 7).

DIET:
Rakotondramanana *et al.* (2015: 74) report the following prey volume percentages: Coleoptera: 55.0 ± 9.01; Hymenoptera: 25.3 ± 15.73; Lepidoptera: 7.5 ± 7.87; Trichoptera: 2.5 ± 2.95, and Homoptera: 9.7 ± 14.00. The frequency by which these occur are: Coleoptera: 96.7 ± 8.16; Hymenoptera: 80.0 ± 25.30; Lepidoptera: 50.0 ± 45.16; Trichoptera: 26.7 ± 30.11, and Homoptera: 40.0 ± 33.47.

POPULATION:
Structure and Density
Population size is not known for this species, but presumably it is substantial as it is found in degraded habitats that have been modified by human actions (Goodman, 2017d).

Trend
2016: Stable (Goodman, 2017d).

PARASITES:
BACTERIA
Gomard *et al.* (2016: 5) found the single specimen they tested to be positive for *Leptospira*.

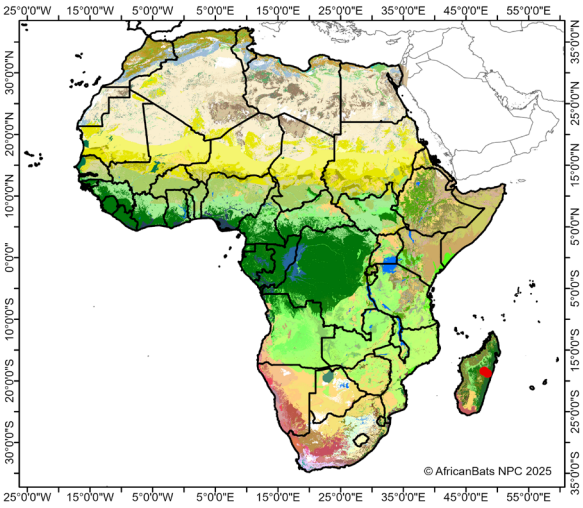

Figure 375. Distribution of *Laephotis robertsi*.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Madagascar.

1993. *Pipistrellus cf. melckorum:* Rautenbach, Bronner and Schlitter, Koedoe, 36 (2): 93. (Name Combination).
1995. *Eptesicus cf. melckorum:* Rautenbach, Fenton and Braack, Koedoe, 28: ???. (Name Combination).
2002. *Neoromicia cf. melckorum:* Kearney, Volleth, Contrafatto and Taylor, Acta Chiropt., 4 (1): 58. (Name Combination).
2005. *Neoromica melckorum:* Simmons, in: Wilson and Reeder, Order Chiroptera, 494. - Comments: in part. (Name Combination).
2011. *Neoromicia sp. aff. melckorum:* ACR, African Chiroptera Report 2011. (Name Combination).
*2017. *Neoromicia stanleyi* Goodman, Kearney, Ratsimbazafy and Hassanin, Zootaxa, 4236 (2): 351, 361, figs 2A, 4, 5, 6A, 7,. Type locality: Botswana: Okavango Delta, Chitabe, Gomoti River, Highbanks [19.41979 S 23.40413 E, 950m]. Holotype: TM 48487: ad ♂, skull and alcoholic. Collected by: Dr. Teresa Catherine Kearney and Ernest Charles James Seamark; collection date: 11 April 2009; original number: ECJS 48/2009. - Etymology: Named in honour of the William ("Bill") T. Stanley (1957 - 2015), who conducted active field and systematic research on African small mammals, particularly in east Africa, until his sudden death.
2017. *Pipistrellus krugeri* Herkt, Skidmore and Fahr, Global Ecol. Biog., 26 (8): Appendix S9. Publication date: 16 June 2017. - Comments: Herkt *et al.* (2017: Appendix S9) refer to the IUCN (2013) attribute table for the shapefile for "*Pipistrellus melckorum*", which notes "that these records must be referred to *Pipistrellus* sp., which will probably become *Pipistrellus krugeri*". As such, the name has no taxonomic value whatsoever.
2019. *L[aephotis] stanleyi:* M. Taylor, Bats: An illustrated guide to all species, 283. Publication date: 11 April 2019. (Name Combination).

? *Eptesicus melckorum subsp.:*
? *Neoromicia cf. melckorum KMN-2014*

? *Pipistrellus melckorum:*

TAXONOMY:

Figure 376. *Laephotis stanleyi* (TM 48487) holotype caught at Chitabe, Okavango, Botswana.

Bronner *et al.* (2003) state that most previous authors recognised "*Eptesicus* (= *Neoromicia*) *melckorum*" as distinct from *Laephotis capensis* (Roberts, 1951); Ellerman *et al.*, 1953; Hayman and Hill, 1971; Corbet and Hill, 1980; Meester *et al.*, 1986). Koopman (1982), however, questioned the status of *L. melckorum*, since it cannot be clearly distinguished from *L. capensis*. Specimens from the type locality (Kersefontein Farm in the Western Cape Province) are morphologically and karyotypically indistinguishable from *L. capensis*, but specimens from the Kruger National Park with a unique karyotype (2*n* = 40, aFN = 50) agree with the original description of *melckorum* (Rautenbach *et al.*, 1993; Kearney *et al.*, 2002 for Kersefontein chromosomal data). The Kruger National Park specimens are also well differentiated from *L. capensis* by allozymes (Morales *et al.*, 1991). *Laephotis melckorum* should thus be synonymised under *L. capensis*, whereas specimens from the Kruger National Park probably represent a distinct species that remained unnamed (Koopman, 1994), and which were referred to as *Laephotis* cf. *melckorum*. It seems likely that the Zimbabwe specimens reported by Cotterill (1996a) represent this latter species. Goodman *et al.* (2017a) studied these (and other southern African) specimens and provided a name and description for this taxon: "*Neoromicia stanleyi*".

COMMON NAMES:

English: Kruger serotine bat (Taylor, 2005: 305 - first use). French: Pipistrelle des Melcks. German: Stanleys Serotine bat.

CONSERVATION STATUS:

Global Justification

Listed as Data Deficient (DD ver 3.1 (2001)) in view of continuing problems with its taxonomy as well as absence of recent information on its extent of occurrence, status and ecological requirements (Jacobs, 2019a).

Assessment History

Global

2018: DD ver 3.1 (2001) assessed as "*Neoromicia melckorum*" (Jacobs, 2019a). 2008: DD ver 3.1 (2001) assessed as "*Pipistrellus melckorum*" (IUCN, 2009).

Regional

South Africa: 2016: LC ver 3.1 (2001) [assessed as "*Neoromicia* cf. *melckorum*"] (Taylor *et al.*, 2016c). 2004: considered a vagrant ("*Pipistrellus spp*" - Kruger Serotine bat) not assessed, single locality (Friedmann and Daly, 2004).

MAJOR THREATS:

The threats to this species are not known. In Madagascar it has been recorded from degraded or modified habitats (Jacobs, 2019a).

CONSERVATION ACTIONS:

Jacobs (2019a) states that this species was not known from any protected areas in southern Africa, but these is incorrect as has been recorded from a number of protected areas (e.g., Kruger National Park). Further studies to better determine the species distribution, habitat requirements and any potential threats.

GENERAL DISTRIBUTION:

Kenya to Zambia and N South Africa (Simmons, 2005). For South Africa, Babiker Salata (2012: 49) found that "*Neoromicia melckorum*" has a distribution which is strongly associated with the amount of precipitation in the coldest quarter of the year.

Native: Botswana (Monadjem *et al.*, 2010d: 568); Malawi (Happold *et al.*, 1988: 568); South Africa (Monadjem *et al.*, 2010d: 568); Zambia (Ansell, 1967; Monadjem *et al.*, 2010d: 568); Zimbabwe (Monadjem *et al.*, 2010d: 568).

DETAILED MORPHOLOGY:

Baculum

In general appearance, this is very similar to the bacula of the closely related *L. capensis, L. matroka, L. robertsi* and *L. malagasyensis*. They all have a ventrally deflected tip, with a small dorsally projecting heel. Compared with the one of *capensis*, its longer and has a broader, shorter tip. The lateral tip flanges in *L. stanleyi* are only curved or notched on the distal edge, whereas there are distally and proximally curved edges on the tip flanges of *L. capensis*. The shaft in

stanleyi is slender and evenly wide from end to end (see Fig. 2 in Goodman *et al.*, 2017a)..

ECHOLOCATION:
In Benin, Roemer *et al.* (2021: Suppl.) categorized the bat's call as a FMd-QCF (Frequency modulation downward - quasi-constant frequency) sonotype [as "*Neoromicia stanleyi*"].

MOLECULAR BIOLOGY:
Karyotype
Rautenbach *et al.* (1993) reported 2*n* = 40; FN = 50, BA = 12, a metacentric X chromosome, and an acrocentric Y chromosome, for specimens from Zimbabwe and South Africa.

Protein / allozyme
See Morales *et al.* (1991) for results from nine specimens from South Africa.

DIET:
Cabrera-Campos *et al.* (2021: Suppl.) estimated the food transit time for these bats (as "*Neoromicia melckorum*") to be about 62 minutes, and the digestibility rate about 82.3 %.

POPULATION:
Structure and Density
Population size and trends are uncertain due to taxonomic difficulties (Jacobs, 2019a).

Trend
2018: Unknown (Jacobs, 2019a).

PARASITES:
HEMIPTERA
Cimicidae
Kock *et al.* (1998b: 237) mentioned the presence of *Aphrania* cf. *barys* Jordan and Rothschild, 1912.

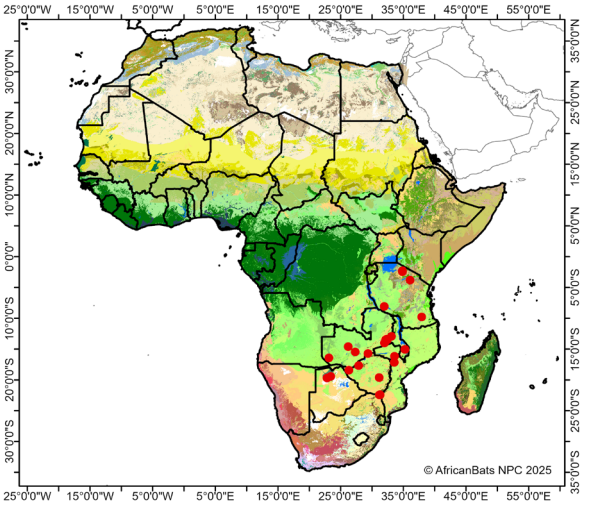

Figure 377. Distribution of *Laephotis stanleyi*.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Botswana, Kenya, Malawi, Mozambique, South Africa, Tanzania, Zambia, Zimbabwe.

Laephotis wintoni (Thomas, 1901)

*1901. *Læphotis Wintoni* Thomas, Ann. Mag. nat. Hist., ser 7, 7 (41): 460. Publication date: 1 May 1901. Type locality: Kenya: Kitui [01 22 S 38 01 E, 3 500 ft]. [Goto Description]. Holotype: NHMUK 1901.5.6.5: ♂, skin and skull. Collected by: Dr. Sidney Langford Hinde; collection date: 7 January 1901; original number: S.L.H.64. - Etymology: In honour of Mr W.E. de Winton, "whose labours on the small mammals of Africa all naturalists...have been so constantly indebted for assistance" (Thomas, 1901d: 462). (Current Combination).
1942. *Laephotis wintoni:* Tate, Bull. Am. Mus. Nat. Hist., 80 (4): 279. Publication date: 27 November 1942. (Current Spelling).
1999. *Laephotis cf. wintoni:* P.J. Taylor, S. Afr. J. Zool., 34 (1): 22. (Name Combination).

TAXONOMY:
In a morphometric analysis with specimens of the other *Laephotis* taxa, specimens of *L. wintoni* and *L. namibensis* were not clearly separated (Kearney and Seamark (2005: 85). Unfortunately, specimens from the Western Cape province in South Africa have been identified as both *L. wintoni* (Rautenbach and Nel, 1978b) and *L. namibensis* (Skinner and Smithers, 1990). Specimens from Lesotho and the Free State province in South Africa were assigned to cf. *wintoni* pending clarification of the species distinctions (Kearney and Taylor, 1997). Additional characters, or other systematic techniques will be required to clarify the species distinction. Specimens from KwaZulu-Natal Province in South Africa previously identified as cf. *wintoni* (Kearney and Taylor, 1997) were reassigned to *L. botswanae* (Kearney and Seamark, 2005: 85).

South African specimens were assigned to *L. wintoni* based on multivariate analysis of external and cranial measurements (Rautenbach and Nel, 1978b, Watson, 1990a, Kearney and Taylor, 1997). However, on the basis of post-palatal measurements and morphometric analyses of cranial characters including palatal measurements by Hill (1974a), the specimens assigned to *L. wintoni* by Kearney and Taylor (1997) have now been re-identified as *L. botswanae* (Kearney and Seamark, 2005). Specimens from Algeria Forest in the Western Cape (South Africa) originally described by

Rautenbach and Nel (1978b) as *L. wintoni* were subsequently re-identified as *L. namibensis* in Skinner and Smithers (1990). However, new specimens from Algeria have been referred to as *L. wintoni* (based on Rautenbach and Nel, 1978b) by Jacobs *et al.* (2005). On the basis of morphometric analyses of cranial characters, including palatal measurements, the distinction between *L. wintoni* and *L. namibensis* could not be confirmed by Kearney and Seamark (2005); therefore, pending clarification of the status of *namibensis*, information from Jacobs *et al.* (2005) is mentioned in the profile for *L. namibensis*.

Laephotis namibensis and *L. wintoni* may be conspecific, which would make the former a paler, western race of the latter (Kearney and Seamark, 2005).

No subspecies are currently recognized.

COMMON NAMES:
Afrikaans: Winton se langoorvlermuis, Winton-langoorvlermuis. Chinese: 温氏长耳蝠. Czech: netopýr Wintonův. English: De Winton's Long-eared Bat, Winton's Long-eared Bat. French: Oreillard de De Winton, Chauve-souris à longues oreilles de De Winton, Noctophile de De Winton. German: De Wintons Langohrfledermaus. Italian: Lefòte di Wìnton.

SIMILAR SPECIES:
Not easily distinguished from other *Laephotis*:
Laephotis angolensis - FA shorter (32 - 36 mm). Ears shorter (15 - 18 mm) and narrower. Skull shorter and broader (GLS: 13.7 - 13.8 mm; GWS: 6.7 - 8.1 mm; C-M^3: 4.3 mm).
L. botswanae - FA on average shorter, 36.3 (30 - 39) mm. Skull usually smaller, GLS: 14.6 (14.1 - 15.5) mm; C-M^3: 4.7 (4.5 - 4.9) mm.
L. namibensis - Skull usually longer, GLS: 16.1 - 17.0 mm. Dorsal pelage and wings sometimes creamy-brown (see Geographic Variation).

CONSERVATION STATUS:
Global Justification
Listed as Least Concern (LC ver 3.1 (2001)) because, although it is seldom recorded, it has a relatively wide distribution, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Schlitter, 2008g; IUCN, 2009; Monadjem and Schlitter, 2017c).

Assessment History
Global
2016: LC ver 3.1 (2001) (Monadjem and Schlitter, 2017c). 2008: LC ver 3.1 (2001) (Schlitter, 2008g; IUCN, 2009). 2004: LC ver 3.1 (2001) (Schlitter, 2004a; Jacobsen *et al.*, 1986). 1996: LR/nt (Baillie and Groombridge, 1996).

Regional
South Africa: 2016: VU D2 ver 3.1 (2001) (Avenant *et al.*, 2016a). 2004: VU D2 ver 3.1 (2001), included *L. botswanae* from Hella-Hella and *L. namibensis* from Cederberg (Friedmann and Daly, 2004).

MAJOR THREATS:
There appear to be no major threats to this species (Schlitter, 2008g; IUCN, 2009; Monadjem and Schlitter, 2017c).

CONSERVATION ACTIONS:
Schlitter (2008g) [in IUCN (2009)] and Monadjem and Schlitter (2017c) reports that it has been recorded from the Sehlabathebe National Park in Lesotho, and may be present in additional protected areas. Additional studies into the population abundance and distribution are needed.

GENERAL DISTRIBUTION:
Recorded from Ethiopia in the north of its range, south through parts of Kenya (including Nyeri, Mount Kenya) and Tanzania (Mazumbai Forest Reserve, West Usambara Mountains (Kock and Howell, 1988); Kebebe Farms, Iringa district (Stanley and Kock, 2004), southern Zambia, Lesotho (including Sehlabathebe National Park), and South Africa (the Clarens district in the eastern Free State).

Laephotis wintoni occurs at high altitude (> 1,500 m above sea level) in Lesotho and the Free State (Kearney and Seamark, 2005), where it has been collected from montane grasslands. In Lesotho, it was netted over water (Lynch, 1994).

Specimens recorded from the Western Cape Province in South Africa have also been identified as *L. namibensis*, see the discussion in the generic account. The specimens from Game Valley Estates (Hella Hella) near Richmond, KwaZulu Natal, South Africa (Kearney and Taylor, 1997; Skinner and Chimimba, 2005: 317) are in fact *L. botswanae* (Kearney and Seamark, 2005).

Native: Ethiopia (Kearney and Seamark, 2005: 87; Simmons, 2005: 492; Skinner and Chimimba, 2005: 317); Kenya (Kearney and Seamark, 2005: 87; Simmons, 2005: 492; Skinner and Chimimba, 2005: 317); Lesotho (Lynch and Watson, 1990; Lynch, 1994: 194; Kearney and Seamark, 2005: 87 as *L.* cf. *wintoni*; Skinner and Chimimba, 2005: 317; Monadjem *et al.*, 2010d: 564 as *L* cf. *wintoni*); South Africa (Lynch, 1994; Kearney and

Taylor, 1997; Kearney and Seamark, 2005: 87 as *L.* cf. *wintoni*; Simmons, 2005: 492; Skinner and Chimimba, 2005: 317; Monadjem *et al.*, 2010d: 564 as *L.* cf. *wintoni*); Tanzania (Kock and Howell, 1988; Stanley and Kock, 2004: 174; Simmons, 2005: 492).

BIOGEOGRAPHY:
There are scattered records in the Afromontane Afroalpine and Somalia Masai BZs of Ethiopia and East Africa and records much further south in the Afromontane Afroalpine and Highveld BZs of South Africa.

GEOGRAPHIC VARIATION:
None recorded (Kearney, 2013e: 584).

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Laephotis wintoni is a small bat with a mass of around 10 g, without noseleaf and with tail more or less fully enclosed in interfemoral membrane; ears separated, of medium length for a vespertilionid (21 - 21 mm) and of medium relative length (53 - 60% of FA, n= 12). Mid-dorsal hairs ca. 8 mm. Dorsal pelage yellowish-brown to reddish-brown; hairs distinctly bicoloured, basal 6 mm dark brown, terminal 2 mm yellowish-brown or reddish-brown. Ventral pelage with chin yellowish-orange, reddish-brown or pale brown, throat paler, pelvic region cream or white. Hairs (except in pelvic region) blackish-brown with yellowish-orange, reddish-brown, cream or white tips. Hairs in pelvic region pure white. Head fairly flat; naked skin on muzzle and around eyes is dark brown. Buccal pads observed in one ♂. Ears dark brown, roughly triangular but very elongated; tip rounded; inner margins almost meeting on forehead hut not joined. Ears may be held erect above the head or (when resting) held horizontally at right-angles to head. Wings dark brown or blackish-brown; presence or absence of hind-border is not known. Interfemoral membrane paler and more translucent.

DENTAL FORMULA:
The permanent dental formula is as follows: $I^2/_3$, $C^1/_1$, $PM^1/_2$, $M^3/_3$ = 32.

Four upper and five lower cheekteeth and two upper incisors on each side. The upper premolar is sharply pointed and rises above the molars.

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:

Figure 378. Clockwise from top lateral, ventral and dorsal skull images of NHMUK 1901.5.6.5, holotype of *Laephotis Wintoni* Thomas, 1901.

As in all *Laephotis* spp. with braincase slightly flattened (rises slightly above the rostrum); rostrum rather narrow; zygomatic arches slender; no sagittal crest; lambdoid crest weakly developed. Skull on average medium-long and wide for the genus (GLS: 15.6 -16.3 mm; GWS: 8.8 - 9.5 mm). Palatal length: 8.1 (7.9 - 8.5) mm, n= 15.

DETAILED MORPHOLOGY:
Baculum
Hill and Harrison (1987) and Kearney *et al.* (2002) as *L.* cf. *wintoni*.

FUNCTIONAL MORPHOLOGY:
Amador *et al.* (2019: Suppl.) [referring to Schoeman and Jacobs (2008)] mention a wing loading value of 7.5 Pa, aspect ratio 5.6 for a wingspan of 27 cm and a wing area of 134 cm^2 and a body mass of 10 g.

SEXUAL DIMORPHISM:
Sexes similar (Monadjem *et al.*, 2010d, Kearney, 2013e: 584).

ECHOLOCATION:
The echolocation call of this species has not been recorded (Monadjem *et al.*, 2010d). However, Thiagavel *et al.* (2017: Suppl.) mention a peak frequency of 23.08 kHz.

MOLECULAR BIOLOGY:
Karyotype
Rautenbach *et al.* (1993) reported 2*n* = 34, FN = 50, BA = 18, a submetacentric X chromosome, and an acrocentric Y chromosome, for specimens from the Western Cape Province in South Africa, which were identified as *L. wintoni*, but reassigned to *L. namibensis* (Skinner and Smithers, 1990). Rautenbach *et al.* (1993) also obtained the same results for specimens from Namibia identified as *L. namibensis*.

Genetics
See Stadelmann *et al.* (2004b) for the results of a specimen from the Western Cape in South Africa, for a locality that has had the taxa reassigned to *L. namibensis* (Skinner and Smithers, 1990).

HABITAT:
Excluding records from the Western Cape province locality in South Africa that have also been assigned to *L. namibensis* (Skinner and Smithers, 1990), it is a montane species found at high altitudes above 1000 m (Kock and Howell, 1988; Stanley and Kock, 2004: 176; Kearney and Seamark, 2005). *L. wintoni* has been found in East Africa in both forest (62.5 % of specimen records) and savanna (37.5 % of specimen records) biomes (Kock and Howell, 1988; Kearney and Seamark, 2005: 85). Specimens assigned to *L.* cf. *wintoni* from the Free State Province of South Africa and Lesotho are from the grassland biome (Kearney and Seamark, 2005: 85).

HABITS:
In Ethiopia, found at 1700 m, near a large Rift Valley reservoir on the Awash R. surrounded by Acacia woodland that has been extensively degraded to provide open farmland (Largen *et al.*, 1974). In East Africa, recorded from highland and mountainous areas with mosaics of evergreen bushland, secondary Acacia wooded grasslands and farmlands, and forests on the mountains: caught in forests, near forests and in woodlands. In the Free State Province of South Africa, recorded amongst large exotic trees in a drainage line flanked by sandstone cliffs (Watson, 1990a). In Lesotho, recorded from the vicinity of a dam surrounded by a vlei overgrown with medium-height (600 mm) vegetation in Sehlabathebe N. P. (Lynch and Watson, 1990). In Sehlabathebe N. P., there is no significant cover of tall grass, forbs or woody vegetation; the climate is harsh; the topographical relief is fairly uniform, and the altitude is 2,300 - 2,650 m (Kearney, 2013e 584).
See Jacobs *et al.*, 2005).

ROOST:
One individual was found under exfoliating rock (TM) (Kearney, 2013d: 583). Kingdon (1974) (in Altringham, 2011: 143) mentions a bat roosting behind tree bark.

DIET:
A study in the Western Cape province of South Africa found the diet was dominated by tympanate moths in three of four individuals studied, the fourth individual's diet was dominated by beetles (Jacobs *et al.*, 2005). Hemiptera and Tricoptera were also eaten but in much smaller proportions (Jacobs *et al.*, 2005).

Cabrera-Campos *et al.* (2021: Suppl.) estimated the food transit time for these bats to be about 68 minutes, and the digestibility rate about 81.4 %.

POPULATION:
Structure and Density
This seems to be an uncommon species, possibly having large population fluctuations. Multiple individuals have been caught in Lesotho and South Africa, however, in East Africa it is known from many localities, but as one or two animals only (Schlitter *pers. comm.* [in Schlitter (2008g) in IUCN (2009)] and Monadjem and Schlitter (2017c)). Rare, but numbers in museum collections are increasing (Kearney, 2013e: 584).

Trend
2016: Unknown (Monadjem and Schlitter, 2017c).
2008: Unknown (Schlitter, 2008g; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
In Lesotho, a pregnant ♀ was collected in November (Lynch, 1994).

VIRUSES:
Bunyaviridae
Phlebovirus
Rift Valley Fever Virus (RVFV)
Oelofsen and Van der Ryst (1999) tested two and four individuals from Clarens, South Africa and Lesotho respectively for RVFV antigen using an enzyme linked immunosorbet assay (ELISA), none tested positive.

Coronaviridae - Coronaviruses
SARS-CoV
Müller *et al.* (2007b) tested between 1986 and 1999, for antibodies to SARS-CoV in serum of one individual from Limpopo Province, South Africa, and found none (0/1).

Rhabdoviridae
Lyssavirus - Rabies related viruses
Rabies

Oelofsen and Smith (1993) tested two and four individuals from Clarens, South Africa and Lesotho respectively using "Trousse Platelia Rage" ELISA kit (Diagnostic Pasteur), none tested positive for antibodies to rabies virus glycoprotein G. Oelofsen and Smith (1993) also tested two and four individuals from Clarens, South Africa and Lesotho respectively by means of the "Rapid rabies enzyme immunodiagnosis" (RREID) test (Diagnostic Pasteur), none were tested positive.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Ethiopia, Kenya, Lesotho, South Africa, Tanzania.

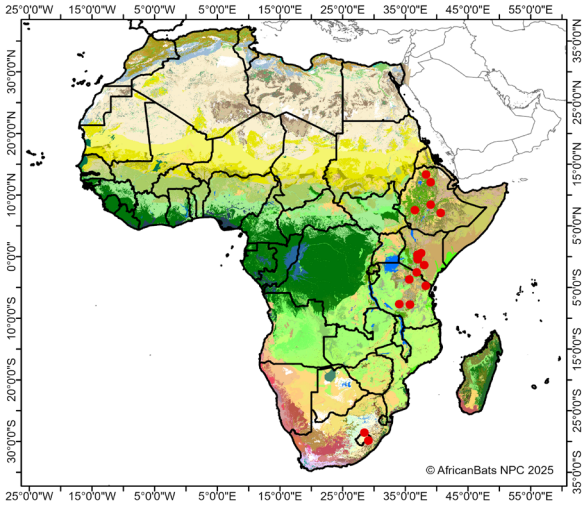

Figure 379. Distribution of *Laephotis wintoni*.

Genus ***Mimetillus*** Thomas, 1904

*1904. *Mimetillus* Thomas, Abstr. Proc. Zool. Soc. Lond., 10: 12. Publication date: 22 November 1904. - Comments: Type species: *Vesperugo (Vesperus) moloneyi* Thomas, 1891. - Etymology: Lanza *et al.* (2015: 361 - 362) indicate that it possibly is derived from the masculine scientific Latin adjective *mimèticus*, meaning "mimetic" and the end of the masculine scientific Latin substantive *(Pipistre)llus*, meaning "bat", which combines to a "bat miming a member of the genus *Pipistrellus* (= *Vesperugo*)". (Current Combination).

? *Mimetillus sp.:*

TAXONOMY:
Pending revision, considered here to be a monotypic genus endemic to tropical Africa including Bioko Island (Happold, 2013da: 585). See Simmons (2005), Cotterill (2001 d) and Monadjem *et al.* (2010d).

Placed in tribe Vespertilionini (Simmons, 2005), but the analyses of the cyt *b* sequences by Monadjem *et al.* (2020a: 1141) indicate that this genus falls outside the Vespertilionini or Pipistrellini tribes.

Currently (Simmons and Cirranello, 2023b) recognized species of the genus *Mimetillus*: ***moloneyi*** (Thomas, 1891).

COMMON NAMES:
Czech: Moloneyovi netopýři. English: Flat-headed Vesper Bats, Mimic Bats, Narrow-winged Bats, Flat-headed Bats. French: Mimétille, Chauve-souris à tête plate. German: Schmalflügel-Fledermäuse. Italian: Mimetìlli.

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Diagnostic combination of characters: four upper and five lower cheekteeth and two upper incisors on each side; head conspicuously flattened; ears relatively short and not joined at base; outer margin of ear not reaching mouth; phalanges of third, fourth and fifth fingers very short (third finger shorter than HB); no body pattern; wings not reticulated (Happold, 2013da: 585).

DENTAL FORMULA:
The permanent dental formula is as follows: $I^2/_3$, $C^1/_1$. $PM^1/_2$, $M^3/_3$ = 32.

Mimetillus moloneyi (Thomas, 1891)

*1891. *Vesperugo (Vesperus) Moloneyi* Thomas, Ann. Mag. nat. Hist., ser 6, 7 (42): 528, text-fig. Publication date: 1 June 1891. Type locality: Nigeria: Western region: Lagos [06 27 N 03 23 E]. [Goto Description]. Holotype: NHMUK 1891.5.5.2: ad ♂, alcoholic (skull not removed). Collected by: Sir Alfred Moloney. Presented/Donated by: Sir Alfred Moloney. See Thomas (1891a: 529). - Etymology: In honour of Sir Cornelius Alfred Moloney (1848 - 1913), a British civil cervant, collector of the type specimen (see Lanza *et al.*, 2015: 363).

1905. *Mimetillus moloneyi:* Thomas, Proc. zool. Soc. Lond., 1904, II (II): 188. Publication date: 18 April 1905. (Name Combination, Current Combination).

1920. *Mimetillus thomasi* Hinton, Ann. Mag. nat. Hist., ser 9, 6 (32): 240. Publication date: 1 August 1920. Type locality: Zambia: Ndola [12 58 S 28 38 E, 1 400 m]. [Goto Description]. Holotype: NHMUK 1920.11.3.28: ad ♀. Collected by: Captain Guy Chester Shortridge; collection date: 4 October 1919; original number: 481. - Etymology: In honour of Oldfield Thomas.

