Appendix 4d: Collector Biographies

Dr. William Louis Abbott

Born: 1860 - Died: 1936

Corbet and Hill (1992): American physician and traveller; collected mammals in the Himalayas and Thailand in the 1890's and in Sumatra, Borneo and adjacent small islands between 1902 and 1908, for the US National Museum.

William L. Abbott studied medicine at the University of Pennsylvania and, after receiving an M.D., continued his training in London. Although a highly successful student, he seems never to have fully committed to medicine. Instead, around 1880, using his own resources, he turned to a life of exploration and the study of natural history.

Abbott's early expeditions began in the United States; but, in time, he went abroad at ever increasing distances, to the Greater Antilles, East Africa, Kashmir, and Turkistan. In 1896, he began work in Malaya and Indonesia that would largely occupy him until 1915. Using Singapore as a base, he sailed his ship, the Terrapin, to points on both coasts of the Malay Peninsula, Trang in Thailand, the Anambas Islands, the Mergui Archipelago, the Nicobars and Andamans, both coasts of Sumatra and the nearby islands (notably Nias, the Mentawai Islands, and Enggano), the Rhio Archipelago, and Borneo. On many voyages, he collected both biological and ethnological specimens and photographs. At times, however, he was accompanied by the Englishman Cecil Boden Kloss, who handled the ethnological work. Kloss retained his own notes and many of his photographs.

Abbott's work in 1916 and 1923 was in Haiti and the Dominican Republic. Afterwards, he retired to a farm on the Elk River in Maryland.

Abbott has been described as one of the great field naturalists of all time simply for the quantity of material he collected. Virtually the only body of work he left is his large collection of specimens and the notes, letters, and photographs that relate to them. Although he contributed to the collections of several museums, the chief benefactor was the United States National Museum. Its staff and associates produced around forty publications based on his material. Abbott himself published very little.

The papers appear to have been brought together in the Smithsonian's Department of Anthropology to process ethnological specimens from Malaya and Indonesia and to prepare publications and an exhibit. Included are some of Abbott's original letters, notes, maps, and many photographs. Most of these materials concern the Enggano, Jakun, and Dyak. Many other documents are copies of or extracts from Abbott's letters. The originals are now in the Smithsonian Archives. There are a few manuscripts, many simple lists of accessions compiled in the Department of Anthropology, and letters and other materials of Otis T. Mason and Walter Hough accumulated as they worked on the collections. In addition, there are printed materials apparently used by the department's staff for reference purposes. Some photographs made in Borneo in 1914 are by Henry C. Raven, Abbott's field assistant and, later, an independent collector financed by Abbott.

Other than Kloss, Mason, and Hough, correspondents include J. Walter Fewkes, William H. Furness III, Alfred C. Haddon, Aleš Hrdlicka, Elmer D. Merrill, and William Palmer. None of the correspondence is extensive. Additional materials of Abbott and Raven are in the Smithsonian Institution Archives, and their materials (often duplicate photographs) are included in several collections in the National Anthropological Archives.

Beolens *et al.* (2009: 18): Dr. William Louis Abbott (1860–1936) was a student, naturalist, and collector. He initially qualified as a medical doctor at the University of Pennsylvania and worked as a surgeon at Guy's Hospital in London. However, he decided not to pursue medicine but instead to use his private wealth for scientific exploration. In 1880, as a student, he had collected in Iowa and Dakota, and in 1883 in Cuba and San Domingo. In 1887 he went to East Africa, spending two years there. From 1891 he studied the wildlife of the Indo-Malayan region, using his Singapore-based ship *Terrapin*, and made large collections of mammals from Southeast Asia for the National Museum of Natural History (Smithsonian) in Washington, DC, USA. In 1897 he switched to Siam (Thailand) and spent 10 years exploring and collecting in and around the China Sea. He provided much of the Kenya material in the Smithsonian and was the author of "Ethnological Collections in the United States National Museum from Kilima-Njaro, East Africa," published in the museum's Annual Report for 1891. In 1917 he returned to San Domingo (Hispaniola), exploring the interior. He retired to Maryland but continued his lifelong study of natural history until his death. He is also commemorated in the names of several birds, such as Abbott's Babbler *Malacocincla abbotti* and Abbott's Starling *Cinnyricinclus femoralis*, and of a lizard, Abbott's Day Gecko *Phelsuma abbotti*. The duiker is found in the highlands of Tanzania and the gibbon in western Borneo.

Dr. Villy Aellen

Born: 4 December 1926 - Died: 22 January 2000

Prof. Aellen (1926 - 2000) was a mammalogist at the Muséum d'histoire naturelle de Genève from 1954 to his retirement in 1989, where he also served as curator, assistant director, and director (Mahnert 2000).

AEW (Agricultural Extension Workers)

Born: ? - Died: ?

Agricultural Extension Workers

Bernard Risky Agwanda

Born: ? - Died: ?

Research scientist and curator of mammals at the National Museums of Kenya.

Carl Ethan Akeley

Born: 9 May 1864: Clarendon, N.Y., U.S.A. - Died: 1926

At the age of thirteen, Akeley became interested in birds. With the aid of a borrowed book Akeley was able to teach himself the procedures of taxidermy up to a point where he felt justified in having business cards printed announcing that he did "artistic taxidermy in all its branches."

In the fall of 1883 at the age of 19, he decided to widen his interests in the field of taxidermy. Over in the nearby town of Brockport there was an Englishman by the name of David Bruce whose hobby it was to do taxidermy. Bruce advised a young Akeley to apply for a job with the famous Wards Natural Science Establishment in Rochester New York. Akeley followed that advice and was subsequently hired by the owner, Professor Henry J Ward. Akeley left this establishment briefly for a period of six months to work with New York taxidermist John Wallace.

Offered an opportunity to further his education through the courtesy of a former employee to Wards now teaching at a High School in Milwaukee, Akerley left Wards and took a position in the Museum to support his educational expenses. It became the turning point of Carl's career where over the eight years that he worked at the museum he was able put into practice many of the ideas he had theorized over during his tenure at Wards. Due to his outstanding work in both taxidermy and museum exhibit's, he was offered a position with the British Museum in London. He accepted and on his way there decided to stop off in Chicago for a visit to the Field Museum of Natural History, which had only recently been founded. Whilst he was at the Field Museum, the officials hearing of the offer made by the British museum offered him a much better contract and the opportunity to go on expedition to Africa to secure specimens. He accepted on the spot.

Captain Alexander

Born: ? - Died: ?

Possibly Captain Claud Alexander, who died on 13 November 1904 at Fort Maifoni, Africa. He was the brother of Lt. Boyd Francis Alexander (°1873), who was murdered by tribesmen in the Sudan on 2 April 1910. Both became Captain, but Boyd Francis is generally mentioned as "Lt.".

Captain Boyd Francis Alexander

Born: 16 January 1873: Cranbrook, Kent, England - Died: 2 April 1910: near Nyeri, Sudan

Captain Boyd Alexander was the oldest son of Lt. Colonel Boyd Francis Alexander (1834-1917), and brother of Captain Claud Alexander.

In 1897 - 1898, he led an expedition to the Cape Verdian Islands, and in 1898 - 1899 to the Zambesi and Kafuc rivers to study birds. In 1899, he joined the Gold Coast constabulary and took part in the relief of Kumasi in 1900. In 1902, he led an expedition to Fernando Po which resulted in a successful ascent of Mount St. Isabel and the discovery of many new birds

He also led the Alexander-Gosling expedition, travelling across Africa from the Niger to the Nile, exporing the area around Lake Chad. Other participants on this expedition were his brother Claud, Captain G. B. Gosling, P.A. Talbot and José Lopes. In February 1904 they set off from the mouth of the Niger, travelling upriver to Lokoja. Claud died in October of enteric fever after making a survey of the Murchison Range. Boyd and Gosling explored the area around Lake Chad. Gosling died in June 1906 at Niangara of blackwater fever. Boyd then followed the River Kibali, reaching the Nile late in the year and returning to England in February 1907. Alexander's account From The Niger To The Nile was published later that year. In 1908 he was awarded the Gold Medal of the Royal Geographical Society "for his three years' journey across Africa from the Niger to the Nile."

For his journey across the continent, Alexander received the Gold Medal of the Royal Geographical Society of Antwerp (1907), and the founders medal of the Royal Geographical Society of London (1908). He was also made an honorary fellow of the Royal Scottish Geographical Society (1907).

Alexander and Lopes sailed back to Africa in 1909, where they visited the islands of São Thomé, Príncipe, and Annobom; the Kamerun mountain; and Lake Chad. They visited Claud's grave at Maifoni in Bornu and then continued to Ouadai. Boyd was

killed in a dispute with locals near Nyeri (seventy miles north of Abeshr, the capital of Wadai). His body was recovered by French soldiers and buried next to his brother in Maifoni.

Glover Morrill Allen

Born: 17 October 1879: Walpole, New Hampshire, USA - Died: 1942

Glover M. Allen graduated from Harvard in 1901 and received his A.M. in 1903 and his PhD in 1904.

In 1903, he went on a long cruise on a sponging schooner to the northern Bahamas (together with Owen Bryant and Thomas Barbour). In 1906, he went to Labrador (with dr C.W. Townsend), and in 1909 to East Africa (with dr. William Lord Smith and Gorham Brooks). In 1910, he visited the island of Grenada (with prof. C.T. Brues). In 1912, he returned to Africa (with dr. John C. Phillips), where he travelled in Eastern Sudan along the course of the Dinder River and the Blue Nile. After this journey, he remained in Cambridge until 1926. There he was already working as mammalogist at the Museum of Comparative Zoology from 1907, and he became formally appointed curator in 1925. In 1926, he returned once more to Africa (together with Strong, George Shattuck, Bequart, and Harold Coolidge), but now to West Africa (Liberia) and the Belgian Congo. Afterwards, he also made an expedition to the Serra de Paranapiacaba in southern Brazil, and another to Australia in 1931 (with William Morton Wheeler).

See: Barbour, T., Lawrence, B., Scheville, W.E., Washburn, S.L. and Cobb, M.B. (1943). Glover Morrill Allen - 1879 - 1942. *J. Mamm.*, **24 (3)**: 297 - 304.

José Alberto de Oliveira Anchieta

Born: 9 October 1832: Lisbon - Died: 14 September 1897: Caconda (Angola)

http://en.wikipedia.org/wiki/Jos%C3%A9_Alberto_de_Oliveira_Anchieta:

José Alberto de Oliveira Anchieta (variations José d'Anchieta, José Anchieta, José de Anchieta - b. October 9, 1832 in Lisbon, Portugal, d. September 14, 1897 in Caconda, Angola) was a 19th century Portuguese explorer and naturalist who, between 1866 and 1897, travelled extensively in Angola, Africa, collecting animals and plants. These species were sent out to Portugal, where they were later examined by several zoologists and botanists, chiefly among them J.V. Barboza du Bocage. Many of the species of birds, amphibians, lizards, snakes, fishes and mammals described by him were unknown and thus were named for Anchieta with the species designation anchietae. Some of them were:
Anchieta's Sunbird (*Anthreptes anchietae*), a bird.
Anchieta's Barbet (*Stactolaema anchietae*), a bird.
Anchieta's Tchagra (*Tchagra anchietae*), a bird.
Anchieta's Ridged Frog (*Ptychadena anchietae*).
Anchieta's Dune Lizard (*Meroles anchietae*).
Anchieta's Frog (*Hylambates anchietae*).
Anchieta's Chameleon (*Chaemeleo anchietae*).
Anchieta's Cobra (*Naja annulifera anchietae*), a venomous snake.
Anchieta's Dwarf Python (*Python anchietae*), a non-venomous snake.
Anchieta's Pipistrelle (*Pipistrellus anchietai*), a bat.
Anchieta's Elephantfish (*Mormyrus anchietae*).
Anchieta's Antelope (*Cephalophus anchietae*).

Life
Anchieta was born in 1832, in Lisbon, and started his studies in Mathematics at the University of Coimbra. Due to his fierce independence and excentric character, however, he did not adapt well and moved to the Escola Politécnica de Lisboa (Polytechnic School). In 1857, one of his closest friends moved to Cabo Verde, a Portuguese colony and a group of islands in the Atlantic Ocean in West Africa, and Anchieta went to join him. He spent his time studying the local fauna and flora in the island of Santo Antão, and finally ended up helping out the local inhabitants as an amateur physician (he had studied some Medicine for himself). A fierce cholera epidemic killed most of the inhabitants and he almost died too, but he was able to return to Portugal after two years. Following what he thought was his vocation, he studied Medicine in Lisbon, London and Paris, but could not complete the course, and returned to Africa again, this time to Angola, one of the largest West African Portuguese colonies. He was very successful as an explorer of the hinterland and as a naturalist, and after studying and collecting many new animal and plant species, he returned to Portugal and donated the remains of is collections to the natural museum of the Polytechnic School (unfortunately most of it had been lost when his canoe foundered in a river).

In 1865, he travelled back on his own once again to his beloved Angola. This time, he was already married and his wife accompanied him. He stayed on his own in the region of Benguela, establishing a laboratory inside the ruins of a church, and exploring and collecting animals; until, in 1867, the Portuguese government hired him, overtly as a naturalist. But what is most probable is that Anchieta was recruited as a secret agent and informer in the Caconda region of Angola, one of the most extreme points of its territory. He stayed there, researching, exploring and sending many specimens and letters to his scientific correspondents in Lisbon. He also helped medically in the local hospital and was much appreciated by the population as a dedicated and humane care-giving person.

Unfortunately, little is known in the manner of documentation about this period of Anchieta's life, because most of the museum specimens have disappeared, as well as his many letters to du Bocage, in a catastrophic fire in the Museum, in 1978.

Achieta died while returning from a zoological expedition to Caconda, in 1897, at 66 years of age, probably of the chronic consequences of malaria, which he and his wife caught, and which had severely mined his health for many years.

In all, according to du Bocage, Anchieta's zoological output was truly prolific. He was responsible for identifying 25 new species of mammals, 46 of birds and 46 of amphibians and ophidians. He didn't care much for writing scientific papers, though, but left this to his correspondents in Lisbon.

Félix / Michel Anciaux de Faveaux

Born: 1920 - Died: ?

Michel Anciaux de Faveaux (during his time as a missionary also known as Dom Félix Anciaux de Faveaux) was professor in zoology at the university of Rwanda and subsequently at the university of Constantine in Algeria.

In 1954, he left for Congo where he founded the Speleological Society of Jadotville.

In 1972, at the age of 52, he obtained his doctors degree with a study on the reproduction of *Myotis myotis* and the reproduction of Central African bats, with an annex on parasites of bats on the African continent.

See: http://speleodinant.blogspot.com/2010/03/michel-anciaux-de-faveaux.html

Dr. John Anderson

Born: 1833: Edinburgh, Scotland, UK - Died: 15 August 1900: Buxton, UK

Corbet and Hill (1992): Superintendent of the Indian Museum and Professor of Comparative Anatomy, Calcutta 1865-86; naturalist and medical officer on the British expeditions from Calcutta to Yunnan, 1868-8 and 1875.

P.D.H. Ansell

Born: ? - Died: ?

Son of William Frank Harding Ansell.

William Frank Harding Ansell

Born: 13 June 1923; Devoran, Cornwall, England, UK - Died: 6 December 1996; Penzance, Cornwall, England, UK

W.F.H. Ansell was a zoologist who studied the mammals of southeast Africa. He obtained his PhD at Liverpool University in 1960 and was then appointed Provincial Game Warden in Northern Rhodesia.

Father of P.D.H. Ansell

Dr. William John Ansorge

Born: 1850 - Died: 1913

William John Ansorge was an English explorer and collector, who was active in Africa in the second half of the 19th century.

(see: Beolens et al.: The Eponym Dictionary of Mammals)

Dr. Harold Elmer Anthony

Born: 1890 - Died: 1970

Corbet and Hill (1992): Assistant, then Curator of Mammalogy, American Museum of Natural History, New York, 1915 (1921)-1958.
Anderson (1997: 126): Ottley-Anthony Expedition of 1929 to Bolivia (Field numbers 3256-3291).

Marchese Orazio Antinori

Born: 23 October 1811: Perugia, Italy - Died: 26 August 1882: Lèt Marefià, Ethiopia

Orazio Antinori was an Italian explorer and zoologist, and one of the most respected specialists on Italian Africa. He completed the "Iconografia della Fauna Italica" started by Bonaparte.

In 1848 he fought against the Neapolitans, and was later forced into exile. He lived in Athens and Smyrna, becoming interested in the avifauna of the area.

In 1854, he accompanied Cristina Trivulzio Belgiojoso to Syria, afterwards visiting Asia Minor. In 1859 he left for Egypt and travelled up the Nile, in 1860-1861, with Carlo Piaggia (1830-1882)..

Antinori took part in the expedition of Odoardo Beccari to Ethiopia and made important collections of natural history specimens. On his return to Italy he became the secretary of the Italian Geographical Society. In 1874, Antinori studied Chott near Tunis. In 1876 he took part in an expedition with Gustavo Chiarini and Antonio Cecchi to the province of Shewa in Ethiopia where they met with Negus Menelik at Liche, and obtained his permission to found a geographical station at Let Marefia. A casual but serious accident deprived him of his right hand making it inactive. He died after a brief illness.

Antinori sent a large amount of interesting material to the museums of Genua and Turin.
See: http://en.wikipedia.org/wiki/Orazio_Antinori, http://it.wikipedia.org/wiki/Orazio_Antinori

Dr. Andrew A. Arata

Born: ? - Died: ?

Dr. Andrew A. Arata was a tropical disease expert, who retired in March 1999. From 1968 to 1985 he was an ecologist for the WHO and Pan American Health organisation in Mexico, Venezuela and Geneva. From 1985 to 1992, he was associated with the Vector Biology and Control (VBC) project of the U.S. Agency for International Development.

see Beolens et al.

Charles R. Aschemeier

Born: ? - Died: ?

Charles R. Aschemeier, was a U.S. National Museum taxidermist, visited the French Congo as a member of the Collins-Garner Expedition, so named for Guy N. Collins (q.v.) and Richard Lynch Garner (q.v.). useum collection records indicate that the objects he donated were collected (and not merely received) in 1919, evidently during the last of Garner's four excursions to the Congo (the earlier visits were in 1892, 1894 and 1911).

See: Leopold, R.S. (1994). A guide to early African collections in the Smithsonian Institution (http://anthropology.si.edu/leopold/pubs/early_african_collections.pdf)

James Ashe

Born: ? - Died: ?

In the 1960's, James Ashe was curator of reptiles at the Croydon Museum (now National Museums of Kenya).

See: http://savingsnakes.wildlifedirect.org/

ATBP Mammal Team

Born: ? - Died: ?

African Tropical Biodiversity Training Programme

Jean Baptiste Audebert

Born: 1759: Rochefort, France - Died: 1800: Paris, France

Rév. Frère Aureliaan

Born: ? - Died: ?

Also mentioned as Aurélien

Alfred Marshall Bailey

Born: 18 February 1894: Iowa City, Iowa, USA - Died: 25 February 1978

Alfred Marshall Bailey attended local schools and the University of Iowa. His interest in taxidermy and his friendship with Homer R. Dill (then director of the University of Iowa Museum) led to his first expedition in 1912 - 1913 to Laysan Island, in the Leeward Chain of Hawaii.

Bailey was curator of birds and mammals at the Louisiana State Museum from 1916 to 1919, and from 1921 to 1926 at the Denver Museum. From 1926 to 1927, he was a staff member of the Field Museum of Natural History. From 1927 to 1936, he was director of the Chicago Academy of Sciences, and from 1936 to 1969 of the Denver Museum of Natural History.

From 1919 to 1921, he made a survey of southeastern Alaska for the United States Fish and Wildlife Service. Further fieldwork included a muleback trip over 3,200 km in Ethiopia, and a 1,200 km dogsled trip in northern Alaska.

See: Phillips, A.R. (1981): In Memoriam: Alfred M. Bailey. - The Auk, 98: 173 - 175.

Rollin Harold Baker

Born: 11 November 1916: Cordova, Illinois, U.S.A. - Died: 12 November 2007,

Rollin H. Baker began started his B.A. in zoology at the University of Texas in 1937. He completed an M.S. in entomology from Texas A&M University in 1938 and a Ph.D. in zoology from the University of Kansas in 1948. In the mean time, he took a position with the Texas Game, Fish, and Oyster Commission. After enlisting in the navy during World War II, he was selected to be a member of the Naval Medical Research Unit 2 (NAMRU-2), which trained at Rockefeller University and deployed to the South Pacific. In 1948, he got a position at the University of Kansas, as curator of mammals of the Museum of Natural History. In 1955, he moved to East Lansing, where he served as Director of the Museum at Michigan State University until his retirement in 1982.

Rollin Baker made several field trips to Mexico, where he studied the biogeography of Mexican mammals.

Dr. Thomas H. Barry

Born: 1924: Mossel Bay South Africa - Died: 1984

Thomas Henry Barry was born in Mossel Bay in 1924 and attained his degree in Zoology at Stellenbosch University. After taking his doctorate, he lectured at the University of Pretoria for four years and it was here that he became interested in the Karoo mammal-like reptiles. In 1959 he was appointed Director of the Albany Museum, Grahamstown. He assumed the Directorship of the South African Museum in 1964, until his death in 1984.

See: http://www.iziko.org.za/sam/muse/hist/barry.html

Bartlett

Born: ? - Died: ?

Eugène Joseph Bastard

Born: 1865 - Died: 1910

French colonial administrator, traveller, zoologist, paleontologist and collector. Worked together with Grandidier in the MNHN in Paris. He undertook a collecting expedition to Madagascar, returning to France in 1898, and visited the island again in 1899.

see Beolens et al.: The Eponym Dictionary of Mammals

Harry A. Beatty

Born: 10 January 1902: St. Croix, Virgin Islands - Died: ?

Harry Beatty graduated from Richmond High School in 1919, after which he attended the Mount Hermon Schools, majoring in zoology.

In 1924 he traveled to Guanica, Puerto Rico, where he met Professor Stuart T. Danforth of the University of Mayaguez, who encouraged him to publish his notes on the Birds of St. Croix and the Birds of Guanica Lagoon.

He returned home in 1929 and a few months later traveled to New York where he met Professor Francis W. O'Cibbir of Columbia University Medical School, who guide him through a crash course of parasitology and tropical medical entomology. However, when a malaria epidemic broke out in the islands in 1933 he joined the staff of the Virgin Islands Department of Health to supervise the malaria and filarial research and control project.

During 1940 - 44, he directed the Pittman - Robertson Deer Research Project for the Virgin Islands under the direction of the United States Fish and Wildlife Service.

A visit to Mona Island, Puerto Rico, in 1944 resulted in a study collection of birds skins for the Academy of Natural Sciences of Philadelphia. A collection of snails went to the Museum of Comparative Zoology at Harvard University.

He joined the staff of the Firestone Plantation Company of Liberia, West Africa, in 1945 as director of a malaria control project. Five years later he led the Field Museum - Equatorial Africa Zoological Expedition to Gabon, Moyen Congo, Oubangui, and Portuguese Angola.

In 1960, he visited the Nimba Mountains in the Ivory Coast of West Africa for the Yale University Peabody Museum of Natural History and made study collections of bird and mammal skins.

From 1960 to 1962, he was in charge of the Field Museum expedition to Suriname, South America, for collections of birds and mammals.

Dr. Odoardo Beccari

Born: 1843 - Died: 1920

Corbet and Hill (1992): Italian botanist, director of Botanic Garden and Herbarium, Florence; collected in Sarawak 1865-67, in the Moluccas and New Guinea 1871-75.

Charles William ("Will") Beebe

Born: 29 July 1877: Brooklyn, New York, USA - Died: 4 June 1962

Will Beebe was Curator of Ornithology for the New York Zoological Society from 1899 to 1952. He was a self-styled naturalist and everything living seemed to hold a continuing fascination for him. In 1919 he was also made Director of the Department of Tropical Research.

His interest in deep-sea exploration led to the development of the bathysphere, a spherical metal diving vessel, with Otis Barton.

He set up a camp for jungle studies in 1942 at Caripito, Venezuela. In 1950, when he was 73 years old, he bought with his own money 228 acres (92 hectares) of land in the Arima Valley (Trinidad and Tobago) which he named "Simla". This land became the New York Zoological Society's Tropical Research Station in Trinidad.

See: http://en.wikipedia.org/wiki/William_Beebe

Constantine ("Con") Walter Benson

Born: 1909 - Died: 21 September 1982

Born and educated in England. Track star at Cambridge. Career in colonial service. 20 yrs in Nyasaland (Malawi). Awarded OBE on retirement in 1965.

Dr. J. Bequaert

Born: ? - Died: ?

Osborn (1919: xvi) places J. Bequaert in Congo in 1913 - 1915.

Pamela Beresford

Born: ? - Died: ?

American ornithologist, with the AMNH 1996-2000.

Wim Bergmans

Born: 11 February 1940;Amsterdam, The Netherlands - Died: 16 February 2018;Amsterdam; The Netherlands

Dutch zoologist.

In the 1960s, Wim Bergmans started his carreer in Mollusk department of the Zoological Museum Amsterdam. From 1971 to 1980, he was assistant curator in the museum's mammalogy department and from 1981 to 1983 he was guest curator in the herpetology department. In 1984, he joined the Duch national IUCN commitee.

From the early 1970s, he began studying the African fruit bats, which resulted in his PhD (1988). He also described a number of bat species, e.g.: *Rhinolophus tatar* (with Frank Rozendaal), *Myonycteris relicta, Paranyctimene tenax, Dobsonia beauforti* and *Rousettus spinalatus* (with John Edwards Hill).

See: https://de.wikipedia.org/wiki/Wim_Bergmans

Hal L. Black

Born: ? - Died: ?

Hal Black obtained his PhD. in zoology in 1972 at the University of New Mexico, and is professor at the Brigham Young University Department of Zoology (since 1989).

(see: http://lifesciences.byu.edu/~hlb3)

Johan Heinrich Blasius

Born: 7 October 1809: Nümbrecht-Eckenbach, Germany - Died: 26 May 1870: Braunschweig, Germany

Father of Rudolf and Wilhelm Blasius.

In 1834, Blasius obtained a degree in mathematics, geography, geology, zoology and botany in Berlin. In 1836, he was appointed associate professor and in 1842 he obtained a full professorship for descriptive natural sciences at the Collegium Carolinum in Braunschweig, where he worked until his death. He was involved with the founding of the Braunschweig Botanical Gardens.

With his friend, Alexander Count Keyserling, he made extensive travels through eastern Europe, the results of which were published in 1840. In 1840 - 1841 a journey was made to Russia, which resulted in a publication made in 1844. Furthermore, there were several travels to the Alps and to Italy.

The material collected during these trips formed the base of the "Herzoglichen Kunst- und Naturalienkabinet", which later became the Natural History Museum, of which he became the director in 1859.

Additionally, from 1844 he became second (and in 1864 first) Librarian of the Hochschule, and between 1862 and 1866, he was a member of the board of the Collegium Carolinum, and from 1866 he became the director of the "Herzoglichen Museums Braunschweigs".

See: http://de.wikipedia.org/wiki/Johann_Heinrich_Blasius

Hans Georg Hermann Bluntschli

Born: 19 February 1877: Frankfurt am Main, Germany - Died: 13 July 1962: Bern, Switzerland

Hans Bluntschli became "prosektor" in 1914 and later director of the Senckenberg Anatomical Institute in Frankfurt, were he was also named professor in 1915, and in 1919 he was appointed professor in Anatomy and development history. In 1933, he took the same post in Bern, where he remained until his retirement in 1942.

see: http://de.wikipedia.org/wiki/Hans_Bluntschli

José Vicente Barboza du Bocage

Born: 2 May 1823: Madeira - Died: 3 November 1907

Director of the National Zoological Museum of Lisbon.

Richard Böhm

Born: 1 October 1854: Berlin, Germany - Died: 1884

Osborn (1919: xv) places R. Böhm and P. Reichard in Congo in 1880 - 1884.

Prince Charles Lucien (Carlo) Jules Laurent Bonaparte

Born: 24 May 1803: Paris, France - Died: 29 July 1857: Paris, France

Corbet and Hill (1992): Nephew of Napoleon Bonaparte; studied mammals in all the major museums in Europe.

Charles Lucien Bonaparte was a French naturalist and ornithologist, and was a nephew of Napoleon Bonaparte.
Bonaparte was raised in Italy, and, after his marriage in 1822, travelled to the United States. At the end of 1826, he returned to Europe and visited Germany, where he met Philip Jakob Cretzschmar, and England, where he met John Edward Gray. In 1828, he settled in Rome, where he published (between 1832 and 1841) the "Iconografia della Fauna Italica".

In 1849, he was elected to the Roman Assembly, where he participated in the creation of the Roman Republic. In 1848 he was forced to leave Rome and travelled to Marseille and subsequently to England, and Paris.

(see http://en.wikipedia.org/wiki/Charles_Lucien_Bonaparte)

John James Lewis Bonhote

Born: 1875: London, UK - Died: 1922

Corbet and Hill (1992): Ornithologist and aviculturalist; unofficial worker in the Mammal Section of the British Museum (Natural History) with Oldfield Thomas; Zoological Gardens, Giza, Egypt 1913-19.

Dr. Paolo Emilio Botta

Born: 1802 - Died: 1870

Naturalist, archeological explorer and traveller. Travelled and collected for the Museum of Natural History of Paris. One of the very first naturalists to collect in California (1827-1828).
(see Jaeger, 1972: 309)

Beltz (2004: http://ebeltz.net/herps/biogappx.html):
also Botta, Paul Emile
19th Century explorer, archaeologist and diplomat.
1827-1829 Naturalist aboard French merchant ship "Heros."
Collected type of *Charina bottae* in CA.
Sent first specimen of roadrunner to France.
1830 Physician to Mohammed Ali.
1833 French consul in Alexandria.
1840 Consular agent in Iraq.
1843-1846 Archaeological pioneer, excavated and identified Khorsabad as Ninevah, discovered Sargon's palace. Found 7th Cent B.C. dictionary for Class III cuneiform script at Kuyunjik.
1847-1846 Wrote "Monuments de Ninive decoverts et decrits par Botta, mesures et dessines par E. Flandin."

Vittorio Bottego

Born: 29 July 1860: Parma, Italy - Died: 17 March 1897: Daga Roba

Vittorio Bottego was an Italian explorer and official who became famous for his travels to the Horn of Africa.

In 1887 he was a member of the scientific and geographical expeditions to Eritrea. In 1891, he was in Danakil and later he planned expeditions to the Juba River region. In 1892 he reached Ganal Doria (upper course of the Juba River). After a brief return to Italy, he went back to Africa to follow the whole course of the Omo River under the patronage of the Italian Geographical Society.

He was killed during a fight at Daga Roba.

See: http://it.wikipedia.org/wiki/Vittorio_Bottego

Adolphe Boucard

Born: 1839: France - Died: 15 March 1905: Hampstead, England, UK

Collected in Mexico
Natural History agent Paris, moved to London in 1890. Passed later years of his life in his villa near Ryde, Isle of Wight.
CWR gives death as Dec. 15, 1904 Hampstead

Jack W. Bradbury

Born: ? - Died: ?

Dr. Bradbury received his BA in Biology from Reed College (Portland, OR) in 1963. He completed his PhD with advisor Dr. Donald Griffin in Animal Behavior at Rockefeller University (New York, NY) in 1968, and then spent two years in Trinidad on a postdoctoral fellowship studying tropical bat social behavior. He has served on the biology faculties of Rockefeller University, the University of California, San Diego, and Cornell University. He is a Fellow of the Animal Behavior Society and a past President of the International Society for Behavioral Ecology.

Research Interests: Dr. Bradbury's research efforts have included field studies on mating system evolution and social dispersion in tropical bats, the evolution of leks in African fruit bats and grouse, foraging dispersions of African antelopes, sexual selection

in hermaphroditic sea slugs, and most recently, the functions of vocal mimicry in wild parrots. Dr. Bradbury retired in July 2009 and no longer has an active laboratory, but he is available to serve as a member of graduate committees.

See: http://www.nbb.cornell.edu/bradbury.shtml

Leo Daniel Brongersma

Born: 1907 - Died: ?

Corbet and Hill (1992): Dutch zoologist; Leiden Museum 1934 - (Director 1958 -).

Buchner

Born: ? - Died: ?

Osborn (1919: xv) places M. Buchner in Congo in 1878 - 1880.

Büttner

Born: ? - Died: ?

Osborn (1919: xv) places R. Büttner in Congo in 1884 - 1886.

Alphonse Cabra

Born: 1862: Chièvres, Belgium - Died: 1932: Antwerp, Belgium

Alphonse Cabra was a miner second class in the engineers corps in 1878, and made sergeant in 1880. He entered the military school in 1880 and was appointed second lieutenant in the carabineers in 1882. He attended the "war school" in 1887, and became aide to lieutenant-general Marchal in 1890. He was promoted to lieutenant-colonel in 1913, and later on lieutenant-general and commander of the second army corps (Antwerp) 1919 - 1924. He was a member of the colonial council (1919) and member of various administrative colonial societies and philanthropic and scientific societies.

He was in charge of an exploration mission (started by Delporte and Gillis) in the Bas-Congo and especially the Mayumbe area (geodesic observations, magnetism, geography, botany and zoology) and was later on designated as commissioner to the border committee that was erected to mark the border between Cabinda and the Congo Free State, but at the same time pursued his scientific research. Afterwards, he returned to Boma where he commanded the operations to pursue the mutineers of the Shinkakasa fortress (1896 - 1900). He acted also as commissioner on the committee to trace the parallel from Noki to Kwango (the border between Congo and Cabinda/Angola? [Portugal]) (1901 - 1902). He defended the Congolese interests in the mixed Franco-Congolese commission to trace the Manyanga-Kaonga border (1903). He also took part of an inspection mission in the Oriental province and the Ruzizi-Kivu territory (1905 - 1906).

See: Van Schuylenbergh (1997: 9).

P. Callewaert

Born: ? - Died: ?

See Père (Monsignor) Richard Callewaert

Père Richard Callewaert

Born: ? - Died: ?

Beolens *et al.* (2009): Monsignor Richard Callewaert (1866 - 1943) was a Belgian missionary and amateur naturalist who collected many different taxa in the then Belgian Congo. There is a record of an R.P. Callewaet collecting the type specimen of an ant in Zaire in 1912, another in 1913, and yet another ant type in 1935 as well as a beetle type specimen in 1923 and small fish in 1932. The zoologist who described the ants reported Callewaert as "noting he found the [ant] colony in his room, going from here to there, through a hole in the wall whence they disappeared one after the other … The ants did not climb the wall itself but ascended between wall and the wood of the door." We think he was the Callewaert who wrote the trace "Rapport sur l'education des Mulâtres," which appeared in Compte-rendus du Congrès International pour l'étude des problems resultant du mélange des races in 1935.

Dr. Anne Margariette Camerik

Born: 1941: Balikpapan, Indonesia - Died: ?

Dutch-born entomologist and Ursuline sister. She spent her early years in Sumatra until her family returned to the Netherlands. In 1964, she obtained a degree in horticulture and garden architecture at the Hogere Tuinbouw School, Frederiksoord, and a few months after graduating joined the Order of St Ursula. From 1970 to 1976, she attended the Catholic University in Nijmegen as a Biology major, earning an MSc degree for her work in geobotanics.

She collected plants in the Itatiaia and Serra dos Orgaõs mountains of Brazil, while on exchange to the Universidade Santa Ursula in Rio de Janeiro (1974-1975). Her later publications have been on mites. She came to Botswana in 1977 as teacher at the secondary school in Mahalapye, where she stayed for twelve years, during which she collected some 800 plant specimens around Mahalapye, Gaborone, and Thamaga. After moving to South Africa, she completed a doctorate in Aracology.

J.S. Carlisle

Born: ? - Died: ?

Dr. Archie Fairly Carr, Jr.

Born: 16 June 1909: Mobile, Alabama, USA - Died: 21 May 1987: Micanopy, Florida, USA

Archie Fairly Carr, Jr. was associated for over fifty years with the University of Florida, first as a student, B.A. (1932), M.S. (1934), and as the University's first Ph.D. (1937) in biology. As a zoologist, he was most noted for his pioneering work in studying sea turtles and especially for discovering their migration patterns

Javier Castroviejo

Born: ? - Died: ?

Anderson (1997: 128): EBD, 1980 at Estancia Venecia and with Huanchaca Expedition in 1986 (Bolivia).

James Paul Chapin

Born: 9 July 1889: New York, USA - Died: 7 April 1964: New York, USA

At the age of 16, James Paul Chapin took a job mounting birds in the American Museum of Natural History, where he stayed for 59 years.

In 1908, Herbert Lang was chosen to lead the American Museum Congo Expedition, and Chapin (19 years old) was asked to come along as assistant and second-in-command. This expedition was originally planned to take two years, but eventually lasted for six, being one of the longest uninterrupted field assignments in the museum's history. During this expedition, Lang and Chapin were sometimes separated for as much as a year. The expedition traveled about 15,000 miles on foot, without accident or serious sickness. The results were overwhelming: 5,800 mammals, 6,400 birds, 4,800 reptiles and amphibians, 6,000 fish, over 100,000 invertebrates, 3,800 anthropological specimens, and 9,890 photographic negatives and 300 water colour paintings.

Upon his return to New York in 1915, Chapin finished his undergraduate studies and obtained his Ph.D. in 1919. Over the next years, he returned several times to Africa, e.g. in 1926 - 1927 with the Ruwenzori-Kiwu expedition to East Africa and Congo. In 1930, he went to Lukolela, and in 1937, he returned to track down the Congo peacock (*Afropavo congensis*), of which he found a single feather on a native hat back at Avakubi in 1913, and of which saw two mounted specimens in 1936 in the Congo Museum at Tervueren, in Belgium. In 1942 he also was in the Congo and on Ascension Island on war work for the Office of Strategic Services. From 1953 to 1958, he lived in the eastern Congo (the highlands west of Lake Kivu), working for the Belgian Institute for Scientific Research in Central Africa [IRSAC: L'Institut pour la Recherche Scientifique en Afrique Centrale].

In 1923, he made a short trip to Panama, and in 1930 he was a member of an expedition to the Galapagos Islands on the yacht "Nourmahal". In 1934, he went to Polynesia on the yacht "Zaca".

Between 1934 and 1939, Chapin was vice president of the American Ornithologists Union, and president from 1939 to 1942.

Friedmann, H. (1966). In Memoriam: James Paul Chapin - The Auk, 83: 240 - 252.

Rev. Héli Chatelain

Born: 1851 - Died: 1908

Heli Chatelain was an author, linguist and missionary in Angola, who collected several hundred objects of material culture in Sierra Leone, Cote d'Ivoire (Grebo), Ghana (Ashanti), Nigeria (Yoruba, Nupe), Cameroon (Bamileke), Zaire, and Angola, as well as among Navaho, Zuni and Mission Indians in the United States. Chatelain appears to have collected many of the African objects in 1899 during his stint with the U.S. Scientific Expedition to Africa, also known as the Eclipse Expedition.

See: Leopold, R.S. (1994). A guide to early African collections in the Smithsonian Institution (http://anthropology.si.edu/leopold/pubs/early_african_collections.pdf)

Colonel Robert Ernest Cheesman

Born: 1878 - Died: 13 February 1962

British Army officer and diplomat serving in India, Iraq (1920-23), Ethiopia and Sudan. He was private secretary to Sir Percy Sykes during his tenure as High Commissioner in Iraq.

See: Corbet and Hill (1992)
http://zoonomen.net/bio/bioc.html

Rev. Frédéric Christol

Born: 8 April 1850: Paris, France - Died: 14 December 1933: Paris, France

Protestant missonary in Lesotho, later pastor in Pantin and Noisy-le-Sec, France. Writer, painter, ethnologist and anthropologist.

In 1882 Frédéric Christol was on vacation from the Mission Populaire Evangélique and destined for the Zambesi Mission. He arrived from Dartmouth via Durban, in Basutoland where family circumstances forced him to remain. He joined the Paris Evangelical Mission Society, working first at Bethesda (now Maphutseng) from 1885. In 1887 he moved to Hermon on the left bank of the Caledon River near Wepener in the Orange Free State. He remained there until 1908 when he retired. At Hermon he was given the Sesotho name Kiritla (meaning the Thunderer). He also did some painting there. In 1892 he received a gold medal at the Kimbereley Exhibition for his collection of old African objects. He also collected African plants, specimens of which he sent to Paris. He returned with his family, to France via the East Coast of Africa. Along the way they visited his parents-in-law in Jerusalem. He settled at Pantin in France where he again did preaching. In his 80th year, he and his wife celebrated their golden anniversary and he was made a Chevalier de la Légion d'Honneur.

Major/dr. Cuthbert Christy

Born: 1863 - Died: 29 May 1932

Osborn (1919: xvi) places C. Christy in Congo in 1911 - 1914.

Ernest Charles Chubb

Born: 16 September 1884; London, United Kingdom - Died: 9 October 1972, Durban, South Africa

Son of Charles Chubb (1851 - 1924), British ornithologist who worked at the Natural History Museum in London.

At 17, he became assistant of Oldfield Thomas at the Natural History Museum in London. In 1906 he visited Southern Rhodesia, where he explored the Matopo Hills south of Bulawayo by bicycle. In 1908, he was appointed as zoologist and assistant curator of the Rhodesia Museum (later the National Museum) in Bulawayo. Chubb immediately became active in the Rhodesia Scientific Association, where he was recognized as a skilled naturalist and taxidermist. In 1910, he became curator of the Durban Municipal Museum, and in 1919 director of the combined Durban Museum and Art Gallery. He reached pensionable age in 1944, but stayed on in his post in temporary service until his retirement at the end of 1951.

Phillip Alexander Clancey

Born: September 1917: Glasgow, Scotland, UK - Died: 18 July 2001

Phillip A. Clancey received his ecudation at the Glasgow School of Arts.

He moved to South Africa in 1950, and was appointed director of the Durban Museum in 1952.

See: http://zoonomen.net/bio/bioc.html

K.M. Clark

Born: ? - Died: ?

Antoine Barthélémy Clot, Bey

Born: 5 November 1793: Grenoble, France - Died: 28 August 1868: Marseille, France

Antoine Barthélémy Clot, generally known as "Clot-Bey" was a French doctor, who primarily worked in Egypt, where he moved to on 21 January 1825 and left in 1849.

See: https://fr.wikipedia.org/wiki/Antoine_Clot

Major Alfred Morris Collins

Born: ? - Died: ?

Anderson (1997: 128): sportsman of Bryn Mawr, Pennsylvania, cosponsor of and participant in the FMNH Collins-Day Expedition (Bolivia) in 1915 (collectors Becker and Cherrie; see also Miller and Boyle); after whom *Rhipidomys collinus* was probably named, although the author (Thomas, 1925: 578) did not mention the source of the name.

(Henry) Boardman Conover

Born: 18 January 1892: Chicago, Illinois, USA - Died: 5 May 1950: Chicago, Illinois, USA

Boardman Conover was a soldier and amateur ornithologist, who studied civil engineering at the Sheffield Scientific School in Yale. He served with the Unites States Reclamation Service in Las Cruces, New Mexico, from 1912 to 1913, and then worked with the Pennsylvania Railroad in Pittsburgh, and later with the Stewart Manufacturing Company in Chicago. In WW I he served in France. Through 1919 and 1920 he travelled to Yukon to shoot big game. In 1919, he met with Dr. Wilfred Hudson Osgood, then assistant curator of mammalogy and ornithology of the Field Museum in Chicago, which in 1920 led to a collecting trip to Venezuela, from which he brought back 133 specimens. In 1922 he went to Chile and Argentina with Dr. Osgood and Mr. Colin C. Sanborn (who stayed in Chile). In 1924, he spent the spring and summer in Hooper Bay, Alaska, and in January 1925, he made a short trip to Mexico.
Together with Mr. R.H. Everard, Conover financed an expedition to East Africa, on which he was accompanied by Mr. John T. Zimmer, and collections were made in Tangayika Territory, Belgian Congo, and Uganda. During that trip, he caught intestinal malaria.

Tenley M. Conway

Born: ? - Died: ?

2004 Ph.D. Geography, Rutgers University (Thesis Title: Ecological Impact of Future Land Use in Southeastern New Jersey, Supervisor Richard Lathrop).
2001 M.S. Geography, Rutgers University.
1997 B.S. Natural Resources, Cornell University.

2004- Present Assistant Professor, Department of Geography, University of Toronto at Mississauga

Orator Fuller Cook, Jr.

Born: 28 May 1867: Clyde, New York, USA - Died: 23 April 1949: Lanham, Maryland, USA

Orator Fuller Cook was educated at Syracuse University, receiving the Ph.B. degree in 1890. After graduation, he remained at Syracuse as an Instructor in the Biology Department. From 1891 to 1897, Cook made several trips to Liberia as an agent for the New York Colonization Society and at various times served as Professor of Natural Sciences and president (in 1896) at Liberia College until 1898. In 1895, he joined the staff of the United States National Museum (USNM), in an honorary capacity, as Custodian of the Section of Myripoda of the Department of Insects. In 1898, Cook was appointed to a salaried position, as Assistant Curator in the Division of Plants, USNM. He resigned the following year to join the United States Department of Agriculture's Bureau of Plant Industry, where he remained until his death. He continued his association with the USNM as Custodian of the Section of Myripoda and was made Honorary Assistant Curator of the Section of Cryptogamic Collections of the Division of Plants in 1899. He retired in 1937.

Harold Jefferson Coolidge

Born: 1904 - Died: 1985

Corbet and Hill (1992): Mammalogist at the Museum of Comparative Zoology, Harvard, USA; organizer of the Asiatic Primate Expedition to Siam, French Indochina, Borneo and Sumatra, 1937.

Charles Barney Cory

Born: 31 January 1857: Boston, U.S.A. - Died: 31 July 1921

In 1875 Cory made a first trip to England, France, Italy, and Alexandria (Egypt). Here, together with Martin Ryerson, an expedition by dahabeeya was organized down the Nile to shoot and collect birds. After returning to Boston, Cory and Ryerson became roommates at Harvard, where Cory attended the Lawrence Scientific School, where he worked at the Museum of Comparative Zoology, where Dr. J.A. Allen was curator of mammals and birds.

From November 1877 to January 1878, he spent some time in Florida. In July and August 1878, he stayed on the Magdalen Islands, in the Gulf of St. Lawrence. In the fall of 1878 he entered the Boston Law School, but he left it for a trip to the Bahamas in December with Arthur Smith as taxidermist. He remained there until July 1879.

In 1880, he went again to England and France, meeting with European ornithologists. After his return to the US, he began preparing for a next trip to the Bahamas and the West Indies. He sailed for Haiti on 4 February 1881, where he again made extensive collections of birds.

In 1882, after the death of his parents and only sister, he became very nearly a millionaire

In 1883, he was one of the 48 ornithologist founders of the American Ornithologists' Union.

In 1884, he went to Dakota and Montana shooting ducks and geese, together with Martin Ryerson and Charles R. Crane, and the following winter he returned to live in Florida. One of his hobbies there was a small museum called "The Florida Museum of Natural History", which he established in Palm Beach, which unfortunately got destroyed by fire in 1903.

In 1886, he made a short trip to Cuba, where he met with Dr. Gundlach.

In 1887, he went to Mexico and the southwestern United States, and later in the year to Canada.

In 1888, he spent a number of weeks in Alberta shooting big game.

In July 1889, another trip to Europe (England and France) was made.

In 1891, he cruised about at the West Indies, visiting Cuba, the Bahamas, and various small islands, and in 1892 he was again in Cuba. During this time, a number of collectors were hired, one of them being Daniel J. Sweeting, who worked in the Bahamas.

In December 1887, Cory was elected Curator of Birds in the Boston Society of Natural History, a largely honorary position, which he held until 1905.

In 1893, he donated his 19,000 bird specimens to the newly established Field Columbian Museum in Chicago, and he became (honorary) curator of Ornithology.

He lost his fortune in 1906, and which forced him to earn his money. The museum created a salaried position of Curator of Zoology.

Raymond Bridgeman Cowles

Born: 1896: South Africa - Died: 1975: US

Professor of the University of California, Los Angeles.

See: Beltz (2004: http://ebeltz.net/herps/biogappx.html):

Newman Hall Dervis Cox

Born: ? - Died: ?

Dr. Newman Cox, of Baltimore, Maryland, was a medical missionary in Batanga, Cameroon, under the Presbyterian Board (U.S.) from 1896-1900.

See: Leopold, R.S. (1994). A guide to early African collections in the Smithsonian Institution (http://anthropology.si.edu/leopold/pubs/early_african_collections.pdf)

G. Kenneth Creighton

Born: ? - Died: ?

Anderson (1997: 129): graduate student UMMZ; 1978, 1979, and 1980 (field numbers 17-466, 874-1401); with L. Snyder in 1978 and 1979 (Bolivia).

Matthew Criblez

Born: ? - Died: ?

Matthew Criblez served in the Peacecorps in Burundi from 1989 to 1991, and in Malawi from 1992 to 1993.

See: http://peacecorpsonline.org/messages/messages/467/2037356.html

Rolla Patterson Currie

Born: 1875 - Died: ?

Rolla Currie worked for the Department of Insects of the U.S. National Museum (c.1897) and was in charge of editorial work in the U.S. Bureau of Entomology beginning in 1904. He collected insects in the United States, Liberia and British Columbia, specializing in Odonata and Neuroptera (Osborn 1937:257). Currie visited Liberia between February 1 and May 10, 1897 to collect insects for the museum. He also collected a small series of birds which he identified in his fieldnotes by their Liberian English and Gola names (Oberholser 1900).

See: Leopold, R.S. (1994). A guide to early African collections in the Smithsonian Institution (http://anthropology.si.edu/leopold/pubs/early_african_collections.pdf)

Giotto Dainelli

Born: 19 May 1878: Florence, Italy - Died: 16 December 1968: Florence, Italy

Italian geologist and geographer.

The son of a general, became accustomed from an early age to travel. He graduated in Natural Sciences in 1900 at the Institute for Advanced Studies in Florence. In 1903 he became a lecturer in geology and physical geography in Florence, and from 1914 to 1921 he held the chair of geography in Pisa. After a brief stay in Naples, he returned to Florence, where he took over the chair of geology and paleontology in 1924.

Dainelli made several expeditions in East Africa and in Asia: in 1905-1906 in Eritrea; in 1913-1914 in the Karakoram, in what was the most important Italian exploratory expedition in Asia in the twentieth century; in 1936-1937 on Lake Tana, Ethiopia. He was president of the Italian Geological Society, member of the Pontifical Academy of Sciences and the Academy of the Lincei, and the Academy of Italy. In February 1944 he was appointed mayor of Florence, the last before the liberation of Florence in August 1944.

Prof. Dr. Walter Woelberg Dalquest

Born: 11 September 1917: Seattle, Washington, USA. - Died: 27 September 2000

Walt Dalquest obtained his B.S. in 1940 and his M.S. in 1941 from the University of Washington, and his Ph.D. in 1951 from the Louisiana State University. He taught human anatomy and physiology, general zoology, comparative vertebrate anatomy, field zoology, limnology, ornithology, herpetology, ichthyology, mammalogy, vertebrate paleontology, wildlife management, and history and literature of the biological sciences. His publications (seven books and 173 research articles) ranged from geology over ichtyology to mammalogy for both fossils and extant forms. His personal vertebrate catalog number reached over 24,000, including over 50 % of mammal skins.

In 1963 and 1965, he accompanied Jerry Vinson to collect mammals near the Save River in south-central Mozambique, and these collections are currently housed at the Midwestern State University.

(see: Horner, N.V., and F.B. Stangl Jr. (2001). Walter Woelber Dalquest: 1917 - 2000. - J. Mamm., 82 (2): 604 - 612.)

Philip Jackson Darlington, Jr.

Born: 14 November 1904: Philadelphia, Pennsylvania, USA - Died: 16 December 1983: Cambridge, Massachusetts, USA

1924, 1926, 1928: field expeditions to locations in the West Indies
1926: B.A., Harvard University
1927: M.S., Harvard
1931: Ph.D. at Harvard
1932-1940: Assistant curator of insects, Museum of Comparative Zoology, Harvar
1938: publishes "The Origin of the Fauna of the Greater Antilles, with Discussion of Dispersal of Animals Over Water and Through the Air" inQuarterly Review of Biology
1940: Curator of Coleoptera at the Museum of Comparative Zoology
1941-1944: World War II serves in Pacific Malaria Survey division/ Army Sanitation Corps
1943: publishes "Carabidae of Mountains and Islands: Data on the Evolution of Isolated Faunas, and on Atrophy of Wings" in Ecological Monographs
1947, 1957: awarded Guggenheim fellowships
1951: Curator of insects at the Museum of Comparative Zoology
1957: publishes Zoogeography: The Geographical Distribution of Animals; receives the Daniel Giraud Eliot Medal from the National Academy of Sciences
1962 - 1971: Alexander Agassiz Professor of Zoology, Harvard
1964: elected to the National Academy of Sciences and the American Academy of Arts and Sciences
1965: publishes Biogeography of the Southern End of the World
1980: publishes Evolution for Naturalists: The Simple Principles and Complex Reality

See: http://zoonomen.net/bio/biod.html

Pierre Paul François Camille Savorgnan de Brazza

Born: 26 February 1852: Rome, Italy - Died: 14 September 1905: Dakar, Senegal

de Brazza was a French-Italian explorer, who laid the foundation of the French colonial empire in central Africa, and who founded the capital of Congo: Brazzaville.

He studied at the "École navale" at Brest. In 1874, he made two inland voyages along the Gabon and Ogooué rivers. He was able to obtain money for an expedition to the source of the Ogooué (1875 - 1878). During a second expedition (1879 - 1882), ha was able to reach the Congo in 1880. In september 1880 he signed a treaty with a local chief by which the area became under French "protection". In 1886 Brazza was named governor-general of the French-Congo protectorate.

see: http://nl.wikipedia.org/wiki/Pierre_Savorgnan_de_Brazza

Raymond Decary

Born: 1891: Méry-sur-Seine, Aube, France - Died: 1973: Paris, France

French administrator and naturalist in Madagascar.

After being severily wounded at the battle of the Marne in 1914, Raymond Decary went to Madagascar as a volonteer in 1916. He then pursued a carreer in the French colonial service. In 1933, he became assistant-director at the office of the governor-general in Tananarive, and in 1937 he was appointed director of scientific research in Madagascar.

See: http://fr.wikipedia.org/wiki/Raymond_Decary

Dr. Jean B. Theodore Delacour

Born: 26 September 1890: Paris, France - Died: 5 November 1985

French ornithologist;

Spent much of youth in Picardy. Obtained his PhD. Of biology at the University of Lille.

Served in WWI. For many months battle line going through family estate. After the war, moved to Chateau Clères in Normandy.

Founded L'Oiseau.

1922: expedition to Venzuela and the Guianas.
1923 - 1940: travelled in Indochina
1939: 15 February 1939 Chateau Clères burned to ground, evidently by arson.
1939: After collapse of the French front, escaped to New York, where he became an associate of the American Museum of Natural History
1952: 1 February 1952 accepted directorship of Los Angeles County Museum.

See: Corbet and Hill (1992):
http://zoonomen.net/bio/biod.html

Lieutenant Charles de la Kethulle de Ryhove

Born: ? - Died: ?

Lieutenant Charles De La Kethulle de Ryhove travelled in Central African Republic in 1892-1893, see his paper in Bull.Soc.Royale Belge de Geographie, 1895, pp. 397-428, 513-542

Terrence C. Demos

Born: ? - Died: ?

Researcher at the FMNH, working on the evolutionary diversification of African small mammals.

He did field research in:
Democratic Republic of Congo: Itombwe Massif and Kahuzi-Biega NP (2014, 2015)
Kenya: Mt. Kenya, Mt. Elgon and Cherangani Hills (2011)
Kenya: Mau Forest (2010)
Democratic Republic of Congo: Itombwe Massif (2008)
Malawi: Misuku Hills (2007)
Kenya: Aberdare Mountains (2006)

see: https://bioone.academia.edu/TerrenceDemos/CurriculumVitae

Captain R.E. Dent

Born: 1882 - Died: ?

British explorer who was in tropical Africa in 1901 and 1906. In 1931 he was a game warden in Africa.

(see Beolens et al., 2009)

13th Earl of Edward Smith Stanley Derby

Born: 1775 - Died: 1851

Corbet and Hill (1992): English naturalist and collector; established the 'Knowlesley Menagerie' in Lancashire and bequeathed his collection to the city of Liverpool.

Drs. Antoon Emeric Marcel De Roo

Born: 26 August 1936: Roeselare, Belgium - Died: 25 February 1971

Antoon De Roo obtained his Biology degree in 1959 at the Katholieke Universiteit Leuven, Belgium, but was already since 1954 involved with the Belgian Bird Ringing Centrale. After his militairy service, he went to Congo for a three year period, teaching at the St. Louis college in Luluabourg [=Kananga]. His great interest into African birds brought him in contact with Dr. Henri Schouteden, honorary director of the Tervueren Museum, who encouraged him to examine the extensive collections at that museum. On 1 May 1968, he was appointed assistant at the Laboratory of General Zoology at the Rijksuniversitair Centrum in Antwerp, where he took part at the first of the three Belgian Togo Expeditions, lead by Prof. Dr. W.N. Verheyen (see Verheyen, 1972).

J.M. Derscheid

Born: ? - Died: ?

Belgian naturalist. Worked in Congo in the late 1920s and 1930s; director of the Albert National Park, and of the Internation Nature Protection Agency.

dr. Fritz Dieterlen

Born: 12 April 1929: Rottweil, Germany - Died: 17 January 2017

Fritz Dieterlen studied zoology, botany and geography in Munich and Freiburg, Germany, where he promoted in 1959. From 1963 to 1967, he worked at the Institut pour la Recherche Scientifique en Afrique Centrale (IRSAC) in Lwiro-Bukavu in the DRC, where he studied the ecology and taxonomy of rodents in the savanna and rain forests of East and Central Africa. From 1967

to 1969, he was curator of mammals in the ZFMK (Bonn, Germany), and from 1969 to 1994, he was in charge of the mammals section of the SMNS (Stuttgart, Germany).

(see: https://de.wikipedia.org/wiki/Fritz_Dieterlen)

George Edward Dobson

Born: 4 September 1848: Edgeworthstown, Ireland - Died: 25 November 1895: Malling Place, Kent, U.K.

G.E. Dobson obtained his B.A. in 1866, his M.B. and M.Ch. the year after, and his M.A. in 1875, all at Trinity College, Dublin. In 1868, he entered the Army medical department, and is stationed in India. In 1872, he relocated to the Andaman Islands. He became a member of the Linnean Society in 1874. He returned to England in 1876, and was appointed curator of the Royal Victoria Hospital's museums. In 1883, he was made a fellow of the Royal Society. In 1888, he fell ill with an ultimately fatal affliction and retired as surgeon-major from the Army.

Corbet and Hill (1992): Surgeon in the Indian Army, later Superintendent of the Military Hospital at Netley, Hampshire, England. They mention 1848 as date of birth. For birth in 1844, see Zool. Anz., 19 (484): 48.

see: http://www.wku.edu/~smithch/chronob/DOBS1848.htm

Felix Anton Dohrn

Born: 1840 - Died: 1909

Marchese Giacomo Doria

Born: 1840 - Died: 1913

Corbet and Hill (1992): Founder of the Genoa Museum.

Jean Dragesco

Born: ? - Died: ?

Former professor at the Federal University of Cameroon, researcher of the French scientific organisation (CNRS), zoologist and film-maker.

Dr. Ralph Evelyn Drake-Brockman

Born: 1 October 1875 - Died: 15 November 1952: Worthing, Sussex, UK

Robert C. Drewes

Born: ? - Died: ?

Bob Drewes received his Ph.D. from the University of California in 1981, and is currently curator of herpetology at the California Academy of Sciences.

See: http://research.calacademy.org/herp/staff/bdrewes#tabs-profile-2

Dr. Albert Dubois

Born: ? - Died: ?

Member of the Congo Red Cross (see Hayman, 1939: 220).

Frederick DuCane Godman, Esq.

Born: 15 January 1834 - Died: 19 February 1919

English lepidopterist, entomologist and ornithologist.

See: http://en.wikipedia.org/wiki/Frederick_DuCane_Godman

Jean Dybowski

Born: 1855 - Died: 1928

Sent by the Comité de l'Afrique Française to reinforce the Paul Crampel mission in Congo (Brazzaville) after the mission's massacre on 14 July 1891. He went into Banda country, among the Ngapou. He gave up trying to reach as-Sanusi and looked for a more westerly route toward the Chad basin. On 1 March 1892, he signed a treaty with Krouma, the leader of the Banda-Togbo, by which the latter accepted a French protectorate over his country. In March 1893, going up the Kemo and then the Tomi, Dybowski found the Kemo post among the Banda-Togbo. Taken ill, he was repatriated to Brazzaville.

Jean Dybowski was also a botanical collector, who travelled in Algeria, Central African Republic, Comoros, Congo, Côte d'Ivoire, Guinea, Madagascar, Mali, Senegal.

see: Kalck, P. (2005). Historical Dictionary of the Central African Republic.

Effeld

Born: ? - Died: ?

or Effeldt

Dr. A. Elbl

Born: ? - Died: ?

Undertook a parasithological mission in the East of Congo and in Rwanda in 1962.

See: Benoit, P.L.G. (1969). Anoplura receuillis par le Dr. A. Elbl au Rwanda et au Kivu (Congo). - Rev. Zool. Bot. Afr., 80 (1 - 2): 97 - 120.

Dr. Emin Pascha / Pasha / Bey

Born: ? - Died: ?

Christened Eduoard Schnitzer.

The name "Emin" he adopted, it was the name of a Doctor that he replaced in Lado. He is frequently referred to as "Emin Pasha", but "Pasha" is a title of rank in the Ottoman empire. General Gordon, for example was often referred to as "Gordon Pasha" but nobody would include "Pasha" as part of his name.

Hartlaub refers to this man as "Emin Bey" similar to "Pasha" "Bey" is a Turkish title for "Chieftan" and, it seems, should not be held as part of a person's name.

Osborn (1919: xv) places Emin Pasha in Congo in 1883.

See: http://zoonomen.net/bio/bioe.html

Louise H. Emmons

Born: ? - Died: ?

Anderson (1997: 129): USNM, with F. Hinojosa on RAP expedition of Conservation International to northern La Paz department (Bolivia) in 1990 (field number 741-762); visited the Huanchaca area in Santa Cruz in 1991 (field numbers 764-784); in Pando with another RAP team in July 1992 (field numbers 832-908).

Leonardo Fea

Born: 1852 - Died: 1903

Corbet and Hill (1992): Italian zoologist, at Genoa Museum; collected in Burma 1885-87.

Pietro Felter

Born: 4 August 1856: Roe Volcano, Brescia, Italy - Died: 25 January 1915: Sabbio Chiese, Italy

Pietro Felter reached the Italian colony of Assab, Eritrea in 1884, but returned to Italy in 1885. In 1890, he arrived in Harar as representative of Bienenfeld & Co. of Aden. After the political relations between Ethiopia and Italy had been broken, he served as official correspondent ("secret agent") of the government in Rome 1891-September 1895. From October 1895, he resided in Zeila. The Italians later appointed Felter commissario of Assab where he stayed for 17 years and finally contracted leprosy.

see: http://www.nai.uu.se/library/resources/dossiers/local_history_of_ethiopia/h/ORTHARAR05.pdf, http://it.wikipedia.org/wiki/Pietro_Felter

Friedrich Hermann Otto Finsch

Born: 8 October 1839: Warmbrunn, Silesia, Germany - Died: 31 January 1917

1861 Obtained a position at Leyden Mus. Under Schlegel
1872 visited California
1884 succeded Hartlaub as curator at Bremen.
1879 - 1882; 1884 - 1886 Toured South Seas.
1898 Leyden, curator Rijk Museum
1904 curator of Ethnographic section Museum at Brunswick, Germany

See: http://zoonomen.net/bio/biof.html

Major Stanley Smyth Flower, OBE

Born: 1 August 1871: London, England - Died: 3 February 1946: Tring, Hertfortshire, England

Major S. S. Flower was an officer in the British army, a science advisor, an administrator, a zoologist, and a conservationist.

Stanley Flower was educated at Rottingdean and Wellington College, Berkshire. He took an early interest in natural history and from the age of eleven regularly attended the meetings of the Zoological Society with his father. After leaving Wellington, Stanley went to King's College London for a brief time, but joined the Artists' Rifles in 1888. In 1890 he obtained a regular commission with the Northumberland Fusiliers. With his regiment he went to India and the Straits Settlements, where he studied the fauna. In 1896 he married and was sent to Bangkok as Scientific Advisor to the Government of Siam. He spent two years in Siam, where he was in charge of the Zoological Museum in Bangkok; he took several trips in Siam and the Malay Peninsula to study the vertebrate fauna. Flower left Bangkok in 1898 because he was appointed by Lord Cromer to the post of Director of the Zoological Gardens in Giza. With the exception of military service during the First World War, Flower remained as director until his retirement in 1924. While in the post of director, Flower went on many trips. In 1913 Field-Marshal Lord Kitchener sent him to India to report on the collections of wild animals held in captivity there. In WWI, Flower organized and commanded the Transport Corps in the Suez Canal Zone, the Sinai, and southern Palestine. During the Insurrection of 1919, Flower acted as Inspector of the Interior, Giza and as Political Officer, Giza; it was for his role in this conflict that he was appointed as an Officer of The Most Excellent Order of the British Empire. While he was in Egypt, Flower organized the Zoological Museum in a building at the Gardens, started the Fish Garden with aquarium on Gezira Island, and was appointed Ranger of Central Africa. He established and enforced game laws in Egypt and the Sudan.

In April 1924, upon his resignation as Director of the Zoological Gardens, Flower and his wife returned to England to settle at Spencer's Green, Tring. During his retirement, he wrote many papers on the mammals, reptiles, and amphibians of Egypt and on animal longevity. He was vice-president of the Zoological Society from 1927 to 1929 and chair of the British Ornithologists' Club from 1930 to 1933.

See: http://en.wikipedia.org/wiki/Stanley_Smyth_Flower

Frans

Born: ? - Died: ?

A native messenger (see Roberts, 1917c: 265).

Serge Frechkop

Born: 1894: Moscow, Russia - Died: 1 december 1967

Serge Frechkop started at the university of Moscow in 1913. His study was interrupted by the revolutionary war in 1916 and it took until 1921 before he could continue his education. Frechkop obtained his PhD in 1924, and in the same year he left the Soviet Union to move to Belgium, where he started to work part time at the zoology lab of the Brussels University. In 1930 he joined the "Institut royal des Sciences naturelle de Belgique" as a scientific collaborator. In 1936, he naturalized and the year after, he was appointed assistant curator. He was head of the Vertebrate section from 1947 to 1953. In 1959, he retired.

During 1937-1938, he took part in the missions to the Albert park in Congo and to the Kagera Park in Rwanda.

see: Anonymus (1968). Nécrologie Serge Frechkop (1894 - 1967). - Mammalia, 31 (1): 132 - 133.

Herbert Friedmann

Born: 22 April 1900: Brooklyn, New York, USA - Died: 14 May 1987: Laguna Hills, California, USA

Herbert Friedmann was an American ornithologist, who worked at the Smithsonian Institution for more than 30 years, becoming curator of birds from 1929.to 1958, and head curator of zoology from 1958 to 1961. In 1961, he became director of the Los Angeles County Museum of Science, History and Art.

After extensive research into honey guides (family Indicatoridae) in European museums during the summer of 1950, he spent the fall and early winter of 1950-51 studying the guiding habit of the bird by direct field observations supplemented by interviews with naturalists and other local observers of birds in South Africa and Southern Rhodesia (now Zimbabwe). Friedmann furthermore secured funds from the National Science Foundation for surveys of the fauna of little-known, isolated, dwindling forests in western Uganda in 1966-70, and the resulting collections further enriched the Los Angeles museum's holdings.

See: http://en.wikipedia.org/wiki/Herbert_Friedmann, http://books.nap.edu/html/biomems/hfriedmann62.pdf

Jiri Gaisler

Born: 3 July 1934: Prague, Czech Republic - Died: 17 July 2014

After completion of his graduate studies at the Faculty of Science at Charles University (Prague) in 1957, Jirí Gaisler started as a research assistant at the Institute of Vertebrate Zoology of the Czechoslovakian Academy of Sciences (Brno), where he specialised in bat research. In 1969, he joined the Department of Animal and Human Biology of the University of Jan Evangelista Purkyne in Brno (currently retitled the Department of Botany and Zoology, Masaryk University), where he worked, with only a few short breaks, to his untimely death. In 1979, he became Associate Professor and in 1991 Full Professor. Between 1990 and 1996, he was Head of the Department of Zoology and Ecologyn and between 1995 and 1999 Vice-Dean of the Faculty of Science for Scientific Education.

Sir Francis Galton

Born: 16 February 1822: near Sparbrook, UK - Died: 1911

Born: The Larches, near Sparkbrook, Birmingham, U.K

Francis Galton launched his scientific career with an expedition to tropical Africa and subsequent election to the Royal Geographical Society.
Galton was a half-cousin of Charles Darwin.
Besides a tropical explorer and geographer, Galton was also a meteorologist, geneticist, phychologiest, statistician, and eugenicist.
In 1845 he undertook a trip to Egypt and the Soudan. In the winter 1900-1901 he visited Egypt again.

[on this first trip he might have collected the type specimen of *Nyctinomus pumilus* - BMNH 1849.2.8.36, which only mentions "Africa" as locality]

(see http://www.galton.org/

see also Galton, F. (1908). Memories of my life. Methuen & Co, London.
(PDF available through the above website))

Carl Gans

Born: 1923 - Died: ?

Anderson (1997: 130): American herpetologist; in Beni (Bolivia) in 1954.

Peter Baaro Gathura

Born: ? - Died: ?

Senior lecturer in Veterinary Medicine at the University of Nairobi, Kenya.

Julius C. Geest

Born: ? - Died: ?

Julius C. Geest collected specimens for the Smithsonian Institution African Mammal Project, primarily in Nigeria (11 October 1966 - 13 June 1967; specimen numbers 200 - 3696) and Ghana.

Guy-Crispin; Musaba Akawa, Prescott; Akaibe, José Gembu Tungaluna,

Born: ? - Died: ?

Guy-Crispin; Musaba Akawa, Prescott; Malekani, André Gembu Tungaluna,

Born: ? - Died: ?

Etienne Geoffroy-Saint-Hilaire

Born: 1772 - Died: 1844

Corbet and Hill (1992): Professor of Zoology, Museum d'Histoire Naturelle, Paris; after whom *Inia geoifrensis, Anoura geoffroyi*, and *Felis geoffroyi* are assumed to have been named.

Rodolphe Germain

Born: ? - Died: ?

Corbet and Hill (1992): Collected in Indochina.

Dr. Burhan M. Gharaibeh

Born: ? - Died: ?

Burhan Gharaibeh obtained in 1997 his Ph.D. in Zoology at the Texas Tech University, Lubbock, Texas, USA.

A. Gierra

Born: ? - Died: ?

A. Gierra was an expert on north and east African languages. He presented a collection of reptiles (and mammals) from Tanga (Tanzania) to the MNHN, and insects to the Entomological Society of France (in 1895).

see Beolens et al. (): The Eponym Dictionary of Reptiles

Georges Gilson

Born: ? - Died: ?

Served with the 9th "rég. de ligne" about 1908; colonel with the 5th "rég. de ligne"; ended his career as general. He was honorary president of the "Fraternelle des Anciens Combattants du 9ème de ligne".

As a second lieutenant of the Public Forces, he was sent to the Yumbi Camp (Stanley Pool) in 1896. As a captain, he was sent to the Bangala district, where he fought against the Budja. He was then made superior, district commissioner at the Uele district and commander of the reinforcement group to Yakuluku (Uele). Later he was commander of the zone from Meridi to Ganzio (at the start of Paulis, in April 1906).

See: Van Schuylenbergh (1997: 36).

Alfred Grandidier

Born: 20 December 1836 - Died: 13 September 1921

Together with his brother (Ernest: 1833 - 1912), he undertook a voyage around the world, which led them to South America (the Andes, Peru, Chili, Bolivia, Argentina and Brazil) in 1858 and 1859. After this voyage, both brothers went their way. Ernest traveled to China and Alfred to India, where he arrived in 1863. A severe fever prevented him from attaining his target: the Tibetan highlands.

Alfred then traveled to Zanzibar to recover, and to compile an important collection. Later on, he visited the island of Reunion, and in 1865 he visited Madagascar for the first time. Subsequent visits were made in 1866 and 1868. In 1870, he definitively returned to France, where he started his opus major: "L'histoire politique, physique et naturelle de Madagascar", together with Alphonse Milne-Edwards and Leon Vaillant.

In 1885, he was elected member of the French "Académie des Sciences", and he was president of the French "Société de Géographie" between 1901 and 1905.

See: http://en.wikipedia.org/wiki/Alfred_Grandidier

Guillaume Grandidier

Born: 1873 - Died: 1957

Son of Alfred Grandidier (1836 - 1921)

Helgen (2002: 381) indicates that the major part of Guillaume Grandidier's collection was purchased in 1947 by Robert Barbour, and was deposited in the Mammal Department of the Museum of Comparative Zoology, at the Harvard University.

R. Grauvet

Born: ? - Died: ?

Prof. Abel Gruvel

Born: 1870 - Died: 1941

Abel Gruvel was professor at the MNHN, Paris, where he held the chair of "Pêcheries et production coloniales d'origine animale" (fisheries and colonial production of animal origin).

In his teens, Gruvel frequently visited the marine stations of Roscoff and Banyuls-sur-Mer, which led to obtaining his master's degree in natural sciences in 1889. He then made a PhD on Cirripedes. Following this work, he rejoined the science faculty of the university of Bordeaux in 1893 as head of the zoology lab.

In 1903, the new governor-general of French Western Africa (Ernest Roume) commissioned the geographical society of Bordeaux to study the fisheries on the western coast of Africa, more specifically in Mauritania. Gruvel led this mission to study the ichtyological fauna of the Arguin bank and its industrial utilisation.

Between 1905 and 1912, Gruvel undertook 6 expeditions. During his third mission (1909-1910), he travelled along the coast from Senegal to South Africa. After World War I, he participated on average in one expedition per year until his retirement in 1940.

André Guissart

Born: 1949 - Died: 11 April 2002

Co-founder of B.E.D.I.M., (Bureau for Exchange and Distribution of Information on Minilivestock) Mr GUISSART was a true ornithologist and naturalist and through his daily professional activities, he was in daily contact with the forests of Belgium. But he also spent several years in a number of different tropical countries (e.g. Congo, Uganda, and Northern Cameroon) and throughout, expressed genuine concern for the well being of the local populations. In our association, he was above al1 responsible for aspects of minilivestock breeding related to diversity.

See: Anonymous (2002). In Memoriam. - Bulletin Bedim, 11 (1): 1.

Gustave Gustin

Born: 1867: Linière - Died: 1911: Pania Mutombo, Kasai, DRC

Gustave Gustin entered the military school in 1886 and was appointed second lieutenant to the 2nd "reg de ligne" in 1888. He became second lieutenant of the Public Forces, attached to the Van Kerckhoven expedition. He accompanied Ponthier at the battle on the Makongo (October 1891) and then left for Bomokandi and the route to the Nile, further on towards Ganda (a post in the Lado enclave). He founded the Alema post (1891 - 1894). He was promoted to district commander and explored the area between Lopori-Congo (Bangala) (1901 - 1904). He became district commissioner in Lualaba-Kasai (1905 - 1908) and organized the expedition against the tetela rebels (Haut-Lubilash) and ultimately was made commissioner-general (1909 - 1911).

See: Van Schuylenbergh (1997: 39).

Dr. Alwin Karl Haagner

Born: 1880 - Died: 15 September 1962

Haagner worked in the Transvaal Museum from 1906, where he started the museum's great ornithological collection. Haagner left the museum in 1911, was succeeded by Austin Roberts, and became director of the Pretoria Zoological Gardens.

See: http://en.wikipedia.org/wiki/Alwin_Karl_Haagner

Prof. Eugene Raymond Hall

Born: 11 May 1902: Imes, Kansas, USA - Died: 1986

Professor E. Raymond Hall was director of the University of Kansas Museum of Natural History and curator of mammals from 1944 to 1967. was a time of rapid expansion of all the collections, particularly the mammals. To house the rapidly growing collections, Hall successfully lobbied for an addition to the museum, which more than doubled the available space.

Hall attended local schools and received his B.A. degree from the University of Kansas in 1924. While an undergraduate, Hall worked in the Division of Mammals under the guidance of C. D. Bunker.

Through diligent study, Hall completed his degree requirements ahead of his class and accepted a teaching assistantship at the University of California at Berkeley in January 1924, receiving his M.A. degree in 1925 and Ph.D. in 1928. He served as curator of mammals at Berkeley from 1927 to 1944 and was acting director of the museum from 1938 to 1944.

In 1967 Professor Hall officially retired, though he continued to work in his office at the Museum of Natural History for many years.

William J. Hamilton, III

Born: 13 November 1931: Ithaca, New York, USA - Died: 24 April 2006

William (Bill) J. Hamilton III was the son of William J. Hamilton II, who was a professor of mammalogy in Cornell's zoology department, and Bill cut his teeth as a naturalist trapping mice in the Adirondacks with him. After graduating from Cornell (1953), and service in the Korean War, Bill signed on to study with Starker Leopold at the University of California Berkeley, receiving his PhD in 1960. After post doctoral research at the California Academy of Sciences, studying dispersal patterns in starlings and with his wife, Marion, studying breeding among yellow-billed cuckoos in Arizona, he joined the faculty at UC-Davis in 1963, remaining there for the rest of his career.

His lifelong love affair with Africa began with a study of coral reef fish near Mozambique in 1963. Between 1968 and 1979 he embarked on multiple projects related to the ecology of desert insects in Egypt, Botswana and Namibia.

In 1972, Bill undertook his first studies of African mammals, oryx and baboons in the Namib Desert and Botswana, and by 1976 had sent up a permanent field camp in the Okavango Swamp, Botswana to study an unusual population of savanna baboons, and subsequently (with John Bulger and John McNutt) a population of wild dogs between Angola and Mozambigue.

Even after Bill retired from UC Davis in 1994 he continued to teach annual courses on environmental problem solving and desertification to Namibian students at the Namib Desert Research Station currently under the direction of his former student, Dr. Mary Seely. Retirement also marked a new phase in Bill's lifelong work as a conservationist. He described it as "evaluating environmental grandeur, local traditions and tourism values of nature". At the top of his list of priorities was saving California's increasingly endangered populations of Tricolored Blackbirds. Working with the U.S. Fish and Wildlife Service, often assisted by his grand-daughter Lily Starling, wading beside him through muddy Central Valley rice fields, Bill developed new management guidelines for this species.

Dr. David Lakin Harrison

Born: 1 October 1926: Sevenoaks, Kent, England, U.K. - Died: 19 March 2015

David Harrison was a medical doctor by profession but an explorer, Arabist, palaeontologist, and distinguished classical taxonomist by inclination.

In August, 1953, at the age of 26, he arrived as a newly qualified doctor in Habbaniya, Iraq to take up his post as 'Deputy medical physician to Middle East Command'. Two years later, he published his first paper on his Arabian field work. Ninety papers followed based on meticulous research and extensive field trips to Kurdistan, Oman, (South) Yemen, Syria, Jordan, and Israel.

Bruce Joliffe Hayward

Born: 13 April 1928 - Died: 3 August 2011: Silver City, New Mexico, USA

Anderson (1997: 130): Silver City, New Mexico; 1987, collected in Santa Cruz with MSB party, July and August 1987 (field numbers 8639-8753); May and June 1988 (field numbers 8785-8939) (Bolivia).

Dr. Bruce J Hayward came to Silver City and Western New Mexico University in 1961 from the University of Arizona and remained at WNMU throughout his career. In addition to teaching his coursed in the Biological Sciences, he was active in small mammal research projects with the New Mexico Department of Game and Fish, Bureau of Land Management, United States Forest Service, the Chicago Museum of Natural History and the Smithsonian Institute in Washington, D.C. He was also active in the New Mexico Ornithological Society and participated in bird counts around the area and state until his death. During his worldwide travels he visited all seven continents and over 100 countries. He was also constantly visiting old mining sites and mist netting stock tanks in pursuit of a variety of bat species.

Célestin Hecq

Born: 1859: Alost, Belgium - Died: 1910: Liège, Belgium

Célestin Hecq entered the lancers regiment in 1878. He was promoted to second lieutenant in the 4th regiment and lieutenant in the second regiment of the guides in 1883. He became captain in the Public Forces, and resident in the territory of the sultan of Rafai and later on in the territory of sultan Semio (Ubangi-Bomu). He was then promoted to commander of the Uere camp (1894 - 1897), designated to the arab zone and the camp at Mtoa (Albertville) to reduce the tetela insurgents to the north of lakes Tanganyika and Kivu. He was then named district commander (Tanganyika, 1899), where he negotiated a frontier convention between the Congo Free State and German East Africa (1898 - 1900).

See: Van Schuylenbergh (1997: 43).

Gerd H. Heinrich

Born: 1896 - Died: ?

Corbet and Hill (1992): German zoologist; travelled in Sulawesi 1930-32.

Kristofer M. Helgen

Born: ? - Died: ?

Curator-in-Charge at the USNM.

He obtained his B.A. (Biology): Harvard University in 2001, and his Ph.D. (Zoology): University of Adelaide in 2007.

Edmund Heller

Born: 21 May 1875: Freepont, Illinois, USA - Died: 18 July 1939;

Edmund Heller studied at the Stanford University, where he collected specimens in the Colorado and Mojave Deserts in 1896-7 and where he graduated in zoology in 1901.

In 1907, he was a member of the Field Columbian Museum's African expedition (with Carl Ethan Akeley). After his return, he was appointed Curator of Mammals at the Museum of Vertebrate Zoology (MVZ) and participated in the 1908 Alexander Alaska Expedition.

In 1909, he started working with the Smithsonian Institution when he was chosen as naturalist for large mammals on the Smithsonian-Roosevelt African Expedition under the command of Colonel Theodore Roosevelt. He worked closely with John Alden Loring who worked as naturalist for the small mammals on the Expedition and they collaborated on their field notes. On his return from the expedition, he co-authored Life Histories of African Game Animals with Roosevelt. Heller also accompanied the Rainey African Expedition of 1911-1912 for the Smithsonian and led the Smithsonian Cape-to-Cairo Expedition of 1919-1920.

Heller also participated in explorations in Alaska with the Biological Survey, in Peru with Yale University and the National Geographic Society, in China with the American Museum of Natural History, and in Russia with Paul J. Rainey, official photographer to the Czech army in Siberia.

From 1926 to 1928, he was curator of mammals at the Field Museum of Natural History in Chicago. From 1928 to 1935, he was the director of the Washington Park Zoo in Milwaukee and from 1935 to 1939 of the Fleishhacker Zoo in San Francisco.

He was also the president of the Association of Zoos & Aquariums from 1935 to 1939.

F.L. Hendricks

Born: ? - Died: ?

Prof. Jean Hiernaux

Born: 1921 - Died: 2007

Jean Hiernaux was professor at the Université Libre de Bruxelles (Belgium) and Director of Research at the National Center for Scientific Research, Paris, France. He carried out extensive anthropometric and serological work on Sub-Saharan Africans.

At least in the period 1959 - 1960, he resided in Lubumbashi.

See: http://en.metapedia.org/wiki/Jean_Hiernaux
Van Schuylenbergh (1997: 46).

Dick Hillenius

Born: 29 May 1927: Amsterdam, The Netherlands - Died: 4 May 1987: Amsterdam, The Netherlands

In 1951, Dick Hillenius became a student-assistant athe Zoological Museum, where he was promoted to temporary exhibition curator in 1952. In 1957, he became curator of the Reptiles and Amphibians department, a function he held until his death.

He was also known as a writer and poet.

See: http://resources.huygens.knaw.nl/bwn1880-2000/lemmata/bwn6/hillenius

Hans Himmelheber

Born: 1908 - Died: ?

Hans Himmelheber, an anthropologist and physician, made ten expeditions to the Dan and neighboring peoples of Liberia and the Ivory Coast between 1949 and 1976. He was usually accompanied by his wife, Ulrike Himmelheber, or his son, Eberhard Fischer, with whom he has published extensively on Dan woodcarving and masking traditions. Himmelheber also conducted fieldwork in Alaska and the Belgian Congo. In 1935, Himmelheber presented several objects he collected among the Baule and Atutu of the Ivory Coast "in gratitude for the friendship and hospitality" afforded by the Institution during his visit that year.

Mrs. Hildegarde Hinde

Born: ? - Died: ?

Wife of dr. Sidney Langford Hinde.

Dr. Sidney Langford Hinde

Born: 1863 - Died: 1930

Husband of Hildegarde Hinde.

Emil Holub

Born: 7 October 1847: Holice, Eastern Bohemia - Died: 21 Dec/Feb 1902: Vienna, Austria

1872 M.D. at Prague University
Died of complications of malaria and other diseases acquired in Africa.

See: http://zoonomen.net/bio/bio*.html

Harry H. Hoogstraal

Born: 24 February 1917: Chicago, Illinois, U.S.A. - Died: 24 February 1986: Cairo, Egypt

American entomologist and parasitologist. He was described as "the greatest authority on ticks and tickborne diseases who ever lived."

Hoogstraal earned his B.A. (1938) and M.S. degrees (1942) from the University of Illinois. During World War II, he served as an officer entomologist (1943 - 1946) in the United States Army. He later received Ph.D. (1959) and D.Sc. (1971) degrees from the London School of Hygiene and Tropical Medicine. In 1938 - 1941, he organized and led four multi-disciplinary biological expeditions into the mountain and desert portions of western and southwestern Mexico. These resulted in the amassing of large, scientifically valuable collections of animals and plants. During World War II, Hoogstraal was assigned to the U.S. Army 19th Medical General Laboratory, near Hollandia, Dutch New Guinea. With the end of World War II, Hoogstraal did not seek an early return to the United States as did most of his Army colleagues. Instead, he took his discharge in Manila and, under the auspices of the Field Museum, organized a major biological expedition into the interior of the Philippine islands of Mindanao and Palawan (1946 - 1947) and spent the next two years exploring and collecting in those biologically poorly-known islands. The collections resulting from his efforts were the richest ever made from those portions of the Philippines. Following his return from the Philippines in 1948, he joined, as an employee of the United States Navy Bureau of Medicine and Surgery, the University of California African Expedition in 1948 - 1949. This began his lifelong sojourn in Africa. At the completion of this expedition (which began in Egypt and traveled through Sudan, Kenya, Uganda, Tanzania, and Madagascar) he continued on for a while in Madagascar and then moved to Cairo, Egypt, to organize and become Head of the Department of Medical Zoology, U.S. Naval Medical Research Unit No. 3 (NAMRU-3), a position which he held for the remainder of his life.

Oliver and Keirans (2000)

Aleš Hrdlicka

Born: 30 March 1869: Humpolec, Bohemia, Czech Republic - Died: 5 September 1943: Washington, D.C., USA

Aleš Hrdlicka was an important figure in the development physical anthropology in the United States.

Aleš Hrdlicka was 13 when his family emigrated to the U.S. and settled in New York. Aleš worked together with his father in the tobacco factory until he was 19 years old. In 1888, he fell seriously ill with typhoid fever. It was during that time Hrdlicka met Dr. M. Rosenblueth, a physician and a former rabbi. This meeting changed his life forever. Upon recovery, with the help of Dr. Rosenblueth, Hrdlicka entered and graduated from the Eclectic Medical College of the City of New York. In 1894, he received a research position in the newly founded State Homeopathic Hospital for the Insane, at Middletown, New York. It was there that he developed his interest in anthropometry, the study of measuring the human body, which he further specialized in Paris, under Leon Manouvrier.

In 1898, Hrdlicka visited Mexico to begin his research on the indigenous peoples there: the Tarahumares, the Huichols, and the Tephuanes. In 1903, the new department of physical anthropology was opened at the National Museum in Washington, DC. Today it is known as the Smithsonian museum. Aleš Hrdlicka became the first curator of the department, a post he held until his retirement in 1941.

R.P. Gustaaf Hulstaert

Born: 5 July 1899: Melsele, Belgium - Died: 1990

Gustaaf Hulstaert was a Belgian entomologist, mainly interested in butterflies(Lepidoptera).

In 1924 he was ordained as missionary in the order of the Holy Heart. He left for the Belgian Congo on 15 September 1925, where he was posted in: Boende (1926 - 1927); Boteka (1927 - 1933); Bokuma (1933 - 1934); Bamanya (1936 - 1946); Boteka (1946 - 1948); and Bamanya (1951 - 1990).

From 1936 to 1946, he was missionary-inspector.

See: Wikipedia
http://www.aequatoria.be/04frans/032biobiblio/0321HULSTAERT.htm

Léon Humblot

Born: ? - Died: ?

Goodman *et al.* (2010c): Léon Humblot visited the Comoros between 1879 and 1880. Starting in 1894, he resided in the archipelago, where he died in 1914 (Dorr, 1997; Ouledi, 2008). The Humblot bat specimens are housed in the MNHN, but there are problems with the original locality information on the associated labels, as collections from Madagascar, the Comoros, and east Africa may have been mixed (Rand, 1936; Dorr, 1997, Labat and Schatz, 2002, Goodman and Maminirina, 2007; Goodman and Ranivo, 2009).

Freiherr Friedrich Wilhelm Heinrich Alexander von Humboldt

Born: 14 September 1769: Berlin, Germany - Died: 6 May 1859: Berlin, Germany

Humboldt was a German naturalist and explorer, and younger brother of the Prussian minister, philosopher and linguist Wilhelm von Humboldt (1767 - 1835).
Studied: Frankfurt University; Göttingen University; mining academy of Freiburg in Saxony.
Influenced by geologist Abraham Gottlob Werner. Worked in Prussian mining service.

1790: visited Paris with Georg Forster (naturalist on Captain James Cook's second voyage).
1796: financially independent; continued studies at Jena; met Goethe and Friedrich Schiller.
1799: accompanied by the botanist Aimé Bonpland, arrived in what is now Venezuela in July and spent the next 5 years exploring the South America. They navigated the Orinoco river and confirmed the existence of a connection between the Orinoco and the Amazon.
1802: June - Humboldt set out to climb the volcanic mount Chimborazo in the Andes (thought to be the highest mountain in the world). Reached nearly 20,000 feet, the highest point then reached by any European mountaineer.
1804: Humboldt brief visit to the United States; returns to Europe, settles in Paris until 1827.

Between May and November 1829, he traversed the Russian empire from the Neva to the Yenesei, travelling 15,472 km.

see http://en.wikipedia.org/wiki/Alexander_von_Humboldt, http://zoonomen.net/bio/bioh.html

M. Hutereau

Born: ? - Died: ?

Rév. Frère Jozef Hutsebaut

Born: 1886 - Died: 1954

Jozef Hutsebaut (Brother Hymelinus) was a friar-missionary of the abbey of Tongerlo (Belgium), who studie the fauna and flora of the Belgian Congo. He was the first to discover the Okapi and sent several specimens of this rare species to various European zoos.

See: http://www.tongerlo.org/abdij/adb_archief_index.htm

Graf Ludwig von Huyn

Born: 14 September 1896 - Died: 20 May 1946

Between about 1930 and 1934 Count Ludwig von Huyn (b. 14th September 1896, d. 20th May 1946) collected in central Ethiopia (province Shoa) more than 760 birds, 100 mammals, a few reptiles and some insects for the Museum Alexander Koenig (see Kumerloeve, 1974: 73).

I.P.N.C.

Born: ? - Died: ?

Institut des Parcs Nationaux du Congo Belge

Michael P. Stuart Irwin

Born: ? - Died: ?

Henry Paul William Lyster Jameson

Born: 1875: Pontypass, Newry, Co. Armagh, Ireland - Died: 22 February 1922: West Mersea, England

Jameson started his study at Trinity College, Dublin in 1891, where he obtained his BA in zoology, botany, physiology and geology in 1896 and his MA and DSc in 1902. He became interested in entomology and received a research grant from the Royal Irish Academy to study the fauna in Mitchelstown Cave. His interest in caves led him to record seven species of bat in Ireland. He was assistant at the Irish Museum in Dublin, which he left in September 1896, when he move to the Royal College of Science in London. He also matriculated on 27 December 1897 at the Zoological Institute of the Heidelberg University in Germany. Between 7 October 1898 and 17 April 1899, he visited the Zoological Station at Naples, Italy. From 1899 to 1900, he managed a pearl fishery at Samarai in the Conflict Islands, SE of Papua New Guinea. In 1901, he moved to Derby where he was appointed lecturer in Natural Science at the Municipal Technical college, where he remained 18 months. He then emigrated to the Transvaal. In 1903, he was appointed Inspector of Schoold in the Natal Department of Education, Pietermaritzburg. At the end of 1904, he was appointed Secretary of a Technical Education Commission to inquire into the higher and technical education in the Colony. In September 1905, he was promoted to be the first Professor of Biology at the Transvaal Technical Institute in Johannesburg.

In the Transvaal Museum some 747 items were associated directly or indirectly with Jameson. Most of them from the former South African colonies, but also from Angola, Botswana, the Democratic Republic of Congo, Mozambique, Uganda, Zambia, Zimbabwe, and Greece, although there is no evidence that Jameson himself had been north of the Limpopo River.

In 1908, he returned to England, where he rejoined the Civil Service. In 1911 he was Senior Examiner for the Board of Education. In February 1918, he was appointed British Sea Fishery Officer for the south-eastern coast. In September 1920 he was appointed Technical Adviser on Inshore Fisheries to the Ministry of Agriculture and Fisheries.

See: Craven (2012).

Jocque

Born: ? - Died: ?

Clyde Jones

Born: 3 March 1935; Scottsbluff, Nebraska, USA - Died: 6 April 2015;

Clyde Jones received his BA in History, Education, and Biology (1957) from Hastings College, and his MS (1960) and PhD (1964) degrees at the University of New New Mexico, Albuquerque. He then (1965) moved to the Tulane University, New Orleans, Louisiana, where he was appointed Assistant Professor and conducted field studies of primates, bats, and other mammals in Rio Muni, Republic of Equatorial Guinea, West Africa [1967 - 1968], as well as studies of mammals in the Southeast. In 1970, he became chief of the mammal section of the Bird and Mammal Laboratories of the U.S. Fish and Wildlife Service

housed in the U.S. National Museum of Natural History. He was appointed director of the National Fish and Wildlife Laboratory (1973 - 1979) and director of the Denver Wildlife Research Center from 1979 to 1982. In 1982, he returned to academic appointments at Texas Tech University, Lubbock, where he served as professor of biological sciences and curator of mammals. He served as director of the Museum of Texas Tech University until 1985, when he became the Chair of the Department of Museum Science until 1987, after which he was appointed full-time professor and researcher in the Department of Biological Sciences. After retiring in 2003, he remained active in research and in the mammal collection.

Bradley *et al.* (2005: 17 - 18); Jones and Jones (2016).

John Knox Jones, Jr.

Born: 16 March 1929: Lincoln, Nebraska, USA - Died: 15 November 1992: Lubbock, Texas, USA

J. Knox Jones, Jr. attended public schools in Lincoln and graduated from High School in 1947, and graduated as a zoologist from the University of Nebraska (at Lincoln) in 1953.

Jones's first publication on mammals appeared in 1949 in the Journal of Mammalogy.

In 1953, he joined the Army as a medical officer in Korea and Japan. During his service to 1955, he studied the epidemiology of Korean hemorrhagic fever.

In 1962, he completed his PhD on the distribution and taxonomy of mammals of Nebraska.

At the university of Kansas, J. Knox Jones, Jr. became Assistant Professor and Assistant Curator of Mammals (1962 - 1965), Associate Professor and Associate Curator (1965 - 1968), Full Professor and Curator of Mammals (1968 - 1971). In 1965, he also became Assistant Director of the Museum of Natural History and in 1967 Associate Director. In 1971 he became Dean of the Graduate School at Texas Tech University (Lubbock, TX). From 1972 to 1984, he was Research Associate at the Museum of the Texas Tech University, from 1971 to 1972 Acting Director and from 1984 to 1992 Curator.

During his active live, he visited many parts of the world, including Asia, Eastern Europe, Mexico, Central America, the Caribbean. During his carreer, he described 33 new mammalian taxa, and three taxa of mammalian parasites.

Findley, *et al.* (1996): Obituary: J. Knox Jones, Jr., 1929 - 1992. - *Journal of Mammalogy*, **77 (2)**: 578 - 593.
Bradley *et al.* (2005: 14).

Theo Simpson Jones

Born: 1923 - Died: 1996

Grubb *et al.* (1998: vi): T.S. Jones graduated in agriculture from Reading University in 1943 and from the Imperial College of Tropical Agriculture in 1945, after which he joined the Colonial Service as Agricultural Officer in Sierra Leone, rising to Acting Director of Agriculture in 1955. He left Sierra Leone in 1960 and from 1960-1964 was Deputy Director of Agriculture and then Permanent Secretary, Ministry of Agriculture in Uganda. He retired from the Colonial Service in 1964 and joined the Commonwealth Development Corporation, retiring in 1983 as Natural Resources Adviser. He was with Hooker Agriculture International for five years, and continued with the Tropical Agriculture Association until just before his death. Theo was the most important individual collector of mammals there has been in Sierra Leone, most of his specimens going to the Natural History Museum, London. In 1953 he submitted a thesis to the Zoology Department of Reading University on the ecology and distribution of Sierra Leone mammals.

Jooris

Born: ? - Died: ?

Dr. Karl Jordan

Born: 1861: Hildersheim, Hanover, Germany - Died: 12 January 1959

Karl Jordan moved from Germany to England in 1892, when he started to work at the Rothschild's Museum at Tring. He was a member of the Commission on Zoological Nomenclature from 1913 to 1950 and its President from 1929 to 1948 (see Hemming, 1960).

Dr. M.P. Kahl

Born: ? - Died: ?

Ornithologist with the AMNH.

Dr. Sir John Kirk

Born: 1832 - Died: 1922

Sir John Kirk was a Scottisch diplomat, explorer and naturalist. He was Livingstone's chief assistante, physician, and naturalist duringhis second Zambesi expedition from 1858 to 1863. He later served as Vice Consul, then Consul General, in Zanzibar from 1866 to 1887. In 1873 he succeeded in obtaining the local sultan's agreement to a treaty abolishing the slave trade and to conced mainland territories to the British East Africa Company in 1887. He served on the Tsetse Fly Commission in 1887. Kirk was a polymath whose interests included botany, geography, history, geology, chemistry, and photography, as well as the study of Swahili, Arabic, Spanish, Portuguese, and French. He was a fellow of the Royal Botanical Society and sent specimens to the Royal Botanical Gardens in Kew in London. He also collected the first fishes from Lake Nyasa to reach Western science and observed that they were almost all endemic. He received numerous honorany degrees and awards, including the fellowships of the Royal society of London and the Geographical Society of Marcella.

Goodman *et al.* (2010c): Sir John Kirk was on Anjouan in April 1861, November 1862, and in 1866 (Dorr, 1997). Bats collected during these trips were deposited in the BMNH and included the holotype of *Pteropus livingstonii* from Anjouan (Bergmans, 1990).

Dr. Christopher P. Kofron

Born: ? - Died: ?

U.S. Fish and Wildlife Service

Prof. Friedrich Anton Kolenati

Born: 1812: Prague - Died: 1864: Praded

Flasar (1997: 149): Friedrich Anton Kolenati (1812- 1864) was a Czech physician, naturalist and traveller. Born in Prague he worked in Russia (1842- 1846) as an assistant zoologist at the Academy of St. Petersbourg. During this time he made several expeditions to Caucasus. He returned to Prague in 1846 and worked at the university as an assistant professor of medically-pharmaceutical zoology, botany and crystallography. He founded Lotos, a natural history association and publishing house which survived him and existed until 1945. In 1849 Kolenati moved to Brno where he was appointed a full professor of natural history at the technical university. He held this post until his death. Kolenati devoted much of his last years to the zoological and botanical research of Mt. Praded (Altvater) and environs in the then Austrian Silesia. He lost his live at an excursion to Praded and is buried at the cemetery of a near-by village of Malá Morávka. Kolenati was never active as physician but he was one of thee greatest natural historians of his time. No doubt he was the greatest personality in natural history at the middle of 19th century in Bohemia and Moravia. The paper gives a full bibliography of Kolenati arranged according to the years when his works were published. He spoke and wrote several languages but his mother tongue was Czech and one of his papers on bee-keeping was written in Czech. His main fields of study concerned zoology, botany, mineralogy, geology and geography. In zoology he made research in entomology, arachnology and chiropterology. He was a leading personality of his time in the study of bats and bat parasites. Unfortunately, and from unknown reasons, zoological and botanical collections of Kolenati were lost. Neither exists a full collection of Kolenati's papers and books. However, many zoological and some other papers by Kolenati are kept in the library of the Department of Zoology and Ecology, Faculty of Sience, Masaryk University in Brno. As an appendix to the paper by I. Flasar, J. Gaisler deals with the major work on bats published by Kolenati, his Monograph of European Chiroptera (Monographie der europäischen Chiroptern). Kolenati recognized 234 chiropteran species in the world and 29 in Europe. Some of the taxa described by him are still valid for subgenera of bats and *Hypsugo* Kolenati, 1856 was placed as a generic name for *H. savii* (instead of *Pipistrellus*) of each other by Henri Menu and Ivan Horácek. Although it is difficult to estimate if Kolenati's heritage is more important to the present chiropterology, entomology, arachnology or any of the non-zoological disciplines he was engaged in, he stands as a scientist who outstripped the study of bats by nearly a century.

Dr. Karl Friedrich Koopman

Born: 1 January 1920 - Died: 20 or 22 September 1997

Corbet and Hill (1992): Mammalogist at the Field Museum Chicago 1959-61, then at the American Museum of Natural History, New York, specializing in Chiroptera.
Anderson (1997: 131): 20 June to 25 August 1964 and 27 June to 25 July 1965 with expedition in Beni (Bolivia) (field numbers 461-684 and 773-936).
Klingerer and Griffiths (1991: 5): bibliography
Assistant Curator Academy of Natural Sciences of Philadelphia (1958 - 1959)

Assistant Curator of Mammals Field Museum of Natural History, Chicago (1959 - 1961)
American Museum of Natural History: Assitant Curator (1961 - 1966), Associate Curator (1966 - 1978), Curator (1978 - 1985), Curator Emeritus (1985 - 1997).

Field trips:
Jamaica: 1950
Greater and Lesser Antilles, Bahamas, Virgin Islands, Mexico, Uruguay, Bolivia: 1950 - 1970

F. Kraus

Born: ? - Died: ?

Director Staatliches Museum für Naturkunde: 1862

28/06/2004 - dr. Barbara Herzig - NWM: "according to our informations F. Kraus has only been to the northern Bribir and never reached Bribir W Knin. We also got African material on exchange from F. Kraus, but this was obviously not collected by himself, but in most cases by Heuglin."

Herbert; Chapin, James Paul; American Museum Congo Expedition, The Lang

Born: ? - Died: ?

Itinerary of the Expedition (see Osborn, 1919: xxiv):

8 May 1909: Leave New York
3 June 1909: Leave Antwerp
22 June 1909: Leave Boma
24 - 30 June 1909: Matadi
1 - 12 July 1909: Leopoldville
3 August - 4 September 1909: Stanleyville
12 September 1909: Bafwaboli
24 September 1909: Bafwasende
30 September - 7 December 1909: Avakubi
10 - 26 December 1909: Ngayu
27 December 1909 - 10 January 1910: Bafwabaka
13 January - 15 October 1910: Medje
18 October 1910: Pawa
23 October 1910:Isiro
26 October 1910: Nala
28 October 1910: Rungu
1 November - 20 January 1911: Niangara and vicinty
25 - 30 January 1911: Dungu
6 February 1911 - 19 February 1913: Northeastern Uele - base at Faradje
12 - 18 July 1911: Aba and vicinity (Chapin)
9 - 12 August 1911: Vankerckhovenville (Chapin)
2 - 6 November 1911: Yakuluku (Lang)
10 - 22 December 1911: Aba and vicinity (Lang and Chapin)
10 - 16 March 1912: Garamba (Lang)
7 - 24 April 1912: Vankerckhovenville (Lang and Chapin)
4 May - 24 July 1912: Garamba (Lang and Chapin)
19 February 1913: Faradje (Lang)
2 - 4 March 1913: Yakuluku (Lang)
12 - 24 March 1913: Bafuka (Lang)
14 June 1913: Niangara (Lang)
19 February 1913: Faradje (Chapin)
24 February - 1 March 1913: Dungu (Chapin)
5 March 1913: Niangara (Chapin)
14 - 21 June 1913: Niangara (Lang and Chapin)
24 June - 1 July 1913: Rungu (Lang and Chapin)
1 - 10 July 1913: Nala (Lang)
15 July - 29 August 1913: Poko (Lang)
1 September - 31 October 1913: Akenge (Lang)
2 November 1913 - 20 February 1914: Niapu (Lang)
27 February - 22 July 1914: Medje (Lang)
1 July 1913: Rungu (Chapin)
5 - 15 July 1913: Pawa (Chapin)
25 July 1913: Bafwabaka (Chapin)
27 July 1913: Ngayu (Chapin)
31 July 1913 - 2 January 1914: Avakubi (Chapin)
19 April 1914: Penge (Chapin)
21 April 1914: Epulu River (Chapin)
25 July - 1 August 1914: Babeyru (Lang and Chapin)
3 August 1914: Ngayu (Lang and Chapin)

5 August - 9 September 1914: Avakubi (Lang and Chapin)
10 September 1914: Bomili (Lang and Chapin)
12 September 1914: Panga (Lang and Chapin)
22 - 25 September 1914: Banalia (Lang and Chapin)
28 September 1914: Bengamisa (Lang and Chapin)
30 September 1914: Stanleyville (Lang and Chapin)
10 December 1914: Left Stanleyville (Chapin)
20 December 1914: Kinshasa (Chapin)
24 December 1914: Matadi (Chapin)
29 December 1914: Boma (Chapin)
14 March 1915: Liverpool (Chapin)
31 March 1915: New York (Chapin)
10 May 1915: Left Stanleyville (Lang)
18 - 22 May 1915: Kinshasa (Lang)
22 - 31 May 1915: Leopoldville (Lang)
9 - 16 June 1915: Matadi (Lang)
17 June 1915: Boma (Lang)
17 June - 21 July 1915: Zambi (Lang)
2 - 12 July 1915: Malela (Lang)
19 - 25 July 1915: Banana (Lang)
25 July - 1 August 1915: St. Antonio (Lang)
6 August - 14 September 1915: Banana (Lang)
15 September - 1 October 1915: St. Paul de Loanda (Lang)
10 October - 2 November 1915: Lisbon (Lang)
12 November 1915: New York (Lang)

Esther M. Langan

Born: ? - Died: ?

Esther Langan is a museum specialist at the USNM's Amphibians and Reptiles division.

Prof. Benedetto Giuseppe Antonio Lanza

Born: 24 May 1924: Florence, Italy - Died: 10 March 2016: Florence, Italy

Benetto ("Bettino") Lanza is a medical doctor and profesional naturalist. He became professor of General Biology at the University of Bologna in 1969, and full professor of General Biology in the Faculty of Mathematics, Physics and Natural Sciences at the University of Florence in 1971. He was appointed director of the Zoological Museum *La Specola* of the aforementioned University a year later, until 1992. He retired in 1996, but remained an active zoologist, as well as an honorary member or president of several Italian and European scientific societies.

See Angelli and Riccucci (2011). A summary of Lanza's research on mammals. *Hystrix, It. J. Mamm.* (n.s.) 22 (1): 4 - 13. Hanák *et al.* (2016).

Edgar Leopold Layard

Born: 23 July 1824: Florence, Italy - Died: 1 January 1900: Budleigh Salterton, Devon, England

1844: entered civil service of Ceylon
1855: posted to civil service at Cape Town where he founded the South African Museum

See: Corbet and Hill (1992)
http://zoonomen.net/bio/biol.html

Jean Lebrun

Born: 1906 - Died: 1985

Jean Lebrun obtained his MS in agricultural sciences in 1928 and his PhD in botany in 1937 at the university of Louvain. He was secretary general of the Institut national pour l'étude agronomique au Congo Belge (INEAC) (1948 -1962), secretary general of the Institut belge pour l'encouragement à la recherche scientifique d'outre-mer (IBERSOM) (1962 - 1963), lector and subsequently professor in ecology (agricultural institute of the university of Louvain) (1947 - 1976), member of the Académie royale des sciences d'outre-mer (ARSOM) and president of the Société royale de botanique de Belgique. He studied the boundaries of the equatorial forest for the agricultural service of the ministery of Colonies (1929 - 1933), agronomist (1933), then became scientific secretary of the Institut National pour l'étude agronomique au Congo Belge (INEAC) (1937), and undertook a botanical prospection of the Albert and Kagera National Parks (1937 - 1947). He was also charged with various scientific inspection missions in the INEAC stations (1946 - 1960).

See: Van Schuylenbergh (1997: 55).

Antonius Josephus Martinus ("Toon") Leeuwenberg

Born: 11 August 1930: Amsterdam, The Netherlands - Died: 2010

A.J.M. Leeuwenberg was a Dutch botanist and taxonomist.

See: https://en.wikipedia.org/wiki/Anthonius_Josephus_Maria_Leeuwenberg

dr. Narcisse Leleup

Born: 1912 - Died: 2001

Dr. Narcisse Leleup was a Belgian entomologist, who collected in the former Belgian Congo in the 1940s and 1950s.

See: Beolens, B., Watkins, M. and Grayson, M. (2013). The Eponym Dictionary of Amphibians.

Charles Lemaire

Born: 1863: Cuesmes, Hainaut, Belgium - Died: 1926: Brussels, Belgium

Charles Lemaire attended the military school between 1881 and 1886. He was appointed second lieutenant with the second artillery regiment. He was secretary general of the Exposition in Tervueren (1897) and creator of the colonial Villa in Waetermael. He was also director of the colonial university in Antwerp (1920) and professor at the colonial school in Brussels. He was assistant district commissioner (Cataracts and later in Equateur - 1889 - 1893). Together with A. Thys, he was a member of the commission sent by the Belgian government to examine the conditions and the state of the works for the Congolese railroads (1895). He was in charge of a scientific mission to Katanga, which covered 3000 km and 195 geodesic stations (1898 - 1900). Furthermore, he was in charge of a mission to Bahr-el-Ghazal, organising the territories leased (?) from England by Leopold II (Dungu, Lado enclave, Rohl basin, Yei station) (1902 - 1905).

First trip: 13/11/1889 - 28/05/1893: Equateur
Second trip: 9/07/1895 - 21/11/1895: railroad inspection
Third trip: 11/05/1898 - 24/09/1900: from Zanzibar to Katanga
Fourth trip: 31/17/1902 - 27/08/1903: Yei and Rafai stations; Strauch and Lambermont rapids; a journey to the source of the Yei river; a journey from Itimbiri to the station at Yakululu.

See: Van Schuylenbergh (1997: 58)

Charles Letourneau

Born: 1831 - Died: 21 February 1902

French anthropologist.

see: http://fr.wikipedia.org/wiki/Charles_Letourneau

José L.P. Lobao Tello

Born: ? - Died: ?

Anderson (1997: 136): European naturalist; in 1985 and 1986 collected in Pando, Beni, and Santa Cruz (Bolivia); specimens were the initial nucleus for the new collection at MNK (field numbers 1-285).

John Alden Loring

Born: 1871 or 1872 - Died: 1947

John Alden Loring was a field naturalist and taxidermist for the 1909 African expedition for the Smithsonian Institution, led by Theodore Roosevelt. During this expedition he was in charge of collecting small mammals.

See: http://indianajones.wikia.com/wiki/John_Alden_Loring, http://www.mnh.si.edu/onehundredyears/expeditions/SI-Roosevelt_Expedition.html

William S. MacGillivray

Born: 1796 - Died: 1852

Scotch naturalist; author of a "History of British Birds" and coadjuctor of John James Audubon in the preparation of his well-known and valuable treatise on American birds (see Jaeger, 1972: 317).

the Machris-Knudsen Expedition

Born: ? - Died: ?

Named after Maurice A. and Paquita Machris
and Mrs. Valley Knudsen.

Father Vedast (Gaston Alfons) Maes

Born: 10 May 1906 - Died: 14 February 1994

Father Gaston Vedast Maes lived over 40 years amongst the Ngbaka (since 1933) and thanks to him we know the major part of the history of the migrations of the Ngbaka.

From 1933 to 1978, Father Vedast Maes lived in the DRC, more specifically in the Ubangi region (Vicariat Apostolique de l'Ubangi, currently Diocèse de Molegbe).

Dr. Charles Immanuel Forsyth Major

Born: 15 August 1843: Glasgow, Scotland, U.K. - Died: 1923

Charles Immanuel Forsyth Major attended the Basle and Zürich Universities, in Switzerland, and the Göttingen University in Germany. In 1868, he graduated in Medicine at the university of Basle, and started his professional carreer in Firenze, Italy. In 1877, he collected fossile vertebrated in Calabria, Corsica, Sardinia, and Sicily at the request of the Italian government. His growing interest in vertebrates made him give up his medical carreer in 1886. He then began a study on the recent and fossil fauna and flora of Greece (mainland and islands), and sent large amounts of these to the Collège Galliard in Lausanne and at the BMNH.

Between 1894 and 1896, dr. Major undertook an expedition to the east-central part of Madagascar. Jenkins and Carleton (2005: 1785) reconstructed this voyage:

15 June 1894: Embarkation
September 1894: Fianarantsoa
October to December 1894: Ivohimanitra
November 1894 to 28 January 1895: Ambohimitombo
???: Ambohimanga
21 - 29 November 1894: Itsimatahodalana
30 November to 6 December 1894: Ambositra
2-15 February 1895: Ambositra (2nd visit)
8 April 1896: Ambositra (4th visit)
December 1894: Loharindra Cavern
9 March to 31 May 1895: Antsirabe
September 1895 to January 1896: Antsirabe (2nd visit)
18 March to 10 April 1895: Fasina
18 March to 15 May 1895: Andranobe
4 - 19 April 1895: Andraikiba Lake
24 February 1896: Andraikiba Lake (2nd visit)
18 April 1895: Betafo
27 April, 7 June 1895: Tritriva
24 May 1895: Ivohitra
23 June to 11 August 1895: Ampitambe
6 - 28 March 1896: Ampitambe (2nd visit)
3, 4 July 1895: Masindrary
18, 31 March 1896: Masindrary (2nd visit)
24 March 1896: Fandriana
10 - 21 January 1896: Ankeramadinika
11, 12 January 1896: Angavo
12 January 1896: Ambataroa
23 April 1896: Ambohimandroso
12 May to 6 June 1896: Vinanitelo
24 May 1896: Amboanara
23 - 30 May 1896: Ambohimanana
4, 6 June 1896: Amboasary
4, 6 June 1896: Itaombelo
30 August 1896: Return

Dr. William M. Mann

Born: 1886 - Died: ?

Anderson (1997: 132): zookeeper and entomologist from Washington, D.C.; collected in 1921 and 1922 with Mulford Expedition (Bolivia).

Hannes Marais

Born: ? - Died: ?

Alfred A. Marche

Born: 1844 - Died: 1898

Corbet and Hill (1992): French anthropologist and zoologist, in Philippines 1879-85.

Undertook between 1871 and 1878 three voyages to west Africa: Senegal - Gambia, Casamance - Gabon - Ogooué.

see: http://gallica.bnf.fr/ark:/12148/bpt6k49798f

Prof. Dr. Cornelis Johannes Marinkelle

Born: 1 July 1925;Vienna, Austria - Died: 18 January 2012;Bogotá, Colombia

Cornelis Johannes Marinkelle was a Dutch MD and biologist. He obtained his PhD from the University of Brussels in 1960. He served as medical personnel in the Peace Corps for the Government of the Netherlands, with humanitarian and research missions at Universidad del Salvador, El Salvador in 1962. In 1963 he was appointed as professor at the Universidad de los Andes, where het taught parasitology, protozoology, entomology and zoonoses in the Department of Biological Sciences until 2011.

See: https://en.wikipedia.org/wiki/Cornelis_Johannes_Marinkelle

Thomas Paul Maslin

Born: 1909: Hankow, China - Died: 1984

Beltz (2004: http://ebeltz.net/herps/biogappx.html):
son of missionary parents.
1909-1927 Schooled in Hankow until the family fled to the Philippines for six months.
1927-1928 Attended Howard Military School in Los Angeles (high school). His parents returned to China.
1928-1933 Attended U CA, Berkeley, BA in 1933, acquired his life-long interest in herpetology.
1934-1936 Taught at Boone Middle School in Wuchang, married Mary Hamilton Watts, researched herpetofauna.
1936 He and his wife returned to the US, began graduate study at U CA, Berkeley.
1937-1940 Curatorial assistant in herpetology and mammalogy at MVZ, and in ornithology at the CA Academy of Sciences, 1939. Until 1940, was a WPA supervisor at the Academy.
1940-1941 Taught at Armstrong Junior College.
1941 MA, U CA, Berkeley, CA.
1941-1945 Transferred to Stanford, worked under George Myers. Teaching assistant for 2 years, then curator at the Natural History Museum. Worked as a Port Supervisor, Officer of Fishery Co-ordination at San Francisco.
1945 PhD, Zoology Stanford U.
1945-1947 Asst. Professor, Zoology, CO Agricultural and Mechanics College. (CO State University)
1947-1974 Asst. Professor to Professor, Biology, U CO, Boulder, CO.
1966-1973 Curator of Zoology, U CO, Boulder, CO.
1974-1978 Partially retired from U CO until 1978.
1966 Curator of University Museum, U CO, Boulder, CO.
1975+ Professor Emeritus, U CO, Boulder, CO.
1981 Re-visited China.
Member of the American Society of Ichthyologists and Herpetologists, The Herpetologists League and Society for the Study of Amphibians and Reptiles. Researched parthenogenesis of lizards.
His zoological photographs are on file at the U CO Museum, as well as his pre-retirement field notes. He published about 56 works on herpetology, but this number does not reflect the importance of his contributions, including pioneer work on parthenogenetic Cnemidophorus. He collected over 60,000 specimens housed at the U CO.

Dr. Edgar Alexander Mearns

Born: 11 September 1856: Highland Falls, Orange Co., NY - Died: 1 November 1916: Walter Reed hospital, USA

dr. Edward Alexander Mearns: Long-time army surgeon; enthusiastic, active and efficient student of natural history. Especially was he interested in birds and mammals but neither botany nor ethnology was neglected on his travels in southwestern United States, in the Philippines and East Africa. One of his great contributions was his report on the "Mammals of the Mexican Boundary of the U.S." (1907).

Beltz (2004: http://ebeltz.net/herps/biogappx.html):
1856: Born in Highland Falls, Orange County, NY, September 11.
1881: Graduated College Physicians and Surgeons, NY.
1883 (3 December): Commissioned 1st Lt. and Assistant Surgeon, US Army.
1883 -1887: Served at Fort Verde, Arizona. Collected 3,500 bird skins, 1000 bird eggs and 600 mammals which were donated to the American Museum of Natural History.
1887 -1890: Served at Fort Snelling, Minnesota.
1891: Captain, US/Mexican Boundary Commission, Fort Meyers, Virginia
1892 - 1894: Lt. Colonel, US Medical Corps, Mexican Boundary Commission (exploring the boundary line from El Paso, Texas, to San Clemente Island).
1894: Explored entire boundary. Collected 30,000 animal and plant specimens.
1894: Collected holotype of *Sceloporus graciosus vandenburgianus* ìon the summit of the coast range, San Diego County, CA.
1895 - 1903: Collected in Catskills, Rhode Island, Florida and Yellowstone.
1897 - 1900: Fort Clark, Texas
1898: Comm. brigade surgeon (later chief surgeon) Volunteers Spanish-American War; Major
1899 (22 March): Honorable discharge
1899 - 1900: Fort Adams, Rhode Island
1900: Nervous breakdown (? Complicated by malaria ?), 3 months leave
1901 (February): Appointed Major, Army Surgeons.
1902: Fort Yellowstone
1903 - 1907: Served two tours in Phillipines, Collected plants, birds and animals.
1904: San Francisco to recover from "parasitic disorders"
1905: visited Guam
1907: Fort Totten, New York
1909 (1 January): Retired Army as Lt. Colonel.
1909 - 1910: Served as naturalist, Smithsonian African Expedition with Theodore Roosevelt, exploring parts of British East Africa from Mount Kenya to the White Nile.
1911 - 1912: Field naturalist of the Childs-Frick African Expedition to Abyssinia (Ethiopia).

By his death, he had collected 7,000 mammals, 20,000 birds, 5,000 reptiles and 5,000 fish.
A founder of the Am. Ornithologists' Union, and a member of many other scientific societies.

Dr. Jurgens Anthonie Janse [=Waldo] Meester

Born: 20 May 1931; - Died: 7 October 1994;

Walde Meester was a South African mammalogist, who obtained his MS in 1953 at the University of Pretoria (RSA). In that year, he also became curator of mammals at the Transvaal Museum. In 1961, he obtained his PhD. In 1963, he was appointed director of the Kaffrarian Museum in King William's Town. In 1966, he founded the mammal research institute at the University of Pretoria, which he led until 1971. In 1972, he was appointed as head of the zoology department of the University of Natal at Pietermaritzburg, and in 1980 head of the biology department of the University of Durban-Westville.

See: https://de.wikipedia.org/wiki/Jurgens_A._J._Meester

Florian Meier

Born: ? - Died: ?

Worked as freelancer for various medical offices (WHO, OMS, …).

James Ian Menzies

Born: ? - Died: ?

English-born Australian zoologist.

See: https://species.wikimedia.org/wiki/James_I._Menzies

Dr. Robert Mertens

Born: 1894: St. Petersburg, Russia - Died: 23 August 1975

Corbet and Hill (1992): Zoologist at Senckenberg Museum, Frankfurt, Germany.

Beltz (2004: http://ebeltz.net/herps/biogappx.html):
1912: Entered Leipzig University, thesis on geographical variation in Lacerta. PhD, U Leipzig, Germany.
1919- 1 925: Asst., Senckenberg Museum, Frankfort, Germany.
1925 -:1946: Curator, Senckenberg Museum, Frankfort, Germany.
1932: Obtained title of Privatdozent.
1932 - 1939: Instructor, U Frankfort, Germany.
1939+: Professor, U Frankfort, Germany.
1946 - 1960: Director, Senckenberg Museum, Frankfort, Germany.
1960+: Emeritus Director, Senckenberg Museum, Frankfort, Germany.
1975: Died from a bite from his pet *Thelotornis kirtlandi*

Published close to 800 items. He had an encyclopedic knowledge ìof reptiles and enjoyed being able to identify, by sight, obscure ìanimals in zoos and collections. Described 100's of new reptiles ìand amphibians - often without first formally revising the group. ÌWrote a popular book about his voyage around the US.

Giacomo Bartolomeo Messedaglia, Bey

Born: 1846: Italy, Venice - Died: 1893 or 1896: Italy, Pisa

Giacomo Bartholomeo Messadaglia attended elementary school in Legnago. At 13, he joined the army and after his discharge in 1869, he moved to the East to seek his fortune. He worked as an assistant in Syria and in Lebanon, working on the construction of roads and bridges. In 1876, he moved to Egypt where he was hired as the official surveyor, with a mandate to carry out exploration, reconnaissance and excavations, but above all to make a large map of the country. Thanks to his contacts with Charles George Gordon, the British governor of the Sudan known as Gordon Pasha, Messedaglia won in 1879 the prestigious post of governor (Bey) of Darfur, where he led a difficult campaign against the local bandits and slave traders and tried to rearrange the administration. His tenure did not last long because of the political turmoil that involved Egypt in those years, but his exploits had a certain resonance even at home. In the latter part of his life he continued to play minor roles while in the Egyptian army, until his retirement in 1889. Due to his poor health, he decided to return to Italy and retired to Pisa, where he lived until his death.

La Mission Scientifique Suisse à Angola

Born: ? - Died: ?

The Second Swiss Scientific Mission to Angola took place between 1932 and 1933 and lasted 18 months.

Participants at this mission were Albert Monard (1886-1952), Théodore Delachaux (1879-1949) and Charles Emile Thiébaud (1910-1995).

Mr. J.J. Monteiro, Esq

John Golding Myers

Born: 22 October 1897: near Rugby, Warwickshire, U.K. - Died: 1942

British entomologist who was employed by the New Zealand Department of Agriculture (1919 - 1924), later returning to England to the Imperial Institute of Entomology (1926). He travelled to the West Indies and South America after joining the Imperial College of Tropical Agriculture in Trinidad (1934) and to Africa as Economic botanist to the Government of Anglo-Egyptian Sudan (1937-). Collected: (1936-1940) in Tropical Africa: Sudan; Tropical South America: Guyana, Suriname.

See: nature 149, 406-406 (11 April 1942).

Colonel C.J.M. Nagtglas

Born: ? - Died: ?

Dutch colonial official and governor.

S.A. Neave

Born: ? - Died: ?

Osborn (1919: xvi) places S.A. Neave in Congo in 1904 - 1908.

Dr. Kimberlyn (Kim) Nelson

Born: ? - Died: ?

Kim Nelson got her B.S in Biology from the Baylor University, Waco, TX in 1982. From 1982 to 1984, she attended the Texas Tech University, Lubbock, TX, where she obtained her M.S. in Zoologyy. In 1988, she received het Ph.D. at the Harvard University, Cambridge, MA. During this time, she also made a six week small mammal collecting trip in Kenya for the Carnegie Museum, Pittsburgh, PA.

From 1999 onwards, she is working as a Forensic Examiner for Mitotyping Technologies, LLC.

See: http://www.mitotyping.net/kim.htm

Dr. William D. Newmark

Born: ? - Died: ?

Bill Newmark is research associate with the Vertebrate Zoology department of the Natural History Museum of Utah.

Michael John Nicoll

Born: 1880 - Died: 1925

Michael Nicoll accompanied the Earl of Crawford on three voyages around the world with the earls yacht "Valhalla".