1933. *Mimetillus berneri* Monard, Bull. Soc. Neuchât. Sci. nat., 57: 49 (for 1932?). Type locality: Angola: South-Central Angola: Vila da Ponte [14 25 S 16 15 E]. Syntype: MHNG 1326.004: ♂, alcoholic (skull not removed).

Collected by: Dr. Albert Monard; collection date: 1928 - 1929. - Comments: Allen (1939a:89) mentions 1932 as year of publication.

1953. *Mimetillus moloneyi berneri:* Ellerman, Morrison-Scott and Hayman, Southern African Mammals 1758 to 1951: a reclassification, 82. Publication date: 23 December 1853. (Name Combination).

1953. *Mimetillus moloneyi moloneyi:* Ellerman, Morrison-Scott and Hayman, Southern African Mammals 1758 to 1951: a reclassification, 82. Publication date: 23 December 1953. (Name Combination).

1953. *Mimetillus moloneyi thomasi:* Ellerman, Morrison-Scott and Hayman, Southern African Mammals 1758 to 1951: a reclassification, 82. Publication date: 23 December 1953. (Name Combination).

TAXONOMY:

Koopman (1993a: 207) included *thomasi* and *berneri*; but see Cotterill (2001c) and Simmons (2005). Monadjem *et al.* (2010d: 444; 2010c: 390) consider *thomasi* to be a separate species.

COMMON NAMES:

Castilian (Spain): Murciélago de cabeza Plana. Chinese: 非洲扁颅蝠. Czech: netopýr Moloneyův. English: Moloney's Flat-headed Vesper Bat, Moloney's Mimic Bat, Moloney's Flat-headed Bat. French: Mimétille de Moloney, Chauve-souris à tête plate de Moloney. German: Moloneys Schmalflügel-Fledermaus, Moloneys Flachkopf-Fledermaus. Italian: Mimetillo di Moloney.

CONSERVATION STATUS:

Global Justification

Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Jacobs *et al.*, 2008ai; IUCN, 2009; Monadjem *et al.*, 2017an).

Assessment History

Global

2016: LC ver 3.1 (2001) (Monadjem *et al.*, 2017an). 2008: LC ver 3.1 (2001) (Jacobs *et al.*, 2008ai; IUCN, 2009). 2004: LC ver 3.1 (2001) (Jacobs *et al.*, 2004ah; IUCN, 2004). 1996: LR/lc (Baillie and Groombridge, 1996).

Regional

None known.

MAJOR THREATS:

There appear to be no major threats to this species as a whole (Jacobs *et al.*, 2008ai; IUCN, 2009; Monadjem *et al.*, 2017an).

CONSERVATION ACTIONS:

Jacobs *et al.* (2008ai) [in IUCN (2009)] and Monadjem *et al.* (2017an) report that there appear to be no direct conservation measures in place. It is not known if the species is present in any protected areas. Additional research into the taxonomy of this species is needed.

GENERAL DISTRIBUTION:

Widespread over much of sub-Saharan Africa. It ranges from Sierra Leone in the west, through West Africa and Central Africa (although seemingly absent from much of the Congo basin), to southern Sudan and western Ethiopia in the east, from here it ranges southwards through East Africa to Zambia and Angola, with the southernmost record from south-central Mozambique. It is found at elevations of up to 2,300 m asl.

Native: Angola; Cameroon; Central African Republic (Lunde *et al.*, 2001: 537); Congo (Bates *et al.*, 2013: 325 - 1st authenticated record); Congo (The Democratic Republic of the) (Hayman *et al.*, 1966; Monadjem *et al.*, 2010d: 564); Côte d'Ivoire; Equatorial Guinea; Ethiopia; Gabon; Ghana; Guinea (Fahr *et al.*, 2006a; Decher *et al.*, 2016: 266); Kenya (Start, 1969: 223); Liberia (Fahr, 2007a: 104); Mozambique; Nigeria; Sierra Leone; Sudan; Tanzania; Togo; Uganda; Zambia.

DETAILED MORPHOLOGY:

Baculum

Hill and Harrison (1987).

ECHOLOCATION:

Roemer *et al.* (2021: Suppl.) categorized the bat's call as a FMd-QCF (Frequency modulation downward - quasi-constant frequency) sonotype.

HABITAT:

Monadjem *et al.* (2016y: 369) recorded this species from forested and disturbed habitats between 400 and 520 m at the Mount Nimba area.

ROOST:

Altringham (2011: 143) [referring to Kingdon (1974)] mentions that this species also roosts behind tree bark.

DIET:

For these bats, Cabrera-Campos *et al.* (2021: Suppl.) estimated the food transit time to be about 83 minutes, and the digestibility rate about 79.2 %.

PREDATORS:
Mikula *et al.* (2016: Supplemental data) mention the Bat hawk (*Macheiramphus alcinus* Bonaparte, 1850) as diurnal avian predator.

POPULATION:
Structure and Density
Although the species is difficult to catch, it is not considered to be especially rare (Jacobs *et al.*, 2008ai; IUCN, 2009; Monadjem *et al.*, 2017an).

Trend
2016: Unknown (Monadjem *et al.*, 2017an). 2008: Unknown (Jacobs *et al.*, 2008ai; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
Krutzsch (2000: 124) indicates that males have enlarged testes in January and June and that females parturate in February/March and in August.

PARASITES:
ACARI
Fain (1959e: 155) described *Notoedres (Notoedres) mimetilli* (Sarcoptidae) from "*Mimetillus thomasi*" from Katanga, DRC, and Fain (1963: 256) reported the same parasite on a *M. moloneyi* from Bio [=Bo?], Sierra-Leone.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Angola, Cameroon, Central African Republic, Congo, Congo (Democratic Republic of the), Côte d'Ivoire, Equatorial Guinea, Gabon, Ghana, Guinea, Kenya, Liberia, Malawi, Mozambique, Nigeria, Sierra Leone, South Sudan, Tanzania, Uganda, Zambia.

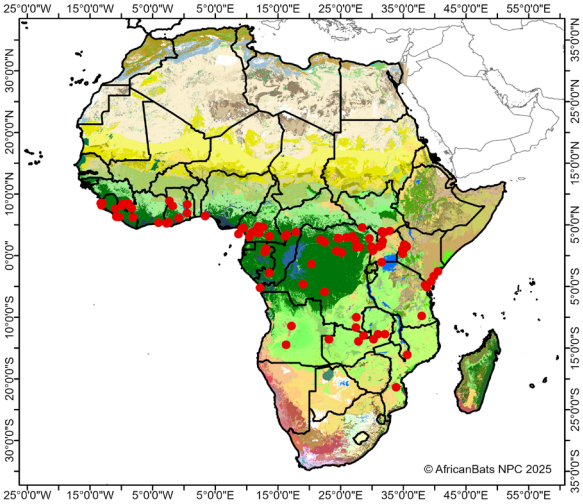

Figure 380. Distribution of *Mimetillus moloneyi*.

Genus ***Neoromicia*** Roberts, 1926

1889. *Vesperus:* Bocage, J. Sci. mat. phys. nat., ser 2, 1 (1): 6. Publication date: March 1889. - Comments: In part. Not of not Keyserling and Blasius (1839). Monadjem *et al.* (2020a: 1127) mention "*Vesperugo* Bocage, 1889", but Bocage (1889a: 7) only uses this genus name in combination with *pipistrellus* and *Kuhli* (and possibly *tenuipinnis*, neither of which is currently assigned to *Neoromicia*. On page 6, he described "*Vesperus guineensis*", which is currently included in *Neoromicia*. Bocage (1889b: 17-18) mentions the following *Vesperus* species: *capensis* and *bicolor*, which again are not in *Neoromicia*.
1901. *Vespertilio:* Thomas, Ann. Mag. nat. Hist., ser 7, 7 (37): 32. Publication date: 1 January 1901. - Comments: In part. Not of Linnaeus, 1758 (see Monadjem *et al.*, 2020a: 1127).
1911. *Eptesicus:* G.M. Allen, Bull. Mus. comp. Zool., 54 (9): 321. Publication date: December 1911. - Comments: In part. Not of Rafinesque, 1820 (see Monadjem *et al.*, 2020a: 1127).
*1926. *Neoromicia* Roberts, Ann. Transv. Mus., 11: 245. Publication date: 14 September 1926 [Goto Description]. - Comments: Type species: *Eptesicus zuluensis* Roberts, 1924. - Etymology: From the Greek prefix "*νεο*" (nèo), meaning "new" and the feminine scientific Latin substantive *Romicia*, which in turn is a feminine scientific Latin substantive almost surely deriving from the Greek substantive "*ῥόμιξα*" (rhómiksa), corresponding to the masculine Latin substantive *rùmex* (genitive *rùmicis*), meaning "dock", a plant with spear-shaped leaves. *Neoromicia calcarata,* the type species of the genus, is really provided of a well-developed calcar, i.e. of a well-developed uropatagial spur (see Lanza *et al.*, 2015: 380). - ZooBank: 7173CFF6-F27B-44D7-948E-23FC40080224.
1930. *Pipistrellus:* Zammarano, Le colonie Italiane di diretto dominio. Fauna e caccia, 147. - Comments: In part. Not of Kaup, 1829 (see Monadjem *et al.*, 2020a: 1127).
1956. *Ephesicus:* Theodor, Parasitology, 46: 391. - Comments: used in combination with the species *tenuipinnis*, and therefore synonym of *Neoromicia*, not of *Eptesicus*. (Lapsus).
1987. *Nycterikaupius* Menu, Palaeovert., 17 (3): 108, pl 4, fig 1. Publication date: 15 November 1987 [Goto Description]. - Comments: In part. The species assigned to this genus by Menu (1987: 109) are currently (sensu Monadjem *et al.*, 2020a: 1140) included in the genera *Laephotis, Neoromicia, Pipistrellus* and *Pseudoromicia*.
1995. *Scabifer:* Peterson, Eger and Mitchell, Faune de Madagascar, Chiroptères, 84: 95. (Lapsus).
2000. *Pipestrellus:* Nwoha, Caxton-Martins and Baxter-Grillo, Folia Morphol., 59 (3): 154. Publication date: 6 July 2000. (Lapsus).
2003. *Neuromicia:* Avery, Avery and Colahan, Navors. nas. Mus., 19 (1): 8. Publication date: April 2003. (Lapsus).
2007. *Neromicia:* Schneider and Jorge, Ostrich, 78 (3): 656. (Lapsus).
2013. *Epseticus:* Bitty, Kadjo, Gonéndélé, Okon and Kouassi, Int. J. Biol. Chem. Sci., 7 (4): 1684. Publication date: August 2013. (Lapsus).
2013. *Necroromicia:* Fenton, Koedoe, 55 (1): 1140 (p3). Publication date: 19 March 2013. (Lapsus).
2015. *Neoromycia:* Thies and Lewis, Occ. Pap. Mus. Texas Tech Univ., 330: 7. Publication date: 10 February 2015. (Lapsus).

2020. *Neomoricia:* Motayo, Oluwasemowo and Akinduti, PeerJ, 8 (e10434): 7. Publication date: 26 November 2020. (Lapsus).
2020. *Neoremicia:* Lacroix, Vidal, Keita, Thaurignac, Esteban, De Nys, Diallo, Toure, Goumou, Soumah, Povogui, Koivogui, Monemou, Raulino, Nkuba, Foulongne, Delaporte, Ayouba and Peeters, Viruses, 12 (855): 2. Publication date: 5 August 2020. (Lapsus).
2020. *Neormicia:* Motayo, Oluwasemowo and Akinduti, PeerJ, 8 (e10434): 4. Publication date: 26 November 2020. (Lapsus).
2020. *Neoromicia cf. guineensisa:* Yu, Csorba, Huang, Li, Liu, Quan, Wang, Shi, Wu and Li, Zool. Res. (China), 42 (1): Suppl. Publication date: 18 December 2020. (Lapsus).
? *Neoromicia sp. IVK-2011*
? *Neoromicia sp.:*

Taxonomy:

Considered a subgenus of *Eptesicus* by Koopman (1993a: 201); considered a subgenus of *Pipistrellus* by Grubb *et al.* (1998: 85) and Hill and Harrison (1987: 248), but considered a valid genus by Volleth *et al.* (2001: 25), Simmons (2005). See also Riccucci and Lanza (2008) for a discussion on the gender of this genus name.

Helbig *et al.* (2010: 168) suggest that *Neoromicia* is actually a para- or polyphyletic group.

Without any further explication, Taylor (2019a: 282, 283) placed all *Neoromicia* species in the genus *Laephotis*, but in their revision of the East African pipistrellus-like bats, Monadjem *et al.* (2020a: 1114, 1127) recognized *Neoromicia* back as a valid genus, containing only *zuluensis* and allied species.

Currently (Simmons and Cirranello, 2023b) recognized pecies of the genus *Neoromicia*: ***anchietae*** (Seabra, 1900), ***bemainy*** (Goodman, Rakotondramanana, Ramasindrazana, Kearney, Monadjem, Schoeman, Taylor, Naughton and Appleton, 2015); ***guineensis*** (Bocage, 1889); ***hlandezi*** Taylor, Strydom, Richards, Markotter, Toussaint, Kearney, Cotterill, Howard, Weier, Keith, Neef, Mamba, Magagula and Monadjem, 2022; ***somalica*** (Thomas, 1901); ***zuluensis*** (Roberts, 1924).

Common Names:

Czech: banánoví netopýři. English: Neoromicia Pipistrelle Bats. Italian: Neoromìcie. Ukrainian: Неоромиція [= Neoromitsiya]

Palaeontological or archaeological records:

Avery (2007: 619) reported on the presence of *Neoromicia* sp. in Pleistocene deposits at Wonderwerk Cave, South Africa.

General description of external morphology:

Tragus: Monadjem *et al.* (2013c: 204) present a line drawing of the tragi of specimen DNSM 13225 (identified as *N.* sp. 1) from Mount Nimba, Liberia.

Detailed morphology:

Baculum

The shaft tip of the baculum was bulbous and lobed in all the *Neoromicia* species from Liberia examined (Monadjem *et al.*, 2013c: 197).

Echolocation:

Kofoky *et al.* (2009: 382) reported the calls potentially from *N. melckorum* and *N. matroka*, which had steep FM followed by a shallow QFM pulse at a low duty cycle.

Predators:

Goodman *et al.* (2015c: 78) found the remains of five *Pipistrellus/Neoromicia* sp. individuals in pellets of Bat Hawk *Macheiramphus alcinus* Bonaparte, 1850 in western central Madagascar.

Parasites:

DIPTERA

Nycteribiidae

Dick *et al.* (2023: 74) mentioned *Basilia (Basilia) robusta* Theodor, 1956 was found on bats belonging to this genus.

Viruses:

Circoviridae

Squirrel associated cyclovirus 1 was reported from a bat in the DRC by Vidovszky *et al.* (2023: Suppl.)

Coronaviridae

None of the 34 Kenyan *Neoromicia* sp. tested by Tao *et al.* (2017: Suppl.) was positive for CoV.

South African *Neoromicia* bats were infected by viruses of the subgenus *Merbecovirus* (Motayo *et al.*, 2020: 4)..

Geldenhuys *et al.* (2018: 5) investigated fecal, rectal and intestinal swaps of 58 *Neoromicia* (*N. capensis, N. zuluensis, N. nana* and *N.* cf. *helios*) specimens collected over an eight-year period (2007 - 2015) in northeastern RSA. In these, they found the following virus families: ssRNA viruses: *Orthomyxoviridae* (30.49 %), *Picornaviridae* (22.56 %), *Bunyaviridae* (10.98 %), *Coronaviridae* (9.15 %), *Virgaviridae* (2.44 %), *Caliciviridae* (2.44 %), *Tymoviridae* (2.44 %), *Flaviviridae* (1.83 %), *Rhabdoviridae* (1.22 %) *Solemoviridae* (0.61 %), and unclassified (15.9

%); ssDNA viruses: *Microviridae* (86 %), *Circoviridae* (8 %), *Parvoviridae* (6 %), *Inoviridae* (0.9 %), and *Anelloviridae* (0.05 %); dsDNA viruses: *Herpesviridae*(48 %), *Caudoviridae* (26.7 %), *Adenoviridae* (17 %), *Papillomaviridae* (2.7 %), *Ampullaviridae* (1.8 %), *Iridoviridae* (0.9 %), *Phycodnaviridae* (0.9 %), *Baculoviridae* (0.6 %), *Polydnaviridae* (0.6 %), *Nimaviridae* (0.3 %), and unclassified (0.3 %). One of the *Ciroviridae* (genus *Cyclovirus*) was found to be a new species: *Neoromicia*-associated cyclovirus 1 strain 19681/RSA (or NeoCycloV-1), for which the closest relative was retrieved from human stool (Geldenhuys *et al.*, 2018: 10). Furthermore, they (p. 13) reported the a novel *Neoromicia* picornavirus sequence (BatPicV/NeoC21877/RSA), which should be the first bat picornavirus from an insectivorous bat genus in Africa.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Ethiopia, Guinea, Kenya, Liberia.

Neoromicia aff. guineensis Bocage, 1889

2016. *Neoromicia sp. (aff. guineensis):* Kruskop, Benda, Vasenkov and Lavrenchenko, Lynx, 47: 62. (Name Combination).
? *Neoromicia cf. guineensisa DMR-2017* (Lapsus).

TAXONOMY:
Although very similar to *N. guineensis* morphologically, preliminary molecular genetic analyses by Kruskop *et al.* (2016: 62) indicated that a number of animals differed from other Ethiopian specimens belonging to *N. guineensis, N.* cf. *zuluensis* and *N. somalica*. Further comparisons with specimens from other areas from Africa will be required to assess the taxonomic status of these specimens.

2020. *Laephotis anchietae:* Simmons and Cirranello, BatNames.org.
2020. *Neoromicia anchietae:* Weier, Keith, Neef, Parker and Taylor, Diversity, 12 (188): 5. Publication date: 11 May 2020. (Name Combination, Current Combination).
? *Hypsugo cf. anchietae:*
? *Pipistrellus (Hypsugo) anchieta:* (Name Combination, Alternate Spelling).

TAXONOMY:

Figure 381. *Neoromicia anchietae* (ECJS-119/2009) caught in the Okavango, Botswana.

The oldest name for this species may be *bicolor*; see Koopman (1975: 404). Koopman (1994: 114) mentions this species as *P. bicolor* in the subgenus *Pipistrellus*. Incorrect original spelling as *anchieta*, corrected to *anchietae* by Seabra (1900b: 120).

Based on the morphology of the penis, Fasel *et al.* (2020: 1) suggest that *anchietae* should be placed in the genus *Neoromicia* rather than in *Hypsugo*.

Simmons and Cirranello (2020) transferred *anchietae* to the genus *Laephotis*, but Monadjem *et al.* (2020a: 1126) transferred it to *Neoromicia*.

COMMON NAMES:

Afrikaans: Anchieta-vlermuis. Czech: netopýr Anchietův. English: Anchieta's Pipistrelle, Anchieta's Bat, Miombo pipistrelle. French: Vespère d'Anchieta, Pipistrelle du Miombo, Pipistrelle d'Anchieta. German: Anchietas Zwergfledermaus, Anchietas Pipistrelle.

CONSERVATION STATUS:

Global Justification

Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, it occurs in a number of protected areas, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Jacobs *et al.*, 2008ap; IUCN, 2009; Monadjem *et al.*, 2017bf).

Assessment History

Global

2016: LC ver 3.1 (2001) [assessed as "*Pipistrellus anchietae*"] (Monadjem *et al.*, 2017bf). 2008: LC ver 3.1 (2001) [assessed as "*Pipistrellus anchietae*"] (Jacobs *et al.*, 2008ap; IUCN, 2009). 2004: LC ver 3.1 (2001) (Jacobs *et al.*, 2004aq; IUCN, 2004). 1996: VU [assessed as "*Pipistrellus anchietai*"] (Baillie and Groombridge, 1996).

Regional

South Africa: 2016: LC ver 3.1 (2001) (Monadjem *et al.*, 2016i). 2004: NT ver 3.1 (2001) [assessed as "*Pipistrellus anchietae*"] (Friedmann and Daly, 2004).

MAJOR THREATS:

There appear to be no major threats to this species, although further research is needed to confirm this (Jacobs *et al.*, 2008ap; IUCN, 2009; Monadjem *et al.*, 2017bf).

CONSERVATION ACTIONS:

Jacobs *et al.* (2008ap) [in IUCN (2009)] and Monadjem *et al.* (2017bf) report that it is present in a number of protected areas in Zimbabwe and South Africa. Further studies are needed into the distribution, natural history and possible threats to this species.

GENERAL DISTRIBUTION:

Neoromicia anchietae is largely a southern African species which formerly was considered to range from Angola in the west, through southern Democratic Republic of the Congo, and from here south into Zambia, Zimbabwe, and eastern South Africa. It could be more widespread in southern Africa than is currently understood (Skinner and Chimimba, 2005). However, as pointed out by Taylor *et al.* (2022) the Angolan population is genetically and morphologically distinct from the eastern population, which led Palmeirim *et al.* (2023: 313) to conclude that *Neoromicia anchietae* is an endemic (or possibly near-endemic) to the Angolan Central Escarpment. Eastwards, its range might extend to western Zambia.

The specimens previously reported from Madagascar are now attributed to *N. bemainty*.

The record from South Sudan (USNM 586793) seems odd and its identity doesn't seem to be confirmed by any recent review, but it currently (April 2024) is still mentioned as "*Hypsugo anchietae*" in the USNM online catalogue.

South of 8° S, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 987,832 km^2.

Native: Angola (Crawford-Cabral, 1989; Monadjem *et al.*, 2010d: 563; Taylor *et al.*, 2018b: 60); Botswana (Monadjem *et al.*, 2010d: 563); Congo (The Democratic Republic of the);

Eswatini (Monadjem *et al.*, 2010d: 563, Monadjem *et al.*, 2021: 5); Mozambique (Monadjem *et al.*, 2010d: 563); South Africa (Koopman, 1994: 114; Kearney and Taylor, 1997: 54; Monadjem *et al.*, 2007c as *H.* cf. *anchietae*; Monadjem *et al.*, 2010d: 563); Zambia (Ansell, 1973; Monadjem *et al.*, 2010d: 563); Zimbabwe (Monadjem *et al.*, 2010d: 563).

Presence uncertain: Namibia (Cotterill, 2004a: 261).

DETAILED MORPHOLOGY:
Penis
According to Fasel *et al.* (2020: 1394), the penises of "*Hypsugo anchietae*" and *Neoromicia zuluensis* are relatively similar, but the one from *anchietae* has longer hairs (more than 50 % of the diameter of the penis) immediately after the flexure.

Baculum
Hill and Harrison (1987) and Kearney *et al.* (2002).

FUNCTIONAL MORPHOLOGY:
Amador *et al.* (2019: Suppl.) [referring to Schoeman and Jacobs (2008)] mention a wing loading value of 6.8 Pa, aspect ratio 5.4 for a wingspan of 22 cm and a wing area of 87 cm^2 and a body mass of 6 g.

ECHOLOCATION:
Schoeman and Waddington (2011: 291) mention a peak frequency of 55.9 ± 0.3 kHz and a duration of 2.1 ± 0.1 ms for specimens from Durban, South Africa.

Weier *et al.* (2020: Suppl.) reported on 18 *Neoromicia anchietae* calls from the Okavango River Basin with the following characteristics: F_{max}: 60.37 ± 3.51 kHz, F_{min}: 52.48 ± 12.57 kHz, F_{knee}: 57.93 ± 0.59 kHz, F_{char}: 56.67 ± 1.14 kHz, slope: 13.75 ± 15.14 OPS, duration: 4.66 ± 1.75 ms.

125 calls of 8 bats were reported by Moir (2020: 29-30) and Moir *et al.* (2021a: 371) from southern KwaZulu-Natal and Eastern Cape (RSA): F_{max}: 87.09 ± 8.74 (74.02 - 92.60) kHz, F_{min}: 46.06 ± 1.26 (44.46 - 47.95) kHz, F_{char}: 46.63 ± 1.29 (44.83 - 48.38) kHz, F_{knee}: 50.5 ± 2.08 (46.88 - 52.85) kHz, and duration: 2.73 ± 0.32 (2.16 - 3.16) ms.

Taylor-Boyd *et al.* (2025: 116) report the following values for 16 calls from Zambian bats: Interpulse interval: 82.0 ± 20.5 (59.2 - 31.0) ms; F_{max}: 48.8 ± 3.1 (44.6 - 56.2) kHz; Start slope: -22.6 ± 3.3 (-16.3 - -27.6) kHz/ms; End slope: -5.7 ± 2.3 (-0.9 - -9.5) kHz/ms; Ledge duration: 0.5 ± 0.1 (0.4 - 0.6) ms.

MOLECULAR BIOLOGY:
Karyotypic
Rautenbach *et al.* (1993) and Kearney *et al.* (2002) both reported 2*n* = 26, FN = 32, BA = 8, a submetacentric X chromosome, and an acrocentric Y chromosome, for specimens from South Africa.

HABITAT:
In southern Africa, the species primarily occurs in Savanna (85 %) and Coastal mosaic (10 %) habitats (Cooper-Bohannon *et al.*, 2016: Table S2).

DIET:
For these bats, Cabrera-Campos *et al.* (2021: Suppl.) estimated the food transit time to be about 86 minutes, and the digestibility rate about 78.8 %.

POPULATION:
Structure and Density
It is a locally common species in southern Africa. Very few specimens are currently known from Madagascar (Jacobs *et al.*, 2008ap; IUCN, 2009; Monadjem *et al.*, 2017bf).

Trend
2016: Unknown (Monadjem *et al.*, 2017bf). 2008: Unknown (Jacobs *et al.*, 2008ap; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
Garbino *et al.* (2021: Suppl.) mention that this species has more than one young per litter.

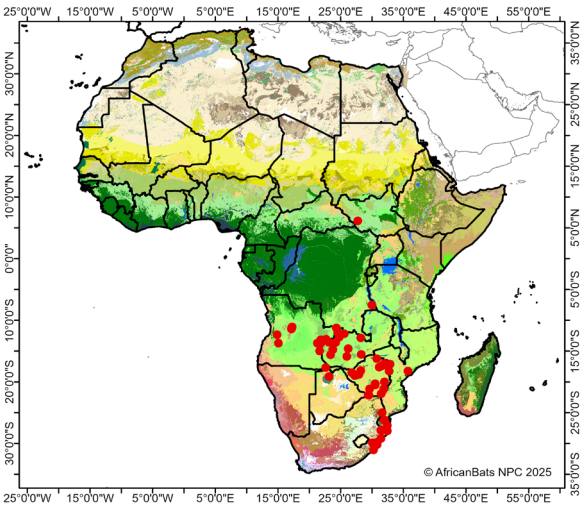

Figure 382. Distribution of *Neoromicia anchietae*.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Angola, Botswana, Congo (Democratic Republic of the), Eswatini, Ethiopia, Mozambique, South Africa, South Sudan, Zambia, Zimbabwe.

Neoromicia bemainty (Goodman, Rakotondramanana, Ramasindrazana, Kearney, Monadjem, Schoeman, Taylor, Naughton and Appleton, 2015)

*2015. *Hypsugo bemainty* Goodman, Rakotondramanana, Ramasindrazana, Kearney, Monadjem, Schoeman, Taylor, Naughton and Appleton, Zool. J. Linn. Soc., 173 (4): 992, 1008, figs 9 - 12. Type locality: Madagascar: Province de Toliara: 60 km N Morondava, along the Kirindy River: Kirindy Forest (CNFEREF) [20°4'29.1"S, 44°40'14.4"E, 45 m].
2020. *Neoromicia bemainty:* Monadjem, Demos, Dalton, Webala, Musila, Kerbis Peterhans and Patterson, Zool. J. Linn. Soc., 191 (4): 1140. Publication date: 10 September 2020. (Name Combination, Current Combination).
? *Hypsugo anchietae:* (Name Combination).

TAXONOMY:
Originally included in the genus *Hypsugo* but transferred to *Laephotis* by Simmons and Cirranello (2020). However, based on cyt *b* sequence analyses, Monadjem *et al.* (2020a: 1120, 1140) transferred it again to *Neoromicia*.

COMMON NAMES:
English: Kirindy serotine, Kirindy Pipistrelle, Dark Madagascar pipistrelle. French: Pipistrelle sombre de Madagascar. German: Kirindy-Zwergfledermaus.

CONSERVATION STATUS:
Global Justification
This species is known from several different portions of western dry deciduous forests of Madagascar, where, based on frequency of capture, it appears to be relatively common (Goodman *et al.*, 2015b). It has been found within and at the edge of several protected areas. This species is known from relatively intact dry deciduous forest, as well in degraded habitats, in both cases often netted over water pools, and it is presumed not to be strictly forest-dependent. As it is difficult to separate in the hand from other sympatrically occurring vesper bats known from western Madagascar, it is presumed to have a broader geographic distribution than currently documented (Goodman, 2017a).

Assessment History
Global
2016: LC ver 3.1 (2001) (Goodman, 2017a).

Regional
Endemic to Madagascar see global status.

MAJOR THREATS:
Goodman (2017a) report that the forested habitats in the region of Madagascar are under considerable pressure associated with logging for wood products and clearing for swidden (slash-and-burn) agriculture (Zinner *et al.*, 2014). It is presumed that these habitat modifications have an impact on this species, but as it is known to not be strictly forest dependent, it is difficult to assess if these pressures form a major threat.

CONSERVATION ACTIONS:
Goodman (2017a) report that this species is known to occur in the general vicinity of the Kirindy Forest north of Morondava, which is part of the Menabe Antimena (Kirindy CNFEREF) protected area; the Zombitse-Vohibasia National Park; the Kirindy Mitea National Park; and Amoron'i Onilahy (Sept Lacs) protected area (Goodman *et al.*, 2015b; Goodman, 2017a).

GENERAL DISTRIBUTION:
This species is recorded from Madagascar, where it was collected from four localities in the centre-west and south-west (Kirindy Forest [CFPF]; Sept Lacs; Parc National de Kirindy-Mitea; Parc National de Zombitse-Vohibasia), where it occurs in dry and degraded forests (Bates *et al.*, 2006: 319; Garbutt, 2022: 100).

Native: Madagascar (Bates *et al.*, 2006: 319, as *Hypsugo anchietae*).

HABITAT:
Ravelomanantsoa *et al.* (2019: 111) captured this bat in a marshy zone near Ambereny.

DIET:
Rakotondramanana *et al.* (2015: 77) reported the following volume percentages present in the diet of *N. bemainty*: Coleoptera: 14.1 ± 12.56; Hymenoptera: 12.0 ± 14.60; Lepidoptera: 18.6 ± 20.27; Isoptera: 52.0 ± 33.78; Homoptera: 2.2 ± 3.59; Arachnida: 0.5 ± 1.73; Orthoptera: 0.5 ± 1.73. Expressed as frequency percentages, the values are: Coleoptera: 61.7 ± 37.62; Hymenoptera: 53.3 ± 47.74; Lepidoptera: 58.3 ± 48.59; Isoptera: 80.0 ± 39.08; Homoptera: 13.3 ± 23.09; Arachnida: 6.7 ± 23.09; Orthoptera: 6.7 ± 23.09.

PREDATORS:
Razakaratrimo *et al.* (2019: 107) mention the bat hawk (*Macheiramphus alcinus anderssoni* (Gurney, 1866)) as predator.

POPULATION:
Population not known but presumably substantial as it has been captured at several different geographically separate sites and in degraded

habitats that have been modified by human actions (Goodman, 2017a).

Trend:- 2016: Unknown (Goodman, 2017a).

DISTRIBUTION BASED ON VOUCHER SPECIMENS: Madagascar.

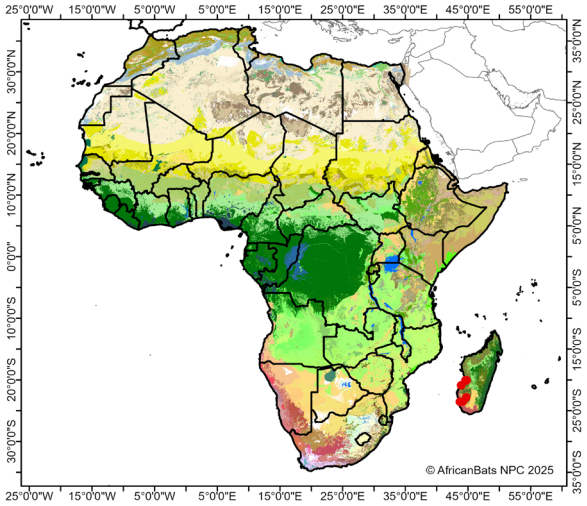

Figure 383. Distribution of *Neoromicia bemainty*.

Neoromicia guineensis (Bocage, 1889)

*1889. *Vesperus guineensis* Bocage, J. Sci. mat. phys. nat., ser 2, 1 (1): 6. Publication date: March 1889. Type locality: Guinea-Bissau: Bissau (island) [11 52 N 15 39 W]. [Goto Description]. - Comments: Bocage (1889a: 7) mentions 2 ♀♀; sent from Bissau in 1879 by Mr. Rodrigo da Costa. - Etymology: From the feminine scientific Latin *guineènsis*, meaning "inhabitnig Guinea", referring to the provenance of the type specimen (Guinea-Bissau) (see Lanza *et al.*, 2015: 403).

1897. *Vesperugo (Vesperus) guineensis:* Trouessart, Catalogus Mammalium tam viventium quam fossilium, fasc I: 110. (Name Combination).

1916. *Eptesicus rectitragus* Wettstein, Anz. kais. Akad. Wiss., Wien, 53: 191. Publication date: 1916. Type locality: Sudan: S Kordofan, N edge of Nuba Mountains: Dilling [12 02 N 29 39 E, 660 m]. [Goto Description]. Holotype: NMW 8411: juv ♂. Collected by: Otto Ritter von Westersheim Wettstein; collection date: 20 March 1914; original number: AM 96/2. - Comments: Wettstein (1916: 189) mentions Prof. Dr. Franz Werner as collector.

? *Eptesicus guineensis rectitragus:* (Name Combination).

? *Neoromicia guineensis guineensis:* (Name Combination).

? *Neoromicia guineensis rectitragus:* (Name Combination).

TAXONOMY:
This species is called *pusillus* by Hayman and Hill (1971); but see Koopman (1975: 406, 407). Mentioned in the genus *Pipistrellus* by Koopman (1994: 117).

COMMON NAMES:
Czech: netopýr savanový. English: Guinean Pipistrelle Bat, Tiny Serotine, Guinea Serotine. French: Sérotine de Guinée, Sérotine minuscule, Pipistrelle de Guinée. German: Guinea-Zwergfledermaus, Guinea-Pipistrelle. Italian: Pipistrèllo guineàno.

CONSERVATION STATUS:
Global Justification
Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Fahr, 2008l; IUCN, 2009; Monadjem and Fahr, 2017e).

Assessment History
Global
2016: LC ver 3.1 (2001) [assessed as *Neoromicia guineensis*] (Monadjem and Fahr, 2017e). 2008: LC ver 3.1 (2001) [assessed as "*Pipistrellus guineensis*"] (Fahr, 2008l; Bocage, 1889c). 2004: LC ver 3.1 (2001) (Fahr, 2004g; IUCN, 2004). 1996: LR/nt (Baillie and Groombridge, 1996).

Regional
None known.

MAJOR THREATS:
There appear to be no major threats to this species as a whole (Fahr, 2008l; IUCN, 2009; Monadjem and Fahr, 2017e).

CONSERVATION ACTIONS:
Fahr (2008l) [in IUCN (2009)] and Monadjem and Fahr (2017e) reports that there appear to be no direct conservation measures in place. It is not known if the species is present in any protected areas.

GENERAL DISTRIBUTION:
Neoromicia guineensis is widely distributed in West and Central Africa, ranging into East Africa. Western distribution ranges from Senegal and Gambia to Ghana, Burkina Faso, and Benin. Recorded as far east as the border between Ethiopia and Somalia, and in Yemen. The southernmost records are from Congo and the DRC (close to the border areas with Angola).

Specimens reported from Tanzania might pertain to *N. somalica*, see Koopman (1994: 117)).

The specimen from Port Said (Egypt - ZMB 54952) was collected by Gustav Schrader. However (see appendix 4d), Schrader was both a collector and natural history dealer based in Port Said, who collected in Egypt, but also in Asia Minor, Ethiopia and Somaliland. Chances are that this specimen was rather collected in Ethiopia, which would fit the general distribution area.

Native: Benin (Capo-Chichi *et al.*, 2004: 163); Burkina Faso (Kock *et al.*, 2002b: 89; Kangoyé *et al.*, 2015a: 620); Cameroon; Central African Republic; Chad (Kock *et al.*, 2002b: 89); Congo (The Democratic Republic of the); Côte d'Ivoire; Ethiopia; Gambia (Kock *et al.*, 2002b: 89); Ghana; Guinea; Guinea-Bissau (Bocage, 1889a; Seabra, 1900a; Monard, 1939; Veiga-Ferreira, 1949;; Rainho and Ranco, 2001; Kock *et al.*, 2002b: 89); Liberia (Monadjem and Fahr, 2007: 47); Nigeria; Senegal; Sudan; Togo; Uganda; Yemen (Entwistle and Corp, 1997a: 40).

Bates *et al.* (2013: 339) rejected the presence of *N. guineensis* in the Republic of Congo as Van Cakenberghe and Happold (2013k: 625) only mark a locality on the map without providing further data.

DETAILED MORPHOLOGY:
Baculum
Hill and Harrison (1987) and Benda *et al.* (2011b: 41).

Brain
Amrein *et al.* (2007) from specimens collected from Bénin reported that proliferating cells, detected with Ki-67 and MCM2, in the subgranular layer of the dentate gyrus was found to be absent. Amrein *et al.* (2007) also reported moderate to ample proliferating cells (Ki-67 positive cells) and migrating young neurons (DCX positive cells) in the rostral migratory stream.

SEXUAL DIMORPHISM:
In Burkina Faso, Kangoyé *et al.* (2015a: 620) found that females have higher average values than males for both body (except Ear and 3ph2) and cranial measurements.

ECHOLOCATION:
Roemer *et al.* (2021: Suppl.) categorized the bat's call as a FMd-QCF (Frequency modulation downward - quasi-constant frequency) sonotype.

MOLECULAR BIOLOGY:
Karyotype:
Rainho *et al.* (2023: 40) reported 2*n*=26, FNa=46 and 12 pairs of autosomes (10 large-to-medium-sized metacentric pairs, one small metacentric and one small acrocentric pair). The X chromosome is a medium-sized subtelocentric.

DIET:
For these bats, Cabrera-Campos *et al.* (2021: Suppl.) estimated the food transit time to be about 62 minutes, and the digestibility rate about 82.3 %.

POPULATION:
Structure and Density
This species is relatively common (Fahr, 2008l; IUCN, 2009; Monadjem and Fahr, 2017e).

Trend
2016: Unknown (Monadjem and Fahr, 2017e). 2008: Unknown (Fahr, 2008l; IUCN, 2009).

PARASITES:
HEMIPTERA
Cimicidae

Szentiványi *et al.* (2022: 12) reported *Aphrania recta* from Senegales *Neoromicia* cf. *guineensis*.

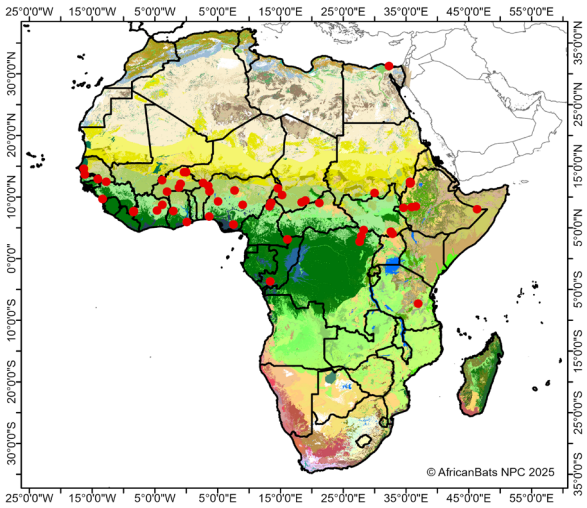

Figure 384. Distribution of *Neoromicia guineensis*.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Benin, Burkina Faso, Cameroon, Central African Republic, Chad, Congo, Congo (Democratic Republic of the), Côte d'Ivoire, Egypt, Ethiopia, Ghana, Guinea, Kenya, Nigeria, Senegal, South Sudan, Sudan, Tanzania, The Gambia.

Neoromicia hlandzeni Taylor, Strydom, Richards, Markotter, Toussaint, Kearney, Cotterill, Howard, Weier, Keith, Neef, Mamba, Magagula and Monadjem, 2022

*2022. *Neoromicia hlandzeni* Taylor, Strydom, Richards, Markotter, Toussaint, Kearney, Cotterill, Howard, Weier, Keith, Neef, Mamba, Magagula and Monadjem, Zool. J. Linn. Soc., 196 (4): 1578, 1583, figs 5-7. Publication date: 7 October 2022. Type locality: Eswatini: Siweni Riparian Site [26 10 48 S 032 02 55 E, 110 m]. Holotype: DNSM 8423: ad ♂, skull and alcoholic. Collection date: 5 September 2005; original number: AM-2066. Paratype: DNSM 8422: ad ♂, skull and alcoholic. Collection date: 6 September 2005. Paratype: TM 47718: ad ♂, skull and alcoholic. Collected by: Dr. Ara Monadjem; collection date: 26 September 2005; original number: AM-2073. - Etymology: eHlandzeni means the 'lowveld' or wilderness in the SiSwati language indicating the specific lowveld (low-lying savanna) habitat of the new species Taylor *et al.* (2022: 1584). (Current Combination).

COMMON NAMES:
English: Lowveld serotine

CONSERVATION STATUS:
Global Justification
Currently not been globally assessed hence no justification.

Assessment History
Global
No assessment known, hence no history of assessment to report.

Regional
None known.

GENERAL DISTRIBUTION:
Native: Eswatini, South Africa, Zimbabwe (Taylor *et al.* (2022: 1586).

ECHOLOCATION:
Taylor *et al.* (2022: 1586) mention the following parameters: F_{max}: 87.09 ± 8.74 kHz, F_{min}: 46.06 ± 1.26 kHz, F_{char}: 46.63 ± 1.29 kHz, F_{knee}: 50.5 ± 2.08 kHz and duration: 2.73 ± 0.32 ms.

MOLECULAR BIOLOGY:
Karyotype
Volleth *et al.* (2023c: 47, 49) mention 2*n* = 26, FNa = 32. The X chromosome is metacentric or submetacentric and the Y chromosome is an acrocentric.

HABITAT:
This species is apparently associated with coastal and scarp forests (Eastern Cape and KwaZulu-Natal, RSA), lowveld savannas (Eswatini) and well wooded riparian areas (Zimbabwe) (Taylor *et al.*, 2022: 1586).

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Eswatini, South Africa.

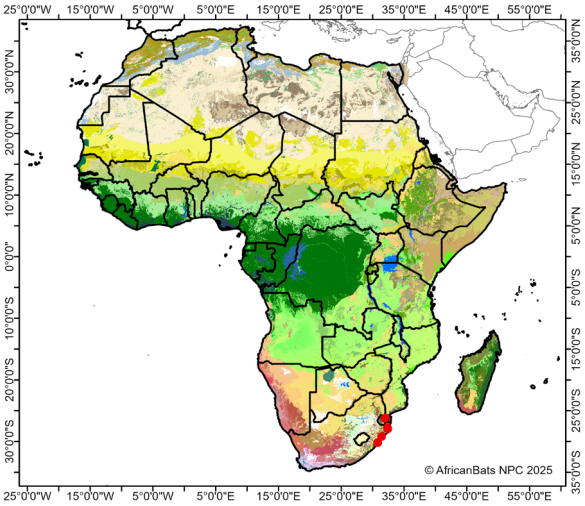

Figure 385. Distribution of *Neoromicia hlandzeni*.

Neoromicia humbloti (A. Milne-Edwards, 1881)

*1881. *Vesperus Humbloti* A. Milne-Edwards, C. R. séances Acad. Sci., Paris, 91: 1035. Publication date: 1881. Type locality: Madagascar: "Madagascar". [Goto Description]. Syntype: MNHN ZM-MO-1986-1074: juv, skull and alcoholic. 1 ad ♀, 2 ad ♂♂, 1 ad? ♂, 2 imm ♀♀, 3 imm ♂♂. Syntype: MNHN ZM-MO-1986-1075: juv, skull and alcoholic. Syntype: MNHN ZM-MO-1986-1076: juv, alcoholic (skull not removed). Syntype: MNHN ZM-MO-1986-1077. Syntype: MNHN ZM-MO-1986-1078. Syntype: MNHN ZM-MO-1986-1079. Syntype: MNHN ZM-MO-1986-1080. Syntype: MNHN ZM-MO-1986-1081. Syntype: MNHN ZM-MO-1986-1082. - Comments: The label on the type specimen mentions: "between Foulepoint and Lake Alaoutr".

1897. *Vesperugo (Vesperus) humbloti:* Trouessart, Catalogus Mammalium tam viventium quam fossilium, fasc I: 110. (Name Combination).

1939. *Eptesicus humbloti:* G.M. Allen, Bull. Mus. comp. Zool., 83: 85. (Name Combination).

1994. *P[ipistrellus (Neoromicia] s[omalicus] humbloti:* Koopman, in: Niethammer, Schliemann and Starck, Handbook of Zoology, volume II (Mammalia) Chiroptera, (60) 117. (Name Combination).

2006. *E[ptesicus] humblotii:* Hoofer, Van den Bussche and Horáček, J. Mamm., 87 (5): 991. Publication date: October 2006. (Lapsus).

2006. *Neoromicia humbloti:* Van Cakenberghe, Kearney and Seamark, African Chiroptera Project, Pretoria, 135. (Name Combination).

2012. *Vespertilio humbloti:* Goodman, Taylor, Ratrimomanarivo and Hoofer, Zootaxa, 25: 25. (Name Combination).

TAXONOMY:

The status of *humbloti* cannot be validated (see Peterson *et al.*, 1995: 104). It is sometimes mentioned as synonym of *somalicus* Thomas, 1901. However, if this is correctly assigned to that form, then *humbloti* A. Milne-Edwards, 1881 should be the valid name for what is now known as *Laephotis somalicus*.

We consider *humbloti* to be an island species, allied to *L. somalicus* Thomas, 1901, but differing from it on specific level. The relation with *L. malagasyensis* Peterson, Eger and Mitchell, 1975 still needs to be evaluated.

Goodman *et al.* (2015a: 1004-1005) studied the type series of *Vesperus humbloti* and concluded that these specimens should be assigned to *Pipistrellus hesperidus* (Temminck, 1840), pending further confirmation based on bacular structure or molecular genetics.

? *Neoromicia somalicus vansoni:* (Name Combination, Alternate Spelling).

TAXONOMY:

Koopman (1993a: 203) included *zuluensis*; see Koopman (1975: 404, 405), but see Peterson *et al.* (1995), Simmons (2005). Mentioned in the genus *Pipistrellus* by Koopman (1994: 117). The subspecific allocations of West African and Tanzanian populations are uncertain (Koopman, 1994: 117).

Riccucci and Lanza (2008) indicated that the genus *Neoromicia* is feminine, therefore the ending of the species name *somalicus* must be *somalica*.

Helbig *et al.* (2010: 168) suggest transferring *somalica* to the genus *Laephotis*. However, this was rejected by Monadjem *et al.* (2020a: 1120, 1140).

COMMON NAMES:

Afrikaans: Somali-dakvlermuis. Chinese: 索马里伏翼. Czech: netopýr somálský. English: Somali Serotine, Somali Pipistrelle Bat, Somalian Pipistrelle Bat, Somali Serotine Bat. French: Sérotine de Somalie, Pipistrelle de Somalie. German: Somalia-Zwergfledermaus, Somalia-Pipistrelle. Italian: Pipistrèllo sòmalo.

CONSERVATION STATUS:

Global Justification

Although this species is known mainly from patchy records from a large area, it is listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, tolerance of a broad range of habitats, presumed large overall population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Jacobs, 2008g; IUCN, 2009; Monadjem and Jacobs, 2017d).

Assessment History

Global

2016: LC ver 3.1 (2001) [assessed as *Neoromicia somalica*] (Monadjem and Jacobs, 2017d). 2008: LC ver 3.1 (2001) [assessed as "*Pipistrellus somalicus*"] (Jacobs, 2008g; IUCN, 2009). 2004: LC ver 3.1 (2001) [assessed as "*Neoromicia somalicus*"] (Jacobs, 2004c; IUCN, 2004). 1996: LR/lc [assessed as "*Eptesicus somalicus*"] (Baillie and Groombridge, 1996).

Regional

None known.

MAJOR THREATS:

There appear to be no major threats to this species as a whole (Jacobs, 2008g; IUCN, 2009; Monadjem and Jacobs, 2017d).

CONSERVATION ACTIONS:

Jacobs (2008g) [in IUCN (2009)] and Monadjem and Jacobs (2017d) report that there appear to be no direct conservation measures in place. It is not known if the species is present in any protected area, although it seems likely to occur in some East African parks. Further studies are needed into the taxonomy, distribution, natural history and threats to this species.

GENERAL DISTRIBUTION:

Neoromicia somalica has been recorded over much of West, Central and East Africa. It ranges from Guinea Bissau in the west, to Sudan, Eritrea and Somalia in the east, being found as far south as Tanzania and southern Democratic Republic of the Congo adjacent to the border with northern Angola, Zambia, and Zimbabwe.

Happold and Happold (1997b: 825) record *N. somalica* in Malawi, with reservations.

Specimens from southern Africa might possibly represent *Neoromicia zuluensis*, since the distinction between the two species (*zuluensis* and *somalica*) has not been made throughout the literature.

Earlier records from Madagascar are now assigned to *Laephotis malagasyensis*.

Native: Benin; Botswana; Burkina Faso (Kangoyé *et al.*, 2015a: 621); Cameroon; Central African Republic; Chad; Congo (The Democratic Republic of the); Côte d'Ivoire; Eritrea; Ethiopia (Lavrenchenko *et al.*, 2004b: 147); Ghana; Guinea (Decher *et al.*, 2016: 273); Guinea-Bissau (Veiga-Ferreira, 1949; Lopes and Crawford-Cabral, 1992; Koopman, 1993a; Rainho and Ranco, 2001:64); Kenya; Liberia; Malawi (Happold and Happold, 1997b: 825); Namibia;

Nigeria; Rwanda; Senegal; Sierra Leone; Somalia; Sudan; Tanzania; Togo; Uganda (Kityo and Kerbis, 1996: 62); Zambia (Benda *et al.*, 2022: 292); Zimbabwe (Cotterill, 2004a: 261).

Bates *et al.* (2013: 339) reject the presence of *N. somalica* in the Republic of Congo as Van Cakenberghe and Happold (2013q: 654) only marked a locality on their map, but did not provide further details.

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Tragus: Monadjem *et al.* (2013c: 204) line drawing of tragi of specimen DNSM 12612 from Mount Nimba, Liberia.

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:

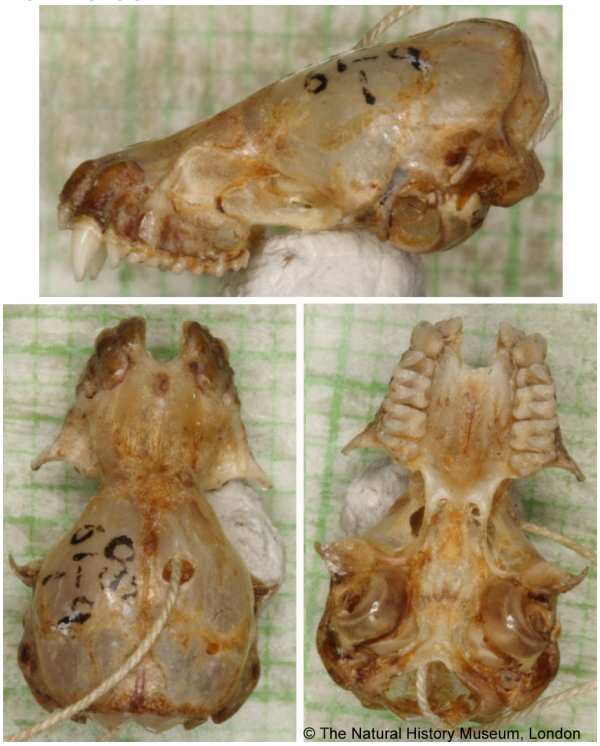

Figure 387. Clockwise from top lateral, ventral and dorsal skull images of NHMUK 1898.6.9.1, holotype of *Vespertilio minutus somalicus* Thomas, 1901.

DETAILED MORPHOLOGY:
Baculum
Hill and Harrison (1987).

ECHOLOCATION:
Roemer *et al.* (2021: Suppl.) categorized the bat's call as a FMd-QCF (Frequency modulation downward - quasi-constant frequency) sonotype.

MOLECULAR BIOLOGY:
Karyotype
McBee *et al.* (1987) reported 2*n* = 26, FN = 48, BA = 24, a subtelocentric X chromosome, and an acrocentric Y chromosome.

From Senegal, Koubínová *et al.* (2013: 3) report the following karyotype for 13 ♂♂ and 7 ♀♀: 2*n*: 28, FNa = 50, FN = 54, X = metacentric, Y = submetacentric. There is one additional pair of acrocentric autosomes as compared to specimens from Cameroon. Koubínová *et al.* (2013: 10) assign these Senegalese specimens to "*Neoromicia* cf. *somalica*".

Genetics
See Hoofer and Van Den Bussche (2003) for the results of a specimen from Kenya.

HABITAT:
Monadjem *et al.* (2016y: 370) recorded this species from an urban environment in the Mount Nimba area, whereas it is otherwise known from savanna areas.

DIET:
Cabrera-Campos *et al.* (2021: Suppl.) estimated the food transit time for these bats to be about 51 minutes, and the digestibility rate about 84.5 %.

POPULATION:
Structure and Density
Little information is available on the population abundance or size of this species. It may be locally rare, or at least rarely recorded (Jacobs, 2008g; IUCN, 2009; Monadjem and Jacobs, 2017d).

Trend
2016: Unknown (Monadjem and Jacobs, 2017d).
2008: Unknown (Jacobs, 2008g; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
The litter size of this species is more than one (polytocy, see Garbino *et al.*, 2021: Suppl.)

PARASITES:
PROTOZOA
Kassahun *et al.* (2015: 168) examined 6 Ethiopian specimens and found two of them (from Aba-Roba) to be infected by *Leishmania* parasites (see also Azami-Conesa *et al.*, 2021: Suppl.; de Souza *et al.*, 2023: 5).

INSECTA
Siphonaptera
Hastriter (2016: 16) reported *Lagaropsylla consularis* Smit, 1957 from a *N. somalica* specimen from Maji Moto, Kenya.

VIRUSES:
Coronaviridae
Lane *et al.* (2022: 221) found Eidolon bat coronavirus in *Neoromicia* cf. *somalica* specimens from Ethiopia.

Rhabdoviridae

Stuchin *et al.* (2018: 345) referred to reports of this species being infected by Rabies lyssavirus.

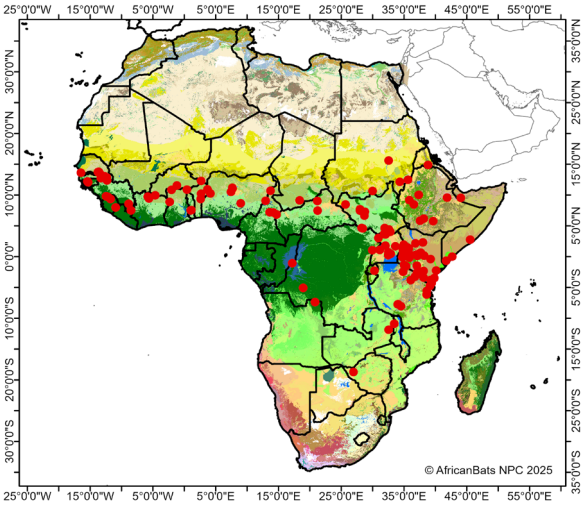

Figure 388. Distribution of *Neoromicia somalica*.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Angola, Benin, Burkina Faso, Cameroon, Central African Republic, Chad, Congo (Democratic Republic of the), Côte d'Ivoire, Eritrea, Eswatini, Ethiopia, Ghana, Guinea, Guinea-Bissau, Kenya, Liberia, Malawi, Nigeria, Rwanda, Senegal, Sierra Leone, Somalia, South Sudan, Sudan, Tanzania, Togo, Uganda, Zambia, Zimbabwe.

Neoromicia zuluensis (Roberts, 1924)

*1924. *Eptesicus zuluensis* Roberts, Ann. Transv. Mus., 10: 60, text-fig 1. Publication date: 31 January 1924. Type locality: South Africa: KwaZulu-Natal: White Umfolosi Game Reserve [28 19 S 31 50 E]. [Goto Description]. Holotype: TM 3024: ad ♀, skin and skull. Collected by: Austin Roberts; collection date: 29 June 1922; original number: 14. [Second label has G.M. Allen as collector]; note: shot at dusk.

1926. *[Neoromicia] zuluensis:* Roberts, Ann. Transv. Mus., 11: 245. (Name Combination).

1932. *Neoromicia vansoni* Roberts, Ann. Transv. Mus., 15 (1): 15. Publication date: 1 October 1932. Type locality: Botswana: Zweizwe Waterhole [18 36 00 S 24 22 00 E]. [Goto Description]. Holotype: TM 6553: ad ♀, skin and skull. Collected by: The Vernay-Lang Kalahari Expedition 1930; collection date: 7 July [June on label] 1930; original number: 882.

1934. *Neoromicia pusilla vansoni:* Shortridge, Mammals of South West Africa, 59. (Name Combination).

1939. *Eptesicus vansoni:* G.M. Allen, Bull. Mus. comp. Zool., 83: 92.

1951. *Neoromicia zuluensis vansoni:* Roberts, Mammals of South Africa, 85. (Name Combination).

1951. *Neoromicia zuluensis zuluensis:* Roberts, Mammals of South Africa, 84. (Name Combination).

1953. *Eptesicus (Eptesicus) zuluensis vansoni:* Ellerman, Morrison-Scott and Hayman, Southern African mammals 1758 to 1951, 77. (Name Combination).

1953. *Eptesicus (Eptesicus) zuluensis zuluensis:* Ellerman, Morrison-Scott and Hayman, Southern African mammals 1758 to 1951, 77. (Name Combination).

1953. *Eptesicus (Eptesicus) zuluensis:* Ellerman, Morrison-Scott and Hayman, Southern African mammals 1758 to 1951, 77. (Name Combination).

1962. *[Eptesicus zuluensis] zuluensis:* Meester, Ann. Transv. Mus., 24 (2/3): 242. (Name Combination).

1970. *Eptesicus zuluensis vansoni:* Roer, Bijdr. Dierk., 40 (1): 71. (Name Combination).

1978. *Eptesicus somalicus zuluensis:* Ansell, Mammals of Zambia, 25. (Name Combination).

1984. *Eptesicus (Eptesicus) somalicus zuluensis:* Anciaux de Faveaux, Ann. Kon. Mus. Mid. Afr., Zool. Wetensch., 244. (Name Combination).

1987. *Pipistrellus (Neoromicia) zuluensis:* Hill and Harrison, Bull. Br. Mus. (nat. Hist.) Zool., 52 (7): 282. (Name Combination).

1988. *P[ipistrellus] zuluensis:* Thorn, Mammalia, 52 (2): ???. (Name Combination).

1992. *Eptesicus zulensis:* Freitas, Bogo and Christoff, Z. Säugetierk., 57: 331. (Lapsus).

1994. *P[ipistrellus (Neoromicia)] s[omalicus] zuluensis:* Koopman, in: Niethammer, Schliemann and Starck, Handbook of Zoology, volume II (Mammalia) Chiroptera, (60) 117. (Name Combination).

2001. *Neoromicia zuluensis:* Volleth, Bronner, Göpfert, Heller, von Helversen and Yong, Chromosome Res., 9 (1): 44. (Name Combination, Current Combination).

2017. *Neoromicia zuluensisin:* Han, Wen, Zhao, Liu, Luo, Zhou, Qin, Zhu, Liu, Qi, Li, Yu and Yu, Zoonoses Public Health, 64 (5): 643. Publication date: 1 April 2017. (Lapsus).