First voyage:

Cowes, 19th November 1902
Lisbon, 24th to 26th November, 1902
Madeira, 29th to 30th November
Las Palmas, 1st to 3rd December
St. Vincent, Cape Verde Islands, 10th to 12th December
St. Paul's Rocks, Mid-Atlantic, 17th to 18th December
Fernando de Noronha, 20th to 22nd December
Bahia, Brazil, 26th December to 5th January 1903
Montevideo, 14th January to 20th January
Straits of Magellan, 28th January to 5th February
Smythe's Channel, 5th to 10th February
Valparaiso, 14th to 24th February
Easter Island, 10th to 13th March
Pitcairn Island, 22nd to 23rd March
Tahiti, Society Islands, 31st March to 17th April
Tutuila Island, Samoan Group, 22nd to 24th April
Apia, Upolu Island, Samoa, 25th to 29th April
Suva, Fiji Islands, 3rd to 6th May
Thursday Island, Torres Straits, 18th to 23rd May
Singapore, 3rd to 9th June
Colombo, 17th to 20th June
Aden, 2nd to 3rd July
Suez, 10th July
Port Said, 11th to 13th July
Gibraltar, 22nd to 26th July
Cowes, 1st August 1903

Second voyage:

Cowes, 18th December 1903
Madeira, 24th to 27th December, 1903
Teneriffe, Canary Islands, 28th December to 1st January, 1904
Barbadoes, West Indies, 15th to 21st January
St. Lucia, 22nd to 25th January
St. Vincent, 25th to 27th January
Cariacou, 27th to 28th January
Grenada, 28th January to 1st February
St. Lucia (second visit), 2nd to 5th February
Martinique, 5th to 7th February
Dominica, 7th to 10th February
Montserrat, 10th to 12th February
St. Kitts, 12th to 15th February
Antigua, 15th to 17th February
St. Kitts (second visit), 17th to 18th February
St. Croix, 19th to 21st February
St. Thomas, 21st to 24th February
Porto Rico, 24th to 26th February
Jamaica, 29th February to 8th March
Grand Cayman, 9th to 13th March
Little Cayman, 13th to 14th March
Havana, Cuba, 17th to 21st March
Punta Gorda,Florida,22nd March to 4th April
Key West, Florida, 5th to 8th April
Bermuda, 13th to 20th April
St. Michael's, Azores, 29th April to 2nd May
Cowes, 8th May 1904

Third voyage:

Cowes, 8th November 1905

Las Palmas, 13th to 16th November, 1905
Put back to Las Palmas owing to illness of one of the crew 17th November
St. Paul's Rocks, 2nd December
Bahia, 10th to 30th December
South Trinidad, 3rd to 5th January, 1906
Martin Vas, 5th January
Tristan da Cunha, 17th to 20th January
Cape Town, 28th January to 8th February
Durban, 14th to 15th February
Mayotte, Comoro Islands, 23rd February to 3rd March
Diego Suarez, Madagascar, 4th to 9th March
Glorioso Island, 10th to 11th March
Assumption Island, 12th to 13th March
Aldabra, 13th to 16th March
Aground on Assumption, 16th to 17th March
Mahe, Seychelles Islands, 22nd March to 2nd April
Praslin and Felicite Islands, Seychelles, 2nd to 5th April
Mahe (second visit), 5th to 8th April
Aden, 14th to 17th April
Suez, 23rd April
Port Said, 24th to 27th April
Gibraltar, 5th to 8th May
Cowes, 13th May, 1906

After the third voyage, Michael Nicoll was appointed by the Egyptian Government to the post of second in charge of the Zoological Gardens at Giza, near Cairo.

See: Nicoll (1908).

Gerhard Nikolaus

Born: ? - Died: ?

German zoologist

Dr. Carrie J. O'Brien

Born: ? - Died: ?

Carrie O'Brien obtained her PhD. at the University of Utah in 2009.

Philip W. Ogilvie

Born: ? - Died: ?

Director of the Oklahoma City Zoo

Dale James Osborn

Born: 10 May 1922: Hemet, California, U.S.A. - Died: 20 August 2004: Praha, Czech Republic

After three years of service in the Navy, Dale Osborn started his university studies at the Colorado State College at Fort Collins, where he obtained his B.S. in 1948. He continued his study at the University of Wyoming, Laramie (M.S., 1949). He worked as an Instructor in Zoology at the University of Wyoming, and in Biology at the Boston University. He then became a Demonstrator in Zoology at McGill University in Montreal, where he completed his PhD. in 1957.

Dale gained very important teaching experience during his first assignment abroad, as an Assistant Professor and the Head of Natural Science Department at Robert College, Istanbul,
Turkey (1957 - 1960). His following position was Assistant Professor in Zoology at Texas Technological College, Lubbock (1960 - 1961), followed by several years as a Teacher of Zoology at the Anatolia College, an American agriculture school in Thessaloniki, Greece (1961 - 1964). His work was always connected to various research grants: 1951 Arctic Institute of North America grant-in-aid for research in zoology in the Quebec-Labrador Peninsula; 1952 Carnegie Corporation Arctic Fellowship and funds for research in zoology in the Quebec-Labrador Peninsula; 1958 - 1961 National Science Foundation grant-in-aid for the study of the taxonomy and distribution of the mammals of Turkey. During these years, Dale became well acquainted with the Mediterranean,its natural history (namely fauna), contributing significantly to the understanding of small mammal distribution there.

From 1964 to 1970, he was a Field Associate of the Field Museum of Natural History, Chicago, and he worked as a mammalogist in the Department of Medical Zoology, US Naval Medical
Research Unit No. 3 at Cairo. He organized numerous short field trips and longer desert expeditions traping animals and collecting plants.

In 1980 (together with I. Helmy), he produced a comprehensive compendium on the recent land mammals of Egypt, including Sinai. He became professionally interested in animals of ancient Egypt, both wild and domesticated. The greater goal in his zoo-archeological studies became close collaboration with top egyptological institutions in Chicago, London, and the Czech Institute of Egyptology of Charles University with its rich library in Prague. This work resulted in his last publication in 1998, The Mammals of Ancient Egypt.

Between his Egyptian and Prague years, he served as a Curator at Large, Curator of Public Relations, and Curator of Special Projects in Chicago Zoological Park, Brookfield.

See: Hanák, V. & M. Kosina (2005). In memoriam Dale James Osborn - Lynx (Praha), n.s. 36: 149 - 152.

Dr. Wilfred Hudson Osgood

Born: 1875 - Died: 1947

Corbet and Hill (1992): Field Museum, Chicago 1909-41.
Anderson (1997: 133): mammalogist at the FMNH Chicago, after whom *Felis osgoodi, Phyllotis osgoodi*, and *Monodelphis osgoodi* were named.

C.R. Owen

Born: ? - Died: ?

W. Paling van Veen

Born: ? - Died: ?

Paul Pallary

Born: 1869 - Died: 1942

Paul Pallary was prolific writer on the land-snails of NW Africa and contributed many papers on the faunas of NW. Africa, especially those of Morocco, Eygpt and Syria. He was a schoolteacher at Oran (1891-1896), who periodically made collecting excursions. He was also a shell dealer, and issued regular lists of marine and land-shells available for purchase. The majority of the material sold came from Morocco (Rif mountains, 1904), NW. Algeria, Tunisia, Eygpt and Syria.

In 1912 to 1913, Pallary was one of a team of Zoologists attached to the Mission of Scientific exploration organised by the Geographical Society. He started collecting in the Haut Atlas region, but on the further outbreaks of war in 1914 the expeditions were suspended until RICARD restarted them in 1921. At this time his contacts with military personel provided him with further material.

See: http://www.museumwales.ac.uk/en/2767/

Daniel Arthur Parelius

Born: 1949 - Died: ?

Between 1964 and 1969, Daniel Parelius made a collection of birds in Côte d'Ivoire, where his parents were missionaries.

See: Engel, J.I., Parelius, D. and Bates, J.M. (2014). The Parelius bird collection from Ivory Coast at the Field Museum of Natural History, and the first country record of Rufous Cisticola *Cisticola rufus*. - Malimbus, 36: 119 - 122.
Beolens, B., Watkins, M., and Grayson, M. (xxxx). The eponym dictionary of birds. - Bloomsbury.

Dr. Emin Pasha

Born: ? - Died: ?

See also "Emin, Pascha"

Marquis Saverio Patrizi Montoro

Born: 11 January 1902: Sasso Furbara, Rome, Italy - Died: 21 February 1957

Italian naturalist, explorer, gatherer, who collected important materials in East Africa, Congo, Cufra and in caves of Central Italy and Sardinia. Wrote 35 publications, some of which regard insects.

See: http://gap.entclub.org/taxonomists/Patrizi/index.html

Dr. James L. Patton

Born: 21 June 1941: St. Louis, Missouri, USA - Died: ?

James Patton obtained his B.A. (1963), his M.S. (1965), and his Ph.D. (1969) at the University of Arizona, and is currently acting director at the Museum of Vertebrate Zoology, University of California, Berkeley.

See: http://ib.berkeley.edu/labs/patton/jim/jlp-cv.html

Dennis R. Paulson

Born: ? - Died: ?

American Zoologist, who focused on biodiversity and biology of dragonflies and birds. He was director of the Slater Museum of Natural History 1990-2004 (presently Director Emeritus).

See: http://species.wikimedia.org/wiki/Dennis_R._Paulson

Frank Elmer Peabody

Born: 28 August 1914 - Died: 27 June 1958

Frank Elmer Peabody was an American palaeontologist noted for his research on fossil trackways and reptile and amphibian skeletal structure.

He received him MA in 1940 at the University of California. During World War II Peabody worked at the Lawrence Berkeley National Laboratory and Oak Ridge National Laboratory, and finished his doctorate at the University of California in 1946. He accompanied the University of California South African Expedition in 1947-1948 as Senior Paleontologist. He and Charles Camp excavated at Gladysvale Cave and nearby Bolt's Farm. Subsequently they visited the Northern Transvaal and Mozambique in their search for specimens. The expedition also visited Wonderwerk Cave in Northern Cape Province.

Peabody later became Instructor in Zoology at the University of Kansas at Lawrence

See: http://en.wikipedia.org/wiki/Frank_Peabody

Guilio Pestalozzi

Born: ? Beirut - Died: 1930: Rome, Italy

Italian consul in Damascus, Zanzibar, Tripoli, Governor of Assab (1882 - 1885).

see: http://www.angelfire.com/hi/eritreans/rullers, http://digilander.libero.it/fiammecremisi/eritrea.htm, http://www.pestalozzi.net/history/familienbuch/index402.html

Prof. Wilhelm Carl Hartwig Peters

Born: 1815 - Died: 1884

Corbet and Hill (1992): Professor of Zoology and associate of the Berlin Museum.

Dr. George A. Petrides

Born: 1 August 1916 - Died: 9 November 2011

Dr. Petrides studied zoology and botany at George Washington University, earning a B.S. in 1938. He went on to earn an M.S. in wildlife biology and ornithology at Cornell in 1940 and a Ph.D. in wildlife biology and botany from Ohio State University in 1948. After two years as an associate professor of wildlife management at Texas A & M, he joined the MSU faculty in 1950 with a joint appointment in zoology and the fledgling fisheries and wildlife department.

He received a Fulbright award to study big game populations in Kenya in 1953-54 and a second Fulbright in 1957-58 for similar population studies in Uganda.

See: https://www.legacy.com/obituaries/lsj/obituary.aspx?n=george-a-petrides&pid=154577679

Nicolas Pike

Born: 26 January 1818: Newburyport, Mass., USA - Died: 1905

As early as 1849 Nicolas Pike was a diligent student of marine algae and in that year he was made president of the Brooklyn Natural History Society. In 1852, he was appointed consul to Oporto, Portugal, where he remained until 1861. At the beginning of the war, he was commissioned lieutenant-colonel and was active in recruiting troops and training volunteers. In 1865, he resumed his studies in natural history.

On 12 January 1867, he arrived on Mauritius, where he was appointed U.S. consul, where he stayed in function until 1874.

see: Gudger, E.W. (1929). Nicolas Pike and his unpublished paintings of the fishes of Mauritius, Western Indian Ocean, with an index to the fishes. - Bull. Amer. Mus. Nat. Hist., 58: 489 - 530.

André Pilette

Born: ? - Died: ?

Around 1921, André Pilette was put in charge of a mission by the Belgian minister of Colonies.

The RMCA has a number of maps: Rhodesia, Katanga (east and west), Dar es Salam, Zanzibar, Karangwe and Lindi (German East Africa), Abyssinia, Marsabit and Mombasa-Nairobi (British East Africa) (1908 - 1921); and a track of his journey between Aba - Faradje (Haut-Uele) - Gombari (Watsa) - Nduye - Equateur (19/04/1921).

See: Van Schuylenbergh (1997: 75)

R.H. Pine

Born: ? - Died: ?

Captain Charles Robert Senhouse Pitman, DSI, MC

Born: 19 March 1890; Bombay, India - Died: 18 September 1975

Charles Pitman was a British herpetologist and conservationist.

He attended the Royal Naval School, Eltham, at Blundell's School in Tiverton, and at Royal Military Academy Sandhurst, which he left in 1909 having obtained a commission in the Indian Army. After his army retirement in 1921, he took up farming in Kenya. In 1924, he became Game Warden of the Uganda Protectorate, a post which he kept until 1951, interrupted only by three years (1931-1933) spent in Northern Rhodesia as Acting Game Warden and undertaking a faunal survey, and by five years (1941-1946) during which he was Director, Security Intelligence (Uganda).

See: https://en.wikipedia.org/wiki/Charles_Pitman_(game_warden)

Charles-Henri Pobéguin

Born: 25 February 1856: Valence, Drôme, France - Died: 25 June 1951: La-Varenne-Saint-Hilaire, Val-de-Mar

Charles-Henri Pobéguin enlisted in the army at the age of 18, when he joined the 53th infantry regiment in Pau. He was sent to Algeria, where he passed a number of months in Tlemcen. After his military service he moved to Paris, where he studied topography.

In 1886, he met with Brazza, and was hired as "auxiliary agent with special duties" and was second in command on the mission to perform the first study to construct a railroad line between Loango and Brazzaville (a project which was only finished in 1934). He continued his mission until 1887, during which he leveled the Kouilou and finished a study on the construction of a dam to suppress the rapids. Following this, he was commissioned to study the construction of a commercial route between the Passa and the Alima.

On 1 November 1888, he was appointed "Chef de Station de 2ème class" in French Congo, and put in charge of the administration of the Batah region. He continued his explorations and his activities as cartograph and natural scientist along the banks of the Congo de Massabé and the Campo rivers until 1890. He then returned to France for two years. In January 1892,

he was appointed administrator at Grand Lahou en subsequently at Tiassalé in Côte d'Ivoire, where he drew the map of the Grand Lahou lagoon and the Bandam river up to Tiassalé, as well as an atlas of the coast of Côte d'Ivoire.

In 1897, Henri Pobéguin was put in charge of the administration of the Protectorate at Grand Comore, where he also studied the fauna and flora. He left Grand Comore in 1898, when he was appointed admininstrator of the "Cercle de Timbo" in French Guinea (October 1899).

In 1911, he was retired, but he still continued his work in Africa for another 15 years, working for private companies.

In 1951, he was made "Commandeur de la Légion d'Honneur".

see: http://fr.wikipedia.org/wiki/Charles-Henri_Pob%C3%A9guin

Tamas Pócs

Born: ? - Died: ?

curator of Hepatics, Eszterházy Károly College Herbarium, Hungary

A.W.J. Pomeroy

Born: ? - Died: ?

Government entomologist, active in Africa (Nigeria, Cameroon, Kenya, Tanzania) around the 1920s.

Léon Poutrin

Born: 1880 - Died: 11 November 1918

French military doctor, who took part on an anthropological expedition to the Kanem-Chari-Logone region between the end of 1907 and august 1909. The expedition crossed French Congo, a small part of the Belgian Congo, the Lobaye,Oubangi, Gribingui, Chari, and Chad rivers basins and reached the Kanem.

see: http://www.persee.fr/web/revues/home/prescript/article/jsa_0037-9174_1919_num_11_1_3878

Major Percy Horace Gordon Powell-Cotton

Born: 20 September 1866: Garlinge, Margate, U.K. - Died: 24 June 1940

Powell-Cotton embarked on over 28 expeditions between 1887 and 1939, across Africa and Asia.

In 1900, he met with Emperor Menelik II of Ethiopia.

In November 1905, he was on an expedition in Kenya, where he maried and the couple went on a honeymoon, which lasted two years.

Powell-Cotton’s expeditions directly led into the creation of the Powell-Cotton Museum in the grounds of Quex House.

Osborn (1919: xvi) places Powell-Cotton in Congo in 1905 - 1906.

see: http://en.wikipedia.org/wiki/Percy_Powell-Cotton

Project Beatra

Born: ? - Died: ?

see: http://archive.fieldmuseum.org/congo/pdf/BEATRA_Initiative_model.pdf

Raymond Pujol

Born: ? - Died: ?

Anderson (1997: 134): from Laboratoire d'Ethnozoologie, Paris; in 1969 with UNESCO misison to Mount Sajama (Bolivia).

Dr. Vincenzo Ragazzi

Born: 1856 - Died: ?

Dr. Ragazzi was for several years director of the Italian station at Let Marefia, Shoa.

Collected plants between 1884 and 1892.

see: http://plants.jstor.org/person/bm000040531

Austin Loomer Rand

Born: 16 December 1905: Kentville, Nova Scotia, Canada - Died: 6 November 1982

Austin Loomer Rand received a Bachelor of Science from Acadia University, an institution which also awarded him an honorary DSc degree in 1961.

In 1929, while still a graduate student at Cornell University, he travelled on an expedition to Madagascar as collector of birds. Rand published the results as his thesis for his Ph.D.. It was on this expedition that he met Richard Archbold, zoologist and philanthropist, with whom he became a lifelong friend. Archbold subsequently financed and led a series of biological expeditions to New Guinea in the 1930s in which Rand participated and co-led. In 1941 he assisted Archbold in the establishment of the Archbold Biological Station at Lake Placid, Florida, a place he eventually retired to.

In 1942, Rand became assistant zoologist at the National Museum of Canada, now the Canadian Museum of Nature, where he worked with ornithologist Percy A. Taverner and mammologist Rudolph Martin Anderson. From 1947 to 1955, he was curator of birds at the Field Museum in Chicago and chief Curator of Zoology from 1955 to 1970.

Austin L. Rand was the father of the noted tropical herpetologist Austin Stanley Rand of the Smithsonian.

See: http://en.wikipedia.org/wiki/Austin_L._Rand

Henry Cushier Raven

Born: 1889 - Died: 1944

Henry Cushier Raven began his zoological career in the Department of Preparation of the American Museum of Natural History in 1907, where he worked with Jesse D. Figgins and Herbert Lang, noted taxidermists. When Figgins moved to the Colorado Museum of Natural History in 1910, Raven went along with him.

In 1912, the Smithsonian Institution and William Louis Abbott were looking for a young collector and explorer to carry on Abbott's work in the East Indies. Raven spent most of the next six years in the islands. His travels in the Pacific took him to Borneo, the Celebes, and the Moluccas.

Raven entered Cornell as a special student in zoology in 1918 and also served as Curator of the zoology museum. In 1919, the Smithsonian again employed him as a field collector, this time for the Cape-to-Cairo African Expedition. Upon his return in 1920, he entered Columbia and there studied comparative anatomy under William King Gregory. From 1921 to his death, Raven worked for the American Museum of Natural History as a collector and Curator of Comparative Anatomy. He also held appointments with New York University, 1924-1926; Columbia University, 1926-1944; Johns Hopkins University, 1936-1938; and the New York Zoological Park, 1921-1944. Raven's major research contributions dealt with the distribution of animals in East Asia, the sperm and beaked whales, and the comparative anatomy of primates, especially gorillas.

Dr. A. Robb

Born: ? - Died: ?

Associated with the United Presbyterian Mission.

Austin Roberts

Born: 1883 - Died: 1948

associated with Transvaal Museum of Natural History.

Phillip T. Robinson

Born: ? - Died: ?

Obtained his MS from the Michigan State University in 1970.

Paul Rode

Born: 1901 - Died: 1948

Paul Rode obtained his masters degree in 1925 and his doctors in 1929. In 1931, he became assistant at the department of Mammalogy and Ornithology of the Paris Museum. In 1946, he was appointed head of the newly created "Service National de Muséologie d'Histoire Naturelle".

See: Anonymus (1948). Nécrologie Paul Rode (1901 - 1948). - Mammalia, 12 (2): 51 - 53.

J. Rodhain

Born: ? - Died: ?

Osborn (1919: xvi) indicates that J. Rodhain was a member of the Commission on Sleeping Sickness (together with C. Pons, F. Vanden Branden, and J. Bequaert, 1910-1912).

Hermann Rolle

Born: ? - Died: ?

Naturalienhändler in Berlin (see NMW materia)

Dr. Jean Romieux

Born: 1893 - Died: 1951: Marseille, France

Jean Romieux was a Swiss-French geologist, who worked as a prospector in many parts of the world. He was a voluntary worker for the Geneva Museum and collected primarily insects.

In 1930-1931 he worked at the Tshinkolobwe uranium mine ("Haut Katanga", DRC).

see: Baldizzone, G. & H. Van der Wolf (2005). New species of Coleophora (Lepidoptera) from Katanga, Central Africa - Rev. suisse Zool., 112 (1): 65 - 82.

Kenneth (Kermit) Roosevelt

Born: 10 October 1889: Oyster Bay, New York, USA - Died: 4 June 1943: Alaska, USA

Son of president Theodore (Teddy) Roosevelt.

In 1913-1914, he went along with his father on what would become known as the Roosevelt-Rondon Scientific Expedition, exploring the Brazilian jungle with explorer Colonel Cândido Rondon

Corbet and Hill (1992): Brother of Theodore Roosevelt; accompanied him on the Asiatic Expedition of the Field Museum, 1928-29.

Theodore (Teddy) Roosevelt

Born: 27 October 1858: New York, New York, USA - Died: 6 January 1919: Oyster Bay, New York, USA

Theodore Roosevelt was the 26th president of the USA, from 1901 to 1908. He was also the first American to receive the Nobel Peace Prize.

After his presidency, he went on safari to Africa, followed in 1913 by a second safari to South America.

See: http://nl.wikipedia.org/wiki/Theodore_Roosevelt

Dr. Donovan Reginald Rosevear

Born: 28 November 1900: Chelsea, England, UK - Died: 1986

Donovan Reginald Rosevear was was educated at Bedford School and Christ's College, Cambridge, where he obtained a B.A. and a Diploma in Forestry. He joined the Colonial Forest Service in 1924, as an Assistant Conservator of Forests. In 1944, he was promoted to Conservator, in 1946 to Assistant Chief Conservator, and in 1950 to Chief Conservator. In 1951, he became Inspector General of Forests. After his retirement in 1954, Rosevear worked as an Honorary Associate at the Natural History Museum, preparing a series of monographs on the mammals of West Africa. He had wide-ranging interests in natural history, local history and ethnography, and was the author of 101 publications between 1931 and 1985.

Edward S.; Lorenzen, Kenneth Ross,

Born: ? - Died: ?

E.S. Ross and K. Lorenzen made collections of ants in several countries in 1966.

See: http://antbase.org/ants/africa/history1.htm

Francis Roux

Born: ? - Died: ?

Corbet and Hill (1992): French ornithologist.

Wilhem Peter Edward Simon Rüppell

Born: 20 November 1794: Frankfurt-am-Main, Germany - Died: 10 December 1884: Frankfurt-am-Main, Germany

Corbet and Hill (1992): German naturalist; travelled in NE Africa supported by the Senckenberg Museum, Frankfurt, 1821-34.

Dr. Jack Henry Sandground

Born: 1899: Johannesburg, South Africa - Died: 1976

U.S. parasitologist, immigrated from South Africa to the U.S. in the early 1920s.

Hermann Schlegel

Born: 1804 - Died: 17 January 1884

Corbet and Hill (1992): Curator of vertebrates, later (succeeding Temminck in 1858) second director of the Rijksmuseum van Natuurlijke Historie, Leiden, Netherlands.

Brian K. Schmidt

Born: ? - Died: ?

Brian Schmidt obtained his B.S. (Mathematics and Biology) at the University of Puget Sound (1991), and is museum specialist at the Ornithology department of the Smithsonian.

See: http://vertebrates.si.edu/birds/birds_staff_pages/BrianSchmidt_staffpage.cfm

Carl Gregory Schmitt

Born: ? - Died: ?

Anderson (1997: 135): Santa Fe, New Mexico; collected with D.C. Cole in 1978, 1979, and 1984 for AMNH

Waldo LaSalle Schmitt

Born: 1887: Washington, D.C., USA - Died: 5 August 1977

Waldo LaSalle Schmitt (1887–1977) was an American biologist, who received his Ph.D. from George Washington University in 1922. In 1948, he received an honorary Doctor of Science degree from the University of Southern California. Schmitt's primary

field of zoological investigation was carcinology, with special emphasis on the decapod crustaceans (crabs, lobsters, shrimp, and so on).

He was an Aide in Economic Botany for the United States Department of Agriculture (1907-1910), and appointed Scientific Aide in the Division of Marine Invertebrates of the United States National Museum. He also served on the staff of the United States Bureau of Fisheries as Scientific Assistant. He was naturalist aboard the Albatross (1911-1914).

He served as Assistant Curator at the United States National Museum as in the Division of Marine Invertebrates (1915-1920), and Curator (1920-1943), after which he became Head Curator of the Departmen of Biology (1943), and Head Curator of Zoology (1943-1957). He remained as Honorary Research Associate and continued his association with the Smithsonian Institution until his death on 5 August 1977.

Biological expeditions.:
1918 studying the life history of the spiny lobster at the Scripps Institution, La Jolla, California.
1924-1925, was at the Carnegie Institution's Marine Laboratory at Dry Tortugas, Florida, surveying the crustacean fauna of the area, identifying crustaceans found in the stomachs of fishes.
1925, awarded the Smithsonian's Walter Rathbone Bacon Traveling Scholarship "for the study of the fauna of countries other than the United States." The scholarship enabled him to collect marine invertebrates along the east coast of South America.
1927 Schmitt was aboard Fleurus at Deception Island
1933-1935, to the Galapagos Islands sponsored by G. Allan Hancock of Los Angeles, California.
1937, a guest of Huntington Hartford, he explored and collected in the West Indies on the Smithsonian-Hartford West Indies Expedition.
1938, accompanied President Franklin D. Roosevelt as naturalist on the Presidential Cruise to Clipperton Island, Cocos, and the Galapagos Islands.
1939, member of the Hancock South America Expedition and
1940 Biologist in charge of field operations on the first United States Fish and Wildlife Service Alaska king crab investigation.
1941-1942, on special detail with the United States Navy investigating the possibility of establishing a biological station in the Galapagos Islands.
1943, visited South America, under the auspices of the State Department, for the purpose of strengthening relations between United States and Latin American scientists.
1955, headed the Smithsonian-Bredin Belgian Congo Expedition.
1956-1960 led Bredin sponsored expeditions to the Caribbean (1956, 1958, 1959), the Society Islands (1957), and the Yucatan (1960).
1961-1962 Sponsored by a grant from the Office of Naval Research, Schmitt spent the summers of with Harry Pederson photographing the coral reef fauna of the Bahamas Islands.
1962-1963, his last expedition - member of the Survey of the United States Antarctic Research Program, the Staten Island cruise to Marguerite Bay and Weddell Sea

See: http://en.wikipedia.org/wiki/Waldo_L._Schmitt

Dr. Henri Schouteden

Born: 3 May 1881: Ixelles, Belgium - Died: 15 November 1972: Auderghem, Belgium

Henri Schouteden was professor at the Colonial University in Antwerp and at the Institute of Tropical Medicine. He was also director of the Royal Museum of Central Africa.

He obtained his PhD in 1905, and started working at the Natural History Museum in Brussels. In 1910, he transferred to the Natural History section of the Museum of Belgian Congo (Tervueren), where he became head of the department in 1919. He took part on two expeditions to the Belgian Congo: 1920-1922 (Mayombe, Équateur, Bas-Congo, Kasaï) and 1924-1925 (Uele, Ituri, Nord-Kivu, Sud-Kivu and Katanga). In 1927, he became director of the museum, a function which he kept until 1947.

See: https://nl.wikipedia.org/wiki/Henri_Schouteden

Karl J. Schuster

Born: ? - Died: ?

Anderson (1997: 135): with AMNH-MSB party in September and October 1986 (field numbers 85-109) (Bolivia).

Georg Schweinfurth

Born: 1836: Riga - Died: 1925: Berlin, Germany

Georg Schweinfurth did his university studies in Munich and Berlin around 1857. He obtained his PhD in 1862 at the university of Heidelberg. Between 1863 and 1866, he made a journey to Egypt, the Nile basin, the western coast of the Red Sea, Nubia and eastern Sudan, and resided in Cairo. He went on with his explorations and botanical collections. President-founder of the Khedival Geographical Society (1874 - 1888). Between 1891 and 1914, he made several study voyages (Egypt, northern Africa), and subsequently to Egypt, Bahr-el-Ghazal, through the Mangbetu country, from Zande to Uele (around Niangara), then returned to the Upper Nile and the Golo country (west of Bahr-el-Ghazal). He made his botanical, geographical, ethnographical collections from the centre of the African continent and the Upper Nile (1868 - 1871).

Osborn (1919: xv) places him in Congo in 1870.

See: Van Schuylenbergh (1997: 86)

William Lutley Sclater

Born: 1863 - Died: 1944

Son of Philip Lutley Sclater.

R.H.; Williams, A. Seed

Born: ? - Died: ?

Captain Guy Chester Shortridge

Born: 1880 - Died: 1949

Corbet and Hill (1992): Collected for the British Museum (Natural History) in Java and later for the Indian Mammal Survey; later director of the Kaffrarian Museum, King William's Town, South Africa, 1921-49.

Terence Michael Shortt

Born: 1 March 1911: Winnipeg, Canada - Died: 28 December 1986: Toronto, Canada

T.M. Shortt joined the Royal Ontario Museum, Toronto, in 1930, where his career spanned 46 years, during which he played an important role in the advancement of ornithology in field research and as an artist of exceptional insight. In 1948, he became head of Biology Display. Shortt led many expeditions to places such as Galapagos, India and East Africa, collecting materials for the world-class dioramas which he created for the museum.

See: http://www.thecanadianencyclopedia.com/articles/terence-michael-shortt

Sintenis

Born: ? - Died: ?

Rev. Henry H. Slater

Born: 1851 - Died: 26 November 1934: Bishop's Lydeard

Slater obtained a scholarship at St. Catherine's College, Cambridge, in 1870, and graduated in Natural Science three years later. In 1874 he visited Rodriguez as naturalist to the expedition to view the Transit of Venus, and was commissioned by the Royal Society to explore for and bring back remains of the Solitaire. In this he was successful, and the report on the collection was made by Sir Edward Newton and J. W. Clark (Phil. Trans. clxviii. pp. 448 - 451). For several years he was interested in Oriental birds, and worked on collections sent home from China by Reid, La Touche, Mr. Rickett, and others, and his reports are found in Isis issues from 1882 to 1897; from these collections he described several new birds. He visited Iceland on three occasions, and his little book on the "Birds of Iceland" (1901) was at one time a standard work, and he frequently contributed to the ' Zoologist.' Slater joined the Union in 1882 and resigned in 1906. He had a wide knowledge of Natural History and was a first-rate botanist. He was responsible for the article on the Birds of Northamptonshire in the "Victoria County History," in which county he at one time resided. Of later years he came to reside in Somerset, and deserted Ornithology for Lepidoptera, specializing in microlepidoptera and organizing the Entomological section of the Somersetshire Archaeological and Natural History Society

Chris Smeenk

Born: 6 July 1942: Oost- en West-Souburg,The Netherlands - Died: 23 March 2017

In 1961, Chris Smeenk started his biology study at the university of Utrecht and later in Leiden.

From 1970 to 1973, he studied the ecological relations between five birds of prey species in the Tsavo National Park in Kenya. Between 1974 and 1976, he was wild manager at the Pandam Wildlife Park in Nigeria, and in 1976 he was appointed curator of mammals at the RMNH, Leiden.

(See: Broekhuizen et al., 2017 - Lutra, 60 (1): 43 - 54.)

Sir Andrew Smith

Born: 3 December 1797: Heronhall, Kirkton, Scotland - Died: 12 August 1872: London, UK.

Andrew Smith attended his primary education at parish schools in Stobs, Minto and Lilliesleaf (Scotland), and later on in Edinburgh (1812-1813). In 1815, he went to London to enter the Medical Department of the Army, as the youngest officer ever admitted to the Department. On 2 August 1819, he graduated at M.D.

In 1821, he was ordered to the Cape, where he remained until 1837, attached to the 49th and 98th Regiments and the Cape Mounted Rifle Corps. Time and again, Smith was released from his official duties in order to carry out scientific investigations or to act as the agent of the Governors of the Cape in confidential missions to native tribes. E.g. in 1824, he was sent on a mission to Kafferland to interview the Xhosa Chief, Gaika. In 1825, he travelled to Namaland, In 1828, he was ordered to the Orange River to visit the Bushmen. In 1830, he was sent to Port Natal, to treat with Dingaan.

On 10 June 1825, Andrew Smith established he first museum of South Africa (the South African Museum), and became its first director.

In 1833, he was one of the driving forces behind the formation of the "Association for the Exploration of Central South Africa", which resulted in an expedition (led by him) in 1834 travelling from the Cape over Graaff Reinet to Kuruman and the Tropic of Capricorn. The expedition returned to the Cape in 1836. A year later, he was called back to England, where he was promoted to Surgeon and was stationed at Fort Pitt Hospital, Chatham.

In 1841, he was promoted to Staff Surgeon of the first class and principal Medical Officer at Chatham. In 1845, he transferred to London, where he became profession assistant to the Director General, Sir James McGrigor. In 1851, the Duke of Wellington promoted him to Superintendent Inspector General, and in 1853, he was appointed Director General. During the Crimean War in 1854, he was the target of Florence Nightingale's denounciations against the Army Medical Department, which he overcame with flying colours.

In 1858, he resigned his post due to ill-health, and devoted himself to his African studies, which he never published. After the death of his wife (1864) and his sister (1865), he gave up this study and started studying the Holy Scriptures.

During his zoology carreer, he was the first author of 76 generic names (67 available, 9 unavailable) and 558 specific names (460 available and 98 unavailable). At least 257 specific names are still in current use for mammals, birds, reptiles, amphibians and fishes.

See: Kirby (1942), Rookmaaker (2016).

Reay Henry Noble Smithers

Born: 1907 - Died: 1987

Former director of the National Museums of Zimbabwe.

H. Soyaux

Born: ? - Died: ?

Osborn (1919: xv) indicates that H. Soyaux took part in the German Loango Expedition (together with P. Güssfeldt, E. Pechuel-Loesche, and Bastian, 1873 - 1876).

Kenneth E. Stager

Born: ? - Died: ?

Anderson (1997: 135): collected with Bromley in 1957 for LACM (Bolivia).

Dr. Louis Stappers

Born: 2 May 1883: Hasselt, Limburg, Belgium - Died: 30 December 1916: Calais, France

Osborn (1919: xvi) places L. Stappers in Congo in 1911 - 1912.

Louis Stappers did his universitary studies at the university of Louvain where he obtained his PhD and MD. In 1907, he took part in the "Belgica" expedition to the South Pole. In 1911, he was charged with a scientific mission to Belgian Congo by the minister of Colonies. During the two years of this mission, he studied the waters of Lakes Moero and Tanganyika.

Franz Steindachner

Born: 1834 - Died: 1919

Beltz (2004: http://ebeltz.net/herps/biogappx.html):
Prominent ichthyologist and herpetologist.
Founded a school of herpetologists in Vienna.
1860 Joined staff of Naturhistorisches Museum.
Published many papers on reptiles and amphibians.
Collected in Africa, Brazil, Galapagos Islands and Southwestern Asia.

Dr. Thomas T. Struhsaker

Born: 1938 - Died: ?

Tom Struhsaker received his Ph.D. in Zoology in 1965 from the University of California at Berkeley.

Tom set off to study vervets (*Cercopithecus aethiops*) in East Africa in 1962. Later on, he worked in Cameroon, where he undertook one of the first studies on multispecific forest primate communities, and in 1970, he went to Kibale Forest in Uganda,

He is currently adjunct professor in evolutionary anthropology at Duke University.

See: Box, H., Butynski, T.M., Chapman, C.A., Lwanga, J.S., Oates, J.F., Olupot, W., Rudran, R. and Waser, P.M. (2008). Thomas T. Struhsaker: Recipient of the Lifetime Achievement Award of the International Primatological Society 2006 - Int J Primatol, 29: 13 - 18.

Dr. Franz Ludwig Stuhlmann

Born: 1863 - Died: ?

Osborn (1919: xv) places Fr. Stuhlmann and Emin Pasha in Congo in 1890 - 1891.

G.H. Swynnerton

Born: ? - Died: ?

Chief Game Warden of Tanganyika, and later the Director of the TseTse research.

R.E. Symons

Born: ? - Died: ?

Dr. Steve Takata

Born: ? - Died: ?

Steve Takata obtained his Ph.D. in 2002 at the University of California, at Berkeley.

George Henry Hamilton Tate

Born: 1894: London, England - Died: 24 December 1953

Corbet and Hill (1992): Assistant then Curator of Mammalogy, American Museum of Natural History, New York 1921 (1945)-1953.
Anderson (1997: 136): AMNH; collected in department of La Paz in 1926; field notes at AMNH; catalog numbers 72550-72850, 72851-73099, 73700, 74153-74154; itinerary summarized by Boom (1981) (Bolivia).
Dorst (1954: 222) indicated that Tate visited Ecuador, Bolivia, Brazil, Venezuela, and British Guyana, before traveling through Africa: Côte d'Ivoire, Cameroon, and Liberia. He also was a member of the Archbold Expedition to New Guinea and the northern part of Australia.

Dr. Ian Tattersall

Born: 1945: England - Died: ?

Ian Tattersall is a paleoanthropologist and a curator of anthropology at the American Museum of Natural History. Tattersall received his PhD from Yale University in 1971. In addition to human evolution, he has worked extensively with lemurs. He is working with The Templeton Foundation.

He maintains an active interest in the systematics, ecology, and conservation of the lemurs of Madagascar, and is collecting material to update his classic book The Primates of Madagascar, originally published in 1982. In addition to Madagascar, he has conducted fieldwork in the Comoro Islands, Mauritius, Borneo, Nigeria, Niger, Sudan, Yemen, Vietnam, Surinam, French Guiana, Reunion, and the United States.

See: http://www.amnh.org/science/divisions/anthro/bio.php?scientist=tattersall

Edward Harrison Taylor

Born: 23 April 1889: Maysville, MO - Died: 1978

Corbet and Hill (1992): American zoologist, mainly working in herpetology; resident in the Philippines 1912-24, subsequently at University of Kansas, Lawrence.

Beltz (2004: http://ebeltz.net/herps/biogappx.html):
c1894 An early trip with his mother to CO awakened his interest in traveling.
1908 Entered U KS, Lawrence in the class of 1912.
1909 Contracted malaria while on a field trip in southeastern KS.
1910 Explored central KS with a U KS Museum of Natural History ìpaleontological group.
1912-1916 Graduated U KS (AB), passed civil service exam for service in the Philippines. Sent there via San Francisco, Hawaii and Nagasaki, Japan.
Accepted a teaching post in a remote village in central Mindano. He collected thoroughly in the area around the school and its fields. Assigned supervisor of teachers in the western part of the island of Negros, in the Visayan group. Climbed Canlaon, the local 8,000 foot volcano.
1915-1928 Published 19 papers on the herpetology of the Philippine Islands.
1916-1920 Returned to U KS, Lawrence for summer school to finish MA. Married Hazel Clark. They returned to the Philippines through San Francisco, Hawaii, Tokyo and Kyoto before reaching Manila.
Appointed Chief of Fisheries working out of offices in the Bureau of Science in Manila.
Travelled widely in the islands on geological and mineralogical surveys. Studied the fish and reptiles wherever the surveys stopped.
c1918 Spent 1 to 2 years, in government service, in Siberia.
1920 Returned to the US for a vacation, but went back to the Philippines as head of the Zoology Department, lived in Manila.
1927 Head Department Zoology, U KS, Lawrence.
1928-1934 Associate Professor Zoology, U KS, Lawrence.
1929-1936 Researched the relationships of the genus *Eumeces* culminating in the publication of a taxonomic and distribution study in 1936.
1932-1933 Gave 10 successful radio talks about herpetology and his travels.
1935 VP, American Society Ichthyologists and Herpetologists.
1937-1948 Explored Mexico with students and coworkers in a series of marginally reliable vehicles, collecting at every planned and unplanned stop.
1945-1946 Worked for the government in Indonesia and southeast Asia during WWII.
1945 Wrote "An annotated checklist and key to the snakes of Mexico" with H. Smith.
1947 Published a new species of *Typhlops* found in Ceylon.
1949-1956 Travelled in Costa Rica, collecting and observing.
1957-1964 Collected reptiles and amphibians in Thailand.
1965+ Began his researches on caecilians after discovering a new species on a tiny island in the Sea of Celebes, Brazil.
1968 Published a taxonomic review of the caecilians of the world.
His collections are at the Museum of Comparative Zoology (Harvard), The Field Museum of Natural History (Chicago) and the Museum of Natural History at U of IL in Urbana. His library is housed at the U KS library. His personal publications total 9,295 pages. His Philippine collections are at the Carnegie Museum, Pittsburg, PA.

Dr. György Topál

Born: 1931 - Died: 14 February 2016

György Topal was curator of the collection of mammals of the Natural Science Museum in Budapest, which he joined shortly after WW II.

Between 1966 and 1967 he spent more than a year in India with the Indian-Hungarian Cultural Exchange Program, and in 1966 and 1971, he conducted expedition to North Vietnam.

See: Hanák *et al.* (2016).

Melvin ("Mel") Alvah Traylor, Jr.

Born: 1915 - Died: 11 February 2008

Mel Traylor, curator emeritus at the Field Museum, died at home over the weekend, at the age of 92 . Mel may be best known for his collaboration with the late Raymond Paynter on the series of gazetteers for South American countries, works that now form an important backbone for many of our distributional and taxonomic studies, and for which Traylor and Paynter were awarded the Elliot Coues Award by the American Ornithologists' Union in 2001. But Mel published extensively over his career, not only on birds of the neotropics but also on birds of Africa (including authoring a major monograph on the birds of Angola), of China, of Nepal, and of many other parts of the world. He hated to see a worthwhile project that was left incomplete, and he was not afraid of tough challenges; it was no surprise that Mel was chosen to revise the tyrannid chapter for the Peters checklist series, a task that he completed successfully and that led to many productive side papers on tyrant flycatcher taxonomy. Mel described a number of bird taxa, including at least one species (*Cisticola restricta*, of Africa); and at least one species, *Tolmomyias traylori*, was named in his honor. Mel was a careful worker in the museum, with a keen eye for detail, but also was cautious in interpreting his results. The collections at the Field Museum contain several specimens that Mel recognized "didn't fit," but in the absence of additional material, he refrained from describing them; his instincts were borne about when the specimens that Mel "flagged" later were described by others as new species, including at least two specimens of "his" *Tolmomyias* (!).

As a Marine Corp officer, Mel was severely injured during the battle of Tarawa in the Pacific theatre during World War II, where he lost one eye and suffered arm and upper body wounds during the famous beach assault. He returned to Chicago and resumed his volunteer participation in the affairs of the Field Museum's bird division, where he later became employed as a curator along with Austin Rand and Emmet (Bob) Blake. During the last few years of his employment he served as Chairman of the Zoology Department, and was as gracious and helpful an administrator as he always was a colleague and friend.

Mel continued to visit the Field Museum for many years after he retired, until this was no longer practical. He always was interested in the work of his younger colleagues, and did his best to keep up with advances in the field. His deep curiosity about the world around him, his good humor, and his gentle spirit were a source of pleasure and inspiration to all who knew him.

Richard George Van Gelder

Born: 1928 - Died: 1994

Anderson (1997: 136): curator at AMNH, New York; 19 April to 11 June 1965, field numbers 1552-1755; organized expeditions to Beni (Bolivia) in 1964 and 1965 with support from grant no. DA-MD-49-193-63-G82, U.S. Army Medical Research and Development Command.

Van Iseghem

Born: ? - Died: ?

Prof. Dr. Gregorius Johannes Van Oordt

Born: 19 March 1892: Arnhem, The Netherlands - Died: 22 April 1963: Bilthoven, The Netherlands

G.J. Van Oordt promoted on 18 February 1921. He was lector (later full professor) in Zoology professor at the university of Utrecht, The Netherlands, from 1934 to 1 September 1962.

See: https://profs.library.uu.nl/index.php/profrec/getprofdata/1524/21/62/0

Dr. R. Van Saceghem

Born: 1884 - Died: 1965

R. Van Saceghem was a Belgian vet in Congo who became reputed for his discovery of *Dermatophilus congolensis*, the etiological agent of an important skin disease of livestock, did several treatment and immunisation trials.

Edgar Verdick

Born: 1868: Brussels, Belgium - Died: 1827: Brussels, Belgium

Edgar Verdick was enlisted in the carabineers regiment in 1883. He was promoted to sergeant-quartermaster in 1889. Around 1911, he was involved in various colonial affairs. Non-commissioned officer in the public forces at the Lusambo (Sankuru) camp. He was part of the "Le Marine" expedition to Katanga (met Msiri) and organised with Legat the military post at Lofoi, where he led an expedition to Lake Moero (1890 - 1895). He was promoted to captain of the public forces at the post at Lofoi, and later on to commander of the post (expedition with Van Bredael on the banks of the Luembe, met the scientific mission of commander Lemaire at Lofoi), transferred later on to Lukafu (1896 - 1901). Zone chief first class (Maniema-Tanganyika); reorganised the public forces in Maniema and led an expedition to Lake Dilolo (1902 - 1906). Assistant-superior at Stanleyville (1907 - 1911).

09/02/1898 - 19/04/1898: reconnaissance trips to the Lofoi-Lake Moero-valley Lubule-mountains Kibara area.
04/08/1898 - 18/09/1898: trips to the frontiers of the extreme southern valleys of Lufira-Luapula and Kafuni.
08/03/1899 - 29/05/1899: Mulumu-Niama affaire.
09/08/1900 - 29/12/1900: return to Katanga, from Lukafu, via Lake Moero and Tanganyika.
16/04/1903 - 29/07/1903: expedition to Lake Dilolo from Lusambo with Ch. Questiaux, director of the Compagnie de Kasai.
April - June 1903: journey from Lusambo to mount Lupunga

See: Van Schuylenbergh (1997: 111)

Arthur S. Vernay

Born: ? - Died: ?

Corbet and Hill (1992): Trustee of the American Museum of Natural History, who sponsored and participated in an expedition to NE Burma 1938-39.

The Vernay-Lang Kalahari Expedition 1930

Born: ? - Died: ?

This expedition took place between March and September 1930.

Other members of this expedition (besides Herbert Lang and Arthur S. Vernay) were: Austin Roberts, Mr. Aebischer, Captain Beeching, Mr. Noomé, Mr. Robertson, Mr. Marnewick, Mr. Van Son, Mr. Vlok, Mr. Engelbrecht, Mr. Legge, Mr. FitzSimons (Roberts, 1935).

Jules Pierre Verreaux

Born: 24 August 1807 - Died: 7 September 1873

Jules Pierre Verreaux was a French botanist ornithologist and professional collector of, and trader in, natural history specimens. He was the brother of Jean Baptiste Edouard Verreaux (1810 - 1868), and Joseph Alexis (? - 1868). and nephew of Pierre Antoine Delalande.

Verreaux worked for his family business, Maison Verreaux, established in 1803 by his father, Jacques Philippe Verreaux, at Place des Vosges in Paris, which was the earliest known company that dealt with objects of natural history. The company funded collection expeditions to various parts of the world. Maison Verreaux was an emporium and dealership in natural history specimens which had, as a frequent client, the Muséum National d'Histoire Naturelle to add to its collections.

In 1819 (age 12), he accompanied his uncle, Delalande, to Cape of Good Hope; remaining 2 years. He then returned to Paris, where he studied at the Paris Museum under G. Cuvier & I. Geoffroy Saint-Hilaire. In 1825, he returned to Cape of Good Hope for another 5 years, some of which he spend helping Andrew Smith, amongst others by founding the South African Museum in Cape Town in 1825.

In 1832 he again summoned his brother Edouard to join him, to help handle specimens. In 1837, he completed travels to Cochin-China and Philippines.

Verreaux travelled to New Holland (Australia) and Tasmania in 1842 to collect plants. He returned to France in 1851 with a natural history collection reported to contain 15,000 items. In 1864 he took over from Florent Prévost as assistant naturalist at the Paris Museum.

Colonel Leslie Desmond Edward Foster Vesey-FitzGerald

Born: c 1910 - Died: 1974

Vesey-Fitzgerald collected between 1943 and 1968 in Western Asia: Kuwait, Oman, Saudi Arabia; Tropical Africa: Tanzania, Zambia; Southern Africa: South Africa; Mascarenes: Seychelles; West Indies: Trinidad and Tobago.

Associates: Fitzgerald, D.V. (synonym), Gilbert, V.C. (fl.1966-1968), Phipps, J.B. (1934-), Richards, M.A.E. (1885-1977), Sharp, A.J. (1904-1997), Sharp, E. (fl.1935-1968).

See: http://plants.jstor.org/person/bm000042502

Jacques Marie Edme Vielliard

Born: 1944 - Died: 9 August 2010: Belém, Pará, Brazil

(1967), with a Masters in Ecology and the École Normale Supérieure (Paris, 1968) and obtained a Ph.D. in ecology from the École Normale Supérieure - ENS (Paris, 1971).

John Visser

Born: ? - Died: ?

South African (Namibian?) herpetologist.

C. Vleeschouwers

Born: 1925? - Died: 1956?

C. Vleeschouwers spent at least two decades in the Belgina Congo, where he appears to have concentrated on ichthyology and collected a number of different fish species in the early 1940s from the River Luie in the Kwango region, and these fish were also described by Poll, who was working in the Congo in the same period. Vleeschouwers was a member of the colonial administration with responsibilities encompassing local hunting and related matters. In 1953 he commented on the growth in the use by local peoples of automatic firearms, and in 1956 he published, in the Congo's Agricultural Bulletin, a paper entitles "Contributions à l'étude cynégétique du District du Kwango" (Contribution to the study of hunting in the Kwango district).

see Beolens et al.

Prof. Dr. Alfred Voeltzkow

Born: 1860 - Died: 1947

Alfred Voeltzkow was a German traveller and zoologist who spent many years in East Africa. Between 1889 and 1895 he traveled in Zanzibar and Pemba. In 1903 and 1906 he was in the Comoro Islands, and at some stage he visited the islands of Grand Comore (late 1903), Anjouan (late 1903), and Aldabra. His East African collection is in the Natural History Museum in Vienna.

This material includes the holotype of *Rousettus obliviosus*.

See Beolens et al., (R):

Baron Karl Klaus von der Decken

Born: 8 August 1833: Kotzen, Brandenburg, Germany - Died: 2 October 1865: near Bardera, Somalia

After his military career, Baron von der Decken explored Eastern Africa, where his first expedition in May 1860 led him into the region of lake Malawi (only one year after David Livingstone). In 1861, together with the English geologist Richard Thornton, he reached mount Kilimanjaro, and in 1862 he was the first European (together with the German explorer and chemist Otto Kersten) to try to reach the top of the mountain, but only got as high as 4,200 m (of the 5,895), when snow forced him to surrender. He then explored the area around the foot the mountain. Later on, he organized a large expedition along the Tana river in Kenya.

In 1863, von der Decken visited Madagascar and the Mascarene islands.

During his last expedition to Somalia in 1865, he traveled along the Juba river up to Bardera where he was killed in a battle with local Somali tribesmen.

Keith M. Waddell

Born: ? - Died: ?

Keith Waddell is an ophthalmologist working for the Uganda Eye Project.

Johann Andreas Wagner

Born: 1797 - Died: 1861

Corbet and Hill (1992): German zoologist.

Henry Augustus Ward

Born: 1834: Rochester, New York, USA - Died: 4 July 1906: Buffalo, New York, USA

Henry Augustus. Ward was an American naturalist and geologist, who after attending Williams College and the Lawrence Scientific School, Harvard (where he was an assistant of Louis Agassiz), traveled in Egypt, Arabia, and Palestine, and studied at the Jardin des Plantes, the Sorbonne, and the School of Mines in Paris, and at the universities of Munich and Freiberg. Subsequently, he traveled in West Africa and the West Indies, collecting natural history specimens.

In 1860, he returned to Rochester where he was professor at the University of Rochester until 1865. In Rochester, he founded Ward's Natural Science, a pioneer enterprise of its kind, which collected specimens from all parts of the world, which were then mounted and sold to colleges and museums.

Stephen L. Williams

Born: 1948: Midland, Texas, U.S.A. - Died: ?

Stephen Williams received his B.S. in Zoology from the Texas Tech University in 1970, his M.S. in Zoology in 1973. In 1975, he became Collection Data Analyst at the Museum of Texas Tech University and in 1976 Collection Manager at the section of Mammals at the Carnegie Museum of Natural History, a position in which he served until 1990, when he returned to the Texas Tech University as Collections Manager and Adjunct Professor of Museum Sciences. In 1995, he became Assitant Professor of Museum Studies at Baylor University. In 1999, he received his Ph.D in Conservation from the Goteborg University in Sweden (see Bradley *et al.*, 2005: 16 - 17).

Don Ellis Wilson

Born: 1942 - Died: ?

Anderson (1997: 137): U.S. Fish and Wildlife Service; visited the EBB (Bolivia) in 1986 (field numbers 7185-7266).

J. Olaf Wirminghaus

Born: ? - Died: ?

South African ornithologist.

Dr. Simeon Burt Wolbach

Born: 1880: Grand Island, Nebraska, USA - Died: 1954

Simeon Burt Wolbach attended Harvard Medical School (M.D., 1903), studying pathology under Councilman and Mallory. After medical school, he worked as director of the Bender Hygienic Laboratory in Albany, NY; pathologist at the Montreal General Hospital and teacher at McGill Medical School. In 1910, he returned to Harvard as an assitant professor of bacteriology. He was promoted to associate professor in 1914. In 1916, he was jointly appointed to the Departments of Bacteriology and Pathology. In 1917, he was pathologist to the Peter Bent Brigham Hospital and the Boston Lying-In Hospital. In 1922, he was appointed the Shattuck professor of pathology at Harvard. He held this position for 25 years. In 1947, he became the director of the Division of Nutritional Research at Children's Hospital in Boston. He held this position until his death in 1954.

Wolbach's interests ranged from the effects of radiation to tropical medicine and infectious diseases. His work on radiation began with Porter in 1907. Later in life, he served as a consultant to the US Atomic Energy Commission (1951-1953). He did field research in Nigeria in 1911 related to the pathology of general paresis. Best known of his work on infectious diseases are his contributions to the understanding rickettsial illnesses, Rocky Mountain spotted fever (1919), and epidemic typhus in Poland (1920). Wolbach's most fundamental work was in the field of vitamin research, and the relationships of vitamins to tissue structure and the pathology of scurvy and other diseases.

Frederic Wood Jones

Born: 23 January 1879; Hackney, London, England, U.K. - Died: 29 September 1954; London, England, U.K.

Frederic Wood Jones was a British observational naturalist, embryologist, anatomist and anthropologist, who spent considerable time in Australia. He taught anatomy and physical anthropology at London School of Medicine for Women, University of Adelaide (chair of anatomy, 1920), University of Hawaii, University of Melbourne, University of Manchester and the Royal College of Surgeons of England.

In 1897 he entered the London Hospital Medical College which in 1900 became part of the University of London where he graduated (B.Sc., 1903; M.B., B.S., 1904; D.Sc., 1910). In 1904 he became a member of the Royal College of Surgeons; he was made a fellow in 1930.

From 1905 to 1906 he was posted as medical officer to the Eastern Extension Telegraph Co. on the Cocos-Keeling Islands.

He obeyed a summons from (Sir) Grafton Elliot Smith, professor of anatomy, Cairo, to join the archaeological survey of Nubia (1907 - 1908), made urgent because the raising in height of the Aswan Dam would soon flood important sites

See: https://en.wikipedia.org/wiki/Frederic_Wood_Jones, http://adb.anu.edu.au/biography/jones-frederic-wood-6872

Mr. R.B. Woosnam

Born: ? - Died: ?

Osborn (1919: xvi) places R.B. Woosnam and A.G.F. Wollaston in Congo in 1906.

Dr. Frederik Roelker Wulsin

Born: 8 July 1891 - Died: 26 February 1961

Frederick Wulsin obtained his PhD from Harvard in 1929.

During his career, he joined Zoological expeditions in East Africa, Madagascar , 1914; China, Mongolia, Kokonor, Indo-China 1921-1924, and made Archaeological travels to Belgian Congo, French Equatorial Africa, 1927-1928; Persia, 1930-1931. From 1926 to 1927 he was tutor in anthropology af Harvard, and between 1935 and 1936 lecturer in anthropology at the Boston University. In 1945, he became lecturere in sociology and anthropology at Tuffs College (now Tuffs University), to become professor in 1947, a position he held to his retirement in 1957.

See: http://oasis.lib.harvard.edu/oasis/deliver/~pea00050

dr. Hans Zerny

Born: 11 June 1887: Vienna, Austria - Died: 14 September 1945: Vienna, Austria

Hans Zerny was an Austrian entomologist best known for his studies of Lepidoptera. He studied zoology at the University of Vienna, where he obtained his PhD in 1911. Afterwards, he began work at the Naturhistorisches Museum in Vienna, serving as an adjunct-curator from 1920 and as curator-first class from 1928 onward.

He undertook numerous scientific trips throughout Eastern Europe and North Africa. In 1927, he spent 28 weeks on an excursion to the lower Amazon region. From his expeditions, a number of new entomological species have been identified. Also, he is credited with conducting significant research involving South East Asian Noctuidae and members of Neotropical Syntomidae.

Travels:
1909 (1 week): Trieste and Istria - (4 weeks) Küstenland (with Dr. Maidl)
1911 (2 weeks): Küstenland (with Dr. Maidl)
1912 (3 weeks): Dalmatia (with Dr. Maidl)
1913 (4 weeks): Upper Italy and Tirol (with Dr. Maidl)
1914 (1 week): Trieste and Istria
1915 (3 weeks): Mühlviertel - Nürnberg - Passau -Linz (with Dr. Ebner).
1916 (3 weeks): Salzburg
1917 (2 weeks): Slovenia
1918 (12 weeks): Albania
1919 (3 weeks): Tirol - Vorarlberg - (2 weeks): Prague
1920 (4 weeks); Carinthia - Osttirol
1921 (7 weeks): Sizilia (with Fritz Wagner) - (2 weeks): Carinthia (with Dr. Ebner)
1922 (4 weeks): Tirol - Vorarlberg (with Dr. Ebner)
1923 (5 weeks): Dalmatia (with Fritz Wagner) - (2 weeks): Germany (with Fritz Wagner)
1924 (7 weeks): Aragon
1925 (8 weeks): Southern Andalusia (with Predota) - (1 week): Züricher Entomologists congres
1926 (3 weeks): Dalmatia - (1 week): southern Burgenland and Oststeiermark (with Mr. and Mrs. Dr. Ginzberger)
1927 (28 weeks): Brasilia, lower Amazon area (with Mr. and Mrs. Dr. Ginzberger)
1928 (5 weeks): Tirol
1929 (1 week): Budapest - Csepel - Soroksar - Törökbalint - (4 weeks): Bosnia-Herzegovina - Montenegro - Dalmatia - (7 weeks): Southern Algeria (with Schwingenschuß)
1930 (2 weeks): Dalmatia - (3 weeks): Bulgaria
1931 (10 weeks): Lebanon (with Schwingenschuß)
1932 (1 week): München (with Dr. Wettstein) - (3 weeks): Vogesen and Paris congres (with Heikertinger)
1933 (7 weeks): Morocco, Higher Atlas (with Schwingenschuß)
1934 (4 weeks): Kroatia
1935/36 (40 weeks): East Africa followed by sailing around Afrida
1937 (3 weeks): Northern Italy - Südtirol (with Dr. Ebner and Schwingenschuß)
1938 (4 weeks): Portugal (with Dr. Ebner) - (1 week): Berlin - München - Entomologists congres
1939 (4 weeks): Tirol

1940 (3 weeks): Lungau
1941 (3 weeks): Carinthia
1942 (4 weeks): Slovenia

George R. Zug

Born: ? - Died: ?

George Zug is curator emeritus of the herpetology department of the Smithsonian.

He obtained his B.S. (1960) from Albright College, his M.S. (1963) from the University of Florida, and his Ph.D. (1968) from the University of Michigan.

See: http://vertebrates.si.edu/herps/herps_staff_pages/zug-staff.cfm

Appendix 5: Keys from the Literature

This appendix contains an overview of the keys on African Chiroptera found in various publications. The keys are presented in a chronological order and within the same year alphabetical per author.
The keys do not include the drawings or figures being references. For this, we refer to the original publication.
If the identifications in the keys are not equal to the ones used in the current publication, the current name is also mentioned in BLUE.
Some notes in GREEN refer to identifications found in error by other publications. The most recent published name for this taxon is given in ORANGE. If the identification has been modified, this modified name has been used to link it with the name used in the present publication.
Unfortunately, however, not all identifications in the keys have been checked on their correctness.

Appendix 5a: Dobson (1877). A Monograph of the Group Molossi.

1	a	First toe much larger and thicker than the other toes and separable from them; ears quite separate. Premaxillary bones united; upper incisors very strong, close together in front (genus *Cheiromeles*). ..... *Cheiromeles torquatus*
	b	First and fifth toes much thicker than the other toes; ears united or close together by their inner margins. 2
2	a	Premaxillary bones united; upper incisors close together in front (genus *Molossus*). 3
	b	Premaxillary bones separate or united by cartilage only; upper incisors separate in front (genus *Nyctinomus*). 13
3	a	Ears more or less united. 4
	b	Ears distinctly separate; upper incisors with diverging summits, their bases removed from the canines by a diastema (subgenus *Myopterus* Geoffr). 5
4	a	Premolars 2-2/2-2; upper incisors with diverging summits, and with their broad bases close to the canines (subgenus *Promops* Gervais). 5
	b	Premolars 1-1/2-2; upper incisors parallel by their inner margins, their bases close to the canines (subgenus *Molossus* (Geoffr.), Peters). 5
5	a	Muzzle obtuse, rounded in front; lips smooth, not wrinkled; tragus triangular or linear. 6
	b	Muzzle very obliquely truncate, its superior and external front margins formed by the sharply cut cartilaginous rim of the nostrils, lips smooth or very slightly wrinkled; tragus quadrate; inc. 2/4, pm. 2-2/2-2. 11
6	a	Antitragus circular, as high as long. 7
	b	Antitragus half-oval or half-cordate, longer than high, tragus linear ; inc. 2/4, pm. 2-2/2-2. ..... *Molossus (Promops) abrasus*
7	a	Tragus triangular with a broad base; inner margins of the ears arising by separate points of origin; inc. 2/1, pm. 1-1/2-2. 8
	b	Tragus linear, subacutely pointed, inner margins of the ears arising from the same point or very close together. 10
8	a	Ears obtusely pointed, forearm 1"2. ..... *Molossus (Myopterus) temminckii*
	b	Ears rounded above. 9
9	a	Centre of breast and abdomen white; forearm 1"35. *Molossus (Myopterus) planirostris*
	b	Centre of breast and abdomen not different from sides; forearm 1"7. ..... *Molossus (Myopterus) brachymeles*
10	a	Inc. 2/2, pm. 1-1/2-2. ..... *Molossus (Molossus) rufus*
	b	Inc. 2/4, pm. 2-2/2-2. ..... *Molossus (Promops) nasutus*
11	a	Ears longer than the head; gular sac large; first upper premolar external. ... *Molossus (Promops) perotis*
	b	Ears shorter than the head, gular sac small; first upper premolar in the tooth-row. 12
12	a	Upper lip smooth; forearm 2"3. ..... *Molossus (Promops) glaucinus*
	b	Upper lip slightly wrinkled; forearm 1"8. ..... *Molossus (Promops) bonariensis*
13	a	Ears very close or united together; upper lip deeply grooved by vertical wrinkles; premolars 2-2/2-2 (subgenus *Nyctinomus* (Geoffr.), Pet). 14
	b	Ears distinctly separate; upper lip slightly wrinkled; premolars 1-1/2-2 (subgenus *Mormopterus* Peters). 14
14	a	Premolars 2-2/2-2. 15

b Premolars 1-1/2-2. Antitragus separated by a very shallow notch, lower incisors 6. Muzzle flat or rounded off above; upper lip with ill-defined vertical wrinkles. Ears separate, tragus triangular, rounded off above. 32

15 a Integument of the ears thick, opaque; keel of the ear-conch thickened in lower third; antitragus separated by a deep notch. 16

b Integument of the ears thin, translucent; keel of the ear-conch slender, deep, bent backwards on itself. 27

16 a Lips smooth: inner margins of the ears arising from the muzzle by distinct points of origin; tragus broad, rounded off above. Antitragus irregularly quadrate; lower incisors 4. ..... *Nyctinomus (Nyctinomus) africanus*
African Chiroptera name ..... *Tadarida ventralis*

b Lips furrowed by deep vertical wrinkles. 17

17 a Ears separate or conjoined at the bases of their inner margins only; tragus broad, rounded off above. 18

b Ears conjoined by a more or less deep band; tragus small; no gular sac. 20

c Ears conjoined by a very deep band anteriorly, and, posteriorly, by a second low band. ..... *Nyctinomus (Nyctinomus) johorensis*

18 a Ears conjoined at the bases of their inner margins; gular sac distinct in males. Antitragus obliquely triangular, rounded; lower incisors 6. . *Nyctinomus (Nyctinomus) cestoni*
African Chiroptera name ..... *Tadarida teniotis*

b Ears separate; no gular sac. Antitragus half oval. 19

19 a Lower incisors 4. ..... *Nyctinomus (Nyctinomus) ægyptiacus*
African Chiroptera name ..... *Tadarida aegyptiaca*

b Lower incisors 6. ..... *Nyctinomus (Nyctinomus) tragatus*

20 a Ears conjoined at the bases of their inner margins. 21

b Ears conjoined by a deep band in front. 22

21 a Fur unicoloured; wings from the lower end of the tibiæ. ..... *Nyctinomus (Nyctinomus) plicatus*

b Fur greyish on the surface; wings from the middle of the tibiæ. ..... *Nyctinomus (Nyctinomus) bivittatus*
African Chiroptera name ..... *Chaerephon bivittatus*

22 a The first upper premolar stands in the tooth-row. 23

b The first upper premolar external to the tooth-row. 25

23 a Lower third of the ear-keel much thickened and flattened externally. ..... *Nyctinomus (Nyctinomus) brachypterus*
African Chiroptera name ..... *Mops (Xiphonycteris) brachypterus*

b Lower third of the ear-keel slightly thickened, not flattened externally. 24

24 a Fur of the chest and abdomen uniform in colour. .. *Nyctinomus (Nyctinomus) pumilus*
African Chiroptera name ..... *Chaerephon pumilus*

b Fur of the lower half of the chest and the abdomen white. ..... *Nyctinomus (Nyctinomus) limbatus*
African Chiroptera name ..... *Chaerephon pumilus*

25 a Lower third of the ear-keel slightly thickened, not flattened externally. Tragus quadrate. ..... *Nyctinomus (Nyctinomus) angolensis*
African Chiroptera name ..... *Mops (Mops) condylurus*

b Lower third of the ear-keel much thickened and flattened externally. 26

26 a Tragus narrow, much longer than broad, rounded off above. ..... *Nyctinomus (Nyctinomus) miarensis*
African Chiroptera name ..... *Mops (Mops) midas miarensis*

b Tragus quadrate. ..... *Nyctinomus (Nyctinomus) mops*

27 a Antitragus separated by a deep notch; lower incisors 4. 28

b Antitragus separated by a very shallow notch; lower incisors 6. Muzzle flat in front of the ears; upper lips with vertical wrinkles. Ears separate. 31

28 a Muzzle thick, not concave in front of the eyes; upper lip with vertical wrinkles. 29

b Muzzle concave between the eyes and extremity of the nose; upper lip furrowed by deep oblique wrinkles; ears united on the forehead slightly in front of the eyes; no gular sac. 30

29 a Ears separate; a large gular sac. ..... *Nyctinomus (Nyctinomus) australis*

b Ears united by a low band near the extremity of the muzzle; no gular sac. .... *Nyctinomus (Nyctinomus) megalotis*

30 a Ears united by a deep band, antitragus much longer than high. .... *Nyctinomus (Nyctinomus) macrotis*

b Ears united by a low band; antitragus as high as long. .... *Nyctinomus (Nyctinomus) gracilis*

31 a Tragus quadrate, broad above; first upper premolar in the centre of the space between the canine and second premolar. ..... *Nyctinomus (Nyctinomus) brasiliensis*

b Tragus triangular, narrow above; first upper premolar larger, filling up the space between the canine and second premolar. ..... *Nyctinomus (Nyctinomus) norfolcensis*

32 a Ear broad above, upper third of the inner margin straight. ..... *N* ..... *yctinomus (Mormopterus) albiventer*

b Ear narrow above, upper third of the inner margin deeply concave. .... *Nyctinomus (Mormopterus) acetabulosus*

African Chiroptera name ..... *Mormopterus acetabulosus*

Appendix 5b: Dobson (1878). Catalogue of the Chiroptera in the collection of the British Museum.

1	a	Megachiroptera (Family Pteropodidæ)..... 2
	b	Microchiroptera..... 67
2	a	Tongue moderate; molars well developed (Group I. Pteropi). 3
	b	Tongue very long, muzzle narrow, elongated; molars very narrow, scarcely raised above the gum (Group II. Macroglossi)..... 8
3	a	Tail very short or none, when present quite free from the interfemoral membrane; second finger with a distinct claw; wings from the sides of the back; premaxillary bones united in front; fur of the nape of the neck and shoulders not differing from that of the back. Inc. $^{4}/_{4}$ or $^{2}/_{4}$, c. $^{1-1}/_{1-1}$, pm. $^{2-2}/_{3-3}$, m. $^{1-1}/_{2-2}$ (Genus *Epomophorus*). 11
	b	Tail very short or none, when present partly contained within the interfemoral membrane. 4
4	a	Second finger with a distinct claw; premaxillary bones united in front. 5
	b	Second finger without a claw; wings from the spine tail distinct; premaxillary bones separate in front. Inc. $^{2}/_{2}$, c. $^{1-1}/_{1-1}$, pm. $^{2-2}/_{3-3}$, m. $^{2-2}/_{3-3}$ (Genus *Cephalotes*). ..... *Cephalotes peronii*
5	a	Nostrils simple, their inner margins alone projecting. 6
	b	Nostrils tubular, projecting abruptly from the muzzle; tail distinct. Inc. $^{2}/_{0}$; c. $^{1-1}/_{1-1}$, pm. $^{2-2}/_{3-3}$, m. $^{2-2}/_{2-2}$ (Genus *Harpyia*). .....*Harpyia cephalotes and Harpyia major*
6	a	Tail none; fur of the nape of the neck and shoulders differing in colour or quality from that of the back. 7
	b	Tail distinct; fur of the nape of the neck and shoulders not differing from that of the back. Inc. $^{4}/_{4}$, c. $^{1-1}/_{1-1}$, pm. $^{3-3}/_{3-3}$, m. $^{2-2}/_{3-3}$ (Genus *Pteropus*)..... 16
7	a	Inc.$^{4}/_{4}$, c. $^{1-1}/_{1-1}$, pm. $^{3-3}/_{3-3}$, m. $^{2-2}/_{3-3}$ (Genus *Cynonycteris*). 53
	b	Inc. $^{4}/_{4}$ or $^{4}/_{2}$, c. $^{1-1}/_{1-1}$, pm. $^{2-2}/_{3-3}$, m. $^{2-2}/_{2-2}$ (Genus *Cynopterus*). 61
8	a	Second linger without a claw; premaxillary bones separate in front. 9
	b	Second finger with a distinct claw; premaxillary bones united in front. Wings to sides of the body. 10
9	a	Wings from the spine; tail long. Inc. $^{2-2}/_{1-1}$, c. $^{1-1}/_{1-1}$, pm. $^{2-2}/_{3-3}$, m. $^{2-2}/_{2-2}$ [Inner upper incisors rudimentary, not visible in recent specimens] (Genus *Notopteris*). .....*Notopteris macdonaldii*
	b	Wings from the sides of the back; tail short. Inc. 2 - $^{2}/_{4}$, c. $^{1-1}/_{1-1}$, pm. $^{3-3}/_{3-3}$, m. $^{2-2}/_{3-3}$ (Genus *Eonycteris*). .....*Eonycteris spelæa*
10	a	Tail short; wing-membrane from the base of the fourth toe. Inc. $^{4}/_{4}$, c. $^{1-1}/_{1-1}$; pm. $^{3-3}/_{3-3}$, m. $^{2-2}/_{3-3}$ (Genus *Macroglossus*).....*Macroglossus minimus*
	b	Tail none; wing-membrane from the base of the third toe. Inc. $^{4}/_{4}$, c. $^{1-1}/_{1-1}$, pm. $^{3-3}/_{3-3}$, m. $^{2-2}/_{3-3}$ (Genus *Melonycteris*). ..... *Melonycteris melanops*
11	a	Shoulder-pouches not developed in either males or females; front of the muzzle with prominent cutaneous foliaceous expansions; molars with distinct external cusps (Subgenus *Hypsignathus*).....*Epomophorus (Hypsignathus) monstrosus* African Chiroptera name .....*Hypsignathus monstrosus*
	b	Shoulder-pouches well developed in males, rudimentary or quite absent in femals; lips pendulous and folded on the sides (especially in adult males), but without broad cutaneous expansions in front; molars with smooth slightly grooved crowns without cusps (Subgenus *Epomophorus*) [not keyed: *Epomophorus (Epomophorus) wahlbergii* and *Epomophorus (Epomophorus) labiatus*]..... 12
12	a	With transverse palate-ridges in front (large Epomophori). 13
	b	No transverse palate-ridges. (Small Epomophori). Muzzle much shorter and comparatively broader than in any of the preceding species; palate with a longitudinal Y-shaped groove.....*Epomophorus (Epomophorus) pusillus* African Chiroptera name ..... *Micropteropus pusillus*
13	a	Palate-ridges very prominent, no semicircular toothed ridges behind; tail very small but distinct. 14
	b	Palate-ridges less prominent, with semicircular toothed ridges behind; no tail externally. 15
14	a	Muzzle very long and slender; the fifth palate-ridge divided, with a lozenge-shaped cell in the centre..... *Epomophorus (Epomophorus) macrocephalus* African Chiroptera name .....*Hypsignathus monstrosus*

b Muzzle shorter and broader, the fifth palate-ridge simple, divided in the centre by a narrow incisor. ..... *Epomophorus (Epomophorus) gambianus*

15 a Muzzle shorter than in *E. gambianus*; the third palate-ridge developed on the sides only. ..... *Epomophorus (Epomophorus) franqueti*
African Chiroptera name ..... *Epomops franqueti*

b Muzzle short ; the third palate-ridge complete, undivided ; upper incisors (in adults) two only. ..... *Epomophorus (Epomophorus) comptus*
African Chiroptera name ..... *Epomops franqueti*

16 a Fur soft and woolly; ears generally shorter than the muzzle, more or less concealed by the long fur. Legs densely clothed as far as the ankles or backs of the feet with erect woolly hair (naked in *Pteropus molossinus* only). 17

b Fur straight, rarely woolly on the legs; ears generally as long or longer than the muzzle. 25

17 a Fur of the back nearly as long as that of the neck; ears shorter than the muzzle. . 18

b Fur of the back slightly appressed, unlike that of the neck; ears as long or longer than the muzzle. 24

18 a First upper premolar very small or deciduous; premolars and molars without prominent cusps. 19

b First upper premolar persistent, as large as one of the inner lower incisors; molars acutely tubercular; third lower premolar with an antero-internal broad projection. Ears slightly shorter than the muzzle, nearly naked; legs clothed to the ankles. Collar bright reddish brown, shoulders pale yellow; forearm 4".5. ..... *Pteropus aneiteanus*

c First upper premolar persistent, as large as (or larger than) one of the lower outer incisors; second lower premolar with an antero-internal basal projection. Ears scarcely longer than the fur of the head, nearly naked; legs naked. Collar scarcely distinguishable by colour from the fur of the back; shoulder-glands with tufts of bright yellow hairs; forearm 3".5. ..... *Pteropus molossinus*

19 a Ears very short, clothed with long hairs, and concealed by the long fur of the head; legs clothed above and beneath. 20

b Ears longer, half clothed, projecting slightly beyond the fur of the head; legs half naked beneath. 21

20 a Larger: forearm 6".2; ears narrow, acutely pointed. ..... *Pteropus vulgaris*
African Chiroptera name ..... *Pteropus niger*

b Smaller: forearm 3".7; ears shorter, obtuse; fur exceedingly fine and soft ..... *Pteropus rubricollis*
African Chiroptera name ..... *Pteropus subniger*

21 a Legs clothed as far as the ankles. 22

b Legs clothed to the base of the claws. 23

22 a Collar not well defined, passing gradually into the light-coloured fur of the back. ..... *Pteropus dasymallus*

b Collar very distinct, bright yellow or yellowish white. ..... *Pteropus formosus*

23 a Collar scarcely distinguishable by colour from the fur of the back; forearm 6".4. ..... *Pteropus pselaphon*

b Collar pale yellowish white above, very distinct; forearm 6".4. ..... *Pteropus vetulus*

24 a First upper premolar small or deciduous; molars rather narrow. Ears much longer than the muzzle, attenuated above and pointed; legs clothed above and beneath; forearm 6".2. ..... *Pteropus poliocephalus*

b First upper premolar persistent, nearly equal to one of the upper incisors in cross-section; molars very broad and strong. Ears as long as the muzzle, obtusely pointed; legs clothed, above, as far as the ankles; fur and membranes very pale-coloured; forearm 6". ..... *Pteropus leucopterus*

25 a No premolar or molar with an anterior basal projection. 26

b Molars well developed ; first upper premolar minute, generally deciduous. 35

26 a First upper premolar persistent, as large as one of the lower incisors. Fur of the back appressed, on the interfemoral and legs erect, woolly. 27

b First upper premolar minute, generally deciduous. 28

27 a Ears shorter than the muzzle; the last upper molar as large as one of the lower outer incisors; fur ferruginous brown; forearm 5".8. ..... *Pteropus rayneri*

b Ears slightly longer than the muzzle; the last upper molar very small, scarcely as large as one of the lower inner incisors; fur yellowish brown; foream 4".5. .... *Pteropus lombocensis*

28 a Fur of the back straight, directed backwards, scarcely appressed, on the interfemoral and legs similar. 29

b Fur of the back short, closely appressed (in adults); tibiæ naked or very thinly clothed with a few scattered hairs. 33

29 a Wings from the sides of the back; general colour of the fur and membranes brown. 30

b Wings from the back near the spine; fur pale-coloured, silky, generally with more or less distinct facial streaks; legs clothed to the ankles. With distinct facial streaks. 31

30 a Ears shorter than the muzzle; the concave surface of the conch thinly clothed with short hairs; tibia covered almost to the ankles; premolars and molars with posterior basal projections; forearm 5". ..... *Pteropus samoensis*

b Ears slightly longer than the muzzle, the concave surface of the conch nearly covered with soft fur, tibiæ half-clothed; premolars and molars with posterior basal projections; forearm 4".9. ..... *Pteropus rodricensis*

c Ears scarcely as long as the muzzle, naked; tibiæ clothed almost to the ankles; premolars and molars without basal projections; forearm 4".5. ..... *Pteropus brunneus*

31 a Facial streaks black or dark brown. 32

b Facial streaks white. ..... *Pteropus wallacei*

c No distinct facial streaks. Ears as long as the muzzle; forearm 4". *Pteropus temminckii*

32 a Muzzle half surrounded by a black streak behind the eyes; forearm 3".6. .... *Pteropus personatus*

b Muzzle completely surrounded by a black streak behind the eyes; forearm 4".4. ..... *Pteropus capistratus*

33 a Molars very narrow, but slightly raised above the gum; first upper premolar minute, persistent. 34

34 a Ears slightly longer than the muzzle; molars exceedingly narrow; forearm 5".4. ..... *Pteropus scapulatus*

b Ears much longer than the muzzle; molars larger; forearm 5".4. ..... *Pteropus macrotis*

35 a Wings from the back close to the spine; back generally clothed by a narrow longitudinal line of short fur, or quite naked. 36

b Wings from the sides of the back, which is covered with short appressed fur. 39

36 a Interfemoral membrane very narrow in the centre, concealed by the fur. Ears not longer thanthe muzzle, obtuse. 37

b Interfemoral wider, not concealed by the fur behind. Ears longer than the muzzle, attenuated above and acutely pointed. 38

37 a Smaller: forearm 4".5; membranes pale brown. ..... *Pteropus griseus*

b Larger: forearm 7"; membranes black. ..... *Pteropus melanopogon*

38 a Muzzle and ears shorter ; interfemoral less developed in the centre; forearm 6".5. ..... *Pteropus chrysoproctus*

b Muzzle and ears much longer; interfemoral 1 inch wide in the centre; forearm 7".2. ..... *Pteropus pteronotus*

39 a Premolars and molars without antero-intemal basal projections. 40

b The third upper premolar and first molar with more or less distinct antero-intemal basal projections. 50

40 a Interfemoral membrane well developed in the centre, not concealed by the fur. ... 41

b Interfemoral membrane narrow in the centre, nearly concealed by the long fur. 44

41 a Ears much longer than the muzzle, attenuated and acutely pointed. 42

b Ears scarcely as long as the muzzle, conical, obtusely pointed; forearm 6".5. .... *Pteropus nicohbricus*

42 a Face reddish brown. 43

b Face black. Smaller than *Pteropus medius*; forearm 6", wings nearer the spine; premolars with a small posterior basal projection. ..... *Pteropus edwardsii*
African Chiroptera name ..... *Pteropus rufus*

43 a Larger: forearm 8".8; chest and abdomen dark reddish brown or black. *Pteropus edulis*

b Smaller: forearm 6".6; chest and abdomen bright bay or pale yellowish. .... *Pteropus medius*

44 a Eyes surrounded by fur not differing in colour from that of the adjacent parts of the face. 45

b Eyes surrounded by more or less conspicuous rings of paler-coloured fur. 49
45 a Ears very broadly rounded off above. Fur deep black, with conspicuous yellow tufts over shoulder-glands. ..... *Pteropus livingstonii*
b Ears not longer than the muzzle, conical, more or less pointed. 46
c Ears much longer than the muzzle, attenuated above and acutely pointed. Fur, except on the back of the neck, very dark-coloured, thighs clothed above and beneath; forearm 6".6. ..... *Pteropus gouldii*
46 a Last upper molar with a nearly circular crown. 47
b Last upper molar narrow, much longer than broad, placed obliquely in the tooth-row. Fur dark brown, back greyish brown; forearm 5".7. ..... *Pteropus fuscus*
African Chiroptera name ..... *Pteropus niger*
47 a First upper premolar deciduous; premolars and molars without posterior basal projections. 48
b First upper premolar persistent; premolars and molars with posterior basal projections. Fur reddish brown; forearm 4".8. ..... *Pteropus tuberculatus*
48 a Larger, forearm 7"; breast and abdomen dark brown or black. ..... *Pteropus alecto*
b Smaller, forearm 5".4; breast and abdomen yellowish brown or pale reddish yellow. ..... *Pteropus hypomelanus*
49 a Ears longer than the muzzle; forearm 7". ..... *Pteropus conspicillatus*
b Ears shorter than the muzzle; forearm 5".35. ..... *Pteropus ocularis*
50 a Interfemoral membrane very narrow in the centre, concealed by the fur. 51
b Interfemoral membrane nearly one inch wide in the centre. Ears slightly longer than the muzzle, obtusely pointed, the third upper premolar and first molar with well-developed antero-internal basal projections; forearm 7".2. ..... *Pteropus jubatus*
51 a First upper premolar nearly as large as one of the inner lower incisors. Ears as long as the muzzle; forearm 5".7. ..... *Pteropus keraudrenii*
b First upper premolar deciduous. 52
52 a Ears much longer than the muzzle, acutely pointed; fur covering the sides of the face long and directed backwards; forearm 5".2. ..... *Pteropus macklotii*
b Ears slightly longer than the muzzle; fur of the sides of the face not peculiar; forearm 5".3. ..... *Pteropus caniceps*
53 a Upper lip with a wide groove in front, with sloping, not elevated margins; molars well developed. 54
b Upper lip with a narrow groove in front, with elevated rounded margins, as in *Pteropus* and *Cynopterus*. Muzzle short; molars small, scarcely raised above the level of the gum. ..... *Cynonycteris grandidieri*
54 a Wings from the sides of the back. 55
b Wings from the back near the spine. Muzzle long and narrow, fur occupying a narrow space across the loins. 60
55 a Neck (in M) with some long coarse hairs beneath scarcely forming a collar. 56
b Neck (in M) with a broad collar in front, terminating by an abrupt well-defined margin. Thumb equal to the tibia in length; forearm 2".3. ..... *Cynonycteris torquata*
African Chiroptera name ..... *Myonycteris torquata*
56 a First upper premolar persistent; ears longer than the muzzle. 57
b First upper premolar deciduous; ear not exceeding the muzzle in length. ..... *Cynonycteris brachyotis*
57 a The first upper premolar in the centre of the space between the canine and second premolar; muzzle long. 58
b The first upper premolar closely wedged in between the canine and second premolar; muzzle short. Thumb shorter than the tibia. Legs naked; forearm 2".8. ..... *Cynonycteris minor*
58 a Thumb longer than the tibia. ..... *Cynonycteris ægyptiaca*
African Chiroptera name ..... *Rousettus aegyptiacus*
b Thumb shorter than the tibia. 59
59 a Legs nearly naked; forearm 3".35. ..... *Cynonycteris amplexicaudata*
b Legs hairy; forearm 3".8. ..... *Cynonycteris collaris*
60 a Fur bright yellowish on the sides of the back and on the extremities. ..... *Cynonycteris straminea*
African Chiroptera name ..... *Eidolon helvum helvum*
b Fur pale greyish brown. ..... *Cynonycteris dupreana*

61 a Tail distinct. 62
b Tail none. Incisors $^{4}/_{2}$ (Subgenus Megærops). Ears as in Cynopterus melanocephalus; forearm 2"1. ..... *Cynopterus (Megærops) ecaudatus*
62 a Incisors $^{4}/_{4}$ (Subgenus *Cynopterus*). 63
b Incisors $^{4}/_{2}$ (Subgenus *Ptenochirus*). Molars as in *Cynopterus marginatus*; inner upper incisors much longer than the outer ones; forearm 3".1. ..... *Cynopterus (Ptenochirus) jagorii*
63 a Molars narrow, much longer than broad; upper incisors nearly equal. 64
b Molars very broad; upper incisors nearly equal. Ears not much longer than the muzzle. Fur of the head dark brown, of the body reddish brown; forearm 2".8. ..... *Cynopterus (Cynopterus) latidens*
64 a Base of the outer margin of the ear-conch straight or faintly convex. 65
b Base of the outer margin of the ear- conch forming a distinct rounded projection. Ears not much longer than the muzzle, no white margin; forearm 2".2. ..... *Cynopterus (Cynopterus) brachysoma*
65 a Ears nearly double the length of the muzzle, margined very distinctly with white. ..... *Cynopterus (Cynopterus) marginatus*
b Ears not much longer than the muzzle, no white margin. 66
66 a Fur of the head scarcely differing in colour from that covering the back; ears narrow; forearm 2".7. ..... *Cynopterus (Cynopterus) scherzeri*
b Fur of the head black, contrasting with the much lighter-coloured fur of the body; ears oval; forearm 1".7. ..... *Cynopterus (Cynopterus) melanocephalus*
67 a Family Rhinolophidæ. 68
b Family Nycteridæ. 113
c Family Vespertilionidæ. 123
d Family Emballonuridæ. 250
e Family Phyllostomidæ. 310
68 a Subfamily Rhinolophinæ, Genus *Rhinolophus* 69
b Subfamily Phyllorhininæ. 89
69 a Second upper premolar separated from the canine by a rather wide space, in the centre of which the first small premolar is placed; second lower premolar small, but distinctly visible, placed in the outer angle between the adjoining premolars, or (rarely) standing in the tooth-row. 70
b Second upper premolar close to the canine, the first small premolar either quite external to the tooth-row or wedged in between the canine and second premolar; second lower premolar very small, generally with difficulty distinguished, always external to the tooth-row. 86
70 a Central nose-leaf or sella not united with the terminal portion of the nose-leaf, the posterior extremity of the connecting process being received into a concavity in the front surface of the terminal lancet-shaped leaf. Antitragus large, separated posteriorly by a deep angular notch; forearm 1".85. ..... *Rhinolophus cœlophyllus*
b Central nose-leaf or sella united posteriorly by a laterally flattened band (the posterior connecting-process) with the upper and front surface of the base of the terminal nose-leaf. 71
71 a Horizontal portion of the sella expanded, much wider than the base of its vertical process. 72
b Horizontal portion of the sella not expanded, scarcely wider than the base of its vertical process. 75
72 a Sides of the base of the sella folded inwards and backwards. 73
b Sides of the base of the sella turned upwards, forming a cup-shaped cavity above and between the nasal orifices. 74
c Sides of the base of the sella forming rather long triangular projections. Horseshoe-shaped membrane divided in front by a longitudinal groove with raised edges; forearm 2".2. ..... *Rhinolophus euryotis*
73 a Summit of the vertical process of the sella broadly rounded off or truncated; forearm 2".9. ..... *Rhinolophus luctus*
b Summit of the vertical process of the sella narrowly rounded off or subacute; forearm 2". ..... *Rhinolophus trifoliatus*
74 a Antitragus separated posteriorly by a shallow notch ; lower lip with a single groove; forearm 2".25. ..... *Rhinolophus mitratus*

b Antitragus separated by a deep angular groove; lower lip with three grooves; forearm 1".85. ..... *Rhinolophus philippinensis*

75 a Upper margin of the posterior connecting-process of the sella conjoined with the summit of the vertical process at the same level, not exceeding it posteriorly in height. 76

b Upper margin of the posterior connecting-process exceeding the summit of the anterior vertical process in height. 77

76 a Vertical process of the sella narrowed abruptly about the middle and rounded off above; lower lip with a single vertical groove; forearm 2".2. ..... *Rhinolophus pearsonii*

b Sides of the vertical process of the sella straight, summit triangular; lower lip with three grooves; forearm 2".1. ..... *Rhinolophus rufus*

77 a Upper margin of the posterior connecting-process forming a low rounded projection, slightly exceeding the summit of the vertical process of the sella in height. 78

b Upper margin of the posterior connecting-process forming a more or less acute projection, exceeding considerably the summit of the vertical process of the sella in height. 81

78 a Vertical process of the sella broad, as broad as the horizontal portion above the nostrils. Ears longer than the head; forearm 1".6. ..... *Rhinolophus macrotis*

b Vertical process of the sella narrower than the horizontal portion. 79

79 a Ears as long as the head. Horseshoe-shaped nose-leaf broad, concealing the muzzle; forearm 1".9, thumb 0".3. ..... *Rhinolophus megaphyllus*

b Ears shorter than the head. 80

80 a Horseshoe-shaped nose-leaf broad, concealing the muzzle; forearm 2".05, thumb 0".45. ..... *Rhinolophus andamanensis*

b Horseshoe-shaped nose-leaf leaving the sides of the muzzle uncovered; forearm 2".1, thumb 0".35. ..... *Rhinolophus affinis*

81 a Sides of the vertical process of the sella parallel, summit broadly rounded off. 82

b Sides of the vertical process of the sella converging upwards. 85

c Sides of the vertical process of the sella concave. Antitragus separated posteriorly by a shallow notch. Wings from the ankles or tibiæ; forearm 1".7. .. *Rhinolophus landeri*

82 a Antitragus separated posteriorly by a deep angular notch. 83

b Antitragus separated posteriorly by a shallow notch. Wings from the tibiæ above the ankles; forearm 1".8. ..... *Rhinolophus euryale*

83 a Terminal process of the posterior nose-leaf short and narrow. 84

b Terminal process of the posterior nose-leaf broad, forming an equilateral triangle. Wings from the ankles; forearm 1".3. ..... *Rhinolophus garoensis*

84 a Wings from the metatarsi or from base of the toes; forearm 1".9. .... *Rhinolophus acuminatus*

b Wings from the ankles; forearm 2". ..... *Rhinolophus petersii*

c Wings from the ankles; forearm 1".5. ..... *Rhinolophus minor*

85 a Antitragus separated posteriorly by a shallow notch. Wings from the ankles; forearm 1".8. ..... *Rhinolophus blasii*

b Antitragus separated posteriorly by a deep angular notch. Wings from the ankles; forearm 1".5. ..... *Rhinolophus hipposideros*

86 a Ears not attenuated near their extremities; first upper premolar wedged in between the canine and second premolar, or half external. 87

b Ears attenuated near their extremities ; first upper premolar quite external to the tooth-row. 88

87 a Ears much shorter than the head; forearm 1".75. ..... *Rhinolophus clivosus*

b Ears as long or longer than the head; forearm 1".9. ..... *Rhinolophus capensis*

88 a Ears shorter than the head, obtusely pointed; horeshoe-shaped noseleaf broad, concealing the muzzle; forearm 2".2. ..... *Rhinolophus æthiops*
African Chiroptera name ..... *Rhinolophus fumigatus*

b Ears shorter than the head, very acutely pointed; horseshoe small, not concealing the sides of the muzzle; forearm 2".25. ..... *Rhinolophus ferrum-equinum*
African Chiroptera name ..... *Rhinolophus ferrumequinum*

89 a Horizontal anterior nose-leaf horseshoe-shaped; metacarpal bone of index finger equal to or scarcely exceeding the metacarpal of the third finger in length. 90

b Horizontal anterior nose-leaf lobate; metacarpal bone of the index finger very long, extending to the first phalanx of the middle finger (Genus Cœlops). ..... *Cœlops frithii*

90 a Centre of the upper surface of the horseshoe supporting the base of a horizontal crest extending backwards between and above the nasal apertures. 91
b Centre of the upper surface of the horseshoe uncovered; no horizontal crest extending backwards between and above the nasal apertures (Genus *Phyllorhina*). 92
91 a Outer margin of the ear commencing near the posterior commissure of the eyelids (Genus *Triænops*). ..... *Triænops persicus and Triænops afer*
b Outer margin of the ear commencing at a point distant from and on a much lower level than the eye (Genus *Rhinonycteris*)..... *Rhinonycteris aurantia*
92 a Upper margin of the terminal erect portion of the nose-leaf tridentate ; no frontal glandular sac (Subgenus *Asellia*)..... 93
b Upper margin of the terminal erect nose-leaf undivided; with or without a frontal sac (Subgenus *Phyllorhina*) 95
93 a Processes of the terminal nose-leaf thickened; extremity of the tail projecting considerably. 94
b Processes of the terminal erect nose-leaf not thickened; extremity of the tail projecting slightly. Premolars $^{2-2}/_{2-2}$; ears broad; forearm 1".5.*Phyllorhina (Asellia) stoliczkana*
94 a Premolars $^{1-1}/_{2-2}$ (in adults); ears broad; forearm 1".75...*Phyllorhina (Asellia) tridens*
African Chiroptera name .....*Asellia tridens*
b Premolars $^{2-2}/_{2-2}$; ears narrow; forearm 1".6.....*Phyllorhina (Asellia) tricuspidata*
95 a Ears separate; premolars $^{2-2}/_{2-2}$. 96
b Ears united by a low band; premolars $^{1-1}/_{2-2}$. Ears ovate (as in *Phyllorhina bicolor*, var. *fulva*); calcaneum shorter than the foot; forearm 1".4. ... *Phyllorhina (Phyllorhina) megalotis*
African Chiroptera name .....*Hipposideros megalotis*
96 a With secondary cutaneous leaflets on the sides of the muzzle external to the horseshoe..... 98
b No secondary cutaneous leaflets on the sides of the muzzle external to the horseshoe. Frontal glandular sac distinct in males, opening transversely..... 109
97 a With a large frontal glandular sac opening longitudinally behind the nose-leaf; ears narrow, attenuated upwards; interfemoral membrane short. 98
b Frontal glandular sac opening transversely or none; ears broad, not attenuated above; interfemoral membrane well developed. 99
98 a Terminal erect nose-leaf with a central club-shaped process, and a similar process from the centre of the sella beneath; forearm 2".45. *Phyllorhina (Phyllorhina) cyclops*
African Chiroptera name .....*Doryrhina cyclops*
b No processes from the nose-leaf; forearm 4".45.*Phyllorhina (Phyllorhina) commersonii*
African Chiroptera name ..... *Macronycteris commersoni*
99 a Terminal erect leaf narrower than the horseshoe. Frontal glandular sac well developed..... 100
b The terminal erect leaf wider than the horseshoe. 101
100 a Upper margin of the erect leaf sinuate, front surface with three prominent vertical ridges; forearm 3".8. ..... *Phyllorhina (Phyllorhina) armigera*
b Upper margin of the erect leaf convex or straight, vertical ridges in front not well defined; forearm 2".45. ..... *Phyllorhina (Phyllorhina) leptophylla*
101 a No frontal sac. 102
b Frontal sac distinct in males. 105
102 a Front concave surface of the terminal erect leaf divided by one or more vertical ridges. 103
b Front concave surface of the terminal leaf not divided by vertical ridges. With two secondary leaflets external to the horseshoe. Wings from the ankles; forearm 1".95. ..... *Phyllorhina (Phyllorhina) fuliginosa*
African Chiroptera name ..... *Hipposideros fuliginosus*
103 a With three secondary leaflets external to the horseshoe. 104
b With two secondary leaflets external to the horseshoe. Wings from the tarsus; forearm 1"45. ..... *Phyllorhina (Phyllorhina) pygmæa*
104 a Wings from the ankles; forearm 3".4. ..... *Phyllorhina (Phyllorhina) diadema*
b Wings from the metatarsus; forearm 2".6. ..... *Phyllorhina (Phyllorhina) nicobarensis*

105 a Front concave surface of the terminal leaf not divided by vertical ridges. With two secondary leaflets external to the horseshoe. Wings from the tarsus; forearm 1".85. ..... *Phyllorhina (Phyllorhina) caffra*
African Chiroptera name ..... *Hipposideros caffer*
b Front concave surface of the terminal leaf divided by three more or less distinct vertical ridges. 106
106 a With two secondary leaflets external to the horseshoe; thumb and foot very small. Wings from the tarsus or metatarsus. 107
b With three secondary leaflets external to the horseshoe; thumb and foot moderately large..... 108
107 a Horseshoe as wide in front as in the middle; forearm 1".75; calcaneum 0".3. ..... *Phyllorhina (Phyllorhina) galerita*
b Horseshoe much narrower in front than behind; forearm 1".75; calcaneum 0".45. ..... *Phyllorhina (Phyllorhina) cervina*
108 a Ears much shorter than the head; lower third of the outer margin of the ear-conch with an acute spine-like projection; last osseous caudal vertebra projecting abruptly; forearm 2"..... *Phyllorhina (Phyllorhina) speoris*
b Ears nearly as long as the head; no spine-like projection from the margin of the ear-conch; tail almost wholly contained within the wing-membrane; forearm 2".45. ..... *Phyllorhina (Phyllorhina) larvata*
109 a Front concave surface of the terminal erect leaf not divided by vertical ridges. ... 110
b Front concave surface of the erect leaf divided by three more or less distinct vertical ridges..... 112
110 a Upper margin of the erect noseleaf thin. 111
b Upper margin of the erect noseleaf thickened, as in *Phyllorhina diadema*. Ears shorter than the head, rounded off above; forearm 1".8. .... *Phyllorhina (Phyllorhina) coronata*
111 a Ears as long as the head; ear-conch with a spine-like projection, as in *Phyllorhina speoris*; forearm 1".8. ..... *Phyllorhina (Phyllorhina) obscura*
b Ears shorter than the head; no spine-like projection from the margin of the ear-conch; forearm 1".3..... *Phyllorhina (Phyllorhina) doriæ*
112 a Ears triangular, obtusely pointed; calcaneum much longer than the foot; forearm 2". ..... *Phyllorhina (Phyllorhina) calcarata*
b Ears ovate, broadly rounded off above; calcaneum not longer than the foot; forearm 1".55. ..... *Phyllorhina (Phyllorhina) bicolor*
113 a Subfamily Megaderminæ. Genus *Megaderma*. 114
b Subfamily Nycterinæ. Genus *Nycteris*. 117
114 a Premolars $^{2-2}/_{2-2}$; frontal bones slightly flattened, with or without small postorbital processes (Oriental Region). 115
b Premolars $^{1-1}/_{2-2}$; frontal bones much flattened, with more or less large postorbital processes (Ethiopian Region). 116
115 a Base of the central longitudinal crest of the nose-leaf expanded above, cordiform; no postorbital processes (Subgenus *Megaderma*). ...*Megaderma (Megaderma) spasma*
b Base of the central longitudinal crest of the nose-leaf circular; postorbital processes small (Subgenus *Lyroderma*). .....*Megaderma (Lyroderma) lyra*
116 a Base of the central longitudinal crest of the nose-leaf expanded, cordiform; frontal bones considerably flattened and grooved, with well-developed postorbital processes (Subgenus *Cardioderma*). .....*Megaderma (Cardioderma) cor*
African Chiroptera name ..... *Cardioderma cor*
b Base of the central longitudinal process irregularly quadrate; centre of the anterior margin of the horizontal leaf bent upwards, forming a prominent projection in front; frontal bones much flattened and grooved, with large postorbital processes. (Subgenus *Lavia*). .....*Megaderma (Lavia) frons*
African Chiroptera name .....*Lavia frons*
117 a The tragus reaches its greatest width opposite the base of its inner margin. Inner margin of the tragus concave..... 118
b Tragus expanded above, reaching its greatest width opposite the middle of its inner margin; ears much longer than the head. 121
118 a Upper incisors trifid; ears scarcely longer than the head. 119
b Upper incisors bifid ; ears considerably longer than the head. 120

119 a Second lower premolar minute, in the tooth-row; forearm 1 $^{1}/_{2}$ inch... *Nycteris hispida*
b Second lower premolar one third the size of the first; forearm 2 $^{1}/_{4}$ inches. .... *Nycteris grandis*
120 a Second lower premolar two thirds the size of the first, in the tooth-row. .... *Nycteris javanica*
b Second lower premolar minute, half internal to the tooth-row..... *Nycteris æthiopica* African Chiroptera name ..... *Nycteris macrotis*
121 a Inner margin of the tragus straight. Upper incisors bifid. Second lower premolar minute, half internal to the tooth-row. ..... *Nycteris macrotis*
b Inner margin of the tragus convex. Upper mcisors bifid..... 122
122 a Second lower premolar minute, quite internal to the tooth-row..... *Nycteris thebaica*
b Second lower premolar minute, in the tooth-row. ..... *Nycteris capensis* African Chiroptera name ..... *Nycteris thebaica*
123 a Crown of the head flat or slightly raised above the face-line; upper incisors close to the canines. 124
b Crown of the head greatly elevated above the face-line; upper incisors separated from the canines, and also in front (Group III. Miniopteri). 136
124 a Nostrils margined behind by rudimentary nose-leaves, or by grooves on the upper surface of the muzzle; ears generally very large; forehead grooved (Group I. Plecoti). 125
b Nostrils simple, opening by crescentic or circular apertures at the extremity of the muzzle; ears generally moderate; forehead not grooved (Group II. Vespertiliones). 129
125 a A small or rudimentary nose-leaf above the nasal apertures; incisors $^{1-1}/_{4}$ or $^{1-1}/_{3}$. 126
b No nose-leaf; nostrils in front of grooves on the upper surface of the muzzle; ears very large..... 127
126 a Incisors $^{1-1}/_{4}$; margins of the nasal apertures continuous with the rim of a small disk above; ears separate (Genus *Antrozous*). ..... *Antrozous pallidus*
b Incisors $^{1-1}/_{6}$; a small nose-leaf above and behind the nasal apertures; ears united (Genus *Nyctophilus*). ..... *Nyctophilus timoriensis*
127 a Incisors $^{2-2}/_{6}$; ears united. 128
b Incisors $^{1-1}/_{6}$; ears separate. Premolars $^{1-1}/_{2-2}$; outer margin of the ear-conch terminating near the angle of the mouth (Genus *Otonycteris*). . *Otonycteris hemprichii*
128 a Premolars $^{2-2}/_{2-2}$; outer margin of the ear-conch carried forwards above the mouth and in front of the eye (Genus *Synotus*). .... *Synotus barbastellus and Synotus darjelingensis*
b Premolars $^{2-2}/_{3-3}$; outer margin of the ear-conch terminating near the angle of the mouth (Genus *Plecotus*)..... 138
129 a The outer margin of the ear-conch commences near the angle of the mouth; ears generally shorter than the head, triangular or rhomboidal in outline; tragus curved inwards or straight; muzzle nearly naked in front of the eyes, with well-developed glandular eminences; upper premolars not exceeding 2 - 2, the first premolar minute or absent. 130
b The outer margin of the ear-conch commences abruptly nearly opposite the base of the inner margin of the tragus; ears generally as long or longer than the head, narrow, thin ; tragus long and narrow, straight or curved outwards; muzzle narrow and hairy in front; upper premolars generally 3 - 3, the first premolar well developed. 134
130 a Premaxillary bones moderately developed, occupying half the space between the canines; upper inner incisors bifid, separated from the canines by a space; inc $^{2-2}/_{6}$, rarely $^{1-1}/_{6}$..... 131
b Premaxillary bones very narrow, slender; upper incisors unicuspidate, close to the canines 132
131 a No lobular projection from the lower lip near the angle of the mouth; tibiæ short (Genus *Vesperugo*). 139
b A distinct lobular projection near the angle of the mouth; tibiæ long (Genus *Chalinolobus*). 180
132 a The first lower premolar small, crushed in between the canine and second premolar; membranes thick, nearly naked (Genus *Scotophilus*). 186
b The first lower premolar not crushed in between the adjoining teeth; membranes thin. 133

133 a Tragus straight, outer margin convex; interfemoral membrane nearly naked (Genus *Nycticejus*). ..... *Nycticejus crepuscularis*
b Tragus curved inwards, outer margin strongly angular below; interfemoral membrane more or less completely covered with hair (Genus *Atalapha*)..... 192
134 a Nostrils tubular, projecting considerably beyond the extremity of the muzzle; premolars $^{2-2}/_{2-2}$ (Genus *Harpiocephalus*). 196
b Nostrils simple, scarcely projecting; premolars $^{3-3}/_{3-3}$. 135
135 a Nasal apertures crescentic; first and second upper premolars much smaller than the third (Genus *Vespertilio*)..... 201
b Nasal apertures circular; first and second upper premolars nearly equal to the third (Genus *Kerivoula*). 238
136 a Premolars $^{3-3}/_{3-3}$..... 137
b Premolars $^{2-2}/_{3-3}$ (Genus *Miniopterus*). 247
137 a Base of thumbs and soles of feet simple (Genus *Natalus*). 246
b Base of thumbs and soles of feet with adhesive disks (Genus *Thyroptera*). .... *Thyroptera tricolor*
138 a Nostrils in front of naked semilunate grooves on the upper surface of the muzzle (Palcearctic Region) (Subgenus *Plecotus*). ..... *Plecotus (Plecotus) auritus*
b Nostrils in front of narrow grooves concealed by the greatly enlarged glandular prominences arising from the sides of the muzzle (Nearctic Region) (Subgenus *Corinorhinus*). ..... *Plecotus (Corinorhinus) macrotis*
139 a Incisors $^{2-2}/_{6}$. 140
b Incisors $^{2-2}/_{2-2}$..... 143
140 a Outer upper incisors well developed, or if small, yet distinct; no bone in the penis. 141
b Outer upper incisors very small, scarcely raised above the gum, occasionally posterior to the tooth-row; penis with a distinct bone. Premolars $^{1-1}/_{2-2}$ (Subgenus *Hesperoptenus*). 178
141 a Lower premolars 2 - 2. 142
b Lower premolars 3 - 3 (Subgenus *Lasionycteris*). .... *Vesperugo (Lasionycteris) noctivagans*
142 a Upper premolars 1 - 1 (Subgenus *Vesperus*). 144
b Upper premolars 2 - 2 (Subgenus *Vesperugo*). 161
143 a Premolars $^{1-1}/_{2-2}$ (Subgenus *Rhogeëssa*)..... *Vesperugo (Rhogeëssa) parvulus*
b Premolars $^{2-2}/_{2-2}$ (Subgenus *Scotozous*). .... *Vesperugo (Scotozous) dormeri and Vesperugo (Scotozous) schlieffeni*
144 a Thumbs and soles of the feet simple, without adhesive cushions. 145
b Base of the thumbs and soles of the feet with broad adhesive cushions. Crown of the head remarkably flattened; ears shorter than the head; tragus as in *Vesperugo minutus*; forearm 1"1. ..... *Vesperugo (Vesperus) pachypus*
145 a Ears longer than the head, auditory bullæ osseæ very large. Tragus long, attenuated upwards and inclined outwards, reaching its greatest width below the middle of its outer convex (Genus *Histiotus*, Gervais). 146
b Ears shorter than the head; auditory bullæ osseæ moderate. 149
146 a Ears very much longer than the head, united across the forehead by a distinct band. 147
b Ears scarcely longer than the head, not united.. *Vesperugo (Vesperus) magellanicus*
147 a Ears triangular; inner margin of the ear-conch very convex in the lower third. Ears more than one third longer than the head, united by a deep band; the last two caudal vertebræ free; forearm 2". ..... *Vesperugo (Vesperus) velatus*
b Ears oval; inner margin of the ear-conch moderately convex throughout. 148
148 a Ears nearly double the length of the head, united by a deep band; the last and the antepenultimate caudal vertebræ free; forearm 1".8. *Vesperugo (Vesperus) macrotus*
b Ears about one third longer than the head, united by a low band; tail and forearm as in the preceding species. ..... *Vesperugo (Vesperus) montanus*
149 a Tragus moderately long, reaching its greatest width slightly above the base of its inner margin; postcalcaneal lobe very narrow or absent. 150
b Tragus rather short, reaching its greatest width about the middle of its inner margin, not curved inwards, inner margin straight; post-calcaneal lobe distinct. Inner upper incisor on each side with a distinct external second cusp at or near its extremity. 156

c Tragus rather short, expanded above, reaching its greatest width slightly above the middle of its inner margin, not curved inwards, inner margin straight; postcalcaneal lobe distinct. Inner upper incisor on each side with a distinct external second cusp.. 159

d Tragus short, expanded above and curved inwards. Inner upper incisor on each side with a distinct external second cusp at or near its extremity. Outer upper incisor on each side very short, unicuspidate, scarcely exceeding the cingulum of the inner incisor in vertical extent. 160

150 a Inner upper incisors with a small external cusp or projection near their extremities, disappearing as the teeth become worn. 151

b Inner upper incisors unicuspidate. 155

151 a Outer upper incisors minute, close to and slightly in front of the inner incisors; one or more caudal vertebræ quite free from the interfemoral membrane. 152

b Outer upper incisors minute, close to and quite external to the inner incisors; half the last caudal vertebra free. 153

152 a The ears laid forwards extend more than midway between the eyes and the end of the muzzle; last two caudal vertebræ free; forearm 2".25. *Vesperugo (Vesperus) serotinus*

b The ears laid forwards extend slightly beyond the eyes; last caudal vertebra free; forearm 2".15. ..... *Vesperugo (Vesperus) andersoni*

c The ears laid forwards extend almost as far as the end of the muzzle; the last caudal vertebra and half the antepenultimate vertebra free; forearm 1".45. .... *Vesperugo (Vesperus) hilarii*

153 a Muzzle broad and flattened in front, nostrils opening by oblique slits. Ears much shorter than the head; forearm 1".35. ..... *Vesperugo (Vesperus) platyrhinus*

b Muzzle as in *Vesperugo serotinus*; ears much shorter than the head. 154

154 a Smaller; forearm 1".15. ..... *Vesperugo (Vesperus) minutus*
African Chiroptera name ..... *Neoromicia capensis*

b Larger; forearm 1".4 - 1".6. ..... *Vesperugo (Vesperus) capensis*
African Chiroptera name ..... *Neoromicia capensis*

155 a Outer upper incisors as in *Vesperugo minutus*. The ears laid forwards extend slightly beyond the eyes; last caudal vertebra free; forearm 2". .... *Vesperugo (Vesperus) megalurus*
African Chiroptera name ..... *Eptesicus hottentotus*

b Outer upper incisors as in *Vesperugo serotinus*. The ears laid forwards extend more than midway between the eyes and the extremity of the muzzle, which projects far beyond the lower lip; fur white beneath; forearm 1".45. .... *Vesperugo (Vesperus) nasutus*

156 a Outer upper incisors very short, unicuspidate ; tail almost wholly included in the interfemoral membrane; ears much shorter than the head. 157

b Outer upper incisor on each side nearly as long as the outer cusp of the inner incisor; lower incisors in the direction of the jaws; ears much shorter than the head. 158

c Outer upper incisors on each side longer than the outer cusp of the inner incisor; lower incisors at right angles to the direction of the jaws; ears much shorter than the head. The last two caudal vertebræ free; forearm 1".6. .... *Vesperugo (Vesperus) borealis*

157 a Wing-membranes and fur beneath pure white; forearm 1".15. *Vesperugo (Vesperus) tenuipinnis*
African Chiroptera name ..... *Neoromicia tenuipinnis*

b Wing-membranes and fur brown; forearm 1".2. ..... *Vesperugo (Vesperus) pumilus*

158 a Half the last caudal vertebra free; forearm 1".25. .. *Vesperugo (Vesperus) grandidieri*
African Chiroptera name ..... *Pipistrellus grandidieri*

b The last two caudal vertebræ free; forearm 1".6.. *Vesperugo (Vesperus) propinquus*

159 a Outer upper incisor on each side nearly as long as the outer cusp of the inner incisor. Ears shorter than the head, the last osseous caudal vertebra quite free. Fur yellowish white on the upper surface; forearm 1".6. ..... *Vesperugo (Vesperus) discolor*

b Outer upper incisors minute. Ears very nearly as long as the head; the last rudimentary caudal vertebra alone free. Ears oval; fur deep black; forearm 1".7. ..... *Vesperugo (Vesperus) atratus*

160 a Outer margin of the ear-conch terminating near the angle of the mouth; fur brown above and beneath; forearm 1".6. ..... *Vesperugo (Vesperus) pachyotis*

b Outer margin of the ear-conch terminating beneath the lower jaw; chin and throat pure white; forearm 1".65. ..... *Vesperugo (Vesperus) albigularis*

161 a Thumb and feet simple, without adhesive cushions. Wings from the ankles or from the tibiæ higher up. 162

b Base of the thumbs and soles of the feet with adhesive cushions ; outer margin of the ear-conch terminating- in a very distinct lobe. 177

162 a Tragus expanded above and curved inwards, reaching its greatest width above the middle of its inner margin. Inner margin of the tragus deeply concave. 163

b Tragus not expanded above, reaching its greatest width about the middle of its inner margin. 165

c The tragus reaches its greatest width slightly above the base of its inner margin. 168

163 a Wings from the ankles; the extreme tip of the tail alone projecting from the interfemoral membrane; postcalcaneal lobe well developed. 164

b Wings from the tibiæ; the extreme tip of the tail alone projecting; postcalcaneal lobe well developed. Fur unicoloured; incisors as in *Vesperugo noctula*; forearm 1".55. ..... *Vesperugo (Vesperugo) stenopterus*

164 a Fur unicoloured above; upper outer incisors double the size of the inner incisors in cross section at the base; lower incisors at right angles to the direction of the jaws; forearm 2" to 2".8. ..... *Vesperugo (Vesperugo) noctula*

b Fur bicoloured above; upper outer incisors equal to the inner incisors in cross section at the base; lower incisors in the direction of the jaws; forearm 1".8. ..... *Vesperugo (Vesperugo) leisleri*

African Chiroptera name ..... *Nyctalus leisleri*

165 a Inner margin of the tragus deeply concave. Wings from the base of the toes; the extreme tip of the tail along free; postcalcaneal lobe small. Tragus crescent-shaped; upper outer incisors half the length of the inner incisors, but less than half their transverse diameter at the base; forearm 1".35... *Vesperugo (Vesperugo) imbricatus*

b Inner margin of the tragus straight or faintly concave. Wings from the base of the toes; last osseous caudal vertebra free. 166

166 a Outer upper incisors as long as (or slightly longer than) the outer cusp of the inner incisor; postcalcaneal lobe small. 167

b Outer upper incisors very short, as in *Vesperugo serotinus*; no postcalcaneal lobe. Fur above deep black, the extremities of some hairs bright ferruginous; forearm 1".5. ..... *Vesperugo (Vesperugo) circumdatus*

c Upper incisors as in *Vesperugo noctula*; postcalcaneal lobe well developed. Fur dark reddish brown above and beneath; lower incisors in the direction of the jaws; forearm 1".5. ..... *Vesperugo (Vesperugo) indicus*

167 a Outer margin of the ear convex in lower half, concave above; fur above deep black; forearm 1".35 to 1".6. ..... *Vesperugo (Vesperugo) maurus*

b Outer margin of the ear straight; fur above brown; forearm 1".55. ..... *Vesperugo (Vesperugo) affinis*

168 a Wings from the tarsi; extremity of the tail scarcely projecting. Outer upper incisor on each side not equaling the outer cusp of the inner incisor in vertical extent, and considerably less than it in cross section. Wings very short; the first upper premolar visible from without; forearm 1".5. ..... *Vesperugo (Vesperugo) brachypterus*

b Wings fro the base of the toes. 169

169 a Postcalcaneal lobe distinct, generally well developed. 170

b No postcalcaneal lobe. 174

170 a Outer upper incisor on each side not equaling the outer cusp of the inner incisor in vertical extent. 171

b Outer upper incisor slightly exceeding the outer cusp of the inner incisor in vertical extent. Outer margin of the ear-conch straight; forearm 1'"35. ..... *Vesperugo (Vesperugo) abramus*

c Outer upper incisors minute. 172

171 a Outer margin of the ear-conch deeply concave above; forearm 1".25. ..... *Vesperugo (Vesperugo) pipistrellus*

African Chiroptera name ..... *Pipistrellus pipistrellus*

b Outer margin of the ear-conch straight or faintly concave above; forearm 1".15. ..... *Vesperugo (Vesperugo) tenuis*

172 a Tragus obtuse, inner margin straight. 173

b Tragus attenuated upwards, acutely pointed, and curved inwards. Postcalcaneal lobe narrow; forearm 1".9. ..... *Vesperugo (Vesperugo) krefftii*

173 a Upper third of the outer margin of the ear-conch slightly concave; tail much shorter than the head and body; interfemoral and part of the wing-membrane behind margined with white; forearm 1".35. ..... *Vesperugo (Vesperugo) kuhlii*
African Chiroptera name ..... *Pipistrellus kuhlii*

b Upper third of the outer margin of the ear-conch deeply emarginated; tail as long as the head and body; no white margin to the membranes; forearm 1.3. .... *Vesperugo (Vesperugo) maderensis*
African Chiroptera name ..... *Pipistrellus maderensis*

174 a Outer upper incisors minute. 175

b Outer upper incisors as long or nearly as long as the inner incisors. 176

175 a Lower incisors in the direction of the jaws; forearm 1".35. .... *Vesperugo (Vesperugo) pulcher*
African Chiroptera name ..... *Pipistrellus rueppellii pulcher*

b Lower incisors at right angles to the direction of the jaws; forearm 1".15. .. *Vesperugo (Vesperugo) temminckii*
African Chiroptera name ..... *Pipistrellus rueppellii*

176 a Outer upper incisor on each side parallel and close to the inner incisor; extreme tip of the tail projecting; forearm 1".8. ..... *Vesperugo (Vesperugo) annectens*

b Outer upper incisor on each side directed vertically downwards, separated from the inner incisor, which is inclined inwards; the last osseous caudal vertebra quite free: forearm 1"35. ..... *Vesperugo (Vesperugo) georgianus*

177 a Outer margin of the ear-conch terminating in a round lobe; tragus with a small tooth-like projection at the base; outer incisors very short; forearm 1".2. ..... *Vesperugo (Vesperugo) tylopus*

b Outer margin of the ear-conch terminating in a square lobe; tragus without a projection at the base; outer incisors nearly as long as the inner ones; forearm 1"2. .... *Vesperugo (Vesperugo) nanus*
African Chiroptera name ..... *Neoromicia nana*

178 a Outer upper incisors in the tooth-row. Base of the thumbs simple, without adhesive cushions; forearm 1".4, tibia 0".7. ..... *Vesperugo (Hesperoptenus) doriæ*

b Outer upper incisors quite posterior to the tooth-row. 179

179 a Base of the thumbs simple, without adhesive cushions; forearm 2".2, tibia 0".9. ..... *Vesperugo (Hesperoptenus) tickelli*

b Base of the thumbs with broad adhesive cushions; forearm 1"01, tibia 0"045 ..... *Vesperugo (Hesperoptenus) blanfordi*

180 a Premolars $^{2-2}/_{2-2}$, first upper premolar minute (Hab. Australia, Tasmania, and New Zealand) (Subgenus *Chalinolobus*). 181

b Premolars $^{1-1}/_{2-2}$; the single upper premolar large, close to the canine (Hab. Southern and Equatorial Africa) (Subgenus *Glauconycteris*). 184

181 a Internal basal lobe of the ear not forming a distinct lobule at the base projecting backwards. 182

b Internal basal lobe of the ear forming a distinct lobule at the base, projecting backwards. 183

182 a With a transverse cutaneous process on the face between the eyes; forearm 1".4 ..... *Chalinolobus (Chalinolobus) signifer*

b No cutaneous process on the face; forearm 1".55. .... *Chalinolobus (Chalinolobus) tuberculatus*

183 a Outer margin of the ear terminating in front in a pendent lobule; forearm 1".8 in adults. ..... *Chalinolobus (Chalinolobus) gouldii*

b Outer margin of the ear terminating in a horizontal lobule; forearm 1".35 in adults. ..... *Chalinolobus (Chalinolobus) nigrogriseus*

184 a Wing-membranes brown, unicoloured. Internal basal lobe of the ear commencing in a short obtuse lobule; lower incisors in the direction of the jaw; forearm 1".65. ..... *Chalinolobus (Glauconycteris) poensis*
African Chiroptera name ..... *Glauconycteris poensis*

b Wing-membranes dusky white, traversed by well-defined reticulations. 185

185 a Internal basal lobe of the ear commencing in a long narrow lobule projecting backwards; lower incisors in the direction of the jaw; forearm 1".7. .... *Chalinolobus (Glauconycteris) argentatus*
African Chiroptera name ..... *Glauconycteris argentata*
b Internal basal lobe of the ear commencing in a short obtuse lobule; lower incisors at right angles to the direction of the jaw; forearm 1".55. .... *Chalinolobus (Glauconycteris) variegatus*
African Chiroptera name ..... *Glauconycteris variegata*
186 a Internal basal lobe of the ear angular, inferior margin straight, forming with the ascending margin almost a right angle; tragus with a narrow prominent ridge passing across its front surface from the base of its inner margin. Upper incisors close to canines; premaxillary bones very narrow, leaving a wide space between them in front, nasal opening very large. (Subgenus *Scotophilus*). 187
b Internal basal lobes of the ear convex, evenly rounded; front surface of the tragus smooth (Subgenus *Scoteinus*). 189
c Upper incisors separated from the canines by a short space; premaxillary bones more developed ; nasal opening small. Cingulum of the upper incisors with a distinct cusp posteriorly; forearm 2".35 (Subgenus *Scotomanes*). .... *Scotophilus (Scotomanus) ornatus*
187 a Cingulum of the upper incisors very narrow. Forearm 2".3 - 2".45. .... *Scotophilus (Scotophilus) temminckii*
b Cingulum of the upper incisors forming: a broad horizontal shoulder behind. 188
188 a Forearm 2"..... *Scotophilus (Scotophilus) borbonicus*
African Chiroptera name ..... *Scotophilus borbonicus*
b Forearm 3".4..... *Scotophilus (Scotophilus) gigas*
African Chiroptera name ..... *Scotophilus nigrita*
189 a Ears nearly as long as the head, internal basal lobe commencing in a long lobule projecting backwards; forearm 2".2. ..... *Scotophilus (Scoteinus) emarginatus*
b Ears much shorter than the head, internal basal lobe commencing in a short lobule. 190
190 a Cingulum of the upper incisors with a small cusp posteriorly; forearm 2"..... ..... *Scotophilus (Scoteinus) rueppellii*
b Cingulum of the upper incisors without a posterior cusp. 191
191 a Lower incisors at right angles to the direction of the jaws; forearm 1".2. .... *Scotophilus (Scoteinus) greyii*
b Lower incisors at right angles to the direction of the jaws; forearm 1".4. .... *Scotophilus (Scoteinus) pallidus*
192 a Premolars $^{2-2}/_{2-2}$; the whole upper surface of the interfemoral membrane clothed with hair (Subgenus *Atalapha*). 193
b Premolars $^{1-1}/_{2-2}$; the posterior half or third of the interfemoral membrane naked (Subgenus *Dasypterus*). 194
193 a Forearm quite naked; fur reddish ashy. ..... *Atalapha (Atalapha) noveboracensis*
b Forearm with a small patch of hairs near the elbow; fur generally brownish ashy. ..... *Atalapha (Atalapha) cinerea*
194 a The posterior third of the interfemoral naked. 195
b The posterior half of the interfemoral naked. Tragus subacute, curved inwards; fur pale yellowish brown. ..... *Atalapha (Dasypterus) ega*
195 a Tragus obtuse, curved inwards; fur olive-brown. ... *Atalapha (Dasypterus) intermedia*
b Tragus subacute, straight, the tip only curved inwards; fur bright reddish. .... *Atalapha (Dasypterus) eyreyia*
196 a First upper premolar much smaller than the second (Subgenus *Murina*). 197
b First upper premolar equal to or nearly equal to the second (Subgenus *Harpiocephalus*) 198
197 a Upper third of the outer margin of the ear-conch concave; forearm 1".35. ..... *Harpiocephalus (Murina) suillus*
b Upper third of the outer margin of the ear-conch convex or straight; forearm 1".1. ..... *Harpiocephalus (Murina) auratus*
198 a Upper third of the outer margin of the ear-conch concave. 199
b Upper third of the outer margin of the ear-conch convex or straight. 200
199 a Ears narrow, pointed; forearm 1".3. ..... *Harpiocephalus (Harpiocephalus) griseus*

b Ears broadly rounded off above; forearm 2".4. .... *Harpiocephalus (Harpiocephalus) harpia*

200 a No spur near the base of the inner margin of the ear-conch; first upper premolar equal to the second; forearm 1".3. ..... *Harpiocephalus (Harpiocephalus) cyclotis*

b A distinct horizontal spur-like projection near the base of the inner margin of the ear-conch; first upper premolar smaller than the second; forearm 1".3. .... *Harpiocephalus (Harpiocephalus) leucogaster*

201 a Feet very large; wing-membrane from the tibia or ankle, rarely from, the side of the foot; interfemoral membrane forming a very acute angle in the centre of its free margin behind; tail projecting by the last vertebra or by the last two vertebræ from the membrane; calcaneum very long, extending at least three fourths the distance between the ankle and the tail (Subgenus *Leuconoë*). 202

b Feet moderate; wing-membrane from the base of the toes, rarely from the metatarsus; interfemoral membrane forming an obtuse angle in the centre of its free margin behind; tail wholly contained in the membrane or projecting by its extreme tip only; calcaneum extending about halfway between the ankle and the tail (Subgenus *Vespertilio*). 211