2019. *L[aephotis] zuluensis:* M. Taylor, Bats: An illustrated guide to all species, 283. Publication date: 11 April 2019. (Name Combination).

2019. *Laephotis zuluensis:* M. Taylor, Bats: An illustrated guide to all species, 284. Publication date: 11 April 2019. (Name Combination).

2020. *Neromicia zuluensis:* Monadjem, Richards, Decher, Hutterer, Mamba, Guyton, Naskrecki, Markotter, Wipfler, Kropff and Dalton, Zool. J. Linn. Soc., 121 (2): Suppl(for 2021). Publication date: 4 September 2020. (Lapsus).

TAXONOMY:

Figure 389. A female *Neoromicia zuluensis* (TM 48097) caught at Lapalala Wilderness Area, Limpopo Province, South Africa.

Bronner *et al.* (2003) state that although Ellerman *et al.* (1953) and Hayman and Hill (1971) recognised "*Eptesicus (= Neoromicia) zuluensis*" as a distinct species, Koopman (1975, 1982, 1993a), Meester *et al.* (1986) and Corbet and Hill (1992) treated it as a subspecies of "*Eptesicus* (= *Pipistrellus*) *somalicus*". Rautenbach *et al.* (1993) confirmed its distinctness from the latter on the grounds of interspecific chromosomal differences.

As a separate species by many authors, e.g., Volleth *et al.* (2001: 44), who assigned it to the genus *Neoromicia*.

Simmons and Cirranello (2020) included this species in the genus *Laephotis*, but this was rejected by Monadjem *et al.* (2020a: 1126, 1140) based on analyses of cyt *b* sequences.

COMMON NAMES:

Afrikaans: Aalwyndakvlermuis, Aalwynvlermuis. Chinese: 祖鲁伏翼. Czech: netopýr zuluský. English: Zulu Pipistrelle Bat, Aloe Bat, Aloe Serotine, Aloe Serotine Bat, Zulu Serotine Bat. French: Sérotine des aloes, Pipistrelle zouloue. German: Zulu-Zwergfledermaus, Zulu-Pipistrelle.

ETYMOLOGY OF COMMON NAME:

Roberts (1924) collected the original specimen at his camp and records in his description of the species that it was the Cape serotine bat, (currently *Laephotis capensis*), that he found in an aloe. He used the name aloe bat and it has remained associated with *N. zuluensis* (Taylor, 2005).

CONSERVATION STATUS:

Global Justification

Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Jacobs and Cotterill, 2008b; IUCN, 2009; Monadjem *et al.*, 2017ad).

Assessment History

Global

2016: LC ver 3.1 (2001) [assessed as *Neoromicia zuluensis*] (Monadjem *et al.*, 2017ad). 2008: LC ver 3.1 (2001) [assessed as "*Pipistrellus zuluensis*"] (Jacobs and Cotterill, 2008b; IUCN, 2009). 2004: LC ver 3.1 (2001) (Jacobs and Cotterill, 2004b; IUCN, 2004). 2000: LR/nt [assessed as "*Eptesicus zuluensis*"] (Hilton-Taylor, 2000).

Regional

South Africa: 2016: LC ver 3.1 (2001) (Monadjem *et al.*, 2016n). 2004: LC ver 3.1 (2001) (Friedmann and Daly, 2004). 1986: Indeterminate (Smithers, 1986).

MAJOR THREATS:

There appear to be no major threats to this species as a whole (Jacobs and Cotterill, 2008b; IUCN, 2009; Monadjem *et al.*, 2017ad).

CONSERVATION ACTIONS:

Jacobs and Cotterill (2008b) [in IUCN (2009)] and Monadjem *et al.* (2017ad) report that it seems probable that this adaptable species is present within a number of protected areas. It has been recorded from Kruger National Park, South Africa. No direct conservation measures are currently needed for the species as a whole.

GENERAL DISTRIBUTION:

Neoromicia zuluensis is widespread in East and southern Africa. The eastern distribution ranges from Ethiopia and South Sudan to Uganda and Kenya. The southern range extends from Zambia and southern parts of the Democratic Republic of the Congo to southern South Africa, and from eastern Angola to central Zambia and Zimbabwe. In the RSA, the species' distribution is linked with land use/land cover (Babiker Salata, 2012: 50).

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 1,198,714 km^2.

Native: Angola (Crawford-Cabral, 1989; Monadjem *et al.*, 2010d:570; Taylor *et al.*, 2018b: 60); Botswana (Archer, 1977; Monadjem *et al.*, 2010d: 570); Congo (The Democratic Republic of the); Eswatini (Monadjem *et al.*, 2010d: 570, Monadjem *et al.*, 2021: 5); Ethiopia (Lavrenchenko *et al.*, 2004b: 153; 2011: 54); Kenya; Malawi (Ansell and Dowsett, 1988: 42); Mozambique (Monadjem *et al.*, 2010d: 570; Monadjem *et al.*, 2010c: 384); Namibia (Monadjem *et al.*, 2010d: 570); South Africa

(Monadjem *et al.*, 2010d: 570); Sudan; Uganda; Zambia (Ansell, 1978; Monadjem *et al.*, 2010d: 570); Zimbabwe (Monadjem *et al.*, 2010d: 570).

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:

Figure 390. Clockwise from top lateral, ventral and dorsal skull images of TM 3024, holotype of *Eptesicus zuluensis* Roberts, 1924.

DETAILED MORPHOLOGY:

Baculum

Hill and Harrison (1987) and Kearney *et al.* (2002).

FUNCTIONAL MORPHOLOGY:

Amador *et al.* (2019: Suppl.) [referring to Norberg and Rayner (1987)] mention a wing loading value of 5.7 Pa, aspect ratio 6.4 for a wingspan of 23 cm and a wing area of 69 cm^2 and a body mass of 4 g.

ECHOLOCATION:

In Waterberg, South Africa, Taylor *et al.* (2013b: 17) recorded the following parameters for 5 calls: F_{max}: 73.8 ± 14.93 (59.1 - 92.8) kHz, F_{min}: 48.1 ± 1.94 (45.7 - 50.5) kHz, F_{knee}: 51.3 ± 2.85 (48.4 - 55.8) kHz, F_{char}: 49.0 ± 1.81 (46.3 - 51.2) kHz, duration: 2.4 ± 0.52 (1.7 - 3.0) ms.

At Farm Welgevonden, South Africa, Taylor *et al.* (2013a: 556) report a F_{knee} value of 51 (48 - 56) kHz.

Linden *et al.* (2014: 40) reported the following parameters from the Soutpansberg range (RSA): F_{min}: 46 - 50 kHz, F_{char}: 46 - 51 kHz, F_{knee}: 48 - 56 kHz, slope: 487 - 867 OPS, duration: 2 - 3 ms. 20 calls were recorded by Parker and Bernard (2018: 57) in the Mapungubwe National Park (RSA): F_{char}: 48.11 ± 1.17 kHz, F_{max}: 63.23 ± 4.44 kHz, F_{min}: 47.70 ± 1.36 kHz, F_{knee}: 52.09 ± 2.33 kHz, duration: 4.91 ± 1.36 ms, at 7.47 ± 2.12 calls/sec.

At Telperion Nature Reserve (RSA), Kearney *et al.* (2019: 37) recorded a release call (6 pulses) with the following characteristics: F_{char}: 45.89 ± 0.43 (45.45 - 46.51) kHz, slope at start of call: 52.41 ± 16.85 (31.71 - 68.40), time between start of call and F_{char}: 3.43 ± 0.84 (2.26 - 4.83) ms and duration: 3.82 ± 0.58 (3.13 - 4.83) ms. From the same locality, De Jong *et al.* (2025: 322) reported the following parameters for 29 calls from 2 *Neoromicia zuluensis* : F_{char}: 45.93 ± 1.28 kHz, F_{knee}: 48.87 ± 1.98 kHz, F_{min}: 45.74 ± 1.31 kHz, F_{max}: 84.90 ± 15.01 kHz, Bandwidth: 39.15 ± 15.53 kHz, Duration: 2.82 ± 0.60 ms. 20 calls from 4 males had the following values: F_{char}: 45.42 ± 0.99 kHz, F_{knee}: 48.92 ± 2.55 kHz, F_{min}: 45.18 ± 1.02 kHz, F_{max}: 72.57 ± 15.74 kHz, Bandwidth: 27.40 ± 15.67 kHz, Duration: 2.78 ± 0.50 ms.

From the MalaMala Game Reserve (KNP, RSA), Gumede *et al.* (2025: Appendix S1) reported F_{char}: 48.11 ± 1.17 kHz, F_{max}: 63.23 ± 4.44 kHz, F_{min}: 47.70 ± 1.36 kHz.

From Swaziland, the following parameters were reported by Monadjem *et al.* (2017c: 179): F_{min}: 46.1 ± 2.82 (39.9 - 45.3) kHz, F_{knee}: 46.6 ± 2.91 (43.3 - 48.5) kHz, F_c: 43.6 ± 3.10 (40.1 - 45.9) kHz and duration: 3.7 ± 0.67 (3.0 - 4.2) ms.

12 calls from the Okavango River Basin reported by Weier *et al.* (2020: Suppl.) had the following characteristics: F_{max}: 54.17 ± 3.34 kHz, F_{min}: 49.65 ± 0.96 kHz, F_{knee}: 50.65 ± 1.40 kHz, F_{char}: 50.14 ± 0.88 kHz, slope: 8.43 ± 16.98 OPS, duration: 3.59 ± 1.28 ms.

In the Limpopo province (RSA), Weier *et al.* (2021: 7) reported the following characteristics for 99 calls of 9 bats: F_{max}: 61.2 ± 8.6 kHz, F_{min}: 46.65 ± 5.2 kHz, F_{knee}: 49.86 ± 2.26 kHz, F_{char}: 48.41 ± 1.76 kHz, slope: -238.88 ± 3564.48 OPS, duration: 3.74 ± 1.5 ms. 15 calls recorded at the Venetia mine by Cory-Toussaint and Taylor (2022: Table S1) had a duration of 3.87 ± 0.79 ms, F_{min}: 44.34 ± 3.87 kHz, F_{max}: 52.77 ± 2.90 kHz, F_{knee}: 48.53 ± 0.84 kHz and F:47.31± 0.66 kHz.

Brinkley *et al.* (2021: Table S1) mention the following parameters for 27 *Neoromicia zuluensis* calls from the Kruger Park (RSA): F_{min}: 46 ± 1.2

(43.9 48.7) kHz, Duration: 3.7 ± 0.7 (2.6 4.9) ms, F_{max}: 58.2 ± 7.9 (32.7 69.7) kHz, F_{knee}: 48.1 ± 1.4 (45.3 51.3) kHz, F_{char}: 46.7 ± 1.3 (44.4 49.3) kHz.

79 pulses recorded by Taylor *et al.* (2020a: 77) at Venetia Limpopo Nature Reserve and Mapungubwe National Park (RSA) had F_{min}: 46 - 51 kHz, F_{max}: 59 - 93 kHz, F_{char}: 46 - 51 kHz, F_{knee}: 48 - 56 kHz and duration 2 - 34 ms.

Along the Chobe River (Botswana/Namibia), Parker and Bernard (2023: 55) reported F_{char}: 48.11 ± 1.17 kHz, F_{max}: 63.23 ± 4.44 kHz and F_{min}: 47.70 ± 1.36 kHz.

Taylor-Boyd *et al.* (2025: 116) report the following values for 12 calls from Zambia: Interpulse interval: 83.6 ± 24.3 (46.3 - 137.0) ms; F_{max}: 52.8 ± 4.0 (45.3 - 57.9) kHz; Start slope: -29.1 ± 12.7 (-18.0 - -8.2) kHz/ms; End slope: -2.7 ± 2.3 (-0.6 - 0.9) kHz/ms; Ledge duration: 0.5 ± 0.1 (0.3 - 0.8) ms.

Molecular Biology:

Karyotype

Both Rautenbach *et al.* (1993) and Kearney *et al.* (2002) recorded 2*n* = 28, FN = 48, BA = 22, and a subtelocentric X chromosome. However, as can been seen from Figure 9 in Kearney *et al.* (2002), the FN number was incorrectly reported and should be FN = 50, and BA = 24. Rautenbach *et al.* (1993) also reported an acrocentric Y chromosome. GTG-bands identified three Robertsonian fusion chromosomes (7/11, 8/9, 10,12), considered as distinguishing characters for the genus *Neoromicia* Kearney *et al.* (2002).

Protein / allozyme

See Morales *et al.* (1991) for results from three specimens from South Africa.

Habitat:

In southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) found that *N. zuluensis* is primarily present in Savanna (81 %) and SW arid (10 %) habitats. In the northern Namib Desert, the activities of this species are related to water quality

Diet:

For these bats, Cabrera-Campos *et al.* (2021: Suppl.) estimated the food transit time to be about 56 minutes, and the digestibility rate about 83.5 %.

Predators:

Malan *et al.* (2022: 167) reported one individual found in a pellet from a bat hawk (*Macheiramphus alcinus* Bonaparte, 1850.

Population:

Structure and Density

In general, this is a locally uncommon species (Jacobs and Cotterill, 2008b; IUCN, 2009; Monadjem *et al.*, 2017ad).

Trends

2016: Unknown (Monadjem *et al.*, 2017ad).
2008: Unknown (Jacobs and Cotterill, 2008b; IUCN, 2009).

Reproduction and Ontogeny:

In Malawi, births occurred early in the wet season (Happold and Happold, 1990b: 568).

Monadjem *et al.* (2010d) [in Weier *et al.* (2018: Suppl.)] mentioned births from late November to early December.

Parasites:

PROTOZOA

Harris *et al.* (2018: 2, 3) reported the presence of *Hepatozoon* sp. from a *Neoromicia zuluensis* from Louis Trichardt, in the Limpopo province (RSA).

HEMIPTERA

Cimicidae

Kock *et al.* (1998b: 237) mentioned *Aphrania* cf. *barys* Jordan and Rothschild, 1912 on bats from Namibia.

Viruses:

Coronaviridae - Coronaviruses

The report of a new virus by Ithete *et al.* (2013: 1697) that was closely related to Middle East respiratory syndrome (MERS)-CoV, the host was incorrectly identified and is related to *Laephotis capensis*.

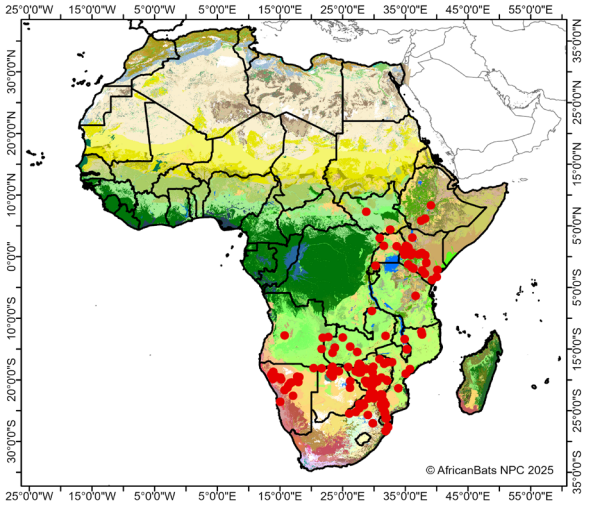

Figure 391. Distribution of *Neoromicia zuluensis*.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Angola, Botswana, Eswatini, Ethiopia, Kenya, Malawi, Mozambique, Namibia, Rwanda, South Africa, South Sudan, Tanzania, Uganda, Zambia, Zimbabwe.

Genus ***Nycticeinops*** Hill & Harrison, 1987

*1987. *Nycticeinops* Hill and Harrison, Bull. Br. Mus. (nat. Hist.) Zool., 52 (7): 254. - Comments: Type species: *Nycticejus schlieffeni* Peters, 1859. - Etymology: Lanza *et al.* (2015: 364) mention the following: "masculin scientific Latin substantive made up of the masculine scientific Latin substantive *Nycticeius* (Nicticèius) and the feminine Greek substantive "*ὄφις*" (ópsis) 'aspect, appearance', referring to the likeness of the genus *Nycticeinops* to the genus *Nycticeius*, The etymology proposed by Hill and Harrison (1987) is imperfect". (Current Spelling).

2005. *Nycteceinops:* Eick, Jacobs and Matthee, Mol. Biol. Evol., 22 (9): 1871. Publication date: 1 June 2005. (Lapsus).

*2019. *Parahypsugo* Hutterer, Decher, Monadjem and Astrin, Acta Chiropt., 21 (1): 7. Publication date: 5 October 2019. - Etymology: From the Greek prefix *para* (meaning beside or near), combined with the existing genus name *Hypsugo*, emphasizing the close genetic and morphological relationships between the two genera (see Hutterer *et al.*, 2019 7).

? *Nycticeinops sp.*

TAXONOMY:
Bronner *et al.* (2003) state that the genus *Nycticeius* has long been considered to comprise two species: *N. humeralis*, from North America, and *N. schlieffenii* from Africa and Arabia. Koopman (1978) found these species so similar that he retained them in the same genus, a treatment disputed by Kitchener and Caputi (1985). Hill and Harrison (1987) demonstrated consistent differences between these species in baculum morphology and proposed the allocation of *schlieffeni* to the distinct genus *Nycticeinops*. Extensive karyotypic differences between the American *humeralis* (2*n* = 46 and FN = 48; Baker and Patton, 1967; Bickham, 1979) and East African *schlieffeni* (2*n* = 34 and FN = 52) provide additional evidence that the two species are not congeneric (Ruedas *et al.*, 1990) and *mt*DNA sequence divergence data strongly support their allocation to distinct genera (Hoofer and Van Den Bussche, 2001). However, Rautenbach *et al.* (1993) report an intermediate karyotype of 2*n* = 42 and FN = 50 for *schlieffeni* from South Africa. This not only suggests the existence of two species in Africa, but also casts some doubt on the karyotypic basis for generic distinction between these forms. We nevertheless recognise these as distinct genera owing to clearcut differences in bacular and *mt*DNA properties.

Meester *et al.* (1986) state that *Scoteinus* Dobson, 1875 has frequently been included in this genus for the species *schlieffenii*, either as a subgenus (Ellerman *et al.*, 1953; Hayman and Hill, 1971), or as a synonym (Rosevear, 1965). Allen (1939a) and Roberts (1951) regard *Scoteinus* as a valid genus, which includes *schlieffenii*. However, Sinha and Chakraborty (1971) place *Nycticeius emarginatus* (Dobson, 1871), the type species of *Scoteinus*, in the distinct Indo-Malayan genus *Scotomanes*, and Koopman (1975, 1978) accordingly regards *schlieffenii* as a *Nycticeius sensu stricto*.

Currently (Simmons and Cirranello, 2023b) recognized extant species of the genus *Nycticeinops*: ***macrocephalus*** (Hutterer and Kerbis Peterhans,2020); ***schlieffenii*** (Peters, 1859). Addtionally there is also the extinct ***†serengetiensis*** Gunnell, Butler, Greenwood and Simmons, 2015.

COMMON NAMES:
Czech: Schlieffenovi netopýři. English: Twilight bats. French: Nycticeinops. German: Abendfledermäuse. Italian: Nitticèinopi, Nicticèinopi.

GEOGRAPHIC VARIATION:
Volleth *et al.* (2023c: 50) point to the importance of the Dahomey gap in this genus. One example is the pair *happoldorum/grandidieri*, where the prior occurs in the west and the latter in the east. They also point out that the baculum of *N. happoldorum* is twice as large as that of *N. grandidieri*. This is also the case for a second species pair: *crassulus/bellieri*, with *crassulus* having the larger baculum. These morphological differences are also supported by molecular results.

PARASITES:
ARACHNIDA
Macronyssidae
Orlova *et al.* (2024: 154) [referring to Zumpt, 1961] mentioned *Nycticeinops* sp. as host for *Chelanyssus aethiopicus* (Hirst, 1921).

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Kenya.

Nycticeinops 'incertae-sedis'

2013. *Nycticeinops cf. schlieffenii:* Koubínová, Irwin, Hulva, Koubek and Zima, Front. Zool., 10: 5. - Comments: Koubínová *et al.* (2013: 7) found differences in diploid chromosome number and/or in chromosome morphology between the populations from Senegal and other regions in Africa. (Name Combination).

POPULATION:
Structure and Density
Unknown.

Trend
Not assessed.

Nycticeinops macrocephalus (Hutterer and Kerbis Peterhans, 2020)

*2013. *Hypsugo cf. eisentrauti:* Kerbis Peterhans, Fahr, Huhndorf, Kaleme, Plumptre, Marks and Kizungu, Bonn. Zool. Bull., 62 (2): 189. Publication date: November 2013. (Current Combination).
2020. *Nycticeinops macrocephalus:* Monadjem, Demos, Dalton, Webala, Musila, Kerbis Peterhans and Patterson, Zool. J. Linn. Soc., 191 (4): 1140. Publication date: 10 September 2020. (Current Combination).
*2020. *Parahypsugo macrocephalus* Hutterer and Kerbis Peterhans, Lynx, NS 50: 53, figs 1, 2A, 3. Publication date: February 2020. Type locality: Congo (Democratic Republic of the): Sud-Kivu province: Misotschi-Kabogo Highlands: Kabobo Forest: 4 km SW Talama [04 59 29 S 29 04 49 E, 1950 m]. Holotype: FMNH 195086: ad ♀, skin and skeleton and skull. Collection date: 17 February 2007; original number: MHH 845. Paratype: SMF 79444: ad ♂, skin and skull. Collected by: Klaus-Gerhard Heller and Marianne Volleth; collection date: 28 March 1990; original number: 339. - Etymology: The name is derived from the Greek "μακρος" (Latinised to macros), meaning large and "κεφαλή" (Latinised to cephale), meaning head.

TAXONOMY:
As already indicated by Van Cakenberghe and Happold (2013i: 622) *eisentrauti* records from the DRC, Uganda, Kenya and Somalia do not resemble closely to the holotype and paratype of "*Pipistrellus] eisentrauti*" to be considered respresentatives of this species. Kerbis Peterhans *et al.* (2013: 189) therefore assigned these tentatively to "*H[ypsugo]* cf. *eisentrauti*", indicating that they could represent a yet undescribed species. Hutterer and Kerbis Peterhans (2020: 53) formally described this species, but also indicated that the specimens from Somalia and Kenya still need to be examined, as they might possibly represent yet another species.

Based on the morphological similarities with *happoldorum*, Monadjem *et al.* (2020a: 1140, 1141) placed this species in the genus *Nycticeinops*.

COMMON NAMES:
English: Large Headed Pipistrelle.

CONSERVATION STATUS:
Global Justification
Not assessed.

Assessment History
Global
Not assessed.

Regional
None known.

GENERAL DISTRIBUTION:
Native: Congo (The Democratic Republic of the), Rwanda

Presence uncertain: Kenya; Somalia; Uganda

DETAILED MORPHOLOGY:
Baculum
Heller *et al.* (1994: 2) (as "*Hypsugo eisentrauti*").

MOLECULAR BIOLOGY:
Karyotype
Volleth *et al.* (2001) reported 2*n* = 42, FN = 58, BA = 18, a metacentric X and a dot-like Y chromosome for a male "*Hypsugo eisentrauti*" specimen from Rwanda, which is currently considered to be the paratype of *Parahypsugo macrocephalus*.

Genetics
Volleth *et al.* (2023c: 37) reported that the cyt b sequence of the paratype was 98.4 % similar to that of a *Nyctinceinops eisentrauti* specimen from Cameroon.

POPULATION:
Structure and Density
Unknown.

Trend
Not assessed.

Nycticeinops schlieffenii (Peters, 1859)

*1859. *Nycticejus Schlieffenii* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, p 224. Type locality: Egypt: Cairo [30 03 N 31 15 E]. [Goto Description]. Holotype: ZMB 585: ad ♂, alcoholic and cranium only (no mandibula). Collected by: Graf Afred von Schlieffen. See Turni and Kock (2008: 53). - Comments: Allen (1939a: 97) mentioned 1860 as year of publication, Kock (1969a: 186) mentions 1859. The publication covers a meeting held on 28 February 1859. - Etymology: In honour of the collector Count Wilhelm von Schlieffen-Schlieffenburg (Smithers, 1983: 111). Johnston (2006: 3) mentions Schlieffen-Schlieffiennburg. Lanza *et al.* (2015: 366) [referring to Beolens *et al.* (2009)] mention Graf Wilhelm Schlieffen von Schlieffenberg (1833 - ?).

1877. *N[ycticejus] adovanus* Heuglin, Reise in Nordost Afrika, 2: 34. Publication date: 1877. Type locality: Ethiopia: Tigre province: As(s)am river: Adowa [14 10 N 38 54 E, 1 900 m]. [Goto Description].

1887. *Scotophilus minimus* Noack, Zool. Jb. Syst., 2 (2): 280, pl 10, fig 36 - 37. Publication date: 7 May 1887. Type locality: Congo (Democratic Republic of the): (formerly indicated as in Democratic Republic of the Congo): Marungu: Qua Mpala [06 45 00 S 29 31 00 E, 774 m]. [Goto Description]. - Comments: Kock (1969a: 187), Meester *et al.* (1986: 62) situate Qua Mpala in the Democratic Republic of the Congo, not in Tanzania. Noack (1887: 280) refers to the type specimen as a female with separate skull.

1905. *Scotophilus schliefferri:* Schwann, Novit. Zool., 12 (1): 1. (Lapsus).

1908. *Scoteinus schlieffeni albiventer* Thomas and Wroughton, Proc. zool. Soc. Lond., 1908, III: 540. Publication date: 30 October 1908. Type locality: Sudan: Northern province: Naikhala. Holotype: NHMUK 1904.11.3.4: ad ♂. Collected by: Nathanial Charles Rothschild; collection date: 13 February 1904; original number: 73. Presented/Donated by: Nathanial Charles Rothschild.

1908. *Scoteinus schlieffeni australis* Thomas and Wroughton, Proc. zool. Soc. Lond., 1908, III: 539. Publication date: 30 October 1908. Type locality: Mozambique: 120 km SW Inhambane: Coguno [24 23 S 34 32 E]. [Goto Description]. Holotype: NHMUK 1906.11.8.19: ad ♂. Collected by: Captain Claude Henry Baxter Grant; collection date: 5 August 1906. - Comments: Considered a valid subspecies of *Nycticeius schlieffeni* by Taylor (1998: 56).

1908. *Scoteinus schlieffeni bedouin* Thomas and Wroughton, Proc. zool. Soc. Lond., 1908, III: 540. Publication date: 30 October 1908. Type locality: : Jemen, Aden, Lahej. - Comments: Extrelimital.

1911. *Nycticeius africanus* G.M. Allen, Bull. Mus. comp. Zool., 54 (6): 328. Publication date: December 1911. Type locality: Kenya: Northern Guaso Nyiro: Meru River: effluent of northern Guaso Nyiro [=Ewaso Ngiro] [00 03 N 37 39 E]. [Goto Description]. Holotype: MCZ 8272: ♂, skin and skull. Collected by: Glover Morrill Allen; collection date: 11 August 1909; original number: 113. See Allen (1911: 328); Helgen and McFadden (2001: 147). - Comments: Thorn *et al.* (2009: 57) mention 00 29 N 37 40 E as coordinates for the type locality.

1916. *Scotoecus cinnamomeus* Wettstein, Anz. kais. Akad. Wiss., Wien, 53: 191. Publication date: 1916. Type locality: Sudan: Kordofan province: Nubbaka [=En Nabbaka] [12 35 N 29 55 E]. [Goto Description]. - Comments: Thorn *et al.* (2009: 57) mention 12 47 N 30 46 E as coordinates for the type locality. Type specimen: ♀, collected by Prof. Dr. Franz Werner, collection date 17 March 1914. Two cotypes [= paratypes], 1 ♀ from Nubbaka, collection date 17 March 1914; 1 ♀ from Dilling, collection date: 20 March 1914 (see Wettstein, 1916: 191).

1926. *Scoteinus schleiffeni:* Cabrera and Ruxton, Ann. Mag. nat. Hist., ser 9, 17 (103): 594. Publication date: 1 May 1926. (Lapsus).

1932. *Scoteinus schlieffeni fitzsimonsi* Roberts, Ann. Transv. Mus., 15 (1): 17. Publication date: 1 October 1932. Type locality: Botswana: N Bechuanaland, Ngamiland,: Tsotsoroga Pan [18 40 S 24 25 E]. [Goto Description]. Holotype: TM 6550: ad ♂, skin and skull. Collected by: The Vernay-Lang Kalahari Expedition 1930; collection date: 19 June 1930; original number: 833. . Cotype: TM 6551: ad ♂, skin and skull. Collected by: The Vernay-Lang Kalahari Expedition 1930; collection date: 19 June 1930; original number: 830.

1987. *Nycticeinops schlieffenii:* Hill and Harrison, Bull. Br. Mus. (nat. Hist.) Zool., 52 (4): 275. Publication date: 30 July 1987. (Name Combination, Current Combination).

2005. *Nycteceinops schlieffeni:* Eick, Jacobs and Matthee, Mol. Biol. Evol., 22 (9): 1871. Publication date: 1 June 2005. (Lapsus).

2020. *Nycticeinops cf. schlieffeni:* Monadjem, Demos, Dalton, Webala, Musila, Kerbis Peterhans, and Patterson, B. D., Zool. J. Linn. Soc., 191 (4): 1123. Publication date: 10 September 2020. (Name Combination, Alternate Spelling).
? *Nycticeinops cf. schlieffeni TD-2020*
? *Nycticeinops schlieffeni albiventer:* (Name Combination).
? *Nycticeinops schlieffeni fitzsimonsi:* (Name Combination).
? *Nycticeinops schlieffeni schlieffeni:* (Name Combination).
? *Nycticeius (Scoteinus) schleiffenii:* (Name Combination).
? *Nycticeius schlieffeni australis:* (Name Combination).
? *Nycticeius schlieffeni:* (Alternate Spelling).
? *Nycticeius schlieffenii:* (Name Combination).

TAXONOMY:

Figure 393. A female *Nycticeinops schlieffenii* (TM 48141) caught at Makalali-GR, Limpopo, South Africa.

Includes *cinnamomeus*; see Koopman (1975: 412 - 413). Assigned to the genus *Nycticeinops* by Harrison and Bates (1991: 94) and Hutson *et al.* (2001: 29), which is considered a subgenus of *Nycticeius* by Pavlinov *et al.* (1995: 116).

Based on COI sequences, Volleth *et al.* (2023c: 37) assigned specimens from Ethiopia, Senegal, Somalia an Burkina Faso to *Nycticeinops schlieffenii*, but animals from South Africa - which showed only 88.6 % similarity - are assigned to *Nycticeinops* cf. *schlieffenii*.

COMMON NAMES:

Afrikaans: Schlieffen se vlermuis, Schlieffen-vlermuis, Klein dakvlermuis. Chinese: 施氏墓蝠. Czech: netopýr Schlieffenův, netopýr krátkouchý. Dutch: Schlieffens vleermuis. English: Schlieffen's Bat, Schlieffen's Twilight Bat. French: Nycticeinops de Schlieffen, Chauve-souris du crépuscule, Chauve-souris de Schlieffen. German: Schlieffens Abendfledermaus. Italian: Nitticèinope di Schlieffen, Nicticèinope di Schlieffen. Kiluba (DRC): Kasusu. Malawian: Liputiputi, Ndemiya, Namzeze. Portuguese: Morcego de Schlieffens.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:

Butler and Greenwood (1965) found material in the early Pleistocene at Olduvai, which they referred to as "cf *Nycticeius* (*Scoteinus*) *schlieffeni* (Peters)" (see Butler (1978).

CONSERVATION STATUS:

Global Justification

Widespread and rather common, with no major threats. Assessed as Least Concern LC ver 3.1 (2001) (Jacobs *et al.*, 2008b; IUCN, 2009).

Assessment History

Global

2008: LC ver 3.1 (2001) [as *Nycticeinops schlieffeni*] (Jacobs *et al.*, 2008b; IUCN, 2009). 2004: LC ver 3.1 (2001) (Jacobs *et al.*, 2004am; IUCN, 2004). 1996: LR/lc (Baillie and Groombridge, 1996).

Regional

South Africa: 2016: LC ver 3.1 (2001) (Monadjem *et al.*, 2016o). 2004: LC ver 3.1 (2001) (Friedmann and Daly, 2004).

MAJOR THREATS:

None known (Jacobs *et al.*, 2008b; IUCN, 2009).

CONSERVATION ACTIONS:

Jacobs *et al.* (2008b; IUCN, 2009).

GENERAL DISTRIBUTION:

Distribution is split into two: one range in W Africa (including N Senegal, S Mauritania, Burkina Faso, Togo, Benin, and Nigeria), and one covering much of E and S Africa (as far south as NE Swaziland). The species is absent from much of the Horn of Africa, NE Ethiopia, E Tanzania, and NE Mozambique. There is a smaller central

African range in NE Democratic Republic of the Congo (DRC). There are also records from Niger, Central African Republic (CAR), and the Nile delta in Egypt.

The record on Madagascar is for three specimens in the Paris Museum (ZM-MO-1985-1036, ZM-MO-1985-1037, ZM-MO-1985-1038) which are currently (November 2021) also in the online catalogue mentioned as "*schlieffeni*".

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 1,003,159 km^2. Babiker Salata (2012: 50) indicated that the distribution in the RSA is mostly affected by the annual mean temperature.

Native: Angola (Crawford-Cabral, 1989; Monadjem *et al.*, 2010d: 570; Taylor *et al.*, 2018b: 63); Benin (Capo-Chichi *et al.*, 2004: 163); Botswana (Archer, 1977; Monadjem *et al.*, 2010d: 570); Burkina Faso (Kangoyé *et al.*, 2015a: 621); Cameroon; Central African Republic; Chad; Congo (The Democratic Republic of the) (Noack, 1887; Hayman *et al.*, 1966; Monadjem *et al.*, 2010d: 570); Djibouti (Pearch *et al.*, 2001: 388); Egypt; Eritrea; Eswatini (Monadjem *et al.*, 2010d: 571, Monadjem *et al.*, 2021: 5); Ethiopia (Lavrenchenko *et al.*, 2004b: 147); Ghana; Kenya; Malawi (Happold *et al.*, 1988; Monadjem *et al.*, 2010d: 570); Mali (Meinig, 2000: 105); Mauritania (Allegrini *et al.*, 2011: 3); Mozambique (Smithers and Lobão Tello, 1976; Monadjem *et al.*, 2010d: 570; Monadjem *et al.*, 2010c: 384); Namibia (Monadjem *et al.*, 2010d: 571); Niger; Nigeria; Saudi Arabia; Senegal; Somalia; South Africa (Monadjem *et al.*, 2010d: 571); Sudan; Tanzania; Togo; Uganda (Kityo and Kerbis, 1996: 62); Yemen (Benda *et al.*, 2011b: 41); Zambia (Ansell, 1978; Monadjem *et al.*, 2010d: 571); Zimbabwe (Monadjem *et al.*, 2010d: 571).

Geographic variation:

Koubínová *et al.* (2013: 9) indicate that *N. schlieffenii* is distributed in three areas in Africa: West, East, and South (respectively represented by Senegal, Somalia, and South Africa in their study) and found that the West and East areas differed in karyotype from the South, and that West and East differed in their *S12* gene.

General description of cranial and dental morphology:

Scott *et al.* (2012: 2943) report that the mandibular symphyse is fully fused in *N. schlieffenii*.

Detailed morphology:

Penis

The penis of *Nycticeinops schlieffenii* was the largest of the six pipistrelloid species examined by Fasel *et al.* (2020: 1394). In flaccid state, it was at least 5.8 mm in length (in the other species it was 5.3 mm at most). The prepuce is covered by long, mostly anteriorly directed hairs.

Baculum

Hill and Harrison (1987) and Kearney *et al.* (2002).

Vomeronasal complex

In this species, the VNC is bar-shaped in cross section (Smith *et al.*, 2024: 9).

Functional morphology:

Amador *et al.* (2019: Suppl.) [referring to Norberg and Rayner (1987)] mention a wing loading value of 6.7 Pa, aspect ratio 6.9 for a wingspan of 22 cm and a wing area of 73 cm^2 and a body mass of 5 g.

Sexual dimorphism:

In Burkina Faso, Kangoyé *et al.* (2015a: 621) found the average body (except Tragus and 3ph3) and cranial (except CM) measurements in females to be larger than in males.

Echolocation:

See Taylor (1999b) and Taylor *et al.* (2005).

From Maroua, Cameroon, Manga Mongombe (2012: 79) reported a FM call type for 1 call and the following parameters: F_{max}: 51.3 kHz, F_{min}: 40.0 kHz, F_{mean}: 45.7 kHz, F_{knee}: 51.3 kHZ, F_{char}: 41.0 kHz, and duration: 0.91 ms.

In Swaziland, Monadjem *et al.* (2017c: 179) recorded F_{min}: 40.1 ± 1.48 (38.7 - 42.4) kHz, F_{knee}: 43.4 ± 1.67 (41.7 - 45.4) kHz, F_c: 40.3 ± 1.29 (39.2 - 42.4) kHz and duration: 3.1 ± 0.64 (2.4 - 4.0) ms. They could detect the calls up to a distance of 15 m.

Weier *et al.* (2020: Suppl.) reported on 25 calls from the Okavango River Basin with the following characteristics: F_{max}: 45.39 ± 3.35 kHz, F_{min}: 39.87 ± 7.35 kHz, F_{knee}: 42.20 ± 0.48 kHz, F_{char}: 41.84 ± 0.60 kHz, slope: 6.66 ± 13.38 OPS, duration: 4.42 ± 1.75 ms.

Luo *et al.* (2019a: Supp.) reported the following data (Hand released bats): F_{peak}: 42.5 kHz, F_{start}: NA kHz, F_{end}: NA kHz, Band width: NA kHz, and duration: 3.5 ms.

In the Limpopo province (RSA), Weier *et al.* (2021: 7) reported the following characteristics for 104 calls of 7 bats: F_{max}: 50.27 ± 9.84 kHz, F_{min}: 40.2 ± 5.93 kHz, F_{knee}: 42.86 ± 0.75 kHz, F_{char}:

41.61 ± 1.35 kHz, slope: -708.66 ± 5655.95 OPS, duration: 3.98 ± 2.13 ms. 15 calls recorded at the Venatia mine by Cory-Toussaint and Taylor (2022: Table S1) had a duration of 3.62 ± 1.17 ms, F_{min}: 38.49 ± 4.40 kHz, F_{max}: 49.89 ± 3.83 kHz, F_{knee}: 44.62 ± 0.69 kHz and F_{char}: 42.45 ± 0.43 kHz.

Brinkley *et al.* (2021: Table S1) mention the following parameters for 1 *Nycticeinops schlieffeni* call from the Kruger Park (RSA): F_{min}: 40.1 kHz, Duration: 3.9 ms, F_{max}: 42.8 kHz, F_{knee}: 42.2 kHz, F_{char}: 42.1 kHz.

Roemer *et al.* (2021: Suppl.) categorized the bat's call as a FMd-QCF (Frequency modulation downward - quasi-constant frequency) sonotype.

26 pulses recorded by Taylor *et al.* (2020a: 77) at Venetia Limpopo Nature Reserve and Mapungubwe National Park (RSA) had F_{min}: 42 kHz, F_{max}: 50 kHz, F_{char}: 41 kHz, F_{knee}: 44 kHz and duration 2 ms.

Along the Chobe River (Botswana/Namibia), Parker and Bernard (2023: 55) reported F_{char}: 42.10 ± 0.30 kHz, F_{max}: 42.80 ± 1.30 kHz and F_{min}: 40.10 ± 1.50 kHz.

In Zambia, Taylor-Boyd *et al.* (2025: 116) report the following values for 8 calls: Interpulse interval: 80.8 ± 39.0 (50.5 - 162.0) ms; F_{max}: 48.5 ± 4.5 (43.4 - 57.2) kHz; Start slope: -29.1 ± 9.8 (-24.1 - -7.7) kHz/ms; End slope: -5.7 ± 3.4 (-1.1 - -7.1) kHz/ms; Ledge duration: 0.5 ± 0.1 (0.3 - 0.6) ms.

Molecular Biology:

Karyotype

Ruedas *et al.* (1990) reported 2*n* = 34, FN = 52, and BA = 20, for specimens from Somalia, whereas Rautenbach *et al.* (1993) reported 2*n* = 42, FN = 50, and BA = 10, for specimens from South Africa. However, both Ruedas *et al.* (1990) and Rautenbach *et al.* (1993) reported submetacentric X, and acrocentric Y chromosomes. Unfortunately, Rautenbach *et al.* (1993) do not identify the actual voucher specimens associated with the work, since further work should be done to ascertain whether this variation is an indication of two distinct species.

From Senegal, Koubínová *et al.* (2013: 3) report the following karyotype for 4 ♂♂ and 1 ♀: 2*n* = 34, Fna = 52, FN = 56, X = metacentric, Y = dot-like. They also found a 5.56 - 5.91 % difference in the *12S* gene as compared with conspecifics from other areas available in GenBank.

Volleth *et al.* (2023c: 44) reported 2*n*=34, FNa = 50 and nine meta- to submetacentric and seven acrocentric autosomal pairs. The X chromosomes is a medium-sized metacentric.

Genetics

See Hoofer and Van Den Bussche (2003).

Habitat:

In southern Africa, it primarily occurs in Savanna habitats (86 %; Cooper-Bohannon *et al.*, 2016: Tabls S2). However, Marsden *et al.* (2023: 7) indicate that this species can inhabit cities, although they possess no obvious advantageous characteristics for urban life.

Diet:

For these bats, Cabrera-Campos *et al.* (2021: Suppl.) estimated the food transit time to be about 62 minutes, and the digestibility rate about 82.4 %.

Predators:

Nyffeler and Knörnschild (2013: 4) refer to Happold *et al.* (1988: 369) for one of two records of an identified African bat becoming entangled in a spider's web (the other being *Neoromicia nana*).

Mikula *et al.* (2016: Supplemental data) and Malan *et al.* (2022: 167) mention the Bat hawk (*Macheiramphus alcinus* Bonaparte, 1850) as diurnal avian predator.

Population:

Structure and Density

Rather common (Jacobs *et al.*, 2008b; IUCN, 2009).

Trend

2008: Unknown (Jacobs *et al.*, 2008b; IUCN, 2009).

Reproduction and Ontogeny:

van der Merwe and Rautenbach (1987: 41) reported that in *N. schlieffenii* spermatogenesis occurs over a 10-month period with the first signs of spermatozoa in the epididymides by the end of April. From the end of April until the beginning of September, they found spermatozoa in the epididymides. Copulation begins during June (early winter in Transvaal) and the females have spermatozoa in the uterine horns from then until the end of August (late winter) when ovulation occurs. *N. schlieffenii* is seasonally monoestrous and most of the births occur in November.

In Malawi, Happold and Happold (1990b: 567) reported births early in the wet season.

Garbino *et al.* (2021: Suppl.) mention that this species has more than one young per litter. van der Merwe and Rautenbach (1986: 48; 1990:

540) reported that "*Nycticeius schlieffeniii*" commonly gives birth to twins and occasionally even triplets. For 11 females, they found an average of 3.1 corpora lutea and 2.8 foetuses.

PARASITES:

HEMIPTERA

Cimicidae

Aphrania recta Ferris and Usinger, 1957 recorded 35 miles east of Kordofan, Sudan (Haeselbarth *et al.*, 1966: 11).

Szentiványi *et al.* (2022: 12) reported *Aphrania recta* Ferris and Usinger, 1957 from Mauritania.

DIPTERA

Nycteribiidae

Dick *et al.* (2023: 73) mentioned *Basilia (Basilia) ansifera* Theodor, 1956 has been found on *Nycticeinops schlieffenii*:

SYPHONAPTERA

Ischnopsyllidae

Lagaropsylla consularis Smit, 1957. Traditional host being Molossid Bats, but has been recorded from this taxa (Haeselbarth *et al.*, 1966: 1990). *Lagaropsylla idea* Smit, 1957, of which the primary host are molossids but recorded from this taxon (Haeselbarth *et al.*, 1966: 190).

Hastriter (2016: 18) reported the flea *Lagaropsylla idae* Smit, 1957 from a *N. schlieffenii* specimen from Majo Moto, Kenya.

VIRUSES:

Rhabdoviridae

Viljoen *et al.* (2023a: 1) reported the coding-complete sequence of a lyssavirus, provisionally designated Phala bat lyssavirus (PBLV) in a bat from South Africa.

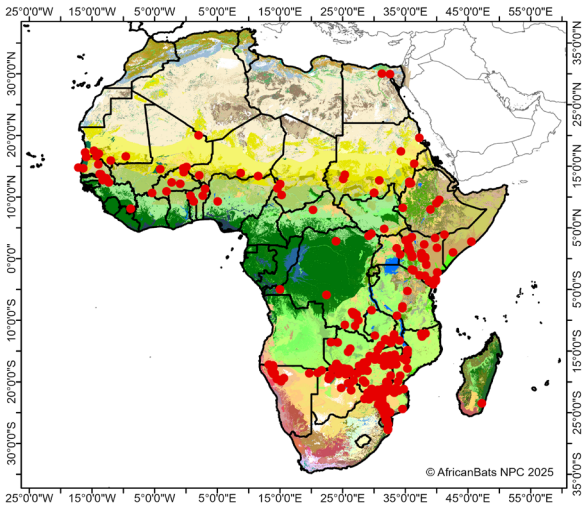

Figure 394. Distribution of *Nycticeinops schlieffenii*.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:

"Africa", Benin, Botswana, Burkina Faso, Cameroon, Central African Republic, Chad, Congo (Democratic Republic of the), Côte d'Ivoire, Egypt, Eswatini, Ethiopia, Ghana, Guinea, Kenya, Madagascar, Malawi, Mali, Mauritania, Mozambique, Namibia, Niger, Nigeria, Senegal, Somalia, South Africa, South Sudan, Sudan, Tanzania, Togo, Uganda, Zambia, Zimbabwe.

†*Nycticeinops serengetiensis* Gunnell, Butler, Greenwood and Simmons, 2015

*2015. *Nycticeinops serengetiensis* Gunnell, Butler, Greenwood and Simmons, Am. Mus. Novit., 3846: 1, 17, figs 9C-H, 10. Publication date: 16 December 2015. - Etymology: Named for the famed Serengeti region in northern Tanzania where Olduvai Gorge is located (Gunnell *et al.* (2015a: 18).

SIMILAR SPECIES:

The teeth of *N. serengetiensis* are on average 20 % larger than those of *N. schlieffeni*.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:

Timeframe:

Pleistocene (Brown *et al.*, 2019: Suppl.).

Genus ***Pseudoromicia*** Monadjem, Patterson, Webala and Demos, 2020

1872. *Vesperus:* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, 263.

1878. *Vesperugo:* Dobson, Catalogue of the Chiroptera of the collection of the British Museum, 183. Publication date: 15 June 1878. - Comments: In part. Not of Keyserling and Blasius, 1839 (see Monadjem *et al.*, 2020a: 1127, 1138).

1897. *Eptesicus:* Matschie, Arch. Naturg., 63 (1): 84. Publication date: October 1897. - Comments: In part. Not of Rafinesque, 1820 (see Monadjem *et al.*, 2020a: 1127).

1900. *Vespertilio:* Miller, Proc. Wash. Acad. Sci., 2: 649. Publication date: 28 December 1900. - Comments: Not of Linnaeus, 1758. Monadjem *et al.* (2020a: 1132) mentions it "in part", but Miller (1900: 649) only mentions one species.

1987. *Nycterikaupius* Menu, Palaeovert., 17 (3): 108, pl 4, fig 1. Publication date: 15 November 1987 [Goto Description]. - Comments: In part. The species assigned to this genus by Menu (1987: 109) are currently (sensu Monadjem *et al.*, 2020a: 1140) included in the genera *Laephotis, Neoromicia, Pipistrellus* and *Pseudoromicia*.

2002. *Neoromicia:* Kearney, Volleth, Contrafatto and Taylor, Acta Chiropt., 4 (1): 58. - Comments: In part. Not of Roberts, 1926 (see Monadjem *et al.*, 2020a: 1132).
*2020. *Pseudoromicia* Monadjem, Patterson, Webala and Demos, in: Monadjem et al., Zool. J. Linn. Soc., 191 (4): 1120, 1132. Publication date: 10 September 2020. - Etymology: From the Greek ψευδο, meaning false and the genus *Romicia* Gray, 1838, in turn derived from the Ancient Greek ρόμιξα, meaning a javelin or huntingspear (Monadjem *et al.*, 2020a: 1132).
2023. *Pseudoroemecia:* Dick, Verrett, Webala and Patterson, ZooKeys, 1169: 74. Publication date: 13 July 2023. (Lapsus).
? *Pseudoromicia sp. Tanzania*

TAXONOMY:
Currently (Simmons and Cirranello, 2023b) recognized species of *Pseudoromicia*: ***brunnea*** (Thomas, 1880); ***isabella*** (Decher, Hutterer and Monadjem, 2016); ***kityoi*** (Monadjem, Kerbis Peterhans, Nalikka, Waswa, Demos and Patterson, 2020); ***mbamminkom*** Grunwald, Demos, Nguéagni, Tchamba, Monadjem, Webala, Kerbis Peterhans, Patterson and Ruedas, 2023; ***nyanza*** (Monadjem, Patterson, Webala and Demos, 2020); ***principis*** Juste, Torrent, Méndez-Rodríguez, Howard, García-Mudarra, Nogueras and Ibáñez, 2023; ***rendalli*** (Thomas, 1889); ***roseveari*** (Monadjem, Richards, Taylor and Stoffberg, 2013); ***tenuipinnis*** (Peters, 1872).

MOLECULAR BIOLOGY:
Genetics
Cytogenetic data examined by Volleth *et al.* (2023c: 50) point to a closer relationship between *P. brunnea* and *P. tenuipinnis* compared to *P. rendalli*.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Tanzania.

Pseudoromicia brunnea (Thomas, 1880)

*1880. *Vesperugo (Vesperus) brunneus* Thomas, Ann. Mag. nat. Hist., ser 5, 6 (32): 165, 1 text-fig. Publication date: 1 August 1880. Type locality: Nigeria: Eastern region: Calabar [04 56 N 08 22 E]. Holotype: NHMUK 1880.7.21.7: ad ♀, skull and alcoholic. Collected by: Dr. A. Robb. Presented/Donated by: Dr. J.A. Smith. - Comments: Allen (1939a: 84), Grubb *et al.* (1998: 86) mentioned "Old Calabar, West Africa" as type locality.
1880. *Vesperugo brunneus:* Dobson, Report 50th Meeting British Association Advancement Science, 1880: 185. - Comments: (redescription of type). (Name Combination).
1939. *Eptesicus brunneus:* G.M. Allen, Bull. Mus. comp. Zool., 83: 84. (Name Combination).
1971. *Eptesicus [(Eptesicus)] brunneus:* Hayman and Hill, Mammals of Africa: Chiroptera, 44. (Name Combination).
1987. *Nycterikaupius brunneus:* Menu, Palaeovert., 17 (3): 109. Publication date: 15 November 1987. (Name Combination).
1987. *Pipistrellus (Neoromicia) brunneus:* Hill and Harrison, Bull. Br. Mus. (nat. Hist.) Zool., 52 (7): 282. (Name Combination).
1989. *P[ipistrellus] brunneus:* Koopman, Am. Mus. Novit., 2946: 10. - Comments: (This might be a lapsus, since Koopman used *Eptesicus brunneus* on page 7). (Name Combination, Lapsus).
1993. *Eptesicus (Neoromicia) brunneus:* Koopman, in: Wilson and Reeder, Mammal species of the World (2nd Edition): Chiroptera, 201. (Name Combination).
1995. *Pipistrellus brunneus:* Koopman, Kofron and Chapman, Am. Mus. Novit., 3148: 11. (Name Combination).
2003. *? (Hypsugo) brunneus:* Hoofer and Van Den Bussche, Acta Chiropt., 5 (Suppl): 38. (Name Combination).
2008. *N[eoromicia] brunnea:* Riccucci and Lanza, Hystrix, It. J. Mamm., (ns) 19 (2): 176. - Comments: Riccucci and Lanza (2008: 176) indicate that the genus *Neoromicia* is feminine, therefore the spelling of the species ending must also be feminine according to Art. 31.2 of the ICZN (1999). (Name Combination).
2013. *Neoromicia bruneus:* Juste, Benda, Garcia-Mudarra and Ibáñez, Zool. Scr., 42 (5): 455. Publication date: September 2013. (Lapsus).
2019. *L[aephotis] brunnea:* M. Taylor, Bats: An illustrated guide to all species, 283. Publication date: 11 April 2019. (Name Combination).
2020. *Laephotis brunneus:* Simmons and Cirranello, BatNames.org. (Current Combination).
2020. *Pseudoromicia brunnea:* Monadjem, Demos, Dalton, Webala, Musila, Kerbis Peterhans and Patterson, Zool. J. Linn. Soc., 191 (4): 1123. Publication date: 10 September 2020. (Current Combination).
? *Neoromicia brunnea:* (Name Combination).
? *Neoromicia brunneus:* (Name Combination).

TAXONOMY:
Mentioned in the genus *Pipistrellus* by Koopman (1994: 117). Included (as "*(Hypsugo) brunneus*") in a separate, unnamed genus by Hoofer and Van Den Bussche (2003: 38).

Helbig *et al.* (2010: 168) suggest that *brunneus* needs to be transferred to a genus that needs to be newly created or resurrected from the current synonymy.

Riccucci and Lanza (2008) indicate that the genus *Neoromicia* is feminine, therefore the species name *brunneus* must be corrected into *brunnea*. This suffix change is still valid after its transfer to the genus *Pseudoromicia* by

Monadjem *et al.* (2020a: 1140) as a result of their analyses of cyt *b* sequences.

COMMON NAMES:
Czech: netopýr kalabarský. English: Brown Pipistrelle Bat, Dark-brown Pipistrelle Bat, Dark-brown Serotine. French: Sérotine brune d'Afrique, Sérotine brun-noire. German: Dunkelbraune Zwergfledermaus, Dunkelbraune Pipistrelle.

CONSERVATION STATUS:
Global Justification
Listed as Near Threatened (NT ver 3.1 (2001)) as its global population is suspected to have declined by ca 25% over the past 10 years (two generations) and will likely continue to decline at a similar rate over the next 5 years (one generation; generation length: 5 years) making it close to qualifying as threatened under criterion A4c. Its extent of occurrence (EOO), area of occupancy (AOO), and habitat is projected to continue to decline due to continuing threats from forest loss and degradation for agricultural use (Cooper-Bohannon and Fahr, 2020).

Assessment History
Global
2019: NT A4c ver 3.1 (2001) [assessed as "*Neoromicia brunnea*"] (Cooper-Bohannon and Fahr, 2020). 2008: NT ver 3.1 (2001) [assessed as "*Pipistrellus brunneus*"] (Fahr, 2008f; IUCN, 2009). 2004: NT ver 3.1 (2001) [assessed as "*Neoromicia brunneus*"] (Fahr, 2004k; IUCN, 2004). 1996: LR/nt [assessed as "*Eptesicus brunneus*"] (Baillie and Groombridge, 1996).

Regional
None known.

MAJOR THREATS:
This species is threatened by deforestation resulting from logging operations, and the conversion of its habitat to agricultural use (Fahr, 2008f; IUCN, 2009; Cooper-Bohannon and Fahr, 2020).

CONSERVATION ACTIONS:
Fahr (2008f) [in IUCN (2009)] there appear to be no conservation measures in place for this species. There is a need to establish and manage suitable protected areas for this species. Cooper-Bohannon and Fahr (2020) report that this species has been recorded from several protected areas including Tai and Comoe National Parks in Ivory Coast and East Nimba Nature Reserve in Liberia. However, due to its habitat specificity, there is a need to establish and manage further suitable protected areas for this species. There is a need for further research to better understand the species distribution and ecology (particularly roosting and foraging requirements) and to identify important areas for this species. Other research needs include: population size and trend data, ecology (i.e. diet, reproduction, roosting requirement) and significant threats (Cooper-Bohannon and Fahr, 2020).

GENERAL DISTRIBUTION:
Pseudoromicia brunnea is known from a few widespread localities in West and Central Africa. It ranges from Sierra Leone in the west, to Congo in the east. The distribution is believed to be patchy, as surveys have generally been unable to locate this species outside of its known range.

Native: Cameroon; Congo (Bates *et al.*, 2013: 325 - 1st authenticated record); Côte d'Ivoire; Equatorial Guinea (Bioko); Gabon; Ghana; Liberia; Nigeria; Sierra Leone.

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Tragus: Monadjem *et al.* (2013c: 204) present a line drawing of the tragi of specimen DNSM 13229 from Mount Nimba, Liberia.

DETAILED MORPHOLOGY:
Baculum
The basal lobes in the lateral view were broadest near the shaft base, tapering to a rounded end and were flattened at the bottom, giving them a 'shoe-like' appearance (Monadjem *et al.*, 2013c: 197). Line drawing of dorsal and ventral bacula of specimen DNSM 13229 from Mount Nimba, Liberia are shown in Monadjem *et al.* (2013c: 204).

MOLECULAR BIOLOGY:
Karyotype
McBee *et al.* (1987) reported 2*n*=36, FN=50, BA = 16, a submetacentric X chromosome and an acrocentric Y chromosome.

Volleth *et al.* (2023c: 41) reported 2*n*=36, FNa=50 and seven large to medium meta- to submetacentric, one small submetacentric, and nine small acrocentric autosomal pairs. The X chromosome is a medium-sized submetacentric and the Y chromosome a small bi-armed one;

GENETICS
See Hoofer and Van Den Bussche (2003).

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:

Figure 395. Clockwise from top lateral, ventral and dorsal skull images of NHMUK 1880.7.21.7, holotype of *Vesperugo* (*Vesperus*) *brunneus* Thomas, 1880.

HABITAT:
Monadjem *et al.* (2016y: 369) recorded this species from forested habitats between 400 and 520 m altitude in the Mount Nimba area.

DIET:
Cabrera-Campos *et al.* (2021: Suppl.) estimated the food transit time for these bats to be about 86 minutes, and the digestibility rate about 78.8 %.

POPULATION:
Structure and Density
Although there are limited data available on the global population for this species (Fahr, 2008f; IUCN, 2009), it is suspected to be declining, but currently not at a rate for it to be designated as threatened. It has a very wide distribution and probably occurs across the Upper Guinea region wherever forest patches remain. However, it is never caught in large numbers (usually in ones and twos) and it is not clear if this reflects its social organisation or reflects its population densities (Cooper-Bohannon and Fahr, 2020).

Trend
2019: Decreasing (Cooper-Bohannon and Fahr, 2020). 2008: Decreasing (Fahr, 2008f; IUCN, 2009).

PARASITES:
DIPTERA
Nycteribiidae
Tripselia echinata Theodor 1957 from Old Calabar, Nigeria (Haeselbarth *et al.*, 1966: 113).

VIRUSES:
Rhabdoviridae
Cameron *et al.* (2021: 2) reported a new rhabdovirus from a "*Neoromicia brunnea*" captured in the Republic of Congo.

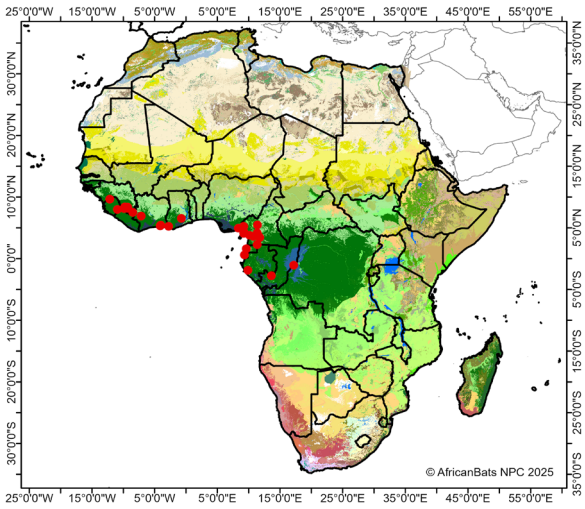

Figure 396. Distribution of *Pseudoromicia brunnea*.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Cameroon, Congo, Congo (Democratic Republic of the), Côte d'Ivoire, Equatorial Guinea, Gabon, Ghana, Guinea, Liberia, Nigeria, Sierra Leone.