202 a Wings from the sides of the back near the spine. 203

b Wings from the sides of the body. 204

203 a Wings from the middle of the tibiæ; the second lower premolar minute, quite internal to the tooth-row. Tragus short, straight, and obtusely pointed; fur long; forearm 2".1. ..... *Vespertilio (Leuconoë) pilosus*

b Wings from the ankles; the second lower premolar in the tooth-row. Tragus moderately long, subacute fur very short; forearm 1'"8. .... *Vespertilio (Leuconoë) macrotarsus*

204 a Wings from the ankles. 205

b Wings from the tarsi. The first and second upper premolars internal to the tooth-row, the third premolar separated by a narrow space from the canine. Tragus straight, subacute; forearm 1".8. ..... *Vespertilio (Leuconoë) ferrugineus*
African Chiroptera name ..... *Nyctalus lasiopterus*

c Wings from the metatarsi. The second lower premolar stands in the tooth-row or is partially drawn inwards. 208

d Wings from the base of the toes. The second premolar in both jaws internal to the tooth-row. The ear laid forwards extends exactly to the end of the muzzle. 210

205 a The second lower premolar minute, quite internal to the tooth-row. Tragus straight; fur very short; forearm 1".6. ..... *Vespertilio (Leuconoë) hasseltii*

b The second lower premolar stands in the tooth-row, or, partially only, internal. ... 206

206 a The second upper premolar quite internal to the tooth-row. Tragus straight; fur moderately long; forearm 1".55. ..... *Vespertilio (Leuconoë) adversus*

b The second upper premolar stands in the tooth-row, or, with the first premolar, is drawn partially inwards. 207

207 a Tragus inclined outwards above, inner margin convex; forearm 1".45. .... *Vespertilio (Leuconoë) capaccinii*
African Chiroptera name ..... *Myotis capaccinii*

b Tragus straight, inner margin straight; forearm 1".45. *Vespertilio (Leuconoë) longipes*

c Tragus inclined inwards, obtuse, inner margin slightly concave; forearm 1".8. ..... *Vespertilio (Leuconoë) dasycneme*

208 a The second upper premolar stands in the tooth-row, or, with the first, is partially drawn inwards. 209

b The second upper premolar internal to the tooth-row. The ear laid forwards does not extend beyond the end of the muzzle; tragus inclined outwards; forearm 1".5. ..... *Vespertilio (Leuconoë) fimbriatus*

209 a The ear laid forwards does not extend beyond the end of the muzzle; forearm 1".45. ..... *Vespertilio (Leuconoë) daubentonii*

b The ear laid forwards extends one tenth of an inch beyond the end of muzzle; forearm 1".45. ..... *Vespertilio (Leuconoë) megalopus*

210 a Fur moderately long ; last two caudal vertebræ projecting; forearm 1".25. .*Vespertilio (Leuconoë) davidii*

b Fur very short; the last osseous caudal vertebra alone projecting; forearm 1".35. ..... *Vespertilio (Leuconoë) bocagii*
African Chiroptera name ..... *Myotis bocagii bocagii*

211 a Old-World Species. 212
b New-World Species. 228

212 a Tragus attenuated above, acutely pointed, and curved outwards. 213
b Tragus straight (curved outwards above in *Vespertilio australis* only), subacutely or obtusely pointed. Wings from the base of the toes. 219

213 a Wings from the metatarsus; fur of the neck and shoulders much longer than that of the rest of the body. Ears nearly as long as the head; the outer margin of the ear-conch deeply concave above; terminal third of the hairs beneath pale brown; forearm 1".5. ..... *Vespertilio (Vespertilio) goudotii*
African Chiroptera name ..... *Myotis goudoti*
b Wings from the base of the toes; fur of the neck and shoulders scarcely longer than that of the rest of the body. 214

214 a Ears shorter than the head. 215
b Ears as long or longer than the head; outer side of the ear-conch flatly emarginated above. 216

215 a Ears much shorter than the head; outer side of the ear-conch deeply concave above; terminal half of the hairs beneath pure white; forearm 1".35. ..... *Vespertilio (Vespertilio) nipalensis*
b Ears much shorter than the head; outer side of the ear-conch slightly concave above; terminal third of the hairs beneath pale reddish brown; forearm 1".9. ..... *Vespertilio (Vespertilio) tricolor*
African Chiroptera name ..... *Myotis tricolor*
c Ears nearly as long as the head; outer side of the ear-conch deeply angularly emarginate above; terminal third of the hairs beneath pale reddish brown; forearm 1".58. ..... *Vespertilio (Vespertilio) emarginatus*

216 a Ears as long as the head. Forearm 1".5. ..... *Vespertilio (Vespertilio) oreias*
b Ears longer than the head. 217

217 a Posterior margin of the interfemoral membrane fringed; tail as long as the head and body. 218
b Posterior margin of the interfemoral membrane naked; tail shorter than the head and body. Wing-membranes unicoloured; forearm 1".55. ..... *Vespertilio (Vespertilio) bechsteinii*

218 a Wing-membranes variegated with orange and black; forearm 2".05. ..... *Vespertilio (Vespertilio) welwitschii*
African Chiroptera name ..... *Myotis welwitschii*
b Wing-membranes unicoloured; forearm 1".45. ..... *Vespertilio (Vespertilio) nattereri*

219 a Outer side of the ear-conch flatly emarginated above. 220
b Outer side of the ear deeply concave above. 224

220 a Wing-membranes unicoloured. 221
b Wing-membranes variegated with orange and black. Ears slightly shorter than the head; forearm 1".9. ..... *Vespertilio (Vespertilio) formosus*

221 a Terminal half of the hairs beneath white. 222
b Hairs black or dark brown beneath, the extreme tips greyish. 223

222 a Ears longer than the head; forearm 2".35. ..... *Vespertilio (Vespertilio) murinus*
b Ears shorter than the head; forearm 2".2. ..... *Vespertilio (Vespertilio) africanus*

223 a Ears broad, slightly shorter than the head; forearm 2".1. ..... *Vespertilio (Vespertilio) murinoides*
b Ears narrow, much shorter than the head; forearm 2".5. ..... *Vespertilio (Vespertilio) chinensis*

224 a Second upper premolar quite internal to the tooth-row. Ears shorter than the head; lower two thirds of the outer margin of the ear-conch strongly and abruptly convex; forearm 1".4. ..... *Vespertilio (Vespertilio) insularum*
b Second upper premolar in the tooth-row, or with the first premolar drawn partially inwards. 225

225 a No postcalcaneal lobule. 226
b Postcalcaneal lobe distinct; muzzle obtuse. 227

226 a Ears shorter than the head; outer margin of the ear-conch slightly convex in the lower half; forearm 1".5. ..... *Vespertilio (Vespertilio) montivagus*
b Ears as long as the head; outer margin of the ear-conch strongly convex in lower half; forearm 1".25. ..... *Vespertilio (Vespertilio) mystacinus*
227 a Tragus straight or slightly inclined inwards; fur long; forearm 1".25. .... *Vespertilio (Vespertilio) muricola*
b Tragus inclined outwards above; fur short; forearm 1".55. .... *Vespertilio (Vespertilio) australis*
228 a Feet small; tail wholly included in the interfemoral membrane or the extreme tip alone projecting. 229
b Feet rather large; last rudimentary caudal vertebra free. 230
c Feet rather large; last osseous caudal vertebra free or half free. 232
229 a Ears as long as the head; muzzle slender, pointed; thumb shorter than the foot. ..... *Vespertilio (Vespertilio) nitidus*
b Ears shorter than the head; muzzle obtuse; thumb moderate, as long as the foot; forearm 1".35. ..... *Vespertilio (Vespertilio) nigricans*
c Ears as long as the head; muzzle obtuse; thumb longer than the foot; face very hairy; forearm 1".6. ..... *Vespertilio (Vespertilio) oxyotus*
230 a Fur very dense and woolly, covering the whole muzzle. Ears shorter than the head; forearm 1".55 ..... *Vespertilio (Vespertilio) polythrix*
b Fur straight, moderately dense, not extending thickly upon the muzzle. 231
231 a Ears as long as the head; tragus straight; a small postcalcaneal lobule; posterior margin of the interfemoral naked; forearm 1".45.... *Vespertilio (Vespertilio) chiloensis*
b Ears longer than the head; tragus inclined outwards; no postcalcaneal lobule; posterior margin of the interfemoral fringed forearm 1".5. *Vespertilio (Vespertilio) levis*
232 a Tragus long, inclined outwards. 233
b Tragus moderately long, straight. Wings from the metatarsus or base of the toes. Ears shorter than the head. 235
233 a Wings from the base of the toes. Ears longer than the head. 234
b Wings from the tarsus or metatarsus. Ears as long as the head. The extremity of the ear laid forwards extends to the end of the muzzle. ..... *Vespertilio (Vespertilio) carolii*
234 a The extremity of the ear laid forwards extends about 0".35 beyond the end of the muzzle. ..... *Vespertilio (Vespertilio) evotis*
b The extremity of the ear extends 0".1 beyond the end of the muzzle. .... *Vespertilio (Vespertilio) subulatus*
235 a The extremity of the ear laid forwards does not extend so far as the end of the muzzle. 237
236 a The extremity of the ear laid forwards extends to the end of the muzzle; forearm 1".4. ..... *Vespertilio (Vespertilio) lucifugus*
237 a The first and second upper premolars internal to the tooth-row; forearm 1".75. ..... *Vespertilio (Vespertilio) albescens*
b The first and second premolars in the tooth-row; forearm 1".35. .... *Vespertilio (Vespertilio) arsinoë*
238 a Outer margin of the tragus without a lobule at the base, but with a more or less distinct process opposite the base of the inner margin, not succeeded by an emargination immediately above or beneath. 240
b Outer margin of the tragus with a distinct lobule at the base as in *Vespertilio*, succeeded immediately above, opposite the base of the inner margin, by an emargination. Outer upper incisor on each side minute, scarcely exceeding the cingulum of the inner incisor in vertical extent. Wing-membranes unicoloured. .. 244
239 a Outer upper incisors equal to or exceeding half the length of the inner incisors; inner incisors with cusp. 240
b Outer upper incisors short, sometimes minute, never equalling half the length of the inner incisors; inner incisors with or without a small basal cusp posteriorly. Wing-membranes unicoloured. 242
c Outer upper incisors nearly as long as the inner incisors; inner incisors with a small posterior basal cusp. Margin of the interfemoral membrane with a comb-like fringe, as in *Kerivoula picta*; forearms, thumbs, and tibise clothed with short appressed hairs. Ears shorter than the head; forearm 1".4. ..... *Kerivoula lanosa*

240 a Wing-membranes variegated with orange and black. Margin of the interfemoral membrane with a well-developed comb-like fringe. Ears shorter than the head; fur orange; forearm 1".4. ..... *Kerivoula picta*
b Wing-membranes unicoloured. 241
241 a Margin of the interfemoral membrane with a well-developed comb-like fringe. Ears shorter than the head; fur brown; forearm 1".3 or slightly more. ..... *Kerivoula brunnea*
African Chiroptera name ..... *Kerivoula lanosa*
b Margin of the interfemoral with a few fine hairs. Ears as long as the head; fur greyish-brown; forearm 1".1. ..... *Kerivoula africana*
242 a Margin of the interfemoral membrane naked. Ears shorter than the head; outer upper incisors nearly half the length of the inner incisors (in immature individuals); fur darker at the base, paler at the extremities; forearm 1".4. ..... *Kerivoula hardwickii*
b Margin of the interfemoral membrane fringed with short rather stiff hairs. 243
243 a Ears shorter than the head; outer upper incisors minute; fur darker at the extremities than at the base; forearm 1".7. ..... *Kerivoula papillosa*
b Ears longer than the head; outer incisors as in *Kerivoula papillosa*; forearm 1".25. ..... *Kerivoula pellucida*
244 a Margin of the interfemoral membrane naked; forearms and thumbs also naked. Ears shorter than the head, outer margin of the ear-conch with a second small concavity about the middle; fur as in *Kerivoula hardwickii*; forearm 1".55. ..... *Kerivoula jagorii*
b Margin of the interfemoral fringed; forearms, thumbs, and tibiæ clothed with short appressed hairs. 245
245 a Margin of the interfemoral with a few fine hairs; ears as long as the head; fur brown, with shining yellow extremities; forearm 1".45. ..... *Kerivoula papuensis*
b Margin of the interfemoral with short bristly hairs; ears shorter than the head; fur tricoloured, with bronze-yellow extremities; forearm 1".45. ..... *Kerivoula ærosa*
246 a Tragus broad at the base, narrow and pointed above; forearm 1"'6. .... *Natalus stramineus*
b Tragus narrow opposite the base of its inner margin, expanded above; forearm 1".05. ..... *Natalus. lepidus*
247 a No lobule or projection above the base of the outer margin of the tragus. 248
b A distinct triangular projection above the base of the outer margin of the tragus. ..... *Miniopterus tristis*
248 a Interfemoral membrane nearly naked. ..... *Miniopterus schreibersii*
b Half the interfemoral membrane clothed, ... 249
249 a Wing-membrane external to the tibiæ naked; muzzle longer. ..... *Miniopterus australis*
b Wing-membrane with a band of fur extending from the elbow to the ankle; muzzle shorter. ..... *Miniopterus scotinus*
250 a Subfamily Emballonurinæ. 251
b Subfamily Molossinæ. 277
251 a Tail shorter than the large interfemoral membrane; index finger formed by the metacarpal alone. 252
b Tail much longer than the short interfemoral membrane; index finger with two phalanges. First phalanx of the middle finger incompletely folded (in repose) on the dorsal surface of the metacarpal bone; pemaxillaries united; incisors very weak (Group Rhinopomata). Upper incisors small, very slender, diverging outwards; ears united; a small nose-leaf behind the valvular nostrils; inc. $^{2}/_{4}$, pm. $^{1-1}/_{2-2}$ (Genus *Rhinopoma*). ..... *Rhinopoma microphyllum*
252 a First phalanx of the middle finger folded (in repose) on the dorsal surface of the metacarpal bone. 253
b First phalanx of the middle finger extended (in repose) in a line with the metacarpal bone; premaxillaries united; upper incisors strong (Group Noctiliones). Upper middle incisors close together in the centre of the space between the canines; ears very narrow; chin with transverse cutaneous ridges; inc. $^{4}/_{2}$, pm. $^{1-1}/_{2-2}$ (Genus *Noctilio*). 276
253 a Tail terminating in the interfemoral membrane. Crown of the head greatly elevated above the face-line; thumb and first phalanx of the middle finger very short; inc. 2 - 2/6, pm. $^{2-2}/_{3-3}$ (Group Furiæ). 254
b Tail perforating the centre of the large interfemoral membrane, and appearing upon its upper surface. 255

254 a Nasal apertures oval, close together in front; bony palate not produced backwards behind the last molar (Genus *Furia*)..... *Furia horens*
b Nasal apertures triangular, widely separated; bony palate produced as far back as the middle of the zygomatic arches (Genus *Amorphochilus*)..... *Amorphochilus schnablii*
255 a Part of the tail included in the basal half of the interfemoral membrane, which it perforates simply. Crown of the head slightly elevated above the face -line; thumb and first phalanx of the middle finger moderately long; premolars $^{2-2}/_{2-2}$ (Group Emballonuræ)..... 256
b Part of the tail suspended in a fold derived from the inferior surface of the basal half of the interfemoral membrane, the terminal portion perforating the bottom of a pouch formed in the centre of the membrane. Crown of the head slightly elevated above the face -line; thumb very short; extremity of the muzzle not produced beyond the lower lip; forehead deeply concave (Group Dicliduri). Incisors $^{1-1}/_{6}$, pm. $^{2-2}/_{2-2}$ (Genus *Diclidurus*). ..... *Diclidurus albus and Diclidurus scutatus*
256 a Lower incisors 6; premaxillaries osseous; upper incisors persistent. 257
b Lower incisors 4 ; premaxillaries cartilaginous; upper incisors deciduous. Upper incisors 1 - 1. Extremity of the muzzle not produced beyond the lower lip; forehead deeply concave (Genus *Taphozous*). 267
257 a No pouch in the antebrachial membrane. 258
b Antebrachial membrane with a pouch opening on its upper surface. Upper incisors 1 - 1. Extremity of the muzzle more or less produced beyond the lower lip; forehead flat (Genus *Saccopteryx*)..... 264
258 a Upper incisors 2 - 2. Extremity of the muzzle more or less produced beyond the lower lip; forehead flat (Genus *Emballonura*). 260
b Upper incisors 1 - 1. 259
259 a Extremity of the muzzle broad, slightly produced beyond the lower lip; forehead concave (Genus *Colëura*). 263
b Extremity of the muzzle narrow, much produced beyond the lower lip; forehead flat (Genus *Rhynchonycteris*)..... *Rhynchonycteris naso*
260 a Nostrils close together in front, opening by circular apertures directed forwards; upper lip projecting more or less beyond the lower in front; lower incisors separated on each side from the canines (Subgenus *Emballonura*). 261
b Nostrils widely separated, opening by elliptical apertures placed obliquely; upper lip not projecting in front; lower incisors filling up the space between the canines (Subgenus *Mosia*). Inner margin of the tragus convex. Calcaneum shorter than the tibia; wings from the base of the toes; forearm 1".45. .... *Emballonura (Mosia) nigrescens*
261 a Inner margin of the tragus concave. Calcaneum shorter than the tibia; wings from the ankles; forearm 1".7. ..... *Emballonura (Emballonura) semicaudata*
b Inner margin of the tragus convex..... 262
262 a Calcaneum shorter than the tibia; wings from the feet; forearm 1".4. .... *Emballonura (Emballonura) monticola*
b Calcaneum longer than the tibia; wings from the ankles; forearm 1".5..... ..... *Emballonura (Emballonura) atrata*
African Chiroptera name ..... *Paremballonura atrata*
263 a Lower lip with a distinct median groove in front; muzzle obtusely conical; ears narrowly rounded off above; forearm 2".2; tibia 0".95..... *Colëura seychellensis*
African Chiroptera name ..... *Coleura seychellensis*
b Lower lip not divided by a groove in front; muzzle acutely conical; ears broadly rounded off above; forearm 1".9; tibia 0".6..... *Colëura afra*
African Chiroptera name ..... *Coleura afra*
264 a Wing-sac opening along the forearm on the outer side of the antebrachial membrane; ears narrowed above, emarginated externally, tragus abruptly truncated above; wings from the tibiæ or from the ankles; premaxillary bones without internal oblique process, facial bones flattened; anterior margin of the orbit in a vertical line with the second upper premolar (Subgenus *Saccopteryx*). 265

b Wing-sac opening near the anterior margin of the antebrachial membrane, aperture directed outwards; ears triangular, rounded, close together or united by a band across the face; tragus rounded off above; wings from the tibia or from the tarsus; premaxillary bones with an internal oblique process; facial bones mesially hollowed, laterally expanded above in front of the orbits; anterior margin of the orbit in the same vertical line with the middle of the second premolar (Subgenus *Peropteryx*). 266

c Wing-sac opening in the centre of the antebrachial membrane, the aperture directed inwards; nu other respects as in subgenus *Peropteryx* (Subgenus *Balantiopteryx*). The posterior edge of the wing-membrane margined with white; forearm 1".7. .....*Saccopteryx (Balantiopteryx) plicata*

d Wing-sac opening on the inner side of the antebrachial membrane near the shoulder; ears separate; wings from the base of the toes; premaxillary bones very small; facial bones flattened above, with a longitudinal central groove (Subgenus *Centronycteris*). Ears slightly longer than the head; forearm 1".75. ....*Saccopteryx (Centronycteris) calcarata*

265 a No longitudinal streaks on the fur of the back; forearm about 1".4. ....*Saccopteryx (Saccopteryx) leptura*

b Two longitudinal streaks on the fur of the back; forearm about 1".8. ....*Saccopteryx (Saccopteryx) bilineata*

266 a Ears separate; wings from the distal end of the tibiæ; forearm 1".8. ....*Saccopteryx (Peropteryx) canina*

b Ears united; wings from the tarsus; forearm 1".7 (Subgenus *Peronymus* Peters). .....*Saccopteryx (Peropteryx) leucoptera*

267 a Radio-metacarpal pouch distinct; lower lip scarcely grooved (Subgenus *Taphozous*). 268

b No radio-metacarpal pouch; lower lip divided in the centre of its upper surface and in front by a deep narrow groove (Subgenus *Taphonycteris*). 274

268 a Radio-metacarpal pouch well developed. 269

b Radio-metacarpal pouch small; fur very short, not extending to membranes; forearm 2".95. .....*Taphozous (Taphozous) nudiventris*
African Chiroptera name ..... *Taphozous nudiventris*

269 a No gular sac in male or female. 270

b Gular sac present in males, rudimentary or absent in females. 271

270 a Fur of the back extending upon part of the wing- and interfemoral membranes; extremity of tail thickened; forearm 2".5. ..... *Taphozous (Taphozous) melanopogon*

b Fur of the back very narrow across loins, not extending upon the membranes; extremity of tail not thickened; forearm 3". ..... *Taphozous (Taphozous) theobaldi*

271 a Gular sac quite absent in females, throat hairy beneath. 272

b Gular sac rudimentary in females, throat naked beneath. 273

272 a Ears as long or longer than the head; forearm 2".7. *Taphozous (Taphozous) australis*

b Ears shorter than the head; forearm 2".4. ..... *Taphozous (Taphozous) perforatus*
African Chiroptera name ..... *Taphozous perforatus*

273 a Fur brown above and beneath; forearm 2".45. .. *Taphozous (Taphozous) longimanus*

b Fur brown above and beneath neck; chest and abdomen pure white; forearm 2".4. ..... *Taphozous (Taphozous) mauritianus*
African Chiroptera name ..... *Taphozous mauritianus*

274 a Ears broadly rounded off above; inner margin smooth, slightly convex above; forearm three inches or less. 275

b Ears triangular, narrowly rounded off above; inner margin papillate; forearm three and a half inches at least. .....*Taphozous (Taphonycteris) peli*
African Chiroptera name ..... *Saccolaimus peli*

275 a Gular sac developed (but smaller) in female also; fur dark brown above and beneath. ..... *Taphozous (Taphonycteris) saccolæmus*

b Gular sac rudimentary in female, the margins alone developed; fur brown above, pure white beneath. ..... *Taphozous (Taphonycteris) affinis*

276 a Larger; forearm in adults at least 3 inches long; foot 1"; upper molars touching by the extremities only of their external cusps, with narrow spaces between the adjacent teeth..... *Noctilio leporinus*

b Smaller; forearm in adults not exceeding 2".5 in length; foot 0".6; upper molars closely approximated together without intervening spaces. ..... *Noctilio albiventer*

277 a Group Molossi. 278
b Group Mystacinæ (Genus *Mystacina*)..... *Mystacina tuberculata*
278 a First toe much larger and thicker than the other toes and separable from them; ears quite separate. Premaxillary bones united; upper incisors very strong, close together in front (Genus *Cheiromeles*). ..... *Cheiromeles torquatus*
African Chiroptera name ..... *Myonycteris torquata*
b First and fifth toes much thicker than the other toes; ears united or close together by their inner margins..... 279
279 a Premaxillary bones united; upper incisors close together in front (Genus *Molossus*). 280
b Premaxillary bones separate, or united by cartilage only; upper incisors separate in front (Genus *Nyctinomus*). 291
280 a To subgenera. 281
b To species. 283
281 a Ears more or less united. 282
b Ears distinctly separate ; upper incisors with diverging summits, their bases removed from the canines by a diastema. ..... *Subgenus Myopterus*
282 a Premolars $^{2-2}/_{2-2}$; upper incisors with diverging summits, and with their broad bases close to the canines..... *Subgenus Promops*
b Premolars $^{1-1}/_{2-2}$; upper incisors parallel by their inner margins, their bases close to the canines. ..... *Subgenus Molossus*
283 a Muzzle rounded in front; lips smooth, not wrinkled; tragus triangular or linear..... 284
b Muzzle very obliquely truncated, its superior and external front margins formed by the sharply cut cartilaginous rims of the nostrils; lips smooth or very slightly wrinkled; tragus quadrate; inc. $^{2}/_{4}$, pm. $^{2-2}/_{2-2}$. 289
284 a Antitragus circular, as high as long. 285
b Antitragus half-oval or half-cordate, longer than high, tragus linear; inc. $^{2}/_{4}$, pm. $^{2-2}/_{2-2}$. Forearm 2".45..... *Molossus (Promops) abrasus*
285 a Tragus triangular, with a broad base; inner margins of the ears arising from the forehead by separate points of origin ; inc. $^{2}/_{4}$, pm. $^{1-1}/_{2-2}$..... 286
b Tragus linear, subacutely pointed; inner margins of the ears arising from the same point, or very close together..... 288
286 a Ears obtusely pointed. Centre of breast and abdomen pale yellowish brown; forearm 1".2. ..... *Molossus (Myopterus) temminckii*
b Ears rounded off above. 287
287 a Centre of breast and abdomen white; forearm 1".35. *Molossus (Myopterus) planirostris*
b Centre of breast and abdomen not different from sides; forearm 1".7. .... *Molossus (Myopterus) brachymeles*
288 a Inc. $^{2}/_{2}$, pm. $^{1-1}/_{2-2}$; the first lower premolar half internal to the tooth-row, partially concealed by the much larger second premolar. Fur very short; forearm 1".7 - 2".1. ..... *Molossus (Molossus) rufus*
b Inc. $^{2}/_{4}$, pm. $^{2-2}/_{2-2}$; the first lower premolar in the tooth-row. Fur moderately long; forearm 2".0..... *Molossus (Promops) nasutus*
289 a Ears longer than the head; gular sac large; first upper premolar external. Forearm 2".9. ..... *Molossus (Promops) perotis*
b Ears shorter than the head; gular sac small; first upper premolar in the tooth-row. 290
290 a Upper lip smooth; forearm 2".35. ..... *Molossus (Promops) glaucinus*
b Upper lip slightly wrinkled; forearm 1".8..... *Molossus (Promops) bonariensis*
291 a Ears very close or united together; upper lip deeply grooved by vertical wrinkles; premolars $^{2-2}/_{2-2}$ (Subgenus *Nyctinomus*). 309
b Ears distinctly separate; upper lip slightly wrinkled; premolars $^{1-1}/_{2-2}$. Antitragus separated by a very shallow notch; lower incisors 6. Muzzle flat or rounded off above; upper lip with ill-defined vertical wrinkles. Tragus triangular, rounded off above (Subgenus *Mormopterus*)..... 292
292 a Integument of the ears thick, opaque; keel of the ear-conch thickened in lower third; antitragus separated by a deep notch..... 293
b Integument of the ears thin, translucent; keel of the ear-conch slender, deep, bent backwards on itself..... 304

293 a Lips smooth; inner margins of the ears arising from the muzzle by distinct points of origin; tragus broad, rounded off above. Antitragus irregularly quadrate; forearm 2".5; lower incisors 4. ..... *Nyctinomus (Nyctinomus) africanus*
African Chiroptera name ..... *Tadarida ventralis*
b Lips furrowed by deep vertical wrinkles. 294
294 a Ears separate or conjoined at the bases of their inner margins only; tragus broad, rounded off above. 295
b Ears conjoined by a more or less deep band; tragus small; no gular sac. 297
295 a Ears conjoined at the bases of their inner margins; gular sac distinct in male. Antitragus obliquely triangular, rounded; forearm 2".4; lower incisors 6. ..... *Nyctinomus (Nyctinomus) cestonii*
African Chiroptera name ..... *Tadarida ventralis*
b Ears separate; no gular sac. Antitragus half-oval. 296
296 a Forearm 1".95; lower incisors 4. ..... *Nyctinomus (Nyctinomus) ægyptiacus*
African Chiroptera name ..... *Tadarida aegyptiaca*
b Forearm 2"; lower incisors 6. ..... *Nyctinomus (Nyctinomus) tragatus*
297 a Ears conjoined at the bases of their inner margins. 298
b Ears conjoined by a deep band in front. 299
c Ears conjoined by a very deep band anteriorly, and, posteriorly, by a second low band ; forearm 1".9. ..... *Nyctinomus (Nyctinomus) johorensis*
298 a Fur unicoloured; wings from the lower end of the tibiæ; forearm 1".95. ..... *Nyctinomus (Nyctinomus) plicatus*
b Fur greyish on the surface; wings from the middle of the tibiæ; forearm 1".9. ..... *Nyctinomus (Nyctinomus) bivittatus*
African Chiroptera name ..... *Chaerephon bivittatus*
299 a The first upper premolar stands in the tooth-row. 300
b The first upper premolar external to the tooth-row. 302
300 a Lower third of the ear-keel much thickened and flattened externally; forearm 1".35. ..... *Nyctinomus (Nyctinomus) brachypterus*
b Lower third of the ear-keel slightly thickened, not flattened externally. 301
301 a Fur of the chest and abdomen uniform in colour; forearm 1".5. ..... *Nyctinomus (Nyctinomus) pumilus*
African Chiroptera name ..... *Chaerephon pusillus*
b Fur of the lower half of the chest and the abdomen white; forearm 1".6. ..... *Nyctinomus (Nyctinomus) limbatus*
African Chiroptera name ..... *Chaerephon pumilus*
302 a Lower third of the ear-keel slightly thickened, not flattened externally. Tragus quadrate; forearm 1".85. ..... *Nyctinomus (Nyctinomus) angolensis*
African Chiroptera name ..... *Mops (Mops) condylurus*
b Lower third of the ear-keel much thickened and flattened externally. 303
303 a Tragus narrow, much longer than broad, rounded off above; forearm 2".4. *Nyctinomus (Nyctinomus) miarensis*
African Chiroptera name ..... *Mops (Mops) midas miarensis*
b Tragus quadrate; forearm 1".8. ..... *Nyctinomus (Nyctinomus) mops*
304 a Antitragus separated by a deep notch; lower incisors 4. 305
b Antitragus separated by a very shallow notch; lower incisors 6. Muzzle flat in front of the ears; upper lips with vertical wrinkles. Ears separate. 308
305 a Muzzle thick, not concave in front of the eyes; upper lip with vertical wrinkles. ... 306
b Muzzle concave between the eyes and the extremity of the nose; upper lip furrowed by deep oblique wrinkles; no gular sac. 307
306 a Ears separate; a large gular sac; forearm 2".35. .. *Nyctinomus (Nyctinomus) australis*
b Ears united by a low band near the extremity of the muzzle; no gular sac; forearm 2".35. ..... *Nyctinomus (Nyctinomus) megalotis*
307 a Ears united by a deep band, antitragus much longer than high; forearm 2".2. ..... *Nyctinomus (Nyctinomus) macrotis*
b Ears united by a low band, antitragus as high as long; forearm 1".8. ..... *Nyctinomus (Nyctinomus) gracilis*
308 a Tragus quadrate, broad above; forearm 1".7. ..... *Nyctinomus (Nyctinomus) brasiliensis*

b Tragus triangular, narrow above; forearm 1".35. .... *Nyctinomus (Nyctinomus) norfolcensis*

309 a Ear broad above, upper third of the inner margin straight; forearm 1".45. *Nyctinomus (Mormopterus) albiventer*
African Chiroptera name ..... *Mormopterus jugularis*

b Ear narrow above, upper third of the inner margin deeply concave; forearm 1".55. ..... *Nyctinomus (Mormopterus) acetabulosus*
African Chiroptera name ..... *Mormopterus acetabulosus*

310 a Nostrils opening by simple apertures at the extremity of the muzzle in front, not margined by a distinct nose-leaf; chin with expanded leaf-like appendages (Subfamily Lobostominæ; Group Mormopes). 314

b Nostrils opening on the upper surface of the muzzle, the nasal apertures more or less surrounded or margined by well-developed cutaneous appendages, forming a distinct nose-leaf; chin with warts (Subfamily Phyllostominæ). 311

311 a Molars well developed; upper incisors 4. 312

b No true molars, or, if present, with crowns reduced to a narrow cutting-edge; upper incisors 2, large, trenchant (Group Desmodontes). 366

312 a Muzzle long and narrow; outer side of true molars with W-shaped cusps..... 313

b Muzzle short, broad, and obtuse; true molars broad and flat, with an outer notched cutting-edge (Group Stenodermata). 348

313 a Tougue moderately long, terminating in an obtuse tip; upper surface of the lower lip not divided in the centre by a deep groove (Group Vampyri). 321

b Tongue very long, much attenuated towards the tip; upper surface of the lower lip divided by a deep groove in the centre (Group Glossophagæ). 339

314 a Crown of the head moderately elevated above the face-line, the basicranial axis almost in the same plane as the facial (Genus *Chilonycteris*). 315

b Crown of the head greatly elevated above the face-line, the basicranial axis almost at right angles with the facial (Genus *Mormops*). 320

315 a Wings from the sides of the hairy back (Subgenus *Chilonycteris*)..... 316

b Wings from the spine; back behind the shoulders naked (Subgenus *Pteronotus*). Ears and muzzle as in *Chilonycteris personata*; forearm 1".85. .... *Chilonycteris (Pteronotus) davyi*

316 a Lower third of the inner margin of the ear-conch thickened and separated by a right-angled notch from the upper two thirds. 317

b Lower third of the inner margin of the ear-conch not thickened, continuous with the upper two thirds. No tooth-like projection from the upper margin of each nostril. Outer margin of the ear-conch abruptly convex at the commencement of its lower two thirds, forming a right-angled notch..... 319

317 a A small tooth-like projection from the upper margin of each nostril; outer margin of the ear-conch abruptly convex at the commencement of its lower two thirds, forming an acute-angled notch; forearm 1".65. ..... *Chilonycteris (Chilonycteris) macleayii*

b No tooth-like projection from the upper margin of each nostril. 318

318 a Outer margin of the ear-conch abruptly convex at the commencement of its lower two thirds, forming a right-angled notch; forearm 1"'8. .... *Chilonycteris (Chilonycteris) personata*

b Outer margin of the ear-conch gradually convex at the commencement of its lower two thirds; forearm 1".65. ..... *Chilonycteris (Chilonycteris) psilotis*

319 a Crown of the head more elevated; an obtusely conical projection on the upper surface of the muzzle forearm 2".l. ..... *Chilonycteris (Chilonycteris) parnellii*

b Crown of the head less elevated; a small transverse rounded projection on the muzzle; forearm 2".46. ..... *Chilonycteris (Chilonycteris) rubiginosa*

320 a Cutaneous band connecting the inner side of the ear-conch with the upper surface of the muzzle in front meeting the corresponding band of the opposite side behind the nostrils, but not united with it; chin-leaf deeply divided; fur reddish brown. .. *Mormops megalophylla*

b Cutaneous band connecting the inner side of the ear-conch with the muzzle united in front with its fellow of the opposite side; chin-leaf not divided; fur bright orange. ..... *Mormops blainvillii*

321 a Tail contained in and produced to the hinder margin of the interfemoral membrane, or extending slightly beyond it. 322

b Tail short, perforating the interfemoral membrane and appearing upon its upper surface, or none. 324

322 a Wing-membrane attached to the base of the calcaneum and to the inferior surface of the tibia. Nose-leaf with erect processes in front of the nasal orifices; chin with a. naked space above and a longitudinal groove beneath it, bounded by two naked prominences ; premolars $^{2-2}/_{3-3}$, second lower premolar minute (Genus *Lonchorhina*). ..... *Lonchorhina aurita*

b Wing-membrane from the outer side of the tibia or foot. 323

323 a Nose-leaf simple in front; chin with a deep V-shaped groove in front, bounded by raised naked prominences; premolars $^{2-2}/_{3-3}$, second lower premolar well developed (Genus *Macrotus*). 329

b Nose-leaf simple in front; lower lip and chin with a central naked space in front, bounded by small warts; premolars $^{2-2}/_{2-2}$ (Genus *Macrophyllum*). .... *Macrophyllum neuwiedii*

324 a Muzzle narrow and elongated, the distance between the eyes less than the length of the muzzle; premolars $^{2-2}/_{3-3}$ 325

b Muzzle shorter and broader, the distance between the eyes equal to or slightly greater than the length of the muzzle; premolars $^{2-2}/_{2-2}$ 328

325 a Wing-membrane from the backs of the feet. 326

b Wing-membrane from the sides of the feet, ... 327

326 a Nose-leaf well developed anteriorly, free in front and laterally; chin with a longitudinal groove margined by naked prominences; wing-membrane extending to the toes; tail very short, or none; skull narrower between the postorbital fossæ than immediately behind the canines; inc. $^{4}/_{4}$ or $^{4}/_{2}$ (Genus *Vampyrus*). 330

b Nose-leaf narrow in front; chin with a central naked space margined by small warts; wing-membrane extending to the tarsal or metatarsal bones of the outer toe; tail distinct; skull narrower between the postorbital fossæ than in front behind the canines; inc. $^{4}/_{2}$ (Genus *Lophostoma*). 331

327 a Nose-leaf well developed in front, but bound down to the muzzle; chin with a deep V-shaped groove margined by naked prominences; wing-membrane from the extremity of the tibiæ or sides of the feet; tail distinct; skull wider between the postorbital fossæ than in front behind the canines; inc. $^{4}/_{4}$ (Genus *Schizostoma*). 333

b Nose-leaf narrow in front, both it and the extremity of the muzzle with numerous small warts; chin with a long V-shaped groove margined by many small warts; wing-membrane extending to the tarsus; skull narrower between the postorbital fossæ than in front behind the canines; inc. $^{4}/_{4}$ (Genus *Trachyops*). ..... *Trachyops cirrhosus*

c Nose-leaf narrow in front; chin with a V-shaped naked space margined by small warts; wing-membrane extending to the metatarsus; skull much wider between the postorbital fossæ than in any part anterior to the orbits; inc. $^{4}/_{4}$ (Genus *Phylloderrma*). ..... *Phylloderma stenops*

328 a Nose-leaf well developed and free in front; chin with a deep V-shaped groove margined by small warts; wing-membrane extending to the ankles; skull narrower between the postorbital fossæ than immediately behind the canines; inc. $^{4}/_{4}$ (Genus *Phyllostoma*). 336

b Nose-leaf as in Phyllostoma in front, longer behind; chin with a naked longitudinal V-shaped space margined by small warts; wing-membrane extending to the base of the toes; skull much narrower between the postorbital fossæ than behind the canines; inc. $^{4}/_{2}$ (Genus *Tylostoma*). 338

c Nose-leaf narrow in front, very large behind; chin with a broad naked space divided by a central groove; wing-membrane from the ankles; inc. $^{4}/_{2}$ (Genus *Mimon*). ..... *Mimon bennettii*

d Nose-leaf as in Schizostoma; chin with a central wart margined by small warts; molars narrow, with obtuse-angled W-shaped cusps; skull wider between the postorbital fossæ than in front behind the canines; zygomatic arches deficient; inc. $^{4}/_{4}$ (Genus *Carollia*). ..... *Carollia brevicauda*

e Nose-leaf and chin-warts as in *Carollia*; molars very narrow, without distinct W-shaped cusps; skull wider between the postorbital fossæ than in front; tail none (Genus *Rhinophylla*). ..... *Rhinophylla pumilio*

329 a Ears longer than the head; front margin of the nose-leaf raised above the front of the muzzle; the last caudal vertebra free. ..... *Macrotus waterhousii*

b Ears as long as the head; front margin of the nose-leaf scarcely defined, continuous with the upper lip; last caudal vertebra and half the antepenultimate vertebra free. ..... *Macrotus bocourtianus*

330 a Tail none; incisors $^{4}/_{4}$ (Subgenus *Vampyrus*). The second lower premolar nearly as large as the first, in the tooth-row; forearm 4".2. ..... *Vampyrus (Vampyrus) spectrum*

b Tail short; incisors $^{4}/_{2}$ (Subgenus *Chrotopterus*). The second lower premolar considerably smaller than the first and drawn inwards; forearm; 3".2. .... *Vampyrus (Chrotopterus) auritus*

331 a Ears separate, not exceeding the head in length; skull nearly as wide between the postorbital fossæ as at the first upper premolar. 332

b Ears considerably longer than the head, united by a low band across the forehead; skull much narrower between the postorbital fossæ than at the first upper premolar. Fur, above, brown, whitish at the base of the hairs; forearm 2".2, tibia 1".3. ..... *Lophostoma amblyotis*

332 a Fur, above, unicoloured, dark brown; forearm 2".1, tibia 0".85. ..... *Lophostoma bidens*

b Fur, above, bicoloured, white at the base of the hairs, towards the extremities dark brown; forearm 1".45, tibia 0".75. ..... *Lophostoma brasiliense*

333 a The second phalanx of the middle finger equal or nearly equal to the first. 334

b The second phalanx of the middle finger conspicuously longer than the first. Calcaneum much shorter than the foot. Wings from the tarsi; forearms and legs nearly naked; forearm 1".85. ..... *Schizostoma behnii*

334 a Calcaneum longer than the foot. Wings from the tarsus or metatarsus 335

b Calcaneum shorter than the foot. Wings from the tibiæ. Forearms and legs naked; the first and second phalanges of the middle finger exactly equal in length; forearm 1".35. ..... *Schizostoma minutum*

335 a Forearms and legs hairy; the second phalanx of the middle finger slightly shorter than the first; forearm 1".6. ..... *Schizostoma hirsutum*

b Forearms and legs naked; the second phalanx of the middle finger slightly longer than the first; forearm 1".45. ..... *Schizostoma megalotis*

336 a Calcaneum longer than the foot. 337

b Calcaneum shorter than the foot. Nose-leaf as long as the foot; forearm 2".3. ..... *Phyllostoma discolor*

337 a Nose-leaf shorter than the foot; forearm 3".2. ..... *Phyllostoma hastatum*

b Nose-leaf longer than the foot; forearm 2".55. ..... *Phyllostoma elongatum*

338 a Lancet-shaped nose-leaf notched along the sides; calcaneum shorter than the tibia. ..... *Tylostoma crenulatum*

b Lancet-shaped nose-leaf with an entire margin; calcaneum longer than the tibia. ..... *Tylostoma longifolium*

339 a Molars with more or less distinct W-shaped cusps. 340

b Molars very narrow, without distinct W-shaped cusps. Inner upper incisors smaller than the outer ones. Inner upper incisors in pairs, separated by a wide space. Zygomatic arch undeveloped; premolars $^{3-3}/_{3-3}$, m. $^{3-3}/_{3-3}$; first upper premolar deciduous; tail short; interfemoral membrane well developed (Genus *Chœronycteris*). 356

340 a Inner upper incisors larger than the outer ones. 341

b Inner upper incisors smaller than the outer ones. Upper incisors in pairs, separated by a wide space. 344

341 a Upper incisors in a row between the canines. 342

b Upper incisors in pairs, separated by a small space. 343

342 a Zygomatic arch complete; interfemoral membrane well developed; premolars $^{2-2}/_{3-3}$, m. $^{3-3}/_{3-3}$ (Genus *Glossophaga*). ..... *Glossophaga soricina*

b Zygomatic arch undeveloped; interfemoral membrane very narrow; premolars $^{2-2}/_{3-3}$, m. $^{3-3}/_{3-3}$ (Genus *Phyllonycteris*). 345

343 a Zygomatic arch complete; tail extending beyond the narrow interfemoral membrane; premolars $^{2-2}/_{3-3}$, m. $^{3-3}/_{3-3}$ (Genus *Monophyllus*). ..... *Monophyllus redmani*

b Zygomatic arch complete; no tail; interfemoral membrane very narrow; premolars $^{2-2}/_{3-3}$, m. $^{2-2}/_{2-2}$ (Genus *Ischnoglossa*). ..... *Ischnoglossa nivalis*

344 a Zygomatic arch complete; premolars $^{3-3}/_{3-3}$, m. $^{3-3}/_{3-3}$; tail and interfemoral membrane very short (Genus *Lonchoglossa*). 346

b Zygomatic arch undeveloped; premolars $^{3-3}/_{3-3}$, m. $^{3-3}/_{3-3}$ (Genus *Glossonycteris*). ..... *Glossonycteris geoffroyii*

345 a Calcaneum none. ..... *Phyllonycteris poeyi*
b Calcaneum short, but distinct. ..... *Phyllonycteris sezekorni*

346 a Tail very short; interfemoral membrane nearly naked; forearm 1".25. ... *Lonchoglossa caudifera*
b Tail absent; interfemoral membrane well covered; forearm 1".6. *Lonchoglossa wiedii*

347 a Calcaneum shorter than the foot; forearm 1".7. ..... *Chœronycteris. mexicana*
b Calcaneum longer than the foot; forearm 1".35. ..... *Chœronycteris. minor*

348 a Nostrils opening on the surface of a well-defined nose-leaf. 349
b No distinct nose-leaf; nostrils opening in a concavity at the extremity of the muzzle. Muzzle short and very broad in front. Face with naked elevated cutaneous ridges; throat with transverse bands; teeth as in *Stenoderma* (Genus *Centurio*). .... *Centurio senex*

349 a Muzzle broad and very obtuse in front. Crowns of the molar teeth very broad, their transverse exceeding their longitudinal diameter in cross section. 350
b Muzzle conical. 355

350 a Facial portion of the skull flat and broad, not elevated in front. 351
b Facial portion of the skull greatly elevated in front. Upper incisors straight, conical; second (last) molar in both jaws very small (Genus *Pygoderma*). .... *Pygoderma bilabiatum*

351 a Nasal opening na the skull small, not prolonged backwards; the second molar in both jaws smaller than the first. 352
b Nasal opening in the skull prolonged backwards by a longitudinal fissure in the centre between the orbits; the second molars in both jaws larger than the first. Upper middle incisors as in *Vampyrops*; skull narrower in front (Genus *Chiroderma*). 363

352 a Bony palate extending backwards in the centre behind the last molars. 353
b Bony palate not extending backwards, deeply emarginate in the centre between the molars. 354

353 a Upper middle incisors broad and straight; third upper molar rudimentary or absent; molars very broad (Genus *Artibeus*). 356
b Upper middle incisors conical and oblique; third upper molar small but distinct; molars narrower than in Artibeus (Genus *Vampyrops*). 359

354 a Crown of the head slightly elevated above the face-line. Upper middle incisors straight, broad, or conical; molars as in *Artibeus* (Genus *Stenoderma*). 361
b Crown of the head greatly elevated above the very broad and short muzzle. Upper middle incisors straight, conical; molars as in *Stenoderma*, but narrower (Genus *Ametrida*). ..... *Ametrida centurio*

355 a Crowns of the anterior molar teeth rather narrow and longitudinally grooved, their longitude equalling their transverse diameter. Nose-leaf well developed, as in *Artibeus*; interfemoral membrane very narrow, margining the legs (Genus *Sturnira*). ..... *Sturnira lilium*
b Crown of the molar teeth broad, their transverse exceeding their longitudinal diameter. Nose-leaf very short behind; interfemoral membrane large (Genus *Brachyphylla*). ..... *Brachyphylla cavernarum*

356 a Molars $^{3-3}/_{3-3}$ (Subgenus *Uroderma*). Front edge of the nose-leaf free, well developed, ... 357
b Molars $^{2-2}/_{3-3}$ (Subgenus *Artibeus*). Front edge of the nose-leaf bound down to the muzzle. Head with more or less distinct white streaks; forearm 2".25 to 2".8. *Artibeus (Artibeus) perspicillatus*
c Molars $^{2-2}/_{2-2}$ (Subgenus *Dermanura*). 358

357 a Sides of the horseshoe straight, not lobed. Head with or without ill-defined whitish streaks; forearm 2".7 ..... *Artibeus (Uroderma) planirostris*
b Sides of the horseshoe with rounded lobes. Head with four distinct white streaks; back with a white line along the spine; forearm 1".6. ... *Artibeus (Uroderma) bilobatus*

358 a Interfemoral membrane extending as far back in the centre as a line corresponding to the knees; head without white streaks; forearm 1".6. . *Artibeus (Dermanura) cinereus*
b Interfemoral membrane extending as far back in the centre as a line corresponding to the centre of the tibia; head with four white streaks; forearm 1".55. .... *Artibeus (Dermanura) quadrivittatus*

359 a Smaller; with four very distinct white streaks on the head. Larger; white streaks on the head much less distinct. 360
b Fur extending outwards upon the wing-membrane as far as a line drawn from the elbow to the middle of the femur; forearm 2".35. .....*Vampyrops. vittatus*
360 a Fur extending outwards upon the wing-membrane as far as a line drawn from the elbow to the knee; forearm 1".65. .....*Vampyrops lineatus*
b Fur extending outwards as far as a line drawn from the elbow to the middle of the tibia; forearm 1".4. ..... *Vampyrops helleri*
361 a Molars $^{2-2}/_{3-3}$; upper central incisors bicuspidate; sides of the palatal emargination parallel. (Subgenus *Peltorhinus*). ..... *Stenoderma (Pelthorinus) achradophilum*
b Molars $^{3-3}/_{3-3}$; upper central incisors unicuspidate. 362
362 a Frontal deeply concave; sides of the palatal emargination parallel (Subgenus *Stenoderma*)..... *Stenoderma (Stenoderma) rufum*
b Frontal slightly concave; sides of the palatal emargination converging forwards (Subgenus *Phyllops*). .....*Stenoderma (Phyllops) falcatum*
363 a Inc. $^{4}/_{4}$; m. $^{2-2}/_{2-2}$; no white line along the spine. 364
b Inc. $^{4}/_{2}$, m. $^{2-2}/_{3-3}$; a white line along the spine. Four broad very distinct streaks on the head; forearm 1".4.....*Chiroderma bidens*
364 a First lower premolar nearly flat-crowned, without a distinct cusp. Four broad very distinct white streaks on the head; forearm 2".1. ..... *Chiroderma salvini*
b First lower premolar with a distinct anterior cusp. 365
365 a Second lower molar nearly double the first molar in antero-posterior diameter; head-streaks narrow; forearm 1".86 or more..... *Chiroderma villosum*
b Second lower molar about one half greater than the first in antero-posterior diameter; head-streaks broad; forearm 1".4..... *Chiroderma pusillum*
366 a Calcaneum none; interfemoral membrane developed in the middle; true molars none, lower incisors small, in pairs, separated by a space (Genus *Desmodus*). . *Desmodus rufus*
b Calcaneum very short; interfemoral membrane not developed In the middle; molars $^{1-1}/_{1-1}$, rudimentary ; lower incisors very broad, forming a row between the canines (Genus *Diphylla*).....*Diphylla ecaudata*

Appendix 5c: Lataste (1885). Etude de la faune des Vertébrés de Barbarie (Algérie, Tunisie et Maroc)

1 a Queue épaisse, dépassant considérablement la membrane interfémorale et coupant son bord libre à angle droit. Première phalange du doigt médian, au repos, repliée en dessus du métacarpien (Famille Emballonuridés). 29

b Queue grêle, dépassant au plus de deux vertèbres la membrane interfémorale et coupant son bord libre à angle aigu. Première phalange du doigt médian, au repos, repliée en dessous du métacarpien. 2

2 a Des appendices membraneux sur le nez (un fer à cheval horizontal et une feuille nasale verticale). Pas d'oreillon (tragus) dans l'intérieur de l'oreille (Famille Rhinolophidés). 3

b Pas d'appendices membraneux sur le nez. Un oreillon distinct de l'oreille (Famille Vespertilionidés). 8

3 a Le premier orteil à deux, les quatre autres à trois phalanges. Feuille nasale développée surtout dans le sens antéro-postérieur (Genre *Rhinolophus*). 4

b Tous les orteils à deux phalanges. Feuille nasale développée surtout dans le sens transversal (Genre *Phyllorhina*). .....*Phyllorhina tridens*
African Chiroptera name .....*Asellia tridens*

4 a Canine et deuxième prémolaire supérieures contiguës, la première prémolaire minuscule et rejetée en dehors de l'alignement dentaire (1)· 5

b Première prémolaire petite, mais en alignement entre la canine et la deuxième prémolaire qu'elle sépare. 6

5 a Longueur de l'avant-bras, 54 à 57 mill. Oreilles effilées à la pointe..... .....*Rhinolophus ferrum-equinum*
African Chiroptera name .....*Rhinolophus ferrumequinum*

b Avant-bras, environ 44 mill. Oreilles pointues, mais non effilées.*Rhinolophus clivosus*

6 a Longueur avant-bras, 35 à 38 mill.....*Rhinolophus hipposideros*

b Longueur avant-bras, de 46 à 50 mill..... 7

7 a Bord libre de la membrane alaire s'insérant au talon. Côtés de la sella (face antérieure de la feuille nasale) convergents. .....*Rhinolophus Blasii*

b Bord libre de la membrane alaire s'insérant au tibia, au-dessus du talon. Côtés de la sella parallèles ou très légèrement concaves. ..... *Rhinolophus euryale*

8 a Front très convexe et brusquement élevé au-dessus du museau. Un intervalle entre les incisives et les canines supérieures (groupe C Miniopteri) (Genre *Miniopterus*). .....*Miniopterus Schreibersi*
African Chiroptera name ..... *Miniopterus schreibersii*

b Front presque sur le même plan que le museau. Incisives supérieures contiguës aux canines. 9

9 a Oreilles soudées l'une à l'autre près de leurs bases (groupe A Plecoti)..... 10

b Oreilles libres (groupe B Vespertiliones)..... 12

10 a Une seule incisive de chaque côté à la màchoire supérieure. Tout au plus une fente prolongeant légèrement en arrière l'orifice nasal. Robe très pâle (Genre *Otonycteris*). .....*Otonycteris Hemprichi*
African Chiroptera name .....*Otonycteris hemprichii*

b Deux incisives de chaque côté à la màchoire supérieure. Museau profondément excavé derrière les narines. Robe plus ou moins brune..... 11

11 a Trois prémolaires de chaque côté à la mâchoire inférieure. Les excavations post-nasales isolées l'une de l'autre. Oreille très grande, presque de la longueur du corps, non dentelée, son bord externe naissant auprès et en arrière de l'angle de la bouche (Genre *Plecotus*). .....*Plecotus auritus*
African Chiroptera name .....*Otonycteris hemprichii*

b Deux prémolaires de chaque côté it la mâchoire inférieure. Les excavations post-nasales confluentes. Oreille courte, large, dentelée, son bord externe naissant en avant et au-dessus de l'angle de la bouche (Genre *Synotus*). ...*Synotus barbastellus*
African Chiroptera name .....*Barbastella barbastellus*

12 a Une ou deux prémolaires seulement de chaque côté à la màchoire supérieure, deux à l'inférieure. Oreillon peu allongé, obtus et plus ou moins recourbé en dedans (Genre *Vesperugo*)..... 13

b Trois prémolaires de chaque coté et à chaque mâchoire (38 dents). Oreillon (sauf pour dasycneme) long, aigu et droit ou recourbé en dehors (Genre *Vespertilio*)... 22
13 a Seulement une prémolaire supérieure, en tout 32 dents (Sous-genre *Vesperus*). 14
b Deux prémolaires supérieures, en tout 34 dents (Sous-genre *Vesperugo*)..... 17
14 a Avant-bras, de 38 à 45 mill..... 15
b Avaut-bras, plus de 45 et jusqu'à 55 mill. 16
15 a Oreillon atténué au sommet, atteignant sa plus grande largeur vers le milieu de son bord interne. .....*Vesperugo (Vesperus) borealis*
b Oreillon dilaté par le haut, atteignant sa plus grande largeur au-dessus du milieu de son bord interne. .....*Vesperugo (Vesperus) discolor*
16 a Plus grande largeur de l'oreillon, environ moitié moindre que la hauteur de son bord interne. Couleur, brunnoiràtre, un peu plus pale en dessous. *Vesperugo (Vesperus) serotinus*
b Plus grande largeur de l'oreillon, presque égale à la hauteur de son bord interne. Couleur, isabelle, très pâle en dessous. ..... *Vesperugo (Vesperus) isabellinus*
African Chiroptera name .....*Eptesicus isabellinus*
17 a Longueur avant-bras, plus de 38, jusqu'à 65 mill. et plus. Oreillon nettement élargi au sommet, sècuriforme. Membrane alaire s'insérant au talon. 18
b Longueur avant-bras, 30 à 36 mill. Oreillon non dilaté par en haut. Membrane alaire s'insérant aux orteils..... 19
18 a Longueur avant-bras, de 50 à 65 mill. et plus. ..... *Vesperugo (Vesperugo) noctula*
b Longueur avant-bras, de 38 à 42 mill..... *Vesperugo (Vesperugo) Leisleri*
African Chiroptera name ..... *Nyctalus leisleri*
19 a Oreillon atteignant sa plus grande largeur vers le milieu de son bord interne. .....*Vesperugo (Vesperugo) Savii*
African Chiroptera name .....*Hypsugo savii*
b Oreillon atteignant sa plus grande largeur immédiatement au-dessus de l'origine de son bord interne. 20
20 a Incisive supérieure interne simple; l'externe très petite.*Vesperugo (Vesperugo) Kühli*
African Chiroptera name .....*Pipistrellus kuhlii*
b Incisive supérieure interne bilobée; l'externe très apparente. son sommet s'écartant peu du niveau du lobe externe de l'interne. 21
21 a Bord externe de l'oreille à peu près rectiligne dans son tiers supérieur. Pénis de longueur moyenne (environ $^1/_2$ centim.). Longueur avant - bras, 30 à 33 mill. .....*Vesperugo (Vesperugo) pipistrellus*
African Chiroptera name .....*Pipistrellus pipistrellus*
b Bord externe de l'oreille légèrement excavé en haut. Pénis très long (13 mill. environ). Longueur avant-bras, 35 à 36 mill. .....*Vesperugo (Vesperugo) abramus*
22 a Calcanéum très long, occupant environ les trois quarts de la distance du tarse à l'angle postérieur de la membrane interfémorale; cet angle très aigu. Membrane alaire insérée au talon ou au métatarse..... 23
b Calcanéum n'occupant guère que la moitié de ladite distance et membrane interfémorale terminée en arrière par un angle obtus. Membrane alaire insérée à la base des orteils. 25
23 a Aile insérée au métatarse. Avant-bras, environ 38 mill..... *Vespertilio Daubentoni*
b Aile insérée au talon. Avant-bras, plus de 40 mill. 24
24 a Oreillon à pointe très aiguë et recourbée en dehors. Avant-bras, environ 41 mill. .....*Vespertilio Capaccinii*
African Chiroptera name .....*Myotis capaccinii*
b Oreillon obtus et recourbé en dedans. Avant-bras, 43 à 46 mill.*Vespertilio dasycneme*
25 a Avant-bras, environ 60 mill.....*Vespertilio murinus*
b Avant-bras, au plus 43 mill. environ. 26
26 a Oreillon assez aigu, droit. Avant-bras, 32 à 34 mill..... *Vespertilio mystacinus*
b Oreillon très aigu et plus ou moins recourbé en arrière. Avant-bras, 38 mill. au moins. 27
27 a Hauteur de l'oreillon, environ les trois quarts de celle de l'oreille. Bord libre de la membrane interfémorale cilié de poils raides. .....*Vespertilio Nattereri*
b Hauteur de l'oreillon, au plus la moitié de celle de l'oreille. Bord libre de la membrane interfémorale nu ou ne présentant que des poils ordinaires..... 28

28 a Oreille profondément èchancrèe sur son bord externe et sensiblement plus courte que la tête.....*Vespertilio emarginatus*
African Chiroptera name .....*Myotis emarginatus*
b Oreille non échancrée et beaucoup plus longue que la tête.....*Vespertilio Bechsteini*
29 a Narines valvulées, en fentes transversales; derrière elles, une feuille nasale rudimentaire. Deux phalanges à l'index (Genus *Rhinopoma*). .....
.....*Rhinopoma microphyllum*
b Narines simples; pas de feuille nasale. Une seule phalange à l'index (Genre *Nyctinomus*). ..... *Nyctinomus Cestonii*
African Chiroptera name .....*Tadarida ventralis*

Appendix 5d: Monticelli (1889). LIX. Some remarks on the genus Taphozous.

1	a	Radio-metacarpal pouch distinct; lower lip scarcely grooved (Subgenus *Taphozous*). 2
	b	No radio-metacarpal pouch; lower lip divided in the centre of its upper surface and in front by a deep narrow groove; inner margin of the ears not papillate; feet without cushions (Subgenus *Taphonycteris*). 8
2	a	Feet very large (17 - 19 millim.); radio-metacarpal pouch generally small; forearm 72 - 75 millim.; feet with cushions; tragus with a distinct lobule at the base. .... *Taphozous (Taphozous) nudiventris* African Chiroptera name ..... Taphozous nudiventris
	b	Feet small (11 - 15 millim.); radio-metacarpal pouch well developed. 3
3	a	No gular sac; no cushions on the feet. 4
	b	Gular sac present, at least in males; feet with or without cushions. 5
4	a	Ears very large; extremity of tail not thickened; forearm 78 millim., feet 15 millim. ..... *Taphozous (Taphozous) Theobaldi*
	b	Ears moderate; extremity of tail thickened; forearm 60 - 64 millim., feet 12 - 13 millim . ..... *Taphozous (Taphozous) melanopogon*
5	a	Gular sac present in males, rudimentary or absent in females; throat hairy beneath; feet without cushions; inner margin of the ears papillate. 6
	b	Gular sac present in males, rudimentary in females; throat naked beneath; feet with cushions; inner margin of the ears not papillate. 7
6	a	Gular sac rudimentary in females; outer margin of the tragus rounded; forearm 65 - 69 millim., feet 11 - 13 millim. ..... *Taphozous (Taphozous) australis*
	b	Gular sac absent in females; outer margin of the tragus truncated; forearm 61 - 63 millim., feet 11 - 12 millim. ..... *Taphozous (Taphozous) perforatus* African Chiroptera name ..... Taphozous perforatus perforatus
7	a	Tragus slender, outer margin truncated; a distinct lobule at the base; forearm 61 - 63 millim., feet 12 - 13 millim.; fur above dark brown, beneath paler. .... *Taphozous (Taphozous) mauritianus* African Chiroptera name ..... Taphozous mauritianus
	b	Tragus moderate, outer margin rounded, without distinct lobule at the base; forearm 59 - 63 millim., feet 11 - 12 1/2 millim.; fur above and beneath varying from reddish brown to black. ..... *Taphozous (Taphozous) longimanus*
8	a	Feet large (20 - 22 millim.); gular sac present in males and females (but smaller in the latter); ears elongated, triangular; tragus without a distinct lobule at the base; forearm 86 - 89 millim. ..... *Taphozous (Taphonycteris) peli* African Chiroptera name ..... Saccolaimus peli
	b	Feet small (15-18 millim.); gular sac present in males and females; ears large; tragus with a distinct lobule at the base. 9
9	a	Gular sac rudimentary in females; the margin alone developed; fur brown above, pure white beneath; forearm 65 - 67 millim., feet 17 - 18 millim. .... *Taphozous (Taphonycteris) affinis*
	b	Gular sac developed in females; fur dark brown above and beneath; forearm 71 - 73 millim., feet 14 - 16 millim. ..... *Taphozous (Taphonycteris) saccolæmus*

Appendix 5e: Matschie (1895). Die Säugethiere Deutsch-Ost-Afrikas

1	a	Der Rand des Ohren bildet einen ovalen Ring (sieh Abb. 7) dadurch, dass sich der Aussen- und Innenrand vor der Ansatzstelle des Ohres am Kopfe berühren; die ostafrikanischen Gattungen haben am Daumen und Zeigefinger je eine Kralle (Unterordnung: Grossfledermäuse, Flederhunde, Megachiroptera). 5
	b	Der Aussenrand des Ohres entspringt an einer andern Stelle der Kopfhaut als der Innenrand; der Zeigefinger trägt niemals eine Kralle (Unterordnung: Kleinfledermäuse, Microchiroptera). 2
2	a	Nasenlöcher von häutigen Anhängen umgeben. 3
	b	Nasenlöcher ohne Anhänge. 4
3	a	Ohren mit Ohrdeckel (Hohlnasen, Nycteridae). 8
	b	Ohren ohne Ohrdeckel (Hufeisennasen, Rhinolophidae). 11
4	a	Der Schwanz is vollständig oder bis zu den allerletzten Wirbeln in die Schenkelflughaut eingeschlossen (Mops-Fledermäuse, Vespertilionidae). 15
	b	Der Schwanz ragt entweder aus der Mitte der Flughaut-Oberfläche oder aus dem Hinterrande derselben hervor (Schwanz-Fledermäuse, Emballonuridae). 22
5	a	Ein Büschel weisser Haare am vorderen Ohrrande (Fliegender Hund, *Epomophorus*). 6
	b	Ohne einen Büschel weisser Haare am vordernen Ohrrande (Nacht-Flederhund, *Xantharpyia*). 7
6	a	Rücken isabellfarbig, Bauchmitte mit schneeweissem Längsfeld. ..... *Epomophorus comptus* African Chiroptera name ..... *Epomops franqueti*
	b	Rücken braungrau bis röthlichgrau, Körper höchstens 13 cm lang. *Epomophorus minor*
	c	Rücken graubraun, Körper 15 - 16 cm lang. ..... *Epomophorus gambianus*
7	a	Körperseiten strohgelb, ein gelbliches Halsband. ..... *Xantharpyia straminea* African Chiroptera name ..... *Eidolon helvum helvum*
	b	Körperseiten braungrau, ein graues Halsband. ..... *Xantharpyia collaris* African Chiroptera name ..... *Myonycteris torquata*
	c	Körperseiten silbergraubraun, Behaarung sehr lang. ..... *Xantharpyia torquata* African Chiroptera name ..... *Myonycteris torquata*
8	a	Nasenlöcher in tiefer Längsgrube, welche jederseits mit rundlichen Anhängen versehen ist (Hohlnase, *Nycteris*). 9
	b	Nasenlöcher von einem blattartigen Besatz verdeckt (Ziernase, *Megaderma*). 10
9	a	Unterarm 6,5 cm lang. ..... *Nycteris grandis*
	b	Unterarm kürzer als 5,5 cm; das Ohr ragt angelegt weit über die Schnauzenspitze hinaus. ..... *Nycteris thebaica*
	c	Unterarm kürzer als 4,5 cm; das Ohr ragt angelegt ungefähr bis zur Schnauzenspitze. ..... *Nycteris hispida*
10	a	Der Nasenbesatz ist oval mit langem, mittleren Kiel. ..... *Megaderma frons* African Chiroptera name ..... *Lavia frons*
	b	Der Nasenbesatz besteht aus einem ovalen und einem herzförmiger Blatt. ..... *Megaderma cor* African Chiroptera name ..... *Cardioderma cor*
11	a	Nasenaufsatz hinten dreieckig gestaltet, in der Mitte desselben ein aufrechtstehender Längskamm (Hufeisennase, *Rhinolophus*). 12
	b	Nasenaufsatz vielblätterig, hinten mit drei langen zahnartigen Fortsätzen (Dreizacknase, *Triaenops*). ..... *Triaenops afer*
	c	Nasenaufsatz hinten bandförmig (Blattnase, *Hipposideros*). 13
12	a	Ohr mindestens 2,9 cm, Unterarm mindestens 6,2 cm lang. *Rhinolophus hildebrandti* African Chiroptera name ..... *Rhinolophus hildebrandtii*
	b	Ohr mindestens 2,2 cm, Unterarm mindestens 5 cm lang. ..... *Rhinolophus capensis*
	c	Ohr höchstens 1,6 cm, Unterarm höchstens 4,7 cm lang. ..... *Rhinolophus lobatus*
13	a	Hinterrand des Nasenaufsatzes glatt. 14
	b	Hinterrand des Nasenaufsatzes mit drei stumpfen Fortsatzen. .. *Hipposideros tridens* African Chiroptera name ..... *Asellia tridens*
14	a	Ohren lang und schmal. ..... *Hipposideros commersoni* African Chiroptera name ..... *Macronycteris commersoni*
	b	Ohren rundlich. ..... *Hipposideros caffer*

15 a Schwanz so lang oder länger als der Körper. 16
b Schwanz kürzer als der Körper. Hinterhaupt nicht über die Stirn vorgewölbt; zweites Glied des längsten Fingers höchstens doppelt so lang als das erste. 17
16 a Hinterhaupt stark gewölbt; das Endglied des längsten Fingers ist dreimal so lang als das erste Glied desselben; Ohren kurz, Ohrdeckel oben abgerundet (Langflügel-Flatterer, *Miniopterus*). ..... *Miniopterus scotinus*
African Chiroptera name ..... *Miniopterus natalensis*
b Hinterhaupt nicht über die Stirn vorgewölbt; das erste Glied des längsten Fingers nicht auffallend kurz; Ohren sehr lang; Ohrdeckel lang und spitz; Nasenlöcher rund (Zwerg-Flatterer, *Cerivoula*)..... *Cerivoula africana*
African Chiroptera name ..... *Kerivoula africana*
17 a Ohrdeckel sehr lang und spitz (Flattermaus, *Vespertilio*). ..... *Vespertilio bocagei*
African Chiroptera name ..... *Myotis bocagii*
b Ohrdeckel länglich oval, nach oben spitz abgerundet. 18
18 a Färbung grau oder grün (Schwirr-Fledermaus, *Nycticejus*). 21
b Färbung braun (Dämmerungs-Fledermaus, *Vesperugo*). 19
19 a Flughäute schneeweiss. ..... *Vesperus tenuipinnis*
African Chiroptera name ..... *Neoromicia tenuipinnis*
b Flughäute dunkel. 20
20 a Unterseite weiss. ..... *Vesperugo temmincki*
African Chiroptera name ..... *Pipistrellus rueppellii*
b Unterseite braun, weiss melirt, Oberkopf rostfarbig. ..... *Vesperugo minutus*
African Chiroptera name ..... *Neoromicia capensis*
c Unterseite blass rothbraun, Oberseite rothbraun. ..... *Vesperugo nanus (?)*
African Chiroptera name ..... *Neoromicia nana*
d Unterseite blass umbrabraun, Oberseite dunkel umbrabraun. . *Vesperugo grandidieri*
African Chiroptera name ..... *Pipistrellus grandidieri*
21 a Oberseite olivengräu, Unterseite gelb. ..... *Nycticejus borbonicus*
(This should be *Scotophilus viridis*.)
African Chiroptera name ..... *Scotophilus viridis*
b Oberseite grau, Unterseite weisslich. ..... *Nycticejus schlieffeni*
African Chiroptera name ..... *Nycticeinops schlieffenii*
22 a Der Schwanz ragt aus der Mitte der Flughaut-Oberfläche frei hervor. 23
b Der Schwanz ragt aus dem Hinterrande der Flughaut frei hervor (Grämler, *Nyctinomus*). 24
23 a Nasenlöcher röhrenförmig verlangert (Spaltnasen Flatterer, *Coleura*).... *Coleura afra*
b Nasenlöcher nicht verlängert (Flügeltaschen-Flatterer, *Taphozous*). ..... *Taphozous mauritianus*
24 a Lippen borstig, ungefurcht. ..... *Nyctinomus brachypterus*
African Chiroptera name ..... *Mops (Xiphonycteris) brachypterus*
b Lippen tiefgefurcht. 25
25 a Oberseite röthlich rauchbraun, Unterseite weissgrau. ..... *Nyctinomus angolensis*
African Chiroptera name ..... *Mops (Mops) condylurus*
b Oberseite umbrabraun. Unterseite graubraun. ..... *Nyctinomus bivittatus*
African Chiroptera name ..... *Chaerephon bivittatus*
c Oberseite röthlich sepiabraun, Unterseite blasser. Bauch weiss. *Nyctinomus limbatus*
African Chiroptera name ..... *Chaerephon pumilus*
d Ober-und Unterseite dunkelbraun. ..... *Nyctinomus pumilus*
African Chiroptera name ..... *Chaerephon pumilus*

Appendix 5f: Sclater (1901). The mammals of South Africa.

1	a	Crowns of the molur teeth smooth; both thumb and second digit terminating in a claw (Family Pteropodidae). 3
	b	Crowns of the molar teeth tubercular; only the thumb with a claw. 2
2	a	Nostrils surrounded by a well-developed nose-leaf; ears large, no tragus (Family Rhinolophidae). 6
	b	Nostrils at the anterior end of a longitudinal groove on the face; no nose-leaf; ears large, united and provided with tragi (Family Nycteridae). 11
	c	Nostrils at the end of the muzzle, opening simply, no nose-leaf; ears separate, with tragi; tail contained in and produced to the end of tho interfemoral membrane (Family Vespertilionidae). 12
	d	Nostrils simple, no nose-leaf; ears large, often united, tragi short and broad; first phalanx of the middle finger folded in repose on the upper surface of the metacarpal bone; tail more or less free from the the interfemoral membrane (Family Emballonuridae). 22
3	a	Tail very short, free from and in front of the interfemoral membrane; a tuft of white hairs at the base of the ears; molars $^1/_2$ (Genus*Epomophorus*). 4
	b	Tail short, contained in the interfemoral membrane; no tuft of white hairs; molars $^2/_3$ (Genus *Rousettus*). 5
4	a	Larger; fore arm 3.5 in.; fifth palatal ridge simple and divided. .... *Epomophorus gambianus*
	b	Smaller; fore arm 3.0 in.; fifth palatal ridge rhomboidal and hollowed out in the centre. ..... Epomophorus crypturus
5	a	Smaller, fore arm about 3.12, fur greyish. ..... *Rousettus collaris*
	b	Larger, fore arm about 4.5, fur yellowish, especially about the neck. .... *Rousettus stramineus*
		African Chiroptera name ..... Eidolon helvum helvum
6	a	First toe with two, others with three joints each; posterior nose-leaf triangular and erect; large antitragus (Genus *Rhinolophus*). 7
	b	All the toes with two joints only; posterior nose-leaf concave, with rounded upper margin; no antitragus (Genus *Hipposiderus*). 10
7	a	First upper premolar in the tooth row between the canine and the second upper premolar; fore arm 1.7. ..... Rhinolophus landeri
	b	Second upper premolar close to the canine forcing the first upper premolar out externally to the tooth row. 8
8	a	Ears qjuite attenuated at the tips, fore arm 2.12. ..... *Rhinolophus ferrum-equinum*
		African Chiroptera name ..... Rhinolophus ferrumequinum
	b	Ears subacutely pointed, not attenuated. 9
9	a	Ears as long as the head; horse-shoe shaped nose-leaf not concealing the sides of the muzzle; fore arm 1.8. ..... Rhinolophus capensis
	b	Ears shorter than the head; horse-shoe shaped nose-leaf, broad, concealing the sides of the muzzle; fore arm 2.2. ..... *Rhinolophus aethiops*
		African Chiroptera name ..... Rhinolophus fumigatus
	c	Ears shorter than the head; nose-leaf thickly coated with hair, hardly concealing the sides of the muzzle; fore arm 2.3. ..... *Rhinolophus hildebrandti*
		African Chiroptera name ..... Rhinolophus hildebrandtii
10	a	Larger, fore arm 3.5; frontal glandular sac with a longitudinal opening. . *Hipposiderus commersoni*
		African Chiroptera name ..... Macronycteris commersoni
	b	Smaller, fore arm 1.85; frontal glandular sac small with transverse opening. ..... *Hipposiderus caffer*
		African Chiroptera name ..... Hipposideros caffer
11	a	Ears short; tragus with concave inner margin, incisors trifid. ..... Nycteris hispida
	b	Ears long; tragus with convex margins, incisors bifid. ..... *Nycteris capensis*
		African Chiroptera name ..... Nycteris thebaica
12	a	Crown of the head flattened to the level of the face line, upper incisors close to the canines. 13

b Crown elevated above the face line; incisors separated by a space from the canines; terminal joint of the middle finger bent in repose on the under suface of the metacarpal bone (Genus *Miniopterus*)..... 21

13 a Outer margin of the ear conch ending near the angle of the mouth; ears short and triangular; tragus curved inwards or straight; premolars two or less. 14

b Outer margin of the ear conch ending opposite the inner margin of the tragus; ears generally long and narrow, the tragus long and narrow straight or outwardly curved; three upper premolars. 16

14 a Two pairs of upper incisors, inner ones bifid. 15

b One pair of upper incisors, unicuspidate, close to the canines; wing membrane thick and leatherly (Genus *Scotophilus*). ..... *Scotophilus borbonicus*

15 a No lobular projection at the angle of the mouth, tibiae short (Genus *Vespertilio*)... 17

b A lobular projection near the mouth; tibiae long (Genus *Chalinolobus*)..... ..... *Chalinolobus variegatus*
African Chiroptera name ..... *Glauconycteris variegata*

16 a Nasal opening crescentic; first and second upper premolars smaller than the third (Genus *Myotis*). ..... *Myotis tricolor*

b Nasal opening circular; first and second upper premolars nearly equal to the third (Genus *Kerivoula*). 20

17 a With one upper premolar (Subgenus *Eptesicus*). 18

b With two upper premolars, first minute and internal to the tooth-row (Subgenus *Pipistrellus*). Outer upper incisors nearly as large as the inner ones; base of thumbs and soles of feet swollen, forming adhesive discs; fore arm 1.2..... ..... *Vespertilio (Pipistrellus) nanus*
African Chiroptera name ..... *Neoromicia nana*

18 a Inner upper incisors with a small external cusp. 19

b Inner upper incisors unicuspidate; forearm 2.0. ..... *Vespertilio (Eptesicus) megalurus*
African Chiroptera name ..... *Eptesicus hottentotus*

19 a Smaller; fore arm 1.25. ..... *Vespertilio (Eptesicus) minutus*
African Chiroptera name ..... *Neoromicia capensis*

b Larger; fore arm 1.44. ..... *Vespertilio (Eptesicus) capensis*
African Chiroptera name ..... *Neoromicia capensis*

20 a Outer upper incisors minute; fur with bronze yellow extremities, fore arm 1.45. ..... *Kerivoula aerosa*

b Outer upper incisors nearly as long as the inner ones; fur with reddish brown extremities, fore arm 1.4. ..... *Kerivoula lanosa*

21 a Interfemoral membrane nearly naked; size larger; fore arm 1.8. .... *Miniopterus schreibersi*
African Chiroptera name ..... *Miniopterus schreibersii*

b Interfemoral membrane half clothed; size smaller; fore arm 1.5. *Miniopterus scotinus*
African Chiroptera name ..... *Miniopterus natalensis*

22 a Tail slender, perforating the interfemoral membrane and appearing on its upper surface (Genus *Taphozous*). ..... *Taphozous mauritianus*

b Tail thick, produced a good distance beyond the posterior margin of the interfemoral membrane (Genus *Nyctinomus*). 23

23 a Premolars $^{2}/_{2}$; antitragus separated by a deep notch; lower incisors four. 24

b Premolars $^{1}/_{2}$; antitragus separated by a very shallow notch; lower incisors, six, fore arm 1.55. ..... *Nyctinomus acetabulosus*
African Chiroptera name ..... *Mormopterus acetabulosus*

24 a Lips smooth; antitragus irregularly quadrate; fore arm 2.5. ..... *Nyctinomus africanus*
African Chiroptera name ..... *Tadarida ventralis*

b Lips vertically wrinkled; antitragus half oval. 25

25 a Ears separate; fore arm 1.75. ..... *Nyctinomus aegyptiacus*
African Chiroptera name ..... *Tadarida aegyptiaca*

b Ears conjoined by a deep band; fore arm 1.5. ..... *Nyctinomus limbatus*
African Chiroptera name ..... *Chaerephon pumilus*

Appendix 5g: Jameson (1909). LIII. On a collection of mammals from South Africa.

1	a	Larger: forearm 43 - 47 mm. 2
	b	Smaller: forearm 37 mm. Type-loc. Coast of Zanzibar. .....*Miniopterus minor*
2	a	Fur with well-marked dark brown or black bases. 3
	b	Bases of hairs scarcely darker than the rest of the fur, which is reddish-brown. Forearm 45 - 47 mm., skull 15.5. Type-loc. Gatkoppies, Waterberg District. .....*Miniopterus breyeri* African Chiroptera name ..... *Miniopterus natalensis*
3	a	Hairs very dark, both basally and at tips. 4
	b	Hairs black at the base, with light tips. Forearm 45 - 47 mm. Type-loc. "South Africa towards Natal". (Probably includes *M. scotinus* Sund., 1847. Type-loc. "Caffraria"). ..... *Miniopterus natalensis*
4	a	Larger: skull 15.5 mm., forearm 45 - 46. Type-loc. "Interior of Caffraria" (also Knysna). ..... *Miniopterus dasythrix*
	b	Smaller: skull 14.7 mm., forearm 43 - 44. Type-loc. Knysna. ..*Miniopterus fraterculus*

Appendix 5h: Andersen (1912). Catalog of the Chiroptera in the collection of the British Museum. Second Edition. Volume I: Megachiroptera

1	a	Key based on both external and cranial characters. 2
	b	Key based on dental and cranial characters. 36
2	a	Molariform teeth not multicuspidate; lower canines not proclivous. 3
	b	Molariform teeth multicuspidate, lower canines strongly proclivous (crossing upper canines at nearly right angles) (Subfamily Harpyionycterinae). Premaxillæ co-ossified in front; incisors $^{1-1}/_{1-1}$ (i^1 and i_1 lost), lower pair rudimentary, upper canines bicuspidate, lower canines tricuspidate and situated close together at extremity of mandible, cheek-teeth $^{5}/_{6}$; second finger clawed, tail absent, tibia unusually short. [1 species: Philippines] (Genus *Harpyionycteris*). ..... *Harpyionycteris whiteheadi*
3	a	Tongue simple; fixed to floor of mouth by posterior half, and without unfringed filiform papillæ at tip (figs. 65 A-H) (Subfamily Pteropodinæ). 4
	b	Tongue more extensible, fixed to floor of mouth by its posterior third, its terminal fourth or fifth covered above with unfringed filiform papillæ (figs. 65 I-L) (Subfamily Macroglossinæ). 30
4	a	Facial axis of skull conspicuously deflected against basicranial axis; alveolar line, if projected backward, passing through middle or upper edge of occipital condyle or even through some point of supraoccipital (*Rousettus* section). 5
	b	Facial axis very little deflected against basicranial axis; alveolar line, if projected backward, passing through lower edge of occipital condyle or even some distance below condyle (exceptions: *Plerotes* and *Sphærias*). 12
5	a	Incisors never $^{1-1}/_{1-1}$, lower canines normal in position, cheek-teeth $^{5}/_{6}$ or (in *Styloctenium* only) $^{5}/_{5}$; cranial rostrum not shortened, premaxillæ not more reduced than usual; second finger clawed. 6
	b	Incisors $^{1-1}/_{1-1}$, lower canines at extremity of mandible, cheek-teeth $^{4}/_{6}$ (p^1 lost); cranial rostrum at least slightly, often considerably shortened, premaxillae sublinear; second finger without claw, a short tail, wings from spinal line, back seemingly naked (the furred back being covered by the naked wing-membranes). [12 species, 13 forms: Austro-Malayan] (Genus *Dobsonia*). 174
6	a	Occipital (sublambdoid) region of skull not elongate; a short tail (third metacarpal nearly always slightly but distinctly longer than fourth and fifth) (*Rousettus* subsection). 7
	b	Occipital (sublambdoid) region of skull elongate, subtubular; no tail (fifth metacarpal nearly always slightly but distinctly longer than third and fourth. (*Pteropus* subsection). 9
7	a	Incisors $^{2-2}/_{2-2}$. 8
	b	Incisors $^{1-1}/_{2-2}$ (i^1 lost), premaxillæ spaced in front. [1 species: Celebes.] (Genus *Boneia*). ..... *Boneia bidens*
8	a	Tympanic forming a short bony auditory meatus, premaxillæ spaced in front ; m_1 equal in length to m_2 and m_3 combined. [3 species: Ethiopian and Malagasy regions.] (Genus *Eidolon*). 215
	b	No bony auditory meatus, premaxillæ in contact or co-ossified in front; m_1 shorter than m_2 and m_3 combined. [14 species: Ethiopian, E. Mediterranean, Oriental, Austro-Malayan.] (Genus *Rousettus*). 217
9	a	Incisors $^{2-2}/_{2-2}$, cheek-teeth $^{5}/_{6}$. 10
	b	Incisors $^{2-2}/_{1-1}$ (i_1 lost), cheek-teeth $^{5}/_{5}$ (m_3 lost). [1 species: Celebes] (Genus *Styloctenium*). ..... *Styloctenium wallacei*
10	a	Premaxillæ in simple contact in front; i_2 once and a half to six times the bulk of i_1 upper canines without secondary cusp (except in *Pteropus tuberculatus*). 11
	b	Premaxillæ co-ossified in front (in adults); i_2 twelve to fifteen times the bulk of i_1, upper canines with large external secondary cusp, upper molariform teeth with prominent anterior and posterior basal ledges, external main cusp of p_4, m_1, and m_2 distinctly bilobed. [2 species: Solomon Islands.] (Genus *Pteralopex*). 233
11	a	No well-differentiated antero-internal tubercle in p^4 and m^1, no sharply defined inner basal ledge in p_4, m_1, and m_2 (except in *Pteropus anetianus*). [85 species, 103 forms: Malagasy, Oriental, Austro-Malayan, Australian, Polynesian; one Ethiopian species] (Genus *Pteropus*). 70

b A well-differentiated antero-internal tubercle in p^4 and m^1 (sometimes also in p^3 and p_3), a sharply defined inner basal ledge in p_4, m_1 and m_2. [6 species, 9 forms: Philippines, W. Austro-Malaya] (Genus *Acerodon*)..... 166

12 a Brain-case peculiarly flattened posteriorly; a small whitish hair-tuft at base of ear-conch anteriorly and posteriorly (except in Scotonycteris). [All genera Ethiopian] (*Epomophorus* section). 13

b Brain-case not flattened posteriorly; no whitish tufts at base of ear-conch [*Cynopterus* section]. 20

13 a Cheek-teeth $^4/_6$ (m^2 absent), molariform teeth sublinear, with flattened crowns; palate-ridges simple (fig. 29 B) [1 species.] (Genus *Plerotes*)..... *Plerotes anchietæ*

b Cheek-teeth $^3/_5$ (p^1, m^2, and m_3 absent); some or all of the palate-ridges peculiarly modified. 14

14 a Cranial rostrum long; orbit to tip of nasals much more than lachrymal breadth..... 15

b Cranial rostrum short: orbit to tip of nasals equal to or less than lachrymal breadth. 17

15 a Rostrum long and broad, post-dental palate flattened posteriorly. 16

b Rostrum long and narrow, postdental palate deeply depressed posteriorly. [8 species, 9 forms] (Genus *Epomophorus*). 227

16 a Rostrum not deeper than usual, premaxillæ in simple contact anteriorly; lower incisors and canines biting against corresponding upper teeth, outer ridge of lower molars simple ; muzzle without cutaneous leaves, tail rudimenfary (two free caudal vertebræ); males with shoulder pouches and erectile shoulder brushes. [3 species, 4 forms] (Genus *Epomops*). 234

b Rostrum considerably increased in depth, premaxillæ ankylosed together anteriorly; lower incisors and canines closing some distance in front of upper, outer ridge of lower molars bilobed or trilobed; upper lip with cutaneous leaves, tail absent (no free caudal vertebræ); no shoulder pouches or brushes in either sex [1 species]. (Genus *Hypsignathus*). ..... *Hypsignathus monstrosus*

17 a Postzygomatic palate not (or scarcely) narrower posteriorly than anteriorly; head without white markings (except for the usual Epomophorine whitish tufts at base of ear-conch anteriorly and posteriorly)..... 18

b Postzygomatic palate either much narrower posteriorly than anteriorly or entirely absent; head with peculiar white markings. 19

18 a Postzygomatic palate at least as long as broad ; maxillary tooth-row extending backward very nearly to ventral margin of orbital cavity; soft palate with a deep median groove, narrowing posteriorly. [1 species] (Genus *Micropteropus*). ..... *Micropteropus pusillus*

b Postzygomatic palate almost twice as broad as long; maxillary tooth-row not nearly reaching ventral margin of orbital cavity; soft palate with a prominent median keel. [1 species] (Genus *Nanonycteris*). ..... *Nanonycteris veldkampi*
African Chiroptera name ..... *Micropteropus pusillus*

19 a Postzygomatic palate long, its lateral margins forming straight lines converging posteriorly; no whitish tufts at base of ear-conch. [1 species] (Genus *Scotonycteris*). ..... *Scotonycteris zenkeri*

b No postzygomatic palate, the mesopterygoid fossa continued forward nearly to level of posterior molar; small whitish hair-tufts at base of ear-conch anteriorly and posteriorly. [1 species] (Genus *Casinycteris*). ..... *Casinycteris argynnis*

20 a Cheek-teeth $^5/_6$; rostrum less shortened: orbit to tip of nasals subequal to lachrymal breadth. [The only Ethiopian genus of the section: 4 species] (Genus *Myonycteris*). 185

b Cheek-teeth less than $^5/_6$; rostrum much shortened; orbit to tip of nasals much less than (only in *Sphærias* subequal to) lachrymal breadth..... 21

21 a Two or one pair of lower incisors, lower canines normal in position; nostrils not tubular; tongue with three circumvallate papillæ. 22

b Incisors $^{1-1}/_{0-0}$ (i^2, i_1, i_2 lost), cheek-teeth $^4/_5$ (m^2, m_3 lost), lower canines close together at extremity of mandible; nostrils elongated into cylindrical tubes, tongue with four circumvallate papillæ, tail not much shorter than tibia, wings spotted. [13 species: Austro-Malaya, Australia] (Genus *Nyctimene*)..... 201

22 a Postorbital foramen (through base of postorbital process) present. 23

b Postorbital foramen absent. 26

23 a Postorbital foramen large, premaxillæ in simple contact in front; cheek-teeth $^{4}/_{5}$ (m^{2} and m_{3} lost); membranes from first toe. 24
b Postorbital foramen extremely small; premaxillæ ankylosed together in front; cheek-teeth $^{3}/_{5}$ (also p^{1} lost); membranes from second toe, tail present. [1 species: Indo-Malaya] (Genus *Dyacopterus*). ..... *Dyacopterus spadiceus*

24 a Cranial rostrum much lower at canine than at p^{3}; upper canines with secondary cusp at inner edge; tail present. 25
b Cranial rostrum as deep in front (at canine) as at p^{3}; no secondary cusp in upper canines; tail absent. [1 species: Indo-Malaya] (Genus *Megærops*). ..... *Megærops ecaudatus*

25 a Incisors $^{2-2}/_{2-2}$, i^{2} not shortened; upper canines without vertical groove on front face. [6 species, 16 forms: Oriental, W. Austro-Malayan] (Genus *Cynopterus*). 188
b Incisors $^{2-2}/_{1-1}$ (i_{1} lost), i^{2} much shortened; upper canines with distinct vertical groove on antero-medial surface. [1 species: Philippines] (Genus *Ptenochirus*). ..... *Ptenochirus jagori*

26 a Incisors simple (terete, crown not peculiarly differentiated), sub-vertical, cheek-teeth not narrow; interfemoral and calcar unmodified. 27
b Upper and lower incisors ($^{2-2}/_{2-2}$) proclivous, crowns highly differentiated, triangularly pointed, cheek-teeth ($^{4}/_{5}$) unusually narrow; interfemoral not extending beyond middle of tibia, calcar and tail absent. [1 species: Indo-China] (Genus *Sphærias*). ..... *Sphærias blanfordi*

27 a p^{3} with antero-external basal lobe or cusp. 28
b p^{3} unmodified. 29

28 a Premaxillæ in simple contact anteriorly; incisors $^{2-2}/_{1-1}$ (i_{1} lost), i^{2} much shortened, cheek-teeth $^{5}/_{5}$ (only m_{3} lost), p^{3} with large antero-external basal lobe; wings spotted. [1 species: Borneo] (Genus *Balionycteris*). ..... *Balionycteris maculata*
b Premaxillæ solidly united anteriorly; incisors $^{2-2}/_{2-2}$, i^{2} normal, cheek-teeth $^{4}/_{5}$ (m_{3} and m^{2} lost), p^{3} with well-defined antero- external basal cusp; wings (probably) not spotted. [1 species: Java] (Genus *Chironax*). ..... *Chironax melanocephalus*

29 a Incisors $^{2-2}/_{2-2}$, i^{2} normal, p_{4} and m_{1} with surface cusp: tail rudimentary,wings from second toe. [1 species: W. Austro-Malaya] (Genus *Thoopterus*). ..... *Thoopterus nigrescens*
b $^{2-2}/_{1-1}$ (i_{1} lost), i^{2} much shortened, no surface cusp in any cheek-tooth; tail about half as long as foot with claws, wings from first toe. [1 species: Indo-Malaya] (Genus *Penthetor*). ..... *Penthetor lucasi*

30 a Premaxillæ not broader in upper than in lower half, infraorbital canal shorter; third metacarpal longest, or third, fourth. and fifth subequal, terminal phalanx of third finger always much shorter than third metacarpal. (p^{1} and p_{1} often unusually large, never absent.) (*Eonycteris* section). 31
b Premaxillæ twice or thrice as broad in upper as in lower half, infraorbital canal long; fifth metacarpal longest, terminal phalanx of third finger subequal to or longer than third metacarpal, (p^{1} and p_{1} minute or absent) (*Notopteris* section). 34

31 a Premaxillæ in simple contact in front or slightly spaced; cheek-teeth less reduced in size: second finger without claw, tail subequal in length to foot with claws. (Facial axis not strongly deflected; incisors $^{2-2}/_{2-2}$, cheek-teeth $^{5}/_{6}$ or, by suppression of small m_{3}, $^{5}/_{5}$.) [3 species: Indo-Malaya, Celebes] (Genus *Eonycteris*). 212
b Premaxillæ solidly fused in front; cheek-teeth much more reduced; second finger clawed, tail rudimentary or absent. 32

32 a Upper incisors minute, crowns not peculiarly differentiated, lower incisors subequal in size; interfemoral and calcar unmodified. (Incisors $^{2-2}/_{2-2}$, cheek-teeth $^{5}/_{6}$, but individual anomalies in number of cheek-teeth of frequent occurrence in *Macroglossus*). 33
b Upper incisors large, crown well differentiated, narrowly chisel-shaped, i_{2} much larger than i_{1} and with obliquely triangular crown; lateral interfemoral unusually narrow, calcar rudimentary. (Incisors $^{2-2}/_{2-2}$, cheek-teeth $^{5}/_{6}$ or, by suppression of small m_{3} and m^{2}, $^{4}/_{5}$.) [3 species, 7 forms: Austro-Malaya, Australia] (Genus *Syconycteris*). 236

33 a Facial axis much less deflected, premaxillæ less proclivous; p^{3} (second premolar) much higher than p^{1}, lower incisors bilobate, subequally spaced; fifth metacarpal much shorter than third, fourth intermediate; males with large neck-tufts. [1 species: Ethiopian] (Genus *Megaloglossus*). ..... *Megaloglossus woermanni*

b Facial axis strongly deflected, premaxillæ more proclivous; p^3 more reduced, little higher than p^1, lower incisors simple, i_1 - i_1 widely spaced; third, fourth, and fifth metacarpals subequal; males without neck-tufts. [2 species, 6 forms: Indo-China to Solomon Islands.] (Genus *Macroglossus*). 242

34 a Premaxillæ in simple contact in front or slightly spaced, angular process of mandible large; p^1 and p_1 present (cheek-teeth $^5/_6$), p_3 smaller than m_1 and m_2: tail absent, membranes from flanks and third or fourth toe, back furred, tibia much less than half the length of forearm. 35

b Premaxillæ co- ossified in front, angular process of mandible small; p^1 and p_1 absent (cheek-teeth $^4/_5$), incisors $^{2\,-\,2}/_{1\,-\,1}$ (or in adults, i^1 being deciduous, $^{1\,-\,1}/_{1\,-\,1}$), p_3 the largest lower cheek-tooth; tail very long, subequal to forearm, membranes from spinal line and first and second toe, back seemingly naked at middle (the furred back being covered by the naked membranes), second finger without claw, tibia longer than usual (half as long as forearm). [2 species: Polynesia] (Genus *Notopteris*)..... 214

35 a Incisors $^{2\,-\,2}/_{2\,-\,2}$; second finger clawed. (Underparts much darker than back.) [1 species: New Guinea, Bismarck Archipelago] (Genus *Melonycteris*). .... *Melonycteris melanops*

b Incisors $^{2\,-\,2}/_{1\,-\,1}$ (i_1 lost); second finger without claw. (Underparts paler than back.) [1 species: Solomon Islands] (Genus *Nesonycteris*). .....*Nesonycteris woodfordi*

36 a No lower incisors (Genus *Nyctimene*)..... 201

b One or two pairs of lower incisors. 37

37 a One pair of lower incisors..... 38

b Two pairs of lower incisors. 46

38 a One pair of upper incisors. 39

b Two pairs of upper incisors (middle pair deciduous in *Notopteris*). 40

39 a Cheek-teeth $^5/_6$ on each side (Genus *Harpyionycteris*)..... *Harpyionycteris whiteheadi*

b Cheek-teeth $^4/_6$ on each side (Genus *Dobsonia*). 174

40 a Cheek-teeth $^5/_6$ on each side (Genus *Nesonycteris*).....*Nesonycteris woodfordi*

b Cheek-teeth less than $^5/_6$ on each side. 41

41 a Cheek-teeth $^5/_5$. 42

b Cheek-teeth $^4/_5$. 43

42 a Length of rostrum (orbit to tip of nasals) greater than lachrymal breadth (across lower edges of lachrymal foramina); m^1 (penultimate upper cheek-tooth) equal in size to p^4 (antepenultimate) (Genus *Styloctenium*).....*Styloctenium wallacei*

b Length of rostrum much less than lachrymal breadth: m^1 much smaller than p^4 (Genus *Balionycteris*)..... *Balionycteris maculata*

43 a Rostrum long, strongly deflected: lower incisors widely spaced; reduced number of cheek-teeth due to loss of anterior premolar above and below (p^1 and p_1) (Genus *Notopteris*)..... 214

b Rostrum short, scarcely deflected; lower incisors close together; reduced number of cheek-teeth due to loss of posterior molar above and below (m^2 and m_3). 44

44 a Postorbital foramen (through base of postorbital process) large. 45

b Postorbital foramen absent (Genus *Penthetor*). ..... *Penthetor lucasi*

45 a Surface cusps in p_4 and m_1 (third and fourth lower cheek-tooth); upper canines grooved (Genus *Ptenochirus*). ..... *Ptenochirus jagori*

b No surface cusps in check-teeth; upper canines without groove (Genus *Megærops*). ..... *Megærops ecaudatus*

46 a One pair of upper incisors (Genus *Boneia*)..... *Boneia bidens*

b Two pairs of upper incisors (outer pair often deciduous in *Epomops*)..... 47

47 a 5 upper cheek-teeth on each side (anterior tooth often deciduous in *Pteropus* and *Acerodon*)..... 48

b Less than 5 upper cheek-teeth on each side. 57

48 a A short bony auditory meatus (Genus *Eidolon*). 215

b No bony auditory meatus. 49

49 a Occiput elongate, subtubular. 50

b Occiput not elongate. 52

50 a Outer lower incisor not more (but generally less) than six times the bulk of inner.. 51

b Outer lower incisor twelve to fifteen times the bulk of inner (Genus *Pteralopex*). 233

51 a No well-defined antero-internal tubercle in p^4 and m^1 (third and fourth upper cheek-tooth) (Genus *Pteropus*)..... 70

b A well -defined antero-internal tubercle in p^4 and m^1 (Genus *Acerodon*). 166
52 a Length of rostrum (orbit to tip of nasals) subequal to lachrymal breadth (across lower edges of lachrymal foramina) (Genus *Myonycteris*). 185
b Length of rostrum conspicuously greater than lachrymal breadth. 53
53 a Outer lower incisor much higher than inner (Genus *Syconycteris*)..... 236
b Lower incisors subequal in height. 54
54 a Cheek-teeth not linear (Genus *Rousettus, Eonycteris*)..... 212
b Cheek-teeth linear. 55
55 a Premaxillæ much broader in upper than in lower half (Genus *Melonycteris*). ..... *Melonycteris melanops*
b Premaxillæ not broader above than below..... 56
56 a Lower incisors subequally spaced (Genus *Megaloglossus*).*Megaloglossus woermanni*
b Inner pair of lower incisors widely spaced (Genus *Macroglossus*). 242
57 a 4 upper cheek-teeth on each side..... 58
b 3 upper [and 5 lower] cheek- teeth on each side. 63
58 a 6 lower cheek-teeth on each side (Genus *Plerotes*). ..... *Plerotes anchietæ*
b 5 lower cheek-teeth on each side. 59
59 a Postorbital foramen (through base of postorbital process) large. 60
b Postorbital foramen absent. 61
60 a Rostrum short, scarcely deflected; inner secondary cusp in upper canines (Genus *Cynopterus*)..... 188
b Rostrum long, strongly deflected; no secondary cusp in canines (Genus *Syconycteris*) 236
61 a Incisors proclivous, highly differentiated, triangularly pointed (Genus *Sphærias*). ..... *Sphærias blanfordi*
b Incisors subvertical, simple. 62
62 a Surface cusp in third and fourth lower cheek-tooth (p_4 and m_1) (Genus *Thoopterus*) ..... *Thoopterus nigrescens*
b No surface cusp in any cheek-tooth (Genus *Chironax*). .....*Chironax melanocephalus*
63 a Length of rostrum (orbit to tip of nasals) much greater than lachrymal breadth (across lower edges of lachrymal loramina). 64
b Length of rostrum less than or subequal to lachrymal breadth. 66
64 a Post dental palate deeply depressed posteriorly (Genus *Epomophorus*)..... 227
b Postdental palate flattened posteriorly. 65
65 a Outer ridge of lower molars simple (Genus *Epomops*). 231
b Outer ridge of lower molars bilobed or trilobed (Genus *Hypsignathus*) .... *Hypsignathus monstrosus*
66 a Palate not extending beyond tooth-rows (choanæ at level of last molar) (Genus *Casinycteris*)..... *Casinycteris argynnis*
b Palate extending behind tooth-rows..... 67
67 a Premaxillæ fused anteriorly (Genus *Dyacopterus*). .....*Dyacopterus spadiceus*
b Premaxillæ separated by suture anteriorly..... 68
68 a Postzygomatic palate much narrower posteriorly than anteriorly (Genus *Scotonycteris*)..... *Scotonycteris zenkeri*
b Postzygomatic palate subequal in breadth throughout. 69
69 a Upper tooth-rows extending practically to ventral margin of orbital cavity (Genus *Micropteropus*). ..... *Micropteropus pusillus*
b Upper tooth-rows not nearly reaching ventral margin of orbital cavity (Genus *Nanonycteris*). .....*Nanonycteris veldkampi*
African Chiroptera name ..... *Micropteropus pusillus*
70 a Posterior basal ledges of large premolars distinct. 71
b Posterior basal ledges of premolars practically obliterated. (Tibia naked above in all species, except *Pteropus poliocephalus*)..... 142
71 a Skull and dentition unmodified Pteropine. Tibia generally naked above. 72
b Rostrum shortened, dentition more or less modified. Tibia nearly always clothed above..... 121
72 a Dentition not unusually heavy. Size moderate or small: forearm 94 - 171 mm. 73
b Dentition unusually heavy. Large: forearm 162 - 204 mm. (*Pteropus melanopogon* group) 118
73 a Interfemoral scarcely developed in centre. 74

b Interfemoral distinct in centre. 108
74 a Ears moderate or short, not narrowly pointed. 75
b Ears longer (reaching back of eye), narrowly pointed above. Dentition heavier (*Pteropus caniceps* group). 106
75 a Colour varying, but never blackish above and beneath with sharply contrasting light yellowish mantle (*Pteropus hypomelamus* group). 76
b Blackish above and beneatli, often sprinkled with pale greyish, and with sharply contrasting- light yellowish mantle (*Pteropus mariannus* group). 99
76 a Cheek-teeth of normal size: breadth of p^1 about one- third that of palate between p^4-p^4. 77
b Cheek-teeth reduced : breadth of p^4 less than one-fourth that of palate between p^4-p^4. Ears very small, hidden in fur; tibia thickly clothed. Forearm 95 - 99 mm. (Mascarenes). ..... *Pteropus subniger*
77 a Tibia naked above. 78
b Tibia clothed above, at least for proximal half. 94
78 a Skull larger; total length 61.3 - 68.7 mm. 79
b Skull smaller; total length 54.5 - 59.8 mm. 88
79 a Fur shorter: 10 - 14 mm. on back. Forearm 121 - 146 mm. (Mergui Archip. to New Guinea). (*Pteropus hypomelanus*) 80
b Fur longer: 18 - 19 mm. on back. (Blackish above and beneath with pale mantle and centre of breast.) Forearm 139 mm. (Andamans). ..... *Pteropus satyrus*
80 a Crown and sides of head generally similar in colour to back; blackish thickly mixed with greyish-white hairs, producing the general effect of a very dark shade of hair-brown. (Individuals occur with back and head more or less suffused with russet or wood-brown.) 81
b Crown and sides of head, in the ordinary phase, similar to or paler than mantle, varying from deep chestnut through several shades of ochra,ceous to almost cream-buff. (In some races a blackish phase occurs, and a phase with head, back, flanks, and belly grizzled greyish and blackish.) 82
81 a Mantle chestnut more or less clouded with seal-brown, rarely as bright as cinnamon-rufous. Size normal: forearm 134 - 137 mm. (Mergui Archipelago). ..... *Pteropus hypomelanus geminorum*
b Mantle much lighter; varying from bright hazel to almost ochraceous-buff. Averaging smaller: forearm 121 - 133.5 mm. (Engano). ..... *Pteropus hypomelanus enganus*
82 a Breast and belly or at least centre of breast, in the ordinary phase, some shade of cinnamon-rufous or hazel or rich ochraceous, darkening on flanks and anal region (often also on belly) into dark chestnut or sealbrown. 83
b Breast and belly, in the ordinary phase, averaging paler, tawny ochraceous or pale ochraceous or ochraceous-buff; flanks and anal region seal-brown or chestnut seal-brown (a phase with blackish underparts occurs, at least in *macassaricus*); back and rump seal-brown or Prout's brown. 87
c Palest extreme; underparts, head, and mantle ochraceous-buff or cream-buff; back and rump from seal-brown to mars-brown. Forearm 128.5 - 135.5 mm. (New Guinea; Trobriand Is.; Woodlark I.). ..... *Pteropus hypomelanus luteus*
83 a Back usually dark hair-brown. Forearm about 135 mm. (Pulo Condor; Cambodja; Siam) ..... *Pteropus hypomelanus condorensis*
b Back usually pale mouse-grey or silvery whitish-grey sprinkled with blackish, with or without buffy or brownish or russet suffusion. [Compare c^2.] 84
c Back usually seal-brown or approximately Prout's brown more or less sprinkled with light greyish. (Individuals occur with the back strongly suffused with russet.) 86
84 a Teeth averaging larger; p^3, length 4.6 - 5.1 mm. 85
b Teeth of normal size; p^3, length 4.2 - 4.8 mm. Back usually strongly suffused with golden ochraceous or Prout's brown. (Phases as in canus.) Forearm about 130 - 133.5 mm. (S. Natunas). ..... *Pteropus hypomelanus annectens*
85 a Mantle usually hazel or chestnut; back and rump not, or only slightly, suffused with buffy. (A blackish phase occurs, and a phase with head, flanks, and belly grizzled greyish and blackish.) Size as *lepidus*. (N. Natunas)... *Pteropus hypomelanus canus*
b Mantle usually darker, chocolate or seal-brown; back and rump conspicuously suffused with buffy or brownish. (Phases as in *canus*.) Forearm 131 - 139 mm. (Tambelan Is.; P. Aor; P. Tioman) ..... *Pteropus hypomelanus lepidus*

86 a Mantle varying from dark maroon-chestnut to cinnamon-rufous; prevailing colour of back seal-brown. Forearm 128 - 142.5 mm. (N. Borneo and coast islands; Sembilan Is.).....*Pteropus hypomelanus tomesi*
b Mantle averaging brighter, rich golden ochraceous-buff; back more tinged with Prout's brown. Forearm 135 - 141.5 mm. (Cagayan Sulu; Philippines). ....*Pteropus hypomelanus cagayanus*
87 a Underparts tawny ochraceous or pale ochraceous; head and mantle tawny. Forearm 131 - 145.5 mm. (Celebes; Sanghir Is.; Talaut Is.). ..... *Pteropus hypomelanus macassaricus*
b Underparts paler, golden buffy; head and mantle light ochraceous. Size as foregoing. (Gilolo group).....*Pteropus hypomelanus hypomelanus*
88 a Ears from orifice 25 - 26 mm. 89
b Ears from orifice 21 - 22 mm. 92
89 a Forearm 120.5 - 128 mm..... 90
b Forearm 113 - 119 mm..... 91
90 a Darker; underparts tawny. (Sibutu I.; Malanipa I.). .....*Pteropus speciosus*
b Lighter; underparts golden ochraceous. (Philippines; Celebes). ..... *Pteropus mimus*
91 a Flanks dark brown. (Banda Is.). .....*Pteropus pallidus*
b Flanks pale like underparts. (Timor; Bonerato; Dyampea: Salayer). ....*Pteropus griseus*
92 a Forearm 118 - 126 mm..... 93
b Forearm 109 - 114 mm (Underparts dark brownish.) (W. Solomon Is.)..... .....*Pteropus colonus*
93 a Underparts ochraceous - buffy tinged with cinnamon (Nicobars). ..*Pteropus faunulus*
b Underparts seal-brown heavily mixed with greyish (Admiralty Is.)..... .....*Pteropus admiralitatum*
94 a Fur of back directed posteriorly. 95
b Fur of back long and spreading. 98
95 a Forearm about 110 - 120 mm. Mantle russet, cinnamon, or mars-brown..... 96
b Forearm about 145 - 152 mm. Mantle bufly. 97
96 a c-m^2 less than 22 mm. Forearm 110 mm. (Central Solomon Is.)..... .....*Pteropus solomonis*
b c-m^2 more than 22 mm. Forearm 118 mm (E. Australia). .....*Pteropus brunneus*
97 a Head, back, and underparts dark brown. (New Caledonia). .....*Pteropus ornatus*
b Head and underparts ochraceous, back mixed ochraceous and brown. (Loyalty Is.). .....*Pteropus auratus*
98 a Varied with buffy on back. Forearm 125 - 137 mm. (S. Liu kiu Is.). .....*Pteropus dasymallus*
b Nearly uniform dark brownish above and beneath. Forearm 130 - 137 mm. (Formosa).....*Pteropus formosus*
99 a Small; forearm about 113 mm. (Pelew Is.).....*Pteropus pelewensis*
b Larger; forearm 139 - 154 mm. 100
100 a Eyes smaller; orbit 11.5 - 11.8 mm. 101
b Eyes larger; orbit 12.5 - 13.8 mm. 104
101 a Fur shorter: 9 - 11 mm. on back. 102
b Fur longer: 14 - 17 mm. on back. Forearm 135 - 143 mm. (S. Liu-kiu Is.). .....*Pteropus loochoënsis*
102 a Dentition weak; length of p^3 3.8 - 4 mm. Forearm 130 - 134 mm. (E. Carolines). .....*Pteropus ualanus*
b Dentition stronger; length of p^3 4.5 - 5 mm. 103
103 a Dentition moderate; length of p_4 3.9 - 4.1 mm. Forearm about 130 mm. (W. Carolines). .....*Pteropus yapensis*
b Dentition strongest; length of p_4 4.8 - 5 mm. Forearm 134 - 137 mm. (Marianne Is.). .....*Pteropus mariannus*
104 a Smaller; c-m^2 24.5 - 26, forearm 136 - 150 mm. 105
b Larger; c-m^2 27.8 - 30, forearm about 154 mm. (New Hebrides; New Caledonia). .....*Pteropus geddiei*
105 a Shorter-winged; third metacarpal about 88 - 89, forearm 136 - 137 mm. (Sta. Cruz Is.).....*Pteropus vanikorensis*

b Longer-winged; third metacarpal about 93.5 - 102.5, forearm 139 - 150 mm. (Fiji; Tonga; Samoa)..... *Pteropus tonganus*

106 a Ears about 24 mm. (orifice to tip). Back sepia suffused with golden buffy. Forearm 145 mm. (Celebes)..... *Pteropus dobsoni*

b Ears about 31 mm. (orifice to tip)..... 107

107 a Dentition stronger: length of m_1 5.1 - 5.5 mm.: fur short. Forearm 135 - 140 mm. (Gilolo group; Sula Is.: Sanghir)..... *Pteropus caniceps*

b Dentition weaker; length of m_1 about 4.7 mm.; fur longer. Forearm ? 136 mm. (? Amboina)..... *Pteropus argentatus*

108 a Ears strongly attenuated above, subacutely pointed (*Pteropus rufus* group)..... 109

b Ears rather broadly rounded off at tip (*Pteropus melanotus* group)..... 114

109 a Tibia naked above. Ears exposed. No colour contrast between lateral and median tract of back..... 110

b Tibia clothed above. Ears nearly concealed in fur. Buffy sides of back contrasting with dark spinal tract. Forearm 159 - 171 mm. (Mascarenes). ..... *Pteropus niger*

110 a Ears much longer: 37 - 38 mm. Size larger: forearm 158 - 171 mm. (Madagascar) (*Pteropus rufus*)..... 111

b Ears much shorter: 31 - 32 mm. Size smaller: forearm 134 - 157 mm. 112

111 a Averaging smaller: skull, total length 69 - 74, forearm 158.5 - 165.5 mm. (N. and C. Madagascar). ..... *Pteropus rufus rufus*
African Chiroptera name ..... *Pteropus niger*

b Averaging larger: skull about 77, forearm 170.5 mm. (S. Madagascar).*Pteropus rufus princeps*
African Chiroptera name ..... *Pteropus rufus*

112 a Back blackish, uniform or sprinkled with greyish. Larger: forearm 143 - 157 mm. 113

b Back strongly tinged with broccoli-brown. Small; forearm about 134 mm. (Aldabra I.). ..... *Pteropus aldabrensis*

113 a Back not, or extremely thinly, sprinkled with greyish; breast and belly yellowish buff. Forearm 151 - 157 mm. (Comoros). ..... *Pteropus comorensis*
African Chiroptera name ..... *Pteropus seychellensis*

b Back conspicuously sprinkled with greyish ; breast and belly much darkened with brownish Forearm 143 - 154 mm. (Seychelles). ..... *Pteropus seychellensis*

114 a Centre of breast light-coloured..... 115

b Underparts uniform blackish. 116

115 a Back blackish seal-brown. Forearm 153 - 165 mm. (Nicobars). *Pteropus melanotus*

b Back approaching hair-brown. Forearm 153 - 160 mm. (Nias)..... *Pteropus niadicus*

116 a Forearm about 150 mm. Mantle sometimes pale-coloured. (Andamans). ..... *Pteropus tytleri*

b Forearm 125 - 141 mm. Mantle never pale-coloured..... 117

117 a Skull (61.5 - 67; fur of back 18; forearm 134 - 141 mm. (Engano). ..... *Pteropus modiglianii*

b Skull 54.5 - 56; fur of back 25; forearm 125 - 135 mm. (Christmas I.). ..... *Pteropus natalis*

118 a Ears not peculiar. Forearm 179 - 204 mm. 119

b Ears semicircularly rounded off above. Forearm 162 - 172 mm. (Comoros). ..... *Pteropus livingstonei*
African Chiroptera name ..... *Pteropus livingstonii*

119 a Furred area of back restricted to narrow spinal line. Forearm 196 - 204 mm. (Amboina group; Banda; Timor Laut)..... *Pteropus melanopoqon*

b Furred area of back of normal breadth..... 120

120 a Back silvery whitish. Forearm about 190 mm. (Aru Is.). ..... *Pteropus aruensis*

b Nearly uniform yellowish above and beneath. Forearm 179 - 188 mm. (Key Is.). ..... *Pteropus keyensis*

121 a Dentition heavy. Fur never silvery whitish or buffy above and beneath..... 122

b Dentition weak or even degenerate. Unusually pale-coloured: silvery whitish or silvery buffy above and beneath (*Pteropus temmincki* group). 140

122 a m_3 always, m^2 often, conspicuously reduced; i_2 and p_1 normal. 123

b m_3, m^2, and i_1 normal; i_2 and p_1 enlarged; rostrum very short..... 132

123 a Rostrum less shortened; i_1 not reduced, $^2/_3$ - $^2/_5$ of i_2. (*Pteropus rayneri* group). . 124

b Rostrum much shortened; i_1 reduced, $^1/_4$ - $^1/_6$ of i_2 (*Pteropus lombocensis* group). 129

124 a Tibia densely furred above, at least for proximal half. (Solomon Is.). 125
b Tibia thinly haired above. Upperside generally tri-coloured. Forearm 163 - 177 mm. (Amboina group). ..... *Pteropus chrysoproctus*
125 a Brownish above and beneath with cinnamon or russet mantle. Forearm at least 121 mm. (San Christoval). ..... *Pteropus cognatus*
b Upperside tri-coloured; bright mantle, dark back, bright rump. 126
126 a Smaller; forearm 137 - 141 mm. (Guadalcanar). ..... *Pteropus rayneri*
b Larger; forearm 151 - 172 mm. 127
127 a Crown and face grizzled with buffy and greyish. 128
b Crown and face blackish seal-brown. Forearm 167 - 172 mm. (Bougainville; Shortland). ..... *Pteropus grandis*
128 a Lower leg about 76.5 mm.; colour much lighter. Forearm about 163 mm. (Rubiaua). ..... *Pteropus rubianus*
b Lower leg about 65 - 68 mm.; colour much darker. Forearm 151 - 156 mm. (Vella Lavella). ..... *Pteropus lavellanus*
129 a Tibia furred above; forearm 108 - 127 mm. 130
b Tibia naked above. Very small: forearm 94 - 99 mm. (Carolines). ..... *Pteropus molossinus*
130 a Ears exposed. 131
b Ears nearly concealed in fur. Forearm 124 - 127 mm. (Rodriguez). ..... *Pteropus rodricensis*
131 a Larger, darker. Forearm 113 - 122 mm. (Lombok; Flores). .... *Pteropus lombocensis*
b Smaller, paler. Forearm about 108 mm. (Alor I.). ..... *Pteropus solitarius*
132 a Posterior ledges of upper incisors of normal breadth (*Pteropus samoënsis* group) 133
b Posterior basal ledges of upper incisors unusually broad (*Pteropus pselaphon* group). 135
133 a No inner basal ledge in lower cheek-teeth. 134
b A broad inner basal ledge in p_4, m_1, and m_2. Forearm 123 - 130 mm. (New Hebrides) ..... *Pteropus anetianus*
134 a i_2 and p_1 slightly enlarged. Forearm 124 - 132 mm. (Fijis) ..... *Pteropus nawaiensis*
b i_2 and p_1 much enlarged. Forearm about 144 mm. (Samoas).... *Pteropus samoënsis*
135 a Tibia naked above. Small: forearm 101 - 109 mm. (Carolines) 136
b Tibia furred above. Larger: forearm 120 - 151 mm. 137
136 a Back dark brown. (Ruck atoll). ..... *Pteropus insularis*
b Back golden cream-buff. (Mortlock). ..... *Pteropus phæocephalus*
137 a Upper molariform teeth not shortened. 138
b Upper molariform teeth shortened, subquadrate. Forearm about 140 mm. (Philippines). ..... *Pteropus leucopterus*
138 a Upper canine without secondary cusp. Larger: forearm 132 - 151 mm. 139
b Upper canine with small secondary cusp. Small: forearm about 120 mm. (? Marianne Is.; ? Vanikoro). ..... *Pteropus tuberculatus*
139 a Feet hairy above; fur of back 30 mm. Forearm 132 - 141 mm. (Bonin and Volcano Is.). ..... *Pteropus pselaphon*
b Feet naked above; fur of back 20 mm. Forearm about 151 mm. (Pelew Is.). ..... *Pteropus pilosus*
140 a Head not striped. Forearm 94 - 101 mm. (Amboina group; Timor). ..... *Pteropus temmincki*
b Head striped. 141
141 a Cheek-teeth of normal breadth. Forearm 110 - 116 mm. (Bismarck Archip.). *Pteropus capistranus*
b Cheek-teeth excessively narrow. Forearm 86 - 96 mm. (Gilolo group; Celebes). ..... *Pteropus personatus*
142 a Cheek-teeth of normal breadth (breadth of p^4 $^1/_3$, rarely $^1/_4$, that of palate between p^4-p^4). 143
b Cheek-teeth excessively narrow (breadth of p^4 1/5 - $^1/_6$ that of palate between p^4-p^4) (*Pteropus scapulatus* group). 165
143 a p^3 and p^4 normal. 144
b p^3 and p^4 subsquarish. Ears long and .sharply pointed (*Pteropus macrotis* group). 163
144 a Furred area of back of normal breadth (not restricted to narrow spinal line). Middle divided palate-ridges less than 8. 145

b Furred area of back (in adults) restricted to narrow spinal line. Palate-ridges 5 + 8 + 3 (*Pteropus neohibernicus* group). 162

145 a Ears long and sharply pointed (*Pteropus vampyrus* group). 146

b Ears not long and sharply pointed. 156

146 a Smaller: forearm 148 - 154 mm. (Siam; Saigon). ..... *Pteropus lylei*

b Larger; forearm 160 - 220 mm. 147

147 a Underside of body paler than back. 148

b Underside of body quite, or nearly, as dark as back. 150

148 a Rather larger, with slenderer rostrum and smaller teeth. Forearm 163 - 177 mm. (India; Ceylon; Himalayas). (*Pteropus giganteus*) 149

b Rather smaller, with broader rostrum and heavier teeth. Forearm about 160 mm. (Maldives). ..... *Pteropus ariel*

149 a Fur shorter; 8 - 12 mm. on back. (India, Ceylon). ..... *Pteropus giganteus giganteus*

b Fur longer; 15 - 18 mm. on back. (Nepal, Assam, Manipur). ..... *Pteropus giganteus leucocephalus*

150 a Smaller; foreneck much lighter than breast. Forearm about 180 mm. (Tenasserim). ..... *Pteropus intermedius*

b Larger; foreneck subsimilar to breast. Forearm 183 - 220 mm. (Malacca ; Indo-Malaya; Lesser Sunda Is.) (*Pteropus vampyrus*). 151

151 a Non-melanistic forms; mantle generally some shade of buffy, much paler than, and strongly contrasting with, back. 152

b Melanistic forms; mantle generally blackish or vandyck-brown, similar in colour to, or not strongly contrasting with, back. 154

152 a Averaging much smaller; forearm 182.5 - 196 mm. (Borneo; Natunas). ..... *Pteropus vampyrus natunæ*

b Averaging much larger; forearm 195 - 220 mm. 153

153 a Forearm 195 - 209 mm. (Malacca; Sumatra). ..... *Pteropus vampyrus malaccensis*

b Forearm 208 - 220 mm. (Java). ..... *Pteropus vampyrus vampyrus*

154 a Averaging much larger; forearm about 214 - 217 mm. (Bali; Lombok). ..... *Pteropus vampyrus pluton*

b Averaging much smaller; forearm 182.5 - 201 mm. 155

155 a Mantle generally blackish (Timor; Savu). ..... *Pteropus vampyrus edulis*

b Mantle generally with some trace of pale colour (Philippines). ..... *Pteropus vampyrus lanensis*

156 a Blackish above and beneath, but never with light yellowish mantle (*Pteropus alecto* group). 157

b Blackish above and beneath with sharply defined light yellowish mantle (*Pteropus conspicillatus* group) 160

157 a Smaller: forearm about 141 mm. (Sumba; Savu) ..... *Pteropus morio*

b Larger; forearm 152 - 176 mm. 158

158 a Orbit smaller: 13.7- 13.9 mm.; dentition heavier: length of p^4 4.6 - 5.1 mm. Forearm 152 - 160 mm. (Bawean I.). ..... *Pteropus aterrinus*

b Orbit larger: 14.2 - 14.8 mm.; dentition weaker; length of p^4 4.1 - 4.7 mm. 159

159 a Cheek-teeth broader ; breadth of p^1 6/7 of length. Forearm 160 - 175 mm. (Celebes; Salayer; Lombok). ..... *Pteropus alecto*

b Cheek-teeth narrower; breadth of p^1 3/4 of length. Forearm 153 - 180 mm. (Australia). ..... *Pteropus gouldi*

160 a Larger: forearm about 157 - 181 mm. 161

b Smaller; forearm about 135 mm. (Amboina group) ..... *Pteropus ocularis*

161 a No well-defined spectacles. Forearm about 175 - 183 mm. (Gilolo group; W. New Guinea). ..... *Pteropus chrysauchen*

b Circumocular space and lores pale-coloured. Forearm 157 - 181 mm. (E. New Guinea; Australia). ..... *Pteropus conspicillatus*

162 a Back dark vandyck-brown. Forearm about 190 mm. (New Guinea). ..... *Pteropus papuanus*

b Back lighter, from yellowish buffy to mars-brown. Forearm 187 - 199 mm. (Bismarck Archip.). ..... *Pteropus neohibernicus*

163 a Tibia naked above. (Blackish above and beneath with sharply contrasting light yellowish mantle.). 164

b Tibia thickly clothed above. Forearm about 160 mm. (Australia). ..... *Pteropus poliocephalus*

164 a Larger; forearm 136 - 141 mm. (New Guinea). ..... *Pteropus epularius*

b Smaller; forearm about 120 mm. (Aru Is.). ..... *Pteropus macrotis*

165 a Ears long and pointed. Much larger; forearm 131 - 143 mm. (Australia). ..... *Pteropus scapulatus*

b Ears small, nearly concealed in fur. Much smaller; forearm 92 - 99 mm. (Solomon Is.). ..... *Pteropus woodfordi*

166 a No antero-internal cusp in p_3. Ears longer than muzzle (front of eye to tip of nose), subacutely pointed. Colour pale : back and underparts approximately mars-brown or vandyck-brown lightened with golden buffy, head and mantle essentially buffy. (Celebes and Timor groups). 167

b A distinct antero-internal cusp in p_3. Ears shorter than muzzle, narrowly rounded off above. Colour dark; back and underparts seal-brown or burnt-umber, more or less sprinkled with pale hairs; mantle chestnut or dark cinnamon-rufous.. (Talaut Is. ; Philippines). 171

167 a Dentition weaker; m^1, length (antero- posterior extent of crown) 4.7 - 5 mm. Skull, total length 62 - 63. Forearm 130 - 140. (Celebes group). ..... *Acerodon celebensis*

b Dentition much heavier: m^1, length 5.6 - 6 mm. Skull, total length 66 - 72. (Timor group). 168

168 a Larger; skull, total length 69 - 72 mm.; forearm 139 - 156. (Timor, Flores, Alor) (*Acerodon mackloti*). 169

b Smaller; skull, total length 66 mm.; forearm 135. (Sumba). ..... *Acerodon gilvus*

169 a Smaller; forearm 139 - 146 mm. 170

b Larger; forearm about 156 mm. (Alor). ..... *Acerodon mackloti alorensis*

170 a Underside of body darker (Timor). ..... *Acerodon mackloti mackloti*

b Underside of body conspicuously paler (Flores). ..... *Acerodon mackloti floresii*

171 a No pale nuchal patch. Small; forearm 140 mm. (Talaut Is.). ..... *Acerodon humilis*

b A pale nuchal patch. Large; forearm 165 -:205 mm. (Philippines). 172

172 a Forearm 182 - 205 mm. (Philippines generally) (*Acerodon jubatus*). 173

b Forearm about 165 mm. (Panay). ..... *Acerodon Lucifer*

173 a Smaller; forearm 182 - 196 mm. (Islands north of Mindanao). *Acerodon jubatus jubatus*

b Larger; forearm about 205 mm. (confined to the southern island). .. *Acerodon jubatus mindanensis*