Pseudoromicia isabella (Decher, Hutterer and Monadjem, 2016)

2013. *Neoromicia cf. rendalli:* Monadjem, Richards, Taylor and Stoffberg, Zool. J. Linn. Soc., 167 (1): 194. Publication date: 18 January 2013. (Name Combination).

*2016. *Neoromicia isabella* Decher, Hutterer and Monadjem, in: Decher et al., Acta Chiropt., 17 (2): 260, 101967, figs 4,6,7B-C, 8 (for 2015). Publication date: 27 January 2016. Type locality: Guinea: Macenta Province: Simandou Range: Foko Confluence [08 29 48.62 N 08 54 48.22 W, 765 m]. Holotype: ZFMK MAM-2008.0292: ad ♂, skull and alcoholic. Collected by: Jan Decher; collection date: 7 March 2008; original number: JD 650. COI sequence GenBank nr. KT598187 (see Decher *et al.*, 2016: 267). Paratype: ZFMK MAM-2008.0291: ad ♀, alcoholic (skull not removed). Collected by: Jan Decher; collection date: 7 March 2008; original number: JD 647. - Etymology: "The species epithet refers (as a noun in apposition) to the 'Isabella' colouration (sensu Ridgeway, 1912) of the dorsal fur of this bat, and also recalls the name of Jan Decher's daughter Isabelle." (see Decher *et al.*, 2016: 267). - ZooBank: 5F782E04-64B5-40EA-8315-92A56DAE3EA8.

2019. *L[aephotis] isabella:* M. Taylor, Bats: An illustrated guide to all species, 283. Publication date: 11 April 2019. (Name Combination).

2020. *Pseudoromicia isabella:* Monadjem, Demos, Dalton, Webala, Musila, Kerbis Peterhans and Patterson, Zool. J. Linn. Soc., 191 (4): 1123. Publication date: 10 September 2020. (Current Combination).
? *Neoromicia cf. rendalli SaSt-2013*

TAXONOMY:
Originally described in the genus *Neoromicia*, but transferred to *Laephotis* by Taylor (2019a: 283). However, based on cyt *b* sequence analyses, Monadjem *et al.* (2020a: 1125) transferred this species to the genus *Pseudoromicia*, although the indicate that the single sequence was on a long branch from the other species assigned to this genus.

COMMON NAMES:
English: Isabelline White-winged Serotine. German: Isabell-Weissflügel Serotine.

CONSERVATION STATUS:
Global Justification
This species is listed as Data Deficient (DD ver 3.1 (2001)) because this species so far is only known from two specimens in the Simandou Range of Guinea, and one specimen from Mount Nimba, Liberia, both areas threatened by iron ore mining (Decher *et al.*, 2017). There is inadequate information to make an assessment of risk of extinction based on distribution or population status (Decher *et al.*, 2017).

Assessment History
Global
2016: DD ver 3.1 (2001) (Decher *et al.*, 2017).

Regional
None known.

MAJOR THREATS:
This species is threatened by deforestation from conversion of its habitat to agricultural use and due to mining activities (Decher *et al.*, 2017).

CONSERVATION ACTIONS:
Decher *et al.* (2017) report that the single known Guinea locality is part of the Forêt Classée du Pic de Fon (Forest Reserve) but also inside an iron ore mining concession. The Liberia site is highly degraded, but is close to East Nimba Nature Reserve, where the species may also occur.

POPULATION:
There is not enough information about population abundance of this species (Decher *et al.*, 2017).

Trend:- 2016: Unknown (Decher *et al.*, 2017).

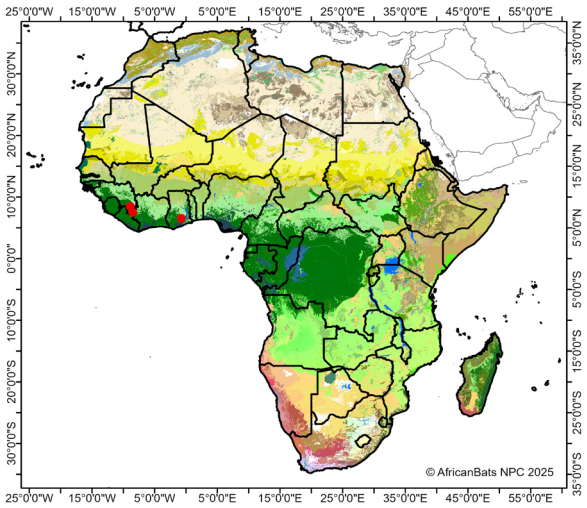

Figure 397. Distribution of *Pseudoromicia isabella*.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Ghana, Guinea, Liberia.

Pseudoromicia kityoi Monadjem, Kerbis Peterhans, Nalikka, Waswa, Demos and Patterson, 2020

*2020. *Pseudoromicia kityoi* Monadjem, Kerbis Peterhans, Nalikka, Waswa, Demos and Patterson, in: Monadjem et al., Zool. J. Linn. Soc., 191 (4): 1120 1133, figs 5B, 9. Publication date: 10 September 2020. Type locality: Uganda: Central region: Mukono District: Mabira Forest Reserve, 0.79 km NE Nagojje Station [00 26 42 N 32 53 20 E, 1130 m]. Holotype: FMNH 223211: ad ♂, skull and alcoholic and tissue. Collected by: Betty Nalikka and Sadic Babyesiza Waswa; collection date: 19 October 2012; original number: JCK-7436. Paratype: FMNH 223555: ad ♂. Collected by: Julian C. Kerbis Peterhans; collection date: 19 October 2012; original number: JCK-7434. - Etymology: In honour of Dr. Robert M. Kityo, mammalogist, mentor and longserving curator at the Museum of Zoology, Makerere University, in recognition of his valuable contributions to bats and small mammal research in the region (see Monadjem *et al.*, 2020a: 1133). (Current Combination).

COMMON NAMES:
English: Kityo's serotine

CONSERVATION STATUS:
Monadjem *et al.* (2020a; 1136) suggest assigning "Data Deficient" status to this species.

GENERAL DISTRIBUTION:
Monadjem *et al.* (2020a: 1136) suggest that this species is also present in the Congo Basin forest patches in Uganda (e.g., Semliki, Kibale, Kashyoha-Kitomi) and Kenya (Kakamega),

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Uganda.

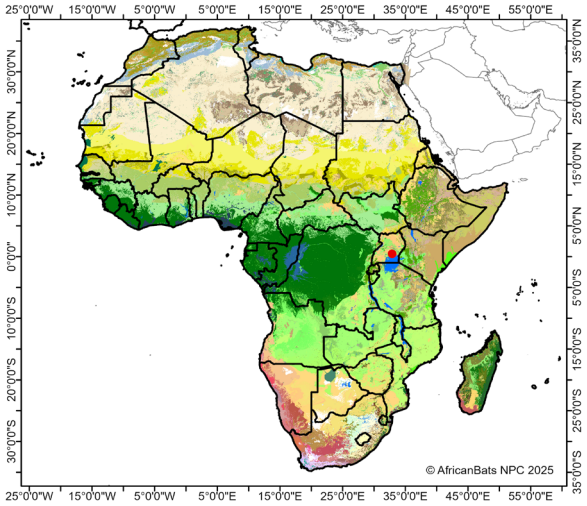

Figure 398. Distribution of *Pseudoromicia kityoi*.

Pseudoromicia mbamminkom Grunwald, Demos, Nguéagni, Tchamba, Monadjem, Webala, Kerbis Peterhans, Patterson and Ruedas, 2023

*2023. *Pseudoromicia mbamminkom* Grunwald, Demos, Nguéagni, Tchamba, Monadjem, Webala, Kerbis Peterhans, Patterson and Ruedas, Syst. Biod., 21 (1), 2156002: 6, 7, figs 7 - 13. Publication date: 18 January 2023. Type locality: Cameroon: Centre region: NW slope of Mount Mbam Minkom: near the village of Nkolakie (also spelled Nkolakié) [03 58 09 N 011 22 50 E, 785 m]. Holotype: FMNH 240714: ad ♀, skull and alcoholic. Collected by: Amanda L. Grunwald, Yvette Nguéagni and Luis A. Ruedas; collection date: 14 August 2019; original number: ALG 23. not pregnant nor lactating. - Etymology: A noun in apposition, referring to the type locality (Grunwald *et al.*, 2023: 7).

COMMON NAMES:
English: Mbam Minkom Serotine

CONSERVATION STATUS:
Grunwald *et al.* (2023: 14) suggest an IUCN status of "Data Deficient", but also indicate that "*P. mbamminkom* may be facing a higher risk of extinction in the wild than its IUCN designation of DD would suggest."

GENERAL DISTRIBUTION:
Only known from the type locality.

DENTAL FORMULA:
The permanent dental formula is as follows: $I^2/_3$, $C^1/_1$, $PM^1/_2$, $M^3/_3$ = 32 (Grunwald *et al.*, 2023: 9).

ECHOLOCATION:
From the Mbam Minkom Massif (Cameroon), Werb *et al.* (2024: 287) reported the following for 22 calls of 1 bat: F_{peak}: 41.6 ± 2.4 (36.0 - 42.9) kHz, F_{min}: 34.2 ± 0.8 (33.5 - 36.8) kHz, F_{max}: 58.4 ± 1.5 (55.6 - 68.4) kHz, duration: 2.5 ± 0.3 (2.0 - 2.9) ms.

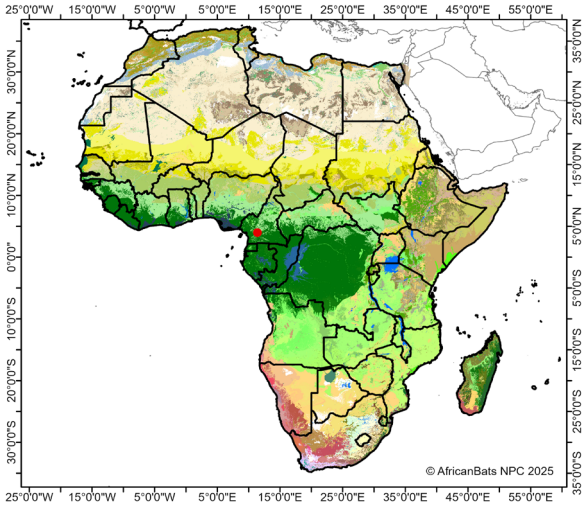

Figure 399. Distribution of *Pseudoromicia mbamminkom*.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Cameroon.

Pseudoromicia nyanza Monadjem, Patterson, Webala and Demos, 2020

2012. *Neoromicia tenuipinnis:* Patterson and Webala, Field. Life Earth Sc., 6: 43. Publication date: 29 November 2012. - Comments: See Monadjem *et al.* (2020a: 1136), who also assigned the *tenuipinnis* specimens referred to by Musila *et al.* (2019b: 127) and Rydell *et al.* (2019: 150) to this species.

*2020. *Pseudoromicia nyanza* Monadjem, Patterson, Webala and Demos, in: Monadjem et al., Zool. J. Linn. Soc., 191 (4): 1120, 1136, figs 8B,10. Publication date: 10 September 2020. Type locality: Kenya: Kisumu county (formerly Nyanza province): Kisumu Impala Sanctuary, State Lodge Campsite [00 06 34 S 34 44 46 E, 1130 m]. Holotype: FMNH 215626: ad ♂, skull and alcoholic and tissue. Collected by: Bruce D. Patterson, Paul W. Webala and Carl W. Dick; collection date: 8 January 2021; original number: BDP-5719. Paratype: FMNH 215625: ♀. Collected by: Bruce D. Patterson; collection date: 8 January 2012; original number: BDP-5697. Paratype: FMNH 215627: ♀. Collected by: Bruce D. Patterson; collection date: 8 January 2012; original number: BDP_5721. Paratype: FMNH 215628: ♀. Collected by: Bruce D. Patterson; collection date: 8 January 2012; original number: BDP-5722. Paratype: FMNH 215629: ♀. Collected by: Bruce D. Patterson; collection date: 8 January 2012; original number: BDP-5723. - Etymology: The name refers to the region where it was found: former Nyanza province, which in turn is a Bantu word, meaning a large body of water (see Monadjem *et al.*, 2020a: 1137). (Current Combination).

2025. *Pseudoromlcia cf. nyanza:* Torrent, Juste, Garin, Aihartza, Dalton, Mamba, Tanshi, Powell, Padidar, Garcia Mudarra, Richards and Monadjem, Zool. J. Linn. Soc., 204 (2): 5, 7. Publication date: 13 June 2025. (Name Combination).

COMMON NAMES:
English: Nyanza serotine

CONSERVATION STATUS:
Monadjem *et al.* (2020a: 1138) suggest assigning this species to the "Least Concern" category.

GENERAL DISTRIBUTION:
Monadjem *et al.* (2020a: 1138) report it from western Kenya, and possibly eastern Uganda.

Benda *et al.* (2025: 99) mention that Monadjem *et al.* (2024) assigned 55 eastern African *Pseudoromicia tenuipinnis* specimens to *P. nyanza* This would result in *P. nyanza* being distributed from NW DRC, SW Ethiopia, central Kenya, N Tanzania, and W Burundi.

ECHOLOCATION:
The type specimen's echolocated calls had a peak frequency (start and end frequencies) of 40.4 kHz (56.4 - 39.3 kHz). The peak frequency of 16 other specimens from the type locality was 40.4 ± 0.84 (55.1 ± 7.91 to 39.5 ± 0.68) kHz (Monadjem *et al.*, 2020a: 1138).

PARASITES:
DIPTERA
Nycteribiidae
Dick *et al.* (2023: 74) found *Basilia (Basilia) robusta* Theodor, 1956 on *Pseudoromicia nyanza*:from Kisumu Impala Sanctuary (Kenya).

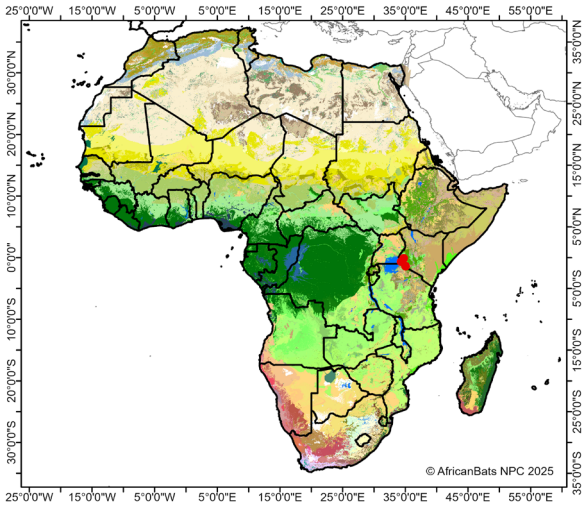

Figure 400. Distribution of *Pseudoromicia nyanza*.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Kenya.

Pseudoromicia principis Juste, Torrent, Méndez-Rodríguez, Howard, García-Mudarra, Nogueras and Ibáñez, 2023

*2023. *Pseudoromicia principis* Juste, Torrent, Méndez-Rodríguez, Howard, García-Mudarra, Nogueras and Ibáñez, J. Mamm., 104 (2): 365, 366, figs 3 - 5, 6A, 6Bc, 6Ce,6Dh, 7. Publication date: 11 January 2023. Type locality: São Tomé and Príncipe: Santo António: Río Papagaio [01 40 00 N 07 25 00 E, 0 m]. Holotype: EBD 17475M: ad ♀, skin and skeleton and skull. Collected by: Carlos J. Ibáñez Uargui and Javier Juste; collection date: 26 March 1988; original number: B6718. Paratype: EBD 17358M: sad ♂, skull and alcoholic. Collected by: Carlos J. Ibáñez Uargui and Javier Juste; collection date: 30 March 1988. Paratype: EBD 29604M: ad ♀, skull and alcoholic. Collection date: 3 November 1992. Paratype: EBD 29605M: ad ♀, skull and alcoholic. Collection date: 3 November 1992. Paratype: EBD 29606M: ad ♀, skull and alcoholic. Collection date: 12 November 1992. Paratype: EBD 29607M: ad ♂, skull and alcoholic. Collection date: 12 November 1992. - Etymology: In reference to the island where the type locality is situated (see Juste *et al.*, 2023: 9).

COMMON NAMES:
English: Principe's Pipistrelle

CONSERVATION STATUS:
Juste *et al.* (2023: 9) suggest to list this species as "Data Deficient" since hardly anything is known about its ecological requirements.

GENERAL DISTRIBUTION:
This species is restricted to the island of Príncipe in the Gulf of Guinea.

DENTAL FORMULA:
The permanent dental formula is as follows: $I^2/_3$, $C^1/_1$, $PM^1/_2$, $M^3/_3$ = 32 (Juste *et al.*, 2023: 7).

DETAILED MORPHOLOGY:
Juste *et al.* (2023: 9) indicate that *P. principis* is the smallest member of the genus, with skull dimensions not overlapping with any other *Pseudoromicia* species.

ECHOLOCATION:
Forty calls analysed by Juste *et al.* (2023: 8) had the following characteristics: F_{start}: 55.47 ± 8.43 (44.75 - 74.05) kHz; F_{end} : 44.71 ± 1.44 (41.92 - 47.83) kHz; F_{peak}: 45.69 ± 1.26 (43.9 - 48.3) kHz; Duration: 5.82 ± 1.39 (5.32 - 9.41) ms; Inter-pulse interval: 90.55 ± 8.89 (72 - 114.7) ms.

HABITAT:
Palmeirim *et al.* (2025: 6, 9) indicated that *Pseudoromicia principis* is an edge forager, which they found in all of the land-use cover types they sampled (old-regrowth forests, secondary regrowth forests, agricultural areas and urban/bare soil areas).

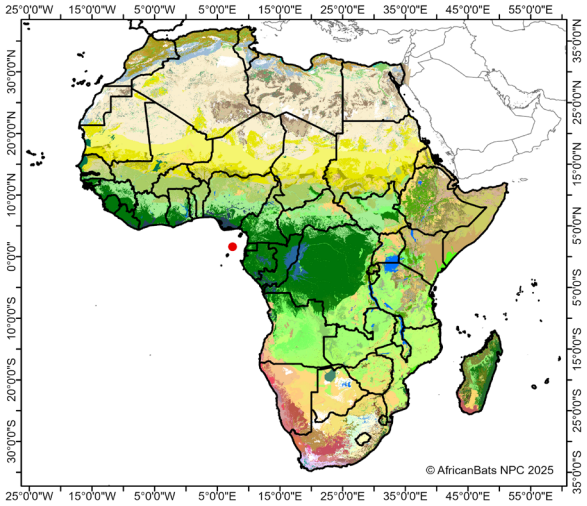

Figure 401. Distribution of *Pseudoromicia principis*.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
São Tomé and Príncipe.

Pseudoromicia rendalli (Thomas, 1889)

*1889. *Vesperugo (Vesperus) Rendalli* Thomas, Ann. Mag. nat. Hist., ser 6, 3 (16): 362, fig 1. Publication date: 1 April 1889. Type locality: The Gambia: Bathurst [=Banjul] [13 28 N 16 39 W]. [Goto Description]. Holotype: NHMUK 1889.3.2.3: ad ♂, skull and alcoholic. Collected by: Dr. Percy John Rendall. See Thomas (1889: 26-7). - Etymology: In honour of Dr. Percy Rendall (1861 - 1948), an English zoologist and the collector of the type specimen (see Thomas, 1889: 364; Smithers, 1983: 102; Taylor, 2005; Lanza *et al.*, 2015: 428).

1897. *Vesperugo (Eptesicus) rendalli:* Thomas, Proc. zool. Soc. Lond., 1896, IV: 791. Publication date: April 1897. (Name Combination).

1899. *Vesperugo Rendalli:* Trouessart, Catalogus Mammalium tam viventium quam fossilium, fasc VI: 1280. (Name Combination).

1911. *Eptesicus phasma* G.M. Allen, Bull. Mus. comp. Zool., 54 (6): 327. Publication date: December 1911. Type locality: Kenya: Northern Guaso Nyiro: Meru River: effluent of northern Guaso Nyiro [=Ewaso Ngiro] [00 03 N 37 39 E]. [Goto Description]. Holotype: MCZ 8279: ad ♂, skin and skull. Collected by: Glover Morrill Allen; collection date: 6 August 1909; original number: 94. See Allen (1911: 327). - Comments: Coordinates of the type locality mentioned as 00 31 N 37 40 E by Thorn *et al.* (2009: 56). The MCZ also has a small series of paratypes (see Helgen and McFadden, 2001: 14).

1917. *Eptesicus faradjius* J.A. Allen, Bull. Am. Mus. Nat. Hist., 37 (18): 444. Publication date: 29 September 1917. Type locality: Congo (Democratic Republic of the): Oriental province: Uele district: Faradje [03 44 N 29 43 E]. [Goto Description]. Holotype: AMNH 49045: ad ♀, skin and skull. Collected by: Herbert Lang, James Paul Chapin and The American Museum Congo Expedition; collection date: 21 February 1911; original number: 1914. Topotype: AMNH 49044: ♀, skin and skull. Collected by: Herbert Lang, James Paul Chapin and The American Museum Congo Expedition. Topotype: AMNH 49048: ♂, skin and skull. Collected by: Herbert Lang, James Paul Chapin and The American Museum Congo Expedition. Topotype: AMNH 49049: ♀, skin only. Collected by: Herbert Lang, James Paul Chapin and The American Museum Congo Expedition. Topotype: AMNH 49051: ♂, skin only. Collected by: Herbert Lang, James Paul Chapin and The American Museum Congo Expedition. Topotype: AMNH 49052: ♂, skin and skull. Collected by: Herbert Lang, James Paul Chapin and The American Museum Congo Expedition. Topotype: AMNH 49053: ♂, skin and skull. Collected by: Herbert Lang, James Paul Chapin and The American Museum Congo Expedition. Topotype: AMNH 49054: ♂, skin and skull. Collected by: Herbert Lang, James Paul Chapin and The American Museum Congo Expedition. Topotype: AMNH 49055: ♀, skin and skull. Collected by: Herbert Lang, James Paul Chapin and The American Museum Congo Expedition. - Comments: The museum label mentions 1414 as original number.

1926. *Eptesicus rendalli:* Cabrera and Ruxton, Ann. Mag. nat. Hist., ser 9, 17 (103): ???. Publication date: 1 May 1926. (Name Combination).

1953. *Eptesicus (Eptesicus) rendalli:* Ellerman, Morrison-Scott and Hayman, Southern African mammals 1758 to 1951, 77. (Name Combination).

1965. *E[ptesicus rendalli] phasma:* Koopman, Am. Mus. Novit., 2219: 14. (Name Combination).

1965. *Eptesicus rendalli faradjius:* Koopman, Am. Mus. Novit., 2219: 14. (Name Combination).

1968. *Eptesicus rendalli phasma:* Funaioli and Lanza, Mon. Zool. ital., (NS) 2 (Suppl): 200. (Name Combination).

1975. *E[ptesicus (Eptesicus)] r[endalli] phasma:* Koopman, Bull. Am. Mus. Nat. Hist., 154 (4): 409. (Name Combination).

1984. *Eptesicus (Eptesicus) rendalli phasma:* Anciaux de Faveaux, Ann. Kon. Mus. Mid. Afr., Zool. Wetensch. (Name Combination).
1984. *Eptesicus (Eptesicus) rendalli rendalli:* Anciaux de Faveaux, Ann. Kon. Mus. Mid. Afr., Zool. Wetensch. (Name Combination).
1987. *Nycterikaupius rendalli:* Menu, Palaeovert., 17 (3): 109. Publication date: 15 November 1987. (Name Combination).
1987. *Pipistrellus (Neoromicia) rendalli:* Hill and Harrison, Bull. Br. Mus. (nat. Hist.) Zool., 52 (7): 282. (Name Combination).
1992. *Eptesicus rendallii:* Rautenbach and Fenton, Z. Säugetierk., 57: 113. (Lapsus).
1993. *Eptesicus (Neoromicia) rendalli:* Koopman, in: Wilson and Reeder, Mammal species of the World (2nd Edition): Chiroptera, 203. (Name Combination).
1994. *E[ptesicus (Neoromicia)] r[endalli] phasma:* Koopman, in: Niethammer, Schliemann and Starck, Handbook of Zoology, volume II (Mammalia) Chiroptera, (60) 117. (Name Combination).
1994. *E[ptesicus (Neoromicia)] r[endalli] rendalli:* Koopman, in: Niethammer, Schliemann and Starck, Handbook of Zoology, volume II (Mammalia) Chiroptera, (60) 117. (Name Combination).
1995. *Pipistrellus rendalli:* Koopman, Kofron and Chapman, Am. Mus. Novit., 3148: 11. (Name Combination).
2002. *Neoromicia rendalli:* Kearney, Volleth, Contrafatto and Taylor, Acta Chiropt., 4 (1): 58. (Name Combination).
2002. *Pipistrellus r[endalli] phasma:* Kock, Barnett, Fahr and Emms, Acta Chiropt., 4 (1): ???. (Name Combination).
2003. *? (Hypsugo) rendalli:* Hoofer and Van Den Bussche, Acta Chiropt., 5 (Suppl): 38. (Name Combination).
2008. *Vesperus hösemanni* Turni and Kock, Zootaxa, 1869: 82. - Comments: Turni and Kock (2008: 82) mention this name as a label name, introduced by Matschie, on ZMB 10096 from Tanzania, Lake Tanganyika, Ujiji, an adult male, skull and alcoholic, and tentatively linked it to "*Neoromicia* cf. *tenuipinnis*". Since this name has not been published before, Turni and Kock should be considered the authors. Monadjem *et al.* (2010d: 477) considered it a synonym of "*Neoromicia rendalli*".
2017. *Neromicia cf. rendalli:* Reardon and Schoeman, Acta Chiropt., 19 (2): Suppl. Publication date: December 2017. (Lapsus).
2019. *L[aephotis] rendalli:* M. Taylor, Bats: An illustrated guide to all species, 283. Publication date: 11 April 2019. (Name Combination).
2020. *Pseudoromicia rendalli:* Monadjem, Demos, Dalton, Webala, Musila, Kerbis Peterhans and Patterson, Zool. J. Linn. Soc., 191 (4): 1123. Publication date: 10 September 2020. (Current Combination).
? *Neoromicia rendalli faradjius:* (Name Combination).
? *Neoromicia rendalli phasma:* (Name Combination).
? *Neoromicia rendalli rendalli:* (Name Combination).
? *Neoromicia rueppellii:* (Alternate Spelling).
? *Pipistrellus (Neoromicia) rendalli rendalli:* (Name Combination).

TAXONOMY:

Figure 402. *Pseudoromicia rendallii* (ECJS-44/2009), caught at Chitabe, Okavango, Botswana.

Mentioned in the genus *Pipistrellus* by Koopman (1994: 117). Volleth *et al.* (2001: 44) assigned this species to the genus *Neoromicia*. Reviewed by Kock *et al.* (2002b: 89). Included (as (*Hypsugo*) *rendalli*) in a separate, unnamed genus by Hoofer and Van Den Bussche (2003: 38).

Helbig *et al.* (2010: 168) suggest that *rendalli* needs to be transferred to a genus that needs to be newly created or resurrected from the current synonymy. The species was transferred to the genus *Leaphotis* by Taylor (2019a: 283), but subsequently transferred again to *Pseudoromicia* by Monadjem *et al.* (2020a: 1132) based on analyses of cyt-*b* sequences.

COMMON NAMES:

Afrikaans: Rendall se dakvlermuis, Rendal-dakvlermuis. Chinese: 任氏伏翼. Czech: netopýr Rendallův. English: Rendall's Serotine, Rendall's Serotine Bat, Rendall's Pipistrelle Bat, Rendall's Pipistrelle. French: Serotine de Rendall, Pipistrelle de Rendall. German: Rendalls Zwergfledermaus, Rendalls Pipistrelle. Italian: Pipistrèllo di Rèndall. Portuguese: Morcego caseiro de Rendall.

CONSERVATION STATUS:

Global Justification

Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Jacobs *et al.*, 2008w; IUCN, 2009; Monadjem *et al.*, 2017ct).

Assessment History

Global

2016: LC ver 3.1 (2001) [assessed as "*Neoromicia rendalli*"] (Monadjem *et al.*, 2017ct). 2008: LC ver 3.1 (2001) [assessed as "*Pipistrellus rendalli*"] (Jacobs *et al.*, 2008w; IUCN, 2009). 2004: LC ver 3.1 (2001) (Jacobs *et*

al., 2004ad; IUCN, 2004). 1996: LR/lc (Baillie and Groombridge, 1996).

Regional
South Africa: 2016: LC ver 3.1 (2001) (Monadjem *et al.*, 2016ab). 2004: CR B2ab(iii) ver 3.1 (2001) (Friedmann and Daly, 2004).

MAJOR THREATS:
In general, there appear to be no major threats to this species. In some parts of its range, this species is threatened by the conversion of its habitat to agricultural use (Jacobs *et al.*, 2008w; IUCN, 2009; Monadjem *et al.*, 2017ct).

CONSERVATION ACTIONS:
Jacobs *et al.* (2008w) [in IUCN (2009)] and Monadjem *et al.* (2017ct) report that there appear to be no direct conservation measures in place. It is not known if the species is present in any protected areas. Further research is needed into the distribution of this patchily recorded species.

GENERAL DISTRIBUTION:
Pseudoromicia rendalli has been widely, but patchily, recorded over much of sub-Saharan Africa. It ranges from Senegal in the west, through West and Central Africa to Somalia in the east, and as far south as eastern South Africa.

Native: Benin (Capo-Chichi *et al.*, 2004: 163); Botswana (Archer, 1975; Monadjem *et al.*, 2010d: 569); Burkina Faso (Kangoyé *et al.*, 2012: 6026; 2015a: 621); Cameroon; Central African Republic; Chad; Congo; Congo (The Democratic Republic of the) (Hayman *et al.*, 1966; Gallagher and Harrison, 1977; Monadjem *et al.*, 2010d: 569); Gambia; Ghana; Kenya; Liberia (Fahr, 2007a: 104); Malawi (Happold *et al.*, 1988; Monadjem *et al.*, 2010d: 569); Mali (Meinig, 2000: 105); Mozambique (Smithers and Lobão Tello, 1976; Monadjem *et al.*, 2010d: 569; Monadjem *et al.*, 2010c: 384); Niger; Nigeria; Rwanda; Senegal; Sierra Leone; Somalia; South Africa [KwaZulu Natal] (Kearney and Taylor, 1997: 54; Monadjem *et al.*, 2010d: 569); Sudan; Tanzania; Togo; Uganda; Zambia (Ansell, 1969; Ansell, 1974; Cotterill, 2004a: 261; Monadjem *et al.*, 2010d: 569); Zimbabwe (Monadjem *et al.*, 2010d: 569).

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Tragus: Monadjem *et al.* (2013c: 204) line drawing of tragi of specimen DNSM 12619 referred to as "*L[aephotis] cf. rendalli*" from Mount Nimba, Liberia.

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:

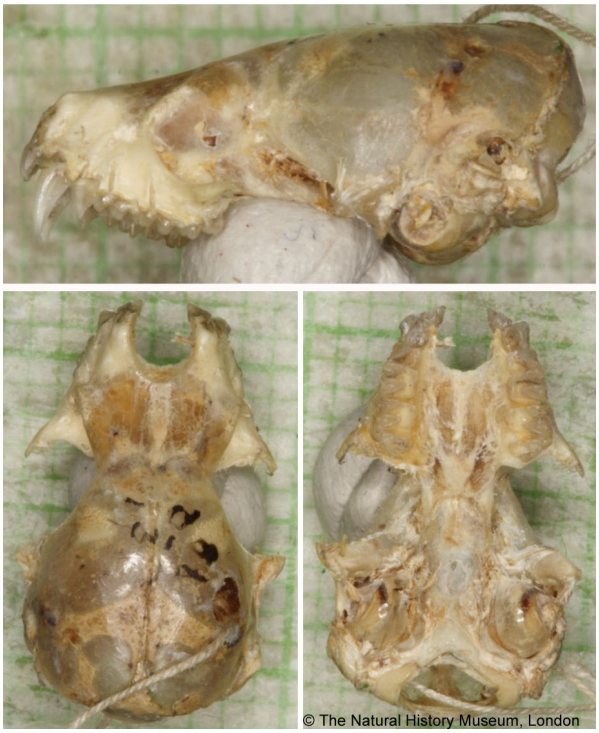

Figure 403. Clockwise from top lateral, ventral and dorsal skull images of NHMUK 1889.3.2.3, holotype of *Vesperugo* (*Vesperus*) *rendalli* Thomas, 1889.

In their study on the reversibility of the mandibular symphyseal fusion, Scott *et al.* (2012: 2943) report that this symphysis is unfused, with smooth surfaces.

DETAILED MORPHOLOGY:
Baculum
Hill and Harrison (1987) and Kearney *et al.* (2002). The baculum of *L[aephotis]* cf. *rendalli* was longer in total length (2.97 mm). The angle of shaft curvature, measured from mid-shaft to the shaft base, was more acute in *N. tenuipinnis* (43°) than in *L.* cf. *rendalli* (58°) (Monadjem *et al.*, 2013c: 197). Line drawing of the dorsal and ventral view of the baculum of specimen DNSM 12619 from Mount Nimba, Liberia referred to as *N.* cf. *rendalli* are shown in Monadjem *et al.* (2013c: 204).

Brain
Amrein *et al.* (2007), from specimens collected from Benin, reported that proliferating cells, detected with Ki-67 and MCM2, in the subgranular layer of the dentate gyrus was found to be absent. Amrein *et al.* (2007) also reported moderate to ample proliferating cells (Ki-67 positive cells) and migrating young neurons (DCX positive cells) in the rostral migratory stream. Amrein *et al.* (2007) furthermore detected few DCX positive cells in the rostral migratory stream and the olfactory bulb.

ECHOLOCATION:
Musila *et al.* (2018c: 43) [referring to Van Cakenberghe and Happold (2013p: 646)] mention a starting frequency of up to 76 kHz and an ending frequency of 42 - 44 kHz.

Roemer *et al.* (2021: Suppl.) categorized the bat's call as a FMd-QCF (Frequency modulation downward - quasi-constant frequency) sonotype [as "*Neoromicia rendalli*"].

MOLECULAR BIOLOGY:
Karyotype
McBee *et al.* (1987), Rautenbach and Fenton (1992) and Kearney *et al.* (2002) all recorded 2*n* = 38, FN = 50, BA = 14, and a submetacentic X chromosome. Rautenbach and Fenton (1992) and Kearney *et al.* (2002) also recorded an acrocentric Y chromosome. GTG-bands identified three Robertsonian fusion chromosomes (7/11, 8/9, 10,12), considered as distinguishing characters for the genus *Neoromicia* Kearney *et al.* (2002).
In Senegal, Koubínová *et al.* (2013: 3) found a very similar karyotype, although they mention the Y chromosome as dot-like and presumably acrocentric.

Genetics
See Hoofer and Van Den Bussche (2003).

ROOST:
In Malawi, Happold and Happold (2023: 160) reported these bats to roost in the fronds of *Hyphaene* palms and in a cotton plant, but in the DRC they were also found in the dense foliage of low bushes and trees, and in huts and houses, where they have been found in groups of up to six animals.

DIET:
Cabrera-Campos *et al.* (2021: Suppl.) estimated the food transit time for these bats to be about 70 minutes, and the digestibility rate about 81.0 %.

POPULATION:
Structure and Density
This appears to be a locally rare species, usually occurring as moderately small colonies of several individuals up to a few dozen animals (Jacobs *et al.*, 2008w; IUCN, 2009; Monadjem *et al.*, 2017ct).

Trend
2016: Unknown (Monadjem *et al.*, 2017ct). 2008: Unknown (Jacobs *et al.*, 2008w; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
Garbino *et al.* (2021: Suppl.) report this species as being polytocous (more than one young per litter).

PARASITES:
ARACHNIDA
Spinturnicidae
Orlova *et al.* (2024: 152) mentioned this species as host for *Spinturnix faini* Benoit, 1959.

DIPTERA
Nycteribiidae
Basilia ansifera Theodor, 1956 mainly a West African species, reaching Lake Victoria in the east and Lake Nyasa in the south, nearly all localities lie between 15° latitude north and south (Haeselbarth *et al.*, 1966: 110). *Basilia bouvieri* (Falcoz, 1924) from Tanzania, Sudan, Senegal and Sierra Leone (Haeselbarth *et al.*, 1966: 111, host referred to as "*Eptesicus phasma*") (see also Dick *et al.*, 2023)..

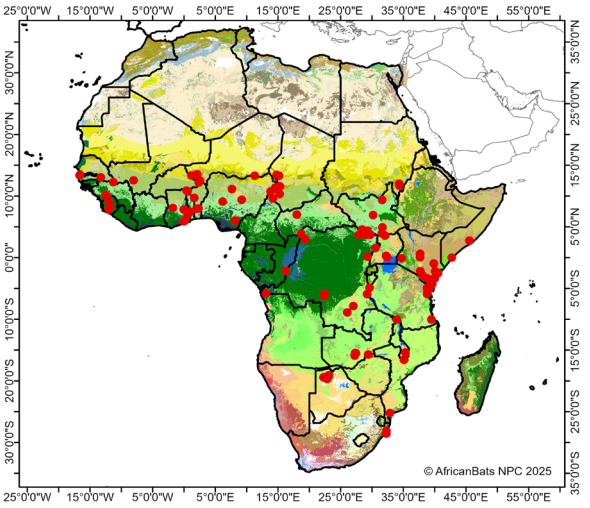

Figure 404. Distribution of *Pseudoromicia rendalli*.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Benin, Botswana, Cameroon, Central African Republic, Chad, Congo (Democratic Republic of the), Ghana, Guinea, Kenya, Malawi, Mali, Mozambique, Niger, Nigeria, Rwanda, Senegal, Sierra Leone, Somalia, South Africa, South Sudan, Sudan, Tanzania, The Gambia, Togo, Uganda, Zambia, Zimbabwe.

Pseudoromicia roseveari (Monadjem, Richards, Taylor and Stoffberg, 2013)

*2013. *Neoromicia roseveari* Monadjem, Richards, Taylor and Stoffberg, Zool. J. Linn. Soc., 167 (1): 191, 197, figs 4 - 7. Publication date: 18 January 2013. Type locality: Liberia: Nimba province: Yiti River [07 29 N 08 35 W]. Holotype: DNSM 12617: ad ♂, skull and alcoholic. Collected by: Dr. Ara Monadjem; collection date: 23 December 2010; original number: AM2010_12_23_1. Paratype: DNSM 13226: ad ♂. Collected by: Dr. Ara

Monadjem; collection date: 23 December 2011; original number: AM2011_12_23_03. - Etymology: In honour of Donovan Reginald Rosevear who made a significant contribution to West African bat research in the 20th century, culminating in his book 'The bats of West Africa' (see Monadjem *et al.*, 2013c: 201).

2019. *L[aephotis] roseveari:* M. Taylor, Bats: An illustrated guide to all species, 283. Publication date: 11 April 2019. (Name Combination).

2020. *Pseudoromicia roseveari:* Monadjem, Demos, Dalton, Webala, Musila, Kerbis Peterhans and Patterson, Zool. J. Linn. Soc., 191 (4): 1123. Publication date: 10 September 2020. (Current Combination).

TAXONOMY:

In the original description, Monadjem *et al.* (2013c) distinguish "*Neoromicia roseveari*" from other similar taxa on molecular grounds, craniodental morphology, and baculum structure.

The species was transferred to the genus *Laephotis* by Taylor (2019a: 283), but Monadjem *et al.* (2020a: 1132) moved it to the genus *Pseudoromicia* based on the results of their cyt *b* sequence analyses.

COMMON NAMES:

German: Rosevears Zwergfledermaus.

CONSERVATION STATUS:

Global Justification

Monadjem (2017e) listed as Endangered (EN B1ab(i,ii,iii)+2ab(i,ii,iii)) because, as currently known, it has an extent of occurrence (EOO) less than 5,000 km^2 and an area of occupancy (AOO) of less than 500 km^2, it is only known from just two populations (estimated to represent two locations), and both populations are under increasing threat of deforestation through logging, mining and slash-and-burn agriculture.

Assessment History

Global

2016: EN B1ab(i,ii,iii)+2ab(i,ii,iii) ver 3.1 (2001) [assessed as *Neoromicia roseveari*] (Monadjem, 2017e).

Regional

None known.

MAJOR THREATS:

The only two populations known are under increasing threat of deforestation through logging, mining and slash-and-burn agriculture (Monadjem, 2017e). This is also the case for the Cameroonian population (Grunwald *et al.*, 2025: 304).

CONSERVATION ACTIONS:

Monadjem (2017e) report that there are currently no known conservation actions for this species. It occurs in the East Nimba Nature Reserve. Ensuring the long-term protection of this reserve may be critical to the survival of this species since the Simandou Range currently has no protected areas and furthermore is being developed for mining.

GENERAL DISTRIBUTION:

Native: Cameroon (1st record: Grunwald *et al.*, 2025: 281); Côte d'Ivoire; Guinea (Decher *et al.*, 2016: 273), Liberia

ECHOLOCATION:

From the Mbam Minkom Massif (Cameroon), Werb *et al.* (2024: 287) reported the following for 20 calls of 2 bats: F_{peak}: 39.9 ± 2.6 (35.7 - 55.3) kHz, F_{min}: 37.9 ± 1.2 (34.8 - 38.8) kHz, F_{max}: 53.1 ± 6.1 (41.2 - 72.8) kHz, duration: 2.0 ± 0.3 (1.6 - 2.4) ms.

HABITAT:

This species has only been recorded in forested habitats at the base of Mount Nimba (Monadjem *et al.*, 2016y: 370). In Cameroon it was captured in intact or minimally disturbed forest (Grunwald *et al.*, 2025: 304).

POPULATION:

Structure and Density

Monadjem (2017e) report that just six specimens of this bat have ever been collected making it impossible to define the size of its population. At Mt Nimba, Liberia, four specimens were collected alongside 11 individuals of the closely related *Pseudoromicia brunnea*.

Trend

2016: Unknown (Monadjem, 2017e).

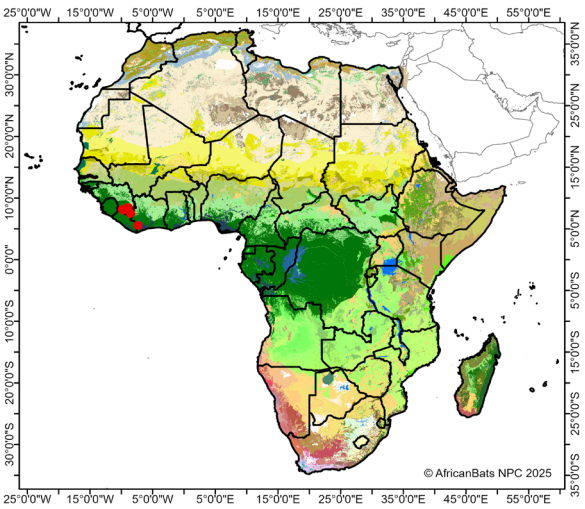

Figure 405. Distribution of *Pseudoromicia roseveari*.

DISTRIBUTION BASED ON VOUCHER SPECIMENS: Côte d'Ivoire, Guinea, Liberia.

Pseudoromicia tenuipinnis (Peters, 1872)

*1872. *Vesperus tenuipinnis* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, 263. Publication date: 1872. Type locality: Guinea: "Guinea". [Goto Description]. Holotype: ZMB 4096: ad ♀. Presented/Donated by: Schlegel. See Turni and Kock (2008), who report it as missing. Neotype: DNSM 13235: ad ♂, skull and alcoholic. Collected by: Dr. Ara Monadjem; collection date: 7 January 2012. Neotype designated by Decher *et al.* (2016: 270). Locality: Liberia: base of Mount Nimba: near Yekepa. - Comments: The publication covers a meeting held on 18 April 1872. Kock (1969a: 162) indicated that the type locality quoted by Ellerman *et al.* (1953: 77, Kuilu River, Congo [B]) is an unjustified assumption. - Etymology: From the feminine scientific Latin adjective *tenuipìnnis*, meaning "slender-winged", made up of the Latin adjective *tènuis*, meaning "slender" and the Latin substantive *pìnna*, meaning "wing": the adjective refers to the slender shape of the wings (see Lanza *et al.*, 2015: 455).

1878. *Vesperugo (Vesperus) tenuipinnis:* Dobson, Catalogue of the Chiroptera of the collection of the British Museum, 200. Publication date: 15 June 1878. (Name Combination).

1889. *Vesperus bicolor* Bocage, J. Sci. mat. phys. nat., ser 2, 1 (1): 5. Publication date: March 1889. Type locality: Angola: Caconda [13 42 S 15 05 E, 1 900 m]. [Goto Description]. Syntype: NHMUK 1889.5.1.3: ad ♂, skull and alcoholic. Collected by: José Alberto de Oliveira Anchieta. Syntype: NHMUK 1889.5.1.5: ad ♂. - Comments: Bocage (1889a: 6) mentions 2 ♀♀ specimens.

1889. *Vesperus tenuipennis:* Noack, Zool. Jb. Syst., 4: 215, 239, 261. (Lapsus).

2025. *Pseudoromicia cf. tenuipinnis:* Torrent, Juste, Garin, Aihartza, Dalton, Mamba, Tanshi, Powell, Padidar, Garcia Mudarra, Richards and Monadjem, Zool. J. Linn. Soc., 204 (2):5, 7. Publication date: 13 June 2025. (Name Combination).

? *Neoromicia tenuipinnis ater:* (Name Combination).
? *Neoromicia tenuipinnis tenuipinnis:* (Name Combination).

GENERAL COMMENTS:
Bocage (1889a: 6) mentions two female specimens only.

TAXONOMY:
Eptesicus bicolor was tentatively included here by Hayman and Hill (1971: 43), but this may be an older name for *Pipistrellus anchietai*; see Koopman (1975: 404). Koopman (1994: 117) mentions this species in the genus *Pipistrellus*.

Helbig *et al.* (2010: 168) suggest that *tenuipinnis* needs to be transferred to a genus that needs to be newly created or resurrected from the current synonymy.

The species was transferred to the genus *Laephotis* by Welch *et al.* (2018: 283), but based on cyt-*b* sequence analyses was transferred once again by Monadjem *et al.* (2020a: 1132) to the genus *Pseudoromicia*.

COMMON NAMES:
Castilian (Spain): Murciélago. Chinese: 白翼伏翼. Czech: netopýr běloblanný. English: Slender-winged Pipistrelle Bat, White-winged Pipistrelle Bat, White-winged Serotine, White-winged Bat. French: Sérotine à ailes blanches, Pipistrelle à ailes blanches. German: Weißflügel-Zwergfledermaus, Weißflügel Pipistrelle, Weissfluegel-Hausfledermaus. Italian: Pipistrèllo di Peters. Tshokwe (Angola): Kafukufuku, Kateta.

CONSERVATION STATUS:
Global Justification
Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Fahr, 2008a; IUCN, 2009; Monadjem and Fahr, 2017f).

Assessment History
Global
2016: LC ver 3.1 (2001) [assessed as *Neoromicia tenuipinnis*] (Monadjem and Fahr, 2017f). 2008: LC ver 3.1 (2001) [assessed as "*Pipistrellus tenuipinnis*"] (Fahr, 2008a; IUCN, 2009). 2004: LC ver 3.1 (2001) (Fahr, 2004j; IUCN, 2004). 1996: LR/lc [assessed as "*Eptesicus tenuipinnis*"] (Baillie and Groombridge, 1996).

Regional
None known.

MAJOR THREATS:
There appear to be no major threats to this species as a whole (Fahr, 2008a; IUCN, 2009; Monadjem and Fahr, 2017f).

CONSERVATION ACTIONS:
Fahr (2008a) [in IUCN (2009)] and Monadjem and Fahr (2017f) reports that there appear to be no direct conservation measures in place. It is not known if the species is present in any protected areas.

GENERAL DISTRIBUTION:
Pseudoromicia tenuipinnis is a sub-Saharan species which is widely distributed through West, Central and parts of East Africa. It ranges from Senegal in the west, through West Africa, to Cameroon and Central Africa including much of the Congo basin, into Uganda and East Africa including Ethiopia, Kenya and Tanzania. It has been recorded as far south as southern Democratic Republic of the Congo and northern Angola. It occurs at elevations of up to 3,200 m asl.

Benda *et al.* (2025: 99) mention that Monadjem *et al*. (2024) assigned 55 eastern African *Pseudoromicia tenuipinnis* specimens to *P. nyanza* *P. tenuipinnis* should then be restricted to West and Central Africa.

Native: Angola (Crawford-Cabral, 1989; Monadjem *et al.*, 2010d: 569); Burundi; Cameroon; Central African Republic; Congo (Bates *et al.*, 2013: 337); Congo (The Democratic Republic of the) (Schouteden, 1944; Hayman *et al.*, 1966; Van Cakenberghe *et al.*, 1999; Dowsett *et al.*, 1991: 259; Monadjem *et al.*, 2010d: 569); Côte d'Ivoire; Equatorial Guinea; Ethiopia (Lavrenchenko *et al.*, 2004b: 147); Gabon; Gambia; Ghana; Guinea (Konstantinov *et al.*, 2000: 145); Guinea-Bissau (Rainho and Ranco, 2001: 66); Kenya; Liberia (Monadjem and Fahr, 2007: 50); Nigeria; Rwanda; Senegal; Sierra Leone; Tanzania; Togo; Uganda (Kityo and Kerbis, 1996: 62).

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Tragus: Monadjem *et al.* (2013c: 204) gives a line drawing of the tragus of specimen DNSM 13235 from Mount Nimba, Liberia.

DETAILED MORPHOLOGY:
Baculum
The basal lobes of *Pseudoromicia tenuipinnis* were long and elongate, terminating in a rounded lobular structure, the total length (1.97 mm), the

angle of shaft curvature, measured from mid-shaft to the shaft base, was more acute in *tenuipinnis* (43°) than in *L.* cf. *rendalli* (58°) (Monadjem *et al.*, 2013c: 197). Line drawings of dorsal and ventral views of specimen DNSM 13235 from Mount Nimba, Liberia are shown in Monadjem *et al.* (2013c: 204). See Hill and Harrison (1987).

ECHOLOCATION:
Musila *et al.* (2018c: 43) [referring to Monadjem *et al.* (2010d: 478)] mention a shallow, frequency modulate call, which sweeps down from 62 to 37 kHz.

MOLECULAR BIOLOGY:
Karyotype
McBee *et al.* (1987) reported 2*n* = 36, FN = 52, BA = 18, a submetacentric X chromosome and an acrocentric Y chromosome.

HABITAT:
In their study at the Mount Nimba area, Monadjem *et al.* (2016y: 370) recorded this species in two small settlements.

DIET:
Feacal pellets of 2 bats from Cameroon examined by Waghiiwimbom *et al.* (2019a: 156), contained the following volume (± SD) and frequency percentages: Lepidoptera (57.9 ± 3.9; 100), Diptera (29.6 ± 5.9; 100), Coleoptera (7.4 ± 0.8; 100), Hemiptera (2.7 ± 0.5; 70), Hymenoptera (2.4 ± 0.3; 60).

For these bats, Cabrera-Campos *et al.* (2021: Suppl.) estimated the food transit time to be about 64 minutes, and the digestibility rate about 82.0 %.

PREDATORS:
Mikula *et al.* (2016: Supplemental data) mention the Bat hawk (*Macheiramphus alcinus* Bonaparte, 1850) as diurnal avian predator of "*E. tenuipinnis*".

POPULATION:
Structure and Density
This species is rather common in suitable habitat. It is most often found in small groups of fewer than 20 animals (Fahr, 2008a; IUCN, 2009; Monadjem and Fahr, 2017f).

Trend
2016: Unknown (Monadjem and Fahr, 2017f).
2008: Unknown (Fahr, 2008a; IUCN, 2009).

PARASITES:
ACARI
Macronyssidae
Orlova *et al.* (2020c: 952) mention the presence of *Steatonyssus after* Radovsky and Yunker, 1963 on bats in Angola.

Sarcoptidae
Fain (1959e: 145) described *Notoedres (Notoedres) schoutedeni* from "*Eptesicus tenuipinnis*" and "*E. ater*" from Buta, Stanleyville (= Kisangani), Mauda, and Tshuapa, DRC.

HEMIPTERA
Cimicidae
Aphrania recta Ferris and Usinger, 1957, recorded from Sierra Leone (Haeselbarth *et al.*, 1966: 12), and DRC (Kock and Aellen, 1987: 876).

DIPTERA
Streblidae
Raymondia intermedia Jobling, 1936 in Sierra Leone (Haeselbarth *et al.*, 1966: 102).

Nycteribiidae
Basilia ansifera Theodor, 1956 mainly a West African species, reaching Lake Victoria in the east and Lake Nyasa in the south, nearly all localities lie between 15° latitude north and south (Haeselbarth *et al.*, 1966: 110). *Basilia robusta* Theodor, 1956 (Haeselbarth *et al.*, 1966: 111; Dick *et al.*, 2023).

VIRUSES:
In their overview table, Maganga *et al.* (2014a: 8) reported that no viruses were ever found in this bat species.

Coronaviridae
None of the 33 Kenyan bats tested by Tao *et al.* (2017: Suppl.) was positive for CoV.

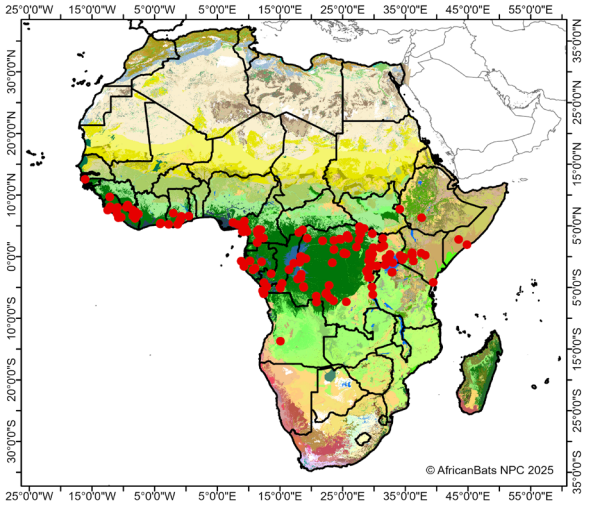

Figure 406. Distribution of *Pseudoromicia tenuipinnis*.

DISTRIBUTION BASED ON VOUCHER SPECIMENS: "Africa", Angola, Burundi, Cameroon, Central African Republic, Congo, Congo (Democratic Republic of the), Côte d'Ivoire, Ethiopia, Gabon, Ghana, Guinea, Kenya, Liberia, Nigeria, Rwanda, Senegal, Sierra Leone, Somalia, South Sudan, Tanzania, Togo, Uganda.

Glossary

Abdomen The belly; that part of the pelage covering the belly region.

Abdominal Of the abdomen.

Abundance The representation of a species in a sampling unit based on the number of individuals, biomass, cover, or similar measures.

Adult Sexually mature

Allopatric Populations or taxa with geographically separated ranges.

Allotype *n.* See under type.

Alpha taxonomy The description and naming of organisms.

Alveolus Socket in jaw where tooth is implanted.

Angular process Projection at the lower posterior part of each mandible.

Anterior Towards the front; fore.

Antitragus Lobe at the basal part of the outer margin of the ear.

Arboreal Living in trees.

Arthropods Invertebrate animals with a hard, joined exoskeleton, e.g. insects, crabs, spiders, …

Articles *n.* The mandatory provisions of the ICZN

Aspect ratio Forearm length (elbow to wrist) + wing tip (wrist to tip of digit III)/length of fifth finger.

Assemblage A group of related organisms living in the same place.

Auditoriry bullae See bulla.

Available name A scientific name applied to an animal taxon that is not excluded under Article 1.3 and that conforms to the provisions of Articles 10 to 20.

Axillary Pertaining to the armpit.

Bachelor colony A group of pre- and post-pubertal males that roosts separately from females, usually during the reproductive period (includes non-harem males).

Baculum (os penis) Bone supporting the penis (and as such only found in males).

Basal metabolic rate Rate of energy expenditure while at rest, post-absorptive, and at thermoneutrality; expressed as kJ. g 1 h 1 (see also roosting metabolic rate).

Bat detector Electronic device sensitive to ultrasonic and audible sounds produced by bats (e.g. QMC mini bat detector, Holgate bat detector, leak detector, ...).

Bat pass One pass by one individual through air space as sampled with a bat detector. (see also feeding buzz).

Bicuspidate With two cusps.

Bifid With two distal processes.

Biodiversity The variety of living species of organisms on Earth. Also: The spatial, temporal, and/or compositional makeup of the individuals, populations, species, and/or communities in a defined set.

Breeding season The period beginning with courtship and ending with weaning. (see also mating, parturition).

Buccal pad Oval epithelial structure of the lipoid substances, situated in the angles of the mouth between the cheeks and posterior teeth.

Bulla (*sing.*) / bullae (*pl.*) Dome-shaped protuberance from the underside of the skull enclosing the inner ear.

Calcar A cartilaginous spur supporting the free margin of the tail membrane [=uropatagium] from the ankle.

Call structure Pattern of frequency change over time in vocalizations; sonograph or period meter display.

Canine teeth Eye teeth, usually long, and sharp pointed.

Carnivorous Flesh eating (e.g. insects, fish, amphibians, reptiles, birds, mammals).

Carpal Wrist bone

Cavernicolous Living in caves.

CF Constant frequency (pure tone) component of ultrasonic pulses produced by some echolocating bats (used for ranging and judging velocity and direction of movement).

Cheek teeth The chewing teeth; those posterior to the canine in each toothrow.

Chiropterophily Mutualistic associations between flowers and flower-visiting bats.

Circadian Relating to a period of approximately 24 hours.

Clade A group of organisms that consists of a common ancestor and all of its descendants.

Cluster A group of (closely together) roosting bats.

Code *n.* (1) An abbreviation of the title International Code of Zoological Nomenclature

Cohort life table A life table constructed from a mortality schedule of individuals that started life together.

Colony Usually a specified aggregation of bats (e.g. maternity colony, hibernating colony, bachelor colony, ...).

Communal roost A roost used simultaneously by more than one individual.

Community A group of populations that coexist in space and time and interact with each other directly or indirectly.

Condylobasal length A technical measurement taken on a prepared skull, being the length of the ventral aspect in the midline from the posterior surfaces of the occipital condyles to the anterior margin of the premaxilla.

Condylocanine length A measurement similar to the condylobasal length, taken parallel to the axis of the skull from the posterior surfaces of the occipital condyles to the anterior surfaces of the canines.

Conserved name A name otherwise unavailable or invalid that the Commission, by the use of its plenary power, has enabled to be used as a valid name by removal of the known obstacles to such use (see conserve).

Contig A set of DNA sequences that overlap to provide a continuous representation of a genomic region.

Contour hairs The close-fitting hairs that form the principal covering of a mammal's body.

Cotype *n.* See under type.

Crepuscular Pertaining to the twilight periods of dawn and dusk.

Critically Endangered (CR) A taxon is Critically Endangered when the best available evidence indicates that it meets any of the criteria A to E for Critically Endangered (see Section V), and it is therefore considered to be facing an extremely high risk in the wild.

Crown age The crown age of a phylogeny is the time between the present and the moment of at which the first diversification (resulting in two lineages) happened.

See: https://search.r-project.org/CRAN/refmans/beautier/html/get_crown_age.html

Cryptic species Two or more distinct species that are erroneously classified (and hidden) under one species name.

Cusp A raised point on the crown of a tooth.

Dactylopatagium The part of the wing membrane between the 2nd and 3rd digits.

Daily Energy Budget (DEB) Amount of energy assimilated or expended daily to sustain free-living existence.

Data Deficient (DD) A taxon is Data Deficient when there is inadequate information to make a direct, or indirect, assessment of its risk of extinction based on its distribution and/or population status. A taxon in this category may be well studied, and its biology well known, but appropriate data on abundance and/or distribution are lacking. Data Deficient is therefore not a category of threat. Listing of taxa in this category indicates that more information is required and acknowledges the possibility that future research will show that threatened classification is appropriate. It is important to make positive use of whatever data are available. In many cases great care should be exercised in choosing between DD and a threatened status. If the range of a taxon is suspected to be relatively circumscribed, and a considerable period of time has elapsed since the last record of the taxon, threatened status may well be justified.

Date of publication *n.* Of a work (and of a contained name and nomenclatural act): the date on which copies of the work become available by purchase or free distribution. If the actual date is not known, the date to be adopted is regulated by the provisions of Article 21.2-7.