174 a Premolars and molars simple; no well-marked antero-internal and posterior basal ledges, no surface-ridges. (*Dobsonia minor* group). Smallest species, forearm about 80 mm. (N.W. New Guinea). ..... *Dobsonia minor*

b A well-marked antero-internal basal ledge (or cusp) at least in p^4 and p_4, a posterior basal ledge at least in p^3, p_3, and p_4, a median surface-ridge (or cusp) at least in m^1 and m_2, often also in p^4 and m_1. 175

175 a Antero-internal corner of m_1 not differentiated as a distinct cusp or ledge (*Dobsonia moluccensis* group). 176

b Antero-internal corner of m_1 sharply marked off as a distinct cusp or ledge. 179

176 a Much smaller; c-m^2 (crowns) 19.8 - 21.3 mm., forearm 109 - 116. 177

b Much larger, with relatively considerably heavier dentition; c-m^2 24.5 - 27.8 mm., forearm 133.5 - 152.5. 178

177 a Rather larger; skull 52 mm., c-m^2 20.5 - 21.3, maxillary teeth on the whole heavier, forearm about 112.5 - 116; surface-ridge distinct in m^1, m_1, and m_2. (Celebes). ..... *Dobsonia exoleta*

b Rather smaller; skull 47 - 48 mm., c-m^2 about 198, maxillary teeth on the whole weaker, forearm about 109 - 112; surface-ridge distinct in m^1 and m_2, rarely (if ever) in m_1. (Trobriand; B'Entrecasteaux; Louisiade Arch.). ..... *Dobsonia pannietensis*

178 a Forearm about 133.5 - 141 mm. (Amboina group: Aru Is.). .... *Dobsonia moluccensis*

b Forearm about 146 - 152.5 mm. (New Guinea; Mysol; Waigeon). .. *Dobsonia magna*

179 a No well-marked antero-internal basal ledge in m^1; longitudinal ridges of cheek-teeth simple (*Dobsonia peroni* group). 180

b Antero-internal corner of m^1 sharply marked off as a distinct ledge; generally a more or less distinct notch in longitudinal ridges of p^4, m^1, p_1, and m_1 behind main cusp of ridge (*Dobsonia viridis* group). 181

180 a Skull 48.8 - 51.7 mm., c-m^2 20 - 22, forearm 108.5 - 117. (Timor group). ..... *Dobsonia peroni*
b Skull 46.5 mm., c-m^2 18.8, forearm 106. (Sumba). ..... *Dobsonia sumbana*
181 a Forearm 111 - 128.5 mm..... 182
b Forearm 105.5 - 109.5 mm..... 184
182 a Lachrymal breadth of rostrum 11.5 - 12.8 mm. 183
b Rostrum conspicuously heavier; breadth across lower edges of lachrymal foramina 12.8 - 13.8 mm.; forearm 111.5 - 121.5 mm. (Bismarck Arch.).... *Dobsonia prædatrix*
183 a Teeth smaller (measurements p. 482); forearm 111 - 118 mm. (Amboina group; Banda Is; Key Is.). ..... *Dobsonia viridis*
b Teeth larger (measurements p. 482); forearm 125 - 128.5 mm. (Gilolo group). ..... *Dobsonia crenulata*
184 a Tip of nasals above middle or front half of alveole of canine; teeth smaller (measurements p. 482). (E. Solomon Is.). ..... *Dobsonia inermis*
b Tip of nasals above hinder edge of alveole of canines; teeth conspicuously heavier (measurements p. 482). (W. and C. Solomon Is.). ..... *Dobsonia nesea*
185 a Dentition weak (figs. 47 A, B); outer and inner ridge of p_4 completely fused anteriorly (fig. 47 C); lower canines at least as high as p_3 (fig. 46); no sagittal crest; coronoid process narrow (fig. 46) (Subgenus Myonycteris). 186
b Premolars and molars much heavier (figs. 47 A', B', below); outer and inner ridge of p_4 widely .separated (fig. 47 C'); canines unusually short, those in mandible lower than p_3 (fig. 47 D'); sagittal crest present; coronoid process broad (fig. 47 D') (Subgenus *Phygetis*). Forearm 63.5 mm. (San Thomé).. *Myonycteris (Phygetis) brachycephala* African Chiroptera name ..... *Myonycteris brachycephala*
186 a Median palatal length 16.3 - 16.8 mm.; m^2 less reduced, about twice the bulk of p^1. . 187
b Median palatal length 14.8 - 15 mm.; m^2 more reduced, subequal to p^1. Forearm 56 - 60.5 mm. (Angola; Lower Congo). ..... *Myonycteris (Myonycteris) torquata* African Chiroptera name ..... *Myonycteris torquata*
187 a Molariform teeth larger; m^1, length 2.2, breadth 1.5 - 1.6 mm.; forearm 65 - 67. (Welle Dist.). ..... *Myonycteris (Myonycteris) wroughtoni* African Chiroptera name ..... *Myonycteris torquata wroughtoni*
b Molariform teeth shorter and narrower; m^1, length 1.8, breadth 1.2 mm.; forearm 61. (Sierra Leone; Liberia)..... *Myonycteris (Myonycteris) leptodon* African Chiroptera name ..... *Myonycteris leptodon*
188 a Cheek-teeth narrower, oval in outline; surface cusp in p_4 and m_1, small or entirely absent. (*Cynopterus* section). 189
b Cheek-teeth broader, subrectangular or subsquarish in outline; surface cusp of p_4 and m_1 always present and well-developed. (*Niadius* section). 197
189 a Ears relatively longer, 18 - 20.5 mm. from orifice. Forearm 66 - 83 mm. (Ceylon; Indian Pen.; N. Siam; Sumatra; Java; Lombok) (*Cynopterus* sphinx). 199
b Ears relatively shorter, 13 - 18 mm. from orifice. 190
190 a Smaller: forearm 54.5 - 72 mm. (Indo-Malayan subregion, W. to Ceylon, N. to Assam, E. to Celebes) (*Cynopterus brachyotis*). 191
b Larger : forearm 75.5 - 82 mm. (Nias)..... *Cynopterus major*
191 a Averaging larger: skull (lambda to gnathion) 30.5 - 33.2, forearm 65 - 72 mm. (Assam to Sumatra, incl. Natuna and Mentawei Is.). ..... *Cynopterus brachyotis angulatus*
b Averaing smaller: skull 25.8 - 31.2, forearm 54.5 - 70.5. 192
192 a Ears relatively larger; length (from orifice) 15 - 17 mm. 193
b Ears averaging shorter and narrower; length (from orifice) 13 - 15 mm. 195
193 a Cranial rostrum (orbit to nares) usually distinctly less than one-fourth of skull (lambda to gnathion). 194
b Cranial rostrum usually subequal to one-fourth of skull. Forearm 59 - 64 mm (Ceylon). ..... *Cynoptuers brachyotis ceylonicus*
194 a Smaller: forearm 57 - 66 mm (Philippines; Celebes; Borneo; Malay Pen.; Sumatra). ..... *Cynopterus brachyotis brachyotis*
b Larger; forearm 61.5 - 68, third metacarpal 38 - 42 mm.; skull averaging broader than in *brachyotis* (Java). ..... *Cynopterus brachyotis javanicus*
c Largest; foreram 66.5 - 69.5; third metacarpal 42 - 46.5 mm (Kangean and Mata Siri Is.)..... *Cynopterus brachyotis insuarum*

195 a Cranial rostrum (orbit to nares) usually distinctly less than one-fourth of skull (lambda to gnathion). Smallest form of genus; forearm 54.5 - 59 mm (Nias). ..... *Cynopterus brachyotis minutus*
b Cranial rostrum usually subequal to one-fourth of skull. 196
196 a Smaller; forearm 59 - 66 mm (Andaman Is.)..... *Cynopterus brachyotis brachysoma*
b Larger; forearm 69.5 (or probably less) - 70.5 mm (Nicobar Is.). ..... *Cynopterus brachyotis scherzeri*
197 a Size medium; forearm 64.5 - 77.5 mm. 198
b Largest species of genus; forearm 84.5 - 89.5 mm. (Nias)..... *Cynopterus princeps*
198 a p_4 and m_1 quite as broad posteriorly as anteriorly. (Java; Sumatra). ..... *Cynopterus horsfieldi*
b p_4 and m_1 conspicuously narrower posteriorly than anteriorly. (Malay Pen.). ..... *Cynopterus harpax*
199 a Cranial rostrum (front of orbit to nares) usually a little more than, rarely equal to, one-fourth of total length of skull (lambda to gnathion); general size averaging smaller, forearm 66 - 78 mm. 200
b Cranial rostrum usually a little less than or equal to one-fourth of total length of skull ; largest form of the species, forearm 74.5 - 83 mm. (Sumatra; Java; Lombok; ? Timor). ..... *Cynopterus sphinx titthæcheilus*
200 a Averaging smaller; forearm 66 - 73.5 mm. (Ceylon; Indian Pen. S., E., and N.E.; Assam; N. Burma; N. Siam). ..... *Cynopterus sphinx sphinx*
b Averaging larger, forearm 73 - 78 mm. (Indian Pen. N.W.). ..... *Cynopterus sphinx gangeticus*
201 a Dorsal stripe narrow (not nearly $^1/_3$ of breadth of furred area of back), generally well-marked from nape to interfemoral, sometimes (*Nyctimene albiventer, minutus, varius, cyclotis*) obsolole anteriorly. 202
b Dorsal stripe very broad (about $^1/_3$ of furred area of back); premaxillæ more proclivous than in other species (fig. 64) (*Nyctimene aëllo* group). Forearm 81.5 - 84 mm. (New Guinea; Mysol). ..... *Nyctimene aëllo*
202 a Small; forearm 50 - 59, c-m^1 (crowns) 8.7 - 10.3 mm. [Sexual colour difference, so far as known, as in *Cynopterus*, i. e., males similar in colour to females, but with fore-neck and flanks much richer in colour.] 203
b Medium-sized or large; forearm 60.5 - 85.5, c-m^1 (crowns) 10.7 - 14.2 mm. [Females of all species, with the possible exception of *Nyctimene robinsoni*, much paler above and beneath than males] (*Nyctimene cephalotes* group). 207
203 a m^1 subequal in size to p^1; ears unmodified (*Nyctimene papuanus* group). 204
b m^1 noticeably smaller than p^1; ears unusually broad, semicircularly rounded off above; colour of back mottled with darker tips to the hairs (*Nyctimene cyclotis* group). Forearm about 53 mm. (New Guinea). ..... *Nyctimene cyclotis*
204 a Inner cusp of p^3 not completely fused with outer. General colour of back practically uniform (except for presence of dorsal stripe). 205
b Inner cusp of p^3 completely fused with outer. Colour of back conspicuously mottled with darker tips to the hairs; dorsal stripe indistinct in anterior half or third of back. Forearm 51 - 55 mm. 206
205 a Larger; forearm 54.5 - 59; dentition heavier; c-m^1 9.7 - 10.3 mm.; dorsal stripe broader (1/8 of furred area of back) and well-marked from nape to interfemoral; membranes usually from 2nd toe. (New Guinea and surrounding islands; Queensland). ..... *Nyctimene papuanus*
b Smaller; forearm 50 - 54.5; dentition weaker; c-m^1 8.7 mm.; dorsal stripe narrower ($^1/_{15}$ of furred area of back), often ill-defined or indistinct anteriorly; membranes usually from 3rd toe. (Gilolo group). ..... *Nyctimene albiventer*
206 a Teeth smaller: c-m^1 8.8 mm.; fur not longer than usual. (Celebes). *Nyctimene minutus*
b Teeth heavier; c-m^1 10 mm.; fur longer. (Amboiua group). ..... *Nyctimene varius*
207 a Skull smaller, lambda to gnathion 30 - 32; c-m^1 10.7 - 11.2 mm. Forearm 60.5 - 69. (Celebes; Amboina group; Tenimber Is.; Timor). ..... *Nyctimene cephalotes*
b Skull larger, lambda to gnathion 32.8 - 37.2; c-m^1 11.5 - 14.2 mm. Forearm 66 - 85.5. 208
208 a Ear conspicuously shorter than hind toot with claws, triangularly rounded off above; fur of back seal-brown at base. 209

b Ear equal in length to hind foot with claws and more acutely pointed; fur of back uniform from base to tip. Forearm about 66 - 67 mm. (Queensland). ..... *Nyctimene robinsoni*

209 a Large; forearm 70.5 - 85.5, c-m^1 12.2 - 14.2, mandible 26.7 - 29 mm..... 210

b Medium; forearm 69, c-m^1 11.5, mandible 25 mm. (Woodlark I.). ... *Nyctimene lullulæ*

210 a Ear longer, 15.5 - 17 mm. from orifice; free edge of bony palate evenly concave. 211

b Ear shorter, about 14 mm. from orifice; free edge of bony palate more acutely angular at middle. Forearm 71.5 - 80 mm. (Solomon Is.) ..... *Nyctimene scitulus*

211 a Forearm 70.5 - 77, c-m^1 12.2 - 13.0 mm. Males brownish drab above. (New Guinea; Trobriand and D'Entrecasteaux Is.)..... *Nyctimene geminus*

b Forearm 78 - 85.5, c-m^1 13.5 - 14.2 mm. Males ash-grey or greyish - hairbrown above (Bismarck Arch.). ..... *Nyctimene major*

212 a A small m_3 normallv present (cheek-teeth 5 - $^5/_6$ -6). 213

b m_3 absent (cheek-teeth 5 - $^5/_5$ - 5); size as *Eonycteris spelæa*. (Celebes). .*Eonycteris rosenbergi*

213 a Smaller; forearm, females 61.5 - 70.5, males 67.5 - 73 mm. (Burma and Siam, to Malay Pen., Sumatra, Java). ..... *Eonycteris spelæa*

b Larger; forearm, females about 79.5 mm.; colour of fur different. (Borneo).*Eonycteris major*

214 a Forearm 65.5 - 68.5 mm. (New Hebrides; Fijis). ..... *Notopteris macdonaldi*

b Forearm (only immature specimens known) at least 59 mm. (New Caledonia). ..... *Notopteris neocaledonica*

215 a Rostrum relatively longer; front of orbit to tip of nasals equalling or exceeding maxillary tooth-row; fur longer, more woolly, not closely adpressed; colour darker; forearm 127 - 131 mm. (Madagascar) ..... *Eidolon dupreanum*

b Rostrum relatively shorter; front of orbit to tip of nasals less than maxillary tooth-row; fur very short, closely adpressed; colour lighter. 216

216 a Skull larger; total length 54.5 - 62.2 mm.; tooth-rows longer: c-m^2 21 - 23.8; molars narrower; forearm 117.5 - 132. (African continent). ..... *Eidolon helvum*

b Skull smaller; total length 51.5 - 55 mm.; tooth-rows shorter: c-m^2 19.2 - 20.8; molars broader; forearm 114 - 127. (S.W. Arabia)..... *Eidolon sabæum*

217 a Brain-case conspicuously deflected; premaxillaries in contact; p_1 much larger in bulk than a lower incisor. 218

b Brain-case slightly deflected; premaxillaries co-ossified; p_1 subequal in bulk to a lower incisor; molars short and broad; wings from 2nd toe; antitragal lobe distinct (Subgenus *Lissonycteris*). Fur long and silky; lower leg 29 - 31; forearm 79 - 83.5 mm. (Ethiopian). ..... *Rousettus (Lissonycteris) angolensis*
African Chiroptera name ..... *Myonycteris angolensis*

218 a Brain-case moderately deflected; width of p^4 about one third that of palate between fronts of p^4; wings from 1st toe; antitragal lobe distinct (Subgenus *Rousettus*).... 219

b Brain-case strongly deflected; cheek-teeth excessively narrow; width of p^1 about one fifth that of palate between fronts of p^4; wings from :2nd toe; antitragal lobe obsolete (Subgenus *Stenonycteris*). Fur long and coarse; lower leg 39 - 40; forearm 88.5 - 90 mm. (Ethiopian). ..... *Rousettus (Stenonycteris) lanosus*
African Chiroptera name ..... *Stenonycteris lanosus*

219 a Pollex 30 - 37.5; 2nd phalanx of third digit 50.5 - 61.5 mm..... 220

b Pollex 24 - 30; 2nd phalanx of 3rd digit 36 - 47.2 mm. 222

220 a Ears not attenuated at tip; lower leg 40 - 45.5 mm. 221

b Ears attenuated at tip; lower leg 37 - 39.5 mm.; forearm 87 - 96. (Arabia to Sind). ..... *Rousettus (Rousettus) arabicus*

221 a Length of skull 40.5 - 43.8 8 mm.; rostrum slenderer; palate-ridges normally 4 + 3 + 1; forearm 89 - 99 mm. (S. Africa)..... *Rousettus (Rousettus) leachi*

b Length of skull 43.6 - 46.7 mm.; rostrum heavier; palate-ridges 4 + 4 + 1; forearm 88 - 99 mm. (Angola to Palestine). ..... *Rousettus (Rousettus) ægyptiacus*
African Chiroptera name ..... *Rousettus aegyptiacus*

222 a Molars not unusually narrow; fur short; notopatagium naked. 223

b Molars unusually narrow; bony palate narrow; fur longer; notopatagium and tibiæ well haired; forearm 72.5 - 75 mm. (Celebes). ..... *Rousettus (Rousettus) celebensis*

223 a m_3 elliptical (about twice as long as broad). 224

b m_3 subcircular, oval, or elliptical oval (breadth from five-sixths to two-thirds of length) (*Rousettus (Rousettus) amplexicaudatus*). 226

224 a Forearm 79 - 87.5 mm..... 225

b Larger (forearm about 91 mm.), with broader rostrum and palate. (Java). ..... *Rousettus (Rousettus) shortridgei*

225 a p^1 not deciduous; fur on nape and shoulders not thinner than usual; forearm 80.5 - 87.5 mm. (India, Himalayas; Indo-China)..... *Rousettus (Rousettus) leschenaulti*

b p^1 deciduous; nape and shoulders semi-naked; forearm 79 - 85.5 mm. (Ceylon). .....*Rousettus (Rousettus) seminudus*

226 a Cheek-teeth not broader than usual; forearm 77 - 87 mm. (Indo-Malaya, excl. Java). .....*Rousettus (Rousettus) amplexicaudatus amplexicaudatus*

b Cheek-teeth not broader than usual; forearm 73 - 81 mm. (Java). .....*Rousettus (Rousettus) amplexicaudatus minor*

c Cheek-teeth averaging broader; size as foregoing (Austro-Malaya). .....*Rousettus (Rousettus) amplexicaudatus brachyotis*

227 a One postdental palate-ridge (fig. 37 A); vertical fasciæ of mesopatagium 22 - 33. (*Epomophorus wahlbergi* group). Skull, total length 47 - 55.5 (males) and 44 - 50.5 (females), forearm 77 - 89 (males) and 72 - 86 mm. (females). (Ethiopian region, north to Cameroons and B. E. Africa, south to Benguela and E. Cape Colony). ..... *Epomophorus wahlbergi*

b Two postdental palate-ridges (tigs. 37B-D); vertical fasciæ of mesopatagium 11 - 24. (*Epomophorus gambianus* group)..... 228

228 a Fourth palate-ridge situated midway between third and fifth (figs. 37 C, D). 229

b Fourth palate-ridge much nearer third than fifth (fig. 37 B). 232

229 a Small species; sexual difference in size none or inconspicuous. Skull, total length 35.8 - 39.7, forearm 60 - 66.5 mm. 230

b Larger; males conspicuously larger than females. 231

230 a Premolars and molars heavier (measurements p. 552). (Sennaar; Abyssinia; Shoa). ..... *Epomophorus labiatus*

b Premolars and molars weaker (measurements p. 5.52). (Shoa to G. E. Africa). .....*Epomophorus minor*

231 a Size medium; skull, total length 40 - 48.8 (males) and 40 - 45 (females), forearm 71.5 - 78 (males) and 66.5 - 74 mm. (females). (Erythrea to G. E. Africa). .....*Epomophorus anurus*
African Chiroptera name ..... *Epomophorus labiatus*

b Larger; skull, total length 52 - 55 (males) and 46 - 49.7 (females), forearm about 81 - 85.5 (males) and 79 - 80 mm. (females). (Zambesi and Limpopo valleys). .....*Epomophorus crypturus*

c Largest; rostrum and palate extremely long and narrow; skull, total length 59.7 - 62 (males) and 52 - 55 (females), forearm 87 - 93 (males) and 81 - 86.5 mm. (females). (Senegal, east along Guinea coast, to Sennaar and Omo R.). .....*Epomophorus gambianus*

232 a Size as *Epomophorus gambianus*; skull, total length 58.5 - 61.5 (males), forearm about 87.5 - 91 (males) and 82.5 mm. (one female). (Benguela; Damaraland). .....*Epomophorus angolensis*
African Chiroptera name .....*Epomophorus crypturus*

b Size probably larger (known from one adult female); skull, total length 55.5, forearm 91 mm. (Shari R.). .....*Epomophorus pousarguesi*
African Chiroptera name ..... *Epomophorus gambianus pousarguesi*

233 a Anterior basal ledge of p^4 not extending on inner side of tooth; fur of back about 20 mm.; tibia and metatarsus densely clothed above; belly drab. (Bougainville). ..... *Pteralopex anceps*

b Anterior basal ledge of p^4 extending on inner side of tooth; fur of back 12 - 14 mm.; metatarsus and distal fourth of tibia naked; uniform blackish or seal-brown above and beneath. (Guadalcanar). .....*Pteralopex atrata*

234 a Four interdental and about five to seven postdental palate-ridges; three anterior interdental ridges thick, prominent, quite or nearly straight, the first and second always undivided in middle; fourth interdental and all postdental ridges thinner, serrate, more or less arcuate or angular (figs. 31 A, B)..... 235

b Three thick and prominent interdental palate-ridges; postdental palate with two pairs of prominent, triangular ridges at middle and one or a few thin and serrate ridges at palation border (fig. 31 C). Forearm of males about 88 mm. (Benguela ; Katanga). ..... *Epomops dobsoni*
African Chiroptera name ..... *Epomophorus dobsonii*

235 a Third interdental palate-ridge nearly always undivided in middle (fig. 31 A); bony palate flatter; zygomatic breadth about three-fifths of total length of skull; skull, total length 46.8 - 53 mm. (males) and 41.8 - 47 (females), forearm 88 - 96 (males) and 82 - 93 (females). (Gold Coast to Victoria Nyanza, and Loanda). ..... *Epomops franqueti*

b Third interdental palate-ridge broadly divided in middle (fig. 31 B); palate conspicuously domed; zygomatic breadth only about one-half of total length of skull; skull, total length 54.5 - 59.5 mm. (males) and 49.5 - 51.5 (females), forearm 92.5-100.5 (males) and 88 - 92.5 (females). (Sierra Leone; Liberia). *Epomops buettikoferi*

236 a Cheek-teeth elongate in transverse section (p^4, m^1, p_4, and m_1, decidedly more than half as broad as long); m^2 and m_3 present (cheek-teeth $^5/_6$). Forearm 39 - 49 mm. (Amboina group; New Guinea group, except Woodlark Is.) (*Syconycteris crassa*). 237

b Cheek-teeth linear (p^1, m^1, p_4, and m_1 only half as broad as long). 241

237 a Average size medium or small; skull, total length 25 - 27.3, forearm 39 - 44 mm. 238

b Averaging larger; skull, total length 27.6 - 29.8, forearm 43.5 - 47 mm. 240

238 a Medium; skull, total length 25.8 - 27.3, forearm 40 - 44 mm..... 239

b Small; skull, total length about 25, forearm 39 mm (Bismarck Arch.). ..... *Syconycteris crassa finschi*

239 a Tooth-rows averaging slightly longer; c-m^2 (crowns) 7.6 - 8.8 mm. (New Guinea; Aru Is.)..... *Syconycteris crassa papuana*

b Tooth-rows averaging slightly shorter; c-m ^2 (crowns) about 7 mm. (Key Is.). ..... *Syconycteris crassa keyensis*

240 a Rather smaller; skull 27.6 - 28.8, forearm 43.5 - 47 mm. (Trobriant Is.; D'Entrecastaux Is.)..... *Syconycteris crassa crassa*

b Rather larger; skull 28.8 - 29.8, forearm 46 - 49 mm. (Amboina group). ..... *Syconycteris crassa major*

241 a m^2 and m_3 present (cheek-teeth $^5/_6$). Forearm about 39 - 40.5 mm. (Queensland). ..... *Syconycteris australis*

b m^2 and m_3 absent (cheek-teeth $^4/_5$). Size as foregoing. (Woodlark Is.). ..... *Syconycteris naias*

242 a Nares directed more outward than forward; median vertical groove on upper lip obsolescent or absent. Forearm 40 - 48.5 mm. (Indo-Chinese and Indo-Malayan subregions, excluding Borneo and Philippines). ..... *Macroglossus minimus*

b Nares directed half outward, half forward; median vertical groove on upper lip sharply defined. Forearm 37 - 44.5 mm. (Austro-Malayan subregion, including Borneo and Philippines) (*Macroglossus lagochilus*). 243

243 a Premolars and molars not narrower than in M. minimus. Forearm 38 - 44.5 mm (Borneo; Philippines; Sanghir; Celebes; Amboina group). ..... *Macroglossus lagochilus lagochilus*

b Premolars and molars averaging narrower (see measurements, p. 770). Forearm 37 - 39 mm (New Guinea and adjacencies; Solomon Is.). 244

244 a Ear, length from orifice 12.5 - 13.5, greatest breadth (flattened) 9 - 9.5 mm..... 245

b Ear slightly smaller, length 11 - 12.5, greatest breadth 8 - 8.5 mm (Solomon Is.). ..... *Macroglossus lagochilus microtus*

245 a Rostrum (orbit to nares) 7.5 - 8.5 mm (Mysol; W. New Guinea; Bismarck Arch.; Key Is., Aru Is.). ..... *Macroglossus lagochilus nanus*

b Rostrum slightly shorter, about 6.8 mm (Murray Is.). ..... *Macroglossus lagochilus pygmaeus*

Appendix 5i: Monard (1935). Contribution à la mammalogie d'Angola et prodrome d'une faune d'Angola.

1	a	Couronnes des molaires aplaties, sans tubercules nets. Premier et second doigts terminés par des griffes. Queue nulle on rudimentaire. Frugivores, dd grande taille. (Megachlroptères, Pteropodidae.)..... 15
	b	Couronnes des molaires hérissées de cônes aigus, normalement 4 ou 5. Deuxième doigt non terminé par une griffe. Queue développée, comprise au moins en partie dans la membrane. Insectivores de petit taille. (Microchiroptères.)..... 2
2	a	Nez surmonté d'un feuillet nasal compliqué, muni d'un lobe aigu à sa partie supérieure. Orteils II à V il trois phalanges (Famille Rhinolophidae). ..... *Rhinolophus aethiops* African Chiroptera name .....*Rhinolophus fumigatus*
	b	Nez surmonté d'un feuillet nasal tronqué à sa partie supérieure. Orteiles II à V à deux phalanges (Famille Hipposideridae).....*Hipposideros angolensis* African Chiroptera name ..... *Hipposideros caffer*
	c	Nez compliqué d'un profond sillon médian longitudinal. Oreilles très grandes (Famille Nycteridae). .....*Nycteris capensis* African Chiroptera name .....*Nycteris thebaica*
	d	Nez simple, sans ornement et sans fente longitudinale..... 3
3	a	Queue perforant la membrane et saillant à sa surface supérieure (Famille Emballonuridae). .....*Taphozous mauritianus*
	b	Queue dépassant longuement la membrane (Famille Molossidae). (genres *Nyctinomus* et *Chaerephon*) 21
	c	Queue comprise entièrement dans la membrane, ou la dépassant seulement d'une partie de dernière vertèbre (Famille Vespertilionidae) 4
4	a	Vertex très bombé élevé au-dessus du rostre. Incisives supérieures séparées des canines. Deuxième phalange du doigt III environ trois fois plus longue que la première. ..... *Miniopterus schreibersii*
	b	Vertex plat ou peu bombé. Deuxième phalange du doigt III non extraordinairement allongée..... 5
5	a	Trois prémolaires supérieures et 3 molaires..... 6
	b	Deux prémolaires supérieures et 3 molaires..... 8
	c	Une prémolaire supérieure et 3 molaires..... 9
6	a	Ouvertures nasales circulaires. Les trois prémolaires presqu'égales..... *Kerivoula brunnea / Kerivoula lanosa*
	b	Ouvertures nasales en croissant. Troisième prémolaire plus grande que les deux premières. 7
7	a	Des glandes sur le côté externe de l'avant-bras. .....*Cistugo seabrae*
	b	Pas de glandes particulières sur les ailes. ..... *Myotis bocagei / Myotis welwischi*
8	a	Incisive supérieure externe très petite, sa pointe ne dépassant pas le cingulum de l'interne, et située extérieurement à la ligne incisive intercanine. .*Scotozous trüppellii* African Chiroptera name ..... *Pipistrellus rueppellii*
	b	Incisive supérieure externe plus petite que l'interne mais dépassant le cingulum. ....*Pipistrellus rüppellii / Pipistrellus nanus / Pipistrellus kühli / Pipistrellus anchietae / Pipistre*
9	a	Deux paires d'incisives supérieures..... 10
	b	Une paire d'incisives supérieures..... 14
10	a	Lèvre inférieure munie de lobes commissuraux. Hauteur du crâne, avec bulles, égalant environ la distance qui sépare les incisives de la racine postérieure du zygomatique. .....*Glauconycteris congicus* African Chiroptera name .....*Glauconycteris argentata*
	b	Lèvre inférieure sans lobes commissuraux. Hauteur du crâne plus petite que cette distance 11
11	a	Crâne remarquablement large et plat, avec région lacrymale renflée. Ailes remarquablement courtes et réduites. .....*Mimetillus berneri* African Chiroptera name .....*Mimetillus thomasi*
	b	Crane normal. Ailes développées. 12
12	a	Rostre convexe latéralement. Nasaux ne s'étendant pas jusqu'à mi-chemin de la constriction interorbitaire. Emargination palatale plus profonde que large..... 13

	b	Rostre concave latéralement. Nasaux s'étendant jusqu'à mi-chemin de la constriction interorbitaire. Emargination palatale plus large que profonde. .....*Vespertilio murinus*
13	a	Oreilles normales .....*Eptesicus minutus / Eptesicus capensis*
	b	Oreilles grandes ..... *Laephotis angolensis*
14	a	Première et seconde molaires supérieures avec mésostyle (petit tubercule se trouvant sur le côte externe de la dent, en son milieu) réduit, le W formé par les cônes principaux tordu ou peu net.....*Pachyotus borbonicus* African Chiroptera name .....*Scotophilus borbonicus*
	b	Mésostyle présent. W non déformé. .....*Scotoecus albigula*
15	a	5 molaires supérieures. 16
	b	4 molaires supérieures. ..... *Plerotes anchietae*
	c	3 molaires supérieures. 19
16	a	Un court meat auditif osseux.....*Eidolon helvum*
	b	Non. 17
17	a	Longueur du rostre (du bord antérieur de l'orbite à l'extrémité de nasaux) plus grande que la largeur lacrymale (genre *Rousettus*) 18
	b	Longueur du rostre égalant sa largeur. .....*Myonycteris torquata*
18	a	Avant-bras 89 – 99 mm. 4, 3, 1 plis palataux. Brun foncé et gris. ...*Rousettus leachi* African Chiroptera name .....*Rousettus aegyptiacus*
	b	Avant-bras 88 – 99 mm. 4, 4, 1 plis palataux. Brun et gris. ...*Rousettus aegyptiacus*
	c	Avant-bras 78 – 83 mm. 3, 4, 2 plis palataux. Brun châtain et brun foncé.*Rousettus angolensis* African Chiroptera name .....*Myonycteris angolensis*
19	a	Rostre plus long que la largeur lacrynale. 20
	b	Rostre environ égal à cette largeur. ..... *Micropteropus pusillus*
20	a	Partie postérieure du palais concave. ..... *Epomophorus zenkeri* African Chiroptera name .....*Kerivoula lanosa*
	b	Partie postérieure du palais plane..... *Epomophorus (Epomops) comptus* African Chiroptera name .....*Epomops franqueti*
21	a	Deux prémolaires supérieures et inférieures. Oreilles épaisses, opaques, jointes par un large bandeau. Lèvres sillonnées verticalement. (Genre *Chaerephon*) 22
	b	genre *Nyctinomus* .....*Nyctinomus bocagei* African Chiroptera name .....*Tadarida aegyptiaca bocagei*
22	a	Première prémolaire supérieure située dans la ligne dentaire..... 23
	b	Première prémolaire supérieure située extérieurement à la ligne dentaire. Avant-bras 46 mm.....*Chaerephon angolensis* African Chiroptera name .....*Mops (Mops) condylurus*
23	a	Région inférieure de la poitrine et ventre blancs. Avant-bras 38 mm. .....*Chaerephon limbatus* African Chiroptera name .....*Chaerephon pumilus*
	b	Poitrine et ventre roussâtres. 24
24	a	Avant-bras 38 mm. .....*Chaerephon pumilus*
	b	Avant-bras 47 – 50 mm. ..... *Chaerephon spillmanni* African Chiroptera name ..... *Chaerephon nigeriae spillmanni*

Appendix 5j: Frechkop (1938). Exploration du Parc National Albert. Mission G. F. De Witte (1933 - 1935). Fascicule 10. Mammifères.

1	a	Queue entièrement comprise dans l'uropatagium. 2
	b	La queue dépasse en arrière l'uropatagium, les fémurs étant en position transversale par rapport à l'axe du corps..... 4
2	a	La longue queue communique à l'uropatagium une forme angulaire; les calcanei longeant le bord de la membrane interfémorale convergent vers le bout de la queue. .....*Vespertilionidae*
	b	L'uropatagium ne forme pas de pointe dirigée en arrière. 3
3	a	L'uropatagium est tendu entre les calcanei qui sont situés parallèlement à la queue, dont le bout bifurque..... *Nycteridae*
	b	L'uropatagium contient une courte queue n'arrivant pas jusqu'à son bord postérieur ou bien la queue est tot à fait requite. ..... *Megadermidae* African Chiroptera name .....*MEGADERMATIDAE*
4	a	La queue est plus courte que les tibiae, et les bouts des calcanei sont dirigés en avant..... *Rhinolophidae*
	b	La queue dépasse en arrière les tibiae; les calcanei sont entraînés en arrière par la membrane interfémorale; un bout de la queue se dégage nettement du bord de cette dernière. ..... *Emballonuridae*
	c	La longue queue, dépassant de beaucoup les tibiae, dégage sa majeure partie de la membrane interfémorale. ..... *Molossidae*

Appendix 5k: Dorst (1948). Les chiroptères du genre Triaenops Dobson (Hipposidérines).

1	a	Bord interne de l'oreille ne présentant pas d'échancrure; oreille de grande taille. Feuille nasale relativement simple; lobes externes du trident non échancrés à leur base, du côté externe. Longueur de l'avant-bras inferieure à 50 mm. (long, moyenne : 45 mm.). ..... *Triaenops furcula* African Chiroptera name ..... *Paratriaenops furculus*
	b	Bord interne de l'oreille profondément échancré; oreille de petite taille. Feuille nasale complexe; lobes externes du trident non échancrés à leur base du côté externe. Longueur de l'avant-bras supérieure à 50 mm. (long, moyenne: 53 mm.). 2
2	a	Prolongement lancéolé de la selle bifide, le lobe antérieur étant le plus court. ..... *Triaenops afer*
	b	Prolongement de la selle se terminant par une seule pointe. 3
3	a	Echancrure du bord interne de l'oreille formant un angle obtus. Pelage de couleur toujours claire. ..... *Triaenops persicus* African Chiroptera name ..... *Triaenops afer*
	b	Echancrure de l'oreille formant un angle droit. Pelage de couleur variable, mais jamais très clair. 4
4	a	Pelage des parties supérieures roux. ..... *Triaenops rufus* African Chiroptera name ..... *Triaenops menamena*
	b	Pelage des parties supérieures gris-beige. ..... *Triaenops Humbloti* African Chiroptera name ..... *Triaenops menamena*

Appendix 5l: Malbrant and Maclatchy (1949). Faune de l'équateur Africain français.

1	a	Couronne des molaires aplatie et lisse sans tubercules marqués. Pouce et second doigt des membres antérieurs terminés par des griffes. Taille variable, souvent grande ou très grande, mais parfois très petite. Queue absente ou rudimentaire. (Sous-ordre des Megachiroptères; Chauves-souris frugivores: Pteropidae)..... 7
	b	Couronne des molaires pourvue de tubercules aigus. Deuxième doigt des membres autérieurs non terminé par une grille. Quelle en général bien développée, incluse au moins en partie dans la membrane interfémorale. Taille faible. (Sous-ordre des Microchiroptères, Chauves-souris insectivores). 2
2	a	Queue à l'extrémité libre, dépassant sensiblement la membrane interfémorale. 3
	b	Queue entièrement incluse dans la membrane interfémorale ou ne la dépassant que d'une partie de la dernière vertèbre caudale..... 4
3	a	Un tragus auriculaire petit et arrondi mais bien visible. Pas de feuilles nasales. Museau légèrement allongé. Membres postérieurs grêles. Queue grêle perforant la membrane interfémorale et saillant sur sa face supérieure. Oreilles largement séparées (Famille Emballonuridae). 18
	b	Tragus auriculaire petit, parfois même rudimentaire. Pas de feuilles nasales. Museau tronqué obliquement. Membres postérieurs trapus. Queue épaisse à la base débordant la membrane interfemorale, qui est étroite, d'au moins un tiers de sa longueur. Oreilles très rapprochées et souvent même reliées entre elles par une bande cutanée sur le front, à bords postérieurs bien descendus sur la joue (Famille Molossidae). 48
4	a	Pas de feuilles nasales. Un tragus auriculaire grêle et droit. Oreilles en général petites et largement séparées (Famille Vespertilionidae). 31
	b	Feuilles nasales plus ou moins développées, mais toujours présentes. 5
5	a	Queue beaucoup plus courte que la membrane interfémorale dont elle ne dépasse pas le bord d'insertion. Oreilles très grandes soUdées à leur base avec tragus allongé en pointe et bifurqué. Membranes. oreilles et tragus de couleur orangé brun (Famille Megadermidae). .....*Lavia frons*
	b	Queue dépassant le bord d'insertion de la membrane interfémorale. Oreilles plus petites, non soudées à la base; tragus arrondi ou absent. 6
6	a	Feuilles nasales présentes; nez compliqué d'un profond sillon médian longitudinal. Oreilles grandes: tragus de grandeur variable mais généralement petit. Queue atteignant l'extremité de la membrane interfémorale, formant un Y renversé à sa jonction avecd celle-ci (Famille Nycteridae)..... 19
	b	Feuilles nasales compliquées, affectant en général la forme d'un fer à cheval. Pas de sillon nasal. Pas de tragus. Queue se terminant en pointe dans la membrane interfémorale (Famille Rhinolophidae). 25
7	a	Langue très extensible fixée au plancher de la bouche par son tiers postérieur, sa partie terminale étant couverte en dessus de papilles filiformes. Cinquième metacarpien beaucoup plus court que le troisième. Très petite taille. Longueur de l'avant-bras ne dépassant pas 45 mm. Molaires 5/5.....*Megaloglossus Woermanni*
	b	Langue simple fixée au plancher de la bouche par sa moitié postérieure et sans papilles fififormes à l'extrémité. Taille plus grande. Longueur de l'avant-bras dépassant toujours 45 mm..... 8
8	a	Molaires 4 - 6. Palais plat. Quatre sillons palataux. Deux taches blanches à la base des oreilles. .....*Plerotes Anchietae*
	b	Molaires 5 - 6. Tête sans taches ni touffes blanches..... 9
	c	Molaires 3 - 5. Tète du mâle parfois pourvue de taches ou de touffes blanches. . 12
9	a	Axe des deux rangées de molaires supérieures passant à travers ou au-dessous du condyle occipital. Petite taille: longueur de l'avant-bras variant de 55 à 60 mm. Pelage brun, plus clair dessous, à l'exception de la collerette, qui est jaune roussâtre. .....*Myonycteris torquata*
	b	Axe de chaque rangée de molaires supérieures passant au-dessus du condyle occipital. Taille plus grande: longueur de l'avant-bras dépassant 65 mm. Museau long..... 10

10 a Bulles tympaniques pourvues d'un méat auditif osseux bien développé. Grande taille. Longueur de l'avant-bras comprise entre 110 et 132 mm. Pelage jaunâtre ou brun jaunâtre dans l'ensemble. M^1 de la mâchoire inférieure aussi longue que les deux suivantes réunies. ..... *Eidolon helvum*

b Pas de tube auditif externe osseux. Taille plus faible. Longueur de l'avant-bras comprise entre 75 et 100 mm. Pelage brun noirâtre dans l'ensemble. M^1 de la mâchoire inférieure plus courte que les deux suivantes réunies. 11

11 a Quatre sillons palataux simples et trois sillons brisés et incurvés. Première prémolaire inférieure beaucoup plus grande que les incisives inférieures. Pelage court, réduit à une étroite bande sur le milieu de la région dorsale. Avant-bras: 88 - 100 mm. ..... *Rousetus aegyptiacus*
African Chiroptera name ..... *Rousettus aegyptiacus*

b Trois sillons palataux simples et quatre sillons brisés. Première prémolaire inférieure à peu pres de la même taille que les incisives inférieures. Pelage plus long et plus abondant sur le dos. Avant-bras 78 - 83 mm. ..... *Rousetus angolensis*
African Chiroptera name ..... *Myonycteris angolensis*

12 a Rostre (du bord antérieur de l'orbit à l'extrémité des nasaux) plus long que la largeur palatale au niveau des dernières molaires, Taille grande ou assez grande. Longueur totale dépassant toujours 130 mm. 13

b Rostre court, à peu près de la même longueur que la largeur palatale au niveau des dernières molaires. Taille très faible. Longueur totale ne dépassant pas 100 mm. 16

13 a Grande taille. Longueur de l'avant-bras dépassant 110 mm. Tête grosse à museau terminé par de vastes expansions foliacées. Pas de queue. Palais très étendu. Molaires inférieures pourvues de deux ou trois tubercules. *Hypsignatus monstruosus*
African Chiroptera name ..... *Hypsignathus monstrosus*

b Taille moins grande. Queue rudimentaire mais toujours présente. Pas d'expansions foliacées à l'extrémité du museau. Molaires inférieures non tuberculées. 14

14 a Palais largen aplati et arqué. Quatrième métacarpien plus court que le cinquième. Quatre sillons palataux bien marqués en avant suivis de plusieurs autres sillons beaucoup plus irréguliers. Avant-bras 85 - 97 mm. ..... *Epomops Franqueti*

b Palais plus étroit et très déprimé. Quatrième métacarpien à peu près de la même longueur ou plus long que le cinquième. 15

15 a Un seul sillon palatal en arrière de la dernière molaire. Avant-bras 74 - 87 mm. ..... *Epomophorus Wahlbergi*

b Deux sillons palataux en arrière de la dernière molaire. Rostrum et palais très longs et étroits. Quatrième sillon palatal situé à égale distance entre le troisième et le cinquième. Avant-bras 81 - 93 mm. ..... *Epomophorus gambianus*

16 a Voûte des os palatins non sensiblement prolongée en arrière de la dernière molaire. Une tache blanche en arrière du nez et en arrière des yeux et lèvre supérieure bordée de blanc. Longueur totale atteignant environ 90 mm. ..... *Casinycteris argynnis*

b voûte des os palatins fortement prolongée en arrière de la dernière molaire. Taille un peu plus faible. 17

17 a Dernière molaire supérieure située au niveau du bord antérieur de l'orbite. Palais présentant sur l'animal en chair, un profond sillon médian allant en se rétrécissant vers l'arrière. Museau relativement large. Des touffes blanchâtres à la base des oreilles et des épaules. ..... *Micropteropus pusillus*

b Dernière molaire supérieure située sensiblement en avant du niveau du bord antérieur de l'orbite. Palais présentant sur l'animal en chair une saillie médiane. Museau plus droit que dans l'espèce précédente. Pas de tache blanche en arrière des oreilles et des épaules. ..... *Nanonycteris Veldkampi*
African Chiroptera name ..... *Micropteropus pusillus*

18 a Taille petite: tête et corps 75 - 90 mm.; avant bras 58 - 65 mm. Pelage gris brunâtre clair tiqueté dessus. Dessous blanc. ..... *Taphozous mauritianus*

b Taille plus grande; tête et corps 103 - 126 mm.; avant-bras 84 - 95 mm. Pelage brun plus ou moins foncé dessus et dessous. ..... *Saccolaimus Peli*

19 a Petite taille: avant-bras n'atteignant pas 40 mm. ..... *Nycteris nana*

b Taille plus grande: avant-bras dépassant 53 mm. ..... *Nycteris grandis*

c Taille moyenne. 20

20 a Avant-bras 47 - 50 mm. environ. 21

b Avant-bras ne dépassant pas 47 mm. 23

21 a Tragus court et ovalaire. Pelage brun foncé dessus, brun grisâtre dessous. Nycteris macrotis
b Tragus plus développé, bien dégagé en hauteur et convexe sur son bord interne. 22
22 a Dessus marron foncé et dessous blanchâtre. Taille relativement faible. Avant-bras ne dépassant pas 48 mm. ..... *Nycteris thebaïca* African Chiroptera name ..... Nycteris thebaica
b Dessus et dessous brun sombre. Taille plus grande, avant-bras dépassant 48 mm. ..... Nycteris major
23 a Dessus brun pâle. Une bande étroite blanchâtre bordant le nez dessus et latéralement..... *Nycteris pallida* African Chiroptera name ..... Nycteris hispida
b Dessus brun foncé; pas de bande blanchâtre nasale. 24
24 a Dessus brun foncé, presque noirâtre sur la partie médiane du dos; dessous plus clair que le dessus. ..... Nycteris hispida
b Dessus et dessous brun sombre. Feuille nasale recouverte de poils épais. . Nycteris arge
25 a Deux phalanges à chaque doigt. Feuilles nasales arrondies ou tronquées à la partie supérfieure, mais non prolongées en pointe. Oreille sans lobe marginal à la base (Genre Hipposideros). 26
b Trois phalanges à chaque doigt, excepté au pouce. Feuille nasale prolongée en pointe dans sa partie supérieure. Un lobe marginal à la base de l'oreille (Genre *Rhinolophus*). ..... *Rhinolophus ferrum-equinum obscurus* African Chiroptera name ..... Rhinolophus ferrumequinum
26 a Taille moyenne: avant-bras n'atteignant pas 55 mm. 27
b Taille plus grande: avant-bras atteignant ou dépassant 55 mm. 28
27 a Longueur de l'avant-bras comprise entre 46,5 et 53,8 mm. ..... Hipposideros caffer
b Longueur de l'avant-bras comprise entre 42,2 et 44,2 mm. ..... Hipposideros beatus
28 a Taille relativement très grande: avant-bras 107 mm. environ. Pelage brun olive dessus. Une marque en Y irrégulièrement présente sur le dos.... *Hipposideros gigas* African Chiroptera name ..... Macronycteris gigas
b Avant-bras plus court. 29
29 a Avant-bras: 92 mm. environ. Coloration générale blanchhâtre. Une tache blanche à l'insertion des membranes. ..... *Hipposideros Commersoni* African Chiroptera name ..... Macronycteris commersoni
b Avant-bras inférieur à 92 mm. 30
30 a Pelage d'apparence laineuse de couleur générale brun pourpré. *Hipposideros cyclops* African Chiroptera name ..... Doryrhina cyclops
b Couleur générale roux cannelle vif. ..... Hipposideros fuliginosus
31 a Six molaires supérieures et six molaires inférieures de chaque côté de la mâchoire. 32
b Quatre ou cinq molaires seulement de chaque côté de la mâchoire supérieure. ... 33
32 a Boîte crânienne haute et bombée et rostre grêle et deprime. Avant-bras, jambes et pieds bien velus. Pelage long et laineux. Oreilles disposées en entonnoir. Ouvertures nasales circulaires. Les trois prémolaires presque égales. Membrane interfémorale garnie en général de poils sur son bord terminal (Genre *Kerivoula*). 47
b Boîte crânienne de hauteur normale et plus bombée. Rostre plus épais. Avant-bras et pattes peu velues. Oreilles non disposées en entonnoir. Tragus allongé. Ouvertures nasales en croissant. Troisième prémolaire plus grande que les deux premières (Genre *Myotis*)..... 37
33 a Molaires $^{5}/_{6}$. Première phalange du troisième doigt courte, n'atteignant pas la moitié de la longueur de la seconde. Doigts 3 et 4 notablement plus longs que chez les autres Vespertilionidae (Genre *Miniopterus*)..... Miniopterus inflatus
b Molaires $^{5}/_{5}$. Première phalange du troisième doigt plus longue que la seconde (Genre *Pipistrellus*)..... 40
c Molaires $^{4}/_{5}$. 34
34 a Incisives $^{1-1}/_{3-3}$. Triangle antérieur de la première et de la deuxième molaire plus grand que le postérieur. Membrane alaire épaisse (Genre *Scotophilus*). *Scotophilus nigrita nux ou Scotophilus nigrita herero.*
b Incisives $^{2-2}/_{3-3}$. 35

35 a Lèvre inférieure munie de lobes commisuraux. Rostre étroit. Hauteur du crâne avec les bulles dépassant les deux tiers de sa longueur basilaire. Dessus clair (Genre *Glauconycteris*). 39
b Lèvre inférieure sans lobes commissuraux. Rostre large. Hauteur du crâne avec les bulles beaucoup moins grande que les deux tiers de sa longueur basilaire. 6
36 a Crâne plat et large. Ailes remarquablement courtes et réduites, le troisième doigt n'étant pas plus long que la longueur de la tête et du corps (Genre *Mimetillus*). ..... *Mimetillus Moloneyi*
b Crâne de longueur normale et pas spécialement aplati. Ailes grandes. Oreilles de taille moyenne (Genre *Eptesicus*). 44
37 a Pelage entièrement noir. ..... *Myotis megalopus*
b Pelage roux cannelle ou grisâtre dessus, gris cannelle ou blanchâtre dessous. ... 38
38 a Dessus roux cannelle. Dessous gris cannelle. Avant-bras 33 - 40 mm. environ. ..... *Myotis Bocagei*
African Chiroptera name ..... *Myotis bocagii*
b Dessus grisâtre. Dessous blanchâtre. Avant-bras 54 mm. environ. *Myotis africanus*
39 a Couleur générale gris argenté. ..... *Glauconyctéris argentatus*
African Chiroptera name ..... *Glauconycteris argentata*
b Dessus crème. Dessous blanchâtre. ..... *Glauconycteris variegata*
c Couleur générale brun noirâtre uniforme. ..... *Glauconycteris beatrix*
40 a Avant-bras 24 à 25 mm. ..... *Pipistrellus musciculus*
African Chiroptera name ..... *Hypsugo musciculus*
b Avant-bras dépassant 25 mm. 41
41 a Dessous blanc teinté de jaunâtre. ..... *Pipistrellus Rüppelli*
African Chiroptera name ..... *Pipistrellus rueppellii*
b Dessous plus sombre. 42
42 a Avant-bras 28 mm. environ. Tête et corps 47 mm. Dessus brun fumeux. Dessous un peu plus clair. ..... *Pipistrellus crassulus*
African Chiroptera name ..... *Hypsugo crassulus*
b Avant-bras 30 - 33 mm. Tête et corps 37 - 47. Dessus brun sépia ou noirâtre. Dessous plus clair. ..... *Pipistrellus nanus*
African Chiroptera name ..... *Neoromicia nana*
c Taille plus faible. Tête et corps ne depassant généralement pas 41 mm. 43
43 a Oreilles longues et pointues, le bord externe étant près des commissures labiales. ..... *Pipistrellus Pagenstecheri*
African Chiroptera name ..... *Neoromicia nana*
b Oreilles assez courtes et franchement arrondies. ..... *Pipistrellus nanulus*
44 a Avant-bras 55 mm. environ. Dessus brun foncé et dessous blanc jaunâtre. *Eptesicus serotinus gabonensis*
African Chiroptera name ..... *Eptesicus isabellinus*
b Avant-bras n'atteignant pas 55 mm. 45
45 a Tête et corps 31 mm. environ. Teinte générale brun noirâtre foncé. Dessous légèrement plus clair que le dessus. ..... *Eptesicus pusillus*
African Chiroptera name ..... *Neoromicia "incertae-sedis"*
b Tête et corps dépassant 35 mm. Teinte générale non brun noirâtre. 46
46 a Tête et corps 40 - 46 mm. Dessus brun plus ou moins foncé et dessous cendré blanchâtre. ..... *Eptesicus tenuipennis*
African Chiroptera name ..... *Neoromicia tenuipinnis*
b Tête et corps 37 mm. Dessus brun rougeâtre et dessous plus clair. ..... *Eptesicus Grandidieri*
African Chiroptera name ..... *Pipistrellus grandidieri*
47 a Avant-bras 27 mm. Une frange de poils sur le bord postértieur de la membrane interfémorale. ..... *Kerivoula muscilla*
African Chiroptera name ..... *Kerivoula lanosa*
b Avant-bras 34 - 35 mm. Pas de frange sur le bord postérieur de la membrane interfémorale. ..... *Kerivoula cuprosa*
48 a Troisième molaire complète à tubercules formant une marque en N sur sa surface (Genre *Mops*). 52
b Troisième molaire incomplète à tubercules formant une marque en V sur sa surface. 49

49 a Prémaxillaires complets couvrant complètement la zone située entre les incisives médianes. Incisives supérieures non en contact l'une avec l'autre. Une touffe de poils sur la nuque chez le mâle. Un bandeau interauriculaire bien marqué et formant parfois un bourrelet frontal (Genre *Choerophon*). 50

b Prémaxillaires incomplets et laissant apparaître une émargination entre les incisives medianes. Incisives supérieures en contact l'une avec l'autre. Pas de bandeau interauriculaire marqué. Oreilles de forme plutôt carrée (Genre *Nyctinomus*). ..... *Nyctinomus brunneus*
African Chiroptera name ..... *Tadarida aegyptiaca bocagei*

50 a Pas de bande blanche sur les flancs le long de la membrane alaire. *Choerophon frater*
African Chiroptera name ..... *Chaerephon leucogaster*

b Une bande blanche sur les flancs en bordure de l'insertion de la membrane alaire. 51

51 a Une zone blanche sur la partie médiane du dessous, couvrant le ventre et la région inguinale. ..... *Choerophon limbatus*
African Chiroptera name ..... *Chaerephon pumilus*

b Zone blanche limitée à la zone médiane. ..... *Choerophon cristatus*
African Chiroptera name ..... *Chaerephon leucogaster*

52 a Avant-bras 31 mm. environ. Dessus brun noir; dessous blanc jaunâtre sale. .... *Mops leonis*
African Chiroptera name ..... *Mops (Xiphonycteris) brachypterus*

b Avant-bras dépassant 31 mm. 53

53 a Avant-bras 47 - 49 mm. Dessus brun foncé clair et dessous plus clair. *Mops Osborni*
African Chiroptera name ..... *Mops (Mops) condylurus*

b Avant-bras 41 mm. environ. Couleur général brun noisette. ..... *Mops thersites*
African Chiroptera name ..... *Mops (Xiphonycteris) thersites*

Appendix 5m: Panouse (1951). Les chauves-souris du Maroc.

1	a	Charactères externes.	2
	b	Charactères osseux et dentaires du crâne.	23
2	a	Queue dépassant largement la membrane interfémorale (fig. 6,7).	3
	b	Queue entièrement incluse (sauf parfois les deux dernières ou la dernière vertèbre) dans la membrane interfémorale (fig. 8).	5
3	a	Queue mince et grêle, presque entièrement dégagée de la membrane interfémorale (fig. 6).	4
	b	Queue épaisse et charnue incluse jusqu'à la moitié au moins de sa longueur dans la membrane interfémorale (fig. 7). *Nyctinomus teniotis* African Chiroptera name *Tadarida teniotis*	
4	a	Queue peu ou pas plus longue que l'avant-bras qui dépasse 63 mm. de longueur. *Rhinopoma microphyllum*	
	b	Queue plus longue que l'avant-bras qui a en général moins de 62 mm. de long. *Rhinopoma cystops*	
5	a	Narines compliquées, présentant des excroissances cutanées (feuille nasale) (fig. 9 à 14).	6
	b	Narines simples, s'ouvrant à l'extrémité du museau qui ne présente pas d'excroissances cutanées (fig. 15).	13
6	a	Partie postérieure de la feuille nasale en forme de languette aiguë non divisée (fig. 9 à 12).	7
	b	Partie postérieure de la feuille nasale non en forme de languette pointue et indivise (fig. 13, 14).	12
7	a	Longueur de l'avant-bras supérieure à 54 mm. Pelage café noirâtre sur le dos, brun sur le ventre. *Rhinolophus ferrum equinum* African Chiroptera name *Rhinolophus ferrumequinum*	
	b	Longueur de l'avant-bras inférieure à 52 mm.	8
8	a	Pelage gris clair. Côtés de la selle nettement échancrés. Espèce des régions désertiques. *Rhinolophus acrotis* African Chiroptera name *Rhinolophus clivosus*	
	b	Pelage brun plus ou moins sombre. Côtés de la selle non distinctement échancrés	9
9	a	Côtés de la selle à bords parallèles (fig. 10, 11).	10
	b	Côtés de la selle à bords convergents vers le haut (fig. 12) *Rhinolophus hipposideros*	
10	a	Chauve-souris de très petite taille (avant-bras ayant 30 - 34 mm. de long). *Rhinolophus hipposideros* African Chiroptera name *Pipistrellus rueppellii fuscipes*	
	b	Chauve-souris de taille moyenne ou grande (avant-bras ayant toujours plus de 36 mm. de long).	11
11	a	Membrane alaire de couleur bistre clair. Oreille non échancrée près de sa pointe. *Rhinolophus euryale*	
	b	Membrane alaire de couleur très sombre, presque noire. Oreille légèrement échancrée près de sa pointe. *Rhinolophus mehelyi*	
12	a	Partie postérieure de la feuille nasale divisée en trois lobes (fig. 13). Oreilles grandes en forme de cornet. *Asellia tridens*	
	b	Partie postérieure de la feuille nasale presque carrée. Oreilles courtes, ouvertes en avant (fig. 14). *Hipposideros caffer*	
13	a	Partie inférieure du corps (ventre et dos) normalement velus.	14
	b	Partie inférieure du corps sans poils dessus ni dessous. *Liponycteris nudiventris* African Chiroptera name *Taphozous nudiventris*	
14	a	Première phalange du troisième doigt très courte, égale au tiers de la deuxième environ. Partie supérieure de la tête très bombée, surélevée par rapport à la face (fig. 16). *Miniopterus schreibersii*	
	b	Première phalange du troisième doigt égale ou supérieure aux 2/3 de la deuxième. Partie supérieure de la tête assez déprimée.	15
15	a	Oreilles séparées l'une de l'autre à leur base, sur le dessus de la tête (fig. 15).	16
	b	Oreilles réunies l'une à l'autre par leur base sur le dessus de la tête (fig. 17, 18). Narines prolongées en arrière par des sillons profonds.	22
16	a	Tragus (oreillon) allongé, pointu à son extrémité (fig. 19).	17
	b	Tragus court, arrondi à son extrémité (fig. 20 à 23).	19

17 a Des poils sur la membrane interfémorale entre la queue et la cuisse. Ailes insérées à la cheville (fig. 24). ..... *Myotis capaccinii*
b Pas de poils sur la membrane interfémorale. Ailes insérées à la base des orteils (fig. 8). 18
18 a Oreilles de taille normale à tragus régulièrement effilé vers son extrémité (fig. 26). ..... *Myotis myotis*
b Oreilles grandes et très larges, à oreillon large à la base et assez brusquement rétréci avant le sommet (fig. 25). ..... *Otonycteris hemprichii*
19 a Avant-bras mesurant plus de 45 mm. de long. 20
b Avant-bras mesurant moins de 35 mm. de long. 21
20 a Oreillon aussi large que long. Oreille carrée (fig. 22). ..... *Nyctalus noctula*
b Oreillon deux fois plus long que large. Oreille triangulaire (fig. 23). ..... *Eptesicus isabellinus*
21 a Une lisière blanche de 1 mm. de large environ borde l'aile entre le pied et le cinquième doigt. ..... *Pipistrellus kuhlii*
African Chiroptera name ..... *Pipistrellus hesperidus*
b Pas de lisière blanche au bord de l'aille. ..... *Pipistrellus pipistrellus*
(This should be *Pipistrellus hanaki*. see Benda et al. (2004))
African Chiroptera name ..... *Pipistrellus hanaki*
22 a Avant-bras mesurant 35 à 38 mm. de long. Oreilles plus courtes que l'avant-bras, à oreillon court et triangulaire (fig. 17, 27). ..... *Barbastella barbastellus*
b Avant-bras mesurant plus de 40 mm. de long. Oreilles très longues à tragus très allongé (fig. 18, 28). ..... *Plecotus auritus*
23 a 4 incisives à la mâchoire supérieure. 24
b 2 incisives à la mâchoire supérieure. 32
24 a 6 dents de chaque côté à la mâchoire inférieure en arrière de la canine. 25
b 5 dents de chaque côté à la mâchoire inférieure en arrière de la canine. 28
25 a 6 dents de chaque côté en arrière de la canine à la mâchoire supérieure (genre *Myotis*) (fig. 60A). 26
b 5 dents de chaque côté en arrière de la canine à la mâchoire supérieure (fig. 83A, 87A). 27
26 a Longueur totale du crâne ne dépassant pas 16 mm. ..... *Myotis capaccinii*
b Longueur totale du crâne toujours supérieure à 18 mm. ..... *Myotis myotis*
27 a Boîte crânienne très renflée, à front presque vertical (fig. 29). *Miniopterus schreibersii*
b Boîte crânienne arrondie mais non renflée; front peu distinct (fig. 30). *Plecotus auritus*
28 a Longueur totale du crâne ne dépassant pas 16 mm. 29
b Longueur totale du crâne supérieure à 17 mm. 31
29 a Incisive supérieure interne avec deux pointes (fig. 31). 30
b Incisive supérieure interne à extrémité simple (fig. 32). ..... *Pipistrellus kuhlii*
30 a 5 dents bien visibles latéralement de chaque côté en arrière de la canine à la mâchoire supérieure (fig. 66). ..... *Pipistrellus pipistrellus*
(This should be *Pipistrellus hanaki*. see Benda et al. (2004))
African Chiroptera name ..... *Pipistrellus hanaki*
b 4 dents seulement visibles latéralement de chaque côté en arrière de la canine à la mâchoire supérieure (en réalité il en existe une cinquième, première prémolaire), mais elle est minuscule et rejetée en dedans de la rangée dentaire, si bien que la canine et la seconde prémolaire se touchent (fig. 78). ..... *Barbastella barbastellus*
31 a Incisive supérieure interne avec une pointe simple (fig. 33). 5 dents de chaque côte en arrière de la canine à la mâchoire supérieure. ..... *Nyctalus noctula*
b Incisive supérieure interne avec deux pointes (fig. 34). 4 dents de chaque côté en arrière de la canine à la mâchoire supérieure. ..... *Eptesicus isabellinus*
32 a 6 incisives à la mâchoire inférieure. 33
b 4 incisives à la mâchoire inférieure. 34
33 a 4 dents de chaque côté en arrière de la canine à la mâchoire supérieure. *Otonycteris hemprichii*
b 5 dents de chaque côté en arrière de la canine à la mâchoire supérieure. *Nyctinomus teniotis*
African Chiroptera name ..... *Tadarida teniotis*
34 a 4 dents de chaque côté en arrière de la canine à la mâchoire supérieure. 35

b 5 dents de chaque côté en arrière de la canine à la mâchoire supérieure, la première d'entre elles étant parfois minuscule. 38

35 a Protubérance nasale située en arrière du plan vertical passant par la prémolaire supérieure (fig. 36, 37). 36

b Protubérance nasale située en avant du plan vertical passant par la prémolaire supérieure (fig. 35). 37

36 a Le trou suborbitaire (Ts, fig. 36) est arrondi et placé de telle façon que le bord antérieur de l'orbite (o) est dirigé vers la protubérance nasale. 40

b Le trou suborbitaire (Ts, fig. 37) est allongé et placé de telle façon que le bord antérieur de l'orbite (o) est dirigé en avant et en dessous de la protubérance nasale. .....*Asellia tridens*

37 a Longueur totale du crâne supérieure à 18 mm. Crâne non renflé en avant, presque plat sur le dessus de sa partie antérieure. .....*Rhinopoma microphyllum*

b Longueur totale du crâne inférieure à 18 mm. Crâne renflé latéralement au niveau des narines, entre lesquelles prend naissance un sillon qui va en s'approfondissant en arrière. .....*Rhinopoma cystops*

38 a Crâne court, à extrémité antérieure retroussée; protubérance nasale située très en avant, antérieure au plan vertical passant par la deuxième prémolaire supérieure; première prémolaire supérieure basse, mais large (fig. 38). ..*Liponycteris nudiventris* African Chiroptera name .....*Taphozous nudiventris*

b Crâne normale, allongé; protubérance nasale située en arrière du plan vertical passant par la deuxième prémolaire (fig. 36). 39

39 a La distance qui sépare les bords internes des bulles auditives est inférieure au tiers de la largeur de ces dernières (fig. 39); 6 dents de chaque côté en arrière de la canine à la mâchoire inférieure, mais la seconde, minuscule et rejetée en dehors de la rangée dentaire, est difficile à voir (genre *Rhinolophus*)..... 40

b La distance qui sépare les bords internes des bulles auditives est à peu près égale aux 2/3 de la largeur de ces dernières (fig. 40); 5 dents de chaque côté en arrière de la canine à la mâchoire inférieure. .....*Hipposideros caffer*

40 a Longueur du crâne supérieure à 17.5 mm. 41

b Longueur totale du crâne inférieure à 16.5 mm. .....*Rhinolophus hipposideros*

41 a Longueur totale du crâne supérieure à 22 mm. La canine et la seconde prémolaire supérieure se touchent, rejetant à l'extérieur la minuscule premolaire (fig. 41). .....*Rhinolophus ferrum equinum* African Chiroptera name .....*Rhinolophus ferrumequinum*

b Longueur du crâne inférieure à 22 mm. 42

42 a La canine et la seconde prémolaire supérieures se touchent, rejetant à l'extérieur la minuscule prémolaire supérieure (fig. 41). .....*Rhinolophus acrotis* African Chiroptera name .....*Rhinolophus clivosus*

b La canine et la seconde prémolaire sont séparées par un étroit espace (fig. 42, 43). 43

43 a La toute petite première prémolaire supérieure touche la canine mais non la seconde prémolaire (fig. 43). .....*Rhinolophus mehelyi*

b La première prémolaire supérieure touche à la fois la canine et la seconde prémolaire (fig. 42). .....*Rhinolophus euryale*

Appendix 5n: Roberts (1951). The mammals of South Africa

1	a	Megachiroptera 2
	b	Microchiroptera..... 4
2	a	Size largest, forearm about 100 mm, skull length about 50 mm, no white patch at the base of ears; jugal bone not broadened opposite the supraorbital process; 3 premolars and 2 molars above; M_1 twice the size of M_2 .....*Eidolon helvum*
	b	Size smaller, forearm less than 100 mm, skull length less than 45 mm, no white patch at base of ears; jugal bone not broadened opposide the supraorbital process; 3 premolars and 2 molars above; M_1 equal to M_2 .....*Rousettus leachii* African Chiroptera name .....*Rousettus aegyptiacus*
	c	Size large or small, but forearm less than 90 mm, skull length over 50 mm, a white patch present at the base of ear; the jugal broadened opposite the supraorbital process; only 2 premolars and one molar above. 3
3	a	With one post-dental palate ridges; palate shorter (MM: 29.5 - 30.5), but broader at M^1 (14.8 - 16) (FF 25 - 27 x 13.6 - 15).....*Epomophorus wahlbergi wahlbergi* African Chiroptera name ..... *Epomophorus wahlbergi*
	b	With two post-dental palate ridges; palate longer (MM 32 - 34), but narrower at m^1 (13.3 - 14.5) (FF 29 - 31.5 x 12.8 - 13.5)..... *Epomophorus crypturus*
4	a	With horseshoe nose-leaves 5
	b	Without horseshoe nose-leaves 6
5	a	A median sella and posterior lancet-like, erect, cutaneous processes; frontal region of skull narrowly constricted; nasal bulbs higher than frontals (Rhinolophidae) 9
	b	No median sella, though posterior erect processes may be present; frontal region of skull narrowly constricted byt nasal bulbs hardly raised above the level of the frontals (Hipposideridae) 22
6	a	Nostrils situated in a slit on th face, ears long and spatulate; frontal region of skull broad and hollowed by raised, thin, laterally expanded, plates (Nycteridae)..... 23
	b	Nostrils simple 7
7	a	Nostrils exposed at the end of the muzzle; tail, when present, to the interfemoral membrane, projecting slightly beyond in some genera; premaxilla more or less divided distally by a space between the lateral sections, which ar ecrushed against the maxilla and bear incisors; suprapostorbital processes absent (Vespertilionidae)..... 26
	b	Tail protruding from the interfemoral membrane..... 8
8	a	Tail protruding from the upper surface of the interfemoral membrane; premaxilla a thin bone on each side, wide apart, not clearly visible, situated close up against the maxillaries, which are narrow in front and bear strong canines; frontals flat; suprapostorbital processes absent (Emballonuridae).....*Taphozous mauritianus*
	b	Tail protruding from the middle of the margin of the interfemoral membrane; premaxilla present as thin bone bearing a large incisor on each side, a wide space between them; frontals hollowed; cranium vrey large and high above the muzzle; no supraorbital processes (Molossidae). 53
9	a	Width of horseshoe over 9 mm, skull length from canines over 23 mm 10
	b	Width of horseshoe less than 9 mm, skull length from canines under 23 mm..... 11
10	a	Size larger; forearm 62 - 67, skull length from canines 26 - 28; length c-m^3 9.2 - 10.1; ears larger, length 29 - 32 .....*Rhinolophus hildebrandti hildebrandti* African Chiroptera name .....*Rhinolophus hildebrandtii*
	b	Size smaller, forearm 56 - 58, skull length from canines 24; c-m^3 8.7 - 9; ears shorter, 21 - 22.5 .....*Rhinolophus aethiops* African Chiroptera name .....*Rhinolophus fumigatus*
11	a	p^3 outside the toothrow, c and p^4 in contact..... 12
	b	p^3 within the toothrow, c and p^4 not in contact 17
12	a	Tibia and hind-foot 30 - 34.5 13
	b	Tibia and hind-foot 26 - 30 15
13	a	Skull length from canines 22 - 23; upper c-m^3 length 8.1 - 9; lower c-m_3: 8.8 - 9.4 14
	b	Skull length from canines 20.7 - 22.4; upper c-m^3 7.8 - 8.4; lower c-m_3 8.2 - 9..... 16
14	a	Forearm 54 - 57.....*Rhinolophus geoffroyi augur* African Chiroptera name ..... *Rhinolophus clivosus*
	b	Forearm 51 - 54.5..... *Rhinolophus geoffroyi geoffroyi* African Chiroptera name ..... *Rhinolophus clivosus*

15 a General colour lighter ..... *Rhinolophus geoffroyi zuluensis*
African Chiroptera name ..... *Rhinolophus clivosus*
b General colour darker..... *Rhinolophus geoffroyi zambesiensis*
African Chiroptera name ..... *Rhinolophus clivosus*
16 a Average length of forearm 47, of skull from canines 20, of upper c-m^3 7.3, of lower c-m_3 7.9; colour drab-grey below .....*Rhinolophus darlingi darlingi*
African Chiroptera name .....*Rhinolophus darlingi*
b Average length of forearm 46, of skull length from canines 19.2, of upper c-m^3 7.1, of lower c-m_3 7.4; colour drag grey below.....*Rhinolophus darlingi barbertonensis*
African Chiroptera name .....*Rhinolophus darlingi*
c Average length of forearm 49, of skull from canines 20, of upper c-m^3 7.4, of lower c-m_3 7.9; colour paler above and whiter below .....*Rhinolophus darlingi damarensis*
African Chiroptera name .....*Rhinolophus damarensis*
17 a Saddle rising to a narrow and high point in the posterio half (as seen from the side) 18
b Saddle not rising to a narrow and high point in the posterior half (as seen from the side)..... 19
18 a Anterior face of the saddle rounded above, posterior connecting process broad at the base; forearm 44 - 46; skull length from canines 18 - 18.6; width across m^3 about 7 mm; p_3 outside toothrow.....*Rhinolophus lobatus*
b Anterior face of saddle pointed above, posterior connecting process narrow at the base, the process like a horn, curving forwar; forearm 46.5 - 48; skull length from canines 19 - 19.8; width across m^3 only 6.1 - 6.4; p_3 within the toothrow *Rhinolophus empusa*
African Chiroptera name .....*Rhinolophus blasii*
19 a Forearm 47 - 51; skull length from canines 20 - 21.3, upper c-m^3 7.5 - 7.8, lower c-m_3 8 - 8.5 .....*Rhinolophus capensis*
b Forearm less than 47, skull length from canines less than 19, c-m^3 less than 7, c-m_3 less than 7.5 20
20 a Wing membrane from the lower third of the tibia; tail 21 - 30, ear 19 - 21; size larger, forearm 42.5 - 45, skull length from canines 18 - 18.7, c-m^3 6.4 - 7, c-m_3 6.8 - 7.3 .....*Rhinolophus simulator*
b Wing membrane from lower third of tibia; tail 21, ear 20; size smaller, forearm 42, skull length 17, c-m^3 5.9, c-m_3 6.6..... *Rhinolophus denti*
c Wing membrane from near the ankle; tail 18 - 22, ear 15 - 18, size small, forearm 40 - 43.75; skull length from canines under 18, c-m^3 6 - 6.7, c-m_3 6.3 - 7 21
21 a Size largest, forearm 42.5 - 43.75, tail 19.5; colour as in swinnyi swinnyi*Rhinolophus swinnyi piriensis*
African Chiroptera name ..... *Rhinolophus swinnyi*
b Size smaller, forearm 40 - 42; H & B 42 - 47, tail 18 - 19, skull length from canines 17.2 - 17.7, upper c-m^3 6 - 6.7, lower c-m_3 6.3 - 7, colour wood brown above, below avellaneous .....*Rhinolophus swinnyi swinnyi*
African Chiroptera name ..... *Rhinolophus swinnyi*
c Size smallest, forearm 40, H & B 52, tail and foot, c.u. 24, ear 15, skull length from canines 17, upper c-m^3 6.3, lower c-m_3 6.5; colour near salmon-orange above and below, tipped with orange-rufous above ..... *Rhinolophus swinnyi rhodesiae*
African Chiroptera name ..... *Rhinolophus rhodesiae*
22 a Size largest, forearm over 75, skull length from canines over 30 mm, ears fairly long and pointed; hair short; back of nose-leaf in a transverse tickened ridge; skull powerful, broad in the muzzle, canines long and strong, sagittal crest from forntals to occiput as a high keel.....*Phyllorhina commersoni marungensis*
African Chiroptera name ..... *Macronycteris vittatus*
b Size intermediate, much smaller, forearm between 45 and 55, skull length between 16 and 20 mm; ears short and round, with only a slight tip; hair longer; back of nost-leaf with a thin transverse ridge; skull much lighter, narrower in the muzzle, the sagittal crest is not so high and extending only to the back of frontals. .... *Hipposideros caffer*
c Size very small, forarm less than 36; skull length less than 14 mm; ears short, rounded and hardly rising aobe the level of the hair; back of nose-leaf with a trident-like set of processes; skull very high, broad in the muzzle, but canines not vry large; sagittal crest not much developed and not extending behind the frontals. ..... *Cloeotis percivali*

23 a Forearm les than 41 mm 24
b Forearm over 41 mm 25
24 a Size smallest, forearm 38; ear 17 mm; upper and lower incisors trifurcate .... *Nycteris hispida villosa*
African Chiroptera name ..... *Nycteris hispida*
b Size small, forearm 40, ear 32 - 34; incisors bifurcate ..... *Nycteris woodi sabiensis*
African Chiroptera name ..... *Nycteris woodi*
25 a Size large, forearm 42 - 49; ear 28 - 32; upper toothrow 6.5 - 7; colour buffy to orange-rufous on head and below ..... *Nycteris capensis capensis*
African Chiroptera name ..... *Nycteris thebaica*
b Forearm 48 - 49; ear 33 - 37; upper toothrow 7.3 - 7.5; colour white on head and below ..... *Nycteris capensis damarensis*
African Chiroptera name ..... *Nycteris thebaica*
26 a Surface of forearm, tail and tibia thicky sprinkled with pointed excrescences. ..... *Rhinopterus notius*
African Chiroptera name ..... *Neoromicia capensis*
b Forearm, tail and tibia without pointed excrescences 27
27 a Second phalanx of third finger not more than two-and-a-half times the length of the first phalanx 28
b Second phalanx of third finger nearly three times the length of the first phalanx; cranium much swollen; 2 upper and 3 lower pairs of incisors, 2 upper and 3 lower pairs of premolars; ears square (genus *Miniopterus*) 37
28 a Frontal region of the skull much swollen, high above the muzzle, which is rather narrow, and above the parietals; hair inclined to be curly on the back; 2 upper and 3 lower pairs of incisors, 3 upper and 3 lower pairs of premolars; ears pointed (genus *Kerivoula*) 38
b Frontal region not so swollen, if above the level of the muzzle then not above the level of the parietals; hair above not inclined to be curly 29
29 a Outer upper incisor in contact with the canine; a fleshy lobe at the angle of the mouth connected by a ridge with th lobe of the ear; wing membranes with dark-rayed markings (genus *Glauconycteris*) 52
b Outer upper incisor not in contact with the canine; no fleshy lobe at the angle of the mouth, if present then not connected with lobe of the ear; wing membranes plainly uniform 30
30 a Cranium raised above the level of the muzzle 31
b Cranium practically level with the muzzle 34
31 a Forearm over 40 mm, ear length over 13 mm (genus *Myotis*) 43
b Forearm under 40, ear under 13 mm 32
32 a Two minute premolars above, placed transverse to the toothrow between the canine and large premolar (genus *Cistugo*) 44
b Only one minute premolmar above, in the toothrow between the canine and large premolar 33
c No minute premolar above -only one large premolar. ..... *Neoromicia zuluensis*
33 a Outer upper incisors more than half the height of the inner incisor; inner upper incisor unicuspid. ..... *Pipistrellus nanus*
African Chiroptera name ..... *Neoromicia nana*
b Similar, but inner upper incisor bicuspid. ..... *Vansonia vernayi*
African Chiroptera name ..... *Pipistrellus rueppellii vernayi*
c Outer upper incisor less than half th height of the inner incisor. *Romicia kuhlii broomi* (This should be *Pipistrellus hesperidus*. See Kock (2001))
African Chiroptera name ..... *Pipistrellus hesperidus*
34 a Skull with a keel-like lambdoid process 35
b Skull without a keel-like lambdoid process 36
35 a Size larger, forearm over 45 mm, one upper incisor and one upper premolar on each side (genus *Scotophilus*) 49
b Lambdoid process can be absent; its size variable, typically forearm over 45 mm, but others much less; two upper incisors, but only one upper premolar on each side (genus *Eptesicus*) 46

36 a Size very small, forearm under 34 mm, only one upper incisor and one upper premolar on each side. ..... *Scoteinus schlieffenii*
African Chiroptera name ..... *Nycticeinops schlieffenii*
b No lambdoid crest; forearm under 31 mm; two upper incisors and two upper premolars on each side (genus *Eptesicops*) 45
37 a Size slightly larger, skull length from premaxilla over 15, upper c-m^3 series 5.6 - 5.9 mm..... *Miniopterus natalensis natalensis*
African Chiroptera name ..... *Miniopterus natalensis*
b Size slightly smaller, skull length from premaxilla under 15, upper c-m^3 series 5.3 - 5.5 mm..... *Miniopterus fraterculus*
38 a Size small, forearm 30 - 33, wingspan 250 - 260, greatest skull length 12.9 - 13.5, width of braincase 6.1 - 7.3 39
b Size larger, forearm 34 - 39, wingspan 265 - 300, greatest skull length from canines 15 or more mm, width of brain-case 7.3 - 7.7 40
39 a Colour darker, below grey for the greatest part ..... *Kerivoula lanosa lanosa*
African Chiroptera name ..... *Kerivoula lanosa*
b colour lighter, below white for the greatest part ..... *Kerivoula lanosa lucia*
African Chiroptera name ..... *Kerivoula lanosa*
40 a Hair of upper parts of body grey at the base; outer upper incisors rudimentary ..... *Kerivoula aerosa*
b Hair of upper parts of body white at the base, outer upper incisor nearly as large as the inner..... 41
41 a Long-winged, forearm 39, wingspan about 280 - 300...*Kerivoula argentata argentata*
African Chiroptera name ..... *Kerivoula argentata*
b Shorter-winged, forearm 35.5, wingspan about 265 - 280..... 42
42 a Colour below buffy-white..... *Kerivoula argentata nidicola*
African Chiroptera name ..... *Kerivoula argentata*
b Colour below smoky greyish-white..... *Kerivoula argentata zuluensis*
African Chiroptera name ..... *Kerivoula argentata*
43 a Size larger, forearm over 53 mm, interfemoral membrane red..... *Myotis welwitschii*
b Size smaller, forearm under 53; interfemoral membrane brown..... *Myotis tricolor*
44 a Size smaller, forearm 32.5, skull length 13.2 ..... *Cistugo seabrae*
b Size larger, forearm 34.5, skull length 14.4..... *Cistugo lesueuri*
45 a Size larger; skull length 11.5 - 11.8 mm..... *Eptesicops rusticus*
African Chiroptera name ..... *Pipistrellus rusticus*
b Size smaller, skull length 11 mm..... *Eptesicops subtilis / Eptesicops fouriei*
46 a Size larger, forearm over 40; skull with a keel-like lambdoid crest 47
b Size smaller, forearm under 40, skull without a keel-like lambdoid crest 48
47 a Colour dark, above brownish-olive, tips of hair honey-yellow..... *Eptesicus hottentota hottentota*
African Chiroptera name ..... *Eptesicus hottentotus*
b Colour very light and yallowish, lighter than "clay colour" *Eptesicus hottentota pallidior*
African Chiroptera name ..... *Eptesicus hottentotus*
48 a Forearm 34.5 - 38; skull length form canines 14.7 - 15.7; widht of braincase 7.1 - 7.9; colour "sayal brown"..... *Eptesicus melckorum*
African Chiroptera name ..... *Neoromicia capensis*
b Forearm 32.5 - 34.5; skull length 13.5 - 14; width of braincase 6.7 - 72; colour yellowish-brown..... *Eptesicus capensis capensis*
African Chiroptera name ..... *Neoromicia capensis*
c Forearm 32 - 35; skull length 14 - 14.9; width of braincase 6.8 - 7.2; colour paler yellowish-brown and white below..... *Eptesicus capensis damarensis*
African Chiroptera name ..... *Neoromicia capensis*
d Forearm 30 - 32; skull length 13 - 13.8; width of braincase 6.5 - 7; colour yellowish-brown, less whitish below..... *Eptesicus capensis gracilior*
African Chiroptera name ..... *Neoromicia capensis*
e Forearm 31 - 33.5; skull length 13.3 - 13.5; width of braincase 6.5 - 7; colour paler brown, especially below, which is whiter..... *Eptesicus capensis nkatiensis*
African Chiroptera name ..... *Neoromicia capensis*
49 a Forearm length 49.5 - 58, skull length 20.5 - 23; width of braincase 9.2 - 10.5..... 50
b Forearm length 46.5 - 52; skull length 17 - 19.2; width of braincase 8.9 - 9..... 51

50 a Colour white below ..... *Scotophilus herero*
African Chiroptera name ..... Scotophilus dinganii
b Colour lighter yellow below..... *Scotophilus nigrita dinganii*
(This should be Scotophilus dinganii. See Robbins (1978))
African Chiroptera name ..... Scotophilus dinganii
c Colour darker yellow below ..... *Scotophilus nigrita pondoensis*
African Chiroptera name ..... Scotophilus dinganii
51 a Colour dark yellow below ..... *Scotophilus viridis viridis*
African Chiroptera name ..... Scotophilus viridis
b Colour white below..... *Scotophilus viridis damarensis*
African Chiroptera name ..... Scotophilus leucogaster
52 a Creamy coloured below..... *Glauconycteris variegata papilio*
African Chiroptera name ..... Glauconycteris variegata
b White below..... *Glauconycteris variegata variegata*
African Chiroptera name ..... Glauconycteris variegata
53 a Ears very large, over 30 mm in length ..... *Otomops icarus*
African Chiroptera name ..... Otomops martiensseni icarus
b Ears shorter than 30 mm..... 54
54 a Ears joined at the base, premaxilla fused anteriorly 55
b Ears separated at the base, premaxilla divided anteriorly 56
55 a Forearm under 45 mm, skull length under 18 mm, two premolars above (genus *Chaerephon*) 58
b Forearm over 45 mm, skull length over 18 mm, only one upper premolar. ..... *Mops condylurus*
African Chiroptera name ..... Mops (Mops) condylurus
56 a Ears pointed, with 3 lower paris of incisors (genus *Mormopterus*) ..... *Null*
b Ears squared, only 2 pairs of lower incisors..... 56
57 a Skull not so flattened, height of braincase about half its width (genus *Tadarida*)... 59
b Skull much flattened, height of braincase about one-third of its width (genus *Platymops*) 60
58 a Middle of lower breast to abdomen white..... *Chaerephon limbatus limbatus*
African Chiroptera name ..... Chaerephon pumilus
b White below confined to lower abdomen and border of membrane; colour above brown to dark brown; crest in MM 4 mm ..... *Chaerephon limbatus elphicki*
African Chiroptera name ..... Chaerephon pumilus
c White below confined to lower abdomen and border or membranes; colour above dusky drab, crest in MM 9 mm ..... *Chaerephon limbatus langi*
African Chiroptera name ..... Chaerephon pumilus
d No pure white below, but whitish; above drab; crest in MM 13 mm..... *Chaerephon limbatus shortridgei*
African Chiroptera name ..... Chaerephon chapini
59 a Lips not wrinkled; colour bright orange-chestnut above and below; larger, forearm 64 ..... *Tadarida africana*
African Chiroptera name ..... Tadarida ventralis
b Lips not wrinkled; colour chocolate-brown to orange-chestnut above and below, but with a broad white line on th integument from forearm to the pubic region and thence up to middle of body to the chest; rather smaller, forearm 57..... *Tadarida mastersoni*
African Chiroptera name ..... Tadarida fulminans
c Lips wrinkled; colour chocolate-brown above and below, with the throat darker; forearm 45, skull length about 19, lower toothrow 8.3; lower canines in contact ..... *Tadarida rhodesiae*
African Chiroptera name ..... Chaerephon ansorgei
d Lips wrinkled; colour greyish-brown above and below; forearm 47 - 51.5, skull length 19 - 20.5, lower toothrow 8 - 8.5; lower canines wide apart..... *Tadarida aegyptiacus*
African Chiroptera name ..... Tadarida aegyptiaca
e Lips wrinkled; colour greyish-brown above and below; forearm 42 - 47, skull length 17.3 - 18.6, lower toothrow 6.8 - 7.5; lower canines wide apart..... *Tadarida bocagei*
African Chiroptera name ..... Tadarida aegyptiaca bocagei
60 a Size larger, forearm 38 - 42, skull length 16.8 - 18, c-m^3 series 6.1 - 6.5..... 61
b Size smaller, forearm 36 - 37; skull length 16 - 16.4, c-m^3 series 5.6 - 5.8 62

61 a Colour tawny-olive above, lightr tawny-olive below *Platymops petrophilus petrophilus*
African Chiroptera name .....*Sauromys petrophilus petrophilus*
b Colour paler above, especially on head and neck, more whitish below .....*Platymops petrophilus fitzsimonsi*
African Chiroptera name ..... *Sauromys petrophilus umbratus*
c Colour considerably paler above all over, and below much more whitish ...*Platymops petrophilus erongensis*
African Chiroptera name .....*Sauromys petrophilus erongensis*
62 a Colour above pale tawny-olive, below whitish, ears paler brown. *Platymops haagneri haagneri*
African Chiroptera name ..... *Sauromys petrophilus haagneri*
b Colour above smoky seal-brown, below paler and more buffy; ears blackish*Platymops haagneri umbratus*
African Chiroptera name ..... *Sauromys petrophilus umbratus*

Appendix 5o: Malbrant (1952). Faune du Centre African français (Mammifères et Oiseaux).

1	a	Couronne des molaires aplatie et lisse sans tubercules marqués. Pouce et second doigt des memhres antérieurs terminés par des griffes. Taille variable, souvent grande ou très grande mais parfois très petite. Queue absente ou rudimentaire (Sous-ordre des Megachiroptères, Chauves-souris frugivores: Famille Pteropidae). 8
	b	Couronne des molaires pourvue de tubercules aigus. Deuxième doigt des membranes antérieurs non terminés par une griffe. Queue en général bien développée, incluse au moins en parte dans la membrane interfémorale. Taille faible (Sous-ordre des Microchiroptères, Chauves-souris insectivores). 2
2	a	Queue à extrémité libre dépassant sensiblement la membrane interfémorale..... 3
	b	Queue entièrement incluse dans la membrane interfémorale ou ne la dépassant que d'une partie de la dernière vertèbre caudale..... 4
3	a	Un tragus auriculaire petit et arrondi mais bien visible. Pas de feuilles nasales. Museau légèrement allongé. Membres postérieurs glèles. Queue grèle perforant la membrane interfémorale et saillant sur la face supérieure. Oreilles largement séparées (Famille Emballonuridae). .....*Taphozous mauritianus*
	b	Tragus auriculaire petit, parfois même rudimentaire. Pas de feuilles nasales. Museau tronqué obliquement. Membres postérieurs trapus. Queue épaisse à la base débordant la membrane interfémorale, qui est étroite, d'au moins un tiers de sa longueur. Oreilles très rapprochées et souvent même reliées entre elles par une bande cutanée sur le front, à bords postérieurs bien descendus sur la joue (Famille Molossidae). 15
4	a	Pas de feuilles nasales. Un tragus auriculaire grêle et droit. Oreilles en général petites et largement séparées (Famille Vespertilionidae). 12
	b	Feuilles nasales plus ou moins développées mais toujours présentes. 5
5	a	Queue beaucoup plus courte que la membrane interfémorale dont elle ne dépasse pas le bord d'insertion. Oreilles très grandes soudées à leur base avec un tragus allongé en pointe et bifurqué. Membranes, oreilles et tragus de couleur orangé. Feuilles nasales bien développées (Famille Megadermidae).....*Lavia frons*
	b	Queue dépassant le bord d'insertion de la membrane interfémorale. Oreilles plus petites, non soudées à la base. Tragus arrondi quand il existe, ou absent..... 6
6	a	Feuilles nasales présentes. Nez compliqué d'un profond sillon médian longitudinal. Oreilles grandes. Tragus de grandeur variable mais généralement petit. Queue atteignant l'extrémité de la membrane interfémorale et formant un Y renversé à sa jonction avec celle-ci (Famille Nycteridae).....*Nycteris aethiopica* African Chiroptera name .....*Nycteris macrotis*
	b	Feuilles nasales développées et compliquées, affectant, en général la forme d'un fer à cheval. Pas de sillon nasal. Pas de tragus. Queue se terminant en pointe dans la membrane interfémorale. 7
7	a	Feuilles nasales pourvues d'un lobe aigu à la partie supérieure. Trois phalanges aux orteils II à V (Famille Rhinolophidae). 10
	b	Feuilles nasales à lobe supérieur tronqué, non aigu. Deux phalanges seulement aux orteils II à V (Famille Hipposideridae). .....*Hipposideros caffer ou Asellia tridens.*
8	a	Molaires 5/6. Tête sans taches, ni touffes blanches. Grande taille, Longueur de l'avant-bras comprise entre 110 et 130 mm. Pelage jaunâtre ou brun jaunâtre dans l'ensemble. M^1 de la mâchoire supérieure aussi longue que les deux suivantes réunies.....*Eidolon helvum*
	b	Molaires. 3/5. Tête du mâle souvent pourvue de taches ou de touffes blanches. Taille moyenne. Longueur de l'avant-bras ne dépassant pas 100 mm. Rostre (du bord antérieur de l'orbite à l'extrémité des nasaux) plus long que la largeur palatale au niveau des dernières molaires. 9
9	a	Dessus brun jaunâtre légèrement teinté de grisâtre, plus clair dessous.*Epomophorus Pousarguesi* African Chiroptera name ..... *Epomophorus gambianus pousarguesi*
	b	Dessus plus clair, café au lait plus ou moins foncé. .....*Epomophorus gambianus*
10	a	Taille assez grande. Longueur de l'avant-bras atteignant 50 mm. . *Rhinolophus Foxi* African Chiroptera name .....*Rhinolophus fumigatus*
	b	Taille plus faible. Longueur de l'avant-bras n'atteignant pas 47 mm. 11

11 a Dessous gris manron clair. ..... *Rhinolophus acrotis Schwarzi*
African Chiroptera name ..... *Rhinolophus clivosus*
b Dessous jaune. ..... *Rhinolophus Dobsoni*
African Chiroptera name ..... *Rhinolophus landeri*
12 a Molaires 5/5. Deux paires d'incisives à la mâchoire supérieure. Première phalange du troisième doigt plus longue que la seconde (Genre *Pipistrellus*). *Pipistrellus deserti ou Pipistrellus marrensis ou Pipistrellus Rüppelli ou Pipistrellus Kuhli*
b Molaires 4/5. Une seule paire d'incisives à la mâchoire supérieure. 13
13 a Mésostyle (petit tubercule placé en partie médiane sur le côté externe de la dent) de la première et seconde molaire supérieure réduit, et marque en W formée par les cônes principaux rétrécie en son milieu. Triangle antérieur de la 1re et 2e molaire plus grand que le postérieur (Genre *Scotophilus*). ..... *Scotophilus nigrita leucogaster*
African Chiroptera name ..... *Scotophilus leucogaster*
b Marque en W de la 1re et 2e molaire normale. Triangle antérieur de la première et deuxième molaire plus petit que le postérieur. 14
14 a Couronne de la troisième molaire pourvue d'une marque en W (Genre *Scotoecus*). ..... *Scotaecus falabae*
African Chiroptera name ..... *Scotoecus hindei*
b Couronne de la troisième molaire pourvue d'une marque en V (Genre *Scoteinus*). ..... *Scoteinus Schlieffeni*
African Chiroptera name ..... *Nycticeinops schlieffenii*
15 a Incisives supérieures séparées; prémaxillaires complets couvrant complètement la zone située entre les incisives médianes. Une toufîe de poils sur la nuque chez le mâle. Oreilles unies à leur base par un bandeau interauriculaire bien marqué formant parfois un bourrelet frontal (Genre *Choerophon*). ..... *Chaerophon Websteri*
African Chiroptera name ..... *Chaerephon leucogaster*
b Incisives supérieures en contact l'une avec l'autre. 16
16 a Une émargination profonde entre les incisives médianes s'étendant en arrière de leur racine. Oreilles très rapprochées, parfois même réunies à leur base, mais sans bandeau interauriculaire marqué. Tragus petit, aplati, généralement tronqué et carré à l'extrémité (Genre *Nyctinomus*). ..... *Nyctinomus tongaensis*
b Pas d'émargination entre les incisives médianes, on seulement une petite encoche qui ne s'étend pas en arrière de leur racine. Oreilles nettement séparées à leur base. Tragus assez grand, aplati, généralement arrondi à l'extrémité (Genre *Myopterus*). ..... *Myopterus albatus*
African Chiroptera name ..... *Myopterus daubentonii*

Appendix 5p: Sanborn and Hoogstraal (1955). The identification of Egyptian bats.

1	a	External characters 2
	b	Skull characters 14
2	a	Second finger with claw (Genus *Rousettus*); Tail short, 16.0 - 24.0 mm., membrane greatly reduced; forearm 88.0 - 99.0 mm. ..... *Rousettus aegyptiacus*
	b	Second finger without claw (Genus *Taphozous*). Tail medium, projecting through center of membrane. 3
	c	Tail extending to edge of membrane, which is not reduced. Muzzle simple, without cutaneous growths. 4
	d	Muzzle not simple. 8
	e	Tail long, extending beyond edge of interfernoral membrane. 11
3	a	Lower back furred, tail 24.0 - 32.0 mm., forearm 60.0 - 66.0 mm. *Taphozous perforatus*
	b	Lower back not furred, tail 35.0 - 40.0, forearm 60.0 - 76.0 mm. *Taphozous nudiventris*
4	a	Ears large, 35.0 - 38.0 mm. Long. 5
	b	Ears small, size small, 1 upper premolar. 6
	c	Tragus wide, 2 upper premolars (Genus *Pipistrellus*). 7
5	a	Forearm 37.7 - 39.2 mm. ..... *Plecotus a(ustriacus) christei* African Chiroptera name ..... *Plecotus christii*
	b	Forearm 57.0 - 65.0 mm. ..... *Otonycteris hemprichi* African Chiroptera name ..... *Otonycteris hemprichii*
6	a	Tragus short, broad, 1 upper incisor, forearm 30.0 - 32.0 mm. ..... *Nycticeius*
	b	Tragus narrow, 2 upper incisors, forearm 41.0 - 44.0 mm. ..... *Eptesicus innesi* African Chiroptera name ..... *Eptesicus bottae*
7	a	Posterior edge of wing membrane white, forearm 32.0 - 36.0 mm. ... *Pipistrellus kuhli* African Chiroptera name ..... *Pipistrellus kuhlii*
	b	Small, color pale, forearm 30.0. ..... *Pipistrellus ariel* African Chiroptera name ..... *Hypsugo ariel*
	c	Underparts white, forearm 30.0 - 34.0. ..... *Pipistrellus ruppelli* African Chiroptera name ..... *Pipistrellus rueppellii*
8	a	Muzzle with longitudinal groove, ears large; forearm 41.0 - 47.0. .... *Nycteris thebaica*
	b	Muzzle with cutaneous growths (Genus *Rhinolophus*). 9
	c	Muzzle with pair of swellings above nostrils; forearm about 40.0 mm. ..... *Barbastella leucomelas*
9	a	Second phalanx of 3rd and 4th fingers more than 1 - 1/2 times length of first phalanges; one mental groove (*Rhinolophus clivosus*). 10
	b	Second phalanx of 3rd finger more than 1 - 1/2 times length of first phalanx, second phalanx of 4th finger twice length of first phalanx; three mental grooves. *Rhinolophus mehelyi*
	c	Second phalanges of all fingers 1 - 1/2 times, or nearly so, length of first phalanges. ..... *Rhinolophus hipposideros*
	d	Smaller, forearm 34.0 - 38.0. ..... *Rhinolophus hipposideros minimus* African Chiroptera name ..... *Rhinolophus hipposideros*
10	a	Paler, forearm 46.0 - 51.0, Eastern Desert and Sinai. .. *Rhinolophus clivosus clivosus* African Chiroptera name ..... *Rhinolophus clivosus*
	b	Darker, forearm 44.0 - 48.0, Nile Valley. ..... *Rhinolophus clivosus brachygnathus* African Chiroptera name ..... *Rhinolophus clivosus*
11	a	Tail very long, thin, and wirelike (Genus *Rhinopoma*). 12
	b	Tail thin, extending but short distance beyond membrane; muzzle with cutaneous growths. Forearm 46.0 - 53.0 mm. ..... *Asellia tridens*
	c	Tail thick and heavy, extending but short distance beyond membrane, muzzle without cutaneous growths (Genus *Tadarida*). 13
12	a	Tail 59.0 - 80.0 mm., longer than forearm 54.0 - 62.0 mm. ..... *Rhinopoma hardwickei cystops* African Chiroptera name ..... *Rhinopoma cystops*
	b	Tail 56.0 - 71.0 mm., shorter than forearm 62.0 - 72.0 mm. *Rhinopoma microphyllum*
13	a	Forearm 50.0 - 55.0 mm. ..... *Tadarida aegyptiaca*
	b	Forearm 59.0 - 65.0 mm. ..... *Tadarida ruppelli* African Chiroptera name ..... *Tadarida teniotis*

14	a	Teeth 36 (i $^{2-2}/_{3-3}$ c $^{1-1}/_{1-1}$ pm $^{2-2}/_{3-3}$ m $^{3-3}/_{3-3}$ ..... *Plecotus*

	c	Teeth 32 19
	d	Teeth 30 21
	e	Teeth 28 (I $^{1-1}/_{2-2}$ c $^{1-1}/_{1-1}$ pm $^{1-1}/_{2-2}$ m $^{3-3}/_{3-3}$) 25
15	a	I $^{2-2}/_{2-2}$ c $^{1-1}/_{1-1}$ pm $^{3-3}/_{3-3}$ m $^{2-2}/_{3-3}$ ..... *Rousettus*
	b	I $^{2-2}/_{3-3}$ c $^{1-1}/_{1-1}$ pm $^{2-2}/_{2-2}$ m $^{3-3}/_{3-3}$ 16
16	a	Brain case arched. ..... *Barbastella*
	b	Brain case flattened (Genus *Pipistrellus*). 17
17	a	Inner upper incisor bilobed. ..... *Pipistrellus ruppelli*
		African Chiroptera name ..... *Pipistrellus rueppellii*
	b	Inner upper incisor simple. 18
18	a	Larger, upper tooth row 4.8 - 5.0 mm. ..... *Pipistrellus kuhli*
		African Chiroptera name ..... *Pipistrellus kuhlii*
	b	Smaller, upper tooth row 3.7 mm. ..... *Pipistrellus ariel*
		African Chiroptera name ..... *Hypsugo ariel*
19	a	I $^{2-2}/_{3-3}$ c $^{1-1}/_{1-1}$ pm $^{1-1}/_{2-2}$ m $^{3-3}/_{3-3}$ 20
	b	I $^{1-1}/_{2-2}$ c $^{1-1}/_{1-1}$ pm $^{2-2}/_{3-3}$ m $^{3-3}/_{3-3}$ ..... *Rhinolophus*
	c	I $^{1-1}/_{3-3}$ c $^{1-1}/_{1-1}$ pm $^{2-2}/_{3-3}$ m $^{3-3}/_{3-3}$ ..... *Tadarida ruppelli*
		African Chiroptera name ..... *Tadarida teniotis*
20	a	Rostrum convex. ..... *Eptesicus*
	b	Rostrum concave. ..... *Nycteris*
21	a	I $^{1-1}/_{3-3}$ c $^{1-1}/_{1-1}$ pm $^{1-1}/_{2-2}$ m $^{3-3}/_{3-3}$ 22
	b	I $^{1-1}/_{2-2}$ c $^{1-1}/_{1-1}$ pm $^{2-2}/_{2-2}$ m $^{3-3}/_{3-3}$ 23
22	a	Larger, tooth row 8.2 mm. ..... *Otonycteris*
	b	Smaller, tooth row 4.1 - 4.5 mm. ..... *Nycticeius*
23	a	Rostrum convex. ..... *Tadarida aegyptiaca*
	b	Rostrum concave (Genus *Taphozous*). 24
24	a	Skull with crests. ..... *Taphozous nudiventris*
	b	Skull without crests. ..... *Taphozous perforatus*
		African Chiroptera name ..... *Taphozous perforatus perforatus*
25	a	Rostrum convex. ..... *Asellia*
	b	Rostrum concave (Genus *Rhinopoma*). 26
26	a	Smaller, lateral swellings on rostrum. ..... *Rhinopoma cystops*
	b	Larger, no lateral swellings on rostrum. ..... *Rhinopoma microphyllum*

Appendix 5g: Hoogstraal (1962). A brief review of the contemporary land mammals of Egypt (including Sinai). 1. Insectivora and Chiroptera.

1	a	Second finger with claw. Forearm 88 - 99. Fruit bat. .....*Rousettus aegyptiacus aegyptiacus* African Chiroptera name .....*Rousettus aegyptiacus*
	b	Second finger lacking claw. Forearm much shorter. Insectivorous bats..... 2
2	a	Tail not projecting through center of membrane. 4
	b	Tail projecting through center of membrane.(Genus *Taphozous*) 3
3	a	Lower back furred. Tail 24 - 32. .....*Taphozous perforatus perforatus*
	b	Lower back not furred. Tail 35 - 40. ..... *Taphozous nudiventris nudiventris* African Chiroptera name .....*Taphozous nudiventris*
4	a	Muzzle with nose leaf or leaves. 5
	b	Muzzle lacking nose leaves..... 10
5	a	Nose leaves in three parts. Tail and ears not as following..... 7
	b	Nose leaf single, short triangular. Tail exceedingly long and slender. Ears united (Genus *Rhinopoma*). 6
6	a	Tail (59 - 80) longer than forearm (54 - 62).....*Rhinopoma hardwickei cystops* African Chiroptera name .....*Rhinopoma cystops*
	b	Tail (56 - 71) shorter than forearm (62 - 72).. *Rhinopoma microphyllum microphyllum* African Chiroptera name .....*Rhinopoma microphyllum*
7	a	Anterior nose leaf flat against muzzle and not notched anteriorly; posterior nose leaf tridentate. Approximately one-fourth of length of tail extending beyond wing-membrane, Forearm 47 - 53. .....*Asellia tridens tridens* African Chiroptera name .....*Asellia tridens*
	b	Anterior nose leaf horizontal and deeply notched anteriorly; posterior nose leaf triangular. Little if any of tail extending beyond wing membrane. (Genus *Rhinolophus*). 8
8	a	Second phalanx of 3rd and 4th fingers more than 1.5 times length of first phalanges; one mental groove. (*Rhinolophus clivosus* subspp.). 9
9	a	Pale. Forearm 46 - 51. Eastern Desert and Sinai. .....*Rhinolophus clivosus clivosus* African Chiroptera name ..... *Rhinolophus clivosus*
	b	Dark. Forearm .44 - 48. Nile Valley. .....*Rhinolophus clivosus brachygnatus* African Chiroptera name ..... *Rhinolophus clivosus*
	c	Second phalanges of all fingers 1.5 times (or nearly so) length of first phalanges. Forearm 24 - 38..... *Rhinolophus hipposideros minimus* African Chiroptera name .....*Rhinolophus hipposideros*
10	a	Upper lips not wrinkled. Ears with tragus. 12
	b	Upper lips wrinkled. Ears broad, tragus lacking. Medium to large bats. (Genus *Tadarida*). 11
11	a	Forearm 50 - 55..... *Tadarida aegyptica aegyptiaca* African Chiroptera name ..... *Tadarida aegyptiaca aegyptiaca*
	b	Forearm 59 - 65..... *Tadarida teniotis ruppelli* African Chiroptera name .....*Tadarida teniotis*
12	a	Ears much longer than head. 13
	b	Ears shorter than or only slightly longer than head. 15
13	a	Muzzle traversed by longitudinal furrow containing nostrils and bordered by valvular folds. Forearm 41 - 47. .....*Nycteris thebaica thebaica* African Chiroptera name .....*Nycteris thebaica*
	b	Muzzle not as above. 14
14	a	Forearm 37.7 - 39.2 ..... *Plecotus auritus christiei* African Chiroptera name ..... *Plecotus christii*
	b	Forearm 57 - 65.....*Otonycteris hemprichi hemprichi* African Chiroptera name .....*Otonycteris hemprichii*
15	a	Muzzle with a pair of swellings above nostrils. Ears very close together, almost joined across forehead. Forearm about 40. (Rare, Red Sea area only). ..... *Barbastella leucomelas leucomelas*
	b	Muzzle lacking pair of swellings above nostrils. Ears well separated. 16
16	a	Two upper incisors. Ears clearly longer than broad. 17

b One upper incisor. Ears about as broad as long. Forearm 30 - 32.. (Known only by 2 specimens). ..... *Nycticeius schlieffeni schlieffeni*
African Chiroptera name ..... *Nycticeinops schlieffenii*

17 a Forearm more than 37 (40 - 44). ..... *Eptesicus isabellinus innesi*
African Chiroptera name ..... *Eptesicus bottae*

b Forearm less than 37 (30 - 35). (Genus *Pipistrellus*). 18

18 a Underparts white, sharply set off from dark brown upper parts. Forearm 30 - 34. ..... *Pipistrellus ruppelli ruppelli*
African Chiroptera name ..... *Pipistrellus rueppellii rueppellii*

b Underparts light brown, grading into dark brown upper parts. Outer upper incisor less than one half height of inner upper incisor. Wing periphery usually white. Forearm 30 – 36..... *Pipistrellus kuhli kuhli*
African Chiroptera name ..... *Pipistrellus kuhlii*

c Outer upper incisor more than one half height of inner upper incisor. Wing periphery brown. Forearm 30. (Known only from Southeastern Desert). ..... *Pipistrellus ariel*
African Chiroptera name ..... *Hypsugo ariel*

Appendix 5r: Hill (1963). A revision of the genus Hipposideros.