Day roost A site or structure used by bats during the day.

DEB See Daily Energy Budget

Deciduous teeth Milk teeth.

Delayed development A condition where the blastocyst implants without delay after entering the uterus but subsequent embryonic development ceases temporarily or proceeds slowly. (see also delayed implantation).

Delayed fertilization See Delayed ovulation.

Delayed implantation A condition where the blastocyst remains in the uterine lumen for a variable period before it implants.

Delayed ovulation A condition in which ovulation is postponed for a period of time following copulation and where spermatozoa are stored in the female reproductive tract. In temperate regions this period is prolonged by hibernation (also called delayed fertilization).

Description *n.* A statement in words of taxonomic characters of a specimen or a taxon [Arts. 12,13].

Original The description of a nominal taxon when it is established.

Diastema Gap between the constituent teeth of a tooth row.

Digit Finger or toe.

Dispersal Usually refers to the movement of an individual away from its place of birth or origin, but also can refer to movements of individuals away from a roost for foraging purposes.

Distal Further away from the centre of the body, or from the point of origin, e.g. of a limb.

Diurnal Active during daylight.

Divergence The amount of evolutionary differentiation of a particular species from other species in a set.

Diversity

Alpha Mean biodiversity (variability) measured at a specified grain within a focus.

Beta The effective number of units within a focus; differences in unit composition along an environmental gradient or among units in a landscape.

Gamma Total biodiversity (variability) measured at a particular extent.

Dorsal Of or towards the back or upper surface.

East Africa Traditionally used for the area currently covering Uganda, Kenya, Rwanda, Burundi and Tanzania.

Eastern Africa Eastern part of the African continent, which is wider than East Africa.

Echolocation Orientation by reference to echoes of emitted sound reflected off solid surfaces.

Ecomorphology Inferential relationships between morphology and ecology.

Endangered (EN) A taxon is Endangered when the best available evidence indicates that it meets any of the criteria A to E for Endangered (see Section V), and it is therefore considered to be facing a very high risk of extinction in the wild.

Endemic A taxon primarily (if not only) occurring in a specific country or area.

Endoskeleton The internal, bony skeleton.

Estrus See Oestrus.

Evolutionary host Host species in which a pathogen, such as a virus, has evolved or is naturally found. In evolutionary or natural hosts, infections induce few or no symptoms.

Extant *a.* (1) Of a taxon: having living representatives. (2) Of specimen: still in existence.

Extinct (EX) *a.* Of a taxon: having no living representatives. IUCN - A taxon is Extinct when there is no reasonable doubt that the last individual has died. A taxon is presumed Extinct when exhaustive surveys in known and/or expected habitat, at appropriate times (diurnal, seasonal, annual) throughout its historic range have failed to record an individual. Surveys should be over a time frame appropriate to the taxon's life cycle and life form (IUCN 2001).

Extinct in the Wild (EW) *a.* A taxon is extinct in the Wild when it is known only to survive in captivity or as a naturalized population (or populations) well outside the past range. A taxon is presumed Extinct in the Wild when exhaustive surveys in known and/or expected habitat, at appropriate times (diurnal, seasonal, annual), throughout its historic range have failed to record an individual. Surveys should be over a time frame appropriate to a taxon's life cycle and life form.

False nipples Supernumerary (pubic) nipples that function as "holdfasts" for suckling young, and which are present in several species of some Old World families.

Fat index The ratio of grams of fat/grams of lean dry mass.

Feeding buzz A rapid series of pulses made by an echolocating bat in its final approach to a prey item. (also see bat pass).

Feeding roost A site used by bats to consume prey too large to consume during flight and as a night-time refuge from predators. (see also night roost).

Fledging period Time when young bats begin to make foraging flights.

Flock An assemblage of bats in flight.

FM Frequency modulated pulses produced by some echolocating bats (mostly used for the discrimination of size and shape).

Forearm That part of the arm between the elbow and the wrist.

Frugivory The habit of eating fruit.

Functional group A set of organisms that uses biotic or abiotic resources in a similar way.

Genus Baird *et al.* (2025: 14) operationally define a genus using the 2 "Sigma Genus Concept" as follows: "*A genus is a formally recognized taxon containing one species or a monophyletic lineage of species. Genera are morphologically and/or genetically distinct from other genera, and genetic as well as morphological and other heritable biological features can be used for diagnoses. Genetic divergence estimates between sister genera should comprise a range between those of subgenera or congeneric species and higher taxa such as tribe, subfamily, or family. Operationally using genetic distance values, this range is set at two standard*

deviations below the mean as the minimum value for a valid genus, and two standard deviations above the mean as the minimum value for a new higher taxon such as tribe or subfamily."

Gestation period Time period during which a pregnant female carries the developing embryo before birth.

Gleaning A foraging tactic used by some bats whereby prey items are taken from a surface (e.g. ground, leaves, tree trunk, ...)

Gregarious Habitually living with numbers of its own species.

Guano Fecal and urinary waste that accumulates within or below a roost.

Guard hairs Long hairs, less numerous than and projecting beyond the contour hairs.

Guild A group of organisms that use biotic or abiotic resources in a similar way, including the environmental conditions within which they can function.

Harem A group of females associated with a single adult male. (See Lewis (1992) for a discussion on the use of the word "Harem".)

Heterothermy The ability to regulate body temperature physiologically, but temperature is not regulated precisely or at the same level at all times.

Hibernaculum Type of roost used by temperate zone bats in winter (e.g. caves, mines, buildings).

Hibernation The assumption of a state of greatly reduced core temperature for prolonged periods of time during cold seasons by an animal which has an active body temperature near 37°C, yet it retains the ability to spontaneously arouse without absorbing heat from the environment.

Homeothermy Regulated maintenance of the body temperature near 37°C.

Homing Refers to the return of individuals to their place of birth or origin or roost.

Homologs Genes or proteins that show a similarity of structure or function based on descendance from a common evolutionary ancestor.

Homonym *n.* (1) In the family group: each of two or more available names having the same spelling, or differing only in suffix, and denoting different nominal taxa. (2) In the genus group: each of two or more names having the same spelling and denoting different nominal taxa. (3) In the species group: each of two or more available specific or subspecific names having the same spelling, or spellings, or spellings deemed under Article 58 to be the same, and established for different nominal taxa, and either originally (primary homonymy) or subsequently (secondary homonymy) combined with the same generic name [Art. 53.3].

Homonymy *n.* (1) The relationship between homonyms. (2) The state of being homonymous.

Immature An animal which has attained adult dimensions but not sexual maturity.

Incisor teeth The front teeth, borne on the premaxilla.

Insectivorous Eating insects, or more generally, arthropods.

Intercanine breath *(C-C)* Distance between the outer surfaces of the two upper canines of either jaw.

Interfemoral membrane Membrane extending immediately after the body and from the inner margins of legs, enclosing whole or a part of the tail.

Internarial Between the nostrils.

Junior homonym Of two homonyms: the latter established, or in the case of simultaneous establishment to one not given precedence under Article 24.

Juvenile An animal which has not reached adult physical dimensions; characterized by unfused epiphyses. (see also immature).

Kilohertz (kHz) 1,000 cycles per second.

Kilojoule (kJ) 4.19 x kcal.

Lactation Active milk production by mammary gland.

Lappet Small protuberent flap, e.g. of skin.

lapsus calami (*sing.* and *pl.*), *n.* A Latin term meaning "slip (or slips) of the pen", i.e. an error (or errors) made by an author in writing a text, such as a misspelling of a name; contrasted with copyist's or printer's errors [Art. 32.5.1].

Lateral Towards the side of the body; away from the midline.

Least Concern (LC) A taxon is Least Concern when it has been evaluated against the criteria and does not qualify for Critically Endangered, Endangered, Vulnerable or Near Threatened. Widespread and abundant taxa are included in this category.

Lek An assembly area used by adult males for courtship display and copulation with females.

Light-sampling Behaviour associated with the onset of nightly emergence where one or more individuals fly in the vicinity of the exit before emergence.

Lingual Towards the tongue or the inside of the mouth.

Longitudinal Extending lengthwise.

Lunar phobia Avoidance response to bright moonlight, where flight activity either becomes reduced or ceases.

Maternity colony An aggregation of female bats during pregnancy and lactation.

Maternity roost A site used by females during pregnancy and lactation.

Mating The pairing of a male and female during courtship and copulation.

Mating Systems See Dorrestein *et al.* (2024: 6)

Monogamy A single male and single female either mate exclusively with each other or form a pair bond for one or multiple seasons. This system can be further subdivided into:

Mating monogamy - A single male and a single female form a pair bond and mate exclusively with each other during a mating season. They do not necessarily maintain this pair bond during multiple mating seasons. As no extra-pair copulation occurs by definition, this can be regarded 'true' monogamy

Social monogamy - A single male and single female form a pair bond but may participate in extra-pair copulations. A pair may stay together for one or multiple mating seasons.

Polygamy Mating system where one or both sexes mate with multiple partners. Also in this system, a number of subcategories can be distinguished:

Female defence polygyny - Males defend multiple females within the females' home ranges to the exclusion of other males. When the females move away, the male moves with the group. Females may secure extra-group/harem copulations. Sometimes multiple males defend the females.

Resource defence polygyny - Males set up a mating territory in or around a resource (roost or foraging site) that is essential to females. They mate with and may defend the females that are using this site. Females may participate in extra-group/harem copulations, or reside in multiple harems over the course of a mating season. In
some instances, multiple males defend a mating territory.

Lek-like mating system - Males establish mating territories that include resources that are not essential to females but that act as a proxy of male quality. Mating territories are clustered as in a lek. Females can move freely among males.

Exploded classical lek - A male defends a mating territory that does not contain resources that are essential to females. Females base their mate choice solely on male quality. Mating territories are spaced out at the scale of the lek but clustered at the landscape scale (e.g. *Epomops franqueti* (?)).

Clustered classical lek - A male defends a mating territory that does not contain resources that are essential to females. Females base their mate choice solely on male quality or phenotypic proxies thereof. Mating territories are highly clustered in space (e.g. *Hypsignathus monstrosus*).

Promiscuity Mating occurs randomly among males and females, but reproductive success may vary between males, due to sperm competition.

Maxillary toothrow The row of teeth on one side of the upper jaw borne on the maxillary bone, i.e. canine, premolars and molars.

Median Of the midline, with reference to an organ or to the body as a whole.

Megabats A traditional name for the suborder of bats that included the Old World fruit bats. The name was initially given as this family (Pteropodidae) contains the largest bat species.

Melanistic Abnormally dark or black in colour.

Mesial Towards the midline of the body.

Metacarpal The long bone joining the base of each finger to the wrist skeleton.

Microbiome A community of microorganisms, such as bacteria, fungi, and algae, that can be found living together in a specific habitat. The mammalian gut microbiome is recognized as a key regulator of host health and disease.

Migration Regular seasonal movements.

Molar Member of the posterior cheek teeth, never more than three in number in any toothrow, which do not have deciduous precursors.

Monestrous See Monoestrus

Monoestrus Pertains to species that have a single oestrous cycle per year.

Monophyly The grouping of an organism and all of its descendants in a clade.

Monotocous Production of one young per pregnancy.

Monotypy *n.* The situation arising (1) when an author establishes a nominal genus or subgenus for what he or she considers to be a single taxonomic species and denotes that species by an available name (the nominal species so named is the type-species by monotypy) [Art. 68.3]; or (2) when an author bases a nominal species-group taxon on a single specimen but does not explicitly designates it as holotype (holotype by monotypy; see Article 73.1.2).

Multiple original spelling See under spelling.

Name combination The unique combination of a genus and specific epithet (or subspecific epithet) to form the scientific name of a then-valid species or subspecies (and forms or varieties in older literature); name combinations are not type-bearing synonyms, rather representing the history of taxonomic change associated with a name moving between genera, species, and subspecies.

Near Threatened (NT) A taxon is Near Threatened when it has been evaluated against the criteria but does not qualify for Critically Endangered, Endangered or Vulnerable now, but is close to qualifying for or is likely to qualify for a threatened category in the near future.

Nectarivorous Feeding on nectar.

Neonate A newborn young.

Net nights The product of the number of mist nets and the number of nights that nets are employed for the purpose of capturing bats (the size of nets should be designated).

New replacement name (*nomen novum*) A name established expressly to replace an already established name. A nominal taxon denoted by a new replacement name (*nomen novum*) has the same name-bearing type as the nominal taxon denoted by the replaced name [Arts. 67.8, 72.7]. See emendation, substitute name.

Niche The range of ecological conditions in which a species will persist.

Night roost Roost site used at night for resting, consuming and digesting prey, and predator avoidance.

***nomen dubium* (*pl. nomina dubia*)** *n.* A Latin term meaning "a name of unknown or doubtful application."

***nomen novum* (*pl. nomina nova*)** *n.* A Latin term equivalent to new replacement name.

***nomen nudum* (*pl. nomina nuda*)** *n.* A Latin term referring to a name that, if published before 1931, fails to conform to Article 12; or, if published after 1930, fails to conform to Article 13. A *nomen nudum* is not an available name, and therefore the same name may be made available later for the same or a different concept; in such a case it would take authorship and date [Arts. 50, 21] from that act of establishment, not from any earlier publication as a *nomen nudum*.

***nomen oblitum* (*pl. nomina oblita*)** *n.* A Latin term (meaning forgotten name) applied after 1 January 2000 to a name, unused since 1899, which as a result of an action taken under Article 23.9.2 does not take precedence over a younger synonym or homonym in prevailing usage; the younger name which takes precedence over the *nomen oblitum* may be called a *nomen protectum (q.v.)*. The term *nomen oblitum* was also applied to a disused senior synonym rejected between 6 November 1961 and 1 January 1973 under Article 23b of the Code editions then in force (see Article 23.12.2). *Nomina oblita* remain available names; see Articles 23.9 and 23.12 for conditions controlling their use as valid names.

nomen protectum *n.* A Latin term (meaning protected name) applied to a name which has been given precedence over its unused senior synonym or senior homonym relegated to the status of *nomen oblitum* (*q.v.*, and see Article 23.9.2).

Nomenclature The process of assigning scientific names to taxa based on a set of standardized rules in which each species has a 2-part name, starting with a genus and ending in a specific epithet (Binomial Nomenclature); nomenclatural changes result in changes to the name used for a taxon that do not change its taxonomic concept; zoological nomenclature for species-, genus-, and family-rank names are governed by the rules published in the ICZN Code (ICZN 1999), written by the International Commission on Zoological Nomenclature (ICZN).

Not Evaluated (NE) A taxon is Not Evaluated when it is has not yet been evaluated against the criteria.

Nulliparous Pertains to a female which has not given birth (includes individuals which are: immature, mature but not inseminated, mature and primigravid).

Oestrus A period when females allow males to mate with them (specifically near the time of ovulation, except in temperate zone hibernators).

Omnivory The habit of feeding on a mixed diet (feeding across two or more trophic levels).

Opportunistic feeding Pertains to a feeding habit where individuals consume the most abundant prey items.

Parous Pertains to a female which has given birth (may include females which have been inseminated, not inseminated, pregnant, or lactating).

Parturition Delivery of infants or pups.

Parturition period The time of year when females give birth to young.

Patagium A sheet-like membrane formed by a double layer of stretched skin.

Pectoral Pertaining to the chest.

Pelage The coat of hair or fur covering a mammal.

Phalanx (*sing.*) / phalanges (*pl.*) Element of the skeleton of a digit.

Philopatry The seasonal return of a bat to its place of birth or to the same hibernaculum.

Phylogenetic diversity The extent to which species within a set are closely or distantly related.

Phylogeny The pattern of relationships among taxa based on evolutionary ancestry.

Pinna External ear.

Piscivory The habit of eating fish.

Plagiopatagium Membrane which forms the part of the wing that extends laterally from the fifth digit of the wing to the ankle.

Polyandry Polyandry is a form of polygamy; in sexually reproducing animals, where females have multiple male mates.

Polyestrous See Polyoestrus

Polygynandry Polygynandry is a form of polygamy; in sexually reproducing animals, it is a multi-male and multi-female mating system. Polygynandry encapsulates both polygyny (males having multiple female mates) and polyandry (females having multiple male mates) within the same species.

Polygyny Polygyny is a form of polygamy; in sexually reproducing animals, where males have multiple female mates

Polyoestrous Subject to recurrent oestrus.

Polyoestrus Pertains to species that have two or more oestrous cycles per year.

Polytocous Producing more than one young per pregnancy.

Posterior Behind; hind.

Post-lactating Reproductive state of a female when lactation has ceased and milk can no longer be expressed from the nipples.

Post-partum oestrus An oestrus immediately following birth (see polyoestrous).

Premolar Member of the anterior cheek teeth, never more than four in number in any toothrow, which succeed a deciduous set.

Preoccupied name An otherwise available scientific name that matches the spelling of an older name within the same taxonomic rank, making it unavailable for nomenclatural use; in species-rank names, the preoccupying name can either be originally described in the same genus (Primary Homonym), or subsequently moved into that genus (Secondary Homonym); when the name for a currently recognized species is preoccupied, a Nomen Novum/Nomina Nova (new name) should be described to replace the preoccupied name.

Primary homonym Each of two or more identical specific or subspecific names established for different nominal taxa and originally combined with the same generic name [Art. 57.2]. For variant spellings deemed to be identical see Article 58.

Propatagium The membrane between the wrist and the body that forms the leading edge of the wing.

Proximal Nearer to the centre of the body, or to the origin, e.g. of a limb.

Pteropodid A member of the Megabats or Old World fruit bats (family Pteropodidae).

Pubertal Pertains to a male undergoing spermatogenesis for the first time, or a female undergoing first oestrus.

Refuging species Pertains to species, in which members form roosting aggregations.

Regionally Extinct (RE) Category for a taxon when there is no reasonable doubt that the last individual potentially capable of reproduction within the region has died or has disappeared from the wild in the region, or when, if it is a former visiting taxon, the last individual has died or disappeared in the wild from the region. The setting of any time limit for listing under RE is left to the discretion of the regional Red List authority, but should not normally pre-date 1500 AD.

Rejected name (1) A name which, under the provisions of the Code, cannot be used as a valid name and which is set aside in favour of another name. (2) A name which, as a matter of taxonomic judgment, is either treated as a junior subjective synonym (*q.v.*) of a name used as valid or is believed not to be applicable to the taxon under consideration.

Reservoir An organism in which an infectious pathogen naturally lives and reproduces.

Resistance Mechanisms evolved by a host to directly limit pathogen burden, leading pathogens to evolve methods to subvert this resistance.

Rhinarium The pad of flesh, usually hairless and often moist, surrounding the nostrils of many mammals.

Roost Site used by bats when not in flight.

Roost fidelity The tendency of a bat to return repeatedly to a certain roost (e.g. cave, tree hollow, barn) or general area (foliage).

Roosting metabolic rate Rate of energy expenditure under natural or semi-natural conditions (includes costs associated with specific dynamic action, movements, clustering, grooming, social interactions, ...).

Rostrum Anterior part of the skull in front of the orbits.

Sanguivory The habit of feeding on blood.

Sella Part of the noseleaf of horseshoe bats.

Senior homonym Of two homonyms: the first established, or in the case of simultaneous establishment the one given precedence under Article 24.

***Sensu lato* (*s. lat.* or *s.l.*)** A Latin term meaning "in the wide sense". Contrast with *sensu stricto (s. str.)*.

***Sensu stricto* (*s. str.* or *s.s.*)** A Latin term meaning "in the strict sense". Often used in conjunction with a name when referring to the nominal taxon in the narrow sense of its subordinate nominotypical taxon (contrast with *sensu lato (s. lat.)*.

sensu A Latin term meaning "in the sense of". Often used to refer to the usage of a name by a (cited) author in a sense different from that of the original author or some other previous author. See also auctorum.

Septum A narrow sheet of skin or flesh forming a partition.

Sibling species Cryptic sister species; two species that are the closest relative of each other and have not been distinguished from one another taxonomically.

Silent heat The occurrence of ovulation without fertilization, prior to behavioural oestrus and insemination.

Sister taxa Two taxa that are derived from the same immediate common ancestor.

Species (*sing.* and *pl.*) *n.* (1) The rank next below the genus group; the basic rank of zoological classification. (2) A taxon at the rank of species. (3) A group of living organisms consisting of similar individuals capable of interbreeding

Species group *n.* In the zoological classification, the lowest-ranking group of taxa the names of which are regulated by the Code. The species group includes all taxa at the ranks of species and subspecies [Art. 45.1].

***species inquirenda* (*pl. species inquirendae*)** *n.* A Latin term meaning a species of doubtful identity needing further investigation.

Specimen *n.* An example of an animal, or a fossil or work of an animal, or of a part of these. See Article 72.5 for the kinds of specimen eligible to be name-bearing types of nominal species-group nominal taxa.

Spelling

Spelling variants A difference in spelling from the original spelling of a scientific name, which can be incorrect in the original publication (Incorrect Original Spelling) or later publications (Incorrect Subsequent Spelling), or a purposeful change considered to be unjustified (Unjustified Emendation) or justified (Justified Emendation) according to the ICZN Code; justified spelling changes are usually those of specific epithets with adjective etymological roots, which change to match the etymological gender of the genus, or to Latinized names with non-standard characters (e.g., ñ, ö), although there are other rare exceptions allowing for justified emendations to the original spelling of a name.

Stem age A clade's stem age represents the time that this clade descended from a common ancestor with its sister clade. The stem age of a clade is always at least as old, and usually older, than the crown age.

See:
https://bio.libretexts.org/Bookshelves/Evolutionary_Developmental_Biology/Phylogenetic_Comparative_Methods_(Harmon)/11%3A_Fitting_Birth-Death_Models/11.02%3A_Clade_Age_and_Diversity

Subadult Approaching maturity but not fully adult.

Subsequent monotypy The situation arising when a nominal genus or subgenus was established before 1931 without any included nominal species, and when only a single taxonomic species denoted by an available name was first subsequently referred to it [Art. 69.3].

Subtriangular Approximately triangular.

Suppression, *n.* (suppress, *v.*) A ruling by the Commission, using its plenary power, (1) that a work is to be deemed, for nomenclature purposes, as unpublished, or that names and acts in it are not available; or (2) that an available name is never to be used as valid because (a) it is available only for the purpose of homonymy ("partial suppression") or (b) it is not available for the purposes of priority and homonymy ("total suppression"; but a totally suppressed species-group name may still denote the type species of a nominal genus or subgenus [Art. 81.2.1]); or (3) that an available name is only to be used as valid under stated conditions (e.g. when not considered a synonym of a particular later name) ("conditional suppression").

Swarming The activity of bats (males and females) from mid-summer through early autumn at sites that ultimately are used as hibernacula (the latter part of this interval is coincident with mating in temperate regions).

Sympatric Species or populations that occur together without inbreeding.

Synanthropy The association of bats with man.

Synonym *n.* Each of two or more names of the same rank used to denote the same taxonomic taxon.

Junior synonym Of two synonyms: the later established, or in the case of simultaneous establishment that not given precedence under Article 24. See also Article 23.9.

Objective synonym Each of two or more synonyms that denote nominal taxa with the same name-bearing type, or (in the cases of family-group and genus-group taxa) that denote nominal taxa with name-bearing types whose own names are themselves objectively synonymous.

Senior synonym Of two synonyms: the earlier established, or in the case of simultaneous establishment that given precedence under Article 24. See also Article 23.9.

Subjective synonym Each of two or more names whose synonymy is only a matter of individual opinion. i.e. it is not objective. See also Article 61.3.1.

Synonymy *n.* (1) The relationship between synonyms. (2) A list of synonyms.

Syntype *n.* See under type.

Taxon, (*pl.* taxa) *n.* A taxonomic unit, whether named or not: i.e. a population, or group of populations of organisms which are usually inferred to be phylogenetically related and which have characters in common which differentiate (*q.v.*) the unit (*e.g.* a geographic population, a genus, a family, an order) from other such units. A taxon encompasses all included taxa of lower rank (*q.v.*) and individual organisms. The Code fully regulates the names of taxa only between and including the ranks of superfamily and subspecies. (2) A species or infraspecific entity whose extinction risk is being assessed.

Taxonomic guild A group of organisms that both share a common ancestor and use biotic or abiotic resources in a similar way.

Taxonomic information

Taxonomy, *n.* (taxonomic, *a.*) The theory and practice of classifying organisms. See taxonomic information, taxonomic taxon.

Alpha taxonomy Deals with species and subspecies.

Beta taxonomy Deals with higher taxonomic groups (genus, family, order, …).

Tent-making The modification of leaves for use as roosts.

Terminal Last or end member of a row or series.

Terrestrial Living on the ground.

Thermal conductance A measure of the insulative properties of the skin and/or pelage.

Thermoneutrality The ambient temperature at which the basal metabolic rate of a homeotherm is minimal.

Tibia The principal bone of the lower leg, from knee to heel.

Time-activity budget The amount of time allocated to various activities (e.g. day roosting, night roosting, flight, rest, grooming), expressed in absolute time units or by percent of total activity.

Tolerance Host mechanisms that evolved to alleviate disease severity, thus having a mostly neutral effect on the pathogen.

Topotype See under type.

Torpor A state in which an animal's body temperature is depressed below homeothermic levels and that results in a lowered metabolic rate and an inability to perform normal locomotor function (e.g. flight).

Tragus A cutaneous and cartilaginous projection arising from the emergence of pinna.

Transient roost Temporary roost used by bats enroute during migration.

Trap-lining A foraging behaviour characteristic of some nectarivorous bats wherein regular and repeated visits are made to flowers along a fixed route.

Type *n.* A term used alone, or forming part of a compound term, to denote a particular kind of specimen or taxon.

Allotype A term, not regulated by the Code, for a designated specimen of opposite sex to the holotype [Recommendation 72A].

Cotype A term not recognized by the Code, formerly used for either syntype or paratype, but that should not now be used in zoological nomenclature [Recommendation 73E].

Genotype A term not recognized by the Code, formerly used for type species, but that should not now be used in zoological nomenclature [Recommendation 67A].

Holotype The single specimen designated or otherwise fixed as the name-bearing type of a nominal species or subspecies when the nominal taxon is established.

Lectotype A syntype designated as the single name-bearing type specimen subsequent to the establishment of a nominal species or subspecies [Art. 74].

Name-bearing type The type genus, type species, holotype, lectotype, series of syntypes (which together constitute the name-bearing type) or neotype that provides the objective standard of reference whereby the application of the name of a nominal taxon can be determined.

Neotype The single specimen designated as the name-bearing of a nominal species or subspecies when there is a need to define the nominal taxon objectively and no name-bearing type is believed to be extant. If stability and universality are threatened, because an existing name-bearing type is either taxonomically inadequate or not in accord with the prevailing usage of a name, the Commission may use its plenary power to set aside that type and designate a neotype.

Paralectotype Each specimen of a former syntype series remaining after the designation of a lectotype [Art. 721.3, Recommendation 74F].

Paratype Each specimen of a type series other than the holotype [Recommendation 73D].

Syntype Each specimen of a type series (*q.v.*) from which neither a holotype nor lectotype has been designated [Arts. 72.1.2, 73.2, 74]. The syntypes collectively constitute the name-bearing type.

Topotype, *n.* (topotypic, *a.*) A term, not regulated by the Code, for a specimen originating from the type locality of the species or subspecies to which it is thought to belong, whether or not the specimen is part of the type series.

Type genus *n.* The nominal genus that is the name-bearing type of a nominal family-group taxon.

Type host *n.* The host species with which the name-bearing type of a nominal species or subspecies was associated [Recommendation 76A.1].

Type locality *n.* The geographical place of capture, collection, or observation of the name-bearing type of a nominal species or subspecies [Art. 76.1, Recommendation 76A].

Type series *n.* The series of specimens, defined in Articles 72.4 and 73.2, on which the original author bases a new nominal species-group taxon. In the absence of a holotype designation, any such specimen is eligible for subsequent designation as the name-bearing type (lectotype); pending lectotype designation, all the specimens of the type series are syntypes and collectively they constitute the name-bearing type. Excluded from the type series are any specimens that the original author expressly excludes or refers to as distinct variants, or doubtfully includes in the taxon.

Type species *n.* The nominal species that is the name-bearing type of a nominal genus or subgenus.

Type specimen A term used in previous editions of the Code for a holotype, lectotype or neotype, or for any syntype; also used generally for any specimen of the type series (*q.v.*).

Ultrasonic Pertains to sound frequencies above the audible range (usually frequencies greater than 20 kHz).

Unavailable name A scientific name that does not meet the standards for nomenclatural availability according to the ICZN Code, often resulting from the name being improperly published (Unpublished Name) or published without a taxonomic description (Nomen Nudum/Nomina Nuda), among other reasons.

Uropatagium Membrane extending between the tail and hind legs (also called interfemoral membrane).

Vagrant A taxon that is currently found only occasionally within the boundaries of a region.

Valid name A scientific name that represents the correct name for a biological taxon as defined by the rules in the ICZN Code and recognized by a particular authority; usually but not always the oldest available name.

Ventral Of or towards the undersurface.

Virome A compilation of viruses described by sequencing of viral nucleic acids and found within a specific organism or ecosystem.

Visitor (also, visiting taxon) A taxon that does not reproduce within a region but regularly occurs within its boundaries either now or during some period of the last century. Regions have several options on how to decide the boundaries between visitors and vagrants, e.g., using a pre-set percentage of the global population found in the region or predictability of occurrence.

Vulnerable (VU) A taxon is Vulnerable when the best available evidence indicates that it meets any of the criteria A to E for Vulnerable (see Section V), and it is therefore considered to be facing a high risk of extinction in the wild.

Water index The ratio of grams of water/grams of lean dry mass.

Weaning Time when a juvenile begins to take food other than its mother's milk.

Whispering bat A species which emits low intensity echolocation pulses (e.g. *Plecotus, Megaderma. Nycteris*).

Wing-loading The ratio of body mass (g)/wing area (cm^2).

Yearling An animal at the beginning of its second year of life.

Zeitgeber An environmental clue (e.g. light) that synchronizes, entrains, or modifies a circadian rhythm.

Zoonotic disease An infectious disease caused by a pathogen, such as a virus, that can spillover from a non-human to a human and vice versa.

Zygoma (*sing.*) / zygomata (*pl.*) Cheek bone.

Zygomatic width (Zyg): The breadth of a skull between the outer surfaces of the zygomata.