1	a	Ears united at the base by a low frontal band (*megalotis* group)..... *Hipposideros megalotis*
	b	Ears not united. 2
2	a	Ears long and narrow, pointed (Figs. 20, 22 - 25): cochleae greatly expanded, their width equal to at least four times their distance apart (cyclops group). 28
	b	Ears short, broad, rounded or triangular: cochleae not expanded, their width approximately equal to their distance apart. 3
3	a	Ears rounded or broadly triangular, bluntly pointed upper incisors weak, the outer lobe obsolescent or obsolete: crown area of outer lower incisors equal to or only slightly greater than that of the inner lower incisors bicolor group)..... 7
	b	Ears triangular, pointed: upper incisors strong, usually retaining much of the outer lobe; crown area of the outer lower incisors much greater than that of the inner lower incisors. 4
4	a	Noseleaf with two lateral supplementary leaflets: frontal depression well-defined; maxillae elongated (pratti group)..... 33
	b	Noseleaf with three or four lateral supplementary leaflets: frontal depression lacking or shallow; maxillae not elongated. 5
5	a	Noseleaf with upper edge of posterior leaf slightly lobate, the posterior leaf narrower than the anterior leaf: rostral eminences not inflated and rostrum flattened; a distinct discontinuity between roofs of narial and mesopterygoid canals (armiger group). .....*Hipposideros armiger, Hipposideros turpis*
	b	Noseleaf with upper edge of posterior leaf forming an arc of a circle, the posterior leaf equal in width to the anterior leaf: rostral eminences moderately inflated and rostrum elevated: roofs of narial and mesopterygoid canals not sharply discontinuous..... 6
6	a	Ears with a small projection at the antitragal fold: sphenoidal bridge narrow, not concealing lateral apertures; pterygoid wings undeveloped (speoris group)..... 34
	b	Ears without antitragal modification: sphenoidal bridge wide, partially concealing lateral apertures; pterygoid wings expanded (diadema group)..... 36
7	a	Lateral supplementary leaflets none or one. 8
	b	Lateral supplementary leaflets two or three. 20
8	a	Anterior upper premolar (pm^2) obsolescent or obsolete, if present minute, extruded from toothrow, with second upper premolar (pm^4) and canine in contact, anterior lower premolar (pm_2) one quarter the length and one third or less the height of the second lower premolar (pm_4)..... 9
	b	Anterior upper premolar (pm^2) present, never minute, anterior lower premolar (pm_2) one third or more the length and height of second lower premolar (pm_4)..... 10
9	a	Anterior leaf without a median emargination: posterior leaf supported by a well-defined median septum and weaker lateral septa: pterygoids long, sphenoidal bridge wide. ..... *Hipposideros dyacorum*
	b	Anterior leaf with well-defined median emargination: posterior leaf lacking supporting septa: pterygoids short, sphenoidal bridge narrow. .....*Hipposideros sabanus*
10	a	Internarial septum expanded to form a more or less disc-like structure between the nostrils: one lateral supplementary leaflet, sometimes rudimentary. 11
	b	Internarial septum not greatly expanded or modified, more or less parallel sided: no lateral supplementary leaflets. 13
11	a	Internarial septum expanded to form a concave sub-circular disc..... 12
	b	Internarial septum expanded to form an ellipsoidal structure. .. *Hipposideros marisae*
12	a	Posterior leaf low, rounded above: lateral supplementary leaflet incipient, barely visible: palation U-shaped, without a post-palatal spicule.....*Hipposideros ridleyi*
	b	Posterior leaf high, sub-triangular above: lateral supplementary leaflet well developed, extending anteriorly beneath anterior leaf to median line: palation square, with a small post-palatal spicule.....*Hipposideros jonesi*
13	a	Interorbital region wide, not sharply constricted, its width nearly equal to that of the rostrum. 14
	b	Interorbital region decidedly constricted, its width considerably less than that of the rostrum. 15
14	a	Sphenoidal bridge well developed, broad, partially concealing small, elongate lateral apertures: well developed sphenoidal depression. .....*Hipposideros calcaratus*

b Sphenoidal bridge narrow, not concealing large, rounded lateral apertures: poorly developed sphenoidal depression. ..... *Hipposideros cupidus*

15 a Anterior leaf without a median emargination: posterior leaf with three supporting septa: no glandular ridge on muzzle beneath margin of anterior leaf. 16

b Anterior leaf with small median emargination: posterior leaf without supporting septa: a low glandular ridge on muzzle beneath margin of anterior leaf. ..... *Hipposideros obscurus*

16 a Internarial septum thickened and bulbous: anterior half of zygomata slender. 17

b Internarial septum uninflated: anterior half of zygomata massive. 18

17 a Superior projection of zygomata lacking or poorly developed: anterior upper premolar (pm^2) not extruded from toothrow. ..... *Hipposideros cineraceus*

b A low superior zygomatic projection: anterior upper premolar (pm^2) extruded or partially extruded from toothrow. ..... *Hipposideros ater*

18 a Posterior projecting portion of vomer blade-like. 19

b Posterior projecting portion of vomer thickened. ..... *Hipposideros bicolor*

19 a Anterior lower premolar (pm_2) much reduced, one third the length of second lower premolar (pm_4) ..... *Hipposideros fulvus*

b Anterior lower premolar (pm_2) less reduced, one half the length of second lower premolar (pm_4) ..... *Hipposideros nequam*

20 a Anterior lateral supplementary leaflet extending anteriorly beneath anterior leaf to the median line. 21

b Anterior lateral supplementary leaflet not extending; anteriorly beneath anterior leaf to the median line. 22

21 a Noseleaf not excessively specialized: intermediate leaf without a median eminence: posterior leaf supported by three septa of equal width, not deeply pocketed. ..... *Hipposideros pygmaeus*

b Noseleaf greatly specialized: intermediate leaf with prominent median eminence: posterior leaf supported by narrow median septum and two broad lateral septa, deeply pocketed. ..... *Hipposideros coxi*

22 a Second lateral supplementary leaflet not extending anteriorly beneath the anterior leaf : no trace of a third leaflet. 23

b Second lateral supplementary leaflet extending anteriorly beneath the anterior leaf: an incipient third leaflet. ..... *Hipposideros papua*

23 a Posterior leaf having a transverse supplementary structure with a serrated upper edge developed from its posterior face. 24

b Posterior leaf without a transverse supplementary structure developed from its posterior face or with such a structure low, undeveloped and lacking a serrated upper edge. 25

24 a Anterior upper premolar (pm^2) small, slightly extruded from toothrow, or compressed between canine and second upper premolar (pm^4). ..... *Hipposideros caffer*

b Anterior upper premolar (pm^2) minute, extruded from toothrow, canine and second upper premolar (pm^4) in contact or nearly so. ..... *Hipposideros beatus*

25 a Posterior leaf supported by three septa. 26

b Posterior leaf without supporting septa, paired low lateral ridges sometimes present. ..... *Hipposideros fuliginosus*

26 a Internarial septum not expanded: pterygoids long, sphenoidal bridge wide, partially concealing lateral apertures. 27

b Internarial septum expanded to form a slightly disc-like structure: pterygoids short, sphenoidal bridge narrow, not concealing lateral apertures. ..... *Hipposideros curtus*

27 a Ears haired for one half of their length: tips of upper incisors strongly convergent. ..... *Hipposideros breviceps*

b Ears haired for two thirds of their length: tips of upper incisors not strongly convergent. ..... *Hipposideros galeritus*

28 a Posterior lateral supplementary leaflet not extending anteriorly beneath the anterior leaf: premaxillae wide, enclosing the anterior palatal foramina, making a broad junction with the maxillae. 29

b Posterior lateral supplementary leaflet extending anteriorly beneath the anterior leaf: premaxillae narrow, not enclosing the anterior palatal foramina, making a narrow, spatulate junction with the maxillae. 30

29 a Smaller, length of forearm less than 74.0 mm: anteorbital foramen relatively large. ..... *Hipposideros cyclops*
African Chiroptera name .....*Doryrhina cyclops*
b Larger, length of forearm exceeding 74.0 mm: anteorbital foramen relatively small. .....*Hipposideros camerunensis*
30 a Median process of intermediate leaf not greatly developed or club-shaped frontal depression absent. shallow sphenoidal depression present, posterior ridge of m^3 reduced, W-pattern of tooth incomplete. 31
b Median process of intermediate leaf well-developed, club-shaped: frontal depression present, sphenoidal depression absent, posterior ridge of m^3 little reduced, W-pattern of tooth almost complete. 32
31 a Posterior leaf with a median process and without a transverse supplementary structure developed from its posterior face: width of cochleae four to five times their distance apart. .....*Hipposideros muscinus*
b Posterior leaf without a median process and with a transverse supplementary structure developed from its posterior face: width of cochleae six or more times their distance apart. ..... *Hipposideros wollastoni*
32 a Median process of posterior leaf well developed: frontal depression shallow, rostral eminences greatly inflated, anteorbital foramen relatively small.*Hipposideros semoni*
b Median process of posterior leaf not greatly developed: frontal depression deep, rostral eminences moderately inflated, anteorbital foramen relatively large. .....*Hipposideros stenotis*
33 a Lateral margins of anterior leaf not continuous with those of posterior leaf: rostrum lacking lateral pits, an abrupt step-like discontinuity between roofs of narial and mesopterygoid canals, vomer projecting posteriorly beyond palate.*Hipposideros pratti*
b Lateral margins of anterior and posterior leaves continuous: rostrum with lateral pits, roofs of narial and mesopterygoid canals merging smoothly, vomer not projecting posteriorly beyond palate. .....*Hipposideros lylei*
34 a Anterior leaf without median emargination: prominent supraorbital ridges, rostrum flattened, vomer not projecting beyond palate, upper canines with shallow antero-internal groove and low posterior cusp. 35
b Anterior leaf with definite median emargination: supraorbital ridges barely developed, rostrum rounded, vomer projecting beyond palate, upper canines not grooved and lacking a posterior cusp.....*Hipposideros larvatus*
35 a Posterior leaf with supporting septa: posterior palatal foramina undeveloped, palation U-shaped, sphenoidal bridge unconstricted. .....*Hipposideros speoris*
b Posterior leaf lacking supporting septa: posterior palatal foramina prominent, palation nearly square, sphenoidal bridge constricted. ..... *Hipposideros abae*
36 a Ears broad at base: postorbital processes not projecting, naso-frontal region rounded, upper incisors in contact or nearly so, upper canines not grooved anteriorly, lacking posterior cusps. 37
b Ears narrow at base: postorbital processes projecting, naso-frontal region pentagonal, upper incisors widely separated, upper canines grooved anteriorly, with high posterior cusp. .....*Hipposideros commersoni*
African Chiroptera name ..... *Macronycteris commersoni*
37 a Frontal region convex or flattened, no frontal depression; palation acute, V-shaped; sphenoidal depression well developed. 38
b Frontal region concave, with a shallow frontal depression; palation rounded, U-shaped; sphenoidal depression shallow. 39
38 a Skull larger, condylocanine length exceeding 26.5 mm., length of maxillary toothrow (c-m^3) exceeding 12.0 mm. .....*Hipposideros lankadiva*
b Skull smaller, condylocanine length less than 25.5 mm., length of maxillary toothrow (c-m^3) less than 11.8 mm. ..... *Hipposideros schistaceus*
39 a Smaller, length of forearm less than 98.0 mm., condylocanine length less than 33.0 mm.; intermediate part of noseleaf with prominent median ridge, sometimes forming a projection. 40
b Larger, length of forearm exceeding 100 mm., condylocanine length exceeding 34.0 mm; intermediate part of noseleaf swollen but without a prominent median ridge or projection. .....*Hipposideros inexpectatus*

40 a Smaller, length of forearm less than 92.0 mm., condylocanine length less than 31.0 mm., length of maxillary toothrow (c-m^3), less than 13.8 mm.. *Hipposideros diadema*
b Larger, length of forearm exceeding 92.0 mm., condylocanine length exceeding 32.0 mm., length of maxillary toothrow (c-m^3) exceeding 14.0 mm. ....*Hipposideros dinops*

Appendix 5s: Hayman et al. (1966). The bats of the Congo and of Rwanda and Burundi

1	a	Cheekteeth without W-pattern of cusps ; second finger with claw; tail absent or rudimentary (suborder Megachiroptera; family Pteropidae)..... 8
	b	Cheekteeth with W-pattern of cusps; second finger entirely included in patagium and without claw; tail generally well developed (suborder Microchiroptera) 2
2	a	Tail completely included in uropatagium (in certain forms the last vertebra can be free) 3
	b	Tail not completely included in uropatagium 7
3	a	No nasal appendages; tragus present ; ears not fused in the mediosagittal plane (family Vespertilionidae) 51
	b	Nasal appendages present 4
4	a	No tragus; ears not fused mediosagitally 5
	b	Tragus present (sometimes small); ears fused or very close to each other mediosagitally..... 6
5	a	Posterior leaflet of nose-leaf low, rounded or tridentate (family Hipposideridae) ... 37
	b	Posterior leaflet of nose-leaf high, erect, pointed (family Rhinolophidae)..... 44
6	a	Tail shorter than uropatagium; no postorbital processes; no premaxillae present (family Megadermidae).....*Lavia frons*
	b	Tail as long as uropatagium; last vertebra Y or T shaped; postorbital process and premaxillae present (family Nycteridae)..... 28
7	a	Basal part of tail included in uropatagium ; distal part of tail resting free on the dorsal side of the uropatagium; ears not fused (family Emballonuridae)..... 24
	b	Distal part of tail not included in uropatagium and not resting on the dorsal side of the uropatagium; ears mostly united to each other by a cutaneous wall (family Molossidae) 82
8	a	Tongue simple, fixed to floor of mouth by posterior half, and without unfringed filiform papillae at tip (subfamily Pteropinae) 9
	b	Tongue more extensible, fixed to floor of mouth by its posterior third, its terminal fourth or fifth covered above with unfringed filiform papillae (subfamily Macroglossinae) .....*Megaloglossus woermanni*
9	a	No white tufts present at base of ears..... 10
	b	White tufts at base of ears..... 13
10	a	3 upper cheekteeth; forearm 48 - 54 mm.....*Scotonycteris zenkeri*
	b	5 upper cheekteeth..... 11
11	a	Facial axis of skull not noticeably deflected against basicranial axis; forearm less than 67 mm..... *Myonycteris wroughtoni* African Chiroptera name .....*Myonycteris torquata wroughtoni*
	b	Facial axis of skull more or less strongly deflected against basicranial axis; forearm 75 - 130 mm 12
12	a	Forearm 115 - 130 mm; M_1 equal in length to M_2 and M_3 combined; tympanic forming a short auditory meatus; premaxillae spaced in front .....*Eidolon helvum*
	b	Forearm 79 - 99 mm; M_1 shorter than M_2 and M_3 combined; no long auditory meatus; premaxillae in contact or co-ossified in front (genus Rousettus) 18
13	a	Cheekteeth 4/6 unusual weak dentition; interfemoral membrane greatly reduced absence or rudimentary condition of calcar ..... *Plerotes anchietae*
	b	Cheekteeth 3/5 14
14	a	Distance of anterior border of orbit to tip of nasals much longer than lacrymal breadth 15
	b	Distance of anterior border of orbit to tip of nasals less than lacrymal breadth (at most equal to)..... 17
15	a	Postdental palate flattened posteriorly; rostrum long and broad 16
	b	Postdental palate deeply depressed posteriorly; rostrum long and narrow (genus *Epomophorus*) 20
16	a	Rostrum considerably increased in depth; premaxillae ankylosed together anteriorly; lower incisors and canines closing some distance in front of upper; outer ridge of lower molars bilobed or trilobed; upper lip with cutaneous leaves; tail absent; no shoulder pouches or tufts in either sex; forearm 118 - 137 mm.....*Hypsignathus monstrosus*

b Rostrum not deeper than usual; premaxillae in simple contact anteriorly; lower incisors and canines biting against corresponding upper teeth; outer ridge of lower molars simple; muzzle without cutaneous leaves; tail rudimentary; males with shoulder pouches and erectile shoulder tufts; forearm 88 - 96 mm (genus *Epomops*) 22

17 a No postzygomatic palate, the mesopterygoid fossa continued forward nearly to level of posterior molar ..... *Casinycteris argynnis*

b Postzygomatic palate prsent ; soft palate with a deep median groove, narrowing posteriorly (genus *Micropteropus*) 23

18 a Pm_1 subequal in bulk to a lower incisor; premaxillae co-ossified braincase slightly deflected; wings from second toe; fur long and silky; forearm 79 - 83.5 mm *Rousettus angolensis*
African Chiroptera name ..... *Myonycteris angolensis*

b Pm_1 much larger in bulk than a lower incisor; premaxillae in contact; braincase conspicuously deflected; forearm at least 88.0 mm 19

19 a Brainease moderately deflected; width of last upper premolar about 1_3 of palate between fronts of last upper premolars; wings from first toe; antitragal lobe distinct ..... *Rousettus aegyptiacus*

b Braincase strongly deflected; cheekteeth excessively narrow; width of last upper premolar about 1/5 of that of the palate between fronts of last upper premolars; wings from second toe; antitragal lobe obsolete; fur long and coarse ..... *Rousettus lanosus*
African Chiroptera name ..... *Stenonycteris lanosus*

20 a One conspicuous postdental palate-ridge; total length skull 44 - 50.5 mm (MM), 47 - 55.5 mm (FF) ; forearm 72 - 86 mm (FF), 77 - 89 mm (MM) *Epomophorus wahlbergi*

b Two conspicuous postdental palate-ridges 21

21 a Forearm 60 - 65.5 mm; total length skull 35.8 - 39.7 mm; no sexual differences in dimensions ..... *Epomophorus labiatus*
African Chiroptera name ..... *Epomophorus minor*

b Forearm 66.5 - 74 mm (FF), 71.5 - 78 mm (MM); total length skull 40 - 45 mm (FF), 46 - 48.8 mm (MM) ..... *Epomophorus anurus*
African Chiroptera name ..... *Epomophorus labiatus*

c Forearm 79 - 80 mm (FF), 81 - 85.5 mm (MM); total length skull 46 - 49.7 mm (FF), 52 - 55 mm (MM) ..... *Epomophorus crypturus*

d Forearm 81 - 86.5 mm (FF), 87 - 93 mm (MM); total length skull 52 - 55 mm (FF), 59.7 - 62 mm (MM) ..... *Epomophorus gambianus*

22 a 4 thick prominent interdental and about 5 - 7 thinner postdental palate ridges *Epomops franqueti*

b 3 thick and prominent interdental palate ridges; postdental palate with two pairs of prominent, triangular ridges at middle and one or a few thin and serrate ridges at palation border ..... *Epomops dobsoni*
African Chiroptera name ..... *Epomophorus dobsonii*

23 a Forearm 50 - 53 mm; total skull length 29 - 29.8 mm ..... *Micropteropus pusillus*

b Forearm 59 - 63 mm; total skull length 33.2 - 33.4 mm ..... *Micropteropus intermedius*

24 a Forearm normally less than 52 mm ..... *Coleura afra*

b Forearm more than 52 mm 25

25 a Forearm more than 80 mm (83 - 96 mm); fur dark to base ..... *Taphozous peli*
African Chiroptera name ..... *Saccolaimus peli*

b Forearm less than 80 mm; fur light at base 26

26 a Forearm more than 70 mm, posterior part of body naked above and below *Taphozous nudiventris*

b Forearm less than 70 mm; body fully haired 27

27 a Dorsally light brown, ventrally light greyish-brown ..... *Taphozous sudani*
African Chiroptera name ..... *Taphozous perforatus sudani*

b Dorsally grizzled grey, ventrally pure white ..... *Taphozous mauritianus*

28 a Second premolar of lower jaw large (equal to or larger than half of the first lower premolar); I^{1-2} bifid (I^2 exceptionally trifid) (*arge*-group) 31

b Second lower premolar small (smaller than half of the first lower premolar) 29

29 a I^{1-2} bifid 30

b I^{1-2} trifid (*hispida*-group) 34

30 a Tragus semilunate (*aethiopica*-group) 35

b Tragus pyriform (free portion narrowest at base; its outer and inner margin evenly convex) (*thebaica*-group) 36
31 a Forearm length more than 39 mm; skull length less more 19 mm 32
b Forearm length less than 38 mm; skull length less than 19 mm 33
32 a Forearm length 47.3 - 50 mm; skull length 20.9 - 22.4 mm; ear length measuring 50 - 65 % of forearm length ..... *Nycteris major*
b Forearm length 39.5 - 46 mm; skull length 19.3 - 20.9 mm; ear length measuring 63 - 77 % of forearm length ..... *Nycteris arge*
33 a Forearm length 36.5 - 37 mm; skull length 18 - 18.7 mm; tibia longer than half the forearm length ..... *Nycteris intermedia*
b Forearm length 32 - 36.2 mm; skull length 15.9 - 16.6 mm; tibia shorter than half the forearm length ..... *Nycteris nana*
34 a Forearm length 39 - 43 mm ..... *Nycteris hispida*
b Forearm length about 57 mm ..... *Nycteris grandis*
35 a Ear length 22 - 26 mm ..... *Nycteris aethiopica*
African Chiroptera name ..... *Nycteris macrotis*
b Ear length 28 - 34 mm ..... *Nycteris macrotis*
36 a Second lower premolar included in the toothrow; forearm length about 45 mm *Nycteris capensis*
African Chiroptera name ..... *Nycteris thebaica*
b Second lower premolar on the lingual side of toothrow; forearm length about 47 mm ..... *Nycteris thebaica*
37 a Rostrum less than half as long as braincase; nasal inflation inconspicuous; ears low; tridentate nose-leaf small, forearm 31 - 35.0 mm ..... *Cloeotis percivali*
b Rostrum at least half as long as braincase; nasal inflation conspicuous; ears more prominent; no tridentate nose-leaf; larger, forearm about 42 mm and more (genus *Hipposideros*) 38
38 a Ears long and narrow, pointed; cochleae greatly expanded, their width equal to at least 4 times their distance apart 41
b Ears short, broad, rounded or triangular; cochleae not expanded, their width approximately equal to their distance apart 39
39 a Ears rounded or broadly triangular, bluntly pointed upper incisors weak, the outer lobe obsolescent or obsolete; crown area of outer lower incisors equal to or only slightly greater than that of the inner lower incisors 42
b Ears triangular, pointed upper incisors strong, usually retaining much of the outer lobe; crown area of the outer lower incisors much greater than that of the inner lower incisors 40
40 a Ears with a small projection at the antitragal fold; sphenoidal bridge narrow, not concealing lateral apertures; pterygoid wings underdeveloped ; forearm from 58 - 66 mm ..... *Hipposideros abae*
b Ears without antitragal modification; sphenoidal bridge wide, partially concealing lateral apertures; pterygoid wings expanded; forearm from 78 - 114 mm *Hipposideros commersoni*
African Chiroptera name ..... *Macronycteris commersoni*
41 a Smaller, length of forearm less than 74.0 mm; anteorbital foramen relatively large ..... *Hipposideros cyclops*
African Chiroptera name ..... *Doryrhina cyclops*
b Larger, length of forearm exceeding 74.0 mm; anteorbital foramen relatively small ..... *Hipposideros camerunensis*
42 a Posterior nose-leaf without a transverse supplementary structure developed from its posterior face or with such a structure low, undeveloped and lacking a serrated upper edge ..... *Hipposideros fuliginosus*
b Posterior nose-leaf having a transverse supplementary structure with a serrated upper edge developed from its posterior face 43
43 a Anterior upper premolar small, slightly extruded from toothrow, or compressed between canine and second upper premolar ..... *Hipposideros caffer*
b Anterior upper premolar minute, extruded from toothrow, canine and second upper premolar in contact or nearly so ..... *Hipposideros beatus*
44 a First upper premolar placed between the upper canine and second premolar 45

b First upper premolar missing or very reduced and external to toothrow; the canine and second premolar touching each other or nearly so 49
45 a Connecting process of nose-leaf rises to a distinct point 46
b Connecting process of nose-leaf low or obsolete 47
46 a First phalange of fourth finger long, more than half as long as second ... *Rhinolophus blasii*
b First phalange of fourth finger shorter ..... *Rhinolophus landeri*
47 a Connecting process of nose-leaf obsolete; forearm 55 mm or more ..... *Rhinolophus ruwenzorii*
b Connecting process of nose-leaf low and rounded 48
48 a Forearm length 49 - 54 mm; skull length 22.4 - 23.3 mm ..... *Rhinolophus alcyone*
b Forearm length 40 - 45 mm; skull length 17.6 mm or less ..... *Rhinolophus swinnyi*
49 a Face and edges of sella naked; forearm length 50 - 56 mm ..... *Rhinolophus clivosus*
b Face and edges of sella with long hairs 50
50 a Forearm 58 - 65 mm ..... *Rhinolophus hildebrandti*
African Chiroptera name ..... *Rhinolophus hildebrandtii*
b Forearm 48 - 58 mm ..... *Rhinolophus fumigatus*
51 a Second phalange of third digit nearly 3 times as long as the first (subfamily Miniopterinae; genus *Miniopterus*) 60
b Second phalange of the third digit shorter 52
52 a Ear slightly but evidently funnel-formed; very high braincase (subfamily Kerivoulinae; genus *Kerivoula*) 61
b Ears largely open at their base and not funnel-formed; normal braincase (subfamily Vespertilioninae) 53
53 a 6 Pm and M in upper and lower jaw (genus *Myotis*) 64
b Less than 6 Pm and M 54
54 a 5 Pm and M in upper and lower jaw (genus *Pipistrellus*) 66
b 4 Pm and M in upper and 5 in lower jaw 55
55 a 1 upper incisor 56
b 2 upper incisors 57
56 a M^1 and M^2 with W-pattern distorted or nearly absent (genus *Scotophilus*) 70
b M^1 and M^2 with W-pattern nomal (genus *Nycticeius*) 72
57 a Ears very enlarged, about 18 mm and more ..... *Laephotis wintoni*
b Ears normally much less enlarged 58
58 a Very short and broad rostrum; the height of the braincase (with the bullae) more than 2/3 of the condylo-basal length; lower lip with fleshy lobes at angle of mouth (genus *Glauconycteris*) 74
b Height of the braincase (bullae included) much less than the distance from incisors to posterior zygoma root 59
59 a Very shortened wings; the third digit not longer than head and body length; skull much flattened ..... *Mimetillus moloneyi*
b Normal wings; skull not especially flattened (genus *Eptesicus*) 80
60 a Forearm 43 - 47 mm ..... *Miniopterus schreibersi*
African Chiroptera name ..... *Miniopterus schreibersii*
b Forearm 45 - 50 mm ..... *Miniopterus inflatus*
c Forearm 37 - 39 mm ..... *Miniopterus minor*
61 a Interfemoral fringe scarcely developed 62
b Interfemoral fringe well developed 63
62 a Forearm 34 mm ..... *Kerivoula smithi*
African Chiroptera name ..... *Kerivoula smithii*
b Forearm 26 - 30 mm ..... *Kerivoula phalaena*
63 a Size larger, forearm 34 - 40 mm; colour bright orange-rufous above, whitish below ..... *Kerivoula argentata*
b Size smaller, forearm 26 - 34 mm; colour dark grey or brownish above, dusky below ..... *Kerivoula harrisoni*
African Chiroptera name ..... *Kerivoula lanosa*
64 a With dichromatic wing membranes; forearm 52 - 58 mm ..... *Myotis welwitschi*
African Chiroptera name ..... *Myotis welwitschii*
b Wing membranes uniformly dark 65
65 a Larger, forearm 47 - 51 mm ..... *Myotis tricolor*

b Smaller, forearm 33 - 40 mm..... *Myotis bocagei*
African Chiroptera name ..... *Myotis bocagii*
66 a Outer upper incisor greatly reduced ; entire underside white .*Pipistrellus (Scotozous) rüppelli*
African Chiroptera name ..... *Pipistrellus rueppellii*
b Outer upper incisor not greatly reduced; underside dark or grey-tipped 67
67 a Outer edge of tragus angular; fur bicolored above and below*Pipistrellus (Pipistrellus) nanus*
African Chiroptera name ..... *Neoromicia nana*
b Outer edge of tragus curved; fur not bicolored above and below 68
68 a Fur bicolored below only ..... *Pipistrellus (Pipistrellus) nanulus*
African Chiroptera name ..... *Pipistrellus nanulus*
b Fur unicolored above and below 69
69 a Size extremely small, forearm 23 - 24 mm; skull not flattened*Pipistrellus (Pipistrellus) musciculus*
African Chiroptera name ..... *Hypsugo musciculus*
b Size not so reduced, forearm 28 mm ; skull broad and flattened .....*Pipistrellus (Pipistrellus) crassulus*
African Chiroptera name .....*Hypsugo crassulus*
70 a Very large, forearm about 80 mm .....*Scotophilus gigas*
African Chiroptera name .....*Scotophilus nigrita*
b Smaller, forearm not over 58 mm..... 71
71 a Forearm 50 - 58 mm; skull total length 18 - 21 mm .....*Scotophilus nigrita*
(This should be *Scotophilus dinganii*. See Robbins (1978))
African Chiroptera name ..... *Scotophilus dinganii*
b Forearm 43 - 50 mm; skull total length 16 - 18 mm .....*Scotophilus leucogaster*
72 a Breadth across upper canines 4 mm; M^3 reduced .. *Nycticeius (Scoteinus) schlieffeni*
African Chiroptera name .....*Nycticeinops schlieffenii*
b Breadth across upper canines 5 mm or more; M^3 not reduced 73
73 a Wing membranes dark ..... *Nycticeius (Scotoecus) hirundo*
African Chiroptera name ..... *Scotoecus hirundo*
b Wing membranes light..... *Nycticeius (Scotoecus) albofuscus*
African Chiroptera name ..... *Scotoecus albofuscus*
74 a Wing and interfemoral membranes conspicuously veined....*Glauconycteris variegata*
b Wing and interfemoral membranes not conspicuously veined..... 75
75 a Body colour black and white..... *Glauconycteris superba*
b Body colour not black and white 76
76 a Wing and interfemoral membranes pale brown ..... *Glauconycteris argentata*
b Wing and interfemoral membranes dark brown 77
77 a No light lateral markings on body; colour dark brown .....*Glauconycteris beatrix*
b Light lateral markings on body; colour dark brown or pale buff 78
78 a Colour buffy .....*Glauconycteris poensis*
b Colour dark brown 79
79 a White spot on shoulder.....*Glauconycteris humeralis*
b White spot on shoulder and white flank band .....*Glauconycteris alboguttatus*
African Chiroptera name .....*Glauconycteris alboguttata*
80 a Wings pale..... 81
b Wings dark; Forearm 26 - 36 mm ..... *Eptesicus capensis*
African Chiroptera name .....*Neoromicia capensis*
81 a Dorsal colour dark brown; forearm 28 - 32 mm ..... *Eptesicus tenuipinnis*
African Chiroptera name .....*Neoromicia tenuipinnis*
b Dorsal colour light brown ; forearm 35 - 38 mm.....*Eptesicus rendalli*
African Chiroptera name ..... *Neoromicia rendalli*
82 a A prominent vertical projection on the zygomatic arch; ears very large, about 38 mm ..... *Otomops martiensseni*
b Not combining these characters..... 83
83 a 4 post-canine upper cheek teeth, 1 lower incisor; upper incisors in contact with canines; ears translucent and widely separated (genus *Myopterus*)..... 86

b 5 post-canine upper cheek teeth (first upper premolar often minute, sometimes deciduous); generally two lower incisors, upper incisors not in contact with canines; ears not translucent or widely separated (genus *Tadarida*) 84

84 a M^3 reduced, cusps forming V pattern, 3rd. enamel crest, when present, less than half length of 2nd. Ears normally conjoined, sometimes with interaural crest (subgenus *Mops*) 87

b M^3 little reduced, cusps forming W pattern, 3rd. enamel crest little reduced; ears conjoined or separate 85

85 a Palate normally without conspicuous premaxillary emargination, a small notch may be present, not extending back to level of canine roots; ears conjoined, often with interaural crests (subgenus *Chaerephon*) 94

b Palate with conspicuous premaxillary emargination, extending back to level of canine roots; ears generally separate, without interaural crests (subgenus *Tadarida*) 100

86 a Size smaller, forearm 33 - 36 mm ..... *Myopterus whitleyi*

b Size larger, forearm 51 - 56 mm ..... *Myopterus albatus*
African Chiroptera name ..... *Myopterus daubentonii*

87 a Size smallest, forearm under 31 mm (28 - 31 mm) ..... *Tadarida (Mops) nanula*
African Chiroptera name ..... *Mops (Xiphonycteris) nanulus*

b Size larger, forearm longer than 35 mm 88

88 a Size largest, forearm over 59 mm (59 - 66 mm.) ..... *Tadarida (Mops) midas*
African Chiroptera name ..... *Mops (Mops) midas*

b Size intermediate, forearm under 59 mm 89

89 a Ears not joined at base; forearm 52 mm ..... *Tadarida (Mops) niangarae*
African Chiroptera name ..... *Mops (Mops) niangarae*

b Ears joined at base 90

90 a Males with paired scent glands bordering penis; forearm 42 - 46 mm *Tadarida (Mops) demonstrator*
African Chiroptera name ..... *Mops (Mops) demonstrator*

b Males without such glands 91

91 a Forearm over 45 mm 92

b Forearm under 45 mm (37 - 41 mm) 93

92 a Forearm 45 - 50 mm ..... *Tadarida (Mops) condylura*
African Chiroptera name ..... *Mops (Mops) condylurus*

b Forearm 52 - 57 mm ..... *Tadarida (Mops) congica*
African Chiroptera name ..... *Mops (Mops) congicus*

93 a Underparts brownish, flanks below deep blackish brown ... *Tadarida (Mops) thersites*
African Chiroptera name ..... *Mops (Xiphonycteris) thersites*

b Underparts whitish, flanks below not blackish brown ..... *Tadarida (Mops) leonis*
African Chiroptera name ..... *Mops (Xiphonycteris) brachypterus*

94 a Distinct projecting separate lobe or lappet between inner bases of ears ..... *Tadarida (Chaerephon) major*
African Chiroptera name ..... *Chaerephon major*

b Without such a lobe or lappet 95

95 a Size larger, forearm over 40 mm 96

b Size smaller, forearm under 40 mm 99

96 a No white lateral band on lower border of wing membrane 97

b White lateral band on lower border of wing membrane 98

97 a Forearm 42 - 46 mm ..... *Tadarida (Chaerephon) russata*
African Chiroptera name ..... *Chaerephon russatus*

b Forearm 48 - 52 mm ..... *Tadarida.(Chaerephon) aloysii-sabaudiae*
African Chiroptera name ..... *Chaerephon aloysiisabaudiae*

98 a Wing membranes dark above ; forearm 44 - 50 mm *Tadarida (Chaerephon) nigeriae*
African Chiroptera name ..... *Chaerephon nigeriae*

b Wing membranes pale above ; forearm 48 - 50 mm *Tadarida (Chaerephon) spillmanni*
African Chiroptera name ..... *Chaerephon nigeriae spillmanni*

99 a Males with long sharply bicolored interaural crest; forearm 34 - 37 mm ..... *Tadarida (Chaerephon) chapini*
African Chiroptera name ..... *Chaerephon chapini*

	b	Males with crest, when present, short and not bicolored; forearm 35 - 40 mm; Wing membranes and underside dark or light.....*Tadarida (Chaerephon) pumila (including limbata)* African Chiroptera name .....*Chaerephon pumilus*
100	a	Size very large, forearm 60 - 66 mm..... 101
	b	Size smaller, forearm under 53 mm..... 102
101	a	Little white on ventral surface.....*Tadarida (Tadarida) africana* African Chiroptera name .....*Tadarida ventralis*
	b	Clear white ventral band.....*Tadarida (Tadarida) fulminans* African Chiroptera name .....*Tadarida fulminans*
102	a	With pair of cutaneous glands opening on undersurface of tail membrane near tail root (in both sexes) ; forearm 44 - 47 mm.....*Tadarida (Tadarida) cistura* African Chiroptera name .....*Chaerephon bemmeleni*
	b	Without such glands..... 103
103	a	With conspicuous black throat patch; forearm 45 - 48 mm..... *Tadarida (Tadarida) ansorgei* African Chiroptera name .....*Chaerephon ansorgei*
	b	Without such throat patch; forearm 52 mm..... *Tadarida (Tadarida) brunnea* African Chiroptera name .....*Tadarida aegyptiaca bocagei*

Appendix 5t: Hayman and Hill (1971). Order Chiroptera: The mammals of Africa

1	a	Second digit terminating in a claw in all African genera; margin of ear conch forming a complete ring; tragus always absent; interfemoral membrane greatly reduced, little more than a narrow band along inside margin of hind legs; tail absent or rudimentary in all African genera; cheek teeth simple, without well-devel.ped cusp pattern (suborder MEGACHIROPTERA; family PTEROPODIDAE) 2
	b	Second digit without a claw; margin of ear conch not forming a complete ring; tragus generally present (absent in two families); interfemoral membrane generally well-developed; tail generally well-developed (absent in one family); cheek teeth cuspidate with generally clearly defined W-pattern (suborder MICROCHIROPTERA)..... 37
2	a	Tongue with tip rounded and not densely papillate, not highly extensible; cheek teeth not extremely reduced (subfamily PTEROPODINAE) 3
	b	Tongue with long pointed tip, densely papillate, highly extensible; cheek teeth extremely reduced (subfamily MACROGLOSSINAE).....*Megaloglossus woermanni*
3	a	Facial pattern of white nose and eye patches..... 4
	b	No facial pattern as above..... 5
4	a	Post-dental palate present (genus *Scotonycteris*) 14
	b	Post-dental palate absent.....*Casinycteris argynnis*
5	a	Ears with white basal tufts..... 6
	b	Ears without white basal tufts..... 11
6	a	Size very large, forearm 118 or more; rostrum very deep, end of muzzle truncated, ending in fleshy plate; no white shoulder tuft in Male .....*Hypsignathus monstrosus*
	b	Size smaller, forearm 45 - 100; rostrum shallow, end of muzzle simple; white shoulder tuft in adult Male 7
7	a	Cheek teeth 4/6, 4/5 or 5/6; interfemoral membrane greatly reduced, no more than a narrow flange; calcar absent .....*Plerotes anchietai* African Chiroptera name ..... *Plerotes anchietae*
	b	Cheek teeth 3/5; interfemoral membrane well developed, calcar present..... 8
8	a	Forearm 60 - 100..... 9
	b	Forearm 45 - 55..... 10
9	a	Six prominent palatal ridges, not more than two being post-dental; the latter not differentiated from inter-dental ridges; post-dental palate strongly concave posteriorly (genus *Epomophorus*)..... 15
	b	Five, or 9 - 11, palatal ridges, with sometimes from 5 to 7 post-dental; latter strongly differentiated from inter-dental ridges; post-dental palate flattened posteriorly (genus *Epomops*) 22
10	a	Rostrum broad; 5 - 6 palatal ridges, obviously divided by median groove (genus *Micropteropus*) 24
	b	Rostrum slender; 12 - 13 palatal ridges, only posterior group narrowly divided .....*Nanonycteris veldkampi* African Chiroptera name ..... *Micropteropus pusillus*
11	a	Forearm generally more than 100; tail present or absent..... 12
	b	Forearm generally under 100; short tail present 13
12	a	Forearm generally more than 120; distinctive colour pattern, generally a red or yellowish mantle contrasting strongly wih black or cream dorsal region, or entirely black; no sharp demarcation of dorsal fur; no tail occipital region of skull tubular; distribution entirely non-continental (genus *Pteropus*)..... 26
	b	Forearm generally 110 - 130; colour generally tawny, with dorsal fur restricted to narrow median band, sharply demarcated from naked wing membranes; short tail; occipital region not..tubular; distribution continental and Madagascar *Eidolon helvum*
13	a	Forearm 65 - 102; muzzle longer; M^2 not greatly reduced; ruff of stiff hair present or absent on lower neck in adult Male (genus *Rousettus*) 34
	b	Forearm 55 - 65; muzzlle shorter; M^2 greatly reduced; ruff of stiff hair on lower neck of adult Male (genus *Myonycteris*) 36
14	a	Forearm 45 - 55; total skull length 24 - 26; no white tuft at base of ears *Scotonycteris zenkeri*
	b	Forearm 74 - 78; total skull length 38 - 40; white tuft at base of ears.....*Scotonycteris ophiodon*

African Chiroptera name ..... *Casinycteris ophiodon*

15 a One post-dental palatal ridge; forearm 77 - 89 (males), 72 - 86 (females) *Epomophorus wahlbergi*

b Two post-dental palatal ridges 16

16 a 4th palatal ridge midway between 3rd and 5th 17

b 4th palatal ridge much nearer 3rd than 5th 20

17 a Smaller, no noticeable sexual size difference; forearm 60 - 66 *Epomophorus labiatus*
African Chiroptera name ..... *Epomophorus minor*

b Larger, noticeable sexual size difference; forearm not less than 70 (males), 66 (females)..... 18

18 a Forearm 87 - 93 (males), 81 - 86 (females) ..... *Epomophorus gambianus*

b Forearm less than above..... 19

19 a Forearm 71 - 78 (males), 66 - 74 (females) ..... *Epomophorus anurus*
African Chiroptera name ..... *Epomophorus labiatus*

b Forearm 81 - 85 (males), 79 - 80 (females) ..... *Epomophorus crypturus*

20 a 6th palatal ridge posterior to middle of post-dental palate; forearm 82 (females) ..... *Epomophorus reii*
African Chiroptera name ..... *Epomophorus labiatus*

b 6th palatal ridge anterior to middle of post-dental palate 21

21 a Forearm 87 - 91 (males), 82 (females) ..... *Epomophorus angolensis*

b Forearm 91 (females)..... *Epomophorus pousarguesi*
African Chiroptera name ..... *Epomophorus gambianus pousarguesi*

22 a 3 thick and prominent interdental palatal ridges, post-dental palate with two pairs of thick ridges, each with two triangular projections; forearm 88 (Male) *Epomops dobsoni*
African Chiroptera name ..... *Epomophorus dobsonii*

b 4 interdental and 5 - 7 post-dental palatal ridges; latter thin, serrate, arcuate..... 23

23 a 3rd interdental palatal ridge nearly always undivided; zygomatic breadth about three-fifths total skull length; forearm 88 - 96 (Males), 82 - 93 (Females) *Epomops franqueti*

b 3rd interdental palatal ridge broadly divided in centre; zygomatic breadth about half total skull length; forearm 92 - 100 (Males), 88 - 92 (Females) . *Epomops buettikoferi*

24 a Six palatal ridges; 2nd to 6th narrowly divided medially, arranged in two parallel lines of separate pairs; forearm 63 - 65.8, total skull length 36.5..... *Micropteropus grandis*
African Chiroptera name ..... *Epomophorus grandis*

b Five palatal ridges 25

25 a 2 - 5 palatal ridges, widely separated anteriorly by a deep V-shaped groove, not arranged in separate pairs; smaller, forearm 48 - 54, total skull length c. 30 ..... *Micropteropus pusillus*

b 2 - 5 palatal ridges, divided medially, converging posteriorly in clearly separate pairs; larger, forearm 58 - 63.5, total skull length 32 - 33.4 ..... *Micropteropus intermedius*

26 a Forearm under 100; fur notably woolly and dense; ears hidden in fur (Réunion, Mauritius)..... *Pteropus subniger*

b Forearm over 120; fur not woolly and dense; ears not hidden in fur 27

27 a General colour above and below a dark seal-brown or black (sometimes a rufous shoulder spot); ears rounded; forearm 162 - 172 (Comoro Is.) .. *Pteropus livingstonei*
African Chiroptera name ..... *Pteropus livingstonii*

b Mantle and back with strongly contrasting bicolor pattern; ears pointed 28

28 a Mantle and median spinal tract blackish, contrasting with pale buff flanks; forearm 159 - 171 (Réunion, Mauritius)..... *Pteropus niger*

b Mantle red or yellow, back blackish 29

29 a Forearm under 141..... 30

b Forearm over 141..... 31

30 a Forearm 124 - 127 (Rodriguez)..... *Pteropus rodricensis*

b Forearm 130 - 141 (Aldabra I.)..... *Pteropus aldabrensis*

31 a Ears longer, 37 - 38; forearm 158 - 171 (Madagascar)..... *Pteropus rufus*

b Ears shorter, 32 or less; forearm 143 - 161 32

32 a Ears 21 - 23; forearm 151 - 161 (Pemba I.) ..... *Pteropus voeltzkowi*

b Ears 31 - 32..... 33

33 a Back sprinkled with grey; forearm 143 - 154 (Seychelles)..... *Pteropus seychellensis*

b Back not sprinkled with grey; forearm 151 - 157 (Comoros: Mafia I.)..... *Pteropus comorensis*

African Chiroptera name ..... *Pteropus seychellensis*

34 a Wings from first toe; hair short and sleek; cheek teeth heavy; forearm generally above 90 (up to 105); premaxillaries in contact, not co-ossified; adult males without collar of stiff hairs (Subgenus *Rousettus*) ..... *Rousettus aegyptiacus*

b Wings from second toe; hair longer and coarser; cheek teeth reduced in bulk; forearm generally below 90; premaxillaries either in contact, or co-ossified; adult males with or without differentiated collar of stiff hairs 35

35 a Braincase strongly deflected; cheek teeth very narrow; premaxillaries not co-ossified; no differentiated collar in adult males; forearm 65 - 90, tibia 39 - 40 (Subgenus *Stenonycteris*) ..... *Rousettus lanosus*

African Chiroptera name ..... *Stenonycteris lanosus*

b Braincase slightly deflected; cheek teeth short and broad; premaxillaries co-ossified; collar of stiff hairs in adult males; forearm 66 - 83, tibia 25 - 34 (Subgenus *Lissonycteris*) ..... *Rousettus angolensis*

African Chiroptera name ..... *Myonycteris angolensis*

36 a Canines not shortened; lower canines clearly longer than P_3; outer and inner ridges of P_4 fused anteriorly; cheek teeth lighter; no sagittal crest (Subgenus *Myonycteris*) ..... *Myonycteris torquata*

b Canines unusually shortened; lower canines conspicuously shorter than P_3; outer and inner ridges of P_4 widely separated; cheek teeth heavier; sagittal crest present (Subgenus *Phygetis*) ..... *Myonycteris brachycephala*

37 a Tragus present (small in Molossidae) 38

b Tragus absent 45

38 a Tail with terminal portion projecting to a marked degree free of interfemoral membrane 39

b Tail entirely enclosed within interfemoral membrane (exceptions in *Asellia* and *Hipposideros jonesi*, both Hipposideridae, both with a slight degree of terminal projection); or entirely absent 42

39 a Free terminal portion of tail emerges above middle of upper surface of interfemoral membrane (family EMBALLONURIDAE) 47

b Free terminal portion of tail projecting considerably beyond hind margin of interfemoral membrane 40

40 a Free portion of tail very slender and very long, much longer than interfemoral membrane (family RHINOPOMATIDAE; genus *Rhinopoma*) 46

b Free terminal portion of tail stout, not appreciably longer than interfemoral membrane 41

41 a Sessile disc on thumb; ear with basal stalked mushroom-shaped process (family MYZOPODIDAE) ..... *Myzopoda aurita*

b Without such disc or process (family MOLOSSIDAE) 171

42 a Tail absent; nose-leaf present (family MEGADERMATIDAE) 65

b Tail always present; nose-leaf present or absent 43

43 a Muzzle without nose-leaves of any kind (family VESPERTILIONIDAE) 100

b Muzzle with nose-leaves 44

44 a Muzzle with deep central longitudinal slit lined with fleshy dermal outgrowths (family NYCTERIDAE) 55

b Face with well-developed nose-leaves covering muzzle 45

45 a Posterior leaflet of nose-leaf subtriangular, with erect pointed tip; toes with three phalanges (family RHINOLOPHIDAE; genus *Rhinolophus*) 66

b Posterior leaflet of nose-leaf with upper edge either elliptical in outline, or tridentate; toes with two phalanges (family HIPPOSIDERIDAE) 82

46 a Forearm generally over 60 (maximum 75); tail nearly always shorter than forearm; nasal inflation of skull relatively smaller ..... *Rhinopoma microphyllum*

b Forearm generally under 60 (minimum 46); tail generally longer than forearm; nasal inflation of skull relatilvely larger ..... *Rhinopoma hardwickei*

African Chiroptera name ..... *Rhinopoma cystops*

47 a 4 lower incisors; 2 upper incisors (very minute, often absent); forearm more than 57; gular sac present or absent (genus *Taphozous*) 49

b 6 lower incisors; 2 or 4 upper incisors; forearm not more than 57; no gular sac 48

48 a 2 upper incisors; forearm 45 - 57 (genus *Coleura*) 54

b 4 upper incisors; forearm 38 ..... *Emballonura atrata*

African Chiroptera name ..... *Paremballonura atrata*

49 a Forearm not exceeding 70; skull with deep frontal depression; radio-metacarpal pouch present; bullae incomplete; total skull length at least 20, up to 22.5 (Subgenus *Taphozous*) 51

b Forearm exceeding 70; skull with frontal depression shallow; bullae complete or incomplete; total skull length 26 - 33 50

50 a Forearm 70 - 75 (in S.W. Asia up to 82); skull 26 - 28; radio-metacarpal pouch present; bullae incomplete; body not fully haired, rump and pygal areas naked ..... *Taphozous (Liponycteris) nudiventris*
African Chiroptera name ..... *Taphozous nudiventris*

b Forearm 84 - 95; skull 30 - 33; bullae complete; no radio-metacarpal pouch; body fully haired..... *Taphozous (Saccolaimus) peli*
African Chiroptera name ..... *Saccolaimus peli*

51 a Entire dorsal fur conspicuously grizzled greyish; entire ventral surface clear white; forearm 58 - 64; large gular sac in male ..... *Taphozous (Taphozous) mauritianus*
African Chiroptera name ..... *Taphozous mauritianus*

b Dorsal fur never grizzled, either unicolor brownish or white-based with brownish tips; ventral surface either dusky or only partially white; forearm 60 or more; gular sac present or absent 52

52 a Adult male with conspicuous blackish-brown throat patch contrasting strongly with pale undersurface; Female with slight blackish wash on throat; wings whitish; no gular sac; underside often clear white except for throat area; forearm 65 - 70 ...*Taphozous (Taphozous) hildegardeae*
African Chiroptera name ..... *Taphozous hildegardeae*

b No blackish throat patch; underside generally dusky, not whitish; wings either whitish or dark; forearm 60 - 67..... 53

53 a Skull very broad and heavily built; body and wings very dark; naked gular patch in Females (Male not known); forearm 66 ..... *Taphozous (Taphozous) hamiltoni*
African Chiroptera name ..... *Taphozous hamiltoni*

b Skull not broad or heavily built; wings dark or pale, body paler; no gular patch in either sex; forearm 60 - 67 ..... *Taphozous (Taphozous) perforatus*
African Chiroptera name ..... *Taphozous perforatus*

54 a Forearm generally below 52, not or only a little more than three times skull length ..... *Coleura afra*

b Forearm generally over 52 (maximum 57), more than 31 times skull length... *Coleura seychellensis*

55 a Posterior lower premolar very small, its tip reaching approximately to cingulum of anterior premolar; no marked concavity at centre of the posterior margin of tragus 56

b Posterior lower premolar large, its height equal or almost equal to that of anterior cusp of first molar; marked concavity at centre of posterior margin of tragus (*arge* group) 63

56 a Upper incisors trifid (tragus falciform or semilunate) (*hispida* group) 57

b Upper incisors bifid (tragus semilunate or pyriform) 58

57 a Forearm 36 - 45, ear 18 - 25 ..... *Nycteris hispida*

b Forearm 57 - 66, ear 28 - 35 ..... *Nycteris grandis*

58 a Tragus semi-lunate, base of its posterior margin not notched (*aethiopica* group).. 59

b Tragus pyriform, base of its posterior margin shallowly notched (*thebaica* group) 62

59 a General colour greyish (forearm 37 - 42, ear 29 - 34) ..... *Nycteris woodi*

b General colour brownish 60

60 a Forearm 38 - 43, ear 19.2 - 21 ..... *Nycteris parisii*

b Forearm above 43, ear above 21 61

61 a Forearm 45 - 52, ear 22 - 28 ..... *Nycteris aethiopica*
African Chiroptera name ..... *Nycteris macrotis*

b Forearm 45 - 50, ear 28 - 34 ..... *Nycteris macrotis*

62 a Forearm 42 - 52, ear 28 - 37 ..... *Nycteris thebaica*

b Forearm 39 - 43, ear 25 - 28 ..... *Nycteris gambiensis*

63 a Forearm 32 - 36, ear 20 - 22 ..... *Nycteris nana*

b Forearm 36 and more, ear above 22 64

64 a Forearm 36 - 46, ear 28 - 33 ..... *Nycteris arge*

b Forearm 47 - 50, ear 27 - 32 ..... *Nycteris major*

65 a Noseleaf small, evenly rounded above, not more than 10 mm long; tragus with inner lobe quadrate or rounded, outer lobe pointed but less than half length of ear ..... *Cardioderma cor*
b Noseleaf long, bluntly truncated at tip, about 20 mm long; tragus with inner lobe sharply pointed, outer lobe pointed and more than half length of ear..... *Lavia frons*
66 a Connecting process behind sella obsolescent, barely marked, very low; antitragus greatly developed 67
b Connecting process behind sella always well-developed, either rounded, erect or long and narrow; antitragus not greatly developed 68
67 a Forearm 57 - 68 (generally 63 and over); antitragus with anterior emargination and basal spur ..... *Rhinolophus maclaudi*
b Forearm 55 - 57; antitragus without anterior emargination and basal spur *Rhinolophus ruwenzorii*
68 a Face and/or lateral margins of sella liberally furnished with long hairs; connecting process low, rounded; greatest breadth of horseshoe generally over 9 69
b Sella naked; connecting process rounded or pointed; greatest breadth of horseshoe generally under 9..... 70
69 a Forearm 62 - 67..... *Rhinolophus hildebrandti* African Chiroptera name ..... *Rhinolophus hildebrandtii*
b Forearm 50 - 60..... *Rhinolophus fumigatus*
70 a Forearm less than 40; connecting process low and blunt; sella cuneate *Rhinolophus hipposideros*
b Forearm over 40, except in R. denti knorri with forearm 37.5 to 40.5, but with erect connecting process and sella parallel-sided 71
71 a Anterior upper premolar, when present, external to toothrow; canine and p^4 in contact; connecting process bluntly pointed 72
b Anterior upper premolar in toothrow; canine and p^4 not in contact; connecting process blunt or sharply pointed 73
72 a Forearm 50 - 57 (See notes below under *R. clivosus*)..... *Rhinolophus clivosus*
b Forearm 45 - 50..... *Rhinolophus darlingi*
c Forearm 53 - 60..... *Rhinolophus ferrumequinum*
73 a 1st phalanx of 4th finger notably shortened in relation to metacarpal length..... 74
b 1st phalanx of 4th finger not notably shortened in relation to metacarpal length.... 76
74 a Conneting process rising to erect point; axillary glandular sac in many adult males 75
b Connecting process lower; rounded; no axillary sac; forearm 45 - 48..... *Rhinolophus alticolus* African Chiroptera name ..... *Rhinolophus simulator*
75 a Forearm 40 - 48..... *Rhinolophus landeri*
b Forearm 49 - 54..... *Rhinolophus alcyone*
76 a Connecting process rises to high and narrow horn..... 77
b Connecting process with low, bluntly pointed tip 79
77 a Sella cuneate or wedge-shaped; no marked contrast between crown areas of anterior and posterior lower premolars; forearm 44 - 48..... *Rhinolophus blasii*
b Sella parallel-sided; strong contrast between crown area of anterior and posterior lower premolars..... 78
78 a Posterior lancet of noseleaf gradually narrowing; forearm 45 - 50 *Rhinolophus euryale*
b Posterior lancet of noseleaf abruptly narrowing to linear tip; forearm 48 - 51 ..... *Rhinolophus mehelyi*
79 a Larger, forearm 47 - 51; skull 20 or more..... *Rhinolophus capensis*
b Smaller, forearm 40 - 46; skull 18.7 or less..... 80
80 a Sella broader; ears longer..... *Rhinolophus simulator*
b Sella narrower; ears shorter..... 81
81 a Front edge of connecting process almost concave; lancet with sides almost convex; fur whitish at base ..... *Rhinolophus denti*
b Front edge of connecting process convex; lancet with sides concave, tip pointed; fur nearly unicolored..... *Rhinolophus swinnyi*
82 a Posterior leaflet on noseleaf simple in outline, elliptical or rounded, not tridentate; ears either separate or united by low band; rostrum at least half as long as braincase; small upper premolar present, with one exception, i.e. *H. megalotis*; zygoma not greatly expanded; forearm 34 - 115 (genus *Hipposideros*) 85

b Posterior leaflet of noseleaf tridentate; ears always separate; small upper molar present or absent; rostrum sometimes less than half as long as braincase; zygoma not or greatly expanded; forearm 31 - 54 83

83 a Tail projecting up to 7 mm beyond end of interfemoral membrane; ears large, 18 - 20, with pointed tip; small upper premolar absent; rostrum at least half as long as braincase; zygoma not greatly expanded; forearm 44 - 54 (genus *Asellia*)..... 96

b Tail not projecting beyond end of interfemoral membrane; small upper premolar present..... 84

84 a Size very small, forearm 31 - 35; ears very low, rounded, rim-like, 8; noseleaf small and inconspicuous; thumbs minute; rostrum less than half length of braincase; zygoma not greatly expanded ..... *Cloeotis percivali*

b Size larger, forearm 50 - 54; ears short, 10 - 14, but pointed; noseleaf conspicuous; thumbs normal; rostrum more than half length of braincase; zygoma greatly expanded into wide plate; upper incisors bifid (genus *Triaenops*)..... 97

85 a Size very small, forearm less than 40 (34 - 38); ears very large, more than half length of forearm, linked at base by low fold of integument across crown; p^2 absent ..... *Hipposideros megalotis*

b Size larger, forearm more than 40; ears not obviously linked in any way; p^2 present 86

86 a Posterior and central noseleaves each bearing a median club-shaped process; size large, forearm 59 - 76; ears narrow and pointed; prominent longitudinal frontal sac in both sexes; colour very distinctive, fur blackish brown with tips frosted with greyish 87

b Noseleaf without club-shaped process; frontal sacs present or absent..... 88

87 a Forearm 59 - 71..... *Hipposideros cyclops*
African Chiroptera name ..... *Doryrhina cyclops*

b Forearm 74 - 76..... *Hipposideros camerunensis*

88 a Noseleaf with enlarged pad-like internarial septum, partly concealing nostrils..... 89

b Internarial septum not enlarged, not concealing nostrils..... 91

89 a Posterior part of noseleaf elongated, subtriangular in outline; internarial septum large, broader than long; ears very large, about half length of forearm; forearm 44 - 55; no frontal sac..... *Hipposideros jonesi*

b Posterior part of noseleaf f usual low arched outline; internarial septum smaller, longer than broad; ears less than half forearm length; frontal sac present..... 90

90 a Two poorly developed lateral leaflets; forearm 42 - 47 ..... *Hipposideros curtus*

b One rudimentary supplementary lateral leaflet; forearm 40 - 41 *Hipposideros marisae*

91 a Size very large, forearm 79 - 115; ears very narrow and pointed; longitudinal frontal sac in both sexes..... *Hipposideros commersoni*
African Chiroptera name ..... *Macronycteris commersoni*

b Size moderate, forearm 40 - 66; ears broad 92

92 a Three secondary lateral leaflets; forearm 58 - 66; frontal sac in both sexes ..... *Hipposideros abae*

b Two secondary lateral leaflets; forearm 41 - 64; frontal sac present or absent..... 93

93 a Frontal sac absent; forearm 59 - 64 ..... *Hipposideros fuliginosus*

b Frontal sac present, opening transversely; forearm 41 - 58 94

94 a Forearm normally 41 - 44, exceptionally to 47; tail 19 - 25..... *Hipposideros beatus*

b Forearm 44 - 58: tail 30 or more 95

95 a Forearm generally less than 48; colour greyish, or pale orange when in bright phase; median posterior narial compartment narrow, with wide lateral inflations *Hipposideros caffer*

b Forearm generally exceeding 48; colour brownish, or rufous when in bright phase; median posterior narial compartment wide with narrow lateral inflations *Hipposideros ruber*

96 a Forearm 45 - 51..... *Asellia tridens*

b Forearm 38 - 41..... *Asellia patrizii*

97 a Internal border of ear deeply notched; external lobes of trident deeply notched at external base; ears small, c. 12 - 14; forearm over 50 (51 - 55) 98

b Internal border of ear not notched; external lobes of trident not notched basally; ears large, c 17; forearm under 50 (42 - 47) ..... *Triaenops furculus*
African Chiroptera name ..... *Paratriaenops furculus*

98 a Colour pale (in both phases); mainland ..... *Triaenops persicus*

	b	Colour darker (in both phases); Madagascar 99
99	a	Colour reddish ..... *Triaenops rufus*
		African Chiroptera name ..... *Triaenops menamena*
	b	Colour greyish-brown ..... *Triaenops humbloti*
100	a	Second phalanx of third digit not especially elongated 101
	b	Second phalanx of third digit about three times as long as first; braincase high and rounded (subfamily MINIOPTERINAE; genus *Miniopterus*) 168
101	a	Ears not funnel-shaped, without deep emargination below tip; tragus short and broad, or long and narrow, but not sharply pointed; braincase not particularly high and rounded (subfamily VESPERTILIONINAE) 102
	b	Ears funnel-shaped, with deep emargination below tip; tragus long, narrow, sharply pointed; braincase high and rounded (subfamily KERIVOULINAE; genus *Kerivoula*) 161
102	a	Six upper, six lower cheek teeth on each side (genus *Myotis*) 113
	b	Less than six upper and six lower cheek teeth 103
103	a	Five upper, six lower cheek teeth; ears much longer than head, nearly equal in length to forearm, joined by low band across crown ..... *Plecotus austriacus*
	b	Five upper, five lower cheek teeth; ears not lengthened 104
	c	Four upper, five lower cheek teeth; ears only exceptionally notably lengthened . 107
104	a	Two upper incisors on each side 105
	b	One upper incisor on each side (genus *Nycticeius*) (in part) 124
105	a	Wing with fifth finger shortened, barely longer than metacarpals of 4th and 3rd (genus *Nyctalus*) 126
	b	Wing with fifth finger not shortened 106
106	a	Ears not joined at base (genus *Pipistrellus*) 127
	b	Ears joined at base (genus *Barbastella*) 150
107	a	Two upper incisors on each side 108
	b	One upper incisor on each side 111
108	a	Wing extremely narrow, third digit not longer than head and body; skull flattened; tragus extremely short and blunt ..... *Mimetillus moloneyi*
	b	Wing not narrowed; skull not flattened; tragus not extremely short and blunt 109
109	a	Rostrum very short and broad; braincase very high more than two-thirds of condylobasal length; lower lip with lobe at posterior angle; frequently with body pattern of spots and/or stripes, or conspicuous reticulation of wing membranes (genus *Glauconycteris*) 151
	b	Rostrum not shortened; braincase not elevated; no body or wing pattern 110
110	a	Ear 18 or more, about half length of forearm ..... *Laephotis wintoni*
	b	Ears under 18, much less than half length of forearm (genus *Eptesicus*) 137
111	a	Ears very large, ore than half length of forearm, separate; pelage almost white ..... *Otonycteris hemprichi*
		African Chiroptera name ..... *Otonycteris hemprichii*
	b	Ear not enlarged; pelage brownish 112
112	a	Size larger, forearm not less than 46; 1st and 2nd upper molars with W-pattern obsolescent; tragus long and tapering (genus *Scotophilus*) 159
	b	Size smaller, forearm under 46; 1st and 2nd upper molars with normal W-pattern; tragus either sickle-shaped or short and broad (genus *Nycticeius*) 124
113	a	Size larger, forearm above 52 114
	b	Size smaller, forearm 52 or less 115
114	a	Wing and interfemoral membranes not parti-coloured ..... *Myotis (Myotis) blythii*
	b	Wing, interfemoral membranes and forearm conspicuously parti-coloured (black and red) ..... *Myotis (Chrysopteron) welwitschii*
		African Chiroptera name ..... *Myotis welwitschii*
115	a	Wings with glands; first two upper premolars greatly reduced and closely crowded together laterally (subgenus *Cistugo*) 118
	b	Wings without glands; first two upper premolars not greatly reduced, not crowded together laterally 116
116	a	Feet enlarged, more than half length of tibia ..... *Myotis (Leuconoe) capaccinii*
		African Chiroptera name ..... *Myotis capaccinii*
	b	Feet not enlarged, not more than half length of tibia 117

117 a Ears not lengthened; calcar usually with lobe; forearm 32 - 52 (subgenus *Selysius*) 119
b Ears lengthened; calcar unlobed; forearm c. 38 .....*Myotis (Isotus) nattereri*
118 a Size smaller, forearm 32.5 - 2.9 ..... *Myotis (Cistugo) seabrai*
African Chiroptera name ..... *Cistugo seabrae*
b Size larger, forearm 34.5.....*Myotis (Cistugo) lesueuri*
African Chiroptera name ..... *Cistugo lesueuri*
119 a Size larger, forearm 47 - 52..... *Myotis (Selysius) tricolor*
African Chiroptera name ..... *Myotis tricolor*
b Size smaller, forearm less than 47..... 120
120 a Canines (upper and lower) much reduced, subequal in length to third premolars; tail long, equal to head and body length; braincase sharply elevated above rostrum; forearm 38 - 40.....*Myotis (Selysius) scotti*
African Chiroptera name .....*Myotis scotti*
b Canines not reduced; tail length and braincase not as above 121
121 a Size smaller, forearm about 34 (32 - 35).....*Myotis (Selysius) mystacinus*
b Size medium, forearm 35 - 45..... 122
122 a Posterior border of ear with conspicuous angular emargination; forearm about 40 (37 - 43) ..... *Myotis (Selysius) emarginatus.*
African Chiroptera name .....*Myotis emarginatus*
b Ear without conspicuous emargination 123
123 a Colour typically orange-rufous above; tragus blunt-tipped, not sharply pointed; forearm 36 - 40 ..... *Myotis (Selysius) bocagei*
African Chiroptera name ..... *Myotis bocagii*
b Colour brown, not orange-rufous; tragus tapering to sharp point; forearm 36 - 45 .....*Myotis (Selysius) goudoti*
African Chiroptera name .....*Myotis goudoti*
124 a Skull with rostrum not broadened; palatal emargination narrow; upper cheek teeth four only; anterior lower premolar about half the size (in crown area) of the next premolar; upper canines with rounded anterior surface; tragus halfmoon-shaped; penis not enlarged; forearm 29 - 33..... *Nycticeius (Scoteinus) schlieffeni*
African Chiroptera name .....*Nycticeinops schlieffenii*
b Skull with rostrum notably broadened, particularly across lachrymals; palatal emargination broader; upper cheek teeth four or five; lower premolars equal in crown area; upper canines with broad flat anterior face; tragus short and broad; penis greatly lengthened; forearm 28 - 38 (subgenus *Scotoecus*)..... 125
125 a Wings dark; four or five upper cheek teeth ..... *Nycticeius (Scotoecus) hirundo*
African Chiroptera name ..... *Scotoecus hirundo*
b Wings pale; four upper cheek teeth ..... *Nycticeius (Scotoecus) albofuscus*
African Chiroptera name ..... *Scotoecus albofuscus*
126 a Size larger; forearm 47 - 55.....*Nyctalus noctula*
b Size smaller; forearm 43 .....*Nyctalus verrucosus*
African Chiroptera name ..... *Nyctalus leisleri*
127 a Inner upper incisor unicuspid or not very deeply bifid; ventral surface brown or grey (subgenus *Pipistrellus*)..... 128
b Inner upper incisors deeply bifid; ventral surface pure white..*Pipistrellus (Scotozous) rueppelli*
African Chiroptera name ..... *Pipistrellus rueppellii*
128 a Tragus hatchet-shaped (with sharp angle on posterior border)*Pipistrellus (Pipistrellus) nanus*
African Chiroptera name .....*Neoromicia nana*
b Tragus not hatchet-shaped (no sharp angle on posterior border) 129
129 a Tragus with greatest width equal to half length of anterior border.....*Pipistrellus (Pipistrellus) savii*
African Chiroptera name .....*Hypsugo savii*
b Tragus with greatest width much less than half length of anterior border 130
130 a Pelage unicoloured above and below 131
b Pelage not unicoloured above and below 132
131 a Skull very broad and flat; forearm 28 .....*Pipistrellus (Pipistrellus) crassulus*
African Chiroptera name .....*Hypsugo crassulus*

	b	Skull very small, rounded, with short rostrum and high braincase; forearm 24 - 25 ..... *Pipistrellus (Pipistrellus) musciculus* African Chiroptera name ..... *Hypsugo musciculus*
132	a	Pelage unicoloured above, bicoloured below..... 133
	b	Pelage bicoloured above and below 134
133	a	Size small, forearm 25.5 - 31.0, total length of skull 11.6 - 11.8, skull with uninflated supraorbital region..... *Pipistrellus (Pipistrellus) nanulus* African Chiroptera name ..... *Pipistrellus nanulus*
	b	Size large, forearm 33.7 - 35.1, total length of skull 14.0 - 14.3, skull with supraorbital region expanded laterally ..... *Pipistrellus (Pipistrellus) eisentrauti* African Chiroptera name ..... *Hypsugo eisentrauti*
134	a	Both upper incisors conical and unicuspid; small upper premolar unusually minute, often hidden by gum..... *Pipistrellus (Pipistrellus) ariel* African Chiroptera name ..... *Hypsugo ariel*
	b	Upper incisors not as above; small upper premolar not unusually minute 135
135	a	Outer upper incisors less than half height of inner incisor; large upper premolar in contact with canine; white border to wing membrane ....*Pipistrellus (Pipistrellus) kuhli* African Chiroptera name .....*Pipistrellus kuhlii*
	b	Outer upper incisor more than half height of inner incisor; large upper premolar well separated from canine by small upper premolar..*Pipistrellus (Pipistrellus) pipistrellus* African Chiroptera name .....*Pipistrellus pipistrellus*
136	a	Forearms, hind legs and tail without horny excrescences on upper surface (subgenus *Eptesicus*)..... 137
	b	Forearm, hind legs and tail sprinkled with horny excrescences on upper surface (subgenus *Rhinopterus*) 148
137	a	Wing membranes white or translucent..... 138
	b	Wing membranes dark 140
138	a	Dorsal pelage blackish-brown, in strong contrast to pale wings; forearm under 32 ..... *Eptesicus (Eptesicus) tenuipinnis* African Chiroptera name .....*Neoromicia tenuipinnis*
	b	Dorsal pelage pale to medium brown, not in strong contrast to pale wings; forearm over 32..... 139
139	a	Pelage buffy-brown above, dirty white below; forearm 34 - 38; inner upper incisors with basal cusp.....*Eptesicus (Eptesicus) rendalli* African Chiroptera name ..... *Neoromicia rendalli*
	b	Pelage nearer reddish-brown above, paler brown below; forearm c. 33; inner upper incisors without accessory cusp..... *Eptesicus (Eptesicus) brunneus* African Chiroptera name .....*Neoromicia brunnea*
140	a	Size larger, forearm more than 40 141
	b	Size smaller, forearm less than 40..... 145
141	a	Inner upper incisors unicuspid; colour dark brown; forearm 46 - 53.....*Eptesicus (Eptesicus) hottentotus* African Chiroptera name .....*Eptesicus hottentotus*
	b	Inner upper incisors bicuspid..... 142
142	a	Tragus broad and blunt; forearm 46 - 51 .....*Eptesicus (Eptesicus) platyops* African Chiroptera name ..... *Eptesicus platyops*
	b	Tragus narrow 143
143	a	Size larger, forearm 49 - 53.....*Eptesicus (Eptesicus) serotinus*
	b	Size smaller, forearm 40 - 46 144
144	a	Forearm 46; colour above pale brown, below greyish brown ....*Eptesicus (Eptesicus) loveni* African Chiroptera name ..... *Myotis tricolor*
	b	Forearm 40 - 43; colour above pale buffy, below white ..*Eptesicus (Eptesicus) bottae* African Chiroptera name .....*Eptesicus bottae*
145	a	Forearm 34.5 - 38.....*Eptesicus (Eptesicus) melckorum*
	b	Forearm 35 or less 146
146	a	Cranial portion of skull elevated above rostrum..... *Eptesicus (Eptesicus) zuluensis* African Chiroptera name .....*Neoromicia zuluensis*
	b	Cranial portion of skull not elevated above rostrum..... 147

147 a Size smallest, forearm 26 - 29 ..... *Eptesicus (Eptesicus) pusillus*
African Chiroptera name ..... *Neoromicia "incertae-sedis"*
b Size medium, forearm 30 - 32; skull lacking posterior occipital "helmet"..... *Eptesicus (Eptesicus) somalicus*
African Chiroptera name ..... *Neoromicia somalica*
c Size larger, forearm 29 - 35; skull with posterior occipital "helmet" ..... *Eptesicus (Eptesicus) capensis*
African Chiroptera name ..... *Neoromicia capensis*
148 a Colour pale fawn above, buff or whitish below..... 149
b Colour brown above and below..... *Eptesicus (Rhinopterus) notius*
African Chiroptera name ..... *Neoromicia capensis*
149 a Colour buff below ..... *Eptesicus (Rhinopterus) floweri*
African Chiroptera name ..... *Eptesicus floweri*
b Colour whitish below ..... *Eptesicus (Rhinopterus) lowei*
African Chiroptera name ..... *Eptesicus floweri*
150 a Posterior border of ear with small projecting lobe ..... *Barbastella barbastellus*
b Posterior border of ear without projecting lobe ..... *Barbastella leucomelas*
151 a Wing and tail membranes conspicuously reticulated by pigmentation of veining; no pale flank-stripe 152
b Wing and tail membranes not reticulated; either translucent or blackish-brown; pale flank-stripe sometimes present 153
152 a Dorsal colour pale buff or light tawny, head and neck generally paler; forearm 41 - 45 ..... *Glauconycteris variegata*
b Dorsal colour, including head and neck, dark brown; forearm 46..... *Glauconycteris machadoi*
153 a Wing and tail membranes pale, translucent; dorsal colour clay-buff; pale cream flank-stripe usually present; forearm 41 - 43..... *Glauconycteris argentata*
b Wing and tail membranes blackish brown..... 154
154 a Body colour, above and below, black with conspicuous pattern of white stripes and spots; forearm 47 ..... *Glauconycteris superba*
b Body colour never black and white 155
155 a Pale flank-stripe or shoulder-spot or both generally present 156
b Stripes or spots as above generally absent 158
156 a Body colour greyish fawn above and below, shoulder-spot and/or flank-stripe usually present; forearm 36 - 40..... *Glauconycteris poensis*
b Body colour brown above and below 157
157 a Shoulder-spot only; body colour hair brown; forearm 35 - 40 *Glauconycteris humeralis*
b Shoulder-spot and/or flank-stripe; body colour seal brown; forearm 41 *Glauconycteris alboguttatus*
African Chiroptera name ..... *Glauconycteris alboguttata*
158 a Colour uniformly dark brown above and below; ears short, rounded; forearm 39 ..... *Glauconycteris beatrix*
b Colour as above; ears large, subquadrangular; forearm 38 ..... *Glauconycteris egeria*
159 a Size very large, forearm 75 - 80; total skull length 30 or more ..... *Scotophilus gigas*
African Chiroptera name ..... *Scotophilus nigrita*
b Size smaller, forearm 43 - 65 160
160 a Forearm 50 - 65; skull 20 - 23 ..... *Scotophilus nigrita*
(This should be *Scotophilus dinganii*. See Robbins (1978))
African Chiroptera name ..... *Scotophilus dinganii*
b Forearm 43 - 50; skull 16 - 19 ..... *Scotophilus leucogaster*
161 a Interfemoral membrane with posterior edge lined with comb-like fringe of stiff hairs .. 162
b Interfemoral membrane without comb-like fringe, carrying only scattered hairs, if any 165
162 a Size large, forearm 34 - 39; skull 15 or more; colour above bright reddish-chestnut, below either whitish or buffy, never brown ..... *Kerivoula argentata*
b Size smaller, forearm 27 - 36; skull 13.5 or less; colour brownish or greyish-brown above and below 163
163 a Forearm 27 - 31; frosting or grizzling of dorsal pelage slight..... *Kerivoula muscilla*
African Chiroptera name ..... *Kerivoula lanosa*

	b	Forearm 30 - 36; frosting or grizzling of dorsal pelage conspicuous 164
164	a	Rostrum longer, C-M^3 greater than M^3-M^3; forearm 30 - 32 ..... *Kerivoula harrisoni* African Chiroptera name ..... *Kerivoula lanosa*
	b	Rostrum shorter, C-M^3 less than M^3-M^3 ; forearm 32 - 36 ..... *Kerivoula lanosa*
165	a	Forearm 32 - 34; dorsal pelage grizzled 166
	b	Forearm 27 - 29; dorsal pelage not grizzled (so far as known)..... 167
166	a	Outer lower incisors unicuspid; upper incisors long ..... *Kerivoula smithi* African Chiroptera name ..... *Kerivoula smithii*
	b	Outer lower incisors trilobed; upper incisors short ..... *Kerivoula cuprosa*
167	a	Fur uniformly light brown above and below; inner upper incisors clearly unicuspid ..... *Kerivoula phalaena*
	b	Fur dark brown basally, with tips greyish brown; inner upper incisors with distinct outer cusp ..... *Kerivoula africana*
168	a	Size very small, forearm less than 40 (35 - 39); condylobasal length of skull usually less than 13 ..... *Miniopterus minor*
	b	Size larger, forearm more than 40 (42 - 50); skull length approximately 14 - 16.. 169
169	a	Size largest, forearm 45 - 50; skull length 16 or more ..... *Miniopterus inflatus*
	b	Size medium, forearm c. 42 - 47; skull length c. 14 - 15..... 170
170	a	Forearm 42 - 44; skull length c. 14..... *Miniopterus fraterculus*
	b	Forearm c. 42 - 47; skull length c. 15..... *Miniopterus schreibersi* African Chiroptera name ..... *Miniopterus schreibersii*
171	a	Prominent vertical projection on zygoma; ears very large, 38 - 40, conjoined on extended snout; size very large, forearm 62 - 73; conspicuous bicolored dorsal pelage pattern, with pale collar separating dark anterior and posterior regions of body ..... *Otomops martiensseni*
	b	Not combining the above characters..... 172
172	a	Skull conspicuously flattened, greatest depth of braincase not more than one-third of greatest width 173
	b	Skull not conspicuously flattened 174
173	a	Upper cheek teeth 4 or 5 (1st upper premolar either greatly reduced or absent); well-developed gular sac; wart-like granulations on forearm; ears widely spaced; forearm 30 - 36 ..... *Platymops setiger*
	b	Upper cheek teeth 5 (1st upper premolar well-developed); no well-developed gular sac; no wart-like granulations on forearm; ears not widely spaced; forearm 36 - 42 ..... *Sauromys petrophilus*
174	a	Ears widely separated; lower incisors 1 - 1, with concave crowns lengthened antero-posteriorly; upper cheek teeth 4; M^3 much reduced; no palatal emargination; upper incisors in contact; ears and wing membranes translucent or whitish; underside of body entirely white (genus *Myopterus*) 176
	b	Ears not widely separated, sometimes conjoined, never translucent 175
175	a	Lower incisors 1 - 1; upper cheek teeth 5; canines greatly enlarged, particularly by basal expansion of cingula; lower canines meeting centrally above the minute and functionless lower incisors; ears separate; forearm under 30... *Xiphonycteris spurrelli* African Chiroptera name ..... *Mops (Xiphonycteris) spurrelli*
	b	Lower incisors 2 - 2 or 3 - 3; upper cheek teeth 4 or 5; canines not enlarged; ears separate or conjoined (in that case often with post-aural tufts or crests in adult males); forearm up to 66 and not less than 30, except in *Tadarida (Mops) nanulus* (genus *Tadarida*) 178
176	a	Size small, forearm 33 - 37; total skull length 17 - 19; pelage dark brown above ..... *Myopterus whitleyi*
	b	Size, larger, forearm more than 40 177
177	a	Forearm 51 - 56; total skull length 24 - 25.7; dorsal pattern slaty-grey with two contrasting lateral bands of dirty white..... *Myopterus albatus* African Chiroptera name ..... *Myopterus daubentonii*
	b	Forearm ? 44; total skull length 22; dorsal pelage brown ..... *Myopterus daubentonii*
178	a	Only 4 upper post-canine cheek teeth; M^3 not reduced; upper incisors widely separated by large palatal emargination; lower incisors 3 - 3; ears separate; size small, forearm c. 38 (subgenus *Mormopterus*) 181

b 5 upper post-canine cheek teeth (the small premolar very reduced, sometimes absent in *T.(Mops) condylura*, but in that case with M^3 reduced, ears conjoined, palatal emargination rudimentary or absent, size large, forearm 43 - 49); lower incisors normally 2 - 2, rarely 3 - 3; ears conjoined or separate; forearm 27 - 66 179

179 a M^3 reduced, cusps rarely more than V pattern; palatal emargination small or absent; ears generally conjoined, sometimes with post-aural tuft; size small to large, forearm 27 - 66 (subgenus *Mops*) 182

b M^3 not reduced, cusps forming N pattern 180

180 a Palatal emargination absent or rudimentary; ears conjoined, often with post-aural tuft, which is sometimes well developed; size medium, forearm 35 - 52 (subgenus *Chaerephon*) 190

b Palatal emargination well-developed; ears generally separate; size medium to large, forearm 45 - 66 (subgenus *Tadarida*) 197

181 a Ears with anterior margin slightly emarginated below pointed tip; colour uniformly dark brown above and below; total skull length 14 - 15 ..... *Tadarida (Mormopterus) acetabulosus*
African Chiroptera name ..... *Mormopterus acetabulosus*

b Ears without emargination, tips broadly rounded; colour above dark brown but with pale bases, underside dirty white over part of throat and ventral area; total skull length 16 - 17 ..... *Tadarida (Mormopterus) jugularis*
African Chiroptera name ..... *Mormopterus jugularis*

182 a Size smallest, forearm 31 or less ..... *Tadarida (Mops) nanula*
African Chiroptera name ..... *Mops (Xiphonycteris) nanulus*

b Size larger, forearm 35 or more 183

183 a Size largest, forearm 58 - 66; skull length 26 - 28 ..... *Tadarida (Mops) midas*
African Chiroptera name ..... *Mops (Mops) midas*

b Size medium, forearm 35 - 58 184

184 a Forearm over 50 185

b Forearm under 50 186

185 a Ears joined at base; forearm 52 - 57; skull 25 ..... *Tadarida (Mops) congica*
African Chiroptera name ..... *Mops (Mops) congicus*

b Ears separated at base; forearm 52; skull c.23 ..... *Tadarida (Mops) niangarae*
African Chiroptera name ..... *Mops (Mops) niangarae*

186 a Male with scent gland at base of penis; forearm 42 - 44 *Tadarida (Mops) demonstrator*
African Chiroptera name ..... *Mops (Mops) demonstrator*

b Male without such gland; forearm 35 - 50 187

187 a Forearm 44 - 50 188

b Forearm 35 - 41 189

188 a Crown darker than back; underside usually mainly white; skull with sagittal crest low, when present; 3rd commissure of M^3 obsolete; deep basisphenoid pits; forearm 44 - 47 ..... *Tadarida (Mops) niveiventer*
African Chiroptera name ..... *Mops (Mops) niveiventer*

b Crown not darker than back; little or no white on underside; skull with well-developed sagittal crest; 3rd commissure of M^3 present, though reduced; shallow basisphenoid pits; forearm 45 - 50 ..... *Tadarida (Mops) condylura*
African Chiroptera name ..... *Mops (Mops) condylurus*

189 a Underside brownish, with blackish flanks; forearm 38 - 41. *Tadarida (Mops) thersites*
African Chiroptera name ..... *Mops (Xiphonycteris) thersites*

b Underside whitish, flanks not blackish; forearm 35 - 38 ..... *Tadarida (Mops) leonis*
African Chiroptera name ..... *Mops (Xiphonycteris) brachypterus*

190 a Distinct separate lobe or lappet projecting between inner bases of ears ..... *Tadarida (Chaerephon) major*
African Chiroptera name ..... *Chaerephon major*

b Without such lobe or lappet 191

191 a Size larger, forearm 42 - 52 192

b Size smaller, forearm 34 - 42 196

192 a Paired caudal glands opening as slits on either side of tail root below; forearm 46 - 47 ..... *Tadarida (Chaerephon) cistura*
African Chiroptera name ..... *Chaerephon bemmeleni*

b Without such glands 193

193 a Conspicuous white lateral band below, along flanks at junction with membrane, contrasting with very dark brown colour above and below; wings dark or pale; forearm 44 - 50 ..... *Tadarida (Chaerephon) nigeriae*
African Chiroptera name ..... *Chaerephon nigeriae nigeriae*
b No white lateral band..... 194
194 a Forearm 42 - 46; colour russet brown ..... *Tadarida (Chaerephon) russata*
African Chiroptera name ..... *Chaerephon russatus*
b Forearm 46 - 52..... 195
195 a Colour umber-brown with variable pattern of white spots or short stripes arranged laterally on crown and sometimes also on shoulders and flanks; wings dark; skull with rostrum not elongated; forearm 46 - 51..... *Tadarida (Chaerephon) bivittata*
African Chiroptera name ..... *Chaerephon bivittatus*
b Colour uniformly russet brown without white spots or stripes; wings dark; skull with elongated narrow rostrum; forearm 52..... *Tadarida (Chaerephon) aloysiisabaudiae*
African Chiroptera name ..... *Chaerephon aloysiisabaudiae*
196 a Males with long (13 - 14mm) bicolored post-aural crest (dark basally, pale apically); forearm 34 - 39; underside white or whitish-tipped .... *Tadarida (Chaerephon) chapini*
African Chiroptera name ..... *Chaerephon chapini*
b Males with short (10 m or less) unicolored post-aural crest; wings dark or light; colour below variable, with or without white on the median area; forearm 37 - 42... *Tadarida (Chaerephon) pumila*
African Chiroptera name ..... *Chaerephon pumilus*
197 a Lower incisors 6; skull very narrow; lower canines widely separated at base; size large, forearm 54 - 64..... *Tadarida (Tadarida) teniotis*
African Chiroptera name ..... *Tadarida teniotis*
b Lower incisors 4; skull generally broad, rarely narrow; lower canines almost touching at base or widely separated; size medium to large, forearm 45 - 66 198
198 a Size large, forearm 57 - 66..... 199
b Size medium, forearm 45 - 53..... 201
199 a Ears very large, united at base very close to nostrils, projecting well beyond muzzle when laid forward; underside all white except for narrow brown flank-stripe; skull, particularly rostrum, very narrow; basisphenoid pits shallow; lower canines almost touching at base; forearm 63 ..... *Tadarida (Tadarida) lobata*
African Chiroptera name ..... *Tadarida lobata*
b Ears smaller, not united at inner margin, well back from nostrils, barely projecting beyond muzzle when laid forward; underside without or with restricted white area; skull not narrowed in rostral region; basisphenoid pits deeper, sharply defined; forearm 57 - 66..... 200
200 a Skull very broad and heavy, particularly in rostral region, total length 23.5 - 25.7; deep, sharply defined basisphenoid pits; lower canines almost touching at base; underside mostly brownish, sometimes with median white area; forearm 63 - 66 ..... *Tadarida (Tadarida) africana*
African Chiroptera name ..... *Tadarida ventralis*
b Skull much less broad in rostral region, total length 22 - 22.9; basisphenoid pits well-defined; lower canines almost touching at base; underside with variable white band on mid-ventral line; forearm 57 - 62 ..... *Tadarida (Tadarida) fulminans*
African Chiroptera name ..... *Tadarida fulminans*
201 a Size medium, forearm 44 - 53; total skull length 19 - 21; braincase flat; lower canines widely separated at base; no blackish area on chin and throat ... *Tadarida (Tadarida) aegyptiaca*
African Chiroptera name ..... *Tadarida aegyptiaca*
b Size smaller, forearm 47.5 or less; total skull length 18 - 20; braincase elevated; lower canines almost touching at base; chin and throat generally blackish ..... *Tadarida (Tadarida) ansorgei*
African Chiroptera name ..... *Chaerephon ansorgei*

Appendix 5u: Smithers (1971). The mammals of Botswana.

1	a	Second digit terminating in a claw; margin of ear conch forming a complete ring; tragus always absent; interfemoral membrane greatly reduced, little more than a narrow band along inside margin of hind-legs; tail absent or rudimentary; cheek teeth simple, without well-developed cusp pattern (Suborder Megachiroptera, Family Pteropodidae). 2
	b	Second digit without a claw (fig. 2); margin of ear conch not forming a complete ring; tragus present except in two families; interfemoral membrane generally well-developed ; tail generally well-developed (absent in one family); cheek teeth cuspidate with generally clearly defined W-pattern (Suborder Microchiroptera). 3
2	a	Post-dental palate markedly concave posteriorly; two postpalatal ridges posterior to teeth (Genus *Epomophorus*). ..... *Epomophorus crypturus*
	b	Post-dental palate rather flat; five to seven ridges posterior to teeth (Genus *Epomops*). ..... *Epomops dobsoni* African Chiroptera name ..... *Epomophorus dobsonii*
3	a	With a distinct tail extending free of the interfemoral membrane. 4
	b	Tail almost entirely enclosed within the interfemoral membrane. 5
4	a	Free terminal part of tail emerging upwards from near the middle of the interfemoral membrane (fig. 3 (a)) (Family Emballonuridae, Genus *Taphozous*). 8
	b	Free terminal part of tail emerging from the posterior part of the interfemoral membrane and extending well beyond it (fig. 3 (b)) (Family Molossidae). 9
5	a	No noseleaves (Family Vespertilionidae). 14
	b	Face with noseleaves. 6
6	a	Face with a deep central slit (fig. 4 (a)) (Family Nycteridae). *Nycteris thebaica capensis* African Chiroptera name ..... *Nycteris thebaica*
	b	Face without a deep central slit. 7
7	a	Posterior nose leaf subtriangular with an erect point (fig. 4 (b)) (Family Rhinolophidae). 27
	b	Posterior noseleaf elliptical (fig. 4 (c)) (Family Hipposideridae). 30
8	a	Fur above grizzled, the tips of the hair whitish, underside pure white; length of skull oyer 21.5 mm; forearm 58 to 64. ..... *Taphozous mauritianus*
	b	Fur above unicolor, length of skull less than 21.5 mm; forearm 60 to 67. .. *Taphozous perforatus rhodesiae* African Chiroptera name ..... *Taphozous perforatus sudani*
9	a	Skull distinctly flattened (depth of braincase about a third of its width) (fig. 5 (a)) (Genus *Sauromys*). ..... *Sauromys petrophilus petrophilus*
	b	Skull not flattened (fig. 5 (b)) (Genus *Tadarida*). 10
10	a	M^3 reduced, cusps rarely more than a V-pattern; palatal emargination small or absent; ears generally conjoined, sometimes with post-aural tuft; size small to large, forearm 27 - 66 (Subgenus *Mops*). 12
	b	M^3 not reduced, cusps forming N-pattern. 11
11	a	Palatal emargination absent or rudimentary; ears conjoined, often with post-aural tuft (sometimes well-developed); size medium, forearm 35 - 52 (Subgenus *Chaerephon*). 13
	b	Palatal emargination well-developed; ears generally separate; size medium to large, forearm 45 - 66 (Subgenus *Tadarida*). ..... *Tadarida (Tadarida) aegyptiaca bocagei* African Chiroptera name ..... *Tadarida aegyptiaca bocagei*
12	a	Size larger, forearm 58 - 66. ..... *Tadarida (Mops) midas midas* African Chiroptera name ..... *Mops (Mops) midas midas*
	b	Size smaller, forearm 45 - 50. ..... *Tadarida (Mops) condylura condylura* African Chiroptera name ..... *Mops (Mops) condylurus*
13	a	Conspicuous white lateral bands below along the flanks at the junction with the membrane, contrasting with the very dark brown colour above and below; forearm 44 - 50. ..... *Tadarida (Chaerephon) nigeriae spillmanni* African Chiroptera name ..... *Chaerephon nigeriae spillmanni*
	b	No white lateral bands; forearm 37 - 42. ..... *Tadarida (Chaerephon) pumila* African Chiroptera name ..... *Chaerephon pumilus*

14 a Ear funnel-formed, posterior edge of the interfemoral membrane with a hairy fringe (Genus *Kerivoula*). ..... *Kerivoula harrisoni lucia*
African Chiroptera name ..... *Kerivoula lanosa*
b Ear not funnel-formed, no hairy fringe..... 15
15 a Second phalanx of third finger nearly three times as long as the first (Genus *Miniopterus*)..... *Miniopterus schreibersi natalensis*
African Chiroptera name ..... *Miniopterus natalensis*
b Second phalanx of third finger not specially elongated..... 16
16 a Two upper incisors each side..... 17
b One upper incisor each side. 20
17 a Wings unicolor..... 18
b Wings with a conspicuous dark reticular pattern on a pale ground (Genus *Glauconycteris*). ..... *Glauconycteris variegata variegata*
African Chiroptera name ..... *Glauconycteris variegata*
18 a Upper jaw with two premolars each side (fig. 6 (b)) (Genus *Pipistrellus*). 21
b Upper jaw with one premolar each side (fig. 6 (a)). 19
19 a Ears longer than the head, over 18, skull elongate (fig. 7 (b) (fig. 10 (b)) (Genus *Laephotis*)..... *Laephotis wintoni angolensis*
African Chiroptera name ..... *Laephotis angolensis*
b Ears less than the length of the head, under 18, skull normal (fig. 7 (a)) (fig. 10 (a)) (Genus *Eptesicus*)..... 24
20 a Skull with a distinct posteriorly projecting helmet, ear tragus long, tapering (fig. 8 (a)) (Genus *Scotophilus*)..... 26
b Skull normal, ear tragus half-moon shaped (fig. 8 (b)) (Genus *Nycticeius*). *Nycticeius (Scoteinus) schlieffeni fitzsimonsi*
African Chiroptera name ..... *Nycticeinops schlieffenii*
21 a Inner upper incisors deeply bifid, ventral surface pure white (fig. 9 (c)) (Subgenus *Scotozous*). ..... *Pipistrellus (Scotozous) rueppelli vernayi*
African Chiroptera name ..... *Pipistrellus rueppellii vernayi*
b Inner upper incisors unicuspid or not very deeply bifid, ventral surface brown or grey (fig. 9 (a)) (Subgenus *Pipistrellus*)..... 22
22 a Second upper incisor very reduced..... *Pipistrellus (Pipistrellus) kuhli subtilis*
(This should be *Pipistrellus hesperidus subtilis*. See Kock (2001))
African Chiroptera name ..... *Pipistrellus hesperidus subtilis*
b Second upper incisor not very reduced, only slightly smaller than first. 23
23 a Braincase flatter, cranium nearly level with muzzle (fig. 10 (d))..... *Pipistrellus (Pipistrellus) rusticus rusticus*
African Chiroptera name ..... *Pipistrellus rusticus*
b Braincase clearly raised above level of muzzle (fig. 10 (c))... *Pipistrellus (Pipistrellus) nanus fouriei*
African Chiroptera name ..... *Neoromicia nana*
24 a Wing membranes white or translucent..... *Eptesicus (Eptesicus) rendalli*
African Chiroptera name ..... *Neoromicia rendalli*
b Wing membranes dark. 25
25 a Cranial portion of skull elevated above rostrum..... *Eptesicus (Eptesicus) zuluensis*
African Chiroptera name ..... *Neoromicia zuluensis*
b Cranial portion of skull not elevated above rostrum... *Eptesicus (Eptesicus) capensis capensis*
African Chiroptera name ..... *Neoromicia capensis*
26 a Length skull 19.6 - 23; under-parts usually yellow; length forearm 50 - 65. *Scotophilus nigrita dingani*
(This should be *Scotophilus dinganii*. See Robbins (1978))
African Chiroptera name ..... *Scotophilus dinganii*
b Length skull 16 - 19.1; under-parts usually beige; length forearm 43 - 50. *Scotophilus leucogaster viridis*
African Chiroptera name ..... *Scotophilus viridis*
27 a Size larger, forearm over 55, skull length over 23. ..... *Rhinolophus hildebrandti hildebrandti*
African Chiroptera name ..... *Rhinolophus hildebrandtii*
b Size smaller, forearm less than 55, skull length less than 23. 28

28 a Canine P^1 in contact; P^3 (if present) outside the tooth-row (fig. 12 (a)). .. *Rhinolophus darlingi darlingi*
African Chiroptera name .....*Rhinolophus darlingi*
b Canine separated from P^1 by P^3 (fig. 12 (b)). 29
29 a Size larger, forearm 42 - 45, skull length over 17.5, overall darker-buffy on ventral surface. .....*Rhinolophus simulator*
b Size smaller, forearm 42 or less, skull length under 17.5, overall paler, near white on ventral surface. ..... *Rhinolophus denti*
30 a Larger, rostrum half-length braincase, forearm over 42 (fig. 13 (a)) (Genus *Hipposideros*). 31
b Smaller, rostrum less than half-length of braincase, forearm less than 35.8 (fig. 14 (a)) (Genus *Cleotis*). .....*Cloeotis percivali australis*
African Chiroptera name .....*Cloeotis percivali*
31 a Smaller, forearm under 50.....*Hipposideros caffer caffer*
African Chiroptera name .....*Hipposideros caffer*
b Larger, forearm over 90.....*Hipposideros commersoni marungensis*
African Chiroptera name .....*Macronycteris commersoni*

Appendix 5v: Hill (1974). A review of Scotoecus Thomas, 1901 (Chiroptera: Vespertilionidae)

1 a Tragus long, relatively narrow; zygomata not cartilaginous; pm_2 reduced, its crown area one third to one half that of pm_4; this tooth not compressed in toothrow. ..... *Scotoecus pallidus*

b Tragus short, relatively wide ; zygomata cartilaginous ; pm_2 unreduced, its crown area subequal to that of pm_4; this tooth compressed in toothrow. 2

2 a Tragus more or less parallel-margined, the upper part of its anterior margin not prolonged anteriorly; outer part of wing membrane pale; ventral surface of body brown; braincase slightly flattened. ..... *Scotoecus albofuscus*

b Tragus slightly hatchet-shaped, the upper part of its anterior margin projected forward; outer part of wing membrane dark; ventral surface of body greyish, at most tinged with brown; braincase slightly elevated. 3

3 a Smaller, length of forearm generally less than 33.0, condylobasal length 13.2 or less, c-m^3 5.1 or less..... *Scotoecus hirundo*

b Larger, length of forearm generally exceeding 32.0, condylobasal length 13.5 or more, c-m^3 5.2 or more..... *Scotoecus hindei*

Appendix 5w: Fenton (1975). Observations on the biology of some Rhodesian bats, including a key to the Chiroptera of Rhodesia.

1	a	Claw present on second finger; FA 66 - 130 (PTEROPODIDAE)..... 7
	b	No claw on second finger; FA usually less than 66 2
2	a	Tail fully enclosed by interfemoral membrane..... 4
	b	Tail not fully enclosed by interfemoral membrane 3
3	a	Tail protruding through the interfemoral membrane; FA 58 - 67 (EMBALLONURIDAE) 12
	b	Tail extending beyond the end of the interfemoral membrane; FA 35 - 73 (MOLOSSIDAE) 49
4	a	Tail terminating in a T-shaped cartilage; ears large; FA 37 - 66 (NYCTERIDAE) .. 13
	b	Tail not terminating in a T-shaped cartilage..... 5
5	a	Nose-leaf ornamentation present..... 6
	b	Nose-leafs absent; FA 25 - 65 (VESPERTILIONIDAE) 29
6	a	Nose-leafs arranged as in Fig. 5; FA 37 - 67 (RHINOLOPHIDAE)..... 17
	b	Nose-leafs not arranged as in Fig. 5; FA 31 - 115 (HIPPOSIDERIDAE)..... 26
7	a	FA greater than 110; narrow band of fur between wings on dorsum; FA 110 - 130 .....*Eidolon helvum*
	b	FA less than 110 8
8	a	Ears with basal tufts of white fur 9
	b	Ears without basal tufts of white fur 11
9	a	One post-dental palatal ridge; FA 72 - 89 ..... *Epomophorus wahlbergi*
	b	Two post-dental palatal ridges 10
10	a	FA males 87 - 93; females 81 - 86 ..... *Epomophorus gambianus*
	b	FA males 81 - 85; females 79 - 80 ..... *Epomophorus crypturus*
11	a	Wing membranes insert on first toe; hair short and slick; FA 90 - 105 ..... *Rousettus aegyptiacus*
	b	Wing membranes insert on second toe; hair longer and coarser; FA 66 - 83*Rousettus angolensis* African Chiroptera name .....*Myonycteris angolensis*
12	a	Fur of dorsum grizzled greyish; venter white; FA 58 - 64 .....*Taphozous mauritianus*
	b	Fur of dorsum bicoloured, not grizzled; FA 60 - 67..... *Taphozous perforatus*
13	a	FA over 55; restricted to closed forest; upper incisors trifid; E 28 - 35; FA 57 - 66 ..... *Nycteris grandis*
	b	FA less than 55 14
14	a	Upper incisors trifid; E 18 - 25; FA 36 - 45 .....*Nycteris hispida*
	b	Upper incisors bifid..... 15
15	a	Tragus semilunate (Fig. 6A) 16
	b	Tragus pyriform (Fig. 6B); E 28 - 37; FA 42 - 52.....*Nycteris thebaica*
16	a	FA 37 - 42; E 29 - 34; colour greyish .....*Nycteris woodi*
	b	FA 45 - 50; E 28 - 34; colour brownish.....*Nycteris macrotis*
17	a	Face and/or lateral margins of sella (Fig. 5) with long hairs; connecting process low and rounded; greatest breadth of horseshoe usually over 9..... 18
	b	Face and/or lateral margins of sella without hairs; greatest breadth of horseshoe usually less than 9..... 19
18	a	FA 62 - 67.....*Rhinolophus hildebrandti* African Chiroptera name .....*Rhinolophus hildebrandtii*
	b	FA 50 - 60.....*Rhinolophus fumigatus*
19	a	Anterior upper premolar external to tooth row; connecting process bluntly pointed; upper canine and p^4 in contact..... 20
	b	Anterior upper premolar in tooth row; upper canine and p^4 not in contact..... 21
20	a	FA 50 - 57..... *Rhinolophus clivosus*
	b	FA 45 - 50.....*Rhinolophus darlingi*
21	a	First phalanx of fourth digit shortened relative to metacarpal; (phalanx less than 8); connecting process to erect point (Fig. 7D); FA 40 - 48 ..... *Rhinolophus landeri*
	b	First phalanx of fourth digit not shortened (over 8) 22
22	a	Connecting process rises to high, narrow horn (Fig. 7E); FA 44 - 48*Rhinolophus blasii*
	b	Connecting process low with bluntly pointed tip 23
23	a	FA 47 - 51..... *Rhinolophus capensis*

b FA less than 45 24
24 a Ears relatively long; sella broad, venter white; FA 40 - 46; connecting process as in Fig. 7F ..... *Rhinolophus simulator*
b Ears relatively short; sella narrow 25
25 a Front edge of connecting process convex; FA 40 - 46 ..... *Rhinolophus swinnyi*
b Front edge of connecting process concave (Fig. 7G); FA 37 - 42 .. *Rhinolophus denti*
26 a FA 31 - 35; nose-leaf small and trident ..... *Cloeotis percivali*
b FA over 40; nose-leaf not trident 27
27 a FA over 75 (79 - 115) ..... *Hipposideros commersoni*
African Chiroptera name ..... *Macronycteris commersoni*
b FA 40 - 55 28
28 a FA less than 48; greyish to pale orange fur; main posterior nasal compartment narrow with wide lateral inflations ..... *Hipposideros caffer*
b FA over 48; brownish to rufous; main posterior nasal compartment wide with narrow lateral inflations ..... *Hipposideros ruber*
29 a Second phalanx of third digit equal to three times the first phalanx; FA 42 - 47 (Miniopterinae) ..... *Miniopterus schreibersi*
African Chiroptera name ..... *Miniopterus schreibersii*
b Second phalanx of third digit less than three times the first phalanx 30
30 a Ears funnel-shaped with deep emargination below tip; tragus long and narrow with sharply pointed tip; FA 30 - 39 (Kerivoulinae) 31
b Not as above (Vespertilioninae) 32
31 a FA 34 - 39; venter whitish or buffy ..... *Kerivoula argentata*
b FA 30 - 32; venter brown ..... *Kerivoula harrisoni*
African Chiroptera name ..... *Kerivoula lanosa*
32 a Elongated muzzle; $P^{3-3}/_{3-3}$ $M^{3-3}/_{3-3}$; fur short and standing away from body; calcar long 33
b Muzzle short (less than three premolars) 35
33 a FA 56 - 57; membranes and FA particoloured (black and red) ..... *Myotis welwitschii*
b Fa less than 56 mm 34
34 a FA 47 - 52; membranes not particoloured ..... *Myotis tricolor*
b FA 36 - 40; membranes not particoloured; orange-rufous dorsum ..... *Myotis bocagei*
African Chiroptera name ..... *Myotis bocagii*
35 a Upper incisors 2 - 2 36
b Upper incisors 1 - 1 45
36 a Upper premolars 2 - 2; tragus short and blunt 37
b Upper premolars 1 - 1 40
37 a Venter pure white; fur extending slightly on to wings; fur of dorsum bicolour (dark base, light tips); membranes pale; FA 34 ..... *Pipistrellus rueppelli*
African Chiroptera name ..... *Pipistrellus rueppellii*
b Fur on venter dark or light grey; membranes dark 38
38 a Tragus hatchet-shaped (Fig. 8A); fur on dorsum bicoloured; FA 25 - 32 ... *Pipistrellus nanus*
African Chiroptera name ..... *Neoromicia nana*
b Tragus not hatchet-shaped (Fig. 8B) 39
39 a Pelage bicoloured above and below; outer upper incisor less than one half inner upper incisor; large upper premolar in contact with canine; FA 30 - 33 ..... *Pipistrellus kuhlii*
b Outer and inner upper incisors equal in size; colour more rufous; white border on posterior part of wing membranes between feet and fifth digit well marked; FA 27 - 30 ..... *Pipistrellus rusticus*
40 a Second phalanx of third digit greater than first; lower lip with lobe at posterior angle 41
b Second phalanx of third digit less than first; lower lip without lobe 42
41 a Wing and interfemoral membrane variegated; fur on venter white and unicoloured; FA 40 - 45 ..... *Glauconycteris variegata*
b Wing and interfemoral membrane not variegated; fur black at base, narrow white middle band, sandy tips; FA 39 - 44 ..... *Glauconycteris argentata**
African Chiroptera name ..... *Glauconycteris argentata*
42 a Ears over 18 and ca. 50 % of FA; FA 36 - 38 ..... *Laephotis angolensis*
b Ears less than 18; 30 - 40 % of FA 43
43 a FA 46 - 53; membranes dark; inner upper incisor unicuspid ..... *Eptesicus hottentotus*

b FA less than 45 44
44 a Membranes light or translucent; buffy brown dorsum; dirty white venter; FA 34 - 48 .....*Eptesicus rendalli**
African Chiroptera name ..... *Neoromicia rendalli*
b Membranes dark; FA 29 - 36..... *Eptesicus capensis*
African Chiroptera name .....*Neoromicia capensis*
45 a FA 40 - 80; tragus long and tapering..... 46
b FA less than 40; tragus short 48
46 a FA over 70 (70 - 80); venter white to orange brown .....*Scotophilus gigas*
African Chiroptera name .....*Scotophilus nigrita*
b Fa less than 70 mm..... 47
47 a FA 50 - 65; venter yellowish .....*Scotophilus nigrita*
(This should be *Scotophilus dinganii*. See Robbins (1978))
African Chiroptera name ..... *Scotophilus dinganii*
b FA 43 - 50; venter beige..... *Scotophilus leucogaster*
48 a Tragus short and rounded; upper canine grooved on anterior face; cheek teeth $^{2-3}/_{2-2}$; penis very elongate; tragus as in Fig. 8C; FA 31 - 33.....*Nycticeius hirundo*
African Chiroptera name ..... *Scotoecus hirundo*
b Tragus as in Fig. 8D; upper canine not grooved on anterior face; cheek teeth not as in preceding; penis not very elongated; FA 30 - 33 .....*Nycticeius schlieffeni*
African Chiroptera name .....*Nycticeinops schlieffenii*
49 a Ears very large (38 - 40), joined on projecting snout; collar of pale fur separating darker anterior and posterior parts; FA 62 - 73..... *Otomops martiensseni*
b Not combining above characteristics 50
50 a FA over 55..... 52
b FA less than 55 51
51 a FA 44 - 55..... 55
b FA 35 - 44..... 60
52 a Ears joined at base; FA 58 - 66..... *Tadarida midas*
African Chiroptera name .....*Mops (Mops) midas*
b Ears separate at base 53
53 a Venter white; wings translucent; ears large (29 - 30); white spot on mid-dorsum in adults; FA 57 - 60..... *Tadarida lobata*
b Venter not white; wings not translucent 54
54 a FA 60 - 67; brown and red forms .....*Tadarida africana**
African Chiroptera name .....*Tadarida ventralis*
b FA 57 - 60; brown and red forms .....*Tadarida fulminans*
55 a Venter dark or perhaps tinged with grey 56
b Venter light-coloured 59
56 a Conspicuous ridge of fur across dorsal surface of hips; variable pattern of white flecks or short stripes laterally on crown and perhaps shoulders and flanks; flanks quite bare; FA 44 - 49.....*Tadarida bivittata*
African Chiroptera name ..... *Chaerephon bivittatus*
b Conspicuous ridge of fur absent; no white flecks..... 57
57 a Ears separate; no white stripe at ventral contact of wings and body..... 58
b Ears joined at bases; white stripes at ventral contact of wings and body; fur on body black; wings translucent; FA 46 - 50 ..... *Tadarida nigeriae*
African Chiroptera name .....*Chaerephon nigeriae nigeriae*
58 a Chin and throat blackish; lower canines almost touching at bases; FA 44 - 47*Tadarida ansorgei*
African Chiroptera name .....*Chaerephon ansorgei*
b Chin and throat not blackish; lower canines well separated at bases; FA 44 - 53 .....*Tadarida aegyptiaca*
59 a Crown darker than back; underside usually mainly white; E 20 - 25; FA 44 - 47 .....*Tadarida niveiventer*
African Chiroptera name .....*Mops (Mops) niveiventer*
b Crown not darker than back; little or no white on venter; E 28 - 30; FA 45 - 50*Tadarida condylura*
African Chiroptera name .....*Mops (Mops) condylurus*

60 a Ears joined on top of head; variable pattern of white on venter including lateral stripes and central area of body; wings translucent; FA 37 - 42..... *Tadarida pumila*
African Chiroptera name .....*Chaerephon pumilus*
b Ears not joined on top of head; no white on venter; wings not translucent; FA 36 - 42 ..... *Sauromys petrophilus*

Appendix 5x: Bergmans (1975). On the differences between sympatric Epomops franqueti (Tomes, 1860) and Epomops buettikoferi (Matschie, 1899), with additional notes on the latter species (Mammalia, Megachiroptera).

1 a Forearm length, males > 91 mm, females usually > 86 mm; greatest skull length, males >51 mm, females usually > 45.8 mm; C^1-M^1, males > 16.5 mm, females usually > 15.0 mm; length M^1 >= 3.2 mm; third palatal ridge, from the front, divided in the middle. ..... *Epomops buettikoferi*

b Forearm length, males < 91 mm, females < 86 mm; greatest skull length, males < 51 mm, females usually < 45.8 mm; C^1-M^1, males < 16.5 mm, females usually < 15.0 mm; length M^1 <= 3.2 mm; third palatal ridge, from the front, undivided in the middle in most specimens. ..... *Epomops franqueti*

Appendix 5y: Hill (1977). A review of the Rhinopomatidae (Mammalia: Chiroptera).

1 a Larger, length of forearm 57.5 - 75 mm, condylobasal length 17.3 - 20.6 mm; tail usuaüy shorter than forearm; prominent sagittal crest; supraorbital ridges high, knife-like, their junction enclosing a recess or pocket, angled, the frontal region more or less pentagonal in outline, flat, rostrum with narial swellings not especially pronounced. .....*Rhinopoma microphyllum*

b Smaller, length of forearm 46 - 63.5 mm, condylobasal length 14.0 - 17.8 mm; tail usually longer than forearm; low sagittal crest; supraorbital ridges low, no prominent recess or pocket at their junction, straight, the frontal region more or less triangular, slightly depressed centrally; rostrum with prominent sub-globular narial swellings.. 2

2 a Muzzle with well-developed transverse dermal ridge; uppermost margins of rostrum slightly divergent anteriorly; narial inflations more or less globose, not projecting laterally much beyond anteriormost point of nasals, foremost extension of swelling in profile above the rear o f c^1. .....*Rhinopoma hardwickei* African Chiroptera name .....*Rhinopoma cystops*

b Dermal ridge on muzzle low; uppermost margins of rostrum more nearly parallel; narial inflations slightly angular, projecting considerably beyond anteriormost point of nasals, foremost extension of swelling in profile above front of c^1.....*Rhinopoma muscatellum*

Appendix 5z: Jones (1977a). Plecotus rafinesquii

1 a Supraorbital region sharply ridged (*Plecotus*) 2
b Supraorbital region not ridged: temporal ridges normally coalesced to form a sagittal crest (*Corynorhinus*) 3
2 a Width of tragus less than 5.4 mm; length of upper canine (height of crown) less than 1.7 mm; dorsal pelage buff or gray; bases of hairs on venter dark brown or buff .....*Plecotus auritus*
b Width of tragus greater than 5.4 mm; length of upper canine (height of crown) greater than 1.7 mm; dorsal pelage usually gray; bases of hairs on venter dark black*Plecotus austriacus*
3 a Tips of ventral hairs white or whitish, sharlpy contrasted with blackish bases; median postpalatan process triangular in shape, with a broad base; rostrum weak and much depressed; I^1 with prominent secondary cusp; anterointernal cusp usually present on cingulum of P^4 .....*Plecotus rafinesquii*
b Tips of ventral hairs brownish of buff, often not shaply contrasted with slate, gray, or brownish bass; median post-palatal process usually styliform, with a narrow base (ocassionally triangular); rostrum strong and not depressed, or variable; I^1 with or without secondary cusp; anterointernal cusp absent or variable on cingulum of P^4. 4
4 a Coloration of dorsum dark sooty-brown, with scant contrast between bases and tips of hairs; greatest length of skull usually less than 15.7 mm (females) or 15.5 mm (males); maxillary toothrow usually less than 4.9 mm; I^1 usually with secondary cusp; tragus usually less than 13 mm long; interfemoral cross ribs usually less than nine .....*Plecotus mexicanus*
b Coloration of dorsum sometimes yellow-bron, with sharp contrast between bases an tips of hairs; greatest length of skull usually more thatn 15.7 mm (females), or 15.5 mm (males); maxillary toothrow usually more than 4.9 mm; I^1 usually simple; tragus usually more than 13 mm long; interfemoral cross ribs usually more than nine*Plecotus townsendii*

Appendix 5aa: Smithers and Wilson (1979). Check List and Atlas of the Mammals of Zimbabwe Rhodesia

1	a	Second digit terminating in a claw; margin of ear forming a complete ring; tragus absent; interfemoral membrane greatly reduced, little more than a narrow band along the inner margin of the hind legs; tail absent or rudimentary; cheek teeth simple, without well developed cusp pattern (Sub Order Megachiroptera, Family Pteropodidae). 2
	b	Second digit without a claw; margin of ear cone not forming a complete ring; tragus general present; interfemoral membrane generally well developed; tail generally well developed; cheek-teeth cuspidate with generally clearly defined W-pattern (Sub Order Microchiroptera). 8
2	a	Ears with white basal tufts. 3
	b	Ears without white basal tufts. 4
3	a	Six palatal ridges, not more than two post-dental, the latter not differentiated from interdental ridges; post -dental palate strongly concave posteriorly (Genus *Epomophorus*). 5
	b	Five, or 9 - 11, palatal ridges, with sometimes five to seven post-dental, the latter strongly differentiated from the interdental ridges; post dental palate flattened posteriorly . ..... *Epomops dobsoni* African Chiroptera name ..... *Epomophorus dobsonii*
4	a	Forearm generally over 100; tail absent. ..... *Eidolon helvum*
	b	Forearm generally under 100; short tail present (Genus *Rousettus*). 7
5	a	One post-dental palatal ridge; forearm in males 77 - 89; females 72 - 86. *Epomophorus wahlbergi wahlbergi* African Chiroptera name ..... *Epomophorus wahlbergi*
	b	Two post-dental palatal ridges. 6
6	a	Forearm 87 - 93 (males), 81 - 86 (females). ..... *Epomophorus gambianus parvus* African Chiroptera name ..... *Epomophorus crypturus*
	b	Forearm 81 - 85 (males), 79 - 80 (females). ..... *Epomophorus crypturus*
7	a	Wings from the first toe; hair short and sleek; cheek teeth heavy; forearm generally above 90 (up to 105); premaxillaries in contact, not co-ossified; adult males without collar or stiff hairs. ..... *Rousettus aegyptiacus leachi* African Chiroptera name ..... *Rousettus aegyptiacus*
	b	Wings from second toe; hair longer and coarser; cheek teeth reduced in bulk; forearm generally below 90; premaxillaries either in contact, or co-ossified; adult males with our without differentiated collar of stiff hairs. ..... *Rousettus (Lissonycteris) angolensis angolensis* African Chiroptera name ..... *Myonycteris angolensis angolensis*
8	a	Tragus present (small in Molossidae). 9
	b	Tragus absent. 13
9	a	Tail with terminal portion projecting to a marked degree free of the interfemoral membrane. 10
	b	Tail entirely enclosed within the interfemoral membrane or entirely absent. 11
10	a	Free terminal portion of the tail emerges above the middle of upper surface of the interfemoral membrane (Family Emballonuridae, Genus *Taphozous*). 14
	b	Free terminal portion of the tail projecting considerably beyond the hind margin of the interfemoral membrane (Family Molossidae). 15
11	a	Muzzle without noseleaves of any kind (Family Vespertilionidae). 26
	b	Muzzle with noseleaves. 12
12	a	Muzzle with deep central longitudinal slit lined with fleshy dermal outgrowths (Family Nycteridae, Genus *Nycteris*). 47
	b	Muzzle without deep central longitudinal slit but covered with well developed nose leaves. 13
13	a	Posterior leaflet of noseleaf subtriangular, with erect pointed tip; toes with three phalanges (Family Rhinolophidae, Genus *Rhinolophus*). 51
	b	Posterior leaflet of noseleaf with upper edge either elliptical in outline, or tridentate; toes with two phalanges (Family Hipposideridae). 59
14	a	Entire dorsal fur conspicuously grizzled greyish; entire ventral surface white; forearm 58 - 64. ..... *Taphozous mauritianus*

b Dorsal fur not grizzled; ventral surface either dusky or only partially white; forearm 60 - 67..... *Taphozous perforatus rhodesiae*
African Chiroptera name ..... *Taphozous perforatus sudani*

15 a Prominent vertical projection on the zygoma; ears large, 38 - 40, conjoined on extended snout; size large, forearm 62 - 73; conspicuous bicoloured dorsal pelage pattern, with a pale collar separating the darker anterior and posterior regions of the body.....*Otomops martiensseni martiensseni*

b Not combining the above characters..... 16

16 a Skull conspicuously flattened, greatest depth of the braincase not more than one third of the greatest width. .....*Sauromys petrophilus petrophilus*

b Skull not conspicuously flattened (Genus*Tadarida*)..... 17

17 a M^3 reduced, cusps rarely more than V pattern: palatal emargination small or absent; ears generally conjoined, sometimes with a post-aural tuft; size small to large, forearm 27 - 66 (Subgenus *Mops*)..... 19

b M^3 not reduced, cusps forming N pattern..... 18

18 a Palatal emargination absent or rudimentary; ears conjoined, often with post-aural tuft, which is sometimes well developed; size medium, forearm 35 - 52 (Subgenus *Chaerephon*). 20

b Palatal emargination well developed; ears generally separate; size medium to large, forearm 45 - 66 (Subgenus *Tadarida*)..... 23

19 a Size large, forearm 58 - 66, total length skull 26 - 28. ..*Tadarida (Mops) midas midas*
African Chiroptera name .....*Mops (Mops) midas midas*

b Size smaller, forearm 44 - 50. .....*Tadarida (Mops) condylura*
African Chiroptera name .....*Mops (Mops) condylurus*

20 a With conspicuous white lateral bands below, along the flanks at the junction with the wing membrane, contrasting with the dark brown colour above and below, wings pale or dark; forearm 44 - 50.....*Tadarida (Chaerephon) nigeriae spillmanni*
African Chiroptera name ..... *Chaerephon nigeriae spillmanni*

b No white lateral bands below. 21

21 a Forearm 46 - 51; colour umber brown with a variable pattern of small white spots or short stripes on the crown, shoulders or flanks..... *Tadarida (Chaerephon) bivittata*
African Chiroptera name ..... *Chaerephon bivittatus*

b Forearm less than 42; no variable pattern of white spots or short stripes. 22

22 a Males with a long (12 - 14 mm) bicoloured post-aural crest, dark basally, pale apically; forearm 34 - 39; underparts white. ..... *Tadarida (Chaerephon) chapini shortridgei*
African Chiroptera name .....*Chaerephon chapini*

b Males with a short (10 mm or less) unicoloured post aural crest ; forearm 37 - 42; underparts flanked with brown or greyish brown with restricted area of white centrally. .....*Tadarida (Chaerephon) pumila*
African Chiroptera name .....*Chaerephon pumilus*

23 a Size large, forearm 57 - 66..... 24

b Size smaller, forearm 45 - 53. 25

24 a Ears large, united at base very close to the nostrils, projecting well beyond muzzle when laid forward; underside all white except for narrow brown flank stripe; skull, particularly rostrum, very narrow; basisphenoid pits shallow; lower canines almost touching at base; forearm 63. .....*Tadarida (Tadarida) lobata*
African Chiroptera name ..... *Tadarida lobata*

b Ears smaller, not united at inner margin, well back from nostrils, barely projecting beyond muzzle when laid forward; underside with or without restricted white area; skull not narrow at rostral region; basisphenoid pits deeper, sharply defined; forearm 57 - 66. ..... *Tadarida (Tadarida) fulminans mastersoni*
African Chiroptera name .....*Tadarida fulminans*

25 a Size medium, forearm 44 - 53; total length of skull 19 - 21; braincase flat; lower canines widely separated at base; no blackish area on chin and throat..... *Tadarida (Tadarida) aegyptiaca aegyptiaca*
African Chiroptera name ..... *Tadarida aegyptiaca aegyptiaca*

b Size smaller, forearm 47.5 or less; total length of skull 18 - 20; braincase elevated; lower canines almost touching at base, chin and throat generally blackish. . *Tadarida (Tadarida) ansorgei*
African Chiroptera name .....*Chaerephon ansorgei*

26	a	Second phalanx of third digit not specially elongated. 27
	b	Second phalanx of third digit about three times as long as first; braincase high and rounded (Subfamily Miniopterinae, Genus *Miniopterus*). 28
27	a	Ears not funnel shaped, without deep emargination below tip; tragus short and broad, or long and narrow, but not sharply pointed; braincase not particularly high and rounded (Subfamily Vepertilioninae). 30
	b	Ears funnel shaped, with deep emargination below tip; tragus long, narrow, sharply pointed; braincase high and rounded (Subfamily Kerivoulinae, Genus *Kerivoula*). 46
28	a	Size large, forearm 45 - 50, total length skull 16 or more. ... *Miniopterus inflatus rufus*
	b	Size medium, forearm c. 42 - 47; total length skull 14 - 15. 29
29	a	Forearm 42 - 44; total length skull c. 14. ..... *Miniopterus fraterculus*
	b	Forearm c. 42 - 47; total length skull c. 15. ..... *Miniopterus schreibersi natalensis* African Chiroptera name ..... *Miniopterus natalensis*
30	a	Six upper, six lower teeth on each side (Genus *Myotis*). 37
	b	Less than six upper and six lower cheek teeth. 31
31	a	Five upper, five lower cheek teeth; ears not lengthened. 32
	b	Four upper, five lower cheek teeth, ears only exceptionally notably lengthened. .. 33
32	a	Two upper incisors on each side (Genus *Pipistrellus*). 39
	b	One upper incisor on each side (Genus *Nycticeius*) (in part). .... *Nycticeius schlieffeni australis* African Chiroptera name ..... *Nycticeinops schlieffenii*
33	a	Two upper incisors on each side. 34
	b	One upper incisor on each side. 36
34	a	Rostrum very short and broad, braincase very high, more than two-thirds of the condylobasal length; wing with conspicuous reticulation of membranes. *Glauconycteris variegata variegata* African Chiroptera name ..... *Glauconycteris variegata*
	b	Rostrum not shortened; braincase not elevated; no body or wing pattern. 35
35	a	Ears 18 or more, about half length of forearm. ..... *Laephotis botswanae*
	b	Ears under 18, much less than half length of forearm (Genus *Eptesicus*). 42
36	a	Size larger, forearm not less than 46; 1st and 2nd upper molars with W pattern obsolescent; tragus long and tapering (Genus *Scotophilus*). 44
	b	Size smaller; forearm under 46; 1st and 2nd upper molars with normal W pattern; tragus either sickle shaped or short and broad. ..... *Nycticeius schlieffeni australis* African Chiroptera name ..... *Nycticeinops schlieffenii*
37	a	Size larger, forearm over 52; wings and interfemoral membrane spotted black or orange. ..... *Myotis welwitschii*
	b	Size smaller, forearm 52 or under; wings and interfernoral membrane not spotted black or orange. 38
38	a	Forearm 47 - 52. ..... *Myotis tricolor*
	b	Forearm 36 - 40. ..... *Myotis bocagei* African Chiroptera name ..... *Myotis bocagii*
39	a	Inner upper incisors deeply bifid; ventral surface whitish. *Pipistrellus rueppelli rueppelli* African Chiroptera name ..... *Pipistrellus rueppellii rueppellii*
	b	Inner upper incisors unicuspid or not very deeply bifid; ventral surface brown or grey. 40
40	a	Second upper incisor very reduced. ..... *Pipistrellus kuhli subtilis* African Chiroptera name ..... *Pipistrellus hesperidus subtilis*
	b	Second upper incisor not very reduced, only slightly smaller than the first. 41
41	a	Braincase flatter, cranium nearly level with the muzzle. .. *Pipistrellus rusticus rusticus* African Chiroptera name ..... *Pipistrellus rusticus*
	b	Braincase clearly raised above the level of the muzzle. ..... *Pipistrellus nanus* African Chiroptera name ..... *Neoromicia nana*
42	a	Larger, forearm 46 - 53. ..... *Eptesicus hottentotus bensoni* African Chiroptera name ..... *Eptesicus hottentotus*
	b	Smaller, forearm 35 or less. 43
43	a	Cranial portion of skull elevated above rostrum. ..... *Eptesicus zuluensis* African Chiroptera name ..... *Neoromicia zuluensis*
	b	Cranial portion of skull not elevated above rostrum. ..... *Eptesicus capensis* African Chiroptera name ..... *Neoromicia capensis*

44 a Large, forearm over 85. ..... *Scotophius gigas*
African Chiroptera name ..... Scotophilus nigrita
b Smaller, forearm not over 65. 45
45 a Total length skull 19.6 - 23; underparts usually yellow; length forearm 50 - 65. ..... *Scotophilus nigrita dingani*
(This should be *Scotophilus dinganii*. See Robbins (1978))
African Chiroptera name ..... Scotophilus dinganii
b Total length skull 16 - 19.1; underparts usually beige; length forearm 43 - 50. ..... Scotophilus leucogaster
46 a Size large, forearm 34 - 39; skull 15 or more; colour above reddish chestnut, below either whitish of buffy, never brown. ..... *Kerivoula argentata argentata*
African Chiroptera name ..... Kerivoula argentata
b Size smaller, forearm 27 - 36; skull 13.5 or less; colour brownish or greyish brown above and below. ..... *Kerivoula harrisoni lucia*
African Chiroptera name ..... Kerivoula lanosa
47 a Upper incisors trifid. 48
b Upper incisors bifid. 49
48 a Forearm 36 - 45, ear 18 - 25. ..... *Nycteris hispida villosa*
African Chiroptera name ..... Nycteris hispida
b Forearm 57 - 66, ear 28 - 35. ..... Nycteris grandis
49 a Tragus semilunate, base of its posterior margin not notched. 50
b Tragus pyriform, base of its posterior margin shallowly notched. ..... *Nycteris thebaica capensis*
African Chiroptera name ..... Nycteris thebaica
50 a Forearm 37 - 42, ear 29 - 34. ..... *Nycteris woodi sabiensis*
African Chiroptera name ..... Nycteris woodi
b Forearm 45 - 50, ear 28 - 34. ..... *Nycteris macrotis oriana*
African Chiroptera name ..... Nycteris macrotis
51 a Face and/or lateral margins of sella liberally furnished with long hairs; connecting process low, rounded; greatest breadth of horseshoe over 9. 52
b Sella naked; connecting process rounded or pointed; greatest breadth of horseshoe generally under 9. 53
52 a Forearm 62 - 67. ..... *Rhinolophus hildebrandti*
African Chiroptera name ..... Rhinolophus hildebrandtii
b Forearm 50 - 60. ..... Rhinolophus fumigatus
53 a Anterior upper premolar, when present, external to toothrow; canines and P^4 in contact, connecting process bluntly pointed. 54
b Anterior upper premolar in the toothrow; canine and P^4 in contact; connecting process blunt or sharply pointed. 55
54 a Forearm 45 - 50. ..... *Rhinolophus darlingi darlingi*
African Chiroptera name ..... Rhinolophus darlingi
b Forearm 53 - 60. ..... *Rhinolophus clivosus zuluensis*
African Chiroptera name ..... Rhinolophus clivosus
55 a 1st phalanx of 4th finger notably shortened in relation to the metacarpal length. ..... *Rhinolophus landeri lobatus*
African Chiroptera name ..... Rhinolophus lobatus
b 1st phalanx of 4th finger not notably shortened in relation to metacarpal length. ... 56
56 a Connecting process rises to high and narrow horn. ..... *Rhinolophus blasi empusa*
African Chiroptera name ..... Rhinolophus blasii
b Connecting process with low, bluntly pointed tip. 57
57 a Sella broader; ears longer. ..... Rhinolophus simulator
b Sella narrower; ears shorter. 58
58 a Front edge of connecting process almost concave. lancet with sides almost convex; fur whitish at base. ..... *Rhinolophus denti denti*
African Chiroptera name ..... Rhinolophus denti
b Front edge of connecting process convex; lancet with sides concave, tip pointed ; fur nearly unicolor. ..... Rhinolophus swinnyi
59 a Posterior leaflet on noseleaf simple in outline, elliptical or rounded, not tridentate; ears either separate or united by a low band; rostrum at least half as long as the braincase; small upper premolar present; forearm 34 - 115 (Genus *Hipposideros*). 61

b Posterior leaflet of noseleaf tridentate; ears separate; small upper premolar present or absent; rostrum sometimes less than half as long as braincase; forearm 31 - 54.. 60

60 a Size very small, forearm 31 - 35; ears very low, rounded, rim-like, length 8; noseleaf small and inconspicuous; thumbs minute; rostrum less than half length of braincase. .....*Cloeotis percivali australis*
African Chiroptera name ..... *Cloeotis percivali*

b Size larger, forearm 50 - 54; ears short, 10 - 14, pointed; noseleaf conspicuous; thumbs normal; rostrum more than half the length of the braincase; upper incisors bifid. .....*Triaenops persicus afer*

61 a Size large, forearm 79 - 115. .....*Hipposideros commersoni marungensis*
African Chiroptera name ..... *Macronycteris commersoni*

b Size smaller, forearm less than 48. ..... *Hipposideros caffer caffer*
African Chiroptera name ..... *Hipposideros caffer*

Appendix 5ab: El-Rayad (1980). Systematics of African molossid bats of the subgenus Xiphonycteris of the genus Tadarida (Molossidae Chiroptera).

1	a	Third commissure of M^3 absent..... 2
	b	Third commissure of M^3 present but reduced. 5
2	a	Palate with conspicuous median emargination separating the upper inner incisors by a space. 3
	b	Palate closed, without conspicuous median emargination, upper incisors in contact. 4
3	a	Upper incisors converge apically, on the same horizontal plane as canines. *Tadarida spurrelli*
	b	Upper incisors do not converge apically and are on the anteriormost projection of the premaxilla. ..... *Tadarida nanula*
4	a	Forearm less than 50 mm., scent gland at the base of penis. .*Tadarida demonstrator*
	b	Forearm more than 60 mm., without scent gland at the base of penis.*Tadarida midas*
5	a	Palate with median emargination. 6
	b	Palate closed. 8
6	a	Forearm less than 35 mm., basisphenoid pits oval, skull length about 15.8 - 17.5 mm. ..... *Tadarida petersoni*
	b	Forearm more· than 35 mm. 7
7	a	Dorsal hair extends onto the endopatagium; lambdoidal crest interrupted, not continuous; basisphenoid pits long oval and tapering anteriorly.*Tadarida brachyptera*
	b	Dorsal hair does not extend onto the endopatagium, posterior dorsolateral surfaces nude; lambdoidal crest continuous; basisphenoid pits deep and round, not tapering anteriorly. ..... *Tadarida thersites*
8	a	Forearm less than 50 mm. 9
	b	Forearm more than 50 mm..... 10
9	a	Forearm about 44 - 47 mm; large lambdoidal crest projecting posteriorly; anterior upper premolar sometimes absent or minute and external to toothrow..... *Tadarida condylura*
	b	Sagittal crest low; anterior upper premolar in line with toothrow; crown darker than back and shoulders. .....*Tadarida niveiventer*
10	a	Forearm about 50.4 - .54.1 mm., skull length about 23.7 - 24.4 mm.; third commissure of M^3 reduced but pronounced. ..... *Tadarida trevori*
	b	Forearm about 54.2 - 59.6 mm., skull length about 24. 7 - 26. 6 mm.; third cornmissure of M^3 reduced but minute. .....*Tadarida congica*

Appendix 5ac: El-Rayah (1981). A New species of bat of the genus Tadarida (Family Molossidae) from West Africa.

1 a Forearm less than 32 mm; M^3 without 3rd commissure..... 2
b Forearm more than 32 mm; M^3 with short but distinct third commissure..... 3
2 a Canines with enlarged cingula; upper incisors not projecting in front of anterior face of canine cingula; skull greatest length 14.0 - 16.8..... *Tadarida spurrelli*
African Chiroptera name .....*Mops (Xiphonycteris) spurrelli*
b Canines without enlarged cingula; upper incisors projecting in front of anterior face of canine cingula; skull greatest length 15.0 – 17.5 ..... *Tadarida nanula*
African Chiroptera name .....*Mops (Xiphonycteris) nanulus*
3 a Forearm less than 35 mm; skull length 15.8 - 17.5..... *Tadarida petersoni*
African Chiroptera name ..... *Mops (Xiphonycteris) petersoni*
b Forearm 35 mm or more; skull length 17.2 - 20.6..... 4
4 a Wing insertion high on sides of back with dorsal pelage restricted to top of back and not extending over rump to base of tail; ventral pelage dark with darker lateral bands; basisphenoid pits deep and rounded laterally with septum between nearly parallel. ..... *Tadarida thersites*
African Chiroptera name .....*Mops (Xiphonycteris) thersites*
b Wing insertion lower on sides of body; dorsal pelage not restricted to back and extends to sides of body and over rump to base of tail; ventral pelage from white to orange buff without dark lateral bands; basisphenoid pits shallow and long oval shape with septum between narrowing anteriorly..... *Tadarida brachyptera*
African Chiroptera name ..... *Mops (Xiphonycteris) brachypterus*

Appendix 5ad: Rautenbach (1982). Mammals of Transvaal.

1	a	Second digit terminating in a claw; margin of ear conch forming a complete ring: tragus always absent interfemoral membrane greatly reduced, little more than a narrow band along inside margin of hind legs: tail absent or rudimentary: cheek teeth simple, without well-developed cusp pattern (Megachiroptera). 2
	b	Second digit without a claw; margin of ear conch not forming a complete ring; tragus generally present; absent in Rhinolophidae and Hipposideridae): interfemoral membrane generally well-developed: tail generally well-developed (absent in one family.); cheek teeth cuspidate, generally with a clearly defined W-pattern (Microchiroptera). 5
2	a	Ears with white basal tufts (Genus *Epomophorus*). 4
	b	Ears without white basal tufts. 3
3	a	Forearm 110 - 130. ..... *Eidolon helvum*
	b	Forearm 65 - 102. ..... *Rousettus aegyptiacus*
4	a	One post-dental palatal ridge. ..... *Epomophorus wahlbergi*
	b	Two post-dental palatal ridges. ..... *Epomophorus crypturus*
5	a	With a distinct tail extending past the interfemoral membrane. 6
	b	Tail almost entirely enclosed within the interfemoral membrane. 7
6	a	Free terminal portion of tail emerges above middle of upper surface of interfemoral membrane (Family Emballonuridae, Genus *Taphozous*). 10
	b	Free terminal portion of tail enclosed in but projecting considerably beyond hind margin of interfemoral membrane (Family Molossidae). 33
7	a	Muzzle without nose-leaves (Family Vespertilionidae). 18
	b	Muzzle with nose-leaves. 8
8	a	Muzzle with deep central longitudinal slit lined with fleshly dermal outgrowths (Family Nycteridae, Genus *Nycteris*). ..... *Nycteris thebaica capensis* African Chiroptera name ..... *Nycteris thebaica*
	b	Face without a deep central slit, but with well-developed nose-leaves covering muzzle. 9
9	a	Posterior nose-leaves subtriangular, with erect pointed tip: toes with three phalanges (Family Rhinolophidae, Genus *Rhinolophus*). 11
	b	Posterior nose-leaves with upper edge either elliptical in outline or tridentate: toes with two phalanges (Family Hipposideridae). 17
10	a	Fur above grizzled, the tips of the hair whitish, underside pure white: length of skull over 21.5 mm; forearm 58 – 64. ..... *Taphozous (Taphozous) mauritianus* African Chiroptera name ..... *Taphozous mauritianus*
	b	Fur above unicolour; length of skull less than 21.5 mm; forearm 60 – 67. .*Taphozous (Taphozous) perforatus* African Chiroptera name ..... *Taphozous perforatus perforatus*
11	a	Face and/or lateral margins of sella liberally furnished with long hairs; connecting process low, rounded; greatest breadth of horseshoe generally over 9 mm. 12
	b	Sella naked; connecting process rounded or pointed; greatest breadth of horseshoe generally under 9 mm. 13
12	a	Forearm 62 - 67; skull length 26 - 30 mm. ..... *Rhinolophus hildebrandtii*
	b	Forearm 50 - 60; skull length 24 - 25 mm. ..... *Rhinolophus fumigatus*
13	a	Anterior upper premolar, when present, external to toothrow; canine and P^4 in contact; connecting process bluntly pointed. 14
	b	Anterior upper premolar in toothrow; canine and P^4 not in contact; connecting process blunt or sharply pointed. 15
14	a	Forearm 50 – 57. ..... *Rhinolophus clivosus*
	b	Forearm 45 – 50. ..... *Rhinolophus darlingi*
15	a	First phalanx of fourth finger notably shortened in relation to metacarpal length. ..... *Rhinolophus landeri*
	b	First phalanx of fourth finger not notably shortened in relation to metacarpal length. 16
16	a	Sella cuneate or wedge-shaped; no marked contrast between crown areas of anterior and posterior lower premolars; forearm 44 - 48. ..... *Rhinolophus blasii*
	b	Sella parallel-sided: strong contrast between crown areas of anterior and posterior lower premolars. ..... *Rhinolophus simulator*
17	a	Larger; rostrum at least half as long as braincase; forearm over 42. *Hipposideros caffer*

b Smaller, rostrum less than half the length of braincase: forearm 31 – 35. ..... *Cloeotis percivali*

18 a Second phalanx of third digit about three times as long as first; braincase high and rounded (Subfamily Miniopterinae, Genus *Miniopterus*). 32

b Second phalanx of third digit not especially elongated. 19

19 a Ears not funnel-shaped, without deep emargination below tip; tragus short and broad, or long and narrow, but not sharply pointed; braincase not particularly high and rounded (Subfamily Verspertilioninae). 20

b Ears funnel-shaped, with deep emargination below tip; tragus long, narrow, sharply pointed; braincase high and rounded (Subfamily Kerivoulinae, Genus *Kerivoula*). 31

20 a Six upper, six lower cheek teeth on each side (Genus *Myotis*). 25

b Less than six upper and six lower cheek teeth. 21

21 a Two upper incisors on each side. 22

b One upper incisor on each side. 24

22 a Wings with a conspicuous dark reticulate pattern on a pale background (Genus *Glauconycteris*). .....*Chalinolobus variegata variegata*
African Chiroptera name .....*Glauconycteris variegata*

b Wings unicolour. 23

23 a Upper jaw with two premolars on each side (Genus *Pipistrellus*). 27

b Upper jaw with one premolar on each side (Genus *Eptesicus*). 29

24 a Skull with a distinct posteriorly-projecting helmet; ear tragus long, tapering (Genus *Scotophilus*). 30

b Skull normal; ear tragus half-moon shaped. .....*Nycticeius (Scoteinus) schlieffenii*
African Chiroptera name .....*Nycticeinops schlieffenii*

25 a Wing and interfemoral membranes and forearm conspicuously part-coloured (black and red). .....*Myotis (Chrysopteron) welwitschii*
African Chiroptera name .....*Myotis welwitschii*

b Wing and interfemoral membranes not parti-coloured. 26

26 a Size larger, forearm 47 - 52 mm. .....*Myotis (Selysius) tricolor*
African Chiroptera name .....*Myotis tricolor*

b Size smaller, forearm 36 - 40 mm; colour typically orange-rufous on back. ..... *Myotis bocagii*

27 a Second upper incisor very reduced. .....*Pipistrellus (Pipistrellus) kuhli*
(This should be *Pipistrellus hesperidus*. See Kock (2001))
African Chiroptera name .....*Pipistrellus hesperidus*

b Second upper incisor not very reduced, only slightly smaller than first. 28

28 a Braincase flatter, cranium nearly level with muzzle. .*Pipistrellus (Pipistrellus) rusticus*
African Chiroptera name .....*Pipistrellus rusticus*

b Braincase clearly raised above level of muzzle. .....*Pipistrellus (Pipistrellus) nanus*
African Chiroptera name .....*Neoromicia nana*

29 a Cranial portion of skull elevated above rostrum. .....*Eptesicus zuluensis*
African Chiroptera name .....*Neoromicia zuluensis*

b Cranial portion of skull not elevated above rostrum. ..... *Eptesicus capensis capensis*
African Chiroptera name .....*Neoromicia capensis*

30 a Length skull 19.6 - 23; length forearm 50 – 65; underparts usually yellow. *Scotophilus dinganii*

b Length skull 16 - 19.1; length forearm 43 -·50; underparts usually beige.. *Scotophilus viridis*

31 a Size larger, forearm 34 – 39; skull 15 or more; colour above bright reddish-chestnut, below either whitish or buffy, never brown. .....*Kerivoula argentata zuluensis*
African Chiroptera name .....*Kerivoula argentata*

b Size smaller, forearm 27 - 36; skull 13.5 or less; colour brownish or greyish-brown above and below. .....*Kerivoula lanosa lucia*
African Chiroptera name .....*Kerivoula lanosa*

32 a Forearm 42 - 44; skull length c. 14. .....*Miniopterus fraterculus*

b Forearm c. 42 - 47; skull length c. 15. .....*Miniopterus schreibersi*
African Chiroptera name .....*Miniopterus schreibersii*

33 a Skull distinctly flattened (depth of braincase about a third of its width). ..... *Sauromys petrophilus petrophilus*

b Skull not conspicuously flattened (Genus *Tadarida*). 34

34 a M^3 reduced, cusps rarely more than a V pattern; palatal emargination small or absent; ears generally conjoined, sometimes with post-aural tuft; size small to large, forearm 27 - 66 (Subgenus *Mops*)..... 36
b M^3 not reduced, cusps forming N pattern..... 35
35 a Palatal emargination absent or rudimentary; ears conjoined, often with post-aural tuft, which is sometimes well-developed; size medium, forearm 37 – 42. ..... *Tadarida (Chaerephon) pumila*
African Chiroptera name .....*Chaerephon pumilus*
b Palatal emargination well-developed; ears generally separate; size medium to large, forearm 45 - 66 (Subgenus *Tadarida*)..... 37
36 a Size larger, forearm 58 – 66; skull length 26 - 28. ..... *Tadarida (Mops) midas*
African Chiroptera name .....*Mops (Mops) midas*
b Size smaller, forearm 44 – 50. ..... *Tadarida (Mops) condylura*
African Chiroptera name .....*Mops (Mops) condylurus*
37 a Size larger, forearm 63 – 66..... *Tadarida (Tadarida) ventralis*
African Chiroptera name .....*Tadarida ventralis*
b Size smaller, forearm 44 – 53. *Tadarida (Tadarida) aegyptiaca aegyptiaca / Tadarida (Tadarida) aegyptiaca bocagei*
African Chiroptera name .....*Tadarida aegyptiaca*

Appendix 5ae: Smithers, R.H.N. (1983). The mammals of the Southern African subregion

1	a	Second digit on forearm terminating in a claw (Fig. V.1), margin of ear forming a complete ring; ear tragus absent; interfemoral membrane greatly reduced, little more than a narrow band along inside margin of hind legs; tail absent or rudimentary (Fig. 45.1): cheek teeth simple, without well-developed cusp pattern (Fig. V.2) (Suborder Megachiroptera) 2
	b	Second digit without a claw; margin of ear not forming a complete ring; ear tragus generally present (absent in family Rhinolophidae); interfemoral membrane and tail generally well-developed; cheek teeth cuspidate with generally well developed W pattern (suborder Microchiroptera)..... 9
2	a	Ears with white basal tufts..... 3
	b	Ears without white basal tufts..... 4
3	a	Six ridges on the palete, not more than two behind the last tooth; these not differentiated from the ridges between the teeth (Fig. 40.1); the back of the palate, behind the teeth, strongly concave at the back (genus *Epomophorus*)..... 5
	b	Five, or 9 to 11 ridgeson the palate, at least five behind the last tooth, these differentiated from the ridges between the teeth; the back of the palate, behind the teeth, flattened at the back..... *Epomops dobsoni* African Chiroptera name ..... *Epomophorus dobsonii*
4	a	Size larger, length of forearm over 100..... *Eidolon helvum*
	b	Size smaller, length of forearm under 100 (genus *Rousettus*)..... 8
5	a	One palatal ridge behind the last tooth (Fig. 40.1.a); length of forearm 77 - 89 (males), 72 - 86 (females) ..... *Epomophorus wahlbergi*
	b	Two palatal ridges behind the last tooth (Fig. 40.1.b) 6
6	a	Fourth palatal ridge midway between third and fifth (fig. 40.1.b) 7
	b	Fourth palatal ridge much nearer the third than fifth; length of forearm 87 - 91 in males, 82 in females (Fig. 41.1.b)..... *Epomophorus angolensis*
7	a	Length of forearm 87 - 93 (males), 81 - 86 (females) ..... *Epomophorus gambianus*
	b	Forearm 81 - 85 (males), 79 - 80 (females) ..... *Epomophorus crypturus*
8	a	Wing membranes arise from the first toe; hair short and sleek; cheek teeth heavy; length forearm generally above 89 and up to 96; adult males without collar of bristly hairs on the throat ..... *Rousettus aegyptiacus*
	b	Wing membranes arise from the second toe; hair longer and coarser; cheek teeth reduced in bulk; length of forearm less than 90; adult males with a disctinct collar of bristly hairs on the throat..... *Rousettus angolensis* African Chiroptera name ..... *Myonycteris angolensis*
9	a	With a distinct tail extending free of the interfemoral membrane..... 10
	b	Tail almost entirely enclosed within the interfemoral membrane 11
10	a	Free terminal part of tail emerging upwards from near the middle of the interfemoral membrane (Fig. VI.1) (family Emballonuridae) 14
	b	Free terminal part of tail emerging from the posterior part of the interfemoral membrane and extending well beyond it (Fig. VII.2) (family Molossidae) 60
11	a	No noseleaves (Fig. VIII.1) (family Vespertilionidae) 33
	b	Face with noseleaves..... 12
12	a	Face with a deep central slit (Fig. IX.1) (family Nycteridae)..... 16
	b	Face without a deep central slit..... 13
13	a	Posterior noseleaf subtriangular with an erect point (Fig. X.1) (family Rhinolophidae) 21
	b	Posterior noseleaf elliptical (Fig. XI.1) (family Hipposideridae)..... 30
14	a	Smaller, forearm less than 55; two upper and six lower incisor teeth..... *Coleura afra*
	b	Larger, forearm over 57, two upper incisors which may be minute or absent, four lower incisor teeth (genus *Taphozous*)..... 15
15	a	Fur on upper parts grizzled greyish, the tips of the hair whitish, under parts pure white; total length of the skull over 21.5 mm; forearm 60 - 64 mm.... *Taphozous mauritianus*
	b	Fur on upper parts unicolour dark brown, the under parts not pure white; total length of the skull less than 21.5 mm; forearm 62 - 67 mm..... *Taphozous perforatus* African Chiroptera name ..... *Taphozous perforatus perforatus*
16	a	Upper incisor teeth trifid (Fig. 94.1)..... 17

	b	Upper incisor teeth bifid 18
17	a	Forearm 36 - 45, ear 18 - 25 ..... *Nycteris hispida*
	b	Forearm 57 - 66, ear 28 - 35 ..... *Nycteris grandis*
18	a	Ear tragus semi-lunate, base of its posterior margin not notched (*aethiopica* group) 19
	b	Ear tragus pyriform, base of its posterior margin shallowly notched (*thebaica* group) 20
19	a	General colour greyish; forearm 37 - 42, ear 29 - 34 ..... *Nycteris woodi*
	b	General colour brownish; forearm over 43; ear over 21 ..... *Nycteris macrotis*
20	a	Size smaller; forearm 42 - 52, ears 28 - 37; skull less massive; breadth of supraorbital flanges about 6.8 ..... *Nycteris thebaica*
	b	Size larger; forearm over 50; ears about 22; skull massive, rostrum 20 % heavier than in *N. thebaica*, breadth of supraorbital flanges about 9.0 ..... *Nycteris vinsoni*
21	a	Face and/or lateral margins of the sella liberally furnished with long hairs; connecting process low, rounded; greatest breadth of horseshoe generally over 9.0 (Fig. X.2) 22
	b	Sella naked; connecting process rounded or pointed; greatest breadth of horseshoe under 9.0 23
22	a	Forearm 62 - 67 ..... *Rhinolophus hildebrandti* African Chiroptera name ..... *Rhinolophus hildebrandtii*
	b	Forearm 50 - 60 ..... *Rhinolophus fumigatus*
23	a	Anterior upper premolar, when present, external to toothrow (Fig. X.5); canines and fourth upper premolar in contact; connecting process bluntly pointed 24
	b	Anterior upper premolar in toothrow (Fig. X.5); canine and fourth upper premolar not in contact; connecting process blunt or sharply pointed 25
24	a	Forearm 50 - 57 ..... *Rhinolophus clivosus*
	b	Forearm 45 - 50 ..... *Rhinolophus darlingi*
25	a	First phalanx of fourth finger notably shortened in relation to metacarpal length: forearm 40 - 48 ..... *Rhinolophus landeri*
	b	First phalanx of fourth finger not notably shortened in relation to metacarpal length 26
26	a	Connecting process rises to high and narrow horn ..... *Rhinolophus blasii*
	b	Connecting process with low, bluntly pointed tip 27
27	a	Larger, forearm 47 - 51; skull 20.0 or more ..... *Rhinolophus capensis*
	b	Smaller, forearm 40 - 46; skull 18.7 or less 28
28	a	Sella broader; ears longer (20 - 22) ..... *Rhinolophus simulator*
	b	Sella narrower; ears shorter (18 - 20) 29
29	a	Front edge of connecting process almost concave; lancet with sides almost convex; fur lights at base ..... *Rhinolophus denti*
	b	Front edge of connecting process convex; lancet with sides concave, tip pointed; fur nearly unicoloured ..... *Rhinolophus swinnyi*
30	a	Posterior leaflet on noseleaf simple in outline, elliptical or rounded, not tridentate; ears either separate or united by low band; rostrum at least half as long as the braincase; small upper premolar present; forearm 40 - 110 (genus *Hipposideros*) 32
	b	Posterior leaflet of noseleaf tridentate; ears separate; small upper molar present or absent; rostrum sometimes less than half as long as braincase; forearm 30 - 40.. 31
31	a	Size very small, forearm 31 - 35; ears very low, rounded, rim-like, length 8; noseleaf small and inconspicuous; thumbs minute; rostrum less than half length of braincase ..... *Cloeotis percivali*
	b	Size larger, forearm 50 - 54; ears short, 10 - 14, but pointed; noseleaf conspicuous; thumbs normal; rostrum more than half the length of the braincase; upper incisors bifid (genus *Triaenops*) ..... *Triaenops persicus*
32	a	Size larger; forearm 90 - 110; ears narrow and pointed ..... *Hipposideros commersoni* African Chiroptera name ..... *Macronycteris commersoni*
	b	Size smaller; forearm 40 - 50; ears broader ..... *Hipposideros caffer*
33	a	Second phalanx of third digit not especially elongated 34
	b	Second phalanx of third digit about three times as long as first; braincase high and rounded (subfamily MINIOPTERINAE; genus *Miniopterus*) 58
34	a	Ears not funnel-shaped, without deep emargination below tip; ear tragus short and broad, or long and narrow, but not sharply pointed; braincase not particularly high and rounded (subfamily VESPERTILIONINAE) 35

b Ears funnel-shaped, with deep emargination below tip; ear tragus long, narrow, sharply pointed; braincase high and rounded (subfamily KERIVOULINAE; genus *Kerivoula*) 57

35 a Six upper, six lower cheek teeth on either side (genus *Myotis*) 42

b Less than six upper and six lower cheek teeth 36

36 a Five upper, five lower cheekteeth; ears nor lengthened; two upper incisors on each side; wing with fifth finger not shortened; ears not joined at base (genus *Pipistrellus*) 47

b Four upper, five lower cheek teeth; ears only exceptionally notably lengthened ... 37

37 a Two upper incisors on each side 38

b One upper incisor on each side 40

38 a Rostrum very short and broad; braincase very high more than two-thirds of condylobasal length; lower lip with lobe at posterior angle; frequently with body pattern of spots and/or stripes, or conspicuous reticulation of wing membranes *Chalinolobus variegatus*
African Chiroptera name ..... *Glauconycteris variegata*

b Rostrum not shortened; braincase not elevated; no body or wing pattern 39

39 a Ear 18 or more, about half length of forearm (genus *Laephotis*) 46

b Ears less than 18, much less than half length of forearm (genus *Eptesicus*) 50

40 a Size larger, forearm not less than 46 mm; first and second upper molars with W-pattern obsolescent; tragus long and tapering (genus *Scotophilus*) 55

b Size smaller, forearm less than 46 mm; first and second upper molars with normal W-pattern; tragus either sickle-shaped or short and broad 41

41 a Skull with rostrum not broadened; palatal emargination narrow; anterior lower premolar about half the crown area of the next premolar; upper canines with rounded anterior surface; tragus halfmoon-shaped; penis not enlarged; forearm 29 - 33 mm ..... *Nycticeius schlieffenii*
African Chiroptera name ..... *Nycticeinops schlieffenii*

b Skull with rostrum notably broadened, particularly across lachrymals; palatal emargination broader; upper cheek teeth four or five; lower premolars equal in crown area; upper canines with broad flat anterior face; tragus short and broad; penis greatly lengthened, nearly a quarter of the length of the head and body; forearm 28 - 38 mm ..... *Scotoecus albofuscus*

42 a Size larger, forearm over 52 mm ..... *Myotis welwitschii*

b Size smaller, forearm 52 or less 43

43 a Wings with glands; first two upper premolars greatly reduced and closely crowded together laterally 44

b Wings without glands; first two upper premolars not greatly reduced, not crowded together laterally (Fig. 72.1) 45

44 a Size smaller, forearm 32.5 - 2.9 ..... *Myotis seabrai*
African Chiroptera name ..... *Cistugo seabrae*

b Size larger, forearm 34.5 ..... *Myotis lesueuri*
African Chiroptera name ..... *Cistugo lesueuri*

45 a Size larger, forearm 47 - 52 ..... *Myotis tricolor*

b Size smaller, forearm less than 47 ..... *Myotis bocagei*
African Chiroptera name ..... *Myotis bocagii*

46 a Larger, total length of the skull over 16 mm; upper parts light drab; length of ears 25 mm; ear tragus with a notch near the base of the outside edge (Fig. 78.1.d) *Laephotis namibensis*

b Smaller, total length of the skull under 15 mm; upper parts buffy-brown; length ears 21 mm; ear tragus without a notch near the base of the outside edge (Fig. 78.1.b) ..... *Laephotis botswanae*

47 a Inner upper incisor teeth unicuspid or not very deeply bicuspid (Fig 75.2); the under parts brown or grey (subgenus *Pipistrellus*) 48

b Inner upper incisors deeply bifid; the under parts pure white .*Pipistrellus (Scotozous) rueppelli*
African Chiroptera name ..... *Pipistrellus rueppellii*

48 a Second upper incisor teeth much reduced ..... *Pipistrellus (Pipistrellus) kuhlii*
(This should be *Pipistrellus hesperidus*. See Kock (2001))
African Chiroptera name ..... *Pipistrellus hesperidus*

b Second upper incisor teeth only slightly smaller than first 49

49 a Braincase flatter, cranium nearly level with the muzzle*Pipistrellus (Pipistrellus) rusticus*
African Chiroptera name ..... *Pipistrellus rusticus*

b Braincase clearly raised above the level of the muzzle*Pipistrellus (Pipistrellus) nanus*
African Chiroptera name ..... *Neoromicia nana*

50 a Wing membranes white or translucent..... *Eptesicus rendalli*
African Chiroptera name ..... *Neoromicia rendalli*

b Wing membranes dark 51

51 a Size larger, forearm over 40; inner upper incisor teeth unicuspid*Eptesicus hottentotus*

b Size smaller, forearm under 40; inner upper incisor teeth bicuspid..... 52

52 a Forearm 34.5 - 38..... *Eptesicus melckorum*
African Chiroptera name ..... *Neoromicia capensis*

b Forearm 35 or less 53

53 a Cranial portion of skull elevated above rostrum (Fig. 84.1) .....*Eptesicus zuluensis*
African Chiroptera name ..... *Neoromicia zuluensis*

b Cranial portion of skull not elevated above rostrum (Fig. 86.1) 54

54 a Colour of the upper parts paler; wing membranes edged with white; fur on the upper parts up to 8 mm long; skull lacking the upwardly projecting "helmet" in the occipital region.....*Eptesicus somalicus*
African Chiroptera name ..... *Neoromicia somalica*

b Colour of the upper parts darker; wing membranes not edgesd with white; fur on the upper parts not over 5 mm long; skull with a "helmet" in the occipital region*Eptesicus capensis*
African Chiroptera name ..... *Neoromicia capensis*

c Size larger, forearm 29 - 35; skull with posterior occipital "helmet" .....*Eptesicus (Eptesicus) capensis*
African Chiroptera name ..... *Neoromicia capensis*

55 a Size large, forearm 75 - 80; total length skull over 30..... *Scotophilus nigrita*

b Size smaller, forearm 43 - 65 56

56 a Forearm 50 - 65; total length skull 20 - 23 ..... *Scotophilus dinganii*

b Forearm 43 - 50; skull 16 - 19 ..... *Scotophilus viridis*

57 a Size large, forearm 34 - 39; total length of skull 15 or more; colour above reddish-chestnut, under parts either whitish or white tinged buffy ..... *Kerivoula argentata*

b Size smaller, forearm 32 - 36; total length of skull 13.5 or less; colour brownish, greyish-brown or dull buffy, the under parts buffy, whitish at least on the chest and belly .....*Kerivoula lanosa*

58 a Average total length of skull 16 or more, forearm 45 - 50..... *Miniopterus inflatus*
African Chiroptera name ..... *Miniopterus inflatus inflatus*

b Average total length of skull 14 - 15, forearm 42 - 47 59

59 a Average total length of skull 14, forearm 42 - 44 .....*Miniopterus fraterculus*

b Average total length of skull 15, forearm 42 - 47 ..... *Miniopterus schreibersii*

60 a Prominent vertical projection on zygoma; ears very large, 38 - 40, conjoined on extended snout; size very large, forearm 62 - 73; conspicuous bicolored pelage pattern, with a pale collar separating dark anterior and posterior regions of body ..... *Otomops martiensseni*

b Not as above 61

61 a Skull conspicuously flattened, greatest depth of braincase not more than one-third of greatest width ..... *Sauromys petrophilus*

b Skull not conspicuously flattened (genus *Tadarida*) 62

62 a Only 4 upper post-canine cheek teeth; M^3 not reduced; upper incisors widely separated by large palatal emargination; six lower incisor teeth; ears separate; size small, forearm about 38 (subgenus *Mormopterus*) ..... *Tadarida (Mormopterus) acetabulosus*
African Chiroptera name .....*Mormopterus acetabulosus*

b 5 upper post-canine cheek teeth (the small premolar very reduced, sometimes absent in *T.(Mops) condylura*, but in that case with M^3 reduced, ears conjoined, palatal emargination rudimentary or absent, size large, forearm 43 - 49); normally four lower incisor teeth, rarely six; ears conjoined or separate; foreram 27 - 66 mm..... 63

63 a M^3 reduced, cusps rarely more than a V pattern; palatal emargination small or absent; ears generally conjoined, sometimes with a post-aural tuft; size small to large, forearm 27 - 66 (subgenus *Mops*) 65
b M^3 not reduced, cusps forming an N pattern 64
64 a Palatal emargination absent or rudimentary; ears conjoined, often with post-aural tuft, which is sometimes well developed; size medium, forearm 35 - 52 (subgenus *Chaerephon*) 66
b Palatal emargination well-developed; ears generally separate; size medium to large, forearm 45 - 66 (subgenus *Tadarida*) 69
65 a Size large, forearm 58 - 66; skull length 26 - 28 ..... *Tadarida (Mops) midas*
African Chiroptera name ..... *Mops (Mops) midas*
b Size smaller, forearm 44 - 50 ..... *Tadarida (Mops) condylura*
African Chiroptera name ..... *Mops (Mops) condylurus*
66 a Size larger, forearm 42 - 52 67
b Size smaller, forearm 34 - 42 68
67 a Conspicuous lateral band of white hair on the wing membrane near the body; wing membranes pale; forearm 44 - 50; upper parts not flecked with white ..... *Tadarida (Chaerephon) nigeriae*
African Chiroptera name ..... *Chaerephon nigeriae nigeriae*
b No white lateral bands; wing membranes dark; forearm 46 - 51; upper parts flecked with white ..... *Tadarida (Chaerephon) bivittata*
African Chiroptera name ..... *Chaerephon bivittatus*
68 a Males with long (12 mm) bicoloured post-aural crests (dark basally, light apically); forearm 34 - 39; colour of upper parts pale, under parts whitish *Tadarida (Chaerephon) chapini*
African Chiroptera name ..... *Chaerephon chapini*
b Males with short (10 m or less) unicoloured post-aural crest; upper parts not pale, under parts variable in colour with or without white on the median area; forearm 37 - 42 ..... *Tadarida (Chaerephon) pumila*
African Chiroptera name ..... *Chaerephon pumilus*
69 a Size large, forearm 57 - 66 70
b Size medium, forearm 45 - 53 72
70 a Ears very large, conjoined at base near the nostrils and projecting well beyond muzzle when laid forward; under parts white or buffy with narrow brown brown flank strips; skull, particularly rostrum, very narrow; lower canines almost touching a their bases; forearm 63 ..... *Tadarida (Tadarida) lobata*
African Chiroptera name ..... *Tadarida lobata*
b Ears smaller, not conjoined at inner margin, situated well back from the nostrils and barely projecting beyond muzzle when laid forward; under parts without or with restricted white area; skull not narrowed in rostral region; forearm 57 - 66 71
71 a Skull very broad and heavy, particularly in rostral region, total length 23.5 - 25.7; lower canines almost touching at their bases; under parts mostly brownish, sometimes with median white area; forearm 63 - 66 ..... *Tadarida (Tadarida) ventralis*
African Chiroptera name ..... *Tadarida ventralis*
b Skull much less broad in rostral region, total length of skull 22 - 22.9; lower canines almost touching at their bases; under parts with variable white band on mid-ventral line; forearm 57 - 62 ..... *Tadarida (Tadarida) fulminans*
African Chiroptera name ..... *Tadarida fulminans*
72 a Size larger, forearm 44 - 53; total length of skull 19 - 21; braincase flat; lower canines widely separated at their bases; no black area on chin and throat *Tadarida (Tadarida) aegyptiaca*
African Chiroptera name ..... *Tadarida aegyptiaca*
b Size smaller, forearm 47.5 or less; total length of skull 18 - 20; braincase elevated; lower canines almost touching at their bases; chin and throat generally black *Tadarida (Tadarida) ansorgei*
African Chiroptera name ..... *Chaerephon ansorgei*

Appendix 5af: Wassif et al. (1984). Fauna and Flora of Egypt. 1. On a collection of bats from Egypt.

1	a	Size large, muzzle conical, nostrils without nose-leaf. Second digit of wing with 3 phalanges, the last phalanx carries a claw. Ear simple, tubular, without a tragus. Tail very short, its proximal half attached to the lower surface of the interfemoral membrane, but not contained in it. The free part of the tail is very short. Skull with well developed post-orbital processes. Teeth highly adapted for frugivorism. Cheekteeth with cusps, ridges and grooves (Family Pteropodidae)..... *Rousettus aegyptiacus*
	b	Size: small to moderately large. Second digit of wing with 2 phalanges. Noseleaf small, ridgelike, Tail very long. Interfemoral membrane short. Ears simple and united at the base, with well developed tragus. Skull with broad nasals, their combined breadth greater than their length. Without post-orbital processes (Family Rhinopomatidae). .....*Rhinopoma microphyllum*
	c	Size moderately, large, with simple nostrils. Nose-leaf absent and eye rather large. Ears with well developed tragus. Tail perforates the interfemoral mnembrane and appears on its dorsal surface. Feet usually with a large calcar. Sagittal crest poorly developed and post-orbital processes large. Basisphenoid pits large (Family Emballonuridae). .....*Taphozous perforatus, Taphozous nudiventris*
	d	Nostrils very small, lying on each side of a deep hairless depression. Ears large, much longer than head, united at their bases by a low transverse fold above the forehead. Tragus present. Last caudal vertebra T-shaped, due to the presence of minute lateral cartilages. Frontal region of skull greatly expanded as supra-orbital ridges join post-orbital processes to form frontal shields (Family Nycteridae). Size small, ears large and eyes minute. Muzzle with a median furrow. Tail long and included in a large interfemoral membrane. Last caudal vertebra T-shaped. Forearm 45 mm (43 - 47), skull 19 mm (18.3 - 19.5) and upper tooth row 6.6 mm (6.5 - 6.7). .....*Nycteris thebaica*
	e	Nostrils surrounded by foliaceous skin appendages. Each nose-leaf consists of 3 parts: an anterior flat, horse-shoe-shaped part, a central part (sella) with more or less parallel sides and a posterior part, triangular in shape. Ears large and separate, without a tragus. Second digit of wing is represented by its metacarpal. Tail included in the interfemoral membrane. Skull without post-orbital processes (Family Rhinolophidae). 2
	f	Nose-leaf consists of 3 parts, the posterior part is rounded above, usually tridentate. Pectoral and pelvic girdles highly modified and lumbar vertebrae fuse together (Family Hipposideridae). Horizontal part of the nose-leaf horse-shoe-shaped, without a notch. Posterior part usually tridentate. Forearm 50 mm (47 - 53), skull 19.4 mm (18.8 - 20) and upper tooth row 6.9 mm (6.4 - 7.1).....*Asellia tridens.* African Chiroptera name .....*Asellia tridens*
	g	Nostrils simple, without nose-leaves, crescentic or circular. Ears moderately developed to large, separate and rarely join across the forehead. Tragus present. Tail well developed and extends to the edge of the wide interfemoral membrane (Family Vespertilionidae)..... 3
	h	Muzzle broad, obliquely truncated, projecting considerably beyond lower lip. Ears large, broad, rounded and united at the base of their inner borders. Tragus small and antitragus large. Terminal half of tail projects beyond the short and leathery interfemoral membrane. Legs short and strong. First toe and generally the fifth thicker than other toes and are furnished with long curved hairs (Family Molossidae). 4
2	a	Medium-sized species. Sella of nose-leaf with a blunt upper part in lateral view. Forearm 47 mm (44 - 50), skull 19.2 mm (19.1 - 19.4), upper tooth row 7 mm (7 - 7.1). ..... *Rhinolophus clivosus*
	b	Small-sized. Lower part of sella sharply pointed. Forearm 36 mm, skull 15 - 16 mm. .....*Rhinolophus hipposideros*
3	a	Two upper incisors and 5 cheekteeth on each side. Ears very large and joined across the forehead. Tragus long. Ear length 32 mm (31 - 32.2), tragus length 16 mm (15 - 16.5). Skull 18.3 mm (18 - 18.9). Upper tooth row 3.9 mm (3.7 - 4.0). .....*Plecotus austriacus*

b One upper incisor and 4 cheekteeth on each side. Ears large and broad, with well developed tragus. Forearm 59.7 mm (59 - 64), skull 23.4 mm (23.3 - 23.7), upper tooth row 7.5 mm (6.3 - 7.8). ..... *Otonycteris hemprichii*

c First upper premolar displaced internally. Ears small and almost triangular, widely separated. Underparts pale brown. Forearm 34 mm (33 - 36), skull 13.5 mm (13 - 13.8), upper tooth row 4.6 mm (4.1 - 4.8). ..... *Pipistrellus kuhli*
African Chiroptera name ..... *Pipistrellus kuhlii*

d First upper premolar not displaced internally. Underparts pure white. Forearm 31.5 mm (31 - 32), skull 13.5 mm (13 - 13.8), upper tooth row 4.6 mm (4.1 - 4.8), with 3 pairs of upper incisors. ..... *Pipistrellus rüppelli*
African Chiroptera name ..... *Pipistrellus rueppellii*

e Forearm 42 mm or more, skull 15.6 mm, upper tooth row 6.8 mm, with 2 pairs of upper incisors. ..... *Eptesicus innesi*
African Chiroptera name ..... *Eptesicus bottae*

4 a Size large, ears very broad and joined across the forehead. Three pairs of lower incisors. Forearm 65 mm (63 - 66.2), skull 24.8 mm (23.7 - 26), upper tooth row 9.3 mm (8.9 - 9.7). ..... *Tadarida teniotis*

b Size medium, ears moderately large. Two pairs of lower incisors. Forearm 53 mm (52 - 54.5), skull 21.3 mm (20.9 - 22.1), upper tooth row 7.9 mm (7.7 - 8.1). *Tadarida aegyptiaca*

Appendix 5ag: Qumsiyeh (1985). The bats of Egypt

1	a	Ear simple, with margin forming a complete ring; tragus and antitragus absent; second finger clawed; skull large (GLS greater than 40); molar and premolar teeth low crowned (Megachiroptera: Pteropodidae) ..... *Rousettus aegyptiacus*
	b	Ear margin not forming complete ring; tragus or antitragus present; second finger not clawed; skull size medium to small (GLS less than 40); molar and premolar teeth high crowned (Microchiroptera) 2
2	a	Muzzle with cutaneous growth forming an elaborate noseleaf structure; tragus absent but antitragus well developed; nasal branches of premaxilla absent, palatal branches fused medially and free of maxilla laterally (Rhinolophidae) 9
	b	Muzzle with no elaborate noseleaf structure; tragus present; nasal branches of premaxilla present or absent; palatal branches present or absent, if not as above.. 3
3	a	Tail protrudes from dorsal surface of uropatagium; premaxilla with nasal branches only, palatal branches absent (Emballonuridae) 8
	b	Tail either completely enclosed by, or protrudes from posterior end of uropatagium; premaxilla always with palatal branches; nasal branches present or absent 4
4	a	Uropatagium short, enclosing less than one-third of the long, thin tail; dental formula $^1/_2$ $^1/_1$ $^1/_2$ $^3/_3$ = 28; nasal region of skull inflated (Rhinopomatidae) 7
	b	Uropatagium long, enclosing more than one-half of the tail, teeth more than 28; nasal region of skull not inflated 5
5	a	Muzzle with longitudinal groove; nasal branches absent; skull with deep concavity on anterior surface between the orbits (Nycteridae) ..... *Nycteris thebaica*
	b	Muzzle simple; nasal branches present; no deep concavity on anterior surface of the skull 6
6	a	Tail scarcely or not protruding beyond posterior edge of the wide uropatagium (Vespertilionidae) 12
	b	Tail protruding conspicuously beyon posterior edge of narrow uropatagium (Molossidae) 21
7	a	Larger; FA 62 - 71, GLS 18.7 - 22.1; tail usually shorter than forearm; lacrymal region of skull relatively shallow; males show significant development of sagittal crest; posterior edge of palate forms an acute angle, never with parallel sides .. *Rhinopoma microphyllum*
	b	Smaller; FA 48.3 - 61, GLS 16.0 - 18.5; tail usually longer than forearm; lacrymal region of skull inflated; males do not show significant development of sagittal crest; posterior edge of palate forms with rounded profile, sides almost or are parallel ..... *Rhinopoma hardwickei* African Chiroptera name ..... *Rhinopoma cystops*
8	a	Fur extends to base of uropatagium both dorsally and ventrally; smaller animal, FA 59 - 64, GLS 19.8 - 21.1; skull smooth with rounded braincase .... *Taphozous perforatus* African Chiroptera name ..... *Taphozous perforatus perforatus*
	b	Fur does not extend to bats of uropatagium dorsally nor ventrally; larger, FA 67 - 82.5, GLS 24.8 - 31.8; skull rugose with distinct sagittal and lambdoidal crests . *Taphozous nudiventris*
9	a	Noseleaf with three dorsally projecting leaflets and without sella or connecting process; only two pairs of lower premolars ..... *Asellia tridens*
	b	Noseleaf with one dorsally projecting leaflet (lancet) and with a distinct sella and connecting process; three pairs of lower premolars present (Rhinolophinae) 10
10	a	Size small, FA 33.5 - 38.6, GLS 14.5 - 16.0 ..... *Rhinolophus hipposideros*
	b	Size larger, FA more than 41, GLS more than 18 11
11	a	Dorsal connecting process of sella blunt; PM^2 displaced labially from toothrow or absent ..... *Rhinolophus clivosus*
	b	Dorsal connecting process of sella long and pointed; PM^2 in toothrow and clearly separating canine and PM^4 ..... *Rhinolophus mehelyi (and R. euryale)* African Chiroptera name ..... *Rhinolophus mehelyi*
12	a	Large, FA greater than 55, GLS greater than 21; ear long measuring 34 - 42 in Egyptian specimens; one pair of upper incisors ..... *Otonycteris hemprichi* African Chiroptera name ..... *Otonycteris hemprichii*
	b	Small to medium sized, FA less than 50, GLS less than 20; ear short or long; one or two pairs of upper incisors 13

13	a	Mandible with three premolars and three molars; ears and tragus elongated *Plecotus austriacus*
	b	Five or less lower postcanine teeth; ears and tragus not elongated 14
14	a	One pair of upper incisors ..... *Nycticeius schlieffenii* African Chiroptera name ..... *Nycticeinops schlieffenii*
	b	Two pairs of upper incisors 15
15	a	Four upper postcanine teeth ..... *Eptesicus bottae*
	b	Five upper postcanine teeth (but PM^2 is absent on some specimens of *Pipistrellus kuhlii* on one side). 16
16	a	Ear connected; skull with a narrow and concave rostrum..... *Barbastella barbestellus* African Chiroptera name ..... *Barbastella barbastellus*
	b	Ears separate; skull with a wider and convex rostrum (*Pipistrellus*) 17
17	a	Outer upper incisor much less than half length of inner..... 18
	b	Outer upper incisor more than half length of inner..... 19
18	a	C-M^3 greater than 4.5; GLS greater than 12.0; skull relatively rugose with distinct lambdoidal ridges ..... *Pipistrellus kuhlii*
	b	C-M^3 less than 4.5; GLS less than 12.0; skull slender, with braincase rounded; rostrum slightly shortened and hence forehead is more elevated than in P. kuhlii. ..... *Pipistrellus aegyptius* African Chiroptera name ..... *Pipistrellus kuhlii*
19	a	Inner upper incisor unicuspid; PM^2 small and possibly not functional; rostrum flattened ..... *Pipistrellus ariel* African Chiroptera name ..... *Hypsugo ariel*
	b	Inner upper incisor bifid or bicuspide; PM^2 clearly distinguished and functional; rostrum concave..... 20
20	a	Inner upper incisor deeply cleft; ventral fur whitish ..... *Pipistrellus rueppellii*
	b	Inner upper incisor bifid but not deeply cleft; ventral fur not whitish ..... *Pipistrellus bodenheimeri*
21	a	Larger, FA greater than 54, GLS greater than 23; mandible with three pairs of lower incisors; skull elongate ..... *Tadarida teniotis*
	b	Smaller, FA less than 54, GLS less than 22; mandible with two pairs of lower incisors; skull more rounded..... *Tadarida aegyptiaca*

Appendix 5ah: Aulagnier and Thevenot (1986). Catalogue des mammifères sauvages du Maroc

1	a	Portion de queue libre depassant largement la membrane interfemorale 2
	b	Queue incluse dans la membrane interfemorale (excepte parfois 1 ou 2 vertebres) 4
2	a	Feuille nasale triangulaire; Portion de queue libre tres longue (Famille Rhinopomatidae) 3
	b	Pas de feuille nasale; Portion de queue libre reduite (Famille Molossidae) .. *Tadarida teniotis*
3	a	AB: 58 - 75 mm; Queue plus courte que l'Avant-Bras .....*Rhinopoma microphyllum*
	b	AB: 46 - 53 mm; Queue plus longue que l'Avant-Bras.....*Rhinopoma hardwickei* African Chiroptera name .....*Rhinopoma cystops*
4	a	Absence de feuille nasale; Tragus present (Famille Vespertilionidae) 10
	b	Feuille nasale complexe; Tragus absent (Famille Rhinolophidae) 5
	c	Sillon median sur le museau; Tragus present (Famille Nycteridae) .*Nycteris thebaica*
5	a	Partie posterieure de la feuille nasale en languette triangulaire aigue; Doigts à trois phalanges 6
	b	Partie posterieure de la feuille nasale arrondie ou à trois pointes; Doigts à deux phalanges 9
6	a	AB > 54 mm.....*Rhinolophus ferrumequinum*
	b	AB < 40 mm.....*Rhinolophus hipposideros*
	c	40 < AB < 54 mm 7
7	a	2ème phalange Doigt IV plus de deux fois plus longue que la première phalange.. 8
	b	2ème phalange Doigt IV moins de deux fois plus longue que la première phalange .....*Rhinolophus blasii*
8	a	see graph .....*Rhinolophus euryale*
	b	see graph .....*Rhinolophus mehelyi*
9	a	Partie posterieure de la feuille nasale arrondie.....*Hipposideros caffer*
	b	Partie posterieure de la feuille nasale à trois pointes .....*Asellia tridens*
10	a	2ème phalange du dpigt III moins de 2 fois plus longue que la première..... 11
	b	2ème phalange du doigt III 3 fois plus longue que la première*Miniopterus schreibersi* African Chiroptera name .....*Miniopterus schreibersii*
11	a	Oreilles separees l''une de l'autre à leur base sur la tête..... 12
	b	Oreilles réunies l'une a l'autre par leur base sur la tête 14
12	a	2 paires d'incisives supérieures 13
	b	1 paire d'incisives supérieures ..... *Otonycteris hemprichi* African Chiroptera name .....*Otonycteris hemprichii*
13	a	Tragus allongé et pointu (genus *Myotis*) 15
	b	Tragus court et arrondi (Genera *Pipistrellus, Nyctalus, Eptesicus*) 19
14	a	Oreilles tres longues; Tragus allongé.....*Plecotus austriacus*
	b	Oreilles courtes; Tragus court .....*Barbastella barbastellus*
15	a	AB < 50 mm..... 16
	b	AB > 50 mm.....*Myotis blythii*
16	a	Longueur du pied inférieure à la moitié de celle du tibia..... 17
	b	Longueur du pied supérieure à la moitié de celle du tibia; 38 < AB < 42 mm ...*Myotis capaccinii*
17	a	AB < 35 mm.....*Myotis mystacinus*
	b	AB > 35 mm..... 18
18	a	Oreille nettement echancrée; Quelques poils sur la membrane interfémorale..*Myotis emarginatus*
	b	Oreille non echancrée; Frange de poils sur la membrane interfémorale.....*Myotis nattereri*
19	a	AB < 35 mm..... 20
	b	AB > 45 mm..... 23
20	a	Incisive supérieure interne bicuspide 21
	b	Incisive supérieure interne unicuspide ..... *Pipistrellus kuhli* African Chiroptera name .....*Pipistrellus kuhlii*
21	a	1ère Premolaire supérieure visible en vue laterale; AB < 33 mm 22
	b	1ère Premolaire supérieure rudimentaire (invisible); AB > 32 mm .....*Pipistrellus savii* African Chiroptera name .....*Hypsugo savii*

22	a	Incisive supérieure externe tres petite; Pelage ventral blanc..... *Pipistrellus rueppelli* African Chiroptera name ..... *Pipistrellus rueppellii*
	b	Incisive supérieure externe de bonne taille; Pelage ventral gris *Pipistrellus pipistrellus*
23	a	Tragus aussi long que large ..... *Nyctalus lasiopterus*
	b	Tragus deux fois plus long que large ..... *Eptesicus serotinus*

Appendix 5ai: Meester et al. (1986). Classification of Southern African mammals

1	a	Second digit (in African species) ending in a claw; margin of ear conch forming a complete ring; tragus always absent; interfemoral membrane greatly reduced, little more than a narrow band along inside margin of hind legs; tail absent or rudimentary; cheekteeth simple, without well-developed cusp pattern (suborder Megachiroptera) 2
	b	Second digit without a claw; margin of ear conch not forming a complete ring; tragus generally present (absent in two families); interfemoral membrane and tail generally well-developed; cheek teeth cuspidate, molars generally with clearly defined W pattern (suborder Microchiroptera) 8
2	a	Ears with white basal tufts 3
	b	Ears without white basal tufts 4
3	a	Six prominent palatal ridges, one or two being post-dental, and these no different from inter-dental ridges; post-dental palate strongly concave posteriorly (genus *Epomophorus*) 5
	b	Five palatal ridges, the last two post-dental, these being differentiated from interdental ridges, thick, and each bearing two triangular projections; post-dental palate flattened posteriorly ..... *Epomops dobsonii* African Chiroptera name ..... *Epomophorus dobsonii*
4	a	Forearm generally 110 - 130 mm; colour generally tawny, with dorsal fur restricted to a narrow median band, sharply demarcated from naked wing membranes ..... *Eidolon helvum*
	b	Forearm 65 - 102 mm; ruff of stiff hair present or absent on lower neck of adult males (genus *Rousettus*) 7
5	a	One post-dental palatal ridge; forearm 77 - 89 mm in males, 72 - 86 mm in females ..... *Epomophorus wahlbergi*
	b	Two post-dental palatal ridges 6
6	a	Fourth palatal ridge mid-way between third and fifth ..... *Epomophorus crypturus*
	b	Fourth palatal ridge much nearer the third than fifth ..... *Epomophorus angolensis*
7	a	Wings from first toe; hair short and sleek; cheekteeth heavy; forearm generally 90 - 105 mm; premaxillaries in contact but not co-ossified; adult males without collar of stiff hairs ..... *Rousettus (Rousettus) aegyptiacus* African Chiroptera name ..... *Rousettus aegyptiacus*
	b	Wings from second toe; hair longer and coarser; cheekteeth reduced in bulk, short and broad; forearm 66 - 83 mm; premaxillaries co-ossified; adult males with collar of stiff hairs ..... *Rousettus (Lissonycteris) angolensis* African Chiroptera name ..... *Myonycteris angolensis*
8	a	Terminal portion of tial projecting markedly past edge of interfemoral membrane ... 9
	b	Tail almost entirely enclosed within the interfemoral membrane 10
9	a	Free terminal portion of tail emerges above middle of upper surface of interfemoral membrane (family Emballonuridae) 13
	b	Free terminal portion of tail projects considerably beyond hind margin of interfemoral membrane (family Molossidae) 60
10	a	Muzzle without nose-leaves or maked modifications of any kind (family Vespertilionidae) 32
	b	Muzzle with nose-leaves or deep central slit 11
11	a	Muzzle with deep central longitudinal slit lined with fleshy dermal outgrowths (family Nycteridae) 15
	b	Face without slit but with well-developed nose-leaves covering muzzle 12
12	a	Posterior leaflet of nose-leaf subtriangular, with erect pointed tip; toes with three phalanges (family Rhinolophidae) 20
	b	Posterior leaflet of nose-leaf with upper edge either elliptical in outline or tridentate; toes with two phalanges (family Hipposideridae) 29
13	a	Six lower incisors; forearm not more than 57 mm; no gular sac ..... *Coleura afra*
	b	Four lower incisors; forearm more than 57 mm; gular sac present or absent (genus *Taphozous*) 14
14	a	Entire dorsal fur conspicuously grizzled greyish; entire ventral surface clear white; forearm 58 - 64 mm; large gular sac in males ..... *Taphozous mauritianus*

	b	Dorsal fur never grizzled, colour pale brownish; ventral surface dusky; forearm 60 - 67 mm; no gular sac ..... *Taphozous perforatus*
15	a	Upper incisors trifid; tragus falciform or semilunate (*hispida* group) 16
	b	Upper incisors bifid; tragus semilunate or pyriform 17
16	a	Forearm 36 - 45 mm; ear 18 - 25 mm; condylocanine length less than 18 mm *Nycteris hispida*
	b	Forearm 57 - 66 mm; ear 28 - 35 mm; condylocanine length more than 18 mm *Nycteris grandis*
17	a	Tragus semi-lunate, base of posterior margin not notched (*macrotis* group) 18
	b	Tragus pyriform, base of its posterior margin shallowly notched (*thebaica* group) 19
18	a	General colour greyish; forearm 37 - 42 mm ..... *Nycteris woodi*
	b	General colour brownish; forearm 45 - 50 mm..... *Nycteris macrotis*
19	a	Size smaller; forearm 42 - 52 mm, ears larger, 28 - 37 mm; skull less massive; breadth of supraorbital flanges about 6.8 mm..... *Nycteris thebaica*
	b	Size larger; forearm over 50 mm; ears smaller, 22 mm; skull massive, breadth of supraorbital flanges about 9.0 mm ..... *Nycteris vinsoni*
20	a	Face and/or lateral margins of the sella liberally furnished with long hairs; connecting process low, rounded; greatest width of horseshoe generally over 9 mm 21
	b	Sella naked; connecting process rounded or pointed; greatest width of horseshoe below 9 mm 22
21	a	Forearm 62 - 67 mm..... *Rhinolophus hildebrandti* African Chiroptera name ..... *Rhinolophus hildebrandtii*
	b	Forearm 50 - 60 mm..... *Rhinolophus fumigatus*
22	a	Anterior upper premolar, when present, external to toothrow; canine and fourth upper premolar in contact; connecting process bluntly pointed 23
	b	Anterior upper premolar in toothrow; canine and fourth upper premolar not in contact; connecting process blunt or sharply pointed..... 24
23	a	Forearm 50 - 57 mm..... *Rhinolophus clivosus*
	b	Forearm 45 - 50 mm..... *Rhinolophus darlingi*
24	a	Connecting process rises to an erect point; interpterygoid groove usually shallow, not clearly defined by bordering ridges; anterior upper premolar usually not crowded between canine and fourth upper premolar, longer than wide..... 25
	b	Connecting process with a low bluntly pointed tip; interpterygoid groove deep and clearly defined by bordering ridges; anterior upper premolar usually more or less crowded between canine and fourth upper premolar, at least as wide as it is long 26
25	a	First phalanx of fourth finger notably shortened in relation to metacarpal length; connecting process pointed; molar width less than half width of palate between molars ..... *Rhinolophus landeri*
	b	First phalanx of fourth finger not notably shortened in relation to metacarpal length; connecting process rises to a high narrow horn; molar width more than half width of palate between molars ..... *Rhinolophus blasii*
26	a	Larger, forearm 47 - 51 mm; skull 20 mm or more ..... *Rhinolophus capensis*
	b	Smaller, forearm 40 - 46 mm; skull 18.7 mm or less 27
27	a	Sella broader; ears longer, 20 - 22 mm; condylocanine length > 15.5 mm *Rhinolophus simulator*
	b	Sella narrower; ears shorter, 18 - 20 mm; condylocanine length < 15.5 mm 28
28	a	Front edge of connecting process almost concave; lancet with sides almost convex; fur whitish at base ..... *Rhinolophus denti*
	b	Front edge of connecting process convex; lancet with sides concave, tip pointed; fur nearly unicoloured..... *Rhinolophus swinnyi*
29	a	Posterior leaflet on noseleaf simple in outline, elliptical or rounded, not tridentate; ears either separate or united by low band; rostrum at least half as long as the braincase; small upper premolar present; forearm 40 - 110 (genus *Hipposideros*) 31
	b	Posterior leaflet of noseleaf tridentate; ears always separate; small upper premolar present or absent; rostrum sometimes less than half as long as braincase; zygoma not, or greatly, expanded; forearm 31 - 54 mm..... 30
30	a	Size very small, forearm 31 - 35 mm; ears very low, rounded, rim-like, 8 mm; noseleaf small and inconspicuous; thumbs minute; rostrum less than half length of braincase; zygoma not greatly expanded ..... *Cloeotis percivali*

b Size larger, forearm 50 - 54 mm; ears short, 10 - 14 mm, but pointed; noseleaf conspicuous; thumbs normal; rostrum more than half the length of the braincase; zygoma greatly expanded into a wide plate; upper incisors bifid...*Triaenops persicus*

31 a Size very large; forearm 90 - 110 mm; ears very narrow and pointed; longitudinal frontal sac in both sexes.....*Hipposideros commersoni*
African Chiroptera name ..... *Macronycteris commersoni*

b Size much smaller; forearm 40 - 50 mm; ears broad..... *Hipposideros caffer*

32 a Second phalanx of third digit not especially elongated 33

b Second phalanx of third digit about three times as long as first; braincase high and rounded (subfamily MINIOPTERINAE; genus *Miniopterus*) 58

33 a Ears not funnel-shaped, without deep emargination below tip; tragus short and broad or long and narrow, but not sharply pointed; braincase not particularly high and rounded (subfamily VESPERTILIONINAE)..... 34

b Ears funnel-shaped, with deep emargination below tip; tragus long, narrow, sharply pointed; braincase high and rounded (subfamily KERIVOULINAE; genus *Kerivoula*) 57

34 a Six upper, six lower cheek teeth on either side (genus *Myotis*)..... 41

b Fewer than six upper and six lower cheek teeth..... 35

35 a Five upper, five lower cheekteeth; ears nor lengthened; two upper incisors on each side; wing with fifth finger not shortened; ears not joined at base (genus *Pipistrellus*) 47

b Four upper, five lower cheek teeth; ears notably lengthened only in exceptional cases 36

36 a Two upper incisors on each side..... 37

b One upper incisor on each side 39

37 a Rostrum very short and broad; braincase very high more than two-thirds of condylobasal length; lower lip with lobe at posterior angle; frequently with body pattern of spots and/or stripes, or conspicuous reticulation of wing membranes *Chalinolobus (Glauconycteris) variegatus*
African Chiroptera name .....*Glauconycteris variegata*

b Rostrum not shortened; braincase not elevated; no body or wing pattern 38

38 a Ear 18 mm or more, about half length of forearm (genus *Laephotis*) 45

b Ears less than 18 mm, much less than half length of forearm (genus *Eptesicus*).. 51

39 a Size larger, forearm not less than 46 mm; first and second upper molars with W-pattern obsolescent; tragus long and tapering (genus *Scotophilus*)..... 55

b Size smaller, forearm less than 46 mm; first and second upper molars with normal W-pattern; tragus either sickle-shaped or short and broad 40

40 a Skull with rostrum not broadened; palatal emargination narrow; anterior lower premolar about half the crown area of the next premolar; upper canines with rounded anterior surface; tragus halfmoon-shaped; penis not enlarged; forearm 29 - 33 mm .....*Nycticeius schlieffenii*
African Chiroptera name .....*Nycticeinops schlieffenii*

b Skull with rostrum notably broadened, particularly across lachrymals; palatal emargination broader; upper cheek teeth four or five; lower premolars equal in crown area; upper canines with broad flat anterior face; tragus short and broad; penis greatly lengthened; forearm 28 - 38 mm..... *Scotoecus albofuscus*

41 a Size larger, forearm over 52 mm.....*Myotis (Chrysopteron) welwitschii*
African Chiroptera name .....*Myotis welwitschii*

b Size smaller, forearm under 52 mm..... 42

42 a Wings with glands; first two upper premolars greatly reduced and crowded together laterally 43

b Wings without glands; first two upper premolars not greatly reduced, not crowded together laterally..... 44

43 a Size smaller, forearm 32.5 - 2.9 mm..... *Myotis (Cistugo) seabrai*
African Chiroptera name ..... *Cistugo seabrae*

b Size larger, forearm 34.5 mm.....*Myotis (Cistugo) lesueuri*
African Chiroptera name ..... *Cistugo lesueuri*

44 a Size larger, forearm 47 - 52 mm ..... *Myotis (Selysius) tricolor*
African Chiroptera name ..... *Myotis tricolor*

b Size smaller, forearm less than 47..... *Myotis (Selysius) bocagei*
African Chiroptera name ..... *Myotis bocagii*

45 a Larger, total skull length over 16 mm; ear length from meatus more than 21 mm; tragus with notch near base of the outside edge 46
b Smaller, total skull length under 15 mm; ear length no more than 18 mm; tragus without notch near base of the outside edge; dorsal colour buffy brown ..... *Laephotis botswanae*

46 a Ear length 24 - 45 mm; dorsal colour light drab ..... *Laephotis namibensis*
b Ear length 21 - 22 mm; dorsal colour mid-brown ..... *Laephotis wintoni*

47 a First upper incisor not, or scarsely, bifid; not grey and white, usually some shade of brown; penis less than half length of tibia the under parts brown or grey (subgenus *Pipistrellus*) 48
b First upper incisors markedly bifid; grey above and white below; penis more than halft length of tibia ..... *Pipistrellus (Vansonia) rueppellii*
African Chiroptera name ..... *Pipistrellus rueppellii*

48 a Outer upper incisor more than half length of inner upper incisor; forehead strongly concave; upper canine and posterior upper premolar separated by a gap through which anterior upper premolar can be clearly seen rising above cingula of adjoining teeth; interdental palate clearly longer than broad ..... *Pipistrellus (Pipistrellus) nanus*
African Chiroptera name ..... *Neoromicia nana*
b Outer upper incisor less than half length of inner upper incisor; forehead usually flat or weakly concave; upper canine and posterior upper premolar in contact or barely separated, anterior upper premolar seen from the side only with difficulty, usually not rising appreciably above cingula of adjoining teeth 49

49 a Interdental palate as broad as long; forehaed flat; total length of skull 12 mm ore less ..... *Pipistrellus (Pipistrellus) rusticus*
African Chiroptera name ..... *Pipistrellus rusticus*
b Interdental palate longer than broad; forehead at least slightly concave; total length of skull more than 12 mm 50

50 a Posterior upper incisor barely extending beyond cingulum of anterior upper incisor; anterior upper premolar a pointed tooth rising abot cingulum of canine but not above cingulum of posterior upper premolar; maxillary toothrow more than 4.5 mm *Pipistrellus (Pipistrellus) kuhlii*
(This should be *Pipistrellus hesperidus*. See Kock (2001))
African Chiroptera name ..... *Pipistrellus hesperidus*
b Posterior upper incisor extending well beyond cingulum of anterior upper incisor; anterior upper premolar a flat-crownede tooth completely below cingula of adjoining teeth; maxillary toothrow less than 4.5 mm ..... *Pipistrellus (Pipistrellus) anchietai*
African Chiroptera name ..... *Hypsugo anchietae*

51 a Wing membranes white or translucent ..... *Eptesicus rendalli*
African Chiroptera name ..... *Neoromicia rendalli*
b Wing membranes dark 52

52 a Size larger, forearm more than 40 mm; inner upper incisors unicuspid ..... *Eptesicus hottentotus*
b Size smaller, forearm less than 40 mm; inner upper incisors bicuspid 53

53 a Forearm 34.5 - 38 mm ..... *Eptesicus melckorum*
African Chiroptera name ..... *Neoromicia capensis*
b Forearm 35 mm or less 54

54 a Dorsal colour paler; wing membranes edged with white; dorsal fur up to 8 mm long; forearm 30 - 32 mm; condylobasal length usually les than 11.9 mm; skull lacking posterior occipital "helmet" ..... *Eptesicus somalicus*
African Chiroptera name ..... *Neoromicia somalica*
b Dorsal colour darker; wing membranes not edgesd with white; dorsal fur not more than 5 mm long; forearm 29 - 35 mm; condylobasal length more than 11.9 mm; skull with posterior occipital "helmet" ..... *Eptesicus capensis*
African Chiroptera name ..... *Neoromicia capensis*
c Size larger, forearm 29 - 35; skull with posterior occipital "helmet" ..... *Eptesicus (Eptesicus) capensis*
African Chiroptera name ..... *Neoromicia capensis*

55 a Size very large, forearm 75 - 80; total skull length 30 mm or more *Scotophilus nigrita*
b Size smaller, forearm 43 - 65 mm; skull length 16 - 23 mm 56

56 a Forearm 50 - 65 mm; skull 20 - 23 mm ..... *Scotophilus dinganii*

b Forearm 43 - 50 mm; skull 16 - 19 mm ..... *Scotophilus borbonicus*

57 a Size large, forearm 34 - 39 mm; skull > 15 mm; colour above bright reddish chestnut, below either whitish or buffish, never brown ..... *Kerivoula argentata*

b Size smaller, forearm 32 - 36 mm; skull < 13.5 mm; colour brownish or greyish-brown above, sometimes lightly grizzled with greyish white or white, and greyish brown to greyish white or white below ..... *Kerivoula lanosa*

58 a Size largern forearm 45 - 50 mm; skull length 16 mm and more .. *Miniopterus inflatus*

b Size smaller, forearm 42 - 47 mm; skull length c. 14 - 15 59

59 a Forearm 42 - 44 mm; skull length c. 14 mm; colour brownish black and/or russet ..... *Miniopterus fraterculus*

b Forearm 42 - 47 mm; skull length c. 15 mm; colour slaty brown *Miniopterus schreibersii*

60 a Prominent vertical projection on zygoma; size very large, forearm 62 - 73 mm; ears very large, 38 - 40 mm, conjoined on extended snout; conspicuous bicoloured dorsal pelage pattern with pale collar separating dark anterior and posterior regions of body ..... *Otomops martiensseni*

b Not combining the above characters 61

61 a Skull conspicuously flattened, greatest depth of braincase not more than one-third of greatest width; 5 upper cheekteeth (P^1 well developed); ears separate, not widely spaced; forearm 36 - 42 mm ..... *Sauromys petrophilus*

b Skull not conspicuously flattened; 4 - 5 upper cheekteeth, ears separate or conjoined; forearm 30 - 66 mm 62

62 a Only 1 upper premolar; three pairs of lower incisors; large palatal emargination; ears separate; size small, forearm c. 38 mm, condylobasal length less than 15 mm (genus *Mormopterus*) ..... *Mormopterus acetabulosus*

b Almost always two upper premolars; not more than two pairs of lower incisors; condylobasal length generally more than 15 mm (genus *Tadarida*) 63

63 a Anterior palatal emargination well developed, extending beyond upper incisors and including area of incisive foramina; third commissure of last upper molar well developed, almost as long as second commissure 64

b Anterior palatal emargination greatly reduced, not extending behind upper incisor and separated from incisive foramina by a bony bar 69

64 a Condylobasal length more than 21 mm 65

b Condylobasal length less than 21 mm 67

65 a Interdental palatal length more than twice palatal width at anterior end, ears very large, united at base close to nostrils, and projecting well beyond muzzle when laid forward; basisphenoid pits shallow; lower canines almost touching at base; forearm 63 mm..... *Tadarida (Tadarida) lobata*
African Chiroptera name ..... *Tadarida lobata*

b Interdental palatal length less than twice palatal width at anterior end 66

66 a Larger, total skull length 23.5 - 25.7 mm, forearm 63 - 66 mm .... *Tadarida (Tadarida) ventralis*
African Chiroptera name ..... *Tadarida ventralis*

b Smaller, total skull length 22 - 22.9 mm, forearm 57 - 62 mm ..... *Tadarida (Tadarida) fulminans*
African Chiroptera name ..... *Tadarida fulminans*

67 a Forehead flat; width of anterior palatal emargination more than diameter of upper incisor; forearm 44 - 53 mm; lower canines widely separated at base ..... *Tadarida (Tadarida) aegyptiaca*
African Chiroptera name ..... *Tadarida aegyptiaca*

b Forehead elevated; width of anterior palatal emargination less than diameter or upper incisor; condylobasal length more than 17 mm 68

68 a Zygomatic breadth more than 12 mm ..... *Tadarida (Chaerephon) bivittata*
African Chiroptera name ..... *Chaerephon bivittatus*

b Zygomatic breadth less than 12 mm ..... *Tadarida (Chaerephon) ansorgei*
African Chiroptera name ..... *Chaerephon ansorgei*

69 a Third commissure of last upper molar well develiped, almost as long as second commissure; basisphenoid pits shallow, separated at most by a low ridge 70

b Third commissure of last upper molar reduced, clearly shorter, and usually much shorter than second commissure 72

70 a Forehead virtually flat; maxillary toothrow length more than 6.3 mm; interdental palate (measured at anterior end of posterior premolar) approximately twice as long as it is wide ..... *Tadarida (Chaerephon) nigeriae*
African Chiroptera name ..... *Chaerephon nigeriae*
b Forehead distinctly elevated; maxillary toothrow less than 6.3 mm..... 71
71 a Interdental palate (measured at anterior end of posterior premolar) approximately twice as long as it is wide; males with long (13 - 14 mm) bicoloured postaural crest, dark basally, pale apically ..... *Tadarida (Chaerephon) chapini*
African Chiroptera name ..... *Chaerephon chapini*
b Interdental palate approximately one-and-a-half times as long as it is wide; males with short (10 mm or less) unicoloured postaural crest..... *Tadarida (Chaerephon) pumila*
African Chiroptera name ..... *Chaerephon pumilus*
72 a Condylobasal length more than 23 mm; forearm 58 - 66 mm. *Tadarida (Mops) midas*
African Chiroptera name ..... *Mops (Mops) midas*
b Condylobasal length less than 21 mm; forearm 45 - 50 mm; third commissure of last upper molar clearly present and approximately half as long as second commissure ..... *Tadarida (Mops) condylura*
African Chiroptera name ..... *Mops (Mops) condylurus*

Appendix 5aj: Qumsiyeh and Jones (1986). Rhinopoma hardwickii and Rhinopoma muscatellum

1	a	Large; forearm 57 to 75 mm, greatest length of the skull 18 to 23 mm; skull robust, with well-developed sagittal and lambdoidal crests; rostrum with narial swellings poorly defined, almost flat .....*Rhinopoma microphyllum*
	b	Small; forearm 46 to 63 mm, greatest length of the skull 14 to 19 mm; skull slender and with rounded braincase; lambdoidad and sagittal crests poorly developed; rostrum with well-defined narial swellings 2
2	a	Muzzle with well-developed transverse dermal ridge; narial inflations rounded; posterior margin of palate rounded .....*Rhinopoma hardwickii* African Chiroptera name .....*Rhinopoma cystops*
	b	Muzzle with poorly developed, almost flat dermal ridge; narial inflations angular in profile; posterior margin of palate angular.....*Rhinopoma muscatellum*

Appendix 5ak: Happold (1987). The mammals of Nigeria.

1	a	Second finger terminating in claw; ear conch forms complete ring around external ear opening; tragus absent; tall absent or very small; interfemoral membrane poorly developed; no nose-leaves or fleshy outgrowths on nasal region or forehead; large eyes; cheek teeth simple without well-developed cusps (Suborder Megachiroptera). 2
	b	Second finger without terminal claw; inner and outer margins of ear conch arise at different points and are not joined at base; tragus usually present; tall long In most species with well-developed interfemoral membrane (except family Megadermatidae); nose-leaves or fleshy outgrowths present in some families; eyes mostly small and obscure; cheek teeth with well-developed cusps (Suborder Microchiroptera)..... 13
2	a	Tongue with pointed tip, densely covered with long papillae (Fig. 3.7); FA 41 - 44, WT 10 - 15. .....*Megaloglossus woermanni*
	b	Tongue with rounded tip, without papillae; FA more than 44, WT more than 15..... 3
3	a	Heas with large white spot between eyes; white spot at posterior margin of each eye; FA 49 - 55.....*Scotonycteris zenkeri*
	b	Head without white spots as above..... 4
4	a	White basal ear-tufts present (often inconspicuous in *Nanonycteris veldkampi*)..... 5
	b	White basal ear-tufts absent..... 10
5	a	Very large; FA 118 or more; wide cylindrical muzzle, not tapering towards nostrils. .....*Hypsignathus monstrosus*
	b	Smaller; FA not more than 100; muzzle tapering towards nostrils. 6
6	a	FA 60 - 100..... 7
	b	FA less than 60. 9
7	a	Head rounded; three prominent palatal ridges between tooth rows, followed by 5 - 6 less prominent ridges (Fig. 3.5); FA 80 - 90; TLS 44 - 51.....*Epomops franqueti*
	b	Head elongated; six prominent palatal ridges (Fig. 3.5); FA 66 - 97; TLS 40 - 67.... 8
8	a	FA 75 - 97; TLS 46 - 67.....*Epomophorus gambianus*
	b	FA 66 - 78; TLS 40 - 49.....*Epomophorus anurus* African Chiroptera name .....*Epomophorus labiatus*
9	a	Nasal region broad; 5 - 7 broad palatal ridges extending to margins of palate, all except first two obviously divided by median groove (Fig. 3.5); FA 49 - 65. .....*Micropteropus pusillus*
	b	Nasal region slender; 12 - 13 narrow palatal ridges, posterior ridges not extending to margins of palate (Fig. 3.5); FA 45 - 54. .....*Nanonycteris veldkampi* African Chiroptera name .....*Micropteropus pusillus*
10	a	FA 110 or more; dorsal pelage dull yellow, hairs dark with dull yellow tips; no collar of stiff hairs on throat and neck of adult males.....*Eidolon helvum*
	b	FA less than 110; collar of stiff hairs on throat and neck of adult males (sometimes inconspicuous). 11
11	a	FA 60 - 64; WT 35 - 41; palatal ridges as in Fig. 3.5; not associated with caves. .....*Myonycteris torquata*
	b	FA more than 65; WT more than 41; usually associated with caves. 12
12	a	FA 66 - 81; WT 54 - 92; pelage-dark brown, long and soft; well-developed collar of stiff hairs on throat of adult males; palatal ridges as in Fig. 3.5; cheek teeth about as broad as long; wings insert on second toe. .....*Rousettus angolensis* African Chiroptera name .....*Myonycteris angolensis*
	b	FA 87 - 102; WT 84 - 131; pelage dark brown, short; poorly developed collar of stiff hairs on throat of adult males; palatal ridges as in Fig. 3.5; cheek teeth longer than they are broad; wings insert on first toe. .....*Rousettus aegyptiacus*
13	a	No visible tail (Family Megadermatidae) .....*Lavia frons*
	b	Tail long and easily visible..... 14
14	a	Part of tail free of the interfemoral membrane..... 15
	b	Tail entirely enclosed in the interfemoral membrane. 17
15	a	Free portion of tail emerges-upwards near centre of the interfemoral membrane (Family Emballonuridae) 20
	b	Free portion of tail emerges at hind margin of the interfemoral membrane..... 16
16	a	Free portion of tail thick and broad, approximately equal in length to portion enclosed in the interfemoral membrane (Family Molossidae) 61

	b	Free portion of tail very long and slender (Family Rhinopomatidae). ..... *Rhinopoma microphyllum*
17	a	Face simple, without nose-leaves (Family Vespertilionidae) 39
	b	Face with nose-leaves. 18
18	a	Face with deep slit from nostrils to forehead, bordered by nose-leaves; tragus present; tail ends in characteristic 'Y'-shaped cartilage (Family Nycteridae) 24
	b	Face without deep slit from nostrils to forehead; noseleaves flattish, covering whole of nasal region; tragus absent or very small; tail does not end in 'Y'-shaped cartilage. 19
19	a	Posterior nose-leaf with an erect fleshy point (sella) (Family Rhinolophidae). 29
	b	Posterior nose-leaf elliptical, without an erect fleshy point (Family Hipposideridae) 33
20	a	FA less than 51; gular pouch absent; radio-rnetacarpal pouch absent. .. *Coleura afra*
	b	FA more than 51; gular pouch present in males; radio-metacarpal pouch present. 21
21	a	FA more than 80; gular pouch in males and females; pelage dark brown; rainforest zone. ..... *Taphozous peli* African Chiroptera name ..... *Saccolaimus peli*
	b	FA less than 80; gular pouch in males only; rainforest and savanna zones. 22
22	a	FA 70 - 75; TLS 26 - 28; naked skin on ventral surface and rump. ..... *Taphozous nudiventris*
	b	FA not more than 70; TLS not more than 22; fully furred on ventral surface and rump. 23
23	a	FA 58 - 64; dorsal pelage speckled grey (salt-and-pepper effect); ventral pelage pure white; large gular pouch in males. ..... *Taphozous mauritianus*
	b	FA 60 - 67; dorsal grey pelage greyish, not speckled; ventral pelage greyish or whitish; small gular pouch in males. ..... *Taphozous perforatus* African Chiroptera name ..... *Taphozous perforatus perforatus*
24	a	Posterior lower premolar large, reaching above cingulum of anterior premolar and equal or almost equal to height of anterior cusp of first molar; obvious concavity on outer margin of tragus. 25
	b	Posterior lower premolar very small, reaching approximately to cingulum of anterior premolar (Fig. 3.9); no obvious concavity on outer margin of tragus. 26
25	a	FA 36 - 46; E 28 - 33. ..... *Nycteris arge*
	b	FA 47 - 50; E 27 - 32. ..... *Nycteris major*
26	a	Upper incisors trifid (Fig. 3.9). 27
	b	Upper.incisors bifid (Fig. 3.9). 28
27	a	Forearm 36 - 45; E 18 - 25; rainforest and savanna zone. ..... *Nycteris hispida*
	b	FA 57 - 66; E 28 - 35; rainforest zone. ..... *Nycteris grandis*
28	a	TLS less than 20; posterior lower premolar extremely small and hardly visible; slight concavity on outer margin of tragus. ..... *Nycteris thebaica*
	b	TLS more than 20; posterior molar small but visible; no concavity on outer margin of tragus. ..... *Nycteris macrotis*
29	a	FA more than 57; TLS at least 29; connecting process does not stand up above level of sella (Fig. 3.11). ..... *Rhinolophus maclaudi*
	b	FA less than 57; TLS less than 29; connecting process stands up above level of sella. 30
30	a	Connecting process rounded (Fig. 3.11). 31
	b	Connecting process pointed (Fig. 3.11). 32
31	a	FA 50 - 53; TLS 21 - 23. ..... *Rhinolophus fumigatus*
	b	FA 45 - 48; TLS about 19. ..... *Rhinolophus alticolus* African Chiroptera name ..... *Rhinolophus simulator*
32	a	FA 38 - 45; TLS 17 - 20; savanna habitats. ..... *Rhinolophus landeri*
	b	FA 49 - 54; TLS 22 - 34; rainforest habitats ..... *Rhinolophus alcyone*
33	a	Central nose-leaf and posterior nose-leaf each with club-like process; FA 62 - 71. ..... *Hipposideros cyclops* African Chiroptera name ..... *Doryrhina cyclops*
	b	Nose-leaves without club-like processes. 34
34	a	Internarial septum enlarged with lateral lobes obscuring the nostrils; FA 50 - 55. ..... *Hipposideros jonesi*
	b	Internarial septum not enlarged, nostrils visible. 35

35 a FA 98 or greater, TLS 34 or greater, E 28 - 32; frontal sac with longitudinal slit. ..... *Hipposideros commersoni*
African Chiroptera name ..... Macronycteris commersoni
b FA less than 98, TLS less than 54; frontal sac, if present, with horizontal slit. 36
36 a Three secondary leaflets on either side of anterior noseleaf; FA 59 - 64. *Hipposideros abae*
b Two secondary leaflets on either side of anterior noseleaf; FA 41 - 52. 37
37 a FA 41 - 44. ..... *Hipposideros beatus*
b FA usually more than 44. 38
38 a FA 43 - 48. ..... *Hipposideros caffer*
b FA 48 - 52. ..... *Hipposideros ruber*
39 a Second phalanx of third finger about three times as long as first phalanx (Fig. 3.4). ..... *Miniopterus schreibersi*
African Chiroptera name ..... Miniopterus schreibersii
b Second phalanx of third finger less than three times as long as the first phalanx. . 40
40 a Pelage woolly; ear funnel-shaped; tragus long and straight, tapering to a slender point. ..... *Kerivoula smithi*
African Chiroptera name ..... Kerivoula smithii
b Pelage generally short, not woolly; tragus not long and straight, not tapering to a slender point. 41
41 a Six upper and six lower cheek teeth on each side of mouth. ..... *Myotis bocagei*
African Chiroptera name ..... Myotis bocagii
b Less than six upper and six lower cheek teeth on each side of mouth. 42
42 a Four upper incisor teeth. 43
b Only two upper incisor teeth. 46
43 a Upper jaw with two premolars on each side (Genus *Pipistrellus*). 49
b Upper jaw with one premolar on each side. 44
44 a Second phalanx of third finger longer than first phalanx; wings white with dark reticulation, or white markings on shoulders or on dorsal surface; nasal region very short (Genus *Glauconycteris*) 51
b Second phalanx of third finger shorter than first phalanx; wings white or dark; no white markings on shoulders or on dorsal surface of body; nasal region not particularly short. 45
45 a Wings extremely narrow and small in relation to size ot body; tragus short and blunt; skull flat and broad. ..... Mimetillus moloneyi
b Wings not extremely .narrow; tragus not particularly short and blunt (Genus *Eptesicus*) 53
46 a FA not less than 40; tragus long and 'sickle-shaped'; skull with mid-dorsal ridge which can be felt on top of head (Genus *Scotophilus*) 57
b FA less than 40; tragus rounded at tip; skull without mid-dorsal ridge. 47
47 a Upper canines with groove on anterior surface (Genus *Scotoecus*) 48
b Upper canines without groove on anterior surface. ..... *Nycticeius schlieffeni*
African Chiroptera name ..... Nycticeinops schlieffenii
48 a Wings white; ventral pelage dark, similar to dorsal pelage; FA 30 - 31. ..... *Scotoecus albofuscus*
b Wings dark; ventral pelage silvery-white; FA 34 - 35. ..... Scotoecus hindei
49 a Ventral pelage pure white; inner upper incisor teeth deeply bifid; FA 32 - 34. ..... *Pipistrellus rueppelli*
African Chiroptera name ..... Pipistrellus rueppellii
b Ventral pelage dark or grey; inner upper incisor teeth not bifid or only slightly bifid; FA less than 32. 50
50 a Tragus 'hatchet-shaped'; dorsal hairs dark brown with golden-brown tips; FA 25 - 32. ..... *Pipistrellus nanus*
African Chiroptera name ..... Neoromicia nana
b Tragus 'sickle-shaped'; dorsal hairs reddish-brown; FA 25 - 31. .. Pipistrellus nanulus
51 a Wings and interfermoral membrane pale, with bold dark reticular pattern; FA 41 - 45. ..... Glauconycteris variegata
b Wings dark, without reticular pattern; FA less than 41. 52
52 a Pelage grey or brownish-grey, with white shoulder spot and white lateral spot or line on each side of body; tragus short and broad. ..... Glauconycteris poensis

	b	Pelage dark brown or rufous-brown, without white markings except for white tuft on each shoulder; tragus long and narrow. ..... *Glauconycteris beatrix*
53	a	Wings white or translucent. 54
	b	Wings dark. 56
54	a	Wings very pale, contrasting with blackish-brown dorsal pelage; FA less than 32. ..... *Eptesicus tenuipinnis* African Chiroptera name ..... *Neoromicia tenuipinnis*
	b	Wings pale, not contrasting so definitely with light-buff to dark brown dorsal pelage; FA usually more than 32. 55
55	a	Dorsal pelage dark brown to reddish-brown; ventral pelage grey, incisor teeth without hook on posterior surface. ..... *Eptesicus brunneus* African Chiroptera name ..... *Neoromicia brunnea*
	b	Dorsal pelage light buff to fawny-brown; ventral pelage light grey; anal region white; upper incisor teeth with hook on posterior surface. ..... *Eptesicus rendalli* African Chiroptera name ..... *Neoromicia rendalli*
56	a	FA more than 45; HB 60 - 75. ..... *Eptesicus platyops*
	b	FA less than 45; HB 30 - 45. *Eptesicus capensis group (including Eptesicus somailcus and Eptesicus puslllus)*
57	a	FA 80 - 88; TLS 31 - 34. ..... *Scotophilus nigrita* (This should be *Scotophilus dinganii*. See Robbins (1978)) African Chiroptera name ..... *Scotophilus dinganii*
	b	FA less than 80; TLS less than 31. 58
58	a	FA 41 - 47; WT14 - 18; ventral pelage yellow to pale buffy-brown, never white; savanna zones. ..... *Scotophilus viridis*
	b	FA 49 - 57; WT 16 - 30;.ventral pelage varying shades of yellow, greyish-white or white; rainforest or savanna zones. 59
59	a	FA about 55; WT about 30; dorsal pelage dark orange-brown; rainforest zone. ..... *Scotophilus nux*
	b	FA 49 - 57; WT usually 16 - 27; dorsal pelage brown to greyish-brown; rainforest and savanna zones. 60
60	a	FA 49 - 57; WT 16 - 27; ventral pelage bright yellow, yellowish orange or pale yellow; rainforest and savanna zones. ..... *Scotophilus dinganii*
	b	FA 49 - 54, WT 16 - 20; ventral pelage greyish-white to white, never yellowish; savanna zones. ..... *Scotophilus leucogaster*
61	a	Tragus large, longer than antitragus and not concealed by antitragus; ears white or translucent, well separated and not connected by flap of skin; FA not more than 37; upper Incisors In contact at their bases. ..... *Myopterus whitleyi*
	b	Tragus small concealed by antitragus (except in *Tadarida aegyptiaca*); ears not translucent, connected by flap of skin or at least very close together; FA 27 - 66; upper incisors clearly separated. 62
62	a	FA 27 - 31. ..... *Tadarida nanula* African Chiroptera name ..... *Mops (Xiphonycteris) nanulus*
	b	FA more than 31. 63
63	a	FA less than 43 64
	b	FA more than 43. 66
64	a	Dorsal pelage blackish-brown; white or pale hairs on ventral surface where wings join flanks; mainly savanna zones. ..... *Tadarida pumila* African Chiroptera name ..... *Chaerephon pumilus*
	b	Dorsal pelage dark brown or orange-brown; no white hairs on ventral surface where wings join flanks; rainforest zone. 65
65	a	FA 35 - 38; dorsal pelage orange-brown to reddish-brown; flanks brownish. *Tadarida leonis* African Chiroptera name ..... *Mops (Xiphonycteris) brachypterus*
	b	FA 38 - 41; dorsal pelage rich dark brown with band of black naked skin adjacent to wings and on rump. ..... *Tadarida thersites* African Chiroptera name ..... *Mops (Xiphonycteris) thersites*
66	a	FA less than 50. 67
	b	FA more than 50. 68

67 a Dorsal and ventral pelage dark brown, with band of long pure white hairs on ventral surface where wings join body; ears with particularly large flap of skin joining inner surfaces of ears; tuft of thickened hairs on top of head. ..... *Tadarida nigeriae*
African Chiroptera name .....*Chaerephon nigeriae*

b Dorsal pelage reddish-brown, ventral pelage usually greyish with band of white hairs where wings join body; ears without particularly large flap of skin joining inner surfaces of ears; no tuft of thickened hairs on top of head. ..... *Tadarida condylura*
African Chiroptera name .....*Mops (Mops) condylurus*

68 a FA 60 - 66. ..... *Tadarida midas*
African Chiroptera name .....*Mops (Mops) midas*

b FA less than 60. 69

69 a Tragus well-developed, not obscured by antitragus; FA 44 - 53; savanna habitats. .....*Tadarida aegyptiaca*

b Tragus small, concealed by antitragus; FA 55 - 57; rainforest habitats. ..... *Tadarida congica*
African Chiroptera name .....*Mops (Mops) congicus*

Appendix 5al: Boulay and Robbins (1989). Epomophorus gambianus

1	a	Single strong transverse palatal ridge between last molars and upturned posterior edge of bony palate (bony support usually evident evne if ridge cleaned of tissue); one postdental palatal ridge, length of forearm 72 to 95 (males) 68 to 88 (females) ..... *Epomophorus wahlbergi*
	b	Two weaker transverse parallel palatal ridges between last molars and upturned posterior edge of bony palate (bony supports faint if bony palate cleaned); two postdental fleshy palatal ridges 2
2	a	Second to fourth fleshy palatal ridge divided in the middle; length of forearm 62.3 to 62.8 (males), 65.8 (females) ..... *Epomophorus grandis*
	b	Second to fourth fleshy palatal ridge s undivided 3
3	a	Fourth fleshy palatal ridge nearer third than fifth; western Angola, north-western Namibia ..... *Epomophorus angolensis*
	b	Fourth fleshy palatal ridge midway between third and fifth 4
4	a	Condylobasal length 51.1 to 63.6 (males), 45.0 to 56.1 (females) ..... *Epomophorus gambianus*
	b	Condylobasal length less than 50 (males), 45 (females) 5
5	a	Condylobasal length 40.0 to 48.4 (males), 37.0 to 43.9 (females) ..... *Epomophorus labiatus* African Chiroptera name ..... *Epomophorus minor*
	b	Condylobasal length usually less than 40 (33.0 to 40.8 in males and 31.0 to 39.0 in females) ..... *Epomophorus minor*

Appendix 5am: Happold and Happold (1989). The bats (Chiroptera) or Malawi, Central Africa: Checklist and keys for identification

1	a	Second finger terminating in claw (Fig. 1); ear conch forms complete ring around external ear opening (Fig. 2a); tragus absent; tail absent or very small (Fig. 3a); interfemoral membrane poorly developed (Fig. 3a); no nose-leaves or fleshy outgrowths on nasal region or forehead; large eyes; cheek-teeth simple without well-developed cusps (Fig. 4) (Suborder Megachiroptera) 2
	b	Second finger without terminal claw; innter and outer margins of ear conch arise at different points and are note joined a t bas; tragus usually present (Fig. (2b-h); tail long and interfemoral membrane well-developed in most families (Fig. 3) except Megadermatidae (Fig. 3d); nose-leaves or fleshy outgrowths present in some families (Fig. 2); eyes small and obscure; cheek-teeth with well-developed cusps (Suborder Microchiroptera) 7
2	a	No white tufts at base of ears; five upper cheek-teeth..... 3
	b	Conspicuous white tuft at the base of each ear (Fig. 2a); three upper cheek-teeth (Fig. 4) 4
3	a	Forearm usually > 100 mm (110 - 130).....*Eidolon helvum*
	b	Forearm usually < 100 mm (80 - 105).....*Rousettus aegyptiacus*
4	a	Five prominent palatal ridges ..... *Epomops dobsoni* African Chiroptera name ..... *Epomophorus dobsonii*
	b	Six prominent palatal ridges (Fig. 4) 5
5	a	One post-dental palatal ridge ..... *Epomophorus wahlbergi*
	b	Two post-dental palatal ridges 6
6	a	Forearm adult male 61 - 69 mm (mean 64), adult female 58 - 64 mm (mean 61); head adult male 41 - 44 mm (mean 42), adult female 35 - 39 mm (mean 37) [but see text] .....*Epomophorus minor*
	b	Forearm adult male 80 - 86 mm (mean 83), adult female 68 - 79 mm (mean 71); head adult male 52 - 59 mm (mean 54), adult female 37 - 49 (mean 40) [but see text] .....*Epomophorus crypturus*
7	a	No visible tail (Fig 3d) (Family Megadermatidae) .....*Lavia frons*
	b	Tail long and easily visible..... 8
8	a	Part of tail free of the interfemoral membrane..... 9
	b	Tail entirely enclosed in the interfemoral membrane 10
9	a	Free portion of tail emerges upwards near centre of the interfemoral membrane (Fig. 3b) (Family Emballonuridae) 13
	b	Free portion of tail emerges at hind margin of the interfemoral membrane (Fig. 3h) (Family Molossidae) 56
10	a	Face simple without nose-leaves (Fig. 2g) (Family Vespertilionidae)..... 30
	b	Face with nose-leaves (Fig. 2c-f) 11
11	a	Face with deep slit from nostrils to forehead, bordered by nose-leaves (Fig. 2c); tragus present; tail ends in characteristic Y-shaped cartilage (Fig. 3c) (Family Nycteridae) 15
	b	Face without deep slit from nostrils to forehead; nose-leaves flattish, covering whole of nasal region; tragus absent or very small; tail does not end in Y-shaped cartilage 12
12	a	Posterior leaflet of nose-leaf triangular, with an erect fleshy point called a sella (Figs. 2e & 6a); three bones in each toe (Family Rhinolophidae)..... 19
	b	Posterior leaflet of nose-leaf elliptical or tridentate, without a sella (Figs. 2f & 7); two bones in each toe (Family Hipposideridae)..... 26
13	a	Forearm < 55 mm..... *Coleura afra*
	b	Forearm > 55 mm..... 14
14	a	Forearm 58 - 64 mm (mean 62); dorsal pelage grizzled dark and pale grey (salt-and-pepper effect); ventral pelage pure white; large gular pouch in males .....*Taphozous mauritianus*
	b	Forearm 60 - 67 mm; dorsal pelage grey, not grizzled; ventral pelage greyish or whitish but not pure white; no gular pouch in males ..... *Taphozous perforatus* African Chiroptera name .....*Taphozous perforatus perforatus*
15	a	Upper incisors bifid (Fig. 5a) 16
	b	Upper incisors trifid (Fig. 5b) 18
16	a	Tragus semi-lunate, base of its posterior margin not notched (Fig. 5c)..... 17

	b	Tragus pyriform, base of its posterior margin with a distinct notch (Fig. 5d) ..... *Nycteris thebaica*
17	a	Forearm 37 - 42 mm, pelage greyish ..... *Nycteris woodi*
	b	Forearm 45 - 54 mm (mean 52), pelage brownish ..... *Nycteris macrotis*
18	a	Forearm 36 - 45 mm; ear 18 - 25 mm ..... *Nycteris hispida*
	b	Forearm 57 - 67 mm (mean 64); ear 26 - 35 mm ..... *Nycteris grandis*
19	a	Connecting process pointed (Fig. 6b) 20
	b	Connecting process rounded (Fig. 6c-e) 21
20	a	Ratio of first phalanx of the fourth finger to the metacarpal 1:3.5 (range 3.1 - 3.9) (see Fig. 1); sella wedge-shaped ..... *Rhinolophus blasii*
	b	Ratio of first phalanx of the fourth finger to the metacarpal 1:4.9 (range 4.3 - 5.6) (see Fig. 1); sella with parallel sides ..... *Rhinolophus landeri*
21	a	Horseshoe wider than 9 mm; sella with abundant long hairs (examine under magnifying glass) 22
	b	Horseshoe usually < 9 mm; sella naked or with very few hairs (examine under magnifying glass) 23
22	a	Forearm 60 - 70 mm (mean 63); horseshoe 12 - 15 mm (mean 14) ..... *Rhinolophus hildebrandtii*
	b	Forearm 45 - 55 mm (mean: male 49, female 52); horseshoe 9 - 12 mm (mean 10) ..... *Rhinolophus fumigatus*
23	a	Forearm 50 - 57 mm (mean 53); connecting process high and rounded (Fig. 6d) ..... *Rhinolophus clivosus*
	b	Forearm < 50 mm; connecting process low and rounded (Fig. 6e) 24
24	a	Anterior upper premolar in toothrow, upper canine not in contact with posterior upper premolar (Fig. 6f); forearm 40 - 46 mm 25
	b	Anterior upper premolar external to toothrow, upper canine in contact with posterior upper premolar (Fig. 6g); forearm 43 - 50 mm ..... *Rhinolophus darlingi*
25	a	Forearm 40 - 46 mm (mean 45); sella broad ..... *Rhinolophus simulator*
	b	Forearm 40 - 46 mm; sella narrow ..... *Rhinolophus swinnyi*
26	a	Posterior leaflet on nose-leaf elliptical (Fig. 7a) 27
	b	Posterior leaflet on nose-leaf tridentate (Fig. 7b) 29
27	a	Forearm 79 - 115 mm ..... *Hipposideros commersoni* African Chiroptera name ..... *Macronycteris commersoni*
	b	Forearm < 60 mm 28
28	a	Forearm 42 - 50 mm (mean 47); pelage either grey or pale orange; median posterior nasal compartment narrow with wide lateral inflations ..... *Hipposideros caffer*
	b	Forearm 48 - 54 mm; pelage either grey-brown or rufous; median posterior nasal compartment wide with narrow lateral inflations ..... *Hipposideros ruber*
29	a	Forearm 50 - 55 mm; nose-leaf conspicuous ..... *Triaenops persicus*
	b	Forearm 31 - 39 mm; nose-leaf inconspicuous ..... *Cloeotis percivali*
30	a	Second phalanx of third finger about three times as long as the first phalanx (Genus *Miniopterus*) 55
	b	Second phalanx of third finger approximately as long as the first 31
31	a	Ears funnel-shaped, with deep emargination below tip; tragus long, narrow and tapering to a slender point (Fig. 8m); pelage woolly (Genus *Kerivoula*) 54
	b	Ears not funnel-shaped; ears without deep emargination below tip; tragus short and broad or long and narrow but not tapering to a slender point (Fig. 8); pelage not woolly 32
32	a	Six upper cheek-teeth on each side (Fig. 9a) (Genus *Myotis*) 39
	b	Four or five upper cheek-teeth on each side (Fig. 9b-d) 33
33	a	Two upper incisors on each side (Fig. 9c) 34
	b	One upper incisor on each side (Fig. 9d) 37
34	a	Five upper cheek-teeth on each side (Fig. 9b) (Genus *Pipistrellus*) 43
	b	Four upper cheek-teeth on each side (Fig. 9c-d) 35
35	a	Ear 18 mm or more, about half length of forearm (Genus *Laephotis*) ..... *Laephotis botswanae*
	b	Ear < 18 mm, much less than half length of forearm 36
36	a	Lower lip with lobe at posterior angle; forearm 39 - 45 mm; nasal region very short and broad; wing membranes reticulated or not reticulated (Genus *Glauconycteris*) 51

	b	Lower lip without lobe at posterior angle; forearm 29 - 53 mm; nasal region not very short and broad; wings without (Genus *Eptesicus*) 46
37	a	Forearm 42 - 88 mm (Genus *Scotophilus*) 52
	b	Forearm 28 - 38 mm 38
38	a	Upper canine with rounded anterior face and no groove; penis not elongated, about 9 mm; forearm 29 - 33 mm (mean 31); four upper cheek-teeth on each side (Genus *Nycticeus*) ..... *Nycticeius schlieffenii* African Chiroptera name ..... *Nycticeinops schlieffenii*
	b	Upper canine with broad flat anterior surface and a shallow groove; penis greatly elongated (14 mm in some specimens); forearm 28 - 38 mm; four or five upper cheek-teeth on each side (Genus *Scotoecus*) 41
39	a	Forearm 52 - 60 mm; very conspicuous pattern of orange-red and black markings on wings and interfemoral membrane ..... *Myotis welwitschii*
	b	Forearm 36 - 52 mm; wings and interfemoral membrane with faint markings or no markings 40
40	a	Forearm 47 - 52 mm (mean 49) ..... *Myotis tricolor*
	b	Forearm 36 - 42 mm (mean 39) ..... *Myotis bocagei* African Chiroptera name ..... *Myotis bocagii*
41	a	Wings white with brown edges; ventral pelage brown ..... *Scotoecus albofuscus*
	b	Wings dark brown; ventral pelage greyish-white 42
42	a	Greatest length of skull 13.5 - 15 mm; canine and cheek-teeth comparatively massive; c^1-c^1 (alveoli) about 5.6 mm, (cingula) about 5.7 mm; m^3-m^3 about 8.0 mm; c^1-m^3 about 6.1 mm; length of mandible about 11.5 mm ..... *Scotoecus albigula*
	b	Greatest length of skull 15.3 - 15.5 mm; canine and cheek-teeth less massive; c^1-c^1 (alveoli) about 5.2 mm, (cingula) about 5.3 mm; m^3-m^3 about 7.2 mm; c^1-m^3 about 5.4 mm; length of mandible about 10.3 mm ..... *Scotoecus hindei*
43	a	Ventral pelage pure white ..... *Pipistrellus rueppellii*
	b	Ventral pelage brown 44
44	a	Tragus hatchet-shaped with sharp angle on posterior border (Fig. 8e); commonly roosts in furled banana leaves ..... *Pipistrellus nanus* African Chiroptera name ..... *Neoromicia nana*
	b	Tragus not hatched-shaped, without sharp angle on posterior border (Fig. 8f-g); not known to roost in furled banana leaves 45
45	a	Forearm 30 - 37 mm (mean 35); head 15.0 - 16.5 mm (mean 15.9); total length of skull more than 12 mm; forehead slightly concave; tragus as in Fig. 8f *Pipistrellus kuhlii*
	b	Forearm 27 - 34 mm (mean 32); head 14.0 - 16.0 mm (mean 15.0); total length of skull 12 mm or less; forehead flat; tragus as in Fig. 8g ..... *Pipistrellus rusticus*
46	a	Wings white or translucent ..... *Eptesicus rendalli* African Chiroptera name ..... *Neoromicia rendalli*
	b	Wings with dark brown or black pigmentation 47
47	a	Forearm 44 - 53 mm ..... *Eptesicus hottentotus*
	b	Forearm < 40 mm 48
48	a	Forearm 34 - 38 mm ..... *Eptesicus melckorum* African Chiroptera name ..... *Neoromicia capensis*
	b	Forearm 35 mm or less 49
49	a	Cranial portion of skull elevated above rostrum; forearm 29 - 32 mm (mean 31) ..... *Eptesicus zuluensis* African Chiroptera name ..... *Neoromicia zuluensis*
	b	Cranial portion of skull note elevated above rostrum; forearm 29 - 35 mm 50
50	a	Skull with posterior occipital "helmet"; forearm 29 - 35 mm (mean 32) ..... *Eptesicus capensis* African Chiroptera name ..... *Neoromicia capensis*
	b	Skull without posterior occipital "helmet"; forearm 30 - 32 mm .... *Eptesicus somalicus* African Chiroptera name ..... *Neoromicia somalica*
51	a	Wings and interfemoral membrane conspicuously reticulated by pigmentation of the veins and therefore having a pattern of dark lines on a pale background ..... *Glauconycteris variegata*
	b	Wings and interfemoral membrane not reticulated and therefore without a pattern ..... *Glauconycteris argentata*
52	a	Forearm 77 - 88 mm ..... *Scotophilus nigrita*

	b	Forearm 42 - 65 mm 53
53	a	Forearm 48 - 60 mm (mean 55); head 23 - 26 mm (mean 25); tragus 9.0 - 10.5 mm (mean 9.6) ..... *Scotophilus dinganii*
	b	Forearm 42 - 52 mm (mean 48); head 17 - 23 mm (mean 21); tragus 8.0 - 9.0 mm (mean 8.3) ..... *Scotophilus viridis*
54	a	Forearm 34 - 41 mm; total length skull 15 mm or more; dorsal pelage bright reddish-chestnut ..... *Kerivoula argentata*
	b	Forearm 30 - 32 mm; total length skull 13.5 mm or less; dorsal pelage brown, grey-brown or dull buffy ..... *Kerivoula harrisoni* African Chiroptera name ..... *Kerivoula lanosa*
55	a	Forearm 42 - 45 mm, skull about 14 mm ..... *Miniopterus fraterculus*
	b	Forearm 42 - 47 mm, skull about 15 mm ..... *Miniopterus schreibersii*
56	a	Forearm 62 - 73 mm; ear 38 - 40 mm; ears joined together and joined to snout ..... *Otomops martiensseni*
	b	Forearm 34 - 66 mm; ear 30 mm or less; ears either joined or not joined together, but not joined to snout 57
57	a	Forearm > 55 mm 58
	b	Forearm < 55 mm 60
58	a	Ears joined together at base; m reduced, cusps forming V pattern (Fig. 10a) *Tadarida midas* African Chiroptera name ..... *Mops (Mops) midas*
	b	Ears not joined together; m not reduced; cusps forming N pattern (Fig. 10b) 59
59	a	Forearm 57 - 62 mm; total length skull 22.0 - 22.9 mm ..... *Tadarida fulminans*
	b	Forearm 60 - 67 mm; total length skull 23.5 - 25.7 mm ..... *Tadarida ventralis*
60	a	Forearm 43 - 53 mm 61
	b	Forearm 34 - 42 mm 64
61	a	Ventral pelage with white, off-white or very pale grey-brown area, especially on abdominal region; dorsal pelage conspicuously darker than ventral pelage; m reduced, cusps forming V pattern (Fig. 10a) 62
	b	Ventral pelage usually dark brown, sometimes tinged with grey; dorsal pelage usually same as ventral pelage or only slightly darker (in T. aegyptiaca, some individuals have off-white and pale grey-brown ventral pelage); m not reduced, cusps forming N or W pattern (Fig. 10b-c) 63
62	a	Crown of head darker than back; skull with sagittal crest low or absent; third commissure of m obsolete ..... *Tadarida niveiventer* African Chiroptera name ..... *Mops (Mops) niveiventer*
	b	Crown of head same colour as back; skull with well-developed sagittal crest; third commissure of m present although reduced ..... *Tadarida condylura* African Chiroptera name ..... *Mops (Mops) condylurus*
63	a	Ears joined at base; pattern of white spots or short stripe on crown of head and sometimes on shoulders and flanks ..... *Tadarida bivittata* African Chiroptera name ..... *Chaerephon bivittatus*
	b	Ears separate; no white spots or striped on crown of head, shoulders or flanks ..... *Tadarida aegyptiaca*
64	a	Males with long (13 - 14 mm) bicoloured post-aural crest with basal half of hairs reddish-brown, remainder white; forearm 34 - 39 mm ..... *Tadarida chapini* African Chiroptera name ..... *Chaerephon chapini*
	b	Males with short (10 mm or less) unicoloured post-aural crest; forearm 36 - 42 mm (mean 38) ..... *Tadarida pumila* African Chiroptera name ..... *Chaerephon pumilus*

Appendix 5an: Kowalski and Rzebik-Kowalska (1991). Mammals of Algeria.

1	a	Tail with terminal portion free, emerging from upper surface of interfemoral membrane (Family Emballonuridae). ..... *Taphozous nudiventris*
	b	Tail enclosed within interfemoral membrane or projecting from its margin. 2
2	a	Free portion of tail very slender, much longer than interfemoral membrane (Family Rhinopomatidae). ..... *Rhinopoma hardwickei* African Chiroptera name ..... *Rhinopoma cystops*
	b	Free portion of tail stout, not longer than interfemoral membrane or tail enclosed within membrane. 3
3	a	Complicated skin folds including a nose-leaf present around the nose (Family Rhinolophidae). 4
	b	Muzzle without skin folds. 10
4	a	Tail protruding from the membrane for more than 3 mm. ..... *Asellia tridens*
	b	Tail entirely enclosed within interfemoral membrane (Genus *Rhinolophus*). 5
5	a	Large, forearm usually more than 53 mm long. Noseleaf with superior connecting process of sella blunt in side view. ..... *Rhinolophus ferrumequinum*
	b	Size medium or small, forearm usually less than 53 mm long. Noseleaf with superior connecting process of sella blunt or pointed in side view. 6
6	a	Small, forearm less than 40 mm long. Noseleaf with superior connecting process blunt in side view, its base projecting prominently forwards. *Rhinolophus hipposideros*
	b	Medium size, forearm between 43 and 53 mm long. 7
7	a	Noseleaf with superior connecting process of sella pointed in side view. Small: forearm usually 43 - 49 mm long. 8
	b	Noseleaf with superior connecting process of sella blunt in side view. Large: forearm usually 48 - 53 mm long. 9
8	a	First phalanx of fourth finger more than half as long as the second. *Rhinolophus blasii*
	b	First phalanx of fourth finger less than half as long as second. .. *Rhinolophus euryale*
9	a	First phalanx of fourth finger more than half as long as the second. ..... *Rhinolophus clivosus*
	b	First phalanx of fourth finger less than half as long as second. .. *Rhinolophus mehelyi*
10	a	About half of tail free, projecting beyond posterior edge of narrow interfemoral membrane (Family Molossidae). 11
	b	Tail entirely enclosed in interfemoral membrane or only its tip protruding from it (Family Vespertilionidae). 12
11	a	Large, forearm more than 54 mm long. Three pairs of lower incisors. *Tadarida teniotis*
	b	Small, forearm less than 54 mm long. Two pairs of lower incisors. ..... *Tadarida aegyptiaca*
12	a	One pair of upper incisors. Ears very large. ..... *Otonycteris hemprichi* African Chiroptera name ..... *Otonycteris hemprichii*
	b	Two pairs of upper incisors. 13
13	a	Three pairs of premolars in upper jaws (Genus *Myotis*). 14
	b	One or two pairs of premolars in upper jaws. 17
14	a	Large, forearm more than 50 mm long. ..... *Myotis blythi*
	b	Small, forearm less than 45 mm long. 15
15	a	Hind foot very large, three-quarters length of tibia. ..... *Myotis capaccinii*
	b	Hind foot smaller, about half length of tibia. 16
16	a	Posterior edge of ear conspicuously indented above half its length. Posterior margin of interfemoral membrane with single soft hair. ..... *Myotis emarginatus*
	b	Posterior edge of ear with slight indentation. Posterior margin of interfemoral membrane covered with stiff, curved hair. ..... *Myotis nattereri*
17	a	Ears very large, about 35 mm long, joined across the forehead... *Plecotus austriacus*
	b	Ears not very large, widely separated from each other. 18
18	a	Three pairs of lower premolars. Terminal portion of unspanned wings curves inward. ..... *Miniopterus schreibersi* African Chiroptera name ..... *Miniopterus schreibersii*
	b	Two pairs of lower premolars. Terminal portion of unspanned wing does not curve inward. 19
19	a	One pair of upper premolars. ..... *Eptesicus serotinus*
	b	Two pairs of upper premolars. 20

20	a	Large, forearm more than 40 mm long. Wings narrow (Genus *Nyctalus*). 21
	b	Small, forearm less than 37 mm long. Wings broad (Genus *Pipistrellus*)..... 22
21	a	Forearm more than 50 mm long.....*Nyctalus noctula*
	b	Forearm less than 46 mm long. ..... *Nyctalus leisleri*
22	a	First upper incisor unicuspid. .....*Pipistrellus savii*
		African Chiroptera name .....*Hypsugo savii*
	b	First upper incisor bicuspid..... 23
23	a	Wing membrane with white margin. 24
	b	Wing membrane without white margin. 25
24	a	LC-M^3 more than 4.5 mm. Forearm 31 - 36 mm. .....*Pipistrellus kuhlii*
	b	LC-M^3 less than 4.5 mm. Forearm 29 - 33 mm.....*Pipistrellus deserti*
		African Chiroptera name .....*Pipistrellus kuhlii*
25	a	Ventral fur white. .....*Pipistrellus rueppelli*
		African Chiroptera name ..... *Pipistrellus rueppellii*
	b	Ventral fur brown. .....*Pipistrellus pipistrellus*

Appendix 5ao: Peterson et al. (1995). Faune de Madagascar: Chiroptères

1	a	Seconde phalange du troisième doigt à peu près trois fois plus longue que la première. Boîte crânienne haute et ronde (genus *Miniopterus*)..... 5
	b	Seconde phalange du troisième doigt pas particulièrement longue 2
2	a	Six dents génales (1), haut et bas, de chaque côté.....*Myotis*
	b	Moins de six dents génales, haut et bas, de chaque côté 3
3	a	Cinq dents génales, haut et bas, de chaque côté. Deux incisives supérieures de chaque côté.....*Pipistrellus*
	b	Quatre dents génales supérieures et cinq dents génales inférieures de chaque côté 4
4	a	Deux incisives supérieures de chaque côté.....*Eptesicus*
	b	Une incisive supérieure de chaque côté .....*Scotophilus*
5	a	Avant-bras mesurant plus de 46 mm (X = 48.4; 46.7 - 49.9) plus grande longueur de la tête dépassant 16.0 mm (X = 16.7; 16.1 - 17.0)..... *Miniopterus gleni*
	b	Avant-bras en général de moins de 46 mm; plus grande longueur de la tête inférieure à 16.0 mm en général 6
6	a	Avant-bras de plus de 40 mm 7
	b	Avant-bras de moins de 40 mm ..... *Miniopterus manavi*
7	a	Plus grande longueur du crâne pas inférieure à 15.0 mm (X = 15.5; 15.0 - 16.1). Avant bras X = 44.2 (41.8 - 46.6); M^3-M^3: X 6.5 (6.3 - 6.8)..... *Miniopterus majori*
	b	Plus grande longueur du crâne en général inférieure à 15.0 mm (X = 14.8; 14.5 - 15.1). Avant-bras X = 42.8 (40.7 - 44.4). M^3-M^3: X 5.9 (5.7 - 6.0) ..... *Miniopterus fraterculus*
8	a	Oreilles simples et séparées par un espace à leur base 9
	b	Oreilles naissant à peu près au même point ou réunies au-dessus du front..... 16
9	a	Palais échancré en avant; antitragus bas ou indistinct et plus large que long; fossettes du basisphénoïde absentes ou peu développées ; troisième commissure de M^3 égale ou plus longue que la seconde 10
	b	Palais non échancré en avant; antitragus bien développé, en général plus haut que large..... 12
10	a	Crâne très plat et large..... 11
	b	Crâne pas très plat; deux ou trois paires d'incisives inférieures une ou deux prémolaires supérieures..... *Mormopterus*
11	a	Avant-bras à granulations verruqueuses; glande gulaire avec des poils internes bien développés; une prémolaire supérieure; échancrure antérieure du palais étroite; processus lacrymal du rostre très large .....*Platymops* African Chiroptera name ..... *Sauromys*
	b	Avant-bras lisse; glande gulaire différente; rostre à naseaux développés et ouverture nasale courte; deux prémolaires supérieures; échancrure palatale antérieure large; processus lacrymal du rostre relativement étroit ..... *Sauromys*
12	a	Crâne et corps massifs; pelage absent sur presque tout le corps; pas de fossettes basisphénoidiennes; une paire d'incisives inférieures et de prémolaires supérieures .....*Cheiromeles*
	b	Crâne et corps non massifs; pelage normal..... 13
13	a	Fossettes du basisphénoïde profondes et bien développées; une paire d'incisives inférieures et de prémolaires supérieures.....*Myopterus*
	b	Fossettes du basisphénoïde absentes ou peu développées; une ou deux paires d'incisives et de prémolaires supérieures 14
14	a	Crâne aplati; troisième commissure de M^3 bien développée; deux paires d'incisives inférieures et de prémolaires supérieures; fossettes du basisphén6ide superficielles, mais bien marquées et circulaires ; incisives supérieures nettement écartées; mandibule à branche ascendante élevée et angle en cylindre allongé ; lèvres à rides ; avant-bras à granulations verruqueuses..... *Neoplatymops*
	b	Crâne pas aplati ; incisives supérieures contiguës; deux prémolaires supérieures; une ou deux incisives inférieures; pas de fossettes basisphénoidiennes, ou fossettes indistinctes, ou de contour elliptique; mandibule à branche ascendante plus basse et angle largement tronqué; lèvres lisses; avant-bras normal, sans granulations verruqueuses..... 15

15 a Une paire d'incisives inférieures, troisième conmissure de M^3 bien développée, à peu près égale à la moitié de la seconde palais nettement en dôme ; secondes phalanges des 3ème et 4ème doigts égales ou plus longues que la première ; oreilles à sommet allongé et pointu, unies à la tête par un pli mobile ..... *Molossops*

b Deux paires d'incisives inférieures ; troisième conmissure de M^3 très réduite; fossettes du basisphénoïde absentes ou indistinctement ovalaires (pas elliptiques); palais pas nettement bombé ; seconde phalange des troisième et quatrième doigts bien plus courts que la première; oreille à sommet arrondi et obtus sans pli mobile l'unissant à la tête..... *Cynomops*

16 a Oreilles longues, soudées à la base; pas d'antitragus; zygoma à saillie dorsale élevée; crâne allongé et relativement étroit; fossettes du basisphénoide très profondes et grandes..... *Otomops*

b Oreilles, zygoma et fossettes du basisphénoïde différents..... 17

17 a Crâne relativement épais et court à crête sagittale nette; lèvres lisses; oreilles relativement courtes; naissant à peu près au même point 18

b Crâne ni épais, ni court; antitragus relativement grand; fossettes du basisphénoide en général développées mais de taille et de forme variables; partie antérieure du palais ou fermée ou échancrée; troisième commissure de M^3 variable; deux ou trois paires d'incisives inférieures ..... *Eumops et/ou Tadarida*

18 a Deux paires de prémolaires supérieures; palais fortement bombé ..... *Promops*

b Une paire de prémolaires supérieures ; palais non fortement bombé ..... *Molossus*

Appendix 5ap: Bergmans (1997). Taxonomy and biogeography of African fruit bats (Mammallia, Megachiroptera).5. The genera Lissonycteris Andersen, 1912, Myonycteris Matschie, 1899 and megaloglossus Pagenstecher, 1.885; General remarks and conclusions; Annex: Key to all species

1 a Facial fur with contrastingly white patches on nose and behind eyes, and/or at anterior and posterior ear bases; three upper and live lower cheek teeth (in one species four or five upper, and five to six lower cheek teeth) 2
b No white facial fur patches or tufts at ear bases; five upper and six (in one species five) lower cheek teeth 18
2 a White fur patches on nose and behind eyes; in one species, white fur tufts also at ear bases 3
b White fur tufts at ear bases only 5
3 a Cheeks and lips conspicuously white; ear tips rather rounded; Fa MM 49 - 55, FF 54 - 64; weight MM 26, FF 28 - 34; finger joints contrastingly yellow; canines simple; forests of Cameroun and Zaïre ..... *Casinycteris argynnis*
b Cheeks and lips not conspicuously white; ears tips either rounded or slightly pointed; finger joints dark and Fa under 57, or finger joints contrastingly coloured and Fa over 70; canines simple or with extra cusp 4
4 a Finger joints as dark as wing membranes; ear tips rounded; Fa MM 45 - 55, FF 47 - 57; weight MM 16 - 24, FF 18 - 27; canines simple; forests of Liberia to East Zalre (discontinuous) ..... *Scotonycteris zenkeri*
b Finger joints whitish or yellowish; ears slightly pointed; Fa MM 74 - 79, FF 75 - 88; weight MM 65 - 71, FF 65 - 95; canines with second, inner cusp; locally in forests of Liberia, Ghana, Cameroun and Congo ..... *Scotonycteris ophiodon* African Chiroptera name ..... *Casinycteris ophiodon*
5 a White ear base tufts not very distinct; anterior end of muzzle truncated and with a fleshy plate (fig. 1); Fa MM 120 - 139, FF 111 - 128; weight MM 290 - 420, FF 207 - 302; no white shoulder tufts; forests, sometimes woodlands, of Sierra Leone to Uganda, southwards to Angola ..... *Hypsignathus monstrosus*
b White ear base tufts conspicuous; muzzle simple (fig. 2); Fa under 105; adult males with retractable white shoulder tufts (not known for Plerotes) 6
6 a Interfemoral membrane extremely narrow; calcar absent; cheek teeth reduced in height and width and variable in number: Four or five upper and five or six lower cheek teeth; woodlands of Angola, South Zaire, North Zambia; Fa 1 M 50, 2 FF 50 - 52.5; weight not known ..... *Plerotes anchietae*
b Interfemoral membrane relatively well developed (fig. 3); calcar present; cheek teeth not much reduced; three upper and five lower cheek teeth (very incidentally rudimentary extra teeth); Fa range variable 7
7 a Three thick palatal ridges in front, followed by five to eight thinner ridges (figs. 4 - 5); Fa over 75 8
b Five to nine thick ridges, followed by two to four thinner ridges; Fa variable 9
8 a Third ridge normally whole; thin ridges rather narrowly divided medially (posterior ones whole) and finely serrate (fig. 4); Fa MM 83 - 101, FF 76 - 97; weight MM 92 - 172, FF 61 - 130; Sierra Leone, eastern Ivory Coast to Uganda, southwards to Angola and Zambia ..... *Epomops franqueti*
b Third ridge normally divided medially; first four or five thin ridges clearly divided medially, irregularly serrate, each half generally with one large central projection pointing forward (5); posterior thin ridges undivided and more evenly serrated; Fa MM 88 - 103, FF 82 - 95; weight MM 133 - 198, FF 94 - 132; Guinea to Ghana, locally in Nigeria ..... *Epomops buettikoferi*
9 a Five thick palatal ridges; second ridge wide and indistinctly bifurcate at its extremities; fourth and fifth postdental, each with two large projections, often triangular and pointing forward; three to four thin, serrated ridges (fig. 6); Fa MM 84 - 94, FF 80 - 89; weight not known; woodlands of Central Angola, southeast Zaire, Zambia, Malawi and eastern Tanzania and Rwanda ..... *Epomops dobsonii* African Chiroptera name ..... *Epomophorus dobsonii*
b At least six thick palatal ridges; ridge pattern different 10

10 a Nine thick or partially thick ridges: three whole, the fourth narrowly divided in same specimens, the fifth to eighth or ninth medially notched with thick, prominent central portions and thin lateral parts; and three or four thin ridges (fig. 7); Fa MM 44 - 50, FF 45 - 54; weight MM 19 - 21, FF 23 - 27; forests and woodlands from Guinea to Central African Republic ..... *Nanonycteris veldkampii*

b At most six thick palatal ridges 11

11 a Six thick palatal ridges, one or two being postdental: first undivided, second to fourth either undivided or divided in the middle, fifth and sixth notched or narrowly divided; ridges never mutually fused 12

b Essentially six thick palatal ridges but fusions between second and third and sometimes others may obscure the picture; first ridge prominent and undivided, second and third either prominent or weak, fourth to sixth prominent; second to sixth palatal ridges divided by a deep, continuous median groove narrowing posteriorly 17

12 a Second to sixth ridges medially divided (fig. 8); Fa 2 MM 62.3 - 62.8, 1 F 65.8; weight not known; probably woodland, southern Congo, probably southern Zaire, and northern Angola ..... *Epomophorus grandis*

b Second to fourth ridge undivided 13

13 a Five thick palatal ridges interdental and only one clearly postdental (fig. 9); Fa MM 72.3 - 94.9, FF 67.7 - 87.5; weight MM 60 - 124, FF 54 - 125; woodlands of Angola, Congo, Gabon, Zaïre, Zambia, East Africa between 4 and 34 S ..... *Epomophorus wahlbergi*

b Four thick palatal ridges interdental, fifth and sixth postdental (fifth exceptionally partly interdental) 14

14 a Fourth thick palatal ridge clearly nearer third than fifth (fig. 10); Fa MM 85.2 - 93.9, FF 81.1 - 85.5; weight not known; woodlands West Angola and North Namibia ..... *Epomophorus angolensis*

b Fourth thick palatal ridge about halfway between third and fifth (fig. 11) 15

15 a Larger, on average; Fa MM 80.0 - 100.0, FF 75.0 - 94.8; weight MM 91 - 155, FF 56 - 130; mainly woodlands, from Senegal to Central African Republic, in Ethiopia, and East Africa south of Lake Tanganyika ..... *Epomophorus gambianus*

b Smaller, on average; Fa MM below 81, FF below 79; weight MM below 100, FF below 85 16

16 a Fa range in MM 66.7 - 80.3, in FF 64.8 - 78.3; weight MM 54 - 99, FF 51 - 81; mainly woodlands, northeast Nigeria, south Sudan to Eritrea and to northwest Tanzania; known from few localities in Congo, Malawi and southeast Kenya ..... *Epomophorus labiatus*
African Chiroptera name ..... *Epomophorus minor*

b Fa range in MM 57.0 - 68.9, in FF 54.1 - 67.6; weight MM 32 - 58, FF 25 - 62; mainly woodlands East Sudan, Ethiopia, Somalia, lower parts of Kenya to South Malawi ..... *Epomophorus minor*

17 a All six thick palatal ridges prominent (fig. 12); second and third ridges may be fused, occasionally also third and fourth; Fa MM 46 - 55, FF 49 - 56; weight MM 24 - 35, FF 20 - 34; woodlands Gambia to Ethiopia and West Kenyan border, southward to Central Angola and southeast Zaïre ..... *Micropteropus pusillus*

b Second and third palatal ridge weakly developed (apparently fused in part of the specimens) (fig. 13); Fa 1 M 58.1, 3 FF 57.2 - 63.6; weight not known; woodland and forest mosaic of western South Zaïre and adjoining Angola *Micropteropus intermedius*

18 a Fa MM 38 - 50, FF 38 - 49; weight MM 11 - 20, FF 13 - 21; no tail; tongue highly extensible, with pointed, densely papillate tip; cheek teeth extremely reduced in height and width; males with ventral collar of thick, whitish hairs; forests Liberia and Guinea to Uganda, southwards to Angola and southeast Zaïre ..... *Megaloglossus woermanni*

b Fa more than 55; tail present or absent; tongue not highly extensible, with rounded tip, not densely papillate; cheek teeth variable; males with or without collar but collar never whitish 19

19 a Short hut distinct external tail. 20

b No external tail 29

20 a Toes partially webbed (fig. 14); Fa range 54 - 90; length second digit 71 - 81 % of Fa; tibiae wholly or partly furred; MM with ruff of thick hairs; upper alveolar line with weak angle between third and fourth premolar (fig. 15); cheek teeth squarish or oblong (fig. 16); simplified palatal ridge pattern 7 + 2 (fig. 17) 21

b Toes not webbed; Fa 66 - 107; length second digit 64 - 71 % of Fa; tibiae practically naked or, when furred, in combination with laterally depressed cheek teeth (fig. 18); MM without ruff of thick hairs; upper alveolar line practically straight (fig. 19); cheek teeth oblong, laterally depressed in one species; simplified palatal ridge pattern 7 + 1 (fig. 20) 24

21 a Fa MM 68 - 88, FF 67 - 90; weight MM 60 - 97, FF 60 - 100; third metacarpal length 73 - 75 % of Fa; tibia length 42 - 46 % of Fa; tibia dorsally furred; P^4 and M^1 squarish in outline; two I_1 present; M_3 reduced but present; forests Guinea-Bissau to Central African Republic, southern Congo and northwestern Angola, and mountainous areas in eastern Central and East Africa from South Ethiopia to Zimbabwe and Mozambique ..... *Lissonycteris angolensis* African Chiroptera name ..... *Myonycteris angolensis*

b Fa 54 - 76; third metacarpal length 67 - 73 % of Fa; tibia length 36 - 43 % of Fa; distal quarter to third of tibia dorsally practically naked; P^4 and M^1 oblong in outline; two or one I_1, present; M_3 reduced or absent..... 22

22 a Fa 65 - 76; weight 1 M 48, 1 F 56; interfemoral membrane only furred near legs; simplified palatal ridge pattern 6 + 2 (possibly also 7 + 2); two I_1 present; M_3 absent; forests southeast Kenya, eastern Tanzania, East Zimbabwe..... *Myonycteris relicta*

b Fa 54 - 68; interfemoral membrane wholly furred; simplified palatal ridge pattern 7 + 2; either one or two I_1; M_3 reduced but normally present; West and Central Africa.... 23

23 a Fa 54 - 68; weight MM 27 - 51, FF 31 - 60; two I_1; C_1 at least as high as P_3; P_4 with fused inner and outer ridges (fig. 21); forests from Guinea to northeast Zaïre, southwards to northwest Angola and North Zambia ..... *Myonycteris torquata*

b Fa <= 62 - 65; weight not known; one lower incisor; C_1 lower than P_3; P_4 with inner and outer ridges widely and deeply separated (fig. 22); forests of Sao Tome ..... *Myonycteris brachycephala*

24 a Fa 66 - 107; weight MM below 180, FF below 165; back fur generally relatively dark brownish or reddish brown, never yellowish; back fur not sharply demarcated from wing membrane; tibiae practically naked or, if furred, in combination with reduced, laterally depressed cheek teeth; simplified palatal ridge pattern 7 + 1 (occasionally 8 + 1); wing inserted at first or second toe or in between 25

b Fa 109 - 134; weight MM above 200, FF above 175; back fur grizzled straw-yellow and hair-brown, closely adpressed, sharply demarcated from wing membrane, or, in combination with a Fa of over 120, greyish brown, more woolly, less adpressed and less sharply demarcated; cheek teeth never laterally depressed; simplified palatal ridge pattern 7 + 3; wing inserted at first toe 28

25 a Fa 85 - 107; tibia furred or naked..... 26

b Fa 66 - 77; tibia practically naked. 27

26 a Fa MM 85 - 94, FF 85 - 95; weight MM 102 - 140, FF 94 - 162; fur long, tibiae dorsally furred; wing insertion at second toe (occasionally between second and first); cheek teeth narrow, with widths of large premolars and molars half their lengths or slightly more; mostly above 1000 m in mountainous areas of southeast Ethiopia, South Sudan, East Zaire, Uganda, Kenya, Tanzania, Malawi ..... *Rousettus lanosus* African Chiroptera name ..... *Stenonycteris lanosus*

b Fa MM 85 - 107, FF 82 - 107 (southwest Asia: MM 85 - 95, Ff 79 - 92); weight MM 111 - 168, FF 100 - 155 (Asia: MM 98 - 128, FF not known); fur short, tibiae dorsally practically naked; wing insertion at first toe (occasionally between first and second); widths of large premolars and molars clearly larger than half their lengths; predominantly lowland areas in Egypt to Turkey and Pakistan, from Gambia to Cameroun, southwards to northwest Angola, including Guinea Gulf islands, and from Ethiopia to South Africa, including continental islands..... *Rousettus egyptiacus* African Chiroptera name ..... *Rousettus aegyptiacus*

27 a Fa MM 71 - 77, FF 70 - 75; weight not known; wings inserted at base of second toe; widths of large premolars and molars clearly larger than half their lengths; the Comoros ..... *Rousettus obliviosus*

b Fa MM 67 - 76, FF 66 - 77; weight MM 60 - 83, FF 44 - 61; wings inserted between first and second toe; width of premolars and molars half their lengths or only slightly more; Madagascar ..... *Rousettus madagascariensis*

28 a Fa MM 129 - 134, FF 122 - 130; weight MM 245 - 340, FF 220 - 330; fur rather long and woolly, light greyish brown; back fur colour not sharply demarcated from wing membrane; tooth rows only weakly diverging backwards; premaxillae proclivous, with a distinct space between I^2 and C^1 when viewed from lateral; P^4 and M^1 with thick inner ridge and distinct median grooves; M^2 wider than long; lower incisors forming a semicircle; P_4 with a rudimentary anterior and a distinct posterior inner cusp; M_1 with thick inner and outer ridges; Madagascar ..... *Eidolon dupreanum*

b Fa MM 109 - 131, FF 111 - 134; weight MM 212 - 311, FF 183 - 350; fur short, closely adpressed, grizzled straw-yellow and hair-brown; back fur colour sharply demarcated from wing membrane; tooth rows diverging backwards; hardly or no space between I^2 and C^1 when viewed from lateral; P^4 and M^1 with weak inner ridges and indistinct median grooves; M^2 longer than wide; lower incisors forming an almost straight row; P_4 without inner cusps; M_1 with thin inner and outer ridges; mainland Africa except deserts, and southwest Arabian Peninsula ..... *Eidolon helvum*

29 a Fa below 110; ear length c. 12, ear nearly concealed in fur; tibia dorsally furred; Mauritius, Reunion (extinct) ..... *Pteropus subniger*

b Fa more than 110; ear length more than 20 30

30 a Ear length usually 25 or more, ear subacutely pointed, well exposed; interfemoral membrane welldeveloped (up to about 15) in the middle 31

b Ear: either less than 25 long, pointed and largely concealed in the fur, or more than 25 long, rounded off and wellexposed; interfemoral membrane very narrow (some mm only) in the middle 34

31 a Larger: Fa MM 168 - 171, FF 153 - 168; ear length 35 - 38; back fur dark brown, without admixed lighter hairs; Madagascar ..... *Pteropus rufus*

b Smaller: Fa generally less than 164 in MM and than 159 in FF; ear length variable; back fur colour variable but in larger specimens, with Fa >= 145, blackish brown with admixed whitish and/or reddish brown hairs; not on Madagascar 32

32 a Smaller: Fa MM 133 - 141; proximal part of dorsal side of tibia thickly furred, fur thinning out on distal part; weight MM 257 - 395, weight FF not known; Aldabra atoll ..... *Pteropus aldabrensis*

b Larger: Fa 145 or more; dorsal side of tibia at most partly thinly haired hut essentially naked; weight MM 470 - 610, FF 430 - 600 33

33 a Fa MM 147 - 159, FF 151 - 155; ear length 29 - 37; fur of head golden yellowish or brownish yellow, fur of mantle golden yellowish or orange brown; weight MM 479 - 604, FF 450 - 508; Seychellen, Comoren, Mafia ..... *Pteropus seychellensis*

b Fa MM 149 - 164, FF 145 - 159; ear length 26 - 28; fur of head mainly dark brown or reddish orange-brown, fur of mantle reddish in appearance; weight MM 470 - 610, FF 430 - 600; Pemba ..... *Pteropus voelzkowi* African Chiroptera name ..... *Pteropus voeltzkowi*

34 a Large: Fa MM about 159 - 171, FF about 150 - 162; ear pointed, length c. 21, almost hidden in the long fur; back fur with a dark brown spinal track and buff on the sides; dorsal side of tibia furred; Mauritius, Reunion ..... *Pteropus niger*

b Either the same size or larger hut with exposed, rounded ear and dorsal side of tibia essentially naked, or much smaller, with Fa less than 140; back fur with out colour contrast 35

35 a Fa 161 - 172; ear semi-circular rounded off, exposed; ear length about 30; dorsal side of tibia essentially naked; Comoros ..... *Pteropus livingstonii*

b Fa MM 121 - 134, FF 123 - 129; ear pointed, almost hidden in the long fur; ear length about 22.5; dorsal side of tibia furred; weight MM 216 - 295, FF 204 - 306; Rodrigues, Round Island ..... *Pteropus rodricensis*

Appendix 5aq: Gharaibeh (1997). Systematics, distribution, and zoogeography of mammals of Tunisia.

1 a Muzzle with obvious nose leaf (extremely complex in some); ears separate, without a tragus and independently mobile; tail extends to edge of well developed interfemoral membrane; premaxillae fused medially but widely separated laterally and only fused posteriorly to the maxillae, resulting in a widely separated palatal branch (Family Rhinolophidae). 4

b Nose leaf absent (muzzle plain or with only a naked muscular pad surrounding the external nares); ears various (separate or joined at the bases) but immobile and with tragus present; tail various; premaxillae fused laterally and posteriorly to the maxillae and anteriorly they are fused (Molossidae and Rhinopomatidae) or separate (Vespertilionidae). 2

2 a Small interfemoral membrane with a long tail, almost the length of the head and body; muzzle with naked muscular pad surrounding external nares; ears joined at bases; rostrum with large swelling anterior to the orbits (Family Rhinopomatidae).*Rhinopoma hardwickei arabium*
African Chiroptera name .....*Rhinopoma cystops*

b Interfemoral membrane medium or long; tail equal in length to the interfemoral membrane or extending posteriorly no more than half of the length of the head and body; muzzle plain; ears free or joined at the bases; rostrum without large swelling anterior to the orbits. 3

3 a Interfemoral membrane medium (with a stout tail extending posteriorly about half the length of the head and body); ears deeply folded and heavy (depressed) in appearance, usually joined at base, and with a low tragus; premaxillae and maxillae fused into a solid structure (Family Molossidae). ..... *Tadarida teniotis teniotis*
African Chiroptera name .....*Tadarida teniotis*

b Long interfemoral membrane with tail that extends only to (or slightly beyond) its posterior edge; ears usually mouse-like (large, upright, thin) and separate; tragus generally prominent; premaxillary gap present at anterior edge of palate, resulting in gap between upper incisors (Family Vespertilionidae). 9

4 a Posterior plate of noseleaf triangular and with erect, pointed tip; digits (except hallux) with three phalanges; tail short; three lower incisors on each side (dental formula $^{1}/_{3}$ $^{1}/_{1}$ $^{1 \text{ or } 2}/_{3}$ $^{3}/_{3}$) (genus *Rhinolophus*). 5

b Posterior plate of nose leaf elliptical; all digits of foot with two phalanges; two lower premolars on each side (dental formula $^{1}/_{1}$ $^{1}/_{1}$ $^{2}/_{2}$ $^{3}/_{3}$). .....*Asellia tridens tridens*
African Chiroptera name .....*Asellia tridens*

5 a Size small; forearm less than 40 mm, weight less than 6 g; greatest length of skull less than 17 mm. .....*Rhinolophus hipposideros escalerae*
African Chiroptera name .....*Rhinolophus hipposideros*

b Size larger; forearm more than 44 mm, weight more than 6 g; greatest length of skull more than 17 mm. 6

6 a Size large; forearm more than 50 mm, weight more than 14 g; from the side view the portion of the connective at the dorsal edge of the sella low and rounded; greatest length of the skull 19 - 22 mm. .....*Rhinolophus ferrumequinum ferrumequinum*
African Chiroptera name .....*Rhinolophus ferrumequinum*

b Size medium; forearm less than 50 and more than 44 mm; weight less than 12 g. . 7

7 a Second (distal) phalanx of digit IV long (more than twice the length of the first phalanx); margins of sella wedge-shaped; occlusal surface of second and third lower premolars approximately equal; greatly depressed saddle between parietal and occipital, making marked separation of occipital region from the rest of the skull. .....*Rhinolophus blasii blasii*
African Chiroptera name .....*Rhinolophus blasii*

b Second (distal) phalanx of digit IV short (less than twice the length of the first); sides of sella parallel; occlusal surface of second lower premolar markedly less than third; parietal-occipital saddle much less developed. 8

8 a Posterior lance of noseleaf gradually tapered; forearm generally 45 - 50 mm. .....*Rhinolophus euryale barbarus*
African Chiroptera name .....*Rhinolophus euryale*

	b	Posterior lance of noseleaf with strongly concave borders; forearm generally 48 - 51 mm.....*Rhinolophus mehelyi tuneti* African Chiroptera name .....*Rhinolophus mehelyi*
9	a	In third digit, second phalanx about 3 times length of first; skull high and rounded, with braincase rising abruptly from rostrum (genus *Miniopterus*)... *Miniopterus schreibersi schreibersi* African Chiroptera name ..... *Miniopterus schreibersii*
	b	In third digit, second phalanx subequal to first; brain-case not markedly inflated... 10
10	a	Ears joined at base, extremely long (almost as long as forearm); five upper and six lower cheek teeth (dental formula $^{2}/_{3}$ $^{1}/_{1}$ $^{2}/_{3}$ $^{3}/_{3}$) (genus *Plecotus*). *Plecotus austriacus aegyptius* African Chiroptera name ..... *Plecotus christii*
	b	Ears not joined at base, generally short, and never much more than half the length of the forearm; cheek teeth varied in number but never $^{5}/_{6}$..... 11
11	a	Ears more than half length of forearm; one upper incisor (dental formula $^{1}/_{3}$ $^{1}/_{1}$ $^{1}/_{2}$ $^{3}/_{3}$) (genus *Otonycteris*).....*Otonycteris hemprichi hemprichi* African Chiroptera name .....*Otonycteris hemprichii*
	b	Ears less than half the length of forearm; two upper incisors. 12
12	a	Tragus high and pointed; six upper and six lower cheek teeth (dental formula $^{2}/_{3}$ $^{1}/_{1}$ $^{3}/_{3}$ $^{3}/_{3}$) (genus *Myotis*). 14
	b	Tragus short and rounded; fewer than six upper and six lower cheek teeth. 13
13	a	Length of forearm more than 45 mm; four upper cheek teeth (dental formula $^{2}/_{3}$ $^{1}/_{1}$ $^{1}/_{2}$ $^{3}/_{3}$) (genus *Eptesicus*).....*Eptesicus serotinus isabellinus* African Chiroptera name .....*Eptesicus isabellinus*
	b	Length of forearm less than 45 mm; five upper cheek teeth (dental formula $^{2}/_{3}$ $^{1}/_{1}$ $^{2}/_{2}$ $^{3}/_{3}$) (genus *Pipistrellus*).....*Null*
14	a	Size large; forearm more than 53 mm; condylobasal length more than 18.6 mm; upper tooth row more than 8.2 mm. .....*Myotis blythii oxygnathus*
	b	Size smaller; forearm less than 52 mm; condylobasal length less than 18.6 mm; upper tooth row less than 8.2 mm. 15
15	a	Posterior margin of ear with deep, angular emargination; forearm more than 36 mm; condylobasal length more than 14.0 mm. .....*Myotis emarginatus emarginatus* African Chiroptera name .....*Doryrhina cyclops*
	b	Posterior margin of ear with shallow, inconspicuous emargination; forearm less than 36 mm; condylobasal length less than 14.0 mm. .....*Myotis capaccinii capaccinii* African Chiroptera name .....*Myotis capaccinii*
16	a	Tragus wide, greatest width equal to half of length of anterior border.*Pipistrellus savii ochromixus* African Chiroptera name .....*Hypsugo savii*
	b	Tragus narrow, greatest width much less than half of length of anterior border..... 17
17	a	Size larger, forearm greater than 32 mm; wing generally with narrow to wide white posterior border; outer upper incisor less than half of the height of the inner. .....*Pipistrellus kuhli kuhli* African Chiroptera name .....*Pipistrellus kuhlii*
	b	Size smaller, forearm less than 30; wing generally without white border; outer upper incisor more than half the height of inner. .....*Pipistrellus pipistrellus mediterraneus*

Appendix 5ar: Bouchard (1998). Chaerephon pumilus

1	a	Ears conjoined 2
	b	Ears separated 6
2	a	Ears conjoined by triangular lappet of skin 3
	b	Ears conjoined by unstructured band of skin 5
3	a	Large paired nasal inflations; length of forearm 37 - 39 mm.... *Chaerephon gallagheri*
	b	No nasal inflations; length of foreram 42 - 50 mm 4
4	a	Color uniformly brown with white belly stripe; lack of well defined interaural pocket; length of forearm 42 - 44 mm ..... *Chaerephon major*
	b	Color blackish brown dorsally and no white stripe ventrally; well defined interaural pocket; length of forearm 46 - 50 mm ..... *Chaerephon johorensis*
5	a	Color uniformly brown; length of forearm 48 - 54 mm..... *Chaerephon jobensis*
	b	Color dark brown dorsally and lighter ventrally; length of forearm 40 - 50 mm ..... *Chaerephon plicata*
6	a	Size larger, length of forearm 42 - 52 mm..... 7
	b	Size smaller, length of forearm 34 - 42 mm 12
7	a	Paired caudal glands opening as slits on either side od tail root below; length of forearm 46 - 47 mm..... *Chaerephon bemmeleni*
	b	Without such glands; length of forearm 42 - 52 mm 8
8	a	White spots, stripes, or lateral bands 9
	b	Without white marks 10
9	a	Color umber brown with variable pattern of white spots or short stripes arranged laterally on crown and sometimes also on shoulders and flanks; length of forearm 46 - 51 mm..... *Chaerephon bivittata* African Chiroptera name ..... *Chaerephon bivittatus*
	b	Conspicuous white lateral band balosw, along flanks at junction with membrane, contrasting with very dark brown color above and below; length of forearm 44 - 50 mm ..... *Chaerephon nigeriae* African Chiroptera name ..... *Chaerephon nigeriae nigeriae*
10	a	Color umber brown, top of head, neck and throat darker, almost black; length of forearm 46 - 48 mm..... *Chaerephon ansorgei*
	b	Color uniformly russet brown; length of forearm 42 - 52 mm..... 11
11	a	Length of forearm 42 - 46 mm..... *Chaerephon russata* African Chiroptera name ..... *Chaerephon russatus*
	b	Length of forearm 50 - 52 mm..... *Chaerephon aloysiisabaudiae*
12	a	Length of forearm 34 - 39 mm; males with long (13 - 14 mm) bicolored postaural crest (dark basally, pale apically); light wings; color below light with whitish band down to the mid-belly ..... *Chaerephon chapini*
	b	Length of forearm 37 - 42 mm; males with short (<= 10 mm) unicolored postaural crest; wings dark or light; color below variable, with or without white on the median area ..... *Chaerephon pumilus*

Appendix 5as: Colket and Wilson (1998). Taphozous hildegardeae

1	a	Frontal region of skull only weakly concave. Rump and pygal areas at least partly naked. Occipital "helmet" on skull more or less developed (Subgenus *Liponycteris*) 2
	b	Frontal region of skull strongly concave. Rump and pygal areas well haired. No occipital "helmet" on skull (Subgenus *Taphozous*) 3
2	a	Small (forearm length 61 - 69 mm). A slight but definite concavity in the frontal region. Hairless rump and pygal areas relatively small. Occipital "helmet" of skull poorly developed ..... *Taphozous hamiltoni*
	b	Larger (forearm length 66 - 79 mm). Frontal concavity virtually absent. Hairless rump and pygal areas relatively large. Occipital "helmet" well developed ..... *Taphozous nudiventris*
3	a	Gular sac present 4
	b	Gular sac absent 8
4	a	Distinctive color pattern, grizzled gray dorsally and white ventrally ..... *Taphozous mauritianus*
	b	Color uniform dorsally and only slightly paler, if at all, ventrally 5
5	a	Basisphenoid pits broad 6
	b	Basisphenoid pits narrow or medium in width 7
6	a	Size medium (forearm length 63 - 67 mm). Anterior ventral mandibular emargination strong. Australia and New Guinea ..... *Taphozous australis* African Chiroptera name ..... *Taphozous perforatus sudani*
	b	Size relatively small (forearm length 55 - 62 mm). Anterio ventral mandibular emargination weak. SE Asia ..... *Taphozous longimanus*
7	a	Size larger (forearm length 63 - 72 mm). Anterior ventral mandibular emargination strong ..... *Taphozous hilli*
	b	Size smaller (forearm length 58 - 63 mm). Anterior ventral mandibular emargination weak ..... *Taphozous kapalgensis*
8	a	Blackish or reddish beard-like throat patch variably developed in males 9
	b	No differentiated throat patch present 11
9	a	Size relatively large (forearm length 69 - 73 mm) ..... *Taphozous theobaldi*
	b	Size medium (forearm length 60 - 70 mm) 10
10	a	Braincase relatively broad. Fur relatively pale in color. Africa *Taphozous hildegardeae*
	b	Braincase relatively slender. Fur relatively dark in color. SE Asia ..... *Taphozous melanopogon*
11	a	Size relatively large (forearm length, 70 - 75 mm) ..... *Taphozous troughtoni*
	b	Size medium (forearm length 57 - 71 mm) 12
12	a	Smaller (forearm length 57 - 67 mm), ears relatively short (17 - 20 mm). Africa and Asia ..... *Taphozous perforatus*
	b	Larger (forearm length 64 - 71 mm), ears longer (21 - 22 mm). Australia .. *Taphozous georgianus*

Appendix 5at: Owen-Ashley and Wilson (1998). Micropteropus pusillus

1 a Size smaller, length of forearm 46.4 - 55.7 mm; greatest length of skull 26.8 - 31.0 mm; halves of palatal ridges 4 - 6 united to ridge 3 and to each other ..*Micropteropus pusillus*

b Size larger, length of forearm 57.2 - 63.6 mm; greatest length of skull 32.0 - 33.3 mm; halves of palatal ridges 4 - 6 separated .....*Micropteropus intermedius*

Appendix 5au: Taylor (1998). The smaller mammals of KwaZulu-Natal.

1	a	Tail reduced or absent; face dog-like; second digit ending in claw; cheekteeth simple without well developed cups pattern (Suborder Megachiroptera) 2
	b	Tail well developed; face not dog-like; second digit not ending in claw; cheekteeth forming well developed cusp pattern 4
2	a	Ears with white basal tufts; no tail (genus *Epomophorus*) .... *Epomophorus wahlbergi wahlbergi* African Chiroptera name ..... *Epomophorus wahlbergi*
	b	Ears without white basal tufts; reduced tail 3
3	a	Forearm generally 110 - 130 mm; colour generally tawny, with dorsal fur restricted to a narrow median band, sharply demarcated from naked wing membranes (genus *Eidolon*) ..... *Eidolon helvum helvum*
	b	Forearm 65 - 102 mm; ruff of stiff hair present or absent on lower neck of adult males (genus *Rousettus*) ..... *Rousettus aegyptiacus leachii* African Chiroptera name ..... *Rousettus aegyptiacus*
4	a	Terminal portion of tail projecting past edge of inter-femoral mebrane 5
	b	Tail almost entirely enclosed within interfemoral membrane 10
5	a	Free terminal portion of tail emerges above middle of upper surface of membrane (family Emballonuridae; genus *Taphozous*) ..... *Taphozous mauritianus*
	b	Free terminal portion of tail projectds considerably beyond hind margin of membran (family Molossidae) 6
6	a	Size very large, forearm 62 - 73 mm; ears very large, 38 - 40 mm, conjoined on extended snout; conspicuous bicoloured dorsal coat with pale neck colar (genus *Otomops*) ..... *Otomops martiensseni icarus*
	b	Size smaller, forearm less than 60 mm; ears smaller; dorsl coat not bicoloured 7
7	a	Size small, forearm 36 - 39 mm (genus *Chaerephon*) 8
	b	Size larger; forearm greater than 40 mm 9
8	a	Anterior palatal emargination well developed, extending beyond upper incisors, and including area of incisive foramina; third commissure of last upper molar well developed, almost as long as second commissure ..... *Chaerephon ansorgei*
	b	Anterior palatal emargination greatly reduced, not extending behind upper incisors and separated from incisive foramina by a bony bar, third commissure much less developed than second ..... *Chaerephon pumila* African Chiroptera name ..... *Chaerephon pumilus*
9	a	Size smaller, forearm 45 - 50 mm; colour dark above and paler below, paler band in front of shoulders (genus *Mops*) ..... *Mops condylurus condylurus* African Chiroptera name ..... *Mops (Mops) condylurus*
	b	Size larger, forearm 46 - 54 mm; colour dark sooty-brown almost black aboven same colour or a shape paler below, no band in front of shoulders (genus *Tadarida*) *Tadarida aegyptiaca aegyptiaca*
10	a	Muzzle with nose-leaves or deep central slit 11
	b	Muzzle without nose-leaves or deep central slit (family Vespertilionidae) 20
11	a	Muzzle with deep, central longitudinal slit (family Nycteridae; genus *Nycteris*) 12
	b	Face without slit, but with well-developed nose-leaves covering muzzle 13
12	a	Upper icisors trifid; tragus falciform or semilunate; ears smaller, 25 mm or less *Nycteris hispida villosa* African Chiroptera name ..... *Nycteris hispida*
	b	Upper incisors bifid; tragus pyriform; ears elongated, 28 - 37 mm ... *Nycteris thebaica capensis* African Chiroptera name ..... *Nycteris thebaica*
13	a	Posterior leaflet of noseleaf with upper edge either ellipical in outline or tridentate (three-pronged) (family Hipposideridae) 19
	b	Posterior leaflet of noseleaf triangular with erect, pointed tip (family Rhinolophidae; genus *Rhinolophus*) 14
14	a	Anterior upper premolar, when present external to toothrow; canine and fourth upper premolar in contact; connecting process bluntly pointed 15
	b	Anterior upper premolar in toothrow; canine and fourth upper premolar not in contact; connecting process blunt or sharply pointed 16

15 a Forearm 50 - 57 mm..... *Rhinolophus clivosus zuluensis*
African Chiroptera name ..... *Rhinolophus clivosus*
b Forearm 45 - 50 mm..... *Rhinolophus darlingi darlingi*
African Chiroptera name ..... *Rhinolophus darlingi*
16 a Connecting process rises to an erect point; inter-pterygoid groove usually shallow, not clearly defined by bordering ridges; anterior upper premolar usually not crowded between canine and fourth upper premolar, longer than wide..... 17
b Connecting process with low, bluntly pointed tip; inter-pterygoid groove deep and clearly defined by bordering ridges; anterior upper premolar usually crowded between canine and fourth upper premolar, at least as wide as it is long..... 18
17 a First phalanx of fourth finger notably shortened in relation to metacarpal length; connecting process pointed, molar width less than half width of palate between molars ..... *Rhinolophus landeri lobatus*
African Chiroptera name ..... *Rhinolophus lobatus*
b First phalanx of fourth finger not notably shortened in relation to metacarpal length; connecting process rises to a high narrow horn, molar width more than half width of palate between molars ..... *Rhinolophus blasii empusa*
African Chiroptera name ..... *Rhinolophus blasii*
18 a Sella broader; ears longer, 20 - 22 mm; condylocanine length more than 15.5 mm ..... *Rhinolophus simulator*
b Sella narrower; ears shorter, 18 - 20 mm; condylocanine length less than 15.5 mm ..... *Rhinolophus swinnyi*
19 a Posterior leaflet of noseleaf with upper edge elliptical in outline; size larger, forearm greater than 40 mm (genus *Hipposideros*)..... *Hipposideros caffer caffer*
African Chiroptera name ..... *Hipposideros caffer*
b Posterior leaflet of noseleaf with tridentate shape; size smaller, forearm 31 - 35 mm (genus *Cloeotis*) ..... *Cloeotis percivali australis*
African Chiroptera name ..... *Cloeotis percivali*
20 a Second phalanx of third digit about three times as long as first (subfamily Miniopterinae; genus *Miniopterus*) 21
b Second phalanx of third digit not especially elongated 22
21 a Forearm 42 - 44 mm; skull length c. 14 mm; colour brownish-black and/or russet ..... *Miniopterus fraterculus*
b Forearm 42 - 47 mm; skull length c. 15 mm; colour slaty-black *Miniopterus schreibersii natalensis*
African Chiroptera name ..... *Miniopterus natalensis*
22 a Ears not funnel-shaped, withou deep emargination below tip; tragus not sharply pointed; braincase not high and rounded (subfamily Vespertilioninae) 23
b Size smaller, forearm 30 - 36 mm; skull < 13.5 mm, colour brownish or greyish-brown above, sometimes lightly grizzled with greyish-white or white, and brown or greyish-brown to greyish-white or white below ..... *Kerivoula lanosa lucia*
African Chiroptera name ..... *Kerivoula lanosa*
23 a Six upper, six lower cheekteeth on each side (genus *Myotis*) 24
b Fewer than six upper and six lower cheekteeth 25
24 a Size larger, forearm over 52 mm..... *Myotis (Chrysopteron) welwitschii*
African Chiroptera name ..... *Myotis welwitschii*
b Size smaller, forearm under 52 mm ..... *Myotis (Selysius) tricolor*
African Chiroptera name ..... *Myotis tricolor*
25 a Five upper, five lower cheekteeth; two upper incisors on each side (genus *Pipistrellus*) 26
b Four upper, five lower cheekteeth; one or two upper incisors on each side..... 28
26 a Outer upper incisor more than half length of inner upper incisor; forehead strongly concave; upper canine and posterior upper premolar separated by a gap through which anterior upper premolar can be clearly seen rising above cingula of adjoining teeth; interdental palate clearly longer than broad..... *Pipistrellus (Pipistrellus) nanus nanus*
African Chiroptera name ..... *Neoromicia nana*

b Outer upper incisor less than half length of inner upper incisor; forehead usually flat or weakly concave; upper canine and posterior upper premolar in contact or barely separatedn anterior upper premolar seen from the side only with difficulty; usually not rising above cingula of adjoining teeth; interdental palate not clearly longer than broad 27

27 a Posterior upper incisor barely extending beyond cingulum of anterior upper incisor; anterior upper premolar a pointed tooth rising above cingulum of canine but not above cingulum of posterior upper premolar; maxillary toothrow more than 4.5 mm*Pipistrellus (Pipistrellus) kuhlii broomi*
(This should be *Pipistrellus hesperidus*. See Kock (2001))
African Chiroptera name ..... *Pipistrellus hesperidus*

b Posterior upper incisor extending well beyond cingulum of anterior upper incisor; anterior upper premolar a flat-crowned tooth completely cingulum of adjoining teeth; maxillary toothrow less than 4.5 mm ..... *Pipistrellus (Pipistrellus) anchietai*
African Chiroptera name ..... *Hypsugo anchietae*

28 a Two upper incisors on each side 29

b One upper incisor on each side 34

29 a Rostrum very short and broad; braincase very high, more than two thirds of condylobasal length; consipicuous reticulation of wing membranes (genus *Chalinolobus*) ..... *Chalinolobus variegatus variegatus*
African Chiroptera name ..... *Glauconycteris variegata*

b Rostrum not shortended; braincase not elevated; no wing pattern 30

30 a Ears 18 mm or more, about half length of forearm (genus *Laephotis*) *Laephotis wintoni*

b Ears less than 18 mm, much less than half length of forearm (genus *Eptesicus*) .. 31

31 a Wing membranes white or translucent ..... *Eptesicus rendalli*
African Chiroptera name ..... *Neoromicia rendalli*

b Wing membranes dark 32

32 a Size larger, forearm more than 40 mm, inner upper incisors unicuspid .....*Eptesicus hottentotus bensoni*
African Chiroptera name ..... *Eptesicus hottentotus*

b Size smaller, forearm less than 40 mm, inner upper incisors bicuspid 33

33 a Dorsal colour paler; wing membranes edged with white; dorsal fur up to 8 mm longe; forearm 30 - 32 mm; condylobasal length less than 11.9 mm; skull lacking posterior occipital 'helmet' ..... *Eptesicus zuluensis*
African Chiroptera name ..... *Neoromicia zuluensis*

b Dorsal colour darker; wing membranes not edged with white; dorsal fur not more than 5 mm long; forearm 29 - 35 mm; condylobasal length more than 11.9 mm; skull with posterior occipital 'helmet' ..... *Eptesicus capensis capensis*
African Chiroptera name ..... *Neoromicia capensis*

34 a Size larger, forearm greater than 46 mm; first and second upper molars with W-pattern obsolescent; tragus long and tapering (genus *Scotophilus*) 35

b Size smaller, forearm less than 46 mm; first andsecond upper molars with normal W-pattern; tragus either sickle-shaped or short and broad 36

35 a Forearm 50 - 65 mm; skull length 20 - 23 mm .....*Scotophilus dinganii dinganii*
African Chiroptera name ..... *Scotophilus dinganii*

b Forearm 43 - 50 mm; skull length 16 - 19 mm ..... *Scotophilus viridis*

36 a Wings dark-coloured; skull with rostrum not broadened; palatal emargination narrow; anterior lower premolar about half the crown area of the next premolar; upper canines with rounded anterior surface; tragus halfmoon-shaped; penis not enlarged; forearm 29 - 33 mm (genus *Nycticeius*) .....*Nycticeius schlieffenii australis*
African Chiroptera name ..... *Nycticeinops schlieffenii*

b Wings pale-coloured; skull with rostrum notably broadened, particularly across lachrymals; palatal emargination broader; lower premolars equal in crown area; upper canines with broad, flat anterior surface; tragus short and broad; penis greatly lengthened; forearm 28 - 38 mm (genus *Scotoecus*).....*Scotoecus albofuscus woodi*
African Chiroptera name ..... *Scotoecus albofuscus*

Appendix 5av: Dunlop (1999). Mops midas

1	a	Anterior palatal emargination present, anterior upper premolar moderately to relatively large (subgenus *Xiphonycteris*)..... 2
	b	Anterior palatal emargination largely closed, anterior upper premolar absent or greatly reduced (subgenus *Mops*)..... 6
2	a	Forearm < 32 mm; M^3 without third commissure 3
	b	Forearm > 32 mm; M^3 with short but distinct commissure 4
3	a	Canines with enlarged cingula, upper incisors not projecting in front of anterior face of canine cingula; length of skull 14.0 - 16.8 mm .....*Mops spurrelli* African Chiroptera name .....*Mops (Xiphonycteris) spurrelli*
	b	Canines without enlarged cingula; upper incisors projecting in front of anterior face of canine cingula; length of skull 15.0 - 17.5 mm .....*Mops nanulus* African Chiroptera name .....*Mops (Xiphonycteris) nanulus*
4	a	Forearm < 35 mm; length of skull 15.8 - 17.8 mm .....*Mops petersoni* African Chiroptera name ..... *Mops (Xiphonycteris) petersoni*
	b	Forearm >= 35 mm; length of skull 17.2 - 20.6 mm 5
5	a	Wing inserts high on back; dorsal pelage restricted to top of back; basisphenoid pits deep and rounded laterally with septum between nearly parallel .....*Mops thersites* African Chiroptera name .....*Mops (Xiphonycteris) thersites*
	b	Wing inserts lower on sides of body; dorsal pelage not restricted to top of back; basisphenoid pits shallow and long oval shped iwth septum between narrowing anteriorly.....*Mops brachypterus* African Chiroptera name ..... *Mops (Xiphonycteris) brachypterus*
6	a	Forearm > 50 mm..... 7
	b	Forearm < 50 mm..... 9
7	a	Skull length >= 26 mm.....*Mops midas* African Chiroptera name .....*Mops (Mops) midas*
	b	Skull length < 26 mm..... 8
8	a	Ears joined at base..... *Mops congicus* African Chiroptera name ..... *Mops (Mops) congicus*
	b	Ears separated at base .....*Mops trevori* African Chiroptera name ..... *Mops (Mops) trevori*
9	a	Forearm < 41 mm..... *Mops demonstrator* African Chiroptera name .....*Mops (Mops) demonstrator*
	b	Forearm 41 - 51 mm..... 10
10	a	Anterior upper premolar vestigial but present ..... *Mops condylurus* African Chiroptera name .....*Mops (Mops) condylurus*
	b	Anterior upper premolar absent 11
11	a	Size relatively small (forearm 39 - 45 mm); C-M^3 6.2 - 6.9 mm .....*Mops sarasinorium*
	b	Size medium (forearm 43 - 48); C-M^3: 7.0 - 7.7 mm .....*Mops mops*

Appendix 5aw: Gray et al. (1999). Nycteris thebaica

1	a	Posterior lower premolar small; its tip reaching about to cingulum of anterior premolar; no marked concavity at center of posterior margin of tragus 2
	b	Posterior lower premolar large; its height about equal to that of anterior cusp of first molar; marked concavity at center of posterior margin of tragus 11
2	a	Upper incisors trifid; tragus small (*hispida* group) 3
	b	Upper incisors bifid; tragus large 6
3	a	Size very large; forearm 51.6 - 64.5 mm; greatest length of skull 23.3 - 27.5 mm; only occurring in central and western African rainforests and in eastern African coastal forests ..... *Nycteris grandis*
	b	Size moderate; forearm 32.8 - 44.5 mm; greatest length of skull 15.3 - 18.4 mm; occurring in central and western African rainforests, eastern African coastal forests, and savanna areas 4
4	a	Occurring in northeastern and eastern African savannas and coastal forests of eastern Africa 5
	b	Occurring in the central and western African rainforests and savanna areas *Nycteris hispida*
5	a	Size slightly larger; forearm 37.3 - 44.5 mm; condylobasal length 14.6 - 15.9 mm; maxillary toothrow 5.7 - 6.2 mm; mandibular toothrow 6.4 - 7.5 mm .... *Nycteris aurita*
	b	Size slightly smaller; forearm 34.8 - 43.4 mm; condylobasal length 13.2 - 15.0 mm; maxillary toothrow 4.8 - 5.8 mm; mandibular toothrow 5.4 - 6.6 mm .. *Nycteris hispida*
6	a	Tragus with squared or flattened top (*macrotis* group) 7
	b	Tragus inverted pear shaped or pyriform (*thebaica* group) 8
7	a	Forearm 36.1 - 41.9 mm; condylobasal length 14.0 - 16.1 mm; very rare species; scarce records from Cameroon, Ethiopia, Zambia, and Zanzibar ..... *Nycteris woodi*
	b	Forearm 39.9 - 54.8 mm; condylobasal length 16.4 - 19.6 mm; common species in rain forest and savanna areas of western, eastern and northeastern Africa .. *Nycteris macrotis*
8	a	Occurring in west African savanna areas 9
	b	Occurring over the remaining part of Africa, south of the Sahara, along the Nile River, on the Arabian Peninsula and Morocco 10
9	a	Size slightly larger; forearm 39.2 - 47.4 mm; condylobasal length 15.8 - 17.5 mm; mandibular length 11.8 - 13.2 mm; mandibular toothrow 6.2 - 7.4 mm; length of metacarpus of third finger 28.9 - 36.1 mm; length of tibia 20.3 - 24.9; the following combination of measurements > 21.7: (1.153 x length of maxillary toothrow + 0.187 x width across the upper canines + 0.557 x width across posterior upper molars + 0.657 x mandibular length + 0.395 x length of mandibular toothrow) ..... *Nycteris thebaica*
	b	Size slightly smaller; forearm 35.1 - 44.0 mm; condylobasal length 14.2 - 16.5 mm; mandibular length 10.4 - 12.2 mm; mandibular toothrow 4.6 - 6.9 mm; length of metacarpus of third finger 26.4 - 32.1; length of tibia: 17.0 - 22.3 mm; the following combination of measurements < 21.7: (1.153 x length of maxillary toothrow + 0.187 x width across the upper canines + 0.557 x width across posterior upper molars + 0.657 x mandibular length + 0.395 x length of mandibular toothrow) .... *Nycteris gambiensis*
10	a	Forearm 32.3 - 50.0 mm; condylobasal length 15.1 - 18.7 mm; common species with wide distribution ..... *Nycteris thebaica*
	b	Forearm > 50.0 mm; condylobasal length > 19.5 mm; very rare species, only known from the type ad paratype from Zinave, Mozambique ..... *Nycteris vinsoni*
11	a	Upper incisors bi- or tricuspid; occurs in the southeastern Asian forest areas (javanica group) 12
	b	Upper incisors bicuspid; occurs in the African forest areas (arge group) 13
12	a	Forearm 41.5 - 50.4 mm; greatest length of skull 19.1 - 20.6 mm; length of mandibula 13.0 - 14.6 mm; upper incisors dominantly tricuspid; limited to Java and Sumatra ..... *Nycteris javanica*
	b	Forearm 56.7 - 52.8 mm; greatest length of skull 21.0 - 22.9 mm; length of mandibula 14.8 - 16.4 mm; upper incisors dominantly bicuspid; occurring on Borneo and Malaysian Peninsula ..... *Nycteris tragata*
13	a	Size smallest; forearm 31.7 - 37.0 mm; condylobasal length 12.8 - 14.0 mm; zygomatic width 8.4 - 9.4 mm; width of braincase 6.5 - 7.4 mm; length of mandibula 9.2 - 10.7 mm ..... *Nycteris nana*

b Size larger; forarm 33.7 - 48.5 mm; condylbasal length 14.6 - 18.8 mm; zygomatic width 10.0 - 12.6 mm; width of braincase 7.3 - 9.0 mm; length of mandibula 10.1 - 15.9 mm..... 14

14 a Size largest; forearm 44.0 - 48.5 mm; greatest length of skull 20.2 - 21.7 mm; length of mandibula 13.8 - 15.9 mm; length of metacarpus of third finger 33.3 - 35.8 mm; length of metacarpus of fourth finger 36.2 - 37.7 mm; very rare species, with some scattered records from the western and central African rainforest ..... *Nycteris major*

b Size intermediate; forearm 33.7 - 46.8 mm; greatest length of skull 15.4 - 20.3 mm; length of mandibula 10.1 - 14.2 mm; length of metacarpus of fourth finger 28.0 - 37.0 mm; fairly common in the western and central African rainforest 15

15 a Slightly smaller; forearm length 33.7 - 38.0 mm; greatest length of skull 15.4 - 18.3 mm; condylobasal length 14.6 - 15.7 mm; length of mandibula 10.1 - 12.6 mm; occurring in the coastal areas of western Africa, Cameroon, Gabon, northeastern Democratic Republic of Congo (formerly Zaire), and northeastern Angola .... *Nycteris intermedia*

b Slightly larger; forearm length 35.4 - 46.8 mm; greatest length of skull 18.0 - 20.3 mm; condylobasal length 15.4 - 18.0 mm; length of mandibula 12.1 - 14.2 mm; commonest species of the group, occurring over the entire western and central African rainforest area ..... *Nycteris arge*

Appendix 5ax: Kwiecinski and Griffiths (1999). Rousettus egyptiacus

1 a Wing membrane (plagiopatagium) attached to second toe of foot 2
b Wing membrane (plagiopatagium) attached to first toe of foot (subgenus *Rousettus*) 3
2 a Braincase strongly deflected ventrally from a line drawn along the axis of the rostrum; premaxillaries not fused to each other; pm^1 much larger in bulk than lower incisor; molars very narrow (width about one-half the length); antitragus of ear obsolete; forearm 84 - 92 mm (subgenus *Stenonycteris*).....*Rousettus lanosus*
African Chiroptera name .....*Stenonycteris lanosus*
b Braincase slightly deflected; premaxillaries fused to each other; pm^1 subequal in bulk to lower incisor; molars broad; antitragus of ear distinct; forearm 66 - 84 mm .....*Lissonycteris angolensis*
African Chiroptera name .....*Myonycteris angolensis*
3 a Median edge of plagiopatagium attached to body near the dorsal midline; forearm 79 - 89 mm (known from Sumatra and Borneo only) .....*Rousettus spinalatus*
b Median edge of plagiopatagium attached to side of the body..... 4
4 a Uropatagium well-furred for nearly entire anterior half; forearm 67 - 83 mm (known from Sulawesi and Sanghir Islands only) .....*Rousettus celebensis*
b If uropatagium has fur, it is well-furred only near root of tail; otherwise sparsely furred to nearly naked..... 5
5 a Width of premolars and molars about equal to or very slightly greater than one-half their length (except m^2 and m^3 which are wider); forearm 65 - 76 mm (known from Madagascar only).....*Rousettus madagascariensis*
b Width of premolars and molars broader..... 6
6 a Pollex 30 - 38 mm, second phalanx of third digit 50 - 62 mm (forearm 81 - 102 mm) .....*Rousettus egyptiacus*
African Chiroptera name .....*Rousettus aegyptiacus*
b Pollex 22 - 31 mm; second phalanx of third digit 36 - 51 mm..... 7
7 a Skull deflection greater than in other species belonging to subgenus *Rousettus*, but not nearly as deflected as in *Rousettus (Stenonycteris) lanosus* (forearm 70 - 75 mm); endemic to Comoro Islands (between Africa and northern Madagascar).... *Rousettus obliviosus*
b Little or no skull deflection; distributed in southern Asia from Pakistan across India (and Sri Lanka) to southeastern China and Viet Nam and south through part of the Malay Peninsula, Sumatra, Java, and Bali (*leschenaulti*) or from Thailand through the Malay Peninsula and East Indies to the Philippines and Solomon Islands (*amplexicaudatus*)..... 8
8 a Third lower molar elliptical in outline, about twice as long as broad; ears 14 - 16 mm in width; forearm 75 - 96 mm .....*Rousettus leschenaulti*
b Third lower molar subcircular in outline, only slightly longer than broad (breadth from $^2/_3$ to $^5/_6$ length); ears 10 - 13 mm in width; forearm 66 - 91 mm.....*Rousettus amplexicaudatus*

Appendix 5ay: Taylor (2000). Bats of Southern Africa

1	a	Claw on second finger, Fa 66 - 115 mm long; face doglike (Suborder Megachiroptera, Family Pteropodidae: fruit bats) 2
	b	Second digit without claw; Fa < 66 long; face not doglike (Suborder Microchiroptera) 9
2	a	Fa > 110 mm long (110 - 130 mm); colour generally tawny, with dorsal fur restricted to a narrow median badn, sharply demarcated from naked wing membranes .... *Eidolon helvum*
	b	Fa < 110 mm long 3
3	a	Ears with white basal tufts; tail absent 4
	b	Ears without white basal tufts; reducted tail present 7
4	a	Rousettes of males particularly developed, yellowish in colur; face shortened, shorter than braincase; distribution in southern Africa limited ot Chobe River in Botswana; Fa 80 - 92 mm ..... *Epomops dobsoni* African Chiroptera name ..... *Epomophorus dobsonii*
	b	Rousettes less conspicuous, white-coloured; face longer than braincase; widespread distribution; Fa 68 - 95 mm (*Epomophorus*)..... 5
5	a	One palatal ridge behind last molar; Fa 68 - 95 mm..... *Epomophorus wahlbergi*
	b	Two palatal ridges behind last molar; Fa 75 - 94 mm 6
6	a	4th palatal ridge halfway between 3rd and 5th; widespread distribution; Fa 75 - 88 mm ..... *Epomophorus gambianus*
	b	4th palatal ridge closer to 3rd than 5th; southern African distribution restricted to southwestern Angola and Ovamboland in northern Namibia; Fa 81 - 94 mm ..... *Epomophorus angolensis*
7	a	Wing membranes arise from first toe; hair short and sleek; Fa > 89 mm (89 - 96 mm); ruff of stiff hairs absent from throat of males; tail fairly robust ... *Rousettus egyptiacus* African Chiroptera name ..... *Rousettus aegyptiacus*
	b	Wing membranes arise from second toe; hair longer and coarser; Fa < 90 mm; ruff of stiff hairs present on throat of males, tail relatively shorter, less robust 8
8	a	Size smaller, Fa < 80 mm (66 - 76 mm); distribution in southern Africa limited to Haroni-Rusitu confluence in eastern Zimbabwe ..... *Myonycteris relicta*
	b	Size larger, Fa > 80 mm (82 - 90 mm); occurring more widely in the Eastern Highlands of Zimbawe and central Mozambique ..... *Lissonycteris angolensis* African Chiroptera name ..... *Myonycteris angolensis*
9	a	Tail ends in a T-shaped cartilage; face with deep slit (Family Nycteridae, genus *Nycteris*; slit-faced bats) 10
	b	Tail without T-shaped cartilage; face without deep slit 14
10	a	Larger in size, Fa 57 - 66 mm, ear 28 - 35; mass over 30 g ..... *Nycteris grandis*
	b	Smaller in size, Fa 37 - 52 mm, ear 18 - 37 mm; mass less than 20 g..... 11
11	a	Tragus has a distinctive 'semi-lunate' (half-moon) shape; Fa 36 - 50 mm, ear 18 - 34 mm..... 12
	b	Tragus has a distinctive 'pyriform' (finger-like) shape; Fa 42 - 52 mm, ear 28 - 37 mm ..... *Nycteris thebaica*
12	a	Ears shorter, 18 - 25 mm; upper incisors trifid (three-lobed), Fa 36 - 45 mm. *Nycteris hispida*
	b	Ears longer, 28 - 34 mm, upper incisors bifid (two-lobed), Fa 37 - 50 mm..... 13
13	a	General colour greyish; smaller, Fa 37 - 42 mm, ear 29 - 34 mm ..... *Nycteris woodi*
	b	General colour brownish, larger, Fa 45 - 50 mm, ear 28 - 34 mm.... *Nycteris macrotis*
14	a	Tail extends beyond the edge of, or protrudes through, the interfemoral membrane 15
	b	Tail almost entirely enclosed within interfemoral membrane (at most two or three vertebrae not included)..... 31
15	a	Free terminal portion of tail protrudes through middle of upper surface of tail membrane (Family Emballonuridae; sheath-tailed bats) 16
	b	Free terminal portion of tail extends considerably beyond hind margin of tail membrane (Family Molossidae; free-tailed bats)..... 18
16	a	Size smaller, Fa < 50 mm (46 - 49 mm); distribution in southern Africa restricted to Zambezi River in Mozambique..... *Coleura afra*
	b	Size larger, Fa > 60 mm; widespread distribution in southern Africa (*Taphozous*) 17
17	a	Colour grizzled-grey above and pure white below; gular throat pouch present in males; Fa 60 - 66 mm; mean 63 mm..... *Taphozous mauritianus*

	b	Dark brown colour above, paler below but not white, no gular pouch in males; Fa 62 - 63 mm; mean 62 mm ..... *Taphozous perforatus*
18	a	Size very large, Fa 62 - 73 mm, ears very large, 38 - 40 mm, meeting on extended snout; conspicuous paler shoulder band separating darker anterior and posterior upper regions ..... *Otomops martiensseni*
	b	Not combining above characters..... 19
19	a	Ears separate (genus *Mormopterus*) 20
	b	Ears joined 21
20	a	Head conspicuously flattened, greatest braincase dept not more than a third of the greatest width; 'warty' muzzle; main 'brush' of hairs above nose; occurring widely in drier, rocky areas of the Western Cape, Northern Cape and Northern Province, Namibia, Botswana, and southern Zimbabwe; Fa 44 mm ... *Mormopterus petrophilus* African Chiroptera name ..... *Sauromys petrophilus*
	b	Skull not as conspicuously flattened, muzzle not warty; no brush of hairs above nose; known southern Africa from just two specimens collected in Durban over 150 years ago..... *Mormopterus acetabulosus*
21	a	Size smaller, Fa 36 - 43 mm, or if larger than 43 mm, almost always having one or more of the following; 1) a dark blackish 'beard' on the throat, 2) characteristic white flecks or short strips on head and shoulders, or 3) conspicuous lateral band of white fure running lengthwise along underneath of the wing membrane where it joins the body; greateste skull length 16 - 21 mm; conspicuous crest of stiff hairs usually present on forehead of males; large ears usually joined above bridge of nose by a band of folded skin; anterior notch ('emargination') of palate usually reduced and separated from the palatal foramina by a bony bar, or, if including palatal foramina, width of emargination less than diameter of upper incisor (Genus *Chaerephon*)... 22
	b	Size larger; Fa 43 - 66 mm, greatest skull length 18 - 29 mm; no conspicuous tufs of fur on forehead of males; anterior palete with or without emargination; ears joined with band of skin or not..... 26
22	a	Size larger, Fa 43 - 51 mm; greatest skull length 18 - 21 mm 23
	b	Size smaller, Fa 34 - 42 mm; greatest skull length 15 - 18 mm..... 25
23	a	White spots, stripes, or lateral band; anterior palate with or without conspicuous emargination; blackish throat patch absent; Fa 44 - 51 mm; greatest skull length 18 - 21 mm..... 24
	b	Without withe markings or conspicuous lateral band; blackish throat patch present; colour umber above and below; Fa 43 - 47.5 mm; greatest skull length 18 - 20 mm; anterior palate with emargination .....*Chaerephon ansorgei*
24	a	Colour umber brown with variable pattern of white spots or short stripes arranged laterally on crown and sometimes also on flanks and shoulders; Fa 46 - 51 mm; greatest skull length 19 - 21 mm; anterior palate with conspicuous emargination .....*Chaerephon bivittata* African Chiroptera name ..... *Chaerephon bivittatus*
	b	No spots or stripes, but conspicuous lateral band of long, white hairs below, along flanks at junction with wing membrane, contrasting with very dark brown colour of body above and below; Fa 44 - 50 mm; greatest skull length 18 - 19 mm; anterior palate without conspicuous emargination .....*Chaerephon nigeriae* African Chiroptera name .....*Chaerephon nigeriae nigeriae*
25	a	Males with long (13 - 14 mm) bicoloured postaural crest (dark basally, pale apically); light wings; colour below light with whitish mid-ventral band down to mid-belly; Fa 34 - 39 mm; greatest skull length 16 - 17 mm .....*Chaerephon chapini*
	b	Males with short (10 mm) unicoloured postaural cerest; wings light or dark; colour below variable, with or without white belly-stripe on the median area; Fa 37 - 42 mm; greatest skull length 16 - 18 mm .....*Chaerephon pumilus*
26	a	Paler band of short hairs in front of shoulders, giving appearance of being naked; ears are joined above bridge of nose by band of skin; colour variable above nut always conspicuously paler below, with variable degree of white colouring ventrally; third upper molar reduced to V-shape, or in Mops condylurus, with third 'leg' nitceably shorter in length than the second; anterior emargination of palate not well developed, with papatal foramina separated by bony bar; Fa 45 - 66 mm, greatest skull length 20 - 29 m (Genus *Mops*) 27

b No naked band in front of shoulders; ears just meet across bridge of nose, but not conspicuously joined by a band of skin; colour variable above, but underparts tend to be same colour or only slightly paler, though white markings may be present; third upper molar N-shaped, with third 'leg' almost as long as second; anterior emargination of palata well developed, width of emargination greater than diameter of upper incisor; Fa 45 - 66 mm, greatest skull length 18 - 26 (Genus *Tadarida*) 28

27 a Smaller in size, Fa 43 - 49 mm, greatest skull length 20 - 23 mm .... *Mops condylurus* African Chiroptera name ..... Mops (Mops) condylurus

b Larger in size, Fa 58 - 66 mm, greatest skull length 27 - 29 mm ..... *Mops midas* African Chiroptera name ..... Mops (Mops) midas

28 a Smaller-sized, Fa 45 - 54 mm, greatest skull length 18 - 19 mm; lips wrinkled Tadarida aegyptiaca

b Larger-sized, Fa 57 - 66 mm, greatest skull length 22 - 26 mm; lips not wrinkled.. 29

29 a Ears extremely large (c. 50 mm), protruding beyond snout when laid forward; white patch of fur between shoulders; interdental palatal length more than twice palatal width at anterior end; Fa 59 - 62.5 mm; greatest skull length 22.5 - 23.5 mm Tadarida lobata

b Ears not as large or extended to same degree (19 - 25 mm); interdental palatal less than twice palatal width at anterior end; Fa 57 - 66 mm; greatest skull length 22.0 - 25.7 mm 30

30 a Larger, Fa 61 - 66 mm, greatest skull length 23.5 - 25.7 mm ..... Tadarida ventralis

b Smaller, Fa 57 - 59 mm, greatest skull length 22.0 - 23.0 mm ..... Tadarida fulminans

31 a Muzzle with nose-leaves 32

b Muzzle without nose-leaves (Family Vespertilionidae; plain-faced bats) 45

32 a Posterior leaflet of noseleaf with upper edge either elliptical in outline or tridentate (three-pronged) (Family Hipposideridae) 33

b Posterior leaflet of noseleaf triangular with erect, pointed tip (lancet) (Family Rhinolophidae) 36

33 a Posterior leaflet of noseleaf with upper edge elliptical in outline; size larger, Fa > 40 mm (Genus *Hipposideros*) 34

b Posterior leaflet of noseleaf with tridentate (three-pronged) shape; size smaller, Fa 31 - 35 mm 35

34 a Much larger sized, Fa 100 - 108 mm; fur short, colour below pure white *Hipposideros commersoni* African Chiroptera name ..... Macronycteris commersoni

b Much smaller sized, Fa 45 - 50 mm; fur long and fluffy, brownish-gray in colour ..... Hipposideros caffer

35 a Size very small, Fa 31 - 35 mm; ears rounded ..... Cloeotis percivali

b Size larger, Fa 48 - 54 mm; ears pointed ..... *Triaenops persicus*

36 a Face and/or lateral margins of sella covered with long hairs; greatest width of horseshoe over 9 mm; Fa 48 - 67 mm; CF component of echolocation call 55 kHz or less 37

b Sella naked; greatest width of horseshoe less than 9 mm; Fa 40 - 57 mm; CF component of echolocation call 80 kHz or more 38

37 a Size larger, Fa 62 - 67 mm; echolocation call has CF frequency of 37 - 46 kHz ..... Rhinolophus hildebrandtii

b Size smaller, Fa 48 - 51 mm; echolocation call has CF frequency of 55 kHZ ..... Rhinolophus fumigatus

38 a Connecting process (Figure 22) rises to erect point or high and narrow horn; Fa 41 - 47 mm 39

b Connecting process blunt and rounded (Figure 22); Fa 40 - 57 mm 40

39 a The concave lancet (Figure 22) from the posterior noseleaf has a narrowly pointed shpe, sella not rising to a very sharp narrow tip; fur shorter and darker; first phalanx of fourth finger (Figure 23) noticeably shortened in relation to metacarpal length; axillary (under-arm) tuft of stiff hairs in males; Fa 41 - 43 mm ..... Rhinolophus landeri

b Margins of lancet not concave, forming equilateral traingle, sella rising to a very sharp narrow tip; fur longer and paler; first phalax of fourth finger not noticeably shortened in relation to metacarpal length; no axillary tuft of still hairs in males; Fa 41 - 47 mm ..... Rhinolophus blasii

40 a Canine and posterior premolar in contact, anterior premolar exterior to toothrow and minute, invisible to naked eye or hand lens; echolocation call has CF component at 86 or 94 kHz; Fa 43 - 57 mm..... 41
b Canine and posterior premolar not in contact, separated by anterior premolar which is just visible to naked eye, or with hand lens; echolocation call has CF component at 80, 83 or > 100 kHz, Fa 40 - 52 mm 42
41 a Larger, Fa 50 - 57 mm; echolocation call has CF component at 94 kHz ..... *Rhinolophus clivosus*
b Smaller, Fa 43 - 49 mm; echolocation call has CF component at 86 kHz .....*Rhinolophus darlingi*
42 a Larger, Fa 48 - 52 mm; distribution limited to the Western Cape and Eastern Cape; echolocation call has CF component at 90 kHz .....*Rhinolophus capensis*
b Smaller, Fa 40 - 46 mm; echolocation call has CF component of 83 kHz, or > 100 kHz 43
43 a Ears longer, > 22 mm; CF component of echolocation call 83 kHz; larger, Fa 42 - 46 mm.....*Rhinolophus simulator*
b Ears shorter, < 22 mm; CF component of echolocation call > 83 kHz; smaller, Fa 40 - 44 mm..... 44
44 a Front edge of connecting process almost concave; lancet with sides almost convex; dorsal fur long and whitish at base, tips grey-brown, ventrally pure white; occurs only in more arid areas of Botswana, Namibia and the Northern Cape; call unrecorded but almost certainly > 100 kHz, based on small body size ..... *Rhinolophus denti*
b Front edge of connecting process convex; lancet with sides almost concave, tip pointed; fur nearly unicoloured, not whitish at base; occurs only in savanna areas of Zimbabwe and eastern South Africa; CF frequency 110 - 115 kHz*Rhinolophus swinnyi*
45 a Second phalanx of third digit about three times as long as first (Figure 24) (Subfamily Miniopterinae)..... *Null*
b Second phalanx of third digit less than three times as long as first 48
46 a Larger-sized, Fa 45 - 50 mm; mass averages 15 g; greatest skull length exceeds 16 mm..... *Miniopterus inflatus*
African Chiroptera name .....*Miniopterus inflatus inflatus*
b Smaller-sized, Fa 42 - 47 mm; mass 9 - 16g; greatest skull length 14 - 15 mm..... 47
47 a Smaller, Fa 42 - 44 mm, mass 9 - 11 g; skull c. 14 mm.....*Miniopterus fraterculus*
b Larger, Fa 42 - 47 mm, mass 9 - 16 g; skull c. 15 mm ..... *Miniopterus schreibersii*
48 a Ears funnel-shaped, with deep emargination below tip; tragus long, narrow, sharply pointd (Figure 25); braincase high and rounded; long, soft, erect, woolly hair, with curled tips, giving grizzled appearance (Subfamily Kerivoulinae)..... 49
b Ears not funnel-shaped, without deep emargination below tip; tragus not sharply pointed; braincase not high and rounded (Subfamily Vespertilioninae)..... 50
49 a Size larger, Fa 34 - 39 mm; greatest skull length 15 mm or more; colour of upper parts reddish-chestnut, underparts whitish or with buffy tinge .....*Kerivoula argentata*
b Size smaller, Fa 30 - 36 mm; greatest skull length 13.5 or less; colour of upper parts brownish, may be lightly grizzled with greyish-white or white, underparts brown to greyish-brown to greyish-white to white .....*Kerivoula lanosa*
50 a Wing extremely narrow, third digit shorter than head and body length; skull flattened; tragus extremely short and blunt; hair very short .....*Mimetillus moloneyi*
b Wing not extremely narrow, third digit longer than head and body length; skull flattened; tragus not extremely short and blunt; hair not so short..... 51
51 a Fur coppery-reddish or yellowish to greyish-yellow in colour above and long and fluffy in texture; six upper cheekteeth and six lower cheekteeth on each side; elongated muzzle (Genus *Myotis*)..... 52
b Fur not coppery-reddisht in oclour or long fluffy in texture; fewer than 6 upper and lower cheekteeth; muzzle not elongated..... 56
52 a Size larger, Fa > 52 mm; distinctive pattern of contrasting black and coppery markings on wings and tail membrane .....*Myotis welwitschii*
b Size smaller, Fa usually < 52 mm (but may be up to 54 mm); colour uniform coppery-red or yellowish, without black markings on wings or tail membrane 53
53 a Wings without glands; size larger, Fa 41 - 54 mm 54
b Wings with glands; size smaller, Fa 32 - 35 mm..... 55
54 a Size larger, Fa 47 - 52 mm..... *Myotis tricolor*

	b	Size smaller, Fa < 47 mm ..... *Myotis bocagei* African Chiroptera name ..... Myotis bocagii
55	a	Size smaller, Fa 32 - 33 mm; upper parts dull greyish-yellow ..... *Myotis seabrai* African Chiroptera name ..... Cistugo seabrae
	b	Size larger, Fa > 34 mm; upper parts honey yellow..... *Myotis lesueuri* African Chiroptera name ..... Cistugo lesueuri
56	a	Wing membranes with conspicuous reticulated pattern; Fa 45 mm .....*Chalinolobus variegatus* African Chiroptera name .....Glauconycteris variegata
	b	Wing membranes without conspicuous reticulated pattern..... 57
57	a	Ear length 18 mm or more, about half length of forearm (genus *Laephotis*) 58
	b	Ear length < 18 mm; or much less than half of forearm 60
58	a	Larger, Fa > 37 mm, greatest skull length > 16 mm, ear length > 19 mm 59
	b	Smaller, Fa < 37 mm (33 - 37 mm), greatest skull length < 15 mm, ear length < 19 mm ..... Laephotis botswanae
59	a	Ear length 24 - 25 mm; Fa 38 - 39 mm; colour light buffy brown; distribution restricted to the Namib Desert ..... Laephotis namibensis
	b	Ear length 19 - 22 mm; Fa 36 - 41 mm; colour buffy brown; occurs in the Western Cape, Free State and KwaZulu-Natal ..... Laephotis wintoni
60	a	Size larger, Fa > 43 mm..... 61
	b	Size smaller, Fa < 43 mm 64
61	a	Tragus characteristically long and fine-pointed (Figure 26), the outer margin convex with a lobe towards its base; pronounced muzzle; dorsal fur soft with sheen, yellowish-brown coloured; underparts yellow, greyish-white or white; one pair of upper incisors present, Fa 43 - 80 mm (Genus *Scotophilus*) 62
	b	Tragus shorter, knife-shaped (Figure 27); muzzle not pronounced; dorsal fur rougher, without sheen, fawn to dark-brown coloured; ventral colour greyish; two pairs of upper incisors present, although outer incisors tiny, only visible with magnifying lens; Fa 46 - 50 mm.....Eptesicus hottentotus
62	a	Larger sized, Fa 70 - 80 mm, greatest skull length > 30 mm.....Scotophilus nigrita
	b	Smaller sized, Fa 43 - 65 mm; greatest skull length 16 - 23 mm..... 63
63	a	Size smaller, Fa 44 - 52 mm, greatest skull length 16 - 20 mm; adults with withish belly ..... Scotophilus viridis
	b	Size larger, Fa 50 - 65 mm; greatest skull length 20 - 23 mm; adults with yellow belly ..... Scotophilus dinganii
64	a	Distinctive pale fawn dorsal colour, slightly paler below, contrasting with much darker brown coloured wings and interfemoral membrane; characteristic tragus shape, indented on the inner surface and with two small lobes on the outer edge (Figure 28); Fa 28 - 33 mm .....*Nycticeinops schlieffeni* African Chiroptera name .....Nycticeinops schlieffenii
	b	Colour and tragus shape not as above 65
65	a	Single, pair or prominent, procumbent upper incisors; rostrum broad, c. 7 mm, about 50 % of greatest skull length; penis elongated, reaching 25 % of head and body length; Fa 30 - 31 mm (Genus *Scotoecus*) 66
	b	Two pairs of upper incisors, outer much smaller than inner; rostrum not broad, c. 5 - 6 mm, or 40 % of greatest skull length; penis not so elongated, less than 25 % of head and body (Genus *Pipistrellus*) 67
66	a	Pale-winged, four or five upper cheekteeth..... Scotoecus albofuscus
	b	Dark-winged, four upper cheekteeth ..... Scotoecus hirundo
67	a	Underparts pure white; upper, inner incisors deeply bifid (i.e. divided) .....Pipistrellus rueppellii
	b	Underparts brown or grey; upper, inner incisors not deeply bifid..... 68
68	a	Five upper cheekteeth, including a tiny anterior premolar, creating a gap between canine and posterior premolar which may be visible with a magnifying lens in the field 69
	b	Four upper cheekteeth, lacking tiny anterior premolar; canine and posterior premolar closely pressed togehter (Subgenus *Neoromicia*, previously grouped in the genus *Eptesicus*)..... 72

69 a Tragus characteristically 'hatchet-shaped' with sharp obtuse angle in posterior edge; outer upper incisor more than half length of inner upper incisor; forehead strongly concave, typically found roosting in unfurling banana or Strelizia leaves ; Fa 29 - 38 mm..... *Pipistrellus nanus*
African Chiroptera name ..... *Neoromicia nana*

b Tragus not 'hatchet-shaped', without distinct angle in posterior edge; outer upper incisor less than half length of inner upper incisor; forehead usually flat or weakly concave, not found in banana or Strelizia leaves 70

70 a Interdental palate as broad as long; forehead flat; total length of skull 12 mm or less; Fa 27 - 29 mm ..... *Pipistrellus rusticus*

b Interdental palate longer than broad; forehead at least weakly concave; total length of skull more than 12 mm; Fa 29 - 35 mm 71

71 a Posterior upper incisor barely extending above cingulum of anterior incisor; anterior upper premolar a pointed tooth rising above cingulum of canine; maxillary toothrow more than 4.5 mm; Fa 31 - 35 mm..... *Pipistrellus kuhlii*

b Posterior upper incisor extending well above cingulum of anterior incisor; anterior upper premolar a flat-crowned tooth; maxillary toothrow less than 4.5 mm; Fa 29 - 33 mm..... *Pipistrellus anchietai*
African Chiroptera name ..... *Hypsugo anchietae*

72 a Wing membranes white or translucent; Fa 34 - 38 mm ..... *Pipistrellus rendalli*
African Chiroptera name ..... *Neoromicia rendalli*

b Wing membranes dark; Fa 29 - 36 mm..... 73

73 a Dorsal colour paler; wing membranes edged with white; dorsal fur up to 8 mm long; Fa 30 - 32 mm; skull lacking posterior, occipital 'helmet'; only occurring in savanna regions..... *Pipistrellus zuluensis*
African Chiroptera name ..... *Neoromicia zuluensis*

b Dorsal colour darker; wing membranes not edged with white; dorsal fur not more than 5 mm long; Fa 29 - 36 mm; skull with posterior, occipital 'helmet'; occurring widely in savanna, grassland, montane and semi-arid regions ..... *Pipistrellus capensis*
African Chiroptera name ..... *Neoromicia capensis*

Appendix 5az: Russ et al. (2001). Key to the bats of Madagascar

1	a	Has a claw on the thumb, and on the second digit. Teeth of the frugivorous type ... 2
	b	Has claw on the thumb, but not on the second digit. Teeth of the insectivorous type 4
2	a	No tail present. ..... *Pteropus rufus rufus* African Chiroptera name ..... *Pteropus niger*
	b	Tail present..... 3
3	a	Forearm much greater than 95 mm. ..... *Eidolon dupreanum*
	b	Forearm much less than 95 mm. .... *Rousettus madagascariensis madagascariensis* African Chiroptera name ..... *Rousettus madagascariensis*
4	a	Has fixed suckers on wrists and ankles. ..... *Myzopoda aurita*
	b	No suckers 5
5	a	Nose leaf present (can be slit nosed)..... 6
	b	No nose leaf present 10
6	a	Muzzle divided by a longitudinal furrow with fleshy dermal outgrowths. Tail terminates in a T-shaped tip. ..... *Nycteris madagascariensis*
	b	Face with well-developed nose-leaf covering muzzle..... 7
7	a	Forearm greater than 75 mm. Top of nose-leaf not very complex and is rounded. ..... *Hipposideros commersoni commersoni* African Chiroptera name ..... *Macronycteris commersoni*
	b	Forearm less than 75 mm. Nose leaf is trident-shaped. 8
8	a	Forearm greater than 48 mm. Ears (from the notch) smaller than 15 mm. *Triaenops rufus* African Chiroptera name ..... *Triaenops menamena*
	b	Forearm less than 48 mm. Ears (from the notch) greater than 15 mm..... 9
9	a	3rd metacarpal greater than 35 mm. Tail less than 20 mm. Dorsal pelage is grey-black. ..... *Triaenops auritus* African Chiroptera name ..... *Paratriaenops auritus*
	b	3rd metacarpal less than 35 mm. Tail greater than 20 mm. Dorsal pelage is grey-brown. ..... *Triaenops furculus* African Chiroptera name ..... *Paratriaenops furculus*
10	a	Free tail. Does not include slight extension past interfemoral membrane (<5mm). 21
	b	Tail enclosed with interfemoral membrane 11
11	a	second phalanx of 3rd digit about three times as long as the first digit; braincase high and rounded. 3rd and 4th fingers are bent at the joint between the 1st and 2nd phalanx when at rest [Fig 41] (all these and no postcalcarial lobe) 12
	b	second phalanx of third digit not especially elongated..... 15
12	a	Forearm measurement more than 46 mm (mean = 48.4; 46.7 - 49.9); greater length of head exceeding 16.0 mm. ..... *Miniopterus gleni*
	b	In general, forearm less than 46 mm; greater length of head smaller than 16.0 mm 13
13	a	Forearm more than 40 mm (14) 14
	b	Forearm less than 40 mm. (May be a form of *Miniopterus minor*) *Miniopterus manavi*
14	a	Greater length of skull is not less than 15 mm (mean = 15.5; 15.0 – 16.1). Forearm mean = 44.2 (41.8 - 46.6); M^3-M^3: mean = 6.5 (6.3 - 6.8). ..... *Miniopterus majori*
	b	Greater length of skull is in general less than 15 mm (mean = 14.8; 14.5 - 15.1). Forearm mean = 42.8 (40.7 - 44.4); M^3-M^3: mean = 5.9 (5.7 - 6.0). ..... *Miniopterus fraterculus*
15	a	Post-calcarial lobe present [Fig. 42A]. Tragus short, curved, and rounded at tip and may be bent forward..... 16
	b	No postcalcarial lobe. Tragus long and sharp.[Fig. 42B] ..... *Myotis goudoti*
16	a	Tragus obviously bent forward [Fig. 43]..... 20
	b	Tragus not bent forward at top. 17
17	a	Last tail vertebrae projects beyond membrane by a maximum of 1mm. The post-calcarial lobe broad with visible T-piece cartilage. Two pairs of upper premolars present..... 18
	b	Last 1 - 2 tail vertebrae project beyond membrane 4 - 5mm. Post-calcarial lobe is narrow, usually without a visible T-piece cartilage. One pair of upper premolars present..... 19
18	a	Note: Pipistrelle species not established as yet – record as *Pipistrellus* spp. But note any observations. ..... *Null*

19	a	There is no single characteristic that separates these species. See text for further information..... *Null*
20	a	Forearm greater than 55 mm. .....*Scotophilus robustus*
	b	Forearm less than 55 mm. .....*Scotophilus borbonicus*
21	a	Free terminal proportion of tail emerges above middle of upper surface of interfemoral membrane [Fig. 44B]..... 22
	b	Free terminal proportion of tail projecting beyond hind margin of interfemoral membrane [Fig. 44A]..... 23
22	a	Forearm > 50 mm (58 - 64); males with large gular sac in the throat. .....*Taphozous mauritianus*
	b	Forearm < 50 mm (37 - 41mm); no gular sac. .....*Emballonura atrata* African Chiroptera name .....*Paremballonura atrata*
23	a	Ears very large (28 - 40 mm), joined on extended snout; forearm > 60 mm. .....*Otomops madagascariensis*
	b	Different face..... 24
24	a	Ears separated at the base [Fig. 46B]..... 25
	b	Ears joined at the base [Fig. 46A]..... 27
25	a	Ears separated at the base. Translucent ears are erect and well separated by a space at the base. Unwrinkled lips. White underside. Forearm less than 45 mm (26) 26
	b	Ears separated at the base. Forearm is greater than 55 mm. ..... *Tadarida (Tadarida) fulminans* African Chiroptera name .....*Tadarida fulminans*
26	a	Ears with anterior margin slightly emarginated below pointed tip. ..... *Tadarida (Mormopterus) acetabulosa* African Chiroptera name .....*Mormopterus acetabulosus*
	b	Ears without emargination, tips broadly rounded. ..*Tadarida (Mormopterus) jugularis* African Chiroptera name .....*Mormopterus jugularis*
27	a	Forearm less than 40 mm 28
	b	Forearm greater than 40 mm 29
28	a	Forearm usually less than 38mm; Tragus is small and square. [Fig. 48A].... *Tadarida (Chaerephon) leucogaster* African Chiroptera name .....*Chaerephon leucogaster*
	b	Forearm usually greater than 38mm; Tragus is small, sharp and straight. [Fig. 48B] .....*Tadarida (Chaerephon) pumila* African Chiroptera name .....*Chaerephon pumilus*
29	a	Forearm greater than 55mm. .....*Tadarida (Mops) midas miarensis* African Chiroptera name .....*Mops (Mops) midas miarensis*
	b	Forearm less than 50 mm. .....*Tadarida (Mops) leucostigma* African Chiroptera name .....*Mops (Mops) leucostigma*

Appendix 5ba: Fahr et al. (2002). A revision of the Rhinolophus maclaudi species group with the description of a new species from West Africa (Chiroptera: Rhinolophidae).

1 a Horseshoe without secondary leaflets; no or very inconspicuous median emargination; rims around nostrils ± straight and parallel; sella inclined forward. FA: 60 - 69, Cblc: 24.0 - 27.8, Mast: 12.3 - 13.9, Zyg: 12.3 - 13.8..... 2

b Horseshoe with one pair of secondary leaflets; with conspicuous median emargination; rims around nostrils semicircular; sella erect and ± parallel to lancet. FA: 54 - 62, Cblc: 20.7 - 23.6, Mast: 10.9 - 12.3, Zyg: 10.5 - 11.4 3

2 a FA: 63.6 - 68.7, Cblc: 27.0 - 27.8, Mast: 13.3 - 13.9, Zyg: 13.2 - 13.8, C-M_3: 10.5 - 10.8.....*Rhinolophus maclaudi*

b FA: 59.9 - 60.5, Cblc: 24.0 - 24.1, Mast: 12.3 - 12.4, Zyg: 12.3 - 12.5, C-M_3: 8.9 - 9.0 .....*Rhinolophus ziama*

3 a Lancet moderately exceeding height of sella. FA: 55.0 - 61.7, Cbs: 22.0 - 23.6, MastoidW: 11.2 - 12.3, ZygomaticW: 10.5 - 11.4, M^3-M^3 : 7.3 - 8.2, C-M_3 : 8.2 - 8.9 .....*Rhinolophus ruwenzorii*

b Lancet conspicuously exceeding height of sella. FA: 54.2 - 54.3, Cblc: 20.7 - 21.2, Mast: 10.9 - 11.2, Zyg: 10.6 - 10.9, M^3-M^3: 7.8 - 8.0, C-M_3: 7.9 - 8.1 *Rhinolophus hilli*

Appendix 5bb: Jacobs and Fenton (2002). Mormopterus petrophilus

1	a	Skull extremely flattened; occurs in Africa 2
	b	Skull not extremely flattened; mostly not in Africa 3
2	a	Forearm with wartlike granulations; length of forearm 29 - 36 mm*Mormopterus setiger* African Chiroptera name .....*Platymops setiger*
	b	Forearm lacking wartlike granulations; length of forearm 38 - 48 mm.... *Mormopterus petrophilus* African Chiroptera name ..... *Sauromys petrophilus*
3	a	Known from the New World..... 4
	b	Not known from the New World 6
4	a	Recorded from Cuba; length of forearm 29 - 31 mm ..... *Mormopterus minutus*
	b	Recorded from southwestern South America; length of forearm 29 - 31 mm..... 5
5	a	Length of forearm 34 - 49 mm; skull not flattened; 1 upper premolar per quadrat; basisphenoid pits present; palate not domed.....*Mormopterus kalinowski*
	b	Length of forearm 33 - 34 mm; skull flattened; 2 upper premolars per quadrat; no basisphenoid pits; palate domed.....*Mormopterus phrudus*
6	a	Recorded from Madagascar; some records from Africa 7
	b	Only known from location east of Madagascar 8
7	a	Madagascar; 2 African records; ears triangular in shape; length of forearm 38 - 39 mm .....*Mormopterus acetabulosus*
	b	Madagascar; ears rounded; length of forearm 35 - 37 mm.....*Mormopterus jugularis*
8	a	Recorded from Sumatra; not known from Australia and/or New Guinea; length of forearm 32 - 34 mm.....*Mormopterus doriae*
	b	Not known from Sumatra; occurs in Australia and/or New Guinea; length of forearm 33 - 40 mm 9
9	a	Length of forearm <= 33 mm..... *Mormopterus planiceps (=loriae)*
	b	Length of forearm > 33 mm..... 10
10	a	Gular gland lacking; heavy build; length of forearm 33 - 99 mm*Mormopterus beccarii*
	b	Gular gland present; light build; length of forearm 36 - 40 mm..... *Mormopterus norfolkensis*

Appendix 5bc: Csorba et al. (2003). Horsehoe bats of the World (Chiroptera: Rhinolophidae).

1	a	Specimen from the Palaearctic Region	2
	b	Specimen outside the Palaearctic Region	6
2	a	Connecting process forming a continuous arch (Fig. 42.1) (*pearsoni*-group: *R. pearsoni*).	77
	b	Connecting process different.	3
3	a	Connecting process high and bluntly rounded (Fig 18.1) (^{ferrumequinum}-group: *R. bocharicus, R. clivosus, R. ferrumequinum*).	66
	b	Connecting process different.	4
4	a	Connecting process pointed, triangular in profile (Fig 7.1).	5
	b	Connecting process low, rounded, its tip pointed downwards (Fig. 27.1) (*hipposideros*-group).	*Rhinolophus hipposideros*
5	a	Sella wedge-shaped (Fig v.2) (*landeri*-group: *R. blasii*).	74
	b	Sella parallel sided (Fig v.1) (*euryale*-group).	58
6	a	Specimen from the Afrotropical Region.	7
	b	Specimen from the Indomalayan, Oceanian and Australian Regions.	20
7	a	Anterior upper premolar (P^2) fully external, small or missing.	8
	b	Anterior upper premolar (P^2) in toothrow or at most half-external.	11
8	a	Sella hairy, connecting process low, forming a continuous arch (Fig. 24.1); general colour greyish (*fumigatus*-group).	9
	b	Sella naked, connecting process higher; general colour not greyish (*ferrumequinum*-group: *R. clivosus, R. darlingi, R. deckeni, R. hillorum, R. sakejiensis, R. silvestris*).	66
9	a	Forearm over 60.5 mm.	*Rhinolophus hildebrandti* African Chiroptera name *Rhinolophus hildebrandtii*
	b	Forearm under 60.5 mm.	10
10	a	Skull length over 24.5 mm.	*Rhinolophus eloquens*
	b	Skull length under 24.5 mm.	*Rhinolophus fumigatus*
11	a	Sella widening at base; anterior median swellings bulbous.	12
	b	Sella normal; anterior median swellings moderate.	15
12	a	Connecting process very low, internarial septum expanded into a cup-like structure (Fig. 32.1) (*maclaudi*-group).	14
	b	Connecting process well developed, internarial septum not expanded (Fig. 1.1) (*adami*-group)	13
13	a	Tip of lancet longer, with convex sides.	*Rhinolophus adami*
	b	Tip of lancet shorter, with nearly straight sides.	*Rhinolophus maendeleo*
14	a	Skull length over 26 mm, mastoid width less or subequal to the zygomatic width.	*Rhinolophus maclaudi*
	b	Skull length less than 25 mm, mastoid width greater than zygomatic width.	*Rhinolophus ruwenzorii*
15	a	Connecting process low, rounded, its tip pointed downwards (Fig. 27.1); anterior half of the zygomatic arch weak, almost parallel-sided (Fig. 27.2) (*hipposideros*-group).	*Rhinolophus hipposideros*
	b	Connecting process well developed, its tip pointed more or less forward; zygomata more robust, medio-laterally flattened.	16
16	a	Connecting process triangular in profile (Fig. 28.1) (*landeri*-group).	74
	b	Tip of connecting process rounded (*capensis*-group)	17
17	a	Skull length over 20 mm, CM^3 length over 7.2 mm.	*Rhinolophus capensis*
	b	Skull and upper toothrow length shorter.	18
18	a	The sides of lancet straight or nearly so.	*Rhinolophus denti*
	b	The sides of lancet concave.	19
19	a	Sella relatively broad, CM^3 length 6.3 - 7.0 mm.	*Rhinolophus simulator*
	b	Sella narrow, CM^3 length 5.8 - 6.7 mm.	*Rhinolophus swinnyi*
20	a	Sella with lateral projecting lappets at its base (Fig. v.4) (*trifoliatus*-group).	21
	b	Sella lacking lateral basal lappets.	25
21	a	Forearm over 48 mm; skull length over 21 mm.	22
	b	Forearm under 48 mm, skull length less than 21 mm.	*Rhinolophus sedulus*
22	a	Noseleaf and ears yellowish; skull length under 25 mm.	*Rhinolophus trifoliatus*
	b	Noseleaf and ears dark brown or blackish; skull length usually over 25 mm.	23

23 a Skull length usually over 28 mm, CM^3 length over 10.5 mm. .....*Rhinolophus luctus*
b Skull length under 28 mm, CM^3 length usually under 10.5 mm. 24
24 a Specimen from South India and Sri Lanka..... *Rhinolophus beddomei*
b Specimen from Taiwan..... *Rhinolophus formosae*
25 a Connecting process pointed..... 26
b Connecting process rounded, not pointed. 38
26 a Anterior median swellings moderately low, protruding anteriorly (Fig. 8.2). 37
b Anterior median swellings higher, directing upwards (Figs 50.2, 59.1) (*pusillus*-group). 27
27 a Forearm over 46 mm; CM^3 length over 20 mm.....*Rhinolophus acuminatus*
b Forearm under 46 mm; CM^3 length less than 19 mm. 28
28 a Lancet strongly rounded off, its outline convex. .....*Rhinolophus convexus*
b Sides of lancet concave or nearly straight. 29
29 a Lancet long, its tip spatulate, connecting process always a long, narrow horn. 30
b Lancet shorter, its tip narrower, connection process shorter, usually more triangular. 31
30 a Upper canines slender, posterior palatal emargination wider than anterior palatal emargination.....*Rhinolophus cognatus*
b Upper canines massive, posterior palatal emargination narrower than anterior palatal emargination..... *Rhinolophus imaizumii*
31 a Upper canines long, wide-based, skull length over 17 mm; sagittal crest well developed for its full length. ..... *Rhinolophus shortridgei*
b Upper canines shorter, skull length usually under 17 mm; sagittal crest weaker posteriorly..... 32
32 a Forearm 41 - 46 mm, CM^3 length under 6 mm. .....*Rhinolophus osgoodi*
b Forearm usually shorter, it longer than 41 mm the CM_3 length over 6 mm. 33
33 a Rostrum narrower, M^3-M^3 width less than 5 mm.....*Rhinolophus subbadius*
b Rostrum wider, M^3-M^3 width over 5 mm..... 34
34 a CM^3 length usually over 6 mm. .....*Rhinolophus lepidus*
b CM^3 length usually under 6 mm. 35
35 a Specimen from Taiwan..... *Rhinolophus monoceros*
b Specimen outside of Taiwan. 36
36 a Specimen from Japan. ..... *Rhinolophus cornutus*
b Specimen not from Japan. ..... *Rhinolophus pusillus*
37 a Sella parallel-sided (*euryale*-group: *R. mehelyi*). 58
b Sella wedge-shaped (*landeri*-group: *R. blasii*). 74
38 a Connecting process low, rounded, its tip pointed downwards (Fig. 27.1); anterior half of the zygomatic arch weak, almost parallel-sided (Fig. 27.2) (*hipposideros*-group). .....*Rhinolophus hipposideros*
b Connecting process usually more developed, its tip pointed more or less forward; zygomata more robust, medio-laterally flattened. 39
39 a Connecting process forming a continuous arch or obsolete (Figs 10.1, 42.1)..... 40
b Connecting process not forming a continous arch (Figs 35.1, 45.1). 41
40 a Lower lip with one mental groove (Fig. vi), internarial region not expanded (*pearsoni*-group). 77
b Lower lip with three mental grooves (fig. vi), internarial region expanded (*euryotis*-group). 58
41 a Sella long and wide; palatal bridge more than 1_3 length of maxillary toothrow (CM^3) (*philippiniensis*-group). 42
b Sella shorter and narrower, palatal bridge less than 1_3 of maxillary toothrow (CM^3). 47
42 a Internarial region not expanded, its width not exceeding that of the sella.*Rhinolophus macrotis*
b Internarial region expanded, much wider than sella. 43
43 a Lateral margins of internarial expansion passing beneath base of sella. 44
b Lateral margins of internarial expansion integral with margins of sella. 45
44 a Forearm more than 56 mm, CM^3 length over 8 mm..... *Rhinolophus rex*
b Forearm less than 57 mm, CM^3 length less than 8 mm.*Rhinolophus paradoxolophus*
45 a Internarial expansion trapezoid with projecting lateral wings....*Rhinolophus marshalli*
b Internarial expansion subcircular. 46
46 a Forearm 49 - 56 mm, skull length over 20 mm. .....*Rhinolophus philippinensis*

	b	Forearm 43.5 - 46.0 mm, skull length 18.45 mm. ..... *Rhinolophus montanus*
47	a	Connecting process high and rounded (Fig. 18.1); anterior upper premolar (P^2) when present always minute and fully external to toothrow (*ferrumequinum*-group: *R. bocharicus, R. ferrumequinum*). 66
	b	Connecting process lower and rounded (Fig. 34.1); anterior upper premolar (P^2) larger, usually in row or only slightly extruded, very rarely totally external. 48
48	a	Lancet abruptly narrower at centre, its lateral margins strongly concave (*rouxi*-group). 56
	b	Lancet triangular, lateral margins more or less straight (*megaphyllus*-group). 49
49	a	Skull length over 21 mm. ..... *Rhinolophus affinis*
	b	Skull shorter than 21 mm. 50
50	a	Anterior rostal swellings very large (Fig. viii), inflated, strongly elevated. 51
	b	Anterior rostal swellings moderate (Fig. viii), less inflated. 52
51	a	Posterior median swellings inflated, in profile median anterior swellings shallowly concave posteriorly; interorbital width over 2 mm. ..... *Rhinolophus malayanus*
	b	Posterior median swllings uninflated, in profile median anterior swellings very sharply concave posteriorly; interorbital width less than 2 mm. ..... *Rhinolophus stheno*
52	a	Facial part of skull elongate, the supraorbital crest combining at a point behind the centre of the orbital cavity. ..... *Rhinolophus megaphyllus*
	b	Facial part of skull shorter, the supraorbital crest combing at a point above or in front of the centre of the orbital cavity. 53
53	a	Skull length 20.87 mm, CM^3 length 8.50 mm. ..... *Rhinolophus nereis*
	b	Skull length less than 19.5 mm, CM^3 length less than 7.5 mm. 54
54	a	Noseleaf very small and narrow. ..... *Rhinolophus virgo*
	b	Noseleaf moderate, wider. 55
55	a	Skull length usually over 18 mm, CM^3 length usually over 7 mm. ..... *Rhinolophus borneensis*
	b	Skull usually shorter than 18 mm, CM^3 length usually less than 7 mm. .. *Rhinolophus celebensis*
56	a	Upper canines small, CM^3 length 6.82 - 7.67 mm. ..... *Rhinolophus thomasi*
	b	Upper canines longer and stronger. 57
57	a	Specimen from Peninsular India and Sri Lanka; CM^3 length 7.88 - 9.24 mm. ..... *Rhinolophus rouxi*
	b	Specimen outside the above territories; CM^3 length 7.04 mm - 8.40 mm. *Rhinolophus sinicus*
58	a	Base of lancet densely pilose. 59
	b	Base of lancet at most sparsely haired. 60
59	a	Hairs at base of lancet forming a dense, bristly sub-conical tuft. *Rhinolophus creaghi*
	b	Hairs at base of lancet long, disperse. ..... *Rhinolophus canuti*
60	a	Lancet thickened and folded to form a vertical fissure enclosing rear of connecting process. 61
	b	Lancet not folded, rear of connecting process not enclosed. 62
61	a	Width across anterior lateral swellings less than 5.5 mm, supraorbital ridges well developed (Fig. 11.3). ..... *Rhinolophus coelophyllus*
	b	Width across anterior lateral swellings more than 5.5 mm, supraorbital ridges weaker. ..... *Rhinolophus shameli*
62	a	Horseshoe with two parallel swollen ridges extending to internarial region and terminating in a small, tooth-like median projection. ..... *Rhinolophus euryotis*
	b	Horseshoe with only a narrow groove reaching less than halfway to internarial region. 63
63	a	Forearm 66 - 74 mm, skull length over 28 mm. ..... *Rhinolophus rufus*
	b	Forearm maximum 57 mm, skull length shorter than 26 mm. 64
64	a	Forearm 52 - 57 mm, CM^3 length 9.5 - 10.5 mm. ..... *Rhinolophus subrufus*
	b	Forearm under 53 mm, CM^3 length less than 9.9 mm. 65
65	a	Skull length over 22.5 mm, CM^3 length 9.3 - 9.9 mm. ..... *Rhinolophus inops*
	b	Skull length shorter than 22.5 mm, CM^3 length shorter than 9 mm. ..... *Rhinolophus arcuatus*
66	a	Specimen from the Palaearctic Region. 67
	b	Specimen from the Afrotropical Region. 69
67	a	Forearm over 53 mm, skull length over 20.5 mm. ..... *Rhinolophus ferrumequinum*

	b	Forearm under 53 mm, skull length under 20.5 mm. 68
68	a	Specimen from Central Asia. .....*Rhinolophus bocharicus*
	b	Specimen from North Africa and Arabia.....*Rhinolophus clivosus (in part)* African Chiroptera name .....*Rhinolophus blasii*
69	a	Connecting process high, pointed or rounded (Fig. 18.1). 70
	b	Connecting process lower, rounded (Fig. 20.1). 72
70	a	Skull length under 23 mm.....*Rhinolophus clivosus (in part)* African Chiroptera name .....*Rhinolophus blasii*
	b	Skull length over 23 mm. 71
71	a	Connecting process pointed. .....*Rhinolophus sakejiensis*
	b	Connecting process blunt. .....*Rhinolophus hillorum*
72	a	Horseshoe with more than 9 mm, skull length over 22 mm. 73
	b	Horseshoe with less than 9 mm, skull length under 21 mm.....*Rhinolophus darlingi*
73	a	Sides of lancet nearly straight. .....*Rhinolophus deckeni* African Chiroptera name .....*Rhinolophus deckenii*
	b	Sides of lancet more or less concave. ..... *Rhinolophus silvestris*
74	a	Sella wedge-shaped, connecting process narrow and pointed. .....*Rhinolophus blasii*
	b	Sella broadly rounded above, connecting process a broadly-based triangle. 75
75	a	Forearm 49 - 54 mm, skull length over 21 mm. .....*Rhinolophus alcyone*
	b	Forearm under 49 mm, skull length shorter than 21 mm. 76
76	a	Skull length over 19.3 mm. .....*Rhinolophus guineensis*
	b	Skull length under 19.3 mm. ..... *Rhinolophus landeri*
77	a	Forearm 47 - 56 mm; skull length under 24.5 mm, CM^3 length less than 10 mm. ..... *Rhinolophus pearsoni*
	b	Forearm 51.5 - 64 mm; skull length over 24.5 mm, CM^3 length over 10 mm. .....*Rhinolophus yunanensis*

Appendix 5bd: Decher and Fahr (2005). Hipposideros cyclops

1	a	Ears united at base by low frontal band (*megalotis* group)..... *Hipposideros megalotis*
	b	Ears separate 2
2	a	Ears long, narrow, and pointed (*cyclops* group) 7
	b	Ears short, broad, and rounded or triangular 3
3	a	Ears rounded or broadly triangular and bluntly pointed; upper incisors weak ... *bicolor group*
	b	Ears triangular and pointed, upper incisors strong 4
4	a	Noseleaf with 2 lateral leaflets; frontal depression of cranium well defined, maxillae elongated..... *pratti group*
	b	Noseleaf with 3 or 4 lateral leaflets; frontal depression of cranium lacking or shallow, maxillae not elongated 5
5	a	Noseleaf with upper edge of posterior leaf slightly lobate; posterior leaf narrower than horseshoe..... *armiger group*
	b	Noseleaf with upper edge of posterior leaf forming an arc or circle; posterior leaf equal in width to horseshoe 6
6	a	Ears with a small projection at the antitragal fold..... *speoris group*
	b	Ears without antitragal modification ..... *diadema group*
7	a	Posterior lateral leaflet not extending anteriorly beneath anterior leaflet onto upper lip; premaxillae wide posteriorly, forming a broad junction with palate; anterior palatal foramina enclosed 8
	b	Posterior lateral leaflet extending anteriorly beneath anterior leaflet onto upper lip; premaxillae narrow posteriorly, forming a narrow, spatulate junction with palate; anterior palatal foramina open posteriorly..... 9
8	a	Length of forearm 56–73 mm; antorbital foramen large compared to overall skull size ..... *Hipposideros cyclops* African Chiroptera name .....*Doryrhina cyclops*
	b	Length of forearm 74–76 mm; antorbital foramen small compared to overall skull size .....*Hipposideros camerunensis*
9	a	Median processes of intermediate and posterior leaves not greatly developed or especially club-shaped; craniumwithout frontal depression..... 10
	b	Median processes of intermediate and posterior leaves well developed, usually club-shaped; cranium with frontal depression..... 11
10	a	Posterior leaf lacking any posterior supplementary structure; rostral eminences not much inflated; rostral profile nearly flat; width of cochleae 4–5 times their distance apart; known only from eastern New Guinea..... *Hipposideros muscinus*
	b	Posterior leaf with a posterior supplementary structure, twin-walled, cellular; rostral eminences inflated; rostral profile concave; width of cochleae 6 or more times their distance apart; confined to western and central New Guinea *Hipposideros wollastoni*
11	a	Interorbital region wide; rostrum elongate; shallow sphenoidal depression present; width of cochleae ca. 4 times their distance apart; posterior ridge of M^3 reduced, N-pattern of tooth incomplete; m^3 with subrectangular posterior trigonid..... 12
	b	Interorbital region narrow; rostrum short; no sphenoidal depression; width of cochleae ca. 6 or more times their distance apart; posterior ridge of M^3 little reduced, N-pattern of tooth nearly complete; m^3 with triangular posterior..... 13
12	a	Dorsal fur color Hair Brown, ventral fur silver-tipped, hair on midback ca. 14 mm long; lower club-shaped process on noseleaf very long and tubular; Telefomin area, central New Guinea..... *Hipposideros corynophyllus*
	b	Dorsal fur color Prout's Brown with reddish tinge; ventral fur Cinnamon Rufus, hair on midback ca. 9 mm long; lower club-shaped process of noseleaf shorter and laterally flattened; near Imonda, northern central New Guinea ..... *Hipposideros edwardshilli*
13	a	Median process of posterior leaf large, club-shaped; skull larger (rostral width 5.6–6.3 mm), C–M^3 6.5–7.3 mm; cranial frontal depression shallow; rostral eminences greatly inflated; known only from eastern New Guinea and northeastern Queensland, Australia.....*Hipposideros semoni*
	b	Median process of posterior leaf tuberclelike, not especially club-shaped; skull smaller (rostral width 5.1 mm); C–M^3 5.6 mm; cranial frontal depression deep; rostral eminences moderately inflated; confined to Northern Territory, northwestern Australia, and northwestern Queensland, Australia.....*Hipposideros stenotis*

Appendix 5be: Bates et al. (2006). A description of a new species of Pipistrellus (Chiroptera: Vespertilionidae) from Madagascar with a review of related Vespertilioninae from the island.

1	a	Two upper premolars (P^2 and P^4 - Fig. 5). 2
	b	One upper premolar (P^2 - Fig. 9). 4
2	a	Long penis (> 9.0 mm), long baculum (> 8.0 mm), relatively large second upper incisor (I^3 = 2/3 the height of the bicuspid I^2), and larger first premolar (P^2 width > 10 % of C-M^3 length - Fig. 5). ..... *Pipistrellus raceyi*
	b	Short penis (< 6.0 mm), short baculum (< 3.0 mm), small second upper incisor [I^3 = 1/2 the height of the (usually) unicuspid I^2], and very small first premolar (P^2 width < 8 % of C-M^3 length) - (Fig. 5). 3
3	a	Baculum thin and curved (Fig. 10A); zygomata thin (Fig. 11A), and upper canine (C^1) not in contact with the second upper premolar (P^4) (Fig. 5B and 5Bi). ..... *Pipistrellus hesperidus*
	b	Baculum broader and not curved (Fig. 10B); zygomata more robust (Fig. 11B) and upper canine (C^1) (usually) in contact with the second upper premolar (P^4 - Fig. 5C). ..... *Hypsugo anchietae*
4	a	Forearm long (> 33 mm); skull large (CCL > 13.0 mm); baculum longer (> 2.7 mm). ..... *Neoromicia melckorum*
	b	Forearm shorter (= 33 mm); skull smaller (CCL < 12.5 mm); baculum shorter (< 2.5 mm). 5
5	a	Pelage paler; tibiae shorter (< 12.5 mm); baculum with relatively narrower shaft (Fig. 8B); narrow braincase (BB < 6.5 mm) and palate (M^3–M^3 < 5.4 mm). ..... *Neoromicia malagasyensis*
	b	Pelage darker; tibiae longer (= 12.5 mm); baculum with relatively broader shaft (Fig. 8A); broader braincase (BB > 6.5 mm) and palate (M^3–M^3 = 5.4 mm). ..... *Neoromicia matroka*

Appendix 5bf: Csorba (2008). Taxonomy of the horseshoe bats of the world (Chiroptera: Rhinolophidae).

1	a	Specimen from the Palaearctic Region. 2
	b	Specimen outside the Palaearctic Region. 6
2	a	Connecting process forming a continuous arch (Fig. 44.1) - pearsoni-group (*R. pearsoni*). 57
	b	Connecting process different. 3
3	a	Connecting process high and blunty rounded (Fig. 18.1) - *ferrumequinum*-group (*R. bocharicus, R. clivosus, R. ferrumequinum*). 36
	b	Connecting process different. 4
4	a	Connecting process pointed, triangular in profile (Fig. 7.1). 5
	b	Connecting process low, rounded, its tip pointed downwards (Fig. 29.1) - *hipposideros*-group. ..... *Rhinolophus hipposideros*
5	a	Sella wedge-shaped - landeri-group (*R. blasii*). 46
	b	Sella parallel sided - *euryale*-group. 27
6	a	Specimen from the Afrotropical Region. 7
	b	Specimen from the Indomalayan, Oceanian and Australalian Regions. 13
7	a	Anterior upper premolar (P^2) fully external, small or missing. 8
	b	Anterior upper premolar (P^2) in toothrow or at most half-external. 9
8	a	Sella hairy, connecting process low, forming a continuous arch (Fig. 26.1); general colour grayish - *fumigatus*-group. 44
	b	Sella naked, connecting process higher; general colour not grayish - *ferrumequinum*-group (*R. clivosus, R. darling, R. deckeni, R. hillorum, R. sakejiensis, R. silvestris*). 36
9	a	Sella widening at base; anterior median swellings bulbous. 10
	b	Sella normal; anterior median swellings moderate. 11
10	a	Connecting process very low, internarial septum expanded into a cup-like structure (Fig. 34.1) - *maclaudi*-group. 49
	b	Connecting process wel developed, internarial septum not expanded (Fig. 1.1) - *adami*-group. 23
11	a	Connecting process low, rounded its tip pointed downwards (Fig. 29.1); the anterior half of the zygomatic arch weak, almost parallel-sided (Fig. 29.2) - *hipposideros*-group. ..... *Rhinolophus hipposideros*
	b	Connecting process well developed, its tip pointed more or less forward; the zygomatat more robust, medio-laterally flattened. 12
12	a	Connecting process triangular in profile (Fig. 30.1) - *landeri*-group. 46
	b	Tip of connecting process rounded - *capensis*-group. 24
13	a	Sella with lateral projecting lappets at its base - *trifoliatus*-group. 75
	b	Sella lacking lateral basal lappets. 14
14	a	Connecting process pointed. 15
	b	Connecting process rounded, not pointed. 17
15	a	Anterior median swellings moderately low, protruding anteriorly (Fig. 8.2). 16
	b	Anterior median swellings higher, directing upwards (Figs 52.2, 61.1) - *pusillus*-group. 63
16	a	Sella parallel-sided - *euryale*-group (*R. mehelyi*). 27
	b	Sella wedge-shaped - *landeri*-group (*R. blasii*). 46
17	a	Connecting process low, rounded, its tip pointed downwards (Fig. 29.1); the anterior half of the zygomatic arch weak, almost parallel-sided (Fig. 29.2) - *hipposideros*-group. ..... *Rhinolophus hipposideros*
	b	Connecting process usually more developed, its tip pointed more or less forward; the zygomata more robust, medio-laterally flattened. 18
18	a	Connecting process forming a continuous arch or obsolete (Figs 10.1, 44.1). 19
	b	Connecting process not forming a continuous arch (Figs 37.1, 47.1). 20
19	a	Lower lip with one mental groove, internarial region not expanded - *pearsoni*-group. 57
	b	Lower lip with three mental grooves, internarial region expanded - *euryotis*-group. 28
20	a	Sella long and wide; palatal bridge more than 1/3 length of maxillary toothrow (CM^3 - *philippinensis*-group. 58
	b	Sella shorter and narrower, palatal bridge less than 1/3 length of maxillary toothrow (CM^3. 21

21 a Connecting process high and rounded (Fig. 18.1); anterior upper premolar (P^2) when present always minute and fully external to toothrow - *ferrumequinum*-group (*R. bocharicus, R. ferrumequinum*). 36
b Connecting process lower and rounded (Fig. 36.1); anterior upper premolar (P^2 larger, usually in row or slightly extruded, very rarely totally external. 22
22 a Lancet abruptly narrowed at centre, its lateral margins strongly concave - *rouxii*-group. 73
b Lancet triangular, lateral margins more or less straight - *megaphyllus*-group. 50
23 a Tip of lancet longer, with convex sides. ..... *Rhinolophus adami*
b Tip of lancet shorter, with nearly straight sides. ..... *Rhinolophus maendeleo*
24 a Skull length over 20 mm, CM^3 length over 7.2 mm. ..... *Rhinolophus capensis*
b Skull and toothrow length shorter. 25
25 a The sides of lancet straight or nearly so. ..... *Rhinolophus denti*
b The sides of lanced concave. 26
26 a Sella relatively broad, CM^3 length 6.3 - 7.0 mm. ..... *Rhinolophus simulator*
b Sella narrow, CM^3 length 5.8 - 6.7 mm. ..... *Rhinolophus swinnyi*
27 a The sides of lancet straight. ..... *Rhinolophus euryale*
b Lancet abruptly narrowing to a linear tip. ..... *Rhinolophus mehelyi*
28 a Base of lancet densely pilose. 29
b Base of lancet at most sparsely haired. 30
29 a Hairs at base of lancet forming a dense, bristly sub-conical tuft. *Rhinolophus creaghI*
b Hairs at base of lancet long, dispersed. ..... *Rhinolophus canuti*
30 a Lancet thickened and folded to form a vertical fissure enclosing rear of connecting process. 31
b Lancet not folded, rear of connecting process not enclosed. 32
31 a Width across anterior lateral swellings less than 5.5 mm, supraorbital ridges well developed (Fig. 11.3). ..... *Rhinolophus coelophyllus*
b Width across lateral swellings more than 5.5 mm, supraorbital ridgtes weaker. ..... *Rhinolophus shameli*
32 a Horseshoe with two parallel swollen ridges extending to internarial region and terminating in a small, tooth-like median projection. ..... *Rhinolophus euryotis*
b Horseshoe with only a narrow groove reaching less than halfway to internarial region. 33
33 a Forearm 66 - 74 mm, skull length over 28 mm. ..... *Rhinolophus rufus*
b Forearm maximum 57 mm, skull length shorter than 26 mm. 34
34 a Forearm 52 - 57 mm, CM^3 length 9.5 - 10.5 mm. ..... *Rhinolophus subrufus*
b Forearm under 53 mm, CM^3 length less than 9.9 mm. 35
35 a Skull length over 22.5 mm, CM^3 length 9.3 - 9.9 mm. ..... *Rhinolophus inops*
b Skull length shorter than 22.5 mm, CM^3 length shorter than 9 mm. ..... *Rhinolophus arcuatus*
36 a Specimen from the Palaearctic Region. 37
b Specimen from the Afrotropical Region 39
37 a Forearm over 53 mm, skull length over 20.5 mm. ..... *Rhinolophus ferrumequinum*
b Forearm under 53 mm, skull length under 20.5 mm. 38
38 a Specimen from Central Asia. ..... *Rhinolophus bocharicus*
b Specimens from North Africa and Arabia. ..... *Rhinolophus clivosus (part)*
African Chiroptera name ..... *Rhinolophus clivosus*
39 a Connecting process high, pointed or rounded (Fig. 18.1). 40
b Connecting process lower, rounded (Fig. 20.1) 42
40 a Skull length under 23 mm. ..... *Rhinolophus clivosus (part)*
African Chiroptera name ..... *Rhinolophus clivosus*
b Skull length over 23 mm. 41
41 a Connecting process pointed. ..... *Rhinolophus sakejiensis*
b Connecting process blunt. ..... *Rhinolophus hillorum*
42 a Horsehoe width more than 9 mm, skull length over 22 mm. 43
b Horseshoe width less than 9 mm, skull length under 21 mm. ..... *Rhinolophus darlingi*
43 a Sides of lance nearly straight. ..... *Rhinolophus deckeni*
African Chiroptera name ..... *Rhinolophus deckenii*
b Sides of lanced more or less concave. ..... *Rhinolophus silvestris*

44 a Forearm over 60.5 mm. ..... *Rhinolophus hildebrandti*
African Chiroptera name ..... *Rhinolophus hildebrandtii*
b Forearm under 60.5 mm. 45
45 a Skull length over 24.5 mm. ..... *Rhinolophus eloquens*
b Skull length under 24.5 mm. ..... *Rhinolophus fumigatus*
46 a Sella wedge-shaped, connecting process narrow and pointed. ..... *Rhinolophus blasii*
b Sella broadly rounded off above, connecting process a broadly-based triangle. ... 47
47 a Forearm 49 - 54 mm, skull length over 21 mm. ..... *Rhinolophus alcyone*
b Forearm under 49 mm, skull length shorter than 21 mm. 48
48 a Skull length over 19.3 mm. ..... *Rhinolophus guineensis*
b Skull length under 19.3 mm. ..... *Rhinolophus landeri*
49 a Skull length over 26 mm, mastoid width less or subequal to the zygomatic width. ..... *Rhinolophus maclaudi*
b Skull length less than 25 mm, mastoid width exceeds the zygomatic width. ..... *Rhinolophus ruwenzori*
African Chiroptera name ..... *Rhinolophus ruwenzorii*
50 a Skull length over 21 mm. ..... *Rhinolophus affinis*
b Skull shorter than 21 mm. 51
51 a Anterior rostral swellings very large, inflated, strongly elevated. 52
b Anterior rostral swellings moderate, less inflated. 53
52 a Posterior median swellings inflated, in profile median anterior swellings shallowly concave posteriorly; interorbital width over 2 mm. ..... *Rhinolophus malayanus*
b Posterior median swellings uninflated, in profile median anterior swellings very sharply concave posteriorly; interorbital width less than 2 mm. ..... *Rhinolophus stheno*
53 a Facial part of skull elongate, the supraorbital crest combining at a point behind the centre of the orbital cavity. ..... *Rhinolophus megaphyllus*
b Facial part of skull shorter, the supraorbital crest combining at a point above or in front of the centre of the orbital cavity. 54
54 a Skull length 20.87 mm, CM^3 8.50 mm. ..... *Rhinolophus nereis*
b Skull length less than 19.5 mm, CM^3 less than 7.5 mm. 55
55 a Noseleaf very small and narrow. ..... *Rhinolophus virgo*
b Noseleaf moderaten wider. 56
56 a Skull length usually over 18 mm, CM^3 length usually over 7 mm. ..... *Rhinolophus borneensis*
b Skull usually shorter than 18 mm, CM^3 length usually less than 7 mm. .. *Rhinolophus celebensis*
57 a Forearm 47 - 56 mm; skull length under 24.5 mm, CM^3 length less than 10 mm. ..... *Rhinolophus pearsoni*
b Forearm 51.5 - 64 mm; skull length over 24.5 mm, CM^3 length over 10 mm. ..... *Rhinolophus yunanensis*
58 a Internarial region not expanded, its width not exceeding that of the sella. *Rhinolophus macrotis*
b Internarial region expanded, much wider than sella. 59
59 a Lateral margins of internarial expansion passing beneath base of sella. 60
b Lateral margins of internarial expansion integral with margins of sella. 61
60 a Forearm more than 56 mm, CM^3 length over 8 mm. ..... *Rhinolophus rex*
b Forearm less than 57 mm, CM^3 less than 8 mm. ..... *Rhinolophus paradoxolophus*
61 a Internarial expansion trapezoid with projecting lateral wings. ... *Rhinolophus marshalli*
b Internarial expansion subcircular. 62
62 a Forearm 49 - 56 mm, skull length over 20 mm. ..... *Rhinolophus philippinensis*
b Forearm 43.5 - 46.0 mm, skull length 18.45 mm. ..... *Rhinolophus montanus*
63 a Forearm over 46 mm; CM^3 length over 20 mm. ..... *Rhinolophus acuminatus*
b Forearm under 46 mm; CM^3 length less than 19 mm. 64
64 a Lancet strongly rounded off, its outline convex. ..... *Rhinolophus convexus*
b Sides of lancet concave or nearly straight. 65
65 a Lancet long, its tip spatulate, connecting process always a long, narrow horn. 66
b Lancet shorter, its tip narrower, connecting process shorter, usually more triangular. 67
66 a Upper canines slender, posterior palatal emargination wider than anterior palatal emargination. ..... *Rhinolophus cognatus*

	b	Upper canines massive, posterior palatal emargination narrower than anterior palatal emargination. ..... *Rhinolophus imaizumi*
67	a	Upper canines long, wide-based, skull length over 17 mm; sagittal crest well developed in its full length. ..... *Rhinolophus shortridgei*
	b	Upper canines shorter, skull length usually under 17 mm; sagittal crest weaker posteriorly. 68
68	a	Forearm 41 - 46 mm, CM^3 length under 6 mm. ..... *Rhinolophus osgoodi*
	b	Forearm usually shorter, if longer than 41 mm the CM^3 length over 6 mm. 69
69	a	Rostrum narrower, M^3-M^3 width less than 5 mm. ..... *Rhinolophus subbadius*
	b	Rostrum wider, M^3-M^3 width over 5 mm. 70
70	a	CM^3 length usually over 6 mm. ..... *Rhinolophus lepidus*
	b	CM^3 length usually under 6 mm. 71
71	a	Specimen from Taiwan. ..... *Rhinolophus monoceros*
	b	Specimen outside of Taiwan. 72
72	a	Specimen from Japan. ..... *Rhinolophus cornutus*
	b	Specimen outside of Japan. ..... *Rhinolophus pusillus*
73	a	Upper canines small, CM^3 length 6.82 - 7.67 mm. ..... *Rhinolophus thomasi*
	b	Upper canines longer and stronger. 74
74	a	Specimen from Peninsular India and Sri Lanka; CM^3 length 7.88 - 9.24 mm. ..... *Rhinolophus rouxii*
	b	Specimen outside the above territories; CM^3 length 7.04 - 8.40 mm..... *Rhinolophus sinicus*
75	a	Forearm over 48 mm; skull length over 21 mm. 76
	b	Forearm under 49 mm, skull length less than 21 mm. ..... *Rhinolophus sedulus*
76	a	Noseleaf and ears yellowish; skull length under 25 mm. ..... *Rhinolophus trifoliatus*
	b	Noseleaf and ears dark brown or blackish; skull length usually over 25 mm. 77
77	a	Skull length usually over 28 mm; CM^3 length over 10.5 mm. ..... *Rhinolophus luctus*
	b	Skull length under 28 mm, CM^3 length usually under 10.5 mm. 78
78	a	Specimen from South India and Sri Lanka. ..... *Rhinolophus beddomei*
	b	Specimen from Taiwan. ..... *Rhinolophus formosae*

Appendix 5bg: Thorn and Kerbis Peterhans (2009). Small mammals of Uganda.

1	a	First and second digits both terminating in a claw. Tail membrane greatly reduced. Tail absent or much reduced. Cheek teeth simple without 'W' cusp pattern. Tragus always absent (MEGACHIROPTERA) (Pteropodidae). 8
	b	First digit only with a claw. Tail membrane well developed. Tail usually well developed (absent in one family). Cheek teeth with 'W' well developed cusp pattern. Tragus often present (MICROCHIROPTERA). 2
2	a	Tail visible. 3
	b	No visible tail (although posterior membrane may be extensive). Ears 30 - 45. No upper incisors (Megadermatidae) (Fig. 13L, 13M, pl. 3). ..... *Lavia frons affinis, Cardioderma cor*
3	a	Tail not completely included within tail membrane. 4
	b	Tail completely included within tail membrane. 6
4	a	Free terminal portion of tail emerges above the middle of the tail membrane and rests on the surface of tail membrane (basal part of tail included within tail membrane). Ears not fused nor closely positioned in the midline. One upper incisor on each side. Slender post-orbital process (Emballonuridae). 42
	b	Free terminal portion of tail projects well beyond the rear margin of tail membrane and is much longer than the tail membrane. 5
5	a	Free portion of tail very slender and long, much longer than tail membrane. Pair of discrete nasal swellings above and to the side of nasal opening (Rhinopomatidae). ..... *Rhinopoma sp.*
	b	Free portion of tail stout and short, not much longer than tail membrane. Ears mostly united in the midline or at least closely positioned. One upper incisor on each side. One or two lower incisors on each side (Molossidae). 79
6	a	Nose without fleshy superstructures and appendages or slits. Tragus present (Vespertilionidae). 44
	b	Nose region with fleshy superstructures or appendages or slits. Tragus absent or present. 7
7	a	Mid facial sagittal slit surrounded by fleshy structures. Ears meet in midline. Tragus present. Tail ends in a Y or T shape. Frontal region of skull concave/hollowed out (Nycteridae). 36
	b	Mid facial slit absent. Nose leafs with either erect tip, trident, or low and rounded horseshoe-like structure. Ears not fused in midline. Tragus absent. Tail does not end in a Y or T shape. Nasal region inflated (Hipposideridae). 22
	c	The top of the rhinarium "horsehoe" usually a rounded or squarish lobe (in a few species this bears a central and two side tall fleshy projections). The four outer toes have only two phalanges (Hipposideridea). 22
	d	The top of the rhinarium surmounted by a large triangular lobe. The four outer toes have three phalanges (Rhinolophidea). 30
8	a	Forearm (FA) 37 - 46; muzzle slender; tongue long with pointed and densely brushed tip; cheek-teeth extremely reduced (Fig. 5B). ..... *Megaloglossus woermanni*
	b	FA 47 - 137; tongue with rounded tip and not densely brushed; muzzle heavier; cheek-teeth not extremely reduced (Fig. 5A, C). 9
9	a	FA 47 - 56. 10
	b	FA 56 - 137 12
10	a	Facial pattern with both white nose spot and white eye patches, but basal white ear-tufts absent (Fig. 5L). 11
	b	Facial pattern not as above; basal white ear-tufts present FA 46 - 55; SK 28 - 31 (Fig. 5J) ..... *Micropteropus pusillus*
11	a	Post-dental palate present; FA 45 - 55; SK 24 - 27 (likely in Uganda). .. *Scotonycteris zenkeri*
	b	Post-dental palate absent; wings yellowish (Fig. 5L). ..... *Casinycteris argynnis*
12	a	Ear without basal white tuft; 5 upper and 6 lower post-canine teeth. 13
	b	Ear with basal white tuft (Fig. 5C). 3 upper and 5 lower post-canine teeth. 17
13	a	FA 109 - 130. ..... *Eidolon helvum*
	b	FA 54 - 106. 14

14 a FA 54 - 67; collar of stiff hairs in adult M SK 31 - 33; m^2 only about half size of m^1. ..... *Myonycteris torquatus*
African Chiroptera name ..... *Myonycteris torquata*
b FA 67 - 106; present or absent collar of stiff hairs in adult M SK 38 - 47; m^2 about same size as m^1. 15
15 a Wing attached to first (outer) toe; FA 85 - 106; adult M without stiff hair collar; cheek-teeth large, rectangular (Fig. 5E). ..... *Rousettus aegyptiacus*
b Wing attached to second toe; FA 67 - 93; stiff hair collar optional for adult M (Fig. 5D). 16
16 a Rear of braincase angled down from horizontal plane of toothrow; molars narrow and weak; FA 84 - 93 adult M without stiff hair collar (Fig. 5M). ..... *Rousettus lanosus*
African Chiroptera name ..... *Stenonycteris lanosus*
b Rear of braincase in line with tooth-row (from side-view (Fig. 5N)), molars large, rounded or squared; also FA 67 - 86, adult M with collar of stiff hair..... *Rousettus angolensis*
African Chiroptera name ..... *Myonycteris angolensis*
17 a FA 118 - 137; largest bat; adult lacks white shoulder-tufts; heavy horselike non-tapering muzzle, specially adult M (Fig. 5A). ..... *Hypsignathus monstrosus*
b FA 53 - 105; adult M with conspicuous white shoulder-tufts (Fig. 5C); muzzle tapers towards nostrils. 18
18 a FA 80 - 100; post-dental palate flat posteriorly, with 3 thick fleshy palate ridges between toothrows, followed by 5-6 less prominent thin, serrated curved ridges (Fig. 5K). ..... *Epomops franqueti*
b Post-dental palate concave posteriorly; with 4 thick inter-dental fleshy palate ridges, followed by 1 - 2 small post-dental ridges (Fig. 5F,G,H). 19
19 a FA 53 - 67; belly usually with pale patch. ..... *Epomophorus minimus*
b FA 67 - 93. 20
20 a 2 post-dental palate ridges, bony palate length of adult 59 - 68 % of greatest skull length; SK 83 - 94; FA 44 - 63; belly uniform gray (likely in Uganda). (Fig. 5G). ..... *Epomophorus gambianus*
b Bony palate length of adult 50 - 60% of SK. 21
21 a SK 37.5 - 48.6; 2 post dental palate ridges; FA 66 - 77; usually whitish patch on belly (Fig. 5C,H). ..... *Epomophorus labiatus*
African Chiroptera name ..... *Epomophorus labiatus*
b SK 44 - 55; 1 post dental palate ridge; FA 73 - 89; belly usually uniform (Fig. 5F). ..... *Epomophorus wahlbergi*
22 a With a round fleshy disk on the nose having an overhanging indented ledge on its upper part (but no midline forward-projecting "sails", nor nipple-like projections. .. 23
b Similar round fleshy nose disk but bearing at its top 3 nipple-like projections. 24
23 a Tail equals length of the hind legs, supporting a substantial tail-web. 25
b Tail and tail-web very much shorter than legs each side of it. 29
24 a Ear 10 - 15 long and pointed, FA 45 - 61 (Fig. 13F). ..... *Triaenops persicus*
b E 15 - 19 long and pointed, FA 49 - 55 (nearest, Kenya/Tanzania coast). *Asellia tridens*
c E 8 - 12, conspicuously round, FA 30 - 39 (nearest, Tanzania coast). *Cloeotis percivali*
25 a E 20 - 21 > half length, FA 37 - 39, ears joined across forehead (Kenya adjacent to Karamoja). ..... *Hipposideros megalotis*
b Ears separate and about one quarter to one third as long as FA. 26
26 a FA > 53. 27
b FA < 54. 29
27 a E >19, nose disk with 3 pairs of supplementary leaflets at sides, SK 22.5 - 24.2 ..... *Hipposideros abae*
b E < 19, disk with 2 pairs supplementary leaflets, SK 21 - 23.50..... *Hipposideros fuliginosus*
c SK < 20.5. 28
28 a SK 18 - 20.3; CM^3 6.4 - 7.1; nasal chambers large, FA 52 - 57 fur usually unicolor dark red-brown (Fig. 13C). ..... *Hipposideros ruber*
b SK 17 - 20.1; CM^3 5.2 - 6.6; M^2M^2 5.6 - 6.4; nasal chambers small, FA 48 - 55; fur usually bright unicolor orange-brown (Fig. 13B,B) ..... *Hipposideros caffer angolensis*
African Chiroptera name ..... *Hipposideros caffer*

c SK 16 - 18; CM^3 5.0 - 6.1; M^2M^2 5.2 - 6.0; nasal chambers small, p^1 / p_1 > half P^2 / P_2; FA 43 - 52, fur usually tricolor medium gray, or bright orange-brown. ..... *Hipposideros caffer caffer*
African Chiroptera name ..... *Hipposideros caffer*
d SK 17 - 18; CM^3 5.1 - 6.1; M^2M^2 5.2 - 6.0; nasal chambers small, P^1 / P_1 < half P^2 / P_2; FA 40 - 48; fur tricolour very dark gray-brown (Fig. 13A). ..... *Hipposideros beatus maximus*
African Chiroptera name ..... *Hipposideros beatus*

29 a T very short, supporting web, FA 85 - 112; SK 38 - 43 (likely in Uganda). ..... *Hipposideros gigas*
African Chiroptera name ..... *Macronycteris gigas*
b T short, FA 62 - 72; SK 27 - 30; CM^3 9.0 - 11.0; anteorbital fossa 7 - 15 diameter (Fig. 13D). ..... *Hipposideros cyclops*
African Chiroptera name ..... *Doryrhina cyclops*
c T short, FA 72 - 76; SK 29 - 32; CM^3 9.5 - 11.5; anteorbital 3 - 7 (Fig. 13E). ..... *Hipposideros camerunensis*

30 a Long transverse fleshy lobe projects from nose disk, quite separated from triangular peak above it; FA 53 (Fig. 13G). ..... *Rhinolophus ruwenzorii*
b Extended bilobed midline connecting-ridge from nose disk. 31

31 a Connecting-ridge front lobe rounded in profile. 32
b Connecting-ridge front lobe an erect point. 35

32 a FA 60 - 67; fur all dark brown; SK 26 - 28; CM^3 9.3 - 10.6 (likely in Uganda). ..... *Rhinolophus hildebrandti*
African Chiroptera name ..... *Rhinolophus hildebrandtii*
b Noseleaf as above, hairy; body smaller, paler. 33
c Noseleaf like above but nearly naked, body smaller and dark. 34

33 a FA 54 - 61; fur medium brown, occasionally orange; SK 22.5 - 27.0; CM^3 8.5 -9.7; usually forest edges (Fig. 13H). ..... *Rhinolophus eloquens*
b FA 47 - 55; fur medium brown; SK 22 - 24; CM^3 7.5 - 8.1; hairy noseleaf; usually open savanna (Fig. 13H). ..... *Rhinolophus fumigatus exsul*
African Chiroptera name ..... *Rhinolophus fumigatus*

34 a FA 49 - 55; medium to dark brown, SK 21.5 - 24.5; CM^3 7.8 - 8.6; M^3M^3 8.3 - 8.4; noseleaf near naked; usually forested hills (Fig. 13J). *Rhinolophus clivosus zuluensis*
African Chiroptera name ..... *Rhinolophus clivosus*
b FA 47 - 51; fur medium to dark brown; SK 20.0 - 21.9; CM^3 7.0 - 7.9; M^3M^3 8.0 - 8.3; noseleaf as above; usually open savannas (Fig. 13J). ... *Rhinolophus clivosus acrotis*
African Chiroptera name ..... *Rhinolophus clivosus*
c FA 48 - 55; fur as above; noseleaf as above; SK 23.0 - 23.3; CM^3 8.6 - 9.0; M^3M^3 8.8 - 9.1; (nearest, Kenya coast). ..... *Rhinolophus deckeni*
African Chiroptera name ..... *Rhinolophus deckenii*
d FA 43 - 50; noseleaf as above; SK 18.5 - 20.6; CM^3 7.1 - 7.8; C^1 touches large Premolar; M^3M^3 7.2 - 8.0; (nearest example from Serengeti,Tanzania). . *Rhinolophus darlingi*
e FA 40 - 49; noseleaf as above; SK 17.9 - 19.5; CM^3 6.3 - 7.0; M^3M^3 6.0 - 6.7; small p^1 between C^1 and large Premolar (likely in Uganda). ..... *Rhinolophus simulator*

35 a FA 50 - 53; noseleaf connecting-ridge has upper lobe an erect point; SK 23.0 - 24.0; CM^3 8.5 - 9.0; M^3M^3 8.3 - 8.8; small P between C^1 and large P; M often has glandular brush in armpit; bright orange brown phase is very common; forests. .... *Rhinolophus alcyone*
b FA 38 - 46; noseleaf as (a) above; SK 17.3 - 20.0; CM^3 6.4 - 7.0; M^3M^3 6.4 - 7.0; small P between C^1 and large P, often armpit brush, bright orange brown or gray-brown phases. ..... *Rhinolophus landeri*

36 a Posterior lower premolar large: equal, or close to the height of anterior cusp on m^1. Tragus with concavity at center of posterior margin, giving the tragus a 'constricted neck'. 37
b Posterior lower premolar small or minute: its height barely reaching the cingula of anterior premolar and first molar. Tragus without marked concavity at center of posterior margin of tragus (although there may be a concavity at the base of the tragus. 39

37 a FA 32 - 36.0; SK < 17.0. ..... *Nycteris nana*

	b	FA > 36.0; SK > 18.0 38
38	a	FA 36.5 - 46.0; SK 18.0 - 20.9 (likely in Uganda). ..... *Nycteris arge (includes N. intermedia)*
		African Chiroptera name ..... *Nycteris arge*
	b	FA 47.3 - 50.0; SK 21.0 - 22.5. ..... *Nycteris major*
		African Chiroptera name ..... *Nycteris macrotis*
39	a	Upper incisors trifid. Tragus semi-lunate, outer margin with smooth curve, broadest in the middle. 40
	b	Upper incisors bifid. Tragus pyriform or with flat top edge. 41
40	a	FA 37 - 41; SK 16.4 - 17.4. ..... *Nycteris hispida*
	b	FA 57 - 66; SK 23 - 25. ..... *Nycteris grandis*
41	a	Tragus the shape of upside-down pear (pyriform). Tragus with shallow notch at base of posterior margin. CM^3 6.2 - 7.0. ..... *Nycteris thebaica*
	b	Tragus with straight and + horizontal top edge, rectangular in appearance. Tragus without notch at base of posterior margin. CM^3 7.0 - 7.6. ..... *Nycteris macrotis*
42	a	FA 78 - 95; WSP 575 - 685; Blackish fur covers all parts of the head and body. ..... *Saccolaimus peli*
	b	FA 57-67; fur covers most of head and body. 43
	c	FA 61 - 69; fur above and below dark brown with pale roots, but narrow naked area on edge of rump and inguinal area; E 20, rounded, wing dark; SK 21 - 22 (likely in Uganda). ..... *Taphozous hamiltoni*
	d	FA 66 - 79; fur above and below medium gray-brown with white roots, but major naked areas across rump and flanks and lower belly; wing medium to dark brown; E 20 - 25 pointed; SK 24.5 - 26 0 (Fig. 23C). ..... *Taphozous nudiventris*
	e	FA 43 - 53; fur above and below medium to dark brown with paler roots; wings and ears pale; E 15 - 17; SK 16.5 - 18 (Fig. 23D). ..... *Coleura afra*
43	a	E. 19 - 21; SK 19 - 23; fur above grizzled with white tips and roots, below pure white except dark throat, wing with large pale area (Fig. 23B). ..... *Taphozous mauritianus*
	b	E. 17 - 20; SK 18.5 - 20; fur above dark brown with white roots, below pale gray; wing all dark. ..... *Taphozous perforatus haedinus*
		African Chiroptera name ..... *Taphozous perforatus*
	c	Similar to above except wing whitish (likely in Uganda). *Taphozous perforatus sudani*
44	a	Braincase very high above top of rostrum. 45
	b	Braincase slightly above top of rostrum or level with it. 4
45	a	2 pairs upper Incisors, 2 pairs upper Premolars ($p^{1,2}$, 3 pairs lower ($p_{1,2,3}$), Tragus long, wing tip folds directly under metacarpal, phalange 2 of 3, three times length of phalanx 1; Tragus short, curved (Genus *Miniopterus*). 55
	b	2 pairs upper Incisors; Tragus long; wing tip swings sideways; phalange 2 of 3 not very different from length of phalange 1. 46
46	a	3 pairs upper Premolars, 3 pairs lower Premolars; Tragus long; Ears stop behind eye above corner of mouth (Genus *Kerivoula*). 57
	b	1 pair upper Premolars; 2 pairs lower Premolars; Tragus short, round; lower rim of Ear curves around corner of mouth (Genus *Glauconycteris*). 61
47	a	3 pairs upper Premolars, 3 pairs lower P; Tragus long, slender (Genus *Myotis*). .. 65
	b	Less than 3 pairs upper, 3 pairs lower Premolars. 48
48	a	1 pair upper Incisors. 49
	b	2 pairs upper Incisors. 51
49	a	Skull with sharp backward projection of occipital/parietal suture = "helmet", 1 upper Premolar, front lower p_1 is half height rear P_2; Tragus long >7 mm, sickle shaped; Forearm > 40mm (Figs 23H, 26G) (Genus *Scotophilus*). 75
	b	2 pairs upper Premolars; Tragus fairly short; FA 28 - 38. 50
50	a	Thick Canines; first lower Premolar half height of second; SK 12.2 - 13.5; fur brown above, white below; FA 30 - 33 (Figs. 23G, 26F). ..... *Nycticeinops schlieffeni*
		African Chiroptera name ..... *Nycticeinops schlieffenii*
	b	Slender Canines; one obvious upper Premolar, sometimes with a minute Premolar inside the row touching Canine, 2 lower Premolars; Tragus short, rounded; Penis very long, 13 mm (Fig. 26E, Pl. 4) (Genus *Scotoecus*) 77

51 a Braincase very low and flat; HBBC 5.5; SK 14; XMST 8.5; one Premolar above, two Premolars below; wing very short and narrow, FA 26 - 29; metacarpal of 3 about 28 (Figs. 23J, 26H, Pl. 4).....*Mimitellus moloneyi*
African Chiroptera name .....Mimetillus moloneyi
b Wing not noticeably short or narrow..... 52
52 a Braincase slightly raised; one upper Premolar, two lowers; upper Incisors remote from small Canine; Ears over 18 mm (Fig. 23K). ..... Laephotis wintoni
b Outer upper Incisors near or touching Canine; Ear under 18. 53
53 a SK > 20; only one upper Premolar; occipital/parietal suture forms "helmet;" FA > 45 mm (likely in Uganda).....Eptesicus hottentotus
b SK < 20..... 54
54 a Usually with only one fairly big upper Premolar (Genus *Pipistrellus* - formerly called "*Eptesicus*") (Fig. 27) (*P. capensis, P. s. ugandae, P. guineensis, P. rendalli, P. grandidieri, P. tenuipinnis*, the last two sometimes have minute upper Premolar wedged between Canine and large Premolar, on one side or both. 67
b Usually with two upper Premolars, one large, and a tiny one wedged next to Canine *Pipistrellus* (part) *crassulus, P. hesperidus, P. rusticus, P. eisentrauti, P. nanulus, P. nanus* (also *P. rueppelli*) (Fig 27). Wing dark, fur below fairly dark specially at roots. 71
55 a FA 47 - 52; SK 16.0 - 17.0; HBBC 7.1 - 7.9 (Figs. 23E, 26A)..... *Miniopterus inflatus*
African Chiroptera name .....Miniopterus inflatus inflatus
b SK16.5 - 17.8; XMST 8.6 - 9.5; HBBC 7.6 - 8.1 (likely in Uganda).....Miniopterus africanus
c FA < 47..... 56
56 a XMST < 8.0. .....Miniopterus fraterculus
b XMST > 8.0; CM^3 5.6 - 6.0. ..... Miniopterus natalensis
c XMST 8.3 - 8.7; CM^3 6.3 - 6.7. ..... *Miniopterus schreibersi*
African Chiroptera name ..... Miniopterus schreibersii
57 a Tail web trailing edge with comb-like fringe of stiff hairs..... 58
b Tail web trailing edge with only irregular scattered soft hairs. 59
58 a FA 34 - 39; fur above reddish brown, below buff or whitish; SK 15.0 -16.1.. Kerivoula argentata
b FA 26 - 32; fur above dark gray brown, with whitish tips scattered or extensive; SK 11.5 - 13.5 (Fig. 23F).....*Kerivoula lanosa muscilla*
African Chiroptera name .....Kerivoula lanosa
59 a FA 32 - 35; SK >13.0; dark brown grizzled with whitish tips. 60
b FA 26 - 29; fur medium brown without grizzled tips (Fig. 26B). .... Kerivoula phalaena
60 a Lower outer Incisor unicuspid (others tricuspid); upper Incisors long; tragus with terminal pencil of hairs (likely in Uganda). .....*?Kerivoula smithi*
African Chiroptera name .....Kerivoula smithii
b Lower outer incisor tricuspid as others; upper incisor short (may be variation of *smithi*). ..... *?Kerivoula cuprosa*
African Chiroptera name ..... Kerivoula cuprosa
61 a Wing and tail web white, entirely covered with dark veins (reticulations); fur above without pale flank stripe; E 12 - 13, Pl. 5.....Glauconycteris variegata
b Wing and tail membrane white with sparse dark reticulation outlining bones of wing and tail; general fur color pale. Slightly paler below; E 13 - 15; FA 38 - 42; SK 13.2 - 14.6 (Fig. 23N) (likely in Uganda). .....Glauconycteris gleni
c Wing and tail membrane brown or blackish. 62
62 a Wing and tail membrane pale brown without dark reticulation; fur above medium brown with white flank stripe, below medium brown; E 8.0 - 14; SK 12.1 - 13.3. ..... Glauconycteris argentata
b Wing and tail web dark, body fur black with contrasting white flank stripes. FA < 42; SK < 13.5; E 13 - 16; (but Type of *G. egeria* is brown without spots) (Figs. 23M, 26C). ..... *Glauconycteris egeria (ssp?)*
African Chiroptera name ..... Glauconycteris egeria
c Wing and tail web dark, body fur brown, may have white spots or stripes. 63
63 a Fur color medium gray brown above and below (likely in Uganda). .... Glauconycteris poensis
b Fur color dark brown above and below. 64

64 a Often with white shoulder spots; FA 35 - 39 (Fig. 23L). ..... *Glauconycteris humeralis*
b Often with white shoulder spots and white flank stripe; FA 39 - 44. ..... *Glauconycteris alboguttatus*
African Chiroptera name ..... *Glauconycteris alboguttata*
65 a Wings bright orange with black spots; FA 52 - 59 (Pl. 5). ..... *Myotis welwitschii*
b Wings dark brown to blackish. 66
66 a FA 46 - 52; above and below fur tricolor, roots black, pale band, brown tips; SK 18.0 - 19.5. ..... *Myotis tricolor*
b FA 36 - 41; fur tips reddish brown above with black roots, whitish or buff below; SK 14.2 - 15.3 (Fig. 26D). ..... *Myotis bocagii*
67 a Wings white or buff. 68
b Wings dark brown or black. 69
68 a FA 27 - 32; SK 11.6 - 13.3; I^2 subequal to I^1; back fur dark; belly white tips over black roots, (Figs. 27D, 28H, J, M). ..... *Pipistrellus tenuipinnis*
African Chiroptera name ..... *Neoromicia tenuipinnis*
b FA 32 - 36; SK 13 - 14.2; I^2 as above; gray over whitish (Figs. 27F, 28H, J, M). ..... *Pipistrellus rendalli*
African Chiroptera name ..... *Neoromicia rendalli*
c FA 28 - 35; above gray with white grizzling; i^1 bifid; I^2 tiny (Figs. 27B, 28E, P). ..... *Pipistrellus rueppelli*
African Chiroptera name ..... *Pipistrellus rueppellii*
69 a FA 26 - 30; SK 11.3 - 11.9 (Figs. 27A, 28A, J, N). ..... *Pipistrellus guineensis*
African Chiroptera name ..... *Neoromicia guineensis*
b FA 2? - 36; SK >11.9. 70
70 a FA 27 - 32; SK 12.0 - 12.8; C^1C^1 3.1 - 3.8; SK even of older examples without "helmet" (see below); upper inner incisor often with medial secondary cusp, and sometimes with another cusp as well, outer upper incisor short but slightly longer and thinner than in capensis (see below) (Figs 27A, 28J, L). ..... *Pipistrellus ?somalicus ugandae*
African Chiroptera name ..... *Neoromicia somalica*
b FA 27 - 33; SK 12.0 - 13.7; C^1C^1 3.7 - 4.3; SK of older examples with parietal/occipital suture raised to form "helmet," outer upper incisor very stubby; inner incisor usually unicuspid, occasionally with minor secondary cusp inside (Figs 27A, 28J, K). ..... *Pipistrellus ?capensis garambae*
African Chiroptera name ..... *Neoromicia capensis*
c FA 31 - 36; SK 12.3 - 15.0; C^1C^1 4.4 - 4.7; braincase somewhat raised above rostrum, and rounded at back; rostrum rounded over the top; fur above pale brown without dark roots, below all whitish (likely in Uganda). ..... *Pipistrellus grandidieri*
71 a Upper outer incisor about $^2/_3$ length of upper inner incisor. 73
b Upper outer incisor short < $^1/_2$ length of inner. 72
72 a Upper inner incisors unicuspid; SK 12.5 - 14.0 (Figs. 27A, C, 28F, H, R). . *Pipistrellus hesperidus*
b Incisors as above; SK 10.9 - 12.2. ..... *Pipistrellus rusticus*
73 a SK > 12.0. 74
b SK 11.0 - 11.8; both upper incisors bifid; braincase slightly above rostrum; FA 24 - 31; fur very dark brown (Figs 27C, 28H, P). ..... *Pipistrellus nanulus*
c SK 11.3 - 12.4; braincase fairly high above rostrum; upper outer incisor fairly long unicuspid, inner often bifid; fur red-brown to medium brown with conspicuous black roots, ears dark (Figs. 27A, 28B, G, M). ..... *Pipistrellus nanus*
African Chiroptera name ..... *Neoromicia nana*
d Very like *nanus*, but ears pinkish, belly fur paler, sometimes has glands along tail, baculum different (likely in Uganda). ..... *Pipistrellus helios*
African Chiroptera name ..... *Neoromicia helios*
74 a SK 12.8 - 13.5; braincase hardly raised above rostrum; M^2M^2 5.7 - 6.2; FA 28 - 32; fur very dark brown (Figs. 27C, 28D, H, P). ..... *Pipistrellus crassulus*
African Chiroptera name ..... *Hypsugo crassulus*
b SK 13.5 - 15.0; braincase somewhat raised above rostrum, rostrum flat with edges forming nearly a diamond shape; M^2M^2 6.0 - 6.8; FA 30 - 36; very dark brown (Figs 27C, 28C, H, P, Q). ..... *Pipistrellus eisentrauti*
African Chiroptera name ..... *Hypsugo eisentrauti*

75 a FA 43 - 53; fur above dark brown, below pale grayish brown; SK 16.8 - 17.6; M^2M^2. 7.8 - 8.0. ..... *Scotophilus nigritellus*
African Chiroptera name ..... *Scotophilus viridis*
b FA 47 - 60; SK 18.0 - 21.0; M^2M^2 8.0 - 8.8..... 76
76 a Fur above dark olive-brown, usually with pale roots, below usually strong yellow or orange; FA 47 - 57; M^2M^2 8.1 - 8.8 (Figs. 23H, 26G)..... *Scotophilus dingani*
African Chiroptera name ..... *Scotophilus dinganii*
b Fur above and below dark brown; FA 52 - 62; M^2M^2 8.8 - 9.5. ..... *Scotophilus nux*
77 a Outer part of wing white or buff. ..... *Scotoecus albofuscus*
b Entire wing and tail web dark. 78
78 a FA 29 - 33 (F small, M big); medium brown above, gradually shading to pale mid belly; SK 12.5 - 14.0. ..... *Scotoecus hirundo*
b FA 32 - 38 (F small, M big); color as above, sometimes pure white stripe mid belly; SK 13.5 - 15.0 (Fig. 26E). ..... *Scotoecus hindei*
79 a Ear (E) 22- 42 extends beyond nostril when pressed forward; Forearm (FA) 56 - 74. 80
b E not surpassing nostril; FA < 60; Skull (SK) < 27.5. 82
80 a E > 32; tragus vestigial; FA > 62; back and belly fur in remarkable black and white patterns; SK about 27; zygoma with very high lobe (Fig. 42A). *Otomops martiensseni*
b E < 32; tragus large enough to be seen easily; FA 56 - 66..... 81
81 a Ears quite separated; fur above dark brown, white nape patch, below pure white; FA 56 - 63; SK 22.5 - 23.5 (Fig. 42D) (likely in Uganda). ..... *Tadarida lobata*
b Ears joined by fleshy bridge, tragus moderate in size; fur gray above and below; FA 57 - 66; SK 24.0 - 29.0 (Fig. 42E). ..... *Mops midas*
African Chiroptera name ..... *Mops (Mops) midas*
82 a Ears separate, not surpassing nostrils. 83
b Ears united by fleshy bridge, not surpassing nostrils. 87
83 a FA < 56. 85
b FA > 56. 84
84 a FA 56 - 62; overall gray or brown, irregular white midline below; SK 22.0 - 24.4; lower first premolar (P_1) half the height of P_2 (likely in Uganda). ..... *Tadarida fulminans*
b FA 61 - 66; similar; SK 23.5 - 26.0; P_1 and P_2 same height. ..... *Tadarida ventralis*
85 a FA 45 - 55; SK 18 - 22 (Fig. 42F). ..... *Tadarida aegyptiaca*
b FA < 40. 86
86 a Wing whitish; FA 33 - 37; ears pale and widely separated; fur above with dark brown tips, below white (Fig. 42B). ..... *Myopterus whitleyi*
b Outer half of wing and tail web pale, inner half dark, FA with sharp scales; fur above gray, below pure white (Fig. 42C) (likely in Uganda). ..... *Platymops setiger*
87 a FA < 32; dark with pale tip; fur above dark brown,below gray SK 15.5 - 17.3; front of palate notched. ..... *Mops nanulus*
African Chiroptera name ..... *Mops (Xiphonycteris) nanulus*
b FA > 32. 88
88 a Crown distinctly blackish; back dark brown, pale below with white axilar flank-stripe; FA 40 - 44; scent glands; SK 20 - 22 (Fig. 42M). ..... *Mops demonstrator*
African Chiroptera name ..... *Mops (Mops) demonstrator*
b Crown not distinctly different from back. 89
89 a Axilar flank-stripe black but belly pale gray; back and wings dark; FA 39 - 42; SK 17 - 21; front of palate notched (Fig. 42N). ..... *Mops thersites*
African Chiroptera name ..... *Mops (Xiphonycteris) thersites*
b Neither axilar stripe black, nor crown contrasting with back. 90
90 a Belly all pure white (or slightly orange); FA 34 - 41. 91
b Belly pale or dark but not pure white or pale orange. 92
91 a Belly all pure white/very pale orange (also see *M. demonstrator*, above); FA 35 - 39; SK 18.0 - 21; palate notched (Fig. 42Q). ..... *Mops brachypterus*
African Chiroptera name ..... *Mops (Xiphonycteris) brachypterus*
b Belly pure white, back pure gray or rust; FA 34 - 39; tall bicolored M brush; SK 15 - 17; palate usually entire, foramina large. ..... *Chaerephon chapini*
92 a Belly almost as dark as back, axilar flankstripe same color. 93
b Belly medium or pale, contrasting with back. 95

93 a Belly almost as dark as back, axilar stripe same; FA 52 - 59; SK 24.9 - 27.4; XIO > 8.0..... *Mops congicus*
African Chiroptera name ..... *Mops (Mops) congicus*
b FA < 54; SK < 25 (usually < 24); XIO < 6.0; body all dark. 94
94 a SK 23.5 - 25.1; palate not notched, slender M^3. .....*Mops trevori*
African Chiroptera name ..... *Mops (Mops) trevori*
b SK 20.4 - 22.1; palate not notched, big foramina; big M^3 (Fig. 42S).....*Chaerephon aloysiisabaudiae*
95 a Chin blackish contrasting with throat (sometimes in *C. aloysiisabaudiae*) too. 96
b Chin about same tone as throat and belly..... 97
96 a Head and shoulders with conspicuous pattern of white spots; FA 42.5 - 52; SK 19.3 - 25.0; palate not notched but large foramina, M^2M^2 > 8.4; M^3 large (Fig. 42K). ..... *Chaerephon bivittatus*
b Head and shoulders usually plain or a few random spots; FA 43 - 49; SK 18.3 - 20.6; palate usually notched, M^3 large; M^2M^2 < 8.4 (Fig. 42L).....*Chaerephon ansorgei*
97 a Axillar and belly pale brown; FA 42 - 47; SK 17.8 - 19.4 (likely in Uganda).*Chaerephon russatus*
b Axillar stripe white, contrasting with belly as dark as back; FA 44 - 51; SK 19.0 - 20.1 (Fig. 42R) (likely in Uganda). .....*Chaerephon nigeriae*
c Axilar stripe white but belly not white only paler than back..... 98
98 a Above dark brown, belly pale, midventral white; wings dark; FA 43 - 51; SK > 19.4; M^3 large (Fig. 42G). .....*Mops condylurus*
African Chiroptera name .....*Mops (Mops) condylurus*
b As above but SK < 19.4. 99
99 a Body color as *M. condylurus*; but wings pale or dark, FA 35 - 41; SK 15.6 - 17.0; dorsal profile sinuous, palate entire, no foramina (Fig. 42H). .....*Chaerephon pumilus*
b FA 39 - 48; SK 16.5 - 19.0..... 100
100 a Mid-abdomen pale patch extends unbroken to chest; wings pale or dark; FA 39 - 48; adult M noticeable glands each side of anus; SK 16 - 19; dorsal profile very flat, large foramina (Fig. 42J). ..... *Chaerephon major*
b Throat and mid-abdomen pale patches separated by dark zone; FA 41 - 48; SK 16.5 - 18.9; dorsal profile arched, palate notched (Fig. 42P). .....*Chaerephon bemmeleni*

Appendix 5bh: Rambaldini (2010). Glauconycteris variegata

1	a	Fur of face with white markings 2
	b	No markings present on fur of face 3
2	a	Dorsal and ventral fur black with white facial markings and shoulder spots or dorsolateral flank stripes or both; length of forearm > 45 mm. *Glauconycteris superba*
	b	Dorsal and ventral fur uniform brown with single white band along sides of face and on throat; dorsolateral flank stripe absent; length of forearm < 45 mm. ... *Glauconycteris kenyacola*
3	a	Dorsal or ventral fur extending onto parts of uropatagia or propatagia. 4
	b	No fur present on patagia. 7
4	a	Wing and tail membranes pale or brown and with conspicuous blackish-brown pigmentation of reticulated venation. 5
	b	Wing and tail membranes pale or dark brown and with faint or no pigmentation of reticulated venation. 6
5	a	Dorsal pelage bicolored and brown; wing and tail membranes dark and opaque. ..... *Glauconycteris machadoi*
	b	Dorsal pelage tricolored and pale; wing and tail membranes pale and translucent. ..... *Glauconycteris variegata*
6	a	Inner margin of tragus strongly curved; white shoulder spot and dorsolateral flank stripe present. ..... *Glauconycteris poensis*
	b	Inner margin of tragus straight; white shoulder spot and dorsolateral flank stripe not present. ..... *Glauconycteris argentata*
7	a	Dorsal and ventral fur overall pale clay or white; patagia pale white and translucent. ..... *Glauconycteris gleni*
	b	Dorsal and ventral fur brown or blackish brown; patagia brown, dark brown, or blackish brown and not translucent. 8
8	a	Inner margin of tragus concave. ..... *Glauconycteris egeria*
	b	Inner margin of tragus straight. 9
9	a	Dorsal hair tricolored and contrasting with blackish brown base, pinkish buff medial band, and umber or sepia terminal band. ..... *Glauconycteris curryae*
	b	Dorsal hair bicolored and less contrasting with blackish brown base and brown, sepia, or dark brown terminal band. 10
10	a	White shoulder spot conspicuous; 2 white dorsolateral flank stripes present. ..... *Glauconycteris alboguttata*
	b	White shoulder spot conspicuous or faint; dorsolateral flank stripes absent. 11
11	a	Ears grayish brown with long and narrow tragus. ..... *Glauconycteris beatrix*
	b	Ears yellowish brown with short and broad tragus. ..... *Glauconycteris humeralis*

Appendix 5bi: Bol et al. (2011). Introduction à l'inventaire des Chauves-souris (Chiroptères) de la ville de Maroua, Extrême-Nord Cameroun.

1	a	Second doigt terminé par une griffe, pavillon de l'oreille formant en cercle complet, tragus toujours absent, membrane interfémorale très réduite, queue absente ou rudimentaire: sous ordre des Mégachiroptères; famille des Ptéropodida. 2
	b	Second doigt dépourvu de griffe; pavillon de l'oreille ne formant pas un cercle complet, tragus généralement présent (absent dans deux familles); membrane interfémorale généralement bien développée; queue généralement bien développée (absent dans une famille): Sous ordre des Microchiroptères. 4
2	a	Absence de touffe blanche à la base des oreilles; grande taille, avant-bras 127.90 mm (M). Pelage jaunâtre ou brun jaunâtre ; queue réduit. .....*Eidolon helvum*
	b	Présence de touffe blanche à la base des oreilles et au niveau des épaules. 3
3	a	Palais présentant des sillons formant une tranchée médiane allant en se rétrécissant vers l'arrière, museau relativement large ; avant bras 46 mm (F). .....*Micropteropus pusillus*
	b	Deux sillons palataux en arrière de la dernière molaire, palais très long et étroit, quatrième sillon palatal situé à égale distance entre le troisième et le cinquième; avant-bras 74 - 79 mm (M) et 84 - 88 mm (F). ..... *Epomophorus gambianus*
4	a	Absence de feuillets nasaux ; queue complètement incluse dans l'uropatagium (famille des Vespertilionidae). 5
	b	Absence de feuillets nasaux; queue libre débordant l'uropatagium (famille des Molossidae). 10
5	a	Deux incisives supérieures de chaque coté. 6
	b	Une incisive supérieure de chaque coté. 7
6	a	Avant bras 34,8 mm (F), poils du corps unicolore de la base au sommet. .*Pipistrellus nanulus*
	b	Avant bras 30 - 33,2 mm (M) et 32,8 - 36,8 mm (F), poils du corps sombres à la base et pâle au somme. .....*Pipistrellus inexspectatus*
7	a	Avant bras supérieur à 45 mm. 8
	b	Avant bras compris entre 29 -33 mm. 9
8	a	Avant bras compris entre 49,7 - 49,8 mm (M) et 50,2 - 50,6 mm (F), ventre jaune. ..... *Scotophilus dinganii*
	b	Avant bras compris entre 48,35 - 50,25 mm (M) et 49,2 - 51,1 mm (F), ventre blanc et bande jaune entre les membres antérieurs et les membres postérieurs. ..*Scotophilus leucogaster*
9	a	Avant bras 28 - 30 mm (M), tragus court, ailes sombres et pelage du ventre blanchâtre. ..... *Scotoecus hirundo*
	b	Avant bras 32,6 - 35 mm (F), tragus court et en forme de demi lune. .....*Nycticeinops schlieffenii*
10	a	Avant bras supérieur à 40 mm, oreilles généralement conjointes. 11
	b	Avant bras généralement inférieur à 50 mm, présence d'une touffe post orale généralement bien développée. 13
11	a	Avant bras 42,40 mm (M). .....*Mops brachypterus* African Chiroptera name ..... *Mops (Xiphonycteris) brachypterus*
	b	Avant bras supérieur à 45 mm, crâne pourvu d'une crête sagittale. 12
12	a	Avant bras 45,79 - 49,11mm (M) et 46,39 - 49,71mm (F), couronne sombre mais pas comme l'arrière du corps; crâne avec une crête sagittale bien développée. .....*Mops condylurus* African Chiroptera name .....*Mops (Mops) condylurus*
	b	Avant bras 43,49 - 44,09 mm (M) et 42 - 42,60 mm (F), couronne aussi sombre que l'arrière du corps, crâne avec une crête sagittale peu développée. .*Mops niveiventer* African Chiroptera name .....*Mops (Mops) niveiventer*
13	a	Avant bras inférieur à 40 mm. 14
	b	Avant bras supérieur à 40 mm. 16
14	a	Avant bras 37,4 - 40,4 mm (M) et 38 - 41,3 mm (F), ailes blanc sombre, ventre sombre, bande blanche de part et d'autre du corps entre les ailes et les cuisses. .....*Chaerephon pumilus*
	b	Aile claire ou blanche, ventre blanc. 15

15 a Avant bras 34,9 mm, présence chez le mâle d'une longue couronne post oral doublement colorée (base sombre sommet claire), ventre blanc. *Chaerephon chapini*
b Avant bras 35,5 - 36,9 mm (M) et 33,41 - 34,59 mm (F), absence de bande blanche entre les membres supérieurs et les membres inférieurs. .... *Chaerephon leucogaster*
16 a Avant bras compris entre 40,8 - 44,5 mm (M) et 40,1 - 42,2 mm (F), oreilles reliées par une large bande, ventre dépourvu de bande blanche, ailes sombres. *Chaerephon nigeriae*
b Auréole de couleur blanche sur le ventre..... 17
17 a Avant bras 43,3 - 43,4 mm (M) et 42,1 - 42,8 mm (F), clapet triangulaire situé entre les oreilles, ligne blanche sur le ventre. ..... *Chaerephon major*
b Avant bras 41,30 mm, ventre blanc, ailes blanches. ..... *Chaerephon limbata*
African Chiroptera name ..... *Chaerephon pumilus*

Appendix 5bj: Patterson and Webala (2012). Keys to the bats (Mammalia: Chiroptera) of East Africa.

1	a	Claw present on D2 that is exposed on the edge of the wing (Fig. 4C) (Pteropodidae). 10
	b	No claw on the end of D2. 2
2	a	Uropatagium present; tail not visible, either within the membrane or emerging from it; no upper incisors; tragus forked (Megadermatidae - Fig. 7). 52
	b	Tail visible, either fully or partially enclosed in the uropatagium; upper incisors present; tragus (if present) unilobed. 3
3	a	Fleshy projections or ‘‘noseleaves’’ on the muzzle of the face. 4
	b	No fleshy projections or ‘‘noseleaves’’ on the muzzle of the face. 6
4	a	A deep longitudinal slit from the nostrils to the forehead, surrounded by fleshy projections on the muzzle oriented along its axis (Figs. 10B, D); tip of tail with Y-shaped cartilage visible through skin (Fig. 10C - Nycteridae). 60
	b	No deep longitudinal slit from the nostrils to the forehead, and any fleshy projections on the muzzle oriented perpendicularly to the muzzle (Figs. 5, 6); tip of tail without Y-shaped cartilage visible through skin. 5
5	a	Posterior noseleaf pointed or erect; three phalanges in each toe (Rhinolophidae - Fig. 5). 27
	b	Posterior noseleaf elliptical; two phalanges in each toe (Hipposideridae - Fig. 6).. 40
6	a	Tail fully enclosed in the uropatagium, with only the tip protruding from its margin. 7
	b	Tail entirely or partially free of the uropatagium (Fig. 11A). 8
7	a	Second phalanx of D3 of the wing approximately three times the length of the first phalanx, such that the wing can fold back on itself (Miniopteridae - Figs. 12, 14L). 93
	b	Second phalanx of D3 of the wing not more than twice the length of the first phalanx (Vespertilionidae - Figs. 13, 14). 97
8	a	Tip of the tail free of and emergent dorsally from the middle of the uropatagium; skull with a narrow finger-like postorbital process (Emballonuridae - Fig. 9) 54
	b	Tail entirely or partially free; skull without postorbital process. 9
9	a	Free end of the tail emerging from the trailing margin of the uropatagium, and extending little beyond it (Molossidae - Fig. 11). 68
	b	Free end of the tail long and whip-like, extending far beyond the uropatagium (Rhinopomatidae - Fig. 8). 53
10	a	Very small (FA 37 - 46 mm); slender muzzle; long tongue with dense brush at tip; cheek-teeth extremely reduced. ..... *Megaloglossus woermanni*
	b	Larger (FA > 47 mm); muzzle heavier; tongue not greatly elongated; cheek-teeth not reduced. 11
11	a	Facial pattern with white nose spot and white eye patches. ..... *Casinycteris argynnis*
	b	Facial pattern lacking white nose spot and eye patches. 12
12	a	White or yellow tuft of hair at the base of each ear; males typically with a white or yellow tuft of hair on the shoulders. 13
	b	No white or yellow tuft of hair at the base of each ear; males lacking a white or yellow tuft of hair on the shoulders (a collar of coarse hair on the neck present in some). 20
13	a	Smaller (FA , 60 mm; GLS , 31 mm); palate abruptly narrowed behind zygomatic processes; soft palate with longitudinal furrow bisecting transverse ridges, forked anteriorly. ..... *Micropteropus pusillus*
	b	Larger (FA . 60 mm; GLS . 31 mm); palate more smoothly tapered; soft palate without longitudinal furrow. 14
14	a	Larger (FA 118 - 137 mm); heavy head, muzzle not tapered; lacking white shoulder tufts. ..... *Hypsignathus monstrosus*
	b	Smaller (FA 53 - 105 mm); tapered head; adult males with conspicuous shoulder tufts. 15
15	a	Head round and snout blunt; two or more (up to seven) postdental ridges on soft palate, less robust than ridges between teeth. 16
	b	Head and snout elongate; one or two post-dental ridges on soft palate, differing little from inter-dental ridges. 17
16	a	Three palatal ridges on soft palate between cheek-teeth; two ridges behind cheek-teeth, with triangular projections. ..... *Epomops dobsonii* African Chiroptera name ..... *Epomophorus dobsonii*

b Four palatal ridges on soft palate between cheek-teeth; at least five ridges behind the cheek-teeth, these thin and serrated without triangular projections. *Epomops franqueti*

17 a Small (FA 53 - 67 mm); belly usually pale or whitish, strongly differentiated from darker collar on neck and chest (especially males); two post-dental ridges. ..... *Epomophorus minimus*

b Larger (FA 67 - 100 mm); belly and chest variable; one or two post-dental ridges. 18

18 a One post-dental palatal ridge; belly usually uniform. ..... *Epomophorus wahlbergi*

b Two post-dental palatal ridges; belly uniform or patchy. 19

19 a FA 80 - 88 mm (males) and 75 - 83 mm (females); ZB 25.5 - 27.4 mm (males) and 23.5 - 25.7 mm (females); belly uniformly grayish. ..... *Epomophorus crypturus*

b FA 66.7 - 80.3 mm (males) and 64.8 - 78.3 mm (females); ZB 21.6 - 25.3 mm (males) and 20 - 24 mm (females); usually whitish patches on belly.... *Epomophorus labiatus*

20 a Larger (FA > 109 mm). 21

b Smaller (FA < 109 mm). 23

21 a Tail not visible; no color contrast between dorsal fur and skin of the wings; fur of upper back and head distinctly more yellowish-reddish than darker fur of lower back. 22

b Short tail visible; clear demarcation between yellowish-brown fur of dorsum and naked black skin of wings; fur of upper back and head same color as fur of lower back. ..... *Eidolon helvum*

22 a Head deep reddish and belly orange; EL < 27 mm; from Pemba Island. ..... *Pteropus voeltzkowi*

b Head paler with mantle and belly yellowish; EL > 27 mm; from Mafia Islands. *Pteropus seychellensis*

23 a Stiff collar of hairs on neck, shoulders, and upper chest; reduced second upper molar (half the size of the first). 24

b Collar present or absent; second upper molar only slightly smaller than first. 25

24 a Larger (FA 66 - 75 mm) with a long and slender rostrum (muzzle); lacking lower third molar..... *Myonycteris relicta*

b Smaller (FA 55 - 67 mm) with shortened rostrum; rudimentary lower third molar. ..... *Myonycteris torquata*

25 a Larger (FA > 90 mm); dorsal pelage sparse between shoulders. ..... *Rousettus aegyptiacus*

b Smaller (FA < 90 mm); dorsal pelage not sparse between shoulders. 26

26 a TiL > 35 mm; no collar of stiff hairs in males; tail roughly 10 mm; braincase strongly deflected ventrally from axis of rostrum; premaxillaries not fused together; cheek-teeth very narrow. ..... *Stenonycteris lanosus*

b TiL < 35 mm; adult males with collar of stiff hairs; tail inconspicuous; braincase slightly deflected; premaxillaries fused; cheek-teeth broad. ..... *Lissonycteris angolensis* African Chiroptera name ..... *Myonycteris angolensis*

27 a Anterior upper premolar fully external and small or missing. 28

b Anterior upper premolar in toothrow or at most half-external. 33

28 a Sella hairy; connecting process low, forming a continuous arch; general color grayish (*fumigatus* group). 29

b Sella naked; connecting process high, bluntly rounded; general coloration not grayish (*ferrumequinum* group)..... 31

29 a FA > 61 mm; third metacarpal > 42 mm; breadth of horseshoe 12 - 15 mm; dark brown. ..... *Rhinolophus hildebrandtii*

b FA < 61 mm; third metacarpal < 42 mm; breadth of horseshoe < 11 mm; fur paler. 30

30 a GLS > 24.5 mm; breadth of horseshoe 11 mm. ..... *Rhinolophus eloquens*

b GLS < 24.5 mm; breadth of horseshoe 9.0 - 10.2 mm. ..... *Rhinolophus fumigatus*

31 a Connecting process high, pointed or rounded. ..... *Rhinolophus clivosus*

b Connecting process lower, rounded. 32

32 a Horseshoe width > 9 mm; GLS > 22 mm. ..... *Rhinolophus deckenii*

b Horseshoe width < 9 mm; GLS < 21 mm. ..... *Rhinolophus darlingi*

33 a Sella widening at base; anterior median swellings bulbous. 34

b Sella normal; anterior median swellings moderate. 36

34 a Connecting process very low; internarial septum expanded into a cup-like structure; lancet long, narrow terminally, and blunt (*maclaudi* group). 35

b Connecting process well developed; internarial septum not expanded; tip of lancet short, broad, with nearly straight sides..... *Rhinolophus maendeleo*

35 a Larger (FA > 55 mm; GLS > 24 mm). ..... *Rhinolophus ruwenzorii*
b Smaller (FA < 55 mm; GLS < 24 mm)..... *Rhinolophus hilli*
36 a Connecting process triangular in profile (*landeri* group). 37
b Connecting process rounded in profile (*capensis* group)..... 39
37 a Sella wedge-shaped, connecting process narrow and sharply pointed... *Rhinolophus blasii*
b Sella broadly rounded above, connecting process a broad-based triangle..... 38
38 a Larger (FA 49 - 54 mm; GLS > 21 mm). ..... *Rhinolophus alcyone*
b Smaller (FA < 49 mm; GLS < 19.3 mm)..... *Rhinolophus landeri*
39 a Sella broad, horseshoe width 7.0 - 8.3 mm, almost covering muzzle; EL 18 - 24 mm; CIL 17.2 - 19.2 mm..... *Rhinolophus simulator*
b Sella narrow, horseshoe width 6.8 - 7.4 mm, not covering muzzle; EL 15 - 20 mm; CIL 15.1 - 16 mm. ..... *Rhinolophus swinnyi*
40 a Posterior leaflet on noseleaf simple in outline, elliptical or rounded, not tridentate; ears separate or united by band; small upper premolar present (except in *H. megalotis*); FA 35 - 124 mm) (*Hipposideros*). 43
b Posterior leaflet of noseleaf tridentate; ears always separate; small upper premolar present or absent; FA 31 - 54 mm. 41
41 a Tip of tail projecting up to 7 mm beyond edge of uropatagium; ears large (18 - 20 mm), pointed; small upper premolar lacking. ..... *Asellia tridens*
b Tail not projecting from uropatagium; ears variable; small upper premolar present. 42
42 a Size very small (FA 31 - 35 mm); noseleaf small and inconspicuous; ears short and rounded; thumbs minute; zygoma typically shaped, not expanded. . *Cloeotis percivali*
b Size larger (FA 45 - 54 mm); conspicuous noseleaf; short but pointed ears (10 - 14 mm); normal thumbs; zygoma expanded into broad plate..... *Triaenops persicus* African Chiroptera name ..... *Triaenops afer*
43 a Size very small (FA 34 - 38 mm); ears very large (> 50% FA), linked at base by low fold across crown; small upper premolar absent. ..... *Hipposideros megalotis*
b Size larger (FA > 40 mm); ears smaller, not conjoined by integumentary fold; small upper premolar present. 44
44 a Central and posterior noseleaves each bearing a median clubshaped process; size large (FA 59 – 76 mm); ears narrow and pointed; prominent frontal gland in both sexes; dark woolly pelage distinctively frosted with gray tips. 45
b Noseleaf without club-shaped processes; size varied (FA 40 - 124 mm); ears variable, frontal gland variably present; pelage not dark woolly and frosted with gray. 46
45 a Smaller (FA 59 - 71 mm); antorbital foramen relatively large. ... *Hipposideros cyclops* African Chiroptera name ..... *Doryrhina cyclops*
b Larger (FA 74 - 76 mm); antorbital foramen relatively small..... *Hipposideros camerunensis*
46 a Size very large (FA 79 - 115 mm); ears very narrow and pointed; frontal gland in both sexes, opening by a vertical slit. 47
b Size moderate (FA 40 - 66 mm); ears broader and more rounded; frontal gland varied. 48
47 a Plagiopatagium and uropatagium uniformly dark; dorsal pelage darker with little or no contrast in dorsal coloration. ..... *Hipposideros gigas* African Chiroptera name ..... *Macronycteris gigas*
b Uropatagium, legs, and sometimes skin of forearms distinctly paler than plagiopatagium; dorsal coloration marked by contrasts, with a darker dorsal vest bordered in front, back, and ventrally by whitish markings, being purest white or cream in the armpit..... *Hipposideros vittatus* African Chiroptera name ..... *Macronycteris vittatus*
48 a Three secondary lateral leaflets alongside noseleaf; FA 58 - 66 mm; frontal gland in both sexes. ..... *Hipposideros abae*
b Two secondary lateral leaflets alongside noseleaf; FA 41 - 64 mm; frontal gland present or absent. 49
49 a Size larger (at least in East African populations), FA 59 - 64 mm; frontal gland absent. ..... *Hipposideros fuliginosus*
b Size smaller (FA 41 - 58 mm); frontal gland present in males, opening horizontally. 50
50 a Size smaller (FA 41 - 44 mm, rarely to 47); tail short (19 - 25 mm); pelage and facial skin dark gray. ..... *Hipposideros beatus*

b Size larger (FA 44 - 58 mm); tail longer (> 30 mm); pelage and facial skin paler gray or reddish. 51

51 a FA usually < 50 mm; pelage grayish (pale orange in bright phase); median posterior narial compartment narrow, with wide lateral inflations. ..... *Hipposideros caffer*

b FA usually > 50 mm; pelage brownish (rufous in bright phase); median posterior narial compartment wide, with narrow lateral inflations. ..... *Hipposideros ruber*

52 a Noseleaf longer than 15 mm, blunt on tip; tragus > 50 % EL. ..... *Lavia frons*

b Noseleaf shorter than 15 mm, rounded on tip; tragus < 50 % EL. .... *Cardioderma cor*

53 a Larger (FA 52 - 59 mm; GLS 15.5 - 19.4 mm); heavier teeth (breadth of second upper molar > 2 mm). ..... *Rhinopoma hardwickii*
African Chiroptera name ..... *Rhinopoma cystops*

b Smaller (FA 45 - 52.5 mm; GLS 14.2 - 16.2 mm); more delicate teeth (breadth of second upper molar < 1.9 mm). ..... *Rhinopoma macinnesi*

54 a FA generally > 80 mm; large with black pelage; gular sac in both sexes. *Saccolaimus peli*

b FA generally < 80 mm, smaller and paler; gular sac variably present. 55

55 a Small (FA < 56 mm; GLS < 19 mm); tragus tall and narrow, parallel-sided; no radio-metacarpal wing sac; three lower incisors. ..... *Coleura afra*

b Large (FA > 56 mm; GLS > 20 mm); tragus laterally expanded; wing sac present; two lower incisors (*Taphozous*). 56

56 a Frontal region of skull only weakly concave; rump and pygal areas at least partly naked; occipital "'helmet"' on skull more or less developed (Subgenus *Liponycterus*). 57

b Frontal areas of skull strongly concave; rump and pygal areas well haired; no occipital helmet on skull (Subgenus *Taphozous*). 58

57 a Smaller (FA 61 - 69 mm); slight but definite concavity in frontal region; hairless rump and pygal areas relatively small; occipital helmet poorly developed. ..... *Taphozous hamiltoni*

b Larger (FA 69 - 81 mm); frontal concavity virtually absent; hairless rump and pygal areas relatively large; occipital helmet well developed. ..... *Taphozous nudiventris*

58 a Gular sac present in males (sometimes also in females); whitish venter strongly contrasting with grizzled dorsal coloration. ..... *Taphozous mauritianus*

b Gular sac absent; venter paler than uniform dorsal coloration. 59

59 a Blackish or reddish beard-like throat patch variably developed in males; whitish or buffy venter; somewhat larger size (FA 60 - 70 mm) and longer ears (EL 18 - 21 mm). ..... *Taphozous hildegardeae*
African Chiroptera name ..... *Eidolon helvum helvum*

b No differentiated throat patch present; tan or brownish venter; slightly smaller (FA 57 - 67 mm) with shorter ears (EL 17 - 20 mm). ..... *Taphozous perforatus*

60 a Posterior lower premolar very small, tip reaching only to the cingulum of anterior premolar; upper incisors either bifid or trifid. 61

b Posterior lower premolar large, height about equal to anterior cusp of first molar; upper incisors bifid (Fig. 10K - *arge* group). 66

61 a Upper incisors trifid (Fig. 10L); tragus small, outer margin smooth, broadest at its mid-length (Fig. 10G - *hispida* group). 62

b Upper incisors bifid (Fig. 10K; tragus large, pear- or moonshaped, with a prominent kink in the outer margin (Fig. 10E). 64

62 a Size very large (FA 57 - 65 mm; GLS 24 - 27 mm); East African coastal forests (Fig. 10H). ..... *Nycteris grandis*

b Size moderate (FA 36 - 45 mm; GLS 15.3 - 18.4 mm); varied habitats including savannas. 63

63 a Size slightly larger (FA 37.3 - 44.5 mm; CBL 14.6 - 15.9 mm; maxillary toothrow 5.7 - 6.2 mm; mandibular toothrow 6.4 - 7.5 mm). ..... *Nycteris aurita*

b Size slightly smaller (FA 36 - 45 mm; CBL 13.2 - 15.0 mm; maxillary toothrow 4.8 - 5.8 mm; mandibular toothrow 5.4 - 6.6 mm) (Fig. 10G). ..... *Nycteris hispida*
African Chiroptera name ..... *Nycteris hispida*

64 a Tragus with squared or flattened tip; GLS > 18 mm (macrotis group). 65

b Tragus inverted pear-shaped or pyriform (Fig. 10J); GLS <= 20 mm. *Nycteris thebaica*

65 a Smaller (FA 36.1 - 41.9 mm; CBL 14.0 - 16.1 mm); fur of underparts pure white, with no trace of dark bases on the hairs; very rare. ..... *Nycteris woodi*

b Larger (FA 45 - 53 mm; CBL 16.4 - 19.6 mm); fur of underparts darker; common (Fig. 10I). ..... *Nycteris macrotis*

66 a Size small (FA 31 - 37 mm; CBL 12.8 - 14 mm; ZB 8.4 - 9.4 mm; width of braincase 6.5 - 7.4 mm; ML 9.2 - 10.7 mm; Fig. 10F). ..... *Nycteris nana*

b Size larger (FA 33.7 - 48.5 mm; CBL 14.6 - 18.8 mm; ZB 10.0 - 12.6 mm;width of braincase 7.3 - 9.0 mm;ML 10.1 - 15.9 mm). 67

67 a Slightly smaller (FA 33.7 - 38 mm; GLS 15.4 - 18.3 mm; CBL 14.6 - 15.7 mm; ZB 10.3 - 10.7 mm; ML 10.1 - 12.6 mm)..... *Nycteris intermedia*

b Slightly larger (FA 39 - 46 mm; GLS 18 - 20.3 mm; CBL 15.4 - 18 mm; ZB 10.8 - 12.6 mm; ML 12.1 - 14.2 mm); commonest of group (Fig. 10E). ..... *Nycteris arge*

68 a Large (FA > 57 mm); ears long (EL > 28 mm), conjoined on elongated snout; bicolored dorsal pelage. ..... *Otomops martiensseni*

b Large or small (FA < 66 mm); ears generally shorter (EL < 33 mm) and not joined on snout; unicolored dorsal pelage. 69

69 a Skull conspicuously flattened, depth of braincase less than one-third its width; anterior upper premolar reduced or absent; well-developed gular sac; wart-like granulations on forearm; ears widely spaced; upper lip lined with short stiff bristles. *Platymops setiger*

b Lacking the above combination. 70

70 a Ears widely separated; one pair of lower incisors; four upper cheek-teeth, the last (M^3) greatly reduced; ears and wing membranes translucent or whitish. *Myopterus whitleyi*

b Ears not widely separated, never translucent; generally two pairs of lower incisors; four or five upper cheek-teeth, the last about half the size of its neighbor; wing membranes varied. 71

71 a Inner margins of the ears coming together at the base, without a band of skin between them; posterior ridge of W-pattern on last upper molar nearly as long as the second (Fig. 11C - *Tadarida*). 90

b Band of skin between the inner margins of the ears at their bases; posterior ridge of W-pattern on last upper molar shorter. 72

72 a First upper premolar minute and outside axis of toothrow, bringing canine and posterior premolar nearly into contact; posterior ridge of last tooth of upper jaw short (<= half length of ridge next to it), little more than a stub (Fig. 11E); anterior palatal gap usually long, reaching back to level of canines (Fig. 11F - Mops). 81

b First upper premolar small but in line with canine and posterior premolar, separating them; posterior ridge of last upper molar about half as long as the second ridge; anterior palatal gap very short (Fig. 11G) or lacking, replaced by two post-incisive foramina (*Chaerephon*). 73

73 a Ears conjoined by triangular lappet of skin. ..... *Chaerephon major*

b Ears completely separated. 74

74 a Size larger (FA 41 - 53 mm). 75

b Size smaller (FA 32 - 43.3 mm). 80

75 a Paired caudal glands opening as slits on either side of the tail root below; FA 41 - 48 mm..... *Chaerephon bemmelini*
African Chiroptera name ..... *Chaerephon bemmeleni*

b Without such glands; FA 32 - 53 mm. 76

76 a White spots, stripes, or lateral bands. 77

b Without white markings. 78

77 a Color umber brown with variable pattern of white spots or short stripes arranged laterally on crown and sometimes also on shoulders or flanks; FA 46 - 52 mm. ..... *Chaerephon bivittatus*

b Conspicuous white ventrolateral band along flanks at juncture with membrane, contrasting with very dark brown color above and below; FA 45 - 51 mm. *Chaerephon nigeriae*

78 a Color umber brown; top of head, neck, and throat of males darker, almost black; FA 43 - 48 mm. ..... *Chaerephon ansorgei*

b Color uniformly russet brown; FA 42 - 53 mm..... 79

79 a Smaller (FA 42 - 46 mm). ..... *Chaerephon russatus*

b Larger (FA 51 - 53 mm). ..... *Chaerephon aloysiisabaudiae*

80 a FA 35 - 42 mm; males with long (13 - 14 mm) bicolored interaural crest (dark basally, pale distally); wings pale; venter pale with whitish band on mid-line of belly. ..... *Chaerephon chapini*

	b	FA 32 - 43 mm; males with short (<= 10 mm) unicolored (dark) interaural crest; wings dark or pale; color below variable, with or without white on mid-venter....*Chaerephon pumilus*
81	a	Size small (FA < 31 mm).....*Mops nanulus* African Chiroptera name .....*Mops (Xiphonycteris) nanulus*
	b	Size larger (FA > 34 mm)..... 82
82	a	Size large (FA > 60 mm; GLS 26 - 28 mm).....*Mops midas* African Chiroptera name .....*Mops (Mops) midas*
	b	Size smaller (FA 35 - 58 mm; GLS < 27.4 mm)..... 83
83	a	FA > 51 mm..... 84
	b	FA < 51 mm..... 85
84	a	Ears joined at base; FA 53 - 58 mm; deep chestnut coloration; wing membranes blackish brown above and a little paler below (bones appear dark). ... *Mops congicus* African Chiroptera name .....*Mops (Mops) congicus*
	b	Ears separated at base; FA 52 - 54 mm; dull cinnamon brown above with much paler pelage below; patagia and wing bones black above and much paler below (bones whitish). .....*Mops trevori* African Chiroptera name .....*Mops (Mops) trevori*
85	a	Male with scent gland at base of penis. .....*Mops demonstrator* African Chiroptera name .....*Mops (Mops) demonstrator*
	b	Male without such gland..... 86
86	a	FA 42 - 51 mm..... 87
	b	FA 34 - 41 mm..... 88
87	a	Crown darker than back; venter mainly white; skull with low or no sagittal crest; third commissure of last upper molar obsolete; deep basisphenoid pits. .*Mops niveiventer* African Chiroptera name .....*Mops (Mops) niveiventer*
	b	Crown not darker than back; little or no white on venter; skull with well-developed sagittal crest; third commissure of last upper molar present but reduced; shallow basisphenoid pits.....*Mops condylurus* African Chiroptera name .....*Mops (Mops) condylurus*
88	a	Underside brownish, with blackish flanks; larger (FA 36 - 41 mm).....*Mops thersites* African Chiroptera name .....*Mops (Xiphonycteris) thersites*
	b	Underside whitish or yellowish; smaller (FA 34 - 39 mm)..... 89
89	a	Skull with well-developed basisphenoid pits; crown of first upper premolar far surpassing cingulum of second premolar and canine. .....*Mops brachypterus* African Chiroptera name ..... *Mops (Xiphonycteris) brachypterus*
	b	Basisphenoid pits lacking; first upper premolar scarcely surpassing cingulum of second premolar and canine. .....*Mops bakarii* African Chiroptera name .....*Mops (Xiphonycteris) bakarii*
90	a	FA < 53 mm; braincase flat; lower canines widely separated at base. ..... *Tadarida aegyptiaca*
	b	FA > 55 mm; braincase deeper; lower canines more crowded..... 91
91	a	Ears very large, united along inner margins close to nostrils, projecting well beyond muzzle when laid forward; underside all white, except for flank stripe; skull (particularly rostrum) narrow. ..... *Tadarida lobata*
	b	Ears smaller, not joined at inner margin, barely projecting past muzzle when laid forward; underside not all white; skull and rostrum not slender. 92
92	a	Skull very broad and heavy (ZB 15.6 mm), especially in rostrum; GLS > 23.4 mm; FA 61 - 65 mm; underside mostly brownish. .....*Tadarida ventralis*
	b	Skull much less broad in rostral region (ZB 13.8 mm); GLS < 23 mm; FA 56 - 62 mm; underside with variable white band along ventral midline. .....*Tadarida fulminans*
93	a	Size small (FA < 42 mm; GLS < 14 mm; TiL < 16 mm). .....*Miniopterus minor*
	b	Size larger (FA > 41 mm; GLS > 14.5 mm; TiL > 16 mm). 94
94	a	Size large (FA 45 - 52 mm; GLS > 16 mm)..... 95
	b	Size smaller (FA 41 - 50 mm; GLS < 16 mm)..... 96
95	a	Metacarpal of D3 short, averaging 41.3 mm (39.3 - 43.2); post-orbital constriction narrow, averaging 3.8 mm (3.6 - 4.1)..... *Miniopterus inflatus*
	b	Metacarpal of D3 long, averaging 45 mm (41.8 - 47.7); postorbital constriction broad, averaging 4.1 mm (3.9 - 4.4)..... *Miniopterus africanus*
96	a	Size smaller (FA 41 - 46 mm; GLS 14.9 - 15 mm. .....*Miniopterus fraterculus*

	b	Size larger (FA 43 - 47 mm; GLS 15 - 15.5 mm). ..... *Miniopterus natalensis*
97	a	Ears funnel-shaped, with an indentation on the outer margin just below the tip; tragus long, narrow and sharply pointed; three premolars above and below; braincase markedly domed (*Kerivoula*). 123
	b	Ears not funnel-shaped and lacking an indentation on the trailing margin; tragus not sharply pointed; fewer premolars, or if 3/3, braincase not markedly domed. 98
98	a	Six upper and six lower cheek-teeth, the anterior-most pair in each series minute; fur long, reddish or brown (*Myotis*). 129
	b	Fewer cheek-teeth, fur never reddish. 99
99	a	Single upper incisor on each side; fur unicolored. 100
	b	Two upper incisors on each side; fur bi- or tricolored. 102
100	a	Size larger (FA > 40 mm); anterior and middle upper molars with W-pattern obsolescent; tragus long (> 7 mm) and tapering, sickle-shaped (Fig. 14O - *Scotophilus*). 138
	b	Size smaller (FA < 38 mm); two anterior molars with typical W-pattern; tragus variable but short. 101
101	a	Fur short; penis exceptionally long (13 mm); tragus broad, short and club-shaped (Figs. 14G–I); slender canines (*Scotoecus*). 135
	b	Fur longer, brown above, white below; penis shorter; tragus narrow, short and rounded (Fig. 14J); stout canines. ..... *Nycticeinops schlieffeni* African Chiroptera name ..... *Nycticeinops schlieffenii*
102	a	Two upper premolars on each side, the anterior one minute (*Pipistrellus* and *Hypsugo*). 115
	b	Single upper premolar on each side. 103
103	a	Wings very short and narrow; skull very flat and broad; tragus extremely short and blunt (Fig. 14F). ..... *Mimetillus moloneyi*
	b	Wings not narrow; skull not flattened; tragus not very short and blunt. 104
104	a	Rostrum short and broad; braincase very high; lower lip with posterior lobe; body frequently spotted, striped, or with reticulations on wing and tail membranes (*Glauconycteris*). 107
	b	Rostrum not shortened; braincase not elevated; lower lip normal; no body or wing patterns. 105
105	a	Ears (>16.5 mm) about half the length of the forearm (*Laephotis*). 128
	b	Ears much shorter than half the length of the forearm. 106
106	a	Large (FA > 45 mm); deep chocolate brown above frosted with tannish tips. *Eptesicus hottentotus*
	b	Small (FA < 40 mm); pelage variable (*Neoromicia*). 131
107	a	White markings on face; uniform brown fur with white band along sides of face and on throat. ..... *Glauconycteris kenyacola*
	b	No markings present on facial fur. 108
108	a	Dorsal or ventral fur extending onto uropatagium or propatagium. 109
	b	No fur present on membranes. 111
109	a	Wing and tail membranes reticulated with conspicuously pigmented venation; dorsal pelage pale yellow or gray and tricolored; membranes pale and translucent. ..... *Glauconycteris variegata*
	b	Wing membranes with faint or no pigmented reticulations; dorsal coloration and wing membranes varied. 110
110	a	Inner margin of tragus strongly curved (Fig. 14A); white shoulder spot and dorsolateral flank stripe present. ..... *Glauconycteris poensis*
	b	Inner margin of tragus straighter (Fig. 14E); white shoulder spot and dorsolateral flank stripe absent. ..... *Glauconycteris argentata*
111	a	Dorsal and ventral fur overall pale clay or white; patagia whitish and translucent. ..... *Glauconycteris gleni*
	b	Dorsal and ventral fur brown or blackish brown; patagia brown or dark, not translucent. 112
112	a	Inner margin of tragus concave (Fig. 14C). ..... *Glauconycteris egeria*
	b	Inner margin of tragus straight (Fig. 14B). 113
113	a	White shoulder spot conspicuous; white dorsolateral stripe present on each flank. ..... *Glauconycteris alboguttata*
	b	White shoulder spot conspicuous or faint; dorsolateral flank stripes absent. 114

114	a	Whitish shoulder spot present; ears yellowish brown; tragus short, broad, convex on outer margin, expanded at middle; TiL > 22 mm. ..... *Glauconycteris humeralis*
	b	Color of dorsum blackish brown without paler markings; ears grayish brown; tragus long, narrow; TiL < 22 mm. ..... *Glauconycteris beatrix*
115	a	Inner upper incisor entire..... 116
	b	Inner upper incisor at least weakly bifid. 118
116	a	Trailing margin of wing membrane whitish. ..... *Pipistrellus rusticus*
	b	Trailing margin of wing membrane blackish brown. 117
117	a	Skull less robust, especially in the rostrum, with lower occipital region; anterior upper premolar sometimes visible from the side. ..... *Pipistrellus aero*
	b	Skull more robust, especially in the rostrum, with elevated occipital region; anterior upper premolar never visible externally. ..... *Pipistrellus hesperidus*
118	a	Anterior upper premolar displaced medially, hidden from external view by canine and posterior upper premolar. 119
	b	Anterior upper premolar clearly visible from the side. 121
119	a	Tibia shorter than the femur; baculum enlarged distally; upper molars with a well-defined hypocone (rear inner cusp on an upper molar). ..... *Pipistrellus grandidieri*
	b	Tibia longer than the femur; baculum not distally enlarged; upper molars without distinct hypocone (Hypsugo). 120
120	a	Larger (FA 33.7 - 36.5 mm); higher braincase, frontals more elevated; supraorbital region expanded so that upper surface of rostrum assumes a pentagonal shape; posterior upper incisor more than half the length of the anterior incisor; lower incisors trifid. ..... *Hypsugo eisentrauti*
	b	Smaller (FA 27 - 32 mm); lower braincase; frontals less elevated; supraorbital region not expanded; posterior upper incisor half the length of the anterior incisor; lower incisors bifid. ..... *Hypsugo crassulus*
121	a	Smaller (FA < 31 mm; GLS < 12 mm); body large in proportion to FA; anterior premolar large, filling the triangular space between the canine and posterior premolar and separating them externally. ..... *Pipistrellus nanulus*
	b	Larger (FA > 32.4 mm; GLS > 13 mm); more proportionate body and wings; anterior premolar smaller, less extensive, bringing canine and posterior premolar closer. 122
122	a	Larger (M > 5.2 g; HBL > 43 mm; HF > 8 mm); pelage gray grizzled with white above and mostly whitish below. ..... *Pipistrellus rueppellii*
	b	Smaller (M = 5 g; HBL = 42 mm; HF = 6 mm); coloration unknown (sole specimen preserved in spirits). ..... *Pipistrellus permixtus*
123	a	Comb-like fringe of hooked, bristle-like hairs on posterior margin of interfemoral membrane. 124
	b	Interfemoral membrane without comb-like fringe. 125
124	a	Size large (FA 34 - 40 mm; GLS > 15 mm); dorsal pelage usually bright reddish chestnut, below whitish or buffy (never brown). ..... *Kerivoula argentata*
	b	Size smaller (FA 28 - 33.1 mm; GLS 11.7 mm); pelage brownish or grayish brown above and below. ..... *Kerivoula lanosa*
125	a	Larger (FA 30 - 36 mm); dorsal pelage grizzled. 126
	b	Smaller (FA 26 - 29 mm); dorsal pelage not grizzled. 127
126	a	Outer lower incisors with simple margins; upper incisors long; tragus long (Fig. 14N). ..... *Kerivoula smithii*
	b	Outer lower incisors trifid; upper incisors short; tragus short. ..... *Kerivoula cuprosa*
127	a	Fur uniformly light brown dorsally and ventrally; inner upper incisors simple. *Kerivoula phalaena*
	b	Fur dark brown at base with grayish-brown tips; inner upper incisors bifid. . *Kerivoula africana*
128	a	Larger (FA 37 - 40 mm); anterior edge of mesopterygoid fossa lying closer to tips of pterygoid hamulars than to posterior margins of third upper molar. *Laephotis wintoni*
	b	Smaller (FA 33 - 38 mm); anterior edge of mesopterygoid fossa lying closer to posterior margins of third upper molar than to tips of pterygoid hamulars.... *Laephotis botswanae*
129	a	FA < 44 mm; tragus blunt (Fig. 14K); pelage orange-rufous above..... *Myotis bocagii*
	b	FA > 47 mm. 130
130	a	Wing bones, flanks, and uropatagium parti-colored with rufous, contrasting sharply with blackish membranes of plagiopatagium; FA > 52 mm. ..... *Myotis welwitschii*

	b	Wings and uropatagium without a distinctive pattern of orange and black; FA < 55 mm..... *Myotis tricolor*
131	a	Wing membranes white, buff, or translucent..... 132
	b	Wing membranes dark. 133
132	a	Dorsal pelage blackish brown, belly with white tips over black roots; dorsum sharply contrasting with wings; FA 28 - 33 mm; GLS 12 - 13.2 mm.....*Neoromicia tenuipinnis*
	b	Dorsal pelage paler, less contrasting with belly and wings; FA 31 - 38 mm; GLS 13.5 - 13.8 mm..... *Neoromicia rendalli*
133	a	Tragus hatchet-shaped (sharp angle on posterior margin; Fig. 14T).*Neoromicia nana*
	b	Tragus not so sharply angled (e.g., Fig. 14P). 134
134	a	Cranial portion of skull not elevated; occiput with "helmet" formed by occipital and parietal bones. .....*Neoromicia capensis*
	b	Cranial portion of skull elevated above rostrum; without occipital helmet. *Neoromicia zuluensis*
135	a	Wings pale, white or buff between forearm and fingers and brown laterally; four upper cheek-teeth..... *Scotoecus albofuscus*
	b	Wing membranes dark; four to five upper cheek-teeth. 136
136	a	Smaller (FA 29 - 33.5 mm), with small cheek-teeth and skulls (GLS 12.5 - 14.3 mm); medium brown above, gradually paler to mid-belly..... *Scotoecus hirundo*
	b	Larger (FA > 32.2 mm, with larger cheek-teeth and skulls (GLS 15.5 - 16.0 mm); color as above, sometimes pure white on throat or belly..... 137
137	a	Smaller, GLS 13.5 - 15 mm; canine and cheek-teeth massive, canine-third molar length about 6.1 mm; mandible length about 11.5 mm.....*Scotoecus albigula*
	b	Larger, GLS 15.0 - 15.5 mm; canine and cheek-teeth less massive; canine-third molar length about 5.4 mm; ML about 10.3 mm. .....*Scotoecus hindei*
138	a	FA > 70 mm; GLS > 25 mm. .....*Scotophilus nigrita*
	b	FA < 60 mm; GLS < 25 mm. 139
139	a	Throat and belly pale (white, cream, or grayish); tragus short (8 - 9 mm); FA <= 51 mm; GLS <= 18 mm. ..... *Scotophilus viridis*
	b	Chest and belly variable (white, brown, or yellow); tragus long (> 9 mm); FA >= 48 mm..... 140
140	a	Light to medium brown on back, off-white to dirty brown on throat and belly. .....*Scotophilus leucogaster*
	b	Olive to dark brown above, yellow or medium brown on throat and belly..... 141
141	a	Olive brown above, bright yellow or orange-yellow below. ..... *Scotophilus dinganii*
	b	Dark brown above, medium brown on throat and belly.....*Scotophilus nux*

Appendix 5bk: Lanza et al. (2015). The bats of Somalia and neighbouring areas.

1	a	Key to suborders according to the previous classification and here reported only for historical purposes (but see O'Leary et al. 2013): suborders Megachiroptera and Microchiroptera. 2
	b	Skip suborders. 3
2	a	Second finger retaining an evident degree of indipendence from third and almost always clawed; humerus with trochiter and trochin small, the former never articulating with the scapula; angular process of mandible broad and low or practically absent; cheek-teeth simple, without well developed cusps; external ear simple with the margin forming complete ring; tragus absent (Megachiroptera). 13
	b	Second finger scarcely if at all independent from third and always claweless: humerus with trochiter and trochin large, the former often articulating with the scapula; angular process of mandible well developed, long and narrow; cheek-teeth with well developed cusps; external ear with the margin not forming a complete ring; tragus usually present (Microchiroptera). 4
3	a	Second finger always clawed in African species; margin of the ear conch forming a complete ring; cheek teeth simple without well-developed cusp pattern (Pteropodidae). 13
	b	Second finger clawless; margin of the ear conch not forming a complete ring; cheek teeth cuspidate, with generally clearly defined W-pattern. 4
4	a	Tragus present (small in Molossidae). 5
	b	Tragus absent. 12
5	a	Tail with terminal portion projecting to a marked degree free of uropatagium. 6
	b	Tail entirely enclosed within or entirely absent (a slight degree of terminal projection, up to 7 mm, occurs only in the Hipposideridae *Asellia*, but this should not lead to confusion with Emballonuridae, Rhinopomatidae or Molossidae since those families lack a noseleaf): upper incisives present or absent. 8
6	a	Free terminal portion of tail emerges above middle of upper surface of uroparagium (Emballonuridae). 36
	b	Free terminal portion of tail projecting considerably beyond hind margin of uropatagium. 7
7	a	Free portion of tail very slender and much longer than uropacagium (Rhinopomatidae, genus *Rhinopoma*). 34
	b	Free portion of tail stout, not appreciably longer than interfemoral membrane (Molossidae). 45
8	a	Tail absent; noseleaf present; upper incisors absent (Megadermatidae). 33
	b	Tail present; noseleaf present or absent; upper incisors present. 9
9	a	Muzzle without noseleaves. 10
	b	Muzzle with noseleaves (poorly developed in Nycteridídae, the only bats with tail tip ⊥-shaped). 11
10	a	Second phalanx of the third finger almost three times as long as the first phalanx of the same finger (Miniopteridae, genus *Miniopterus*). 55
	b	Second phalanx of the third finger not particularly lengthened (Vespertilionidae and Cistugidae). 57
11	a	Muzzle with a deep central longitudinal slit lined with fleshy dermal outgrowtb; tail tip ⊥-shaped) (Nycteridídae, genus *Nycteris*). 41
	b	Face with well developed noseleaves covering muzzle; tail tip not ⊥-shaped). 12
12	a	Posterior leaflet (lancet) of noseleaf subtriangular, with erect pointed tip; hallux with two, the other toes with three phalanges (Rhinolophidae - genus *Rhinolophus*)..... 19
	b	Posterior leaflet of noseleaf with upper edge either elliptical in outline, or tridentate; all the roes with two phalanges (Hipposideridae). 27
13	a	Ears with white basal tufts; shoulders of the adult male with a large glandular sac provided with a conspicuous hair tuft; post-dental palate strongly concave posteriorly; forearm length 53 - 100 mm (genus *Epomophorus*). 16
	b	Ears without white basal tuffs; shoulders of the male not as above; post-dental palate flattened posteriorly; forearm length 80 - 134 mm. 14

14 a Forearm length over 98 mm, generally 109 - 134 mm; dorsal fur restricted to a narrow median band, sharply demarcated from naked wing membranes; some specimens have a yellow to orange collar extending from the underside to the sides of the neck (genus *Eidolon*). ..... *Eidolon helvum*

b Forearm length up to 107 mm, but usually under 98 mm; dorsal fur not as above, collar always absent. 15

15 a Wing membrane originating from the first toe; tibia practically naked; throat of adult males without ruff of stiff hairs; forearm length 86 - 106 mm (exceptionally 82 and 107 mm; arithmetic mean = 89) (genus *Rousettus* - uncertain occurrence in Somalia). ..... *Rousettus aegyptiacus*

b Wing membranes originating from the second toe; tibia dorsally furred; throat of adult males with ruff of stiff hairs; forearm length 82 - 88 mm (exceptionally 72 and 90 mm; arithmetic mean = 85) (genus *Lissonycteris* - occurring in nearby areas).*Lissonycteris angolensis*
African Chiroptera name ..... *Myonycteris angolensis*

16 a Adults and subadults with one palatal ridge behind last molar (very young animals without any postdental palatal ridge); forearm length: ♂♂ 69 - 96, ♀♀ 65 - 91 mm. ..... *Epomophorus wahlbergi*

b Adults and subadults with two palatal ridges behind last molar (very young animals with only one post-dental palatal ridge); forearm length less than 80 mm..... 17

17 a Greatest skull length larger than 40 mm in ♂♂, than 36.5 in ♀♀ (uncertain occurrence in Somalia). ..... *Epomophorus labiatus*

b Greatest skull length smaller. 18

18 a x = -0.483 * zygomatic breadth + 0.588 * breadth of braincase + 0.331 * length of the upper tooth row (CM^3) larger than 87 ♂♂; x = -0.447 * zygomatic breadth + 0.780 * breadth of braincase + 0.246 * length of the upper tooth row (CM^3) larger than 116 ♀♀ (uncertain occurrence in Somalia). ..... *Epomophorus labiatus*

b x = smaller than 87 ♂♂; x = smaller than 116 ♀♀. ..... *Epomophorus minimus*

19 a Anterior upper premolar fully external, small, sometimes missing. 20

b Anterior upper premolar in toothrow or at most half-external. 24

20 a Sella hairy; connecting process relatively low forming a continuous arch. 21

b Sella naked; connecting process higher. 23

21 a Forearm length usually more than 60 mm (60 - 68 mm) (uncertain occurrence in Somalia). ..... *Rhinolophus hildebrandtii*

b Forearm length usually less than 60 mm (46 - 60.5 mm). 22

22 a Skull length (from occiput to front of canine) over 24.5 mm; forearm length 50.5 - 60.5 mm..... *Rhinolophus eloquens*

b SkuII length (from occiput to front of canine) under 24.5 mm; forearm length 46 - 60 mm..... *Rhinolophus fumigatus*

23 a Lancet with definitely concave sides; horseshoe 5.6 -8.3 mm width across, not covering the whole muzzle; connecting process relatively high and rounded, skull length (from occiput to front of canine) 18.06 (m = 20.72) 22.82 mm; forearm length under 45 mm. ..... *Rhinolophus clivosus*

b Lancet almost straight sided; horseshoe 9 -11 mm width across, covering the whole muzzle; connecting process semicircular; skull length (from occiput to front of canine) 22.56 (m = 23.35) 24.12 mm; forearm length 48 - 56 mm (occurring in nearby areas). ..... *Rhinolophus deckenii*

24 a Connecting process relatively low, rounded (sometimes very bluntly pointed in R. hipposideros); skull length (from occiput to front of canine) sometimes (in *R. hipposideros*) under 14.6 mm. 25

b Connecting process relatively well-developed and more or less triangular in profile; skull length (from occiput to front of canine) always over 17 mm. 26

25 a Forearm length 34 - 42 mm; skull length (from occiput to front of canine) under 14.6 mm (occurring in nearby areas). ..... *Rhinolophus hipposideros*

b Forearm length 40 - 49 mm; skull length (from occiput to from of canine) over 17 mm (occurring in nearby areas). ..... *Rhinolophus simulator*

26 a Lancet almost straight or only slightly concave sided; the ratio metacarpal of the 4th finger / first phalanx of the 4th finger length = 3 - 3.9; adult ♂♂ without axillary tuft of hairs. ..... *Rhinolophus blasii*

b Lancet usually with definitely concave sides; the ratio metacarpal of the 4th finger / first phalanx of the 4th finger length = 4.3 - 5.6; adult ♂♂ usually with a reddish axillary tuft of stiff hairs lying in a glandular sac. ..... *Rhinolophus landeri*

27 a Posterior leaflet of noseleaf simple in outline, elliptical or rounded, not tridentate; forearm length 32 - 115 mm (genus *Hipposideros*). 31

b Posterior leaflet of noseleaf tridentate; forearm length 31 - 54 mm. 28

28 a Tail projecting 1 - 7 mm beyond end of interfemoral membrane; ear length 16 - 20 mm; upper incisors not bifid; first upper premolar absent; zygoma abruptly expanded posteriorly, but height of expanded portion much less than distance between last molar and glenoid fossa (genus *Asellia*). 30

b Tail not projecting beyond end of interfemoral membrane; ear length 8 - 14 mm; upper incisors not or noticeably bifid; first upper premolar absent or present; zygoma slightly or greatly expanded. 29

29 a Size very mall, forearm length 30 - 39 mm; ear small, almost circular, its internal hedge entire, its length up to 10 mm, scarcely projecting above the level of the hair; noseleaf small and relatively inconspicuous; thumb minute; upper incisors not bifid; first upper premolar absent; rostrum less than half length of braincase; zygoma slightly expanded (genus *Cloeotis* - occurring in nearby areas). ..... *Cloeotis percivali*

b Size larger, forearm length 48 - 55.8 mm; ear larger, pointed, its internal hedge with a deep subapical indentation; its length 10 - 14 mm; noseleaf conspicuous, thumb normal; upper incisors noticeably bifid; first upper premolar present but functionless, very small and rarely absent; rostrum more than half length of braincase; zygoma greatly expanded throughout, but most conspicuously posteriorly, with the height of expanded portion equal to distance between last molar and glenoid fossa (genus *Triaenops*). ..... *Triaenops afer*

30 a Forearm length 41.9 - 49 mm; skull length (occiput to canine) 16 - 19 mm; condylocanine length 14 - 16 mm; zygomatic width 19 - 10.5 mm. *Asellia italosomalica*

b Forearm length 36 - 41 mm; skull length (occiput to canine) 14 - 15.6 mm; condylocanine length 12.5 - 13.5 mm; zygomatic width 6.6 - 8.3 mm (occurring in nearby areas). ..... *Asellia patrizii*

31 a Forearm length less than 40 mm (34 - 38 mm); ears very large. more than half length of forearm, linked at base by low fold of integument across crown; 1st upper premolar absent. ..... *Hipposideros megalotis*

b Forearrn length usually more than 40 mm; ears not obviously linked in any way; 1st upper premolar present. 32

32 a Forearm length more than 70 mm (78 - 115 mm). ..... *Hipposideros vittatus* African Chiroptera name ..... *Macronycteris vittatus*

b Forearm length less than 60 mm (40 - 55 mm). ..... *Hipposideros caffer*

33 a Noseleaf small, evenly rounded above, not more than 10 mm long; tragus less than half length of ear, with inner lob quadrate or rounded and outer lobe pointed (genus *Cardioderma*). ..... *Cardioderma cor*

b Noseleaf long, bluntly truncated at tip, about 20 mm long; tragus more than half length of ear, with both inner and outer lobes pointed (genus *Lavia*). ..... *Lavia frons*

34 a Tail nearly always shorter than the forearm; preorbital foramen dot-like. placed at the bottom of a large cavity; rostrum pentagonal shaped in a dorsal view; narial swellings hardly developed, always behind the level of the canines; sagittal crest prominently present; postpalaral ridge usually V-shaped; forearm length generally over 60 mm (57.3 - 71 mm) (occurring in nearby areas). ..... *Rhinopoma microphyllum*

b Tail generally longer than the forearm; preorbiral foramen dot-like, but almost superficial; rostrum triangular shaped in a dorsal view: nasal inflation of skull moderately or well developed (anterior most point of the narial swelling behind the level of the canines or at the level of the canine); forearm length generally under 70 mm (minimum 46 mm). 35

35 a Anterior most point of the narial swelling behind the level of the canines. *Rhinopoma cystops*

b Anterior most point of the narial swelling at the level of the canines. ..... *Rhinopoma macinnesi*

36 a Tragus expanded laterally, not parallel-sided, about a broad as long; radio-metacarpal pouch present; sometimes scarcely developed; glandular throat pouch present or absent; four lower incisors, large and permanent; two upper incisors, very minute and often absent in old individuals; forearm length rarely a little less than 58 mm (genus *Taphozous*). 37

b Tragus tall and narrow, parallel-sided: radio-metacarpal pouch and throat pouch absent; six lower incisors, small and apparently often deciduous in old individuals; two upper incisors, small but well-developed and permanent;·forearm length no more than 57.5 mm (genus *Coleura*)..... *Coleura afra*

37 a Forearm length 66 - 82 mm, usually exceeding 70 mm; greatest skull length (occiput to canine) 26 - 28 mm; relatively broad, almost hairless rump and pygal areas (character sometimes only scarcely evident in dry skins)..... *Taphozous nudiventris*

b Forearm length not exceeding 70 mm; greatest skull length (occiput to canine) at least 19 mm, up to 25 mm; rump and pygal areas hairy (relarively small, semi-naked rump and pygal areas only in *T. hamiltoni*). 38

38 a Entire ventral surface pure white; entire dorsal fur conspicuously grizzled greyish or brown; forearm length 57 - 66 mm; no papillae on the inner edge of ear. ..... *Taphozous mauritianus*

b Ventral surface either dusky or only partially white; dorsal fur never grizzled, either unicolor brownish or white-based with brownish tips; forearm length 57 - 70 mm; papillae on the inner edge of the ear present or absent. 39

39 a Adult males with conspicuous blackish brown, beard-like throat patch contrasting strongly with pale ventral surface; females with slight blackish wash on throat; wings whitish; underside often pure white except for throat area; forearm length 63 - 70 mm; papillae on inner edge of the ear absent (occurring in nearby areas). ..... *Taphozous hildegardeae*

b No blackish throat patch in the adult males; underside usually dusky, not whitish; wings either whitish or dark; forearm length 57 - 69 mm; papillae on the inner edge of the ear present or absent. 40

40 a Both sexes with a conspicuous almost hairless gular area; small, almost hairless rump and pygal areas; body and wings very dark; skull very broad and heavily built; forearm length 61 - 71 mm; no papillae on the inner edge of ear (uncertain occurrence in Somalia). ..... *Taphozous hamiltoni*

b Gular, rump and pygal areas hairy; wings dark or pale, body paler; skull not as above; forearm length 57 - 67 mm; a series of minute papillae on the inner edge of ear. ..... *Taphozous perforatus* African Chiroptera name ..... *Taphozous perforatus perforatus*

41 a Upper incisors trifid (at least the internal ones; caution with worn down teeth!); tragus small. 42

b Upper incisors bifid (caution with worn down teeth!); tragus large. 43

42 a Average size slightly larger; forearm length 37.3 - 45.3 mm; condylobasal length 14.6 - 16.3 mm; length of the upper tooth row (CM^3) 5.7 - 6.55 mm; length of the lower tooth (CM_3) 6.4 - 7.5 mm. ..... *Nycteris aurita*

b Average size slightly smaller; forearm length 33.5 - 43.9 mm; condylobasal length 12.8 - 15.7 mm; length of the upper tooth row (CM^3) 4.6 - 6.7 mm; length of the lower tooth row (CM_3) 5.1 - 7.6 mm. ..... *Nycteris hispida*

43 a Tragus with squared or flattened top; baculum more than 3 mm long, its apex expanded and trifid, with three variably developed processes. 44

b Tragus with rounded, pear shaped top; baculum (n = 14) 2.49 - 3.50 mm long), usually less than 3 mm long, its apex slightly expanded and simple. ..... *Nycteris thebaica*

44 a Size larger: forearm length 39.9 - 54.8 mm; condylocanine length 16.3 - 20.6 mm; length of upper tooth row (CM^3) 5.6 - 8.2 mm; baculum (n = 9) 3.84 - 5.12 mm long, its shaft usually straight, sometimes ventrally concave in lateral profile. *Nycteris macrotis*

b Size smaller: forearm length 38.0 - 43.0 mm; condylocanine length 14 - 15 mm; length of upper tooth row (CM^3) 5.6 - 6.0 mm; baculum (n = 1) 4.30 mm long, its shaft ventrally concave in lateral profile. ..... *Nycteris parisii*

45 a Size relatively small to large, forearm length 49 - 73 mm, ears very large, their length 38 - 40 mm, meeting on the protruding pig-like snout; conspicuous bicolored dorsal pelage pattern, with pale collar separating dark anterior and posterior regions of body (genus *Otomops* - occurring in nearby areas). ..... *Otomops martiensseni*

b Not combining the above characters..... 46

46 a Skull conspicuously flattened, greatest depth of braincase no more than one-third of greatest width (genus *Platymops* - occurring in nearby areas).....*Platymops setiger*

b Skull not conspicuously flattened. 47

47 a Third upper molar reduced, its commissures forming a V-shaped pattern (i. e. with only first and second commissure) or; in *Mops condylurus* an N pattern (i. e. with first, second and a variably developed third commissure, which is usually clearly shorter or much shorter than the second commissure however usually less than half of length of second commissure); usually rather well-developed sagittal and lambdoid crests; ears joined above bridge of nose by a band of folded skin; size small to large, forearm length 29 - 66 mm (genus *Mops* [Owing to the difficulty to distinguish between *Mops* and *Chaerephon* it is always advisable to look at the descriptions and iconographic of all the members of the two genera])..... 52

b Third upper molar not or slightly reduced, its commissures not always forming a clear N-shaped pattern (i.e. with first, second and a full developed third commissure), however, with third commissure usually greater than half of length of secondcommissure; usually less developed sagittal and lambdoid crests; ear separate or conjoined; size medium to large, forearm length 35 - 100 mm..... 48

48 a Anterior palatal emargination absent or rudimentary, its width always less than diameter of upper incisors; ears joined above bridge of nose by a band of folded skin; forearm length 32 - 53 mm (genus *Chaerephon* [Owing to the difficulty to distinguish between *Mops* and *Chaerephon* it is always advisable to look at the descriptions and iconographic of all the members of the two genera]). 49

b Anterior palatal emargination well-developed, about as large as base of canine, wider posteriorly than between incisors; ears just meeting above bridge of nose bur not joined by a band of skin; forearm length 45 - 100 mm (genus *Tadarida* - occurring in nearby areas). 54

49 a Size smaller; forearm length 32 - 42 mm, greatest skull length 15 - 18.1 mm; wings and uropatagium light or dark. .....*Chaerephon pumilus*

b Size larger; forearm length 44 - 51.7 mm, greatest skull length 18 - 21.3 mm; wings and uropatagium light or dark. 50

50 a Upper parts greyish-, umber- or reddish-brown, with variable pattern of white spots or short stripes arranged laterally on crown and sometimes also on flanks and shoulders; wings and uropatagium dark brown. 51

b Upper parts very dark brown, without spots or stripes; wings and uropatagium off-white (occurring in nearby areas).....*Chaerephon nigeriae*

51 a On average larger; forearm length 47 (m = 49.6) 51.7 mm (♂♂) and 46.3 (m = 49.2) 51.3 mm (♀♀); greatest skull length 20 (m = 20.8) 21.3 mm (♂♂) and 19.5 (m = 20.1) 20.8 mm (♀♀); zygomatic width 12 (m = 12.6) 13.1 mm (♂♂) and 11.7 (m =12.2) 12.8 mm (♀♀); mastoid width 11.3 (m = 11.7) 12.2 mm (♂♂) and 11 (m = 11.5) 11.9 mm (♀♀); upper toothrow length 7.3 (m = 7.6) 8 mm (♂♂) and 7 (m = 7.4) 7.7 mm (♀♀); lower toothrow length 7.7 (m = 8.3) 8.7 mm (♂♂) and 7.5 (m = 8) 8.5 mm (♀♀). Darker wings, more spotting of the dorsal pelage, and less contrast between the abdomen and the dark throat (occurring in nearby areas)..... *Chaerephon bivittatus*

b On average smaller; forearm length 44.4 (m = 46.2) 48.3 mm (♂♂) and 43 (m = 45.8) 47.9 mm (♀♀); greatest skull length 19.1 (m = 19.8) 20.5 mm (♂♂) and 18.6 (m = 19.4) 20.3 mm (♀♀); zygomatic width 11.1 (m = 11.8) 12.2 mm (♂♂) and 11 (m = 11.4) 12.2 mm (♀♀); mastoid width 10.2 (m = 12.08) 11.2 mm (♂♂) and 10.2 (m = 10.7) 11.1 mm (♀♀); upper toothrow length 7 (m = 7·3) 7.7 mm (♂♂) and 6.8 (m = 7.2) 7.6 mm (♀♀); lower toothrow length 7.4 (m = 7.8) 8.2 mm (♂♂) and 7.3 (m = 7.6) 8.1 mm (♀♀). Paler wings, less spotting of the dorsal pelage, and more contrast between the abdomen and the dark throat (occurring in nearby areas). ..*Chaerephon ansorgei*

52 a Size larger, forearm length 57 - 66 mm; greatest skull length 26 - 28 mm; third commissure of M^3 lacking. .....*Mops midas*
African Chiroptera name .....*Mops (Mops) midas*

b Size smaller, forearm length 31 - 50 mm; greatest skull length less than 24 mm; third commissure of M^3 well developed or lacking. 53

53 a Size larger, forearm length 43 - 51 mm; greatest skull length 20 - 23 mm; third commissure of M^3 well developed (Fig. 202). ..... *Mops condylurus* African Chiroptera name ..... *Mops (Mops) condylurus*
b Size smaller, forearm length 31 - 38 mm; greatest skull length 18 mm, third commissure of M^3 extremely reduced (occurring in nearby areas). *Mops brachypterus* African Chiroptera name ..... *Mops (Xiphonycteris) brachypterus*
54 a Forearm 60.8 - 66 mm long (occurring in nearby areas). ..... *Tadarida ventralis*
b Forearm 42 - 56 mm long (occurring in nearby areas). ..... *Tadarida aegyptiaca*
55 a Size small, forearm length no more than 40 mm, condylobasal length 13 - 14 mm (occurring in nearby areas). ..... *Miniopterus minor*
b Size larger, forearm length more than 40 mm; condylobasal length 13.6 - 17 mm. 56
56 a Size larger, forearm length 45 - 51 mm, condylobasal length 15 - 17 mm. *Miniopterus inflatus*
b Size smaller, forearm length 42 - 50 mm (usually < 45 mm), condylobasal length 14 - 16 mm (occurring in nearby areas). ..... *Miniopterus schreibersii sensu lato* African Chiroptera name ..... *Miniopterus schreibersii*
57 a Wing extremely narrow, third digit shorter than head and body length; tragus extremely short and blunt; skull remarkably flat and broad (genus *Mimetillus* - occurring in nearby areas)..... *Mimetillus moloneyi*
b Not as above 58
58 a One upper incisor on each side (very rarely two upper incisors in *Nycticeinops*)... 59
b Two upper incisors on each side. 61
59 a Larger size; forearm length more than 45 mm (genus *Scotophilus*). 72
b Smaller size; forearm length less than 40 mm. 60
60 a Anterior lower premolar about half the crown area of the next premolar; upper canine with rounded anterior face; tragus almost half-moon-shaped; rostrum not broadened; palatal emargination well-developed but relatively narrow; penis not particular long (genus *Nycticeinops*). ..... *Nycticeinops schlieffenii*
b Lower premolars subequal in crown area; upper canine with broad, flat or grooved anterior face; tragus very short and dumpy; rostrum noticeably broadened, particularly across lachrymals; palatal emargination broader; penis greatly elongated (genus *Scotoecus*). ..... *Scotoecus albigula / hindei / hirundo* African Chiroptera name ..... *Scotoecus*
61 a Lower lip with fleshy lobe at posterior angle, connected by a ridge with the lobe of the ear; sometimes a body pattern of spots and/or stripes, or a conspicuous reticulation of wing and tail membranes (genus *Glauconycteris*). 63
b Not as above. 62
62 a Upper premolars 3 - 3 genus *Myotis* - occurring in nearby areas). ..... *Myotis sp.* African Chiroptera name ..... *Myotis*
b Upper premolars 1 - 1 or 2 - 2 (genus *Pipistrellus*). [The following key entries are adopted from Rosevear (1965) and pertain to West African "*Eptesicus*" species, but could be useful] 65
63 a Wing and uropatagium without a distinct reticulared pattern. 64
b Wing and uropatagium conspicuously reticulated. ..... *Glauconycteris variegata*
64 a Distinctive whitish facial marking on the nose, chin and at the bases of the ears; dorsal pelage darker and lacking pale cream dorso-lateral bands (occurring in nearby areas). ..... *Glauconycteris kenyacola*
b No distinctive whitish facial markings; dorsal pelage light brownish grey, usually with pale flank stripes (occurring in nearby areas). ..... *Glauconycteris argentata*
65 a Wings white or translucent. 66
b Wings dark. 68
66 a The white or transparent wings contrast very strongly with the blackish-brown pelage of the upper; forearm usually less than 32 mm; inner upper incisors with bifid crowns; skull not more than 13 mm long. ..... *[Pipistrellus (Neoromicia)] tenuipinnis* African Chiroptera name ..... *Neoromicia tenuipinnis*
b The transparent wings not in such marked contrast with the pale to medium-brown pelage; forearm usually over 32 mm: inner upper incisors with simple crowns; skull greater than 13 mm long. 67

67 a Pelage buffy-brown above, dirty white below; tragus curved (fig. 67d; our fig. 263D [should be 255D]); inner upper incisor with a prominent hook about half way up its posterior surface (Fig. 70d; our Fig. 261D [should be 253D]). ..... *[Pipistrellus (Neoromicia)] rendalli*
African Chiroptera name ..... *Neoromicia rendalli*
b Pelage deeper red-brown above, a little paler below; tragus almost straight-sided, hatchet-shaped above (fig. 67a; our Fig. 263A [should be 255A]); upper incisors without a posterior hook. ..... *[Pipistrellus (Neoromicia)] brunneus*
African Chiroptera name ..... *Neoromicia brunnea*
68 a Forearm over 45 mm; tibia over 19 mm; skull over 18 mm long. ..... *platyops*
African Chiroptera name ..... *Eptesicus platyops*
b Measurements less than above. 69
69 a Forearrn less than 28 mm; total length of middle finger less than 50 mm; skull not more than 11 mm long. 70
b Measurements greater than above. 71
70 a Total length of middle finger less than 40 mm; colour of back blackish. ..... *pusillus*
African Chiroptera name ..... *Neoromicia "incertae-sedis"*
b Total lengrh of middle finger over 40 mm; colour of back chestnut. ..... *[Pipistrellus (Neoromicia)] guineensis*
African Chiroptera name ..... *Neoromicia guineensis*
71 a Fur very long (8 mm); skull less than 12.5 mm long and lacking a posterior "helmet" (fig. 69; our Fig. 260C [should be 252C]). ..... *[Pipistrellus (Neoromicia)] somalicus*
African Chiroptera name ..... *Neoromicia somalica*
b Fur only moderately long; skull at least 12.5 mm long and with a more or less pronounced "helmet" formed by the junction of sagittal and occipital crest (fig. 68; our Fig. 260B [should be 252B]). ..... *[Pipistrellus (Neoromicia)] capensis*
African Chiroptera name ..... *Neoromicia capensis*
72 a Using key from Aellen (1956) 73
b Using key from Meester et al. (1986) 74
73 a Forearm about 85; total length of skull 30 or more. ..... *Scotophilus gigas [= nigritus].*
African Chiroptera name ..... *Scotophilus nigrita*
b Forearrn about 43 to 51; total length of skull 16 to 18 or more. *Scotophilus leucogaster*
74 a Size large, forearm length 70 - 80 mm; total length of skull more than 30 mm. ..... *Scotophilus nigrita*
b Size smaller, forearm length 43 - 65 mm; total length of skull 16 - 23 mm. 75
75 a Forearm length 50 - 60 mm; total length of skull 20 - 23 mm. ..... *Scotophilus dinganii*
b Forearm 43 - 52 mm; total length of skull 16 - 20 mm. 76
76 a Occurring in Namibia. ..... *Scotophilus leucogaster*
b Not occurring in Namibia. ..... *Scotophilus viridis*

Appendix 5bl: Van Cakenberghe et al. (2017). The bats of the Congo and of Rwanda and Burundi revisited (Mammalia: Chiroptera).

1	a	Cheekteeth without W-pattern of cusps; second finger with claw; tail absent or rudimentary; interfemoral membrane reduced; ears very short, well separated, no tragus; margin of ear forming a complete ring (family Pteropidae). 9
	b	Cheekteeth with W-pattern of cusps; second finger entirely included in patagium and without claw; tail generally well developed; interfemoral membrane developed; ears very short to very long, widely separed or joined; tragus present in most cases (except for Rhinolophidae, Rhinonycteridae and Hipposideridae). 2
2	a	Tail more or less completely included in uropatagium (in certain forms the last vertebra can be free). 3
	b	Tail not completely included in uropatagium. 8
3	a	No nasal appendages; tragus conspicuous; ears very short to very long, widely separated or joined, but not fused in the mediosagittal plane. 64
	b	Nasal appendages present. 4
4	a	No tragus or tragus inconspicuous; ears very short to medium, not fused mediosagitally. 5
	b	Tragus present (sometimes small); ears fused or very close to each other mediosagitally. 6
5	a	Posterior leaflet of nose-leaf low, rounded or with three pointed projections (tridentate); two pedal phalanges; tragus inconspicuous. 43
	b	Posterior leaflet of nose-leaf high, erect, pointed; three pedal phalanges; no tragus (family Rhinolophidae, genus *Rhinolophus*) 53
6	a	Tail shorter than uropatagium; no postorbital processes; no premaxillae present; noseleaf very large, comparatively simple; tragus very conspicuous, bifid (family Megadermatidae). 7
	b	Tail as long as uropatagium; last vertebra Y- or T-shaped; postorbital process and premaxillae present; noseleaf is formed by a longitudinal slit bordered by fleshy outgrowths; tragus conspicuous, not bifid (family Nycteridae). 35
7	a	Noseleaf less than 15 mm; pelage grey without yellow tinge; frontal shield of skull strongly concave, minimum breadth of shield less than 6.5 mm. ..... *Cardioderma cor*
	b	Noseleaf over 18 mm; pelage bluish-grey, generally with yellowish tinge; frontal shield of skull comparatively flat, minimum breadth of shield over 6.5 mm. ..... *Lavia frons*
8	a	Basal part of tail included in uropatagium; distal part of tail resting free on the dorsal side of the uropatagium; ears very short, widely separated, not fused, backwards-pointing; tragus conspicuous (family Emballonuridae). 31
	b	Distal part of tail (ca half the width of the interfemoral membrane) not included in uropatagium and not resting on the dorsal side of the uropatagium; ears short, mostly united to each other by a cutaneous wall (family Molossidae). 108
9	a	Tongue simple, fixed to floor of mouth by posterior half, and without unfringed filiform papillae at tip; muzzle not elongated. 10
	b	Tongue more extensible, fixed to floor of mouth by its posterior third, its terminal fourth or fifth covered above with unfringed filiform papillae ("brush-tipped"), muzzle elongated. ..... *Megaloglossus woermanni*
10	a	Facial pattern of white nose and eye patches. 11
	b	No facial pattern. 12
11	a	White tufts at base of ears inconspicuous or absent; bony palate extending well beyond teeth; rostrum, when viewed laterally, not upturned. *Scotonycteris bergmansi*
	b	White tufts at base of ears present, although sometimes inconspicuous; no postdental bony palate; rostrum, when viewed laterally, upturned. ..... *Casinycteris argynnis*
12	a	No white tufts present at base of ears, or tufts inconspicuous. 13
	b	White tufts at base of ears present, although sometimes inconspicuous. 17
13	a	Facial axis of skull not noticeably deflected against basicranial axis; forearm 54 - 90 mm, length second digit 71 - 81 % of forearm; toes partially webbed; cheek teeth squarish or oblong; 6 + 2 or 7 + 2 palatal ridges (genus Myonycteris). 14
	b	Facial axis of skull more or less strongly deflected against basicranial axis; forearm 75 - 130 mm, length of second digit 64 - 71 % of forearm; toes not webbed; cheek teeth oblong; 7 + 1 palatal ridges. 16
14	a	Tibia dorsally furred; P4 and M1 squarish in outline; two lower incisors; M3 reduced

but present; forearm 68 - 88 mm (♂♂) and 67 - 90 mm (♀♀); weight 60 - 97 g (♂♂) and 60 - 100 g (♀♀); third metacarpal 73 - 75 % of forearm length; tibia 42 - 46 % of forearm length. ..... *Myonycteris angolensis*

b Tibia dorsally practically naked over distal quarter to third; P4 and M1 oblong in outline; one or two lower incisors; M3 reduced or absent; forearm 54 - 76 mm; third metacarpal 67 - 73 % of forearm length; tibia 36 - 43 % of forearm length. 15

15 a Interfemoral membrane only furred near legs; palatal ridge pattern 6 + 2 (sometimes 7 + 2); two lower incisors; M3 absent; forearm 65 - 76 mm. ..... *Myonycteris relicta*

b Interfemoral membrane wholly furred; palatal ridge pattern 7 + 2; one or two lower incisors; M3 reduced but normally present; forearm 54 - 68 mm. *Myonycteris torquata*

16 a Forearm 115 - 130 mm; M1 equal in length to M2 and M3 combined; tympanic forming a short tubular bony auditory meatus; premaxillae spaced in front; colour generally tawny. ..... *Eidolon helvum*

b Forearm 79 - 107 mm; M1 shorter than M2 and M3 combined; tympanic not forming a bony auditory meatus; premaxillae in contact or co-ossified in front; colour generally not tawny nor yellowish. 22

17 a Cheekteeth 4/5 , 4/6 or 5/6; unusual weak dentition; interfemoral membrane greatly reduced; calcar absent or rudimentary; forearm 47 - 53 mm. ..... *Plerotes anchietae*

b Cheekteeth 3/5; interfemoral membrane well developed; calcar present; forearm generally larger (except for Micropteropus). 18

18 a Size very large, forearm 118 - 133 mm; rostrum very deep, end of muzzle truncated, ending in fleshy plate; no white shoulder tuft in ♀. ..... *Hypsignathus monstrosus*

b Size smaller, forearm 45 - 100 mm; rostrum shallow, end of muzzle simple; white shoulder tuft in ♀. 19

19 a Forearm 60 - 100 mm 20

b Forearm 45 - 55 mm 21

20 a Six prominent palatal ridges, not more than two being post-dental; the latter not differentiated from inter-dental ridges; post-dental palate strongly concave posteriorly (genus *Epomophorus*). 24

b Five, or 9 - 11, palatal ridges, with sometimes from 5 to 7 post-dental; latter strongly differentiated from inter-dental ridges; post-dental palate flattened posteriorly (genus *Epomops*). 29

21 a Rostrum broad; 5 - 6 palatal ridges, obviously divided by median groove (genus *Micropteropus*). 30

b Rostrum slender; 12 - 13 palatal ridges, only posterior group narrowly divided. ..... *Nanonycteris veldkampii*

22 a Pm1 subequal in bulk to a lower incisor; premaxillae co-ossified; braincase slightly deflected; wings from second toe; fur long and silky; forearm 79 - 83.5 mm. ..... *Myonycteris angolensis*

b Pm1 much larger in bulk than a lower incisor; premaxillae in contact; braincase conspicuously deflected; forearm at least 82.0 mm; tibia furred or naked. 23

23 a Braincase moderately deflected; width of last upper premolar about 1/3 of palate between fronts of last upper premolars, clearly larger than half their lengths; wings from first toe (occasionally between first and second); antitragal lobe distinct; fur short; tibiae dorsally practically naked; predominantly in lowland areas; forearm 85 - 107 mm (♂♂) and 82 - 107 mm (♀♀); weight 111 - 168 g (♂♂) and 100 - 155 g (♀♀). *Rousettus aegyptiacus*

b Braincase strongly deflected; cheekteeth excessively narrow; width of last upper premolar about 1/5 of that of the palate between fronts of last upper premolars, about half their lengths or slightly more; wings from second toe (occasionally between first and second); antitragal lobe obsolete; fur long and coarse; tibiae dorsally furred; mostly above 1000 m; forearm 85 - 94 mm (♂♂) and 85 - 95 (♀♀); weight 102 - 140 g (♂♂) and 94 - 162 g (♀♀). ..... *Stenonycteris lanosus*

24 a One conspicuous, thick postdental palatal ridge; total length of skull 44.4 - 57.3 mm (♂♂), 41.0 - 55.5 mm (♀♀); forearm 72 - 95 mm (♂♂), 67 - 89 mm (♀♀). ..... *Epomophorus wahlbergi*

b Two postdental palatal ridges 25

25 a Size small to medium; total length of skull < 50 mm (♂♂) and < 46 mm (♀♀); forearm < 80 mm (♂♂) and < 76 mm (♀♀). 26

b Size larger; total length of skull > 51.8 mm (♂♂) and > 44 mm (♀♀); forearm > 80 mm

(♂♂) and > 75 mm (♀♀); fourth palal ridge mid-way between third and fifth. ..... *Epomophorus crypturus*

26 a Two thick postdental palatal ridges in ♂♂, one postdental and one partially postdental in ♀♀; total length of skull 47.1 mm (♂), 38.7 and > 41.2 mm (♀♀); forearm 77 mm (♂♂), 68 - 74 mm (♀♀) (otherwise known from Malawi and SW Tanzania only). ..... *Epomophorus anselli*

b Two thick postdental palatal ridges in both sexes; total length of skull < 48 mm (♂♂) and < 46 mm (♀♀); forearm < 80 mm (♂♂) and < 76 mm (♀♀). 27

27 a Size smaller; total length of skull < 40 mm (♂♂) and < 36.5 mm (♀♀).. *Epomophorus minimus*

b Size medium; total length of skull > 40 mm (♂♂) and > 36.5 mm (♀♀)..... 28

28 a Size larger; forearm 66.7 - 80.3 mm (♂♂) and 64.8 - 78.3 mm (♀♀); weight 54 - 99 g (♂♂) and 51 - 81 g (♀♀); mainly woodlands. Distributed from NE Nigeria over S Sudan to Eritrea and to NE Tanzania; furthermore known from few localities in DRC, Malawi and SE Kenya. ..... *Epomophorus labiatus*

b Size smaller; forearm 57.0 - 68.9 mm (♂♂) and 54.1 - 67.6 mm (♀♀); weight 32 - 58 g (♂♂) and 25 - 62 g (♀♀); mainly woodlands. Distributed in E Sudan, Ethiopia, Somalia, lower parts of Kenya to S Malawi. ..... *Epomophorus minor*

29 a Four thick, prominent interdental and about 5 - 7 thinner postdental palate ridges. ..... *Epomops franqueti*

b Three thick and prominent interdental palate ridges; postdental palate with two pairs of prominent, triangular ridges at middle and one or a few thin and serrate ridges at palation border. ..... *Epomops dobsonii*
African Chiroptera name ..... *Epomophorus dobsonii*

30 a Forearm 50 - 53 mm; total skull length 29 - 29.8 mm. ..... *Micropteropus pusillus*

b Forearm 59 - 63 mm; total skull length 33.2 - 33.4 mm. .... *Micropteropus intermedius*

31 a Six lower incisors; two or four upper incisors; forearm normally less than 52 mm. ..... *Coleura afra*

b Four lower incisors; two upper incisors (very minute, often absent); forearm more than 57 mm..... 32

32 a Forearm more than 80 mm (83 - 96 mm); total skull length 30 - 33 mm; skull with shallow frontal depression; no radio-metacarpal pouch; bullae complete; fur dark at base. ..... *Saccolaimus peli*

b Forearm less than 80 mm; total skull length 20 - 28 mm; skull with shallow (T. nudiventris) or deep frontal depression; radio-metacarpal pouch present; bullae incomplete; fur light at base. 33

33 a Forearm more than 70 mm, posterior part of body naked above and below. *Taphozous nudiventris*

b Forearm less than 70 mm; body fully haired. 34

34 a Dorsally light brown, ventrally pale grey to dark greyish-brown; throat usually sepia-brown, darker than belly; no gular patch in either sex; forearm 60 - 67 mm. *Taphozous perforatus*
African Chiroptera name ..... *Taphozous perforatus perforatus*

b Dorsally grizzled grey, ventrally pure white or stained yellowish; throat white; large gular sac in male; forearm 58 - 64 mm. ..... *Taphozous mauritianus*

35 a Second premolar of lower jaw large (equal to or larger than half of the first lower premolar); I1-2 bifid (I2 exceptionally trifid); marked constriction halfway along the height of the tragus (*arge*-group). 38

b Second lower premolar small (smaller than half of the first lower premolar); I1-2 bi- or trifid; no constriction in the tragus. 36

36 a I1-2 bifid..... 37

b I1-2 trifid (*hispida*-group). 41

37 a Tragus semilunate (*macrotis*-group). 42

b Tragus pyriform (free portion narrowest at base; its outer and inner margin evenly convex); forearm length 42 - 52 mm; ear length 28 - 37 mm (*thebaica*-group). *Nycteris thebaica*

38 a Forearm length more than 39 mm; skull length more than 19 mm. 39

b Forearm length less than 38 mm; skull length less than 19 mm..... 40

39 a Forearm length 47.3 - 50 mm; skull length 20.9 - 22.4 mm; ear length measuring 50 - 65 % of forearm length. ..... *Nycteris major*

b Forearm length 39.5 - 46 mm; skull length 19.3 - 20.9 mm; ear length measuring 63 - 77 % of forearm length. ..... *Nycteris arge*

40 a Forearm length 36.5 - 37 mm; skull length 18 - 18.7 mm; tibia longer than half the forearm length. ..... *Nycteris intermedia*

b Forearm length 32 - 36.2 mm; skull length 15.9 - 16.6 mm; tibia shorter than half the forearm length. ..... *Nycteris nana*

41 a Forearm length 39 - 43 mm. ..... *Nycteris hispida*

b Forearm length 57 - 66 mm. ..... *Nycteris grandis*

42 a Forearm length 45 - 52 mm; ear length 22 - 34 mm. ..... *Nycteris macrotis*

b Forearm length 37 - 42 mm; ear length 29 - 34 mm. ..... *Nycteris parisii*

43 a Posterior leaflet of noseleaf simple in outline, elliptical or rounded, not tridentate; ears either separate or united by low band; rostrum at least half as long as braincase; small upper premolar present; forearm over 40 mm (family Hipposideridae, genera *Doryrhina, Hipposideros, Macronycteris*). 45

b Posterior leaflet of noseleaf tridentate; ears always separate; rostrum sometimes less than half as long as braincase; small upper premolar present or absent; forearm 31 - 54 mm. 44

44 a Rostrum less than half as long as braincase; ears low, 8 mm, rounded, rim-like; tridentate nose-leaf; small, forearm 31 - 35 mm; tail not projecting beyond end of interfemoral membrane; two upper premolars on each side; M3 not reduced (family Rhinonycteridae). ..... *Cloeotis percivali*

b Rostrum at least half as long as braincase; ears large, 18 - 20 mm with pointed tip; larger, forearm 44 - 54 mm; tail projecting up to 7 mm beyond end of interfemoral membrane; one upper premolar on each side; M3 greatly reduced (family Hipposideridae). ..... *Asellia tridens*

45 a Ears long and narrow, pointed; cochleae greatly expanded, their width equal to at least 4 times the distance between them. 49

b Ears short, broad, rounded or triangular; cochleae not expanded, their width approximately equal to the distance between them. 46

46 a Ears rounded or broadly triangular; bluntly pointed upper incisors weak, the outer lobe obsolescent or obsolete; crown area of outer lower incisors equal to or only slightly greater than that of the inner lower incisors. 50

b Ears triangular; pointed upper incisors strong, usually retaining much of the outer lobe; crown area of the outer lower incisors much greater than that of the inner lower incisors. 47

47 a Ears with a small projection at the antitragal fold; sphenoidal bridge narrow, not concealing lateral apertures; pterygoid wings underdeveloped; forearm 58 - 66 mm. ..... *Hipposideros abae*

b Ears without antitragal modification; sphenoidal bridge wide, partially concealing lateral apertures; pterygoid wings expanded; forearm 78 - 114 mm. 48

48 a Number of lateral leaflets 3; smaller on average, forearm 93 - 106 mm (♂♂) and 84 - 101 mm (♀♀); pelage shorter, not slightly wooly; predominantly in savannas. ..... *Macronycteris vittatus*

b Number of lateral leaflets 3 or 4; larger on average, forearm 100 - 124 mm (♂♂) and 95 - 116 (♀♀); pelage longer, slightly wooly; predominantly in forests. . *Macronycteris gigas*

49 a Smaller, length of forearm less than 74.0 mm; anteorbital foramen relatively large. ..... *Doryrhina cyclops* African Chiroptera name ..... *Doryrhina cyclopsar*

b Larger, length of forearm exceeding 74.0 mm; anteorbital foramen relatively small. ..... *Hipposideros camerunensis*

50 a Posterior nose-leaf without a transverse supplementary structure developed from its posterior face or with such a structure low, undeveloped and lacking a serrated upper edge. ..... *Hipposideros fuliginosus*

b Posterior nose-leaf having a transverse supplementary structure with a serrated upper edge developed from its posterior face. 51

51 a Anterior upper premolar small, slightly extruded from toothrow, or compressed between canine and second upper premolar. 52

b Anterior upper premolar minute, extruded from toothrow, canine and second upper premolar in contact or nearly so. ..... *Hipposideros beatus*

52 a Frontal sac opening in both sexes; forearm generally less than 48 mm (42 - 52 mm); tibia 18 - 22 mm; dorsal pelage greyish or pale orange; median posterior narial compartiment of nasal swelling relatively narrow, with wide lateral inflations. ..... *Hipposideros caffer*

b Frontal sac opening in ♂♂ only; forearm generally over 48 mm (47 - 55 mm); tibia 18 - 24 mm; dorsal pelage brownish or rufous; median posterior narial compartment of nasal swelling relatively wide, with narrow lateral inflations. ..... *Hipposideros ruber*

53 a First upper premolar placed between the upper canine and second premolar or slightly reduced and partially displaced labially. 54

b First upper premolar missing or very reduced and external to toothrow; the canine and second premolar touching each other or nearly so. 62

54 a Connecting process of nose-leaf rises to a distinct point. 55

b Connecting process of nose-leaf low, subtriangular or obsolete. 56

55 a First phalange of fourth finger long, more than half as long as second, 24 - 28 % of metacarpal length; sella wedge-shaped, top narrow; lancet subtriangular or hastate, tip rounded. ..... *Rhinolophus blasii*

b First phalange of fourth finger shorter, 19 - 23 % of metacarpal length; sella sides slightly concave; lancet hastate, tip bluntly pointed. ..... *Rhinolophus landeri*

56 a Connecting process of nose-leaf obsolete or poorly developed; ears large; forearm 50 mm or more. 57

b Connecting process of nose-leaf low and rounded or subtriangular; forearm 55 mm or less. 60

57 a Eight or nine internal ear folds. 58

b 11 or 12 internal ear folds. 59

58 a Lancet tip truncated, only moderately exceeding height of sella; ear with eight folds; larger, forearm 55 - 62 mm; skull with braincase conspicuously constricted behind the mastoid process; infraorbital bridge longer and more slender; lower molars comparatively small; ear length 32 - 40 mm. ..... *Rhinolophus ruwenzorii*

b Lancet tip bluntly pointed, conspicuously exceeding height of sella; ear with nine folds; smaller, forearm 54 mm; skull with braincase not conspicuously constricted behind the mastoid process; infraorbital bridge shorter and stouter; lower molars comparatively large; ear length 28.5 mm. ..... *Rhinolophus hilli*

59 a 11 internal ear folds; forearm length 54.5 mm; ear length 34.5 mm. *Rhinolophus kahuzi*

b 12 internal ear folds; forearm length 49.7 - 51.5 mm; ear length 24.2 - 29 mm. ..... *Rhinolophus willardi*

60 a Forearm length 49 - 54 mm; skull length 22.4 - 23.3 mm. ..... *Rhinolophus alcyone*

b Forearm length 40 - 45 mm; skull length 17.6 mm or less. 61

61 a Sella comparatively narrow (1.2 - 1.3 mm prior to preservation); lancet subtriangular, almost hastate, sides concave, tip bluntly pointed; horseshoe 6.0 - 7.4 mm. ..... *Rhinolophus swinnyi*

b Sella comparatively broad (1.5 - 1.7 mm after preservation); lancet subtriangular or hastate, tip somewhat rounded; horseshoe 6.7 - 9.0 mm. ..... *Rhinolophus simulator*

62 a Face and edges of sella naked; forearm length 50 - 56 mm; lancet hastate, tip rounded; horseshoe 6.6 - 9.6 mm, narrower as muzzle; nasal swellings very low; frontal depression very shallow; supraorbital ridges weak; interpterygoid groove absent or very indistinct. ..... *Rhinolophus clivosus* African Chiroptera name ..... *Rhinolophus blasii*

b Face and edges of sella with long hairs. 63

63 a Forearm length 60 - 67 mm; tibia 26 - 31 mm; ear length 26 - 36 mm; baculum > 3 mm; anterior medial nasal swellings longer than broad. ..... *Rhinolophus hildebrandtii*

b Forearm length 53 - 63 mm; tibia 22 - 25 mm; ear length 21 - 38 mm; baculum < 3 mm. ..... *Rhinolophus eloquens*

c Forearm length 47 - 60 mm; tibia 19 - 24 mm; ear length 19 - 28 mm; anterior medial nasal swellings broader than long. ..... *Rhinolophus fumigatus*

64 a Second phalange of third digit nearly 3 times as long as the first (family Miniopteridae; genus *Miniopterus*). 75

b Second phalange of the third digit shorter (family Vespertilionidae). 65

65 a Ear slightly but evidently funnel-formed; very high braincase (subfamily Kerivoulinae; genus *Kerivoula*). 76

b Ears largely open at their base and not funnel-formed; normal braincase. 66

66 a Six Pm and M in upper and lower jaw (subfamily Myotinae, genus *Myotis*). 80
b Less than 6 Pm and M. 67
67 a One upper incisor and M1 and M2 with W-pattern distorted or nearly absent (subfamily Scotophilinae; genus *Scotophilus*)..... 82
b Two upper incisors or 1 upper incisor and M1 and M2 with W-pattern normal (subfamily Vespertilioninae). 68
68 a One upper incisor. 85
b Two upper incisors. 69
69 a Five Pm and M in upper and lower jaw (genera *Neoromicia* / *Pipistrellus* / *Hypsugo*). 99
b Four Pm and M in upper and 5 in lower jaw. 70
70 a Ears very enlarged, about 15 mm and more (genus *Laephotis*). 74
b Ears normally much less enlarged. 71
71 a Very short and broad rostrum; the height of the braincase (with the bullae) more than ? of the condylo-basal length; lower lip with fleshy lobes at angle of mouth (genus *Glauconycteris*). 87
b Height of the braincase (bullae included) much less than the distance from incisors to posterior zygoma root. 72
72 a Very shortened wings; the third digit not longer than head and body length; skull much flattened (genus *Mimetillus*). 73
b Normal wings; skull not especially flattened (genus *Neoromicia*). 94
73 a Pelage dark brown; wing membranes dark; occurring in forest habitats. .... *Mimetillus moloneyi*
b Pelage pale brown; wing membranes lighter; occurring in savanna habitats. *Mimetillus thomasi*
74 a On average larger; greatest skull length 14.1 - 15.5 mm; ear length 17 - 22 mm; forearm length 30 - 39 mm; palatal length 6.2 - 7.3 mm. ..... *Laephotis botswanae*
b On average smaller; greatest skull length 13.7 - 13.8 mm; ear length 15 - 18 mm; forearm length 32 - 36 mm; palatal length 6.1 - 6.2 mm. ..... *Laephotis angolensis*
75 a Forearm length 45 - 52 mm; greatest skull length 16.4 - 17.8 mm; hind foot (including claw) 7 - 11 mm; total length 92 - 128 mm; weight 8 - 19 g. ..... *Miniopterus inflatus* African Chiroptera name ..... *Miniopterus inflatus inflatus*
b Forearm length 35 - 42 mm; greatest skull length 11.1 - 14.5 mm; hind foot (including claw) 5 - 10 mm; total length 82 - 97 mm; weight 5 - 10 g. ..... *Miniopterus minor*
c Forearm length 42 - 47 mm; greatest skull length 13.6 - 15.5 mm; hind foot (including claw) 6 - 11 mm; total length 104 - 115 mm; weight 6 - 11 g. .. *Miniopterus natalensis*
d Forearm length 41 - 45 mm; greatest skull length 13.3 - 15.5 mm; hind foot (including claw) 7 - 11 mm; total length 88 - 103 mm; weight 7 - 11 g. .... *Miniopterus fraterculus*
76 a Comb-like fringe of hairs on interfemoral membrane well developed. 77
b Comb-like fringe of hairs on interfemoral membrane absent or scarcely developed. 78
77 a Dorsal pelage bright reddish-brown with conspicuous frosting (highlighted tips); ventral pelage cream, dirty-white or white; size on average larger, forearm length 28 - 40 mm; skull longer and more robust, greatest length 14.7 - 16.5 mm; outer lower incisors usually with three cusps, sometimes four; inner upper incisors uni-, bi- or tricuspid. ..... *Kerivoula argentata*
b Dorsal pelage dark brown to pale grey with (in)conspicuous frosting, but not bright reddish-brown with conspicuous frosting; ventral pelage sepia brown, grey to whitish; size on average smaller, forearm length 26 - 34 mm; skull shorter and more delicate, greatest length 11.2 - 13.5 mm; outer lower incisors with two or three cusps; inner upper incisors uni- or bicuspid. ..... *Kerivoula lanosa*
78 a Size smaller; forearm length 25 - 30 mm; dorsal pelage pale reddish-brown, fawn-brown or greyish-brown, usually darker at base, without frosting; outer lower incisors unicuspid; inner upper incisors uni- or bicuspid. ..... *Kerivoula phalaena*
b Size larger; forearm length 30 mm or more; dorsal pelage dark, frosted; inner upper incisors bicuspid. 79
79 a Dorsal pelage blackish or dark brown; forearm length 32 - 36 mm; lower incisors unicuspid. ..... *Kerivoula smithii*
b Dorsal pelage dark brown with terminal third bright rusty-brown or chocolate brown; forearm length 30 - 33 mm; lower incisors tricuspid. ..... *Kerivoula cuprosa*
80 a With dichromatic (black and orange) wing membranes; forearm length 52 - 60 mm;

sparse fringe of bristle-like hairs along margin of interfemoral membrane between tips of calcars and tip of tail. ..... *Myotis welwitschii*

b Wing membranes uniformly dark; size smaller; no fringe of bristle-like hairs along margin of interfemoral membrane. 81

81 a Larger, forearm length 47 - 53 mm; wing membrane uniformly dark or inconspicuously particoloured, black on most of the membrane and orange to dark red along the fingerbones; ventral and dorsal hairs tricoloured. ..... *Myotis tricolor*

b Smaller, forearm length 33 - 42 mm; wing membrane uniformly blackish-brown; ventral hairs bicoloured; dorsal hairs bi- or tricoloured. ..... *Myotis bocagii*

82 a Very large, forearm length 78 - 88 mm. ..... *Scotophilus nigrita*

b Smaller, forearm not over 61 mm. 83

83 a Ventral pelage dark brown to reddish-orange; habitat rainforest. ..... *Scotophilus nux*

b Ventral pelage pure white, yellowish, yellow, orange-yellow; habitat savannas and rainforest-savanna mosaics. 84

84 a Ventral pelage pure white to medium brown, never yellowish; dorsal pelage pale to medium brown, never tinged with yellow or green; forearm length 44 - 58 mm; skull total length 16 - 18 mm. ..... *Scotophilus leucogaster*

b Ventral pelage pale yellow, bright yellow or orange-yellow, not tinged with brown; dorsal pelage sepia brown, greenish-brown, greyish-brown or reddish-brown; forearm 47 - 60 mm; skull total length 18 - 21 mm. ..... *Scotophilus dinganii*

85 a Penis short (5.6 - 6.2 mm); upper canine with anterior surface rounded, not grooved; anterior lower premolar ca half height of posterior premolar. *Nycticeinops schlieffenii*

b Penis extremely long (ca 9 - 16 mm); upper canine with anterior surface flat and grooved; anterior lower premolar at least two-thirds height of posterior premolar, usually subequal (genus *Scotoecus*). 86

86 a Wing membranes dark-brown, slightly translucent. ..... *Scotoecus hindei*

b Wing membranes light, semi-translucent, becoming brownish around edges and near body. ..... *Scotoecus albofuscus*

87 a Wing and interfemoral membranes conspicuously veined; wings pale; colour of dorsal hairs creamy-buff to yellowish-fawn (tricoloured or inconspicuously bicoloured); forearm length 38 - 45 mm. ..... *Glauconycteris variegata*

b Wing and interfemoral membranes not conspicuously veined. 88

88 a Dorsal body colour black and white; five to seven dorsal markings (spots, patches and stripes); ears subquadrangular; inner upper incisors unicuspid; forearm length 45 - 48 mm. ..... *Glauconycteris superba*

b Dorsal body colour not black and white; ears rounded. 89

89 a No body pattern; dorsal body colour umber-, sepia-, or reddish-brown; dorsal hairs tricoloured; inner upper incisors strongly bicuspid, with unequal cusps; forearm length 34 - 38 mm. ..... *Glauconycteris curryae*

b Markings restricted to flank stripes or shoulder spots; dorsal hairs bi- or tricoloured; inner upper incisors generally bicuspid (except for argentata), with subequal or unequal cusps; forearm length 44 mm or less. 90

90 a Wing and interfemoral membranes pale brown; dorsal hairs pale golden-fawn or darker and greyer. ..... *Glauconycteris argentata*

b Wing and interfemoral membranes dark brown; dorsal hairs medium to dark greyish or dark sepia brown. 91

91 a Inner upper incisors strongly bicuspid, with subequal or unequal cusps; dorsal hairs tricoloured; no body patterns or at most a shoulder spot. 92

b Inner upper incisors weakly bicuspid, with unequal cusps; dorsal hairs bicoloured; body pattern includes flank stripe and/or shoulder spot. 93

92 a No light lateral markings on body (perhaps rarely a white shoulder spot); forehead region of skull weakly concave. ..... *Glauconycteris beatrix*

b White shoulder spot is generally present; forehead region of skull moderately concave. ..... *Glauconycteris humeralis*

93 a Dorsal hairs sepia brown; wings not reticulated. ..... *Glauconycteris alboguttata*

b Dorsal hairs medium to dark greyish or brownish; wings faintly reticulated. ..... *Glauconycteris poensis*

94 a Wings pale or white translucent; mid-ventral pelage cream, whitish or pale grey. . 98

b Wings dark; mid-ventral pelage whitish or pale greyish-brown to medium brown. . 95

95 a Mid-ventral pelage white, whitish, cream or buff; forehead region of skull straight to

weakly concave; inner upper incisors weakly bicuspid (unicuspid when worn); forearm length 28 - 38 mm; occipital helmet usually well developed. ..... *Neoromicia capensis*

b Mid-ventral pelage pale (greyish-)brown to (medium-)brown; forehead region of skull weakly to moderately concave (exceptionally almost straight); occipital helmet absent. 96

96 a Size large; forearm length 33 - 38 mm; greatest length of skull 13.0 - 14.1 mm; dorsal hairs unicoloured; mid-ventral pelage greyish-brown to medium brown; inner upper incisors unicuspid; no anterior upper premolar; forehead region of skull weakly concave. ..... *Neoromicia brunnea*

b Size smaller; forearm length less than 33 mm; dorsal hairs not unicoloured; inner upper incisors usually unicuspid; anterior upper premolar extremely rarely present, in which case minute. 97

97 a Dorsal and ventral hairs faintly bicoloured; mid-ventral colour pale brown or brown; forehead region of skull weakly concave to almost straight; forearm length 22 - 32 mm..... *Neoromicia somalica*

b Dorsal hairs bi- or tricoloured; mid-ventral colour pale greyish-brown or brown; forehead region of skull weakly to moderately concave; forearm length 27 - 33 mm. ..... *Neoromicia zuluensis*

98 a Dorsal colour dark brown, in strong contrast to pale wings; dorsal hairs usually unicoloured; ventral hairs bicoloured; inner upper incisors weakly bicuspid; forearm length 28 - 33 mm. ..... *Neoromicia tenuipinnis*

b Dorsal colour light brown, not in strong contrast to pale wings; dorsal hairs bi- or tricoloured; ventral hairs bicoloured; inner upper incisors unicuspid; forearm length 29 - 38 mm. ..... *Neoromicia rendalli*

99 a Outer upper incisor greatly reduced; entire underside pure white; dorsal pelage grey to sepia brown [lower molars nyctalodont; forearm length 29 - 37 mm; anterior upper premolar medium sized, conspicuous, within toothrow or slightly displaced; dorsal and ventral hairs bicoloured]. ..... *Pipistrellus rueppellii*

b Outer upper incisor not greatly reduced; underside light, dark or grey-tipped..... 100

100 a Inner upper incisors unicuspid; both dorsal and ventral hairs bicoloured; dorsal pelage greyish-brown, reddish-brown, dark brown or blackish; anterior upper premolar medium-size to minute, usually visible, within toothrow or fully displaced lingually; no white border on hind border of wing; forearm length 29 - 38 mm. ..... *Pipistrellus hesperidus*

b Inner upper incisors bicuspid..... 101

101 a Dorsal and ventral hairs bicoloured..... 102

b Dorsal hairs unicoloured; ventral hairs usually unicoloured. 105

102 a Outer edge of tragus angular (hatchet-shaped); dorsal pelage chocolate brown or sepia brown, sometimes with gold sheen; anterior upper premolar medium-sized, slightly displaced lingually; no white border on hind border of wing; forearm length 25 - 35 mm..... *Neoromicia nana*

b Outer edge of tragus curved (no sharp angle). 103

103 a Skull larger, very weakly concave, greatest length 13.7 - 14.1 mm; wings without white hind border; forearm length 32 - 36 mm; mid-ventral pelage slightly reddish-brown tinged with beige; anterior upper premolar minute to medium-sized, usually visible, occasionally absent. ..... *Hypsugo eisentrauti*

b Skull smaller, weakly concave, greatest length less than 13.7 mm; wings with or without white hind border. 104

104 a Mid-ventral pelage pale brown, cream or white; anterior upper premolar minute, not visible above gum; greatest length of skull 11.2 - 13.7 mm; forearm length 29 - 34 mm. ..... *Hypsugo anchietae*

b Mid-ventral pelage dark to medium rust-brown, sometimes speckled; anterior upper premolar absent; greatest length of skull 10.7 - 11.8 mm; forearm length 23 - 35 mm. ..... *Neoromicia guineensis*

105 a Size larger, forearm 33 - 38 mm; greatest length of skull 13.8 - 14.7 mm; mid-ventral pelage pale brown, usually yellowish; anterior upper premolar minute, sometimes not visible, sometimes missing; forehead region of skull weakly concave, sometimes almost straight. ..... *Pipistrellus grandidieri*

b Size smaller, forearm 33 mm or less; greatest length of skull 13.6 mm or less.... 106

106 a Anterior upper premolar medium-sized to well-developed, visible, in toothrow or

slightly lingually displaced; dorsal pelage reddish-brown; white border on wing edge usually missing; forearm length 24 - 29 mm. ..... *Pipistrellus nanulus*

b Anterior upper premolar minute, barely visible above gum or not at all. 107

107 a Size larger, forearm length 28 - 33 mm; greatest length of skull 12.1 - 13.6 mm; mid-ventral pelage pale to dark brown or reddish-brown. ..... *Hypsugo crassulus*

b Size smaller, forearm length 23 - 26 mm; greatest length of skull 10.3 - 11.4 mm; mid-ventral pelage dark umber-brown. ..... *Hypsugo musciculus*

108 a A prominent vertical projection on the zygomatic arch; ears very large, 38 - 40 mm, conjoined on extended snout; size very large, forearm length 62 - 73 mm; conspicuous bicolored dorsal pelage pattern, with pale collar separating dark anterior and posterior regions of body. ..... *Otomops martiensseni*

b Not combining these characters. 109

109 a Ears widely separated; ears and wing membranes translucent or whitish; underside of body entirely white; 4 post-canine upper cheek teeth, M3 much reduced; one lower incisor on each side, with concave crowns lengthened antero-posteriorly; upper incisors in contact with canines; no palatal emargination (genus *Myopterus*). 113

b Ears not widely separated, sometimes conjoined, never translucent; 4 or 5 post-canine upper cheek teeth (first upper premolar often minute, sometimes deciduous); one to three (generally two) lower incisors; upper incisors not in contact with canines. 110

110 a Inner margins of ears meeting or almost meeting to form a V-shaped valley; third ridge of posterior upper molar (M3) more than half length of second or equal in length; two lower incisors on each side; anterior palatal emargination wide (genus *Tadarida*). 133

b Inner margins of ears generally joined by band of skin (uncertain in niangarae, where they might be well separated); anterior palatal emargination narrow or closed. ... 111

111 a Third ridge of posterior upper molar (M3) more than half length of second or equal in length (genus *Chaerephon*). 114

b Third ridge of posterior upper molar (M3) less than half length of second or absent (sometimes equal in condylurus) (genus *Mops*). 112

112 a Anterior palatal emargination closed (subgenus *Mops*). 124

b Anterior palatal emargination narrow (subgenus *Xiphonycteris*). 130

113 a Size smaller, forearm length 33 - 37 mm; skull length 17 - 19 mm; pelage dark brown above, without lateral bands. ..... *Myopterus whitleyi*

b Size larger, forearm length 48 - 56 mm; skull length 21.3 - 25.7 mm; dorsal pelage slaty-grey with two contrasting lateral bands of dirty white. ..... *Myopterus daubentonii*

114 a Ears separated by a lobe or lappet. 115

b Ears joined by a band. 116

115 a Ears long, separated by a large bulbous lobe projecting well over the forehead; ventral flank stripe absent; wing membrane greyish-black; basisphenoid pits deep and large; rostrum uniquely with prominent nasal swellings; forearm length 38 mm. *Chaerephon gallagheri*

b Ears separated by a flat lappet over a small, backward-opening pocket; white or whitish ventral flank stripe present; wing membrane dark brown to blackish; depth of basisphenoid pits shallow to moderate, size small to medium; forearm length 39 - 46 mm. ..... *Chaerephon major*

116 a Size smaller; forearm length less than or equal to 41 mm. 117

b Size larger; forearm length larger than 41 mm. 119

117 a Dorsal pelage pale grey, pale rusty-brown or medium greyish-brown; wing membrane usually white, sometimes pale brown or greyish-brown; ♂♂ with long bicoloured interaural crest. ..... *Chaerephon chapini*

b Dorsal pelage almost black, brown, greyish-brown or reddish-brown; wing membrane white or blackish-brown; ♂♂ with short unicoloured interaural crest. 118

118 a Size smaller; forearm length 32.8 - 37.8 mm; condylobasal length 14.4 - 15.9 mm; zygomatic width 9.3 - 10.3 mm. ..... *Chaerephon leucogaster*

b Size larger; forearm length 38.3 - 41.0 mm; condylobasal length 15.3 - 16.4 mm; zygomatic width 10.4 - 10.9 mm. ..... *Chaerephon pumilus*

119 a Ventral flank stripe present. 120

b Ventral flank stripe absent. 121

120 a Flank stripe whitish; wing membranes pale grey; shallow basisphenoid pits of medium size; anterior palatal emargination narrow; forearm length 41 - 48 mm; uniquely with

pair of tail-glands opening ventrally as a slit on each side of base of tail. *Chaerephon bemmeleni*

b Flank stripe white; wing membranes dorsally whitish or blackish, ventrally white; shallow to medium basisphenoid pits of small to medium size; anterior palatal emargination closed; forearm length 41 - 51 mm; no such glands. *Chaerephon nigeriae*

121 a Anterior palatal emargination closed; size of basisphenoid pits large. 122

b Anterior palatal emarganation narrow; size of basisphenoid pits small to medium. 123

122 a Size larger; forearm length 48 - 53 mm; basisphenoid pits deep; wing membrane blackish-brown; sometimes with greyish spots dorsally. *Chaerephon aloysiisabaudiae*

b Size smaller; forearm length 42 - 46 mm; basisphenoid pits moderately deep; wing membrane mostly dark brown, lighter towards tip; no spots or stripes. ... *Chaerephon russatus*

123 a Wing membrane light reddish-brown or light grey; forearm length 43 - 48 mm; dorsal pelage somewhat frosted, occasionally with white spots. ..... *Chaerephon ansorgei*

b Wing membrane dark brown or light reddish-brown; forearm length 46 - 51 mm; white or whitish stripes and/or rows of spots on crown of most individuals, and sometimes on shoulders and flanks. ..... *Chaerephon bivittatus*

124 a Size smaller; forearm length 51 mm or less. 125

b Size larger; forearm length 51 mm or more. 127

125 a ♂♂ with paired glands between penis and anus; forearm length 41 - 46 mm; phalanges of 3rd (16 - 19 mm) and 4th (13 - 16 mm) fingers short; ventral pelage white or very pale; crown darker than back; whitish or pale grey flank stripe present, but faint; basisphenoid pits deep and large. ..... *Mops (Mops) demonstrator*

b ♂♂ without paired glands between penis and anus; phalanges of 3rd and 4th fingers medium to long. 126

126 a Forearm length 45 - 51 mm; phalanges of 3rd (20 - 24 mm) and 4th (17 - 20 mm) fingers long; ventral pelage with little or no white; crown same colour as back; white ventral flank stripe present or absent; basisphenoid pits shallow and small. ..... *Mops (Mops) condylurus*

b Forearm length 44 - 48 mm; phalanges of 3rd (19 - 21 mm) and 4th (15 - 17 mm) fingers of medium length; ventral pelage predominantly white or cream; crown darker than back; ventral flank stripe absent; basisphenoid pits moderately deep and medium to large in size. ..... *Mops (Mops) niveiventer*

127 a Size largest; forearm length 59 - 67 mm; white or pale ventral flank stripe present; dorsal pelage colour variable; frosted and flecked; basisphenoid pits moderately deep and medium to large in size. ..... *Mops (Mops) midas*

b Size smaller; forearm 58 mm or less. 128

128 a Inner margin of ears uncertain, possibly well separated; ventral flank stripe probably absent; wing membrane dark brown; forearm length approximately 52 mm. ..... *Mops (Mops) niangarae*

b Inner margin of ears joined by a band 129

129 a Forearm length 51 - 55 mm; wing membrane dark brown; dorsal pelage medium sepia or yellowish-brown, or pale rusty-brown. ..... *Mops (Mops) trevori*

b Forearm length 54 - 58 mm; wing membrane blackish-brown; dorsal pelage dark brown to almost black; not frosted or flecked ..... *Mops (Mops) congicus*

130 a Size smaller, forearm length 31 mm or less. 131

b Size larger, forearm length 34 mm or more. 132

131 a Two lower incisors on each side; lower canines without greatly enlarged cingula; upper incisors procumbent (inclined towards the lips); wing membrane blackish-brown, pale brown to whitish, ventral side paler; forearm length 27 - 31 mm. ..... *Mops (Xiphonycteris) nanulus*

b Usually one lower incisor on each side, rarely two; lower canines with greatly enlarged cingula, especially in ♂♂; wing membrane blackish; forearm length 27 - 30 mm. *Mops (Xiphonycteris) spurrelli*

132 a Ventral flank stripe present, but contrast weak; wing membrane blackish; ventral pelage dark; occipital helmet prominent; wing insertion higher on body; basisphenoid pits of moderately depth and small to medium in size; forearm length 35 - 42 mm. ..... *Mops (Xiphonycteris) brachypterus*

b Ventral flank stripe absent; wing membrane various shades of brown; ventral pelage pale; occipital helmet moderately prominent; wing insertion lower on body;

basisphenoid pits moderate or shallow deep and medium to large in size; forearm length 34 - 41 mm. .....*Mops (Xiphonycteris) thersites*

133 a Little white on ventral surface; forearm length 60 - 67 mm; both sides of wing membrane dark brown to almost black; basisphenoid pits medium in size; plantar pad absent. .....*Tadarida ventralis*

b Clear white, cream or yellowish ventral flank band present; forearm length 56 - 61 mm; dorsal side of wing membrane brown, ventral side whitish; basisphenoid pits large in size; plantar pad present. .....*Tadarida fulminans*

Appendix 6: Images of Type Specimens

Clockwise from top, lateral, ventral and dorsal skull images of type specimens. The squares of the graph paper are 2 mm wide.

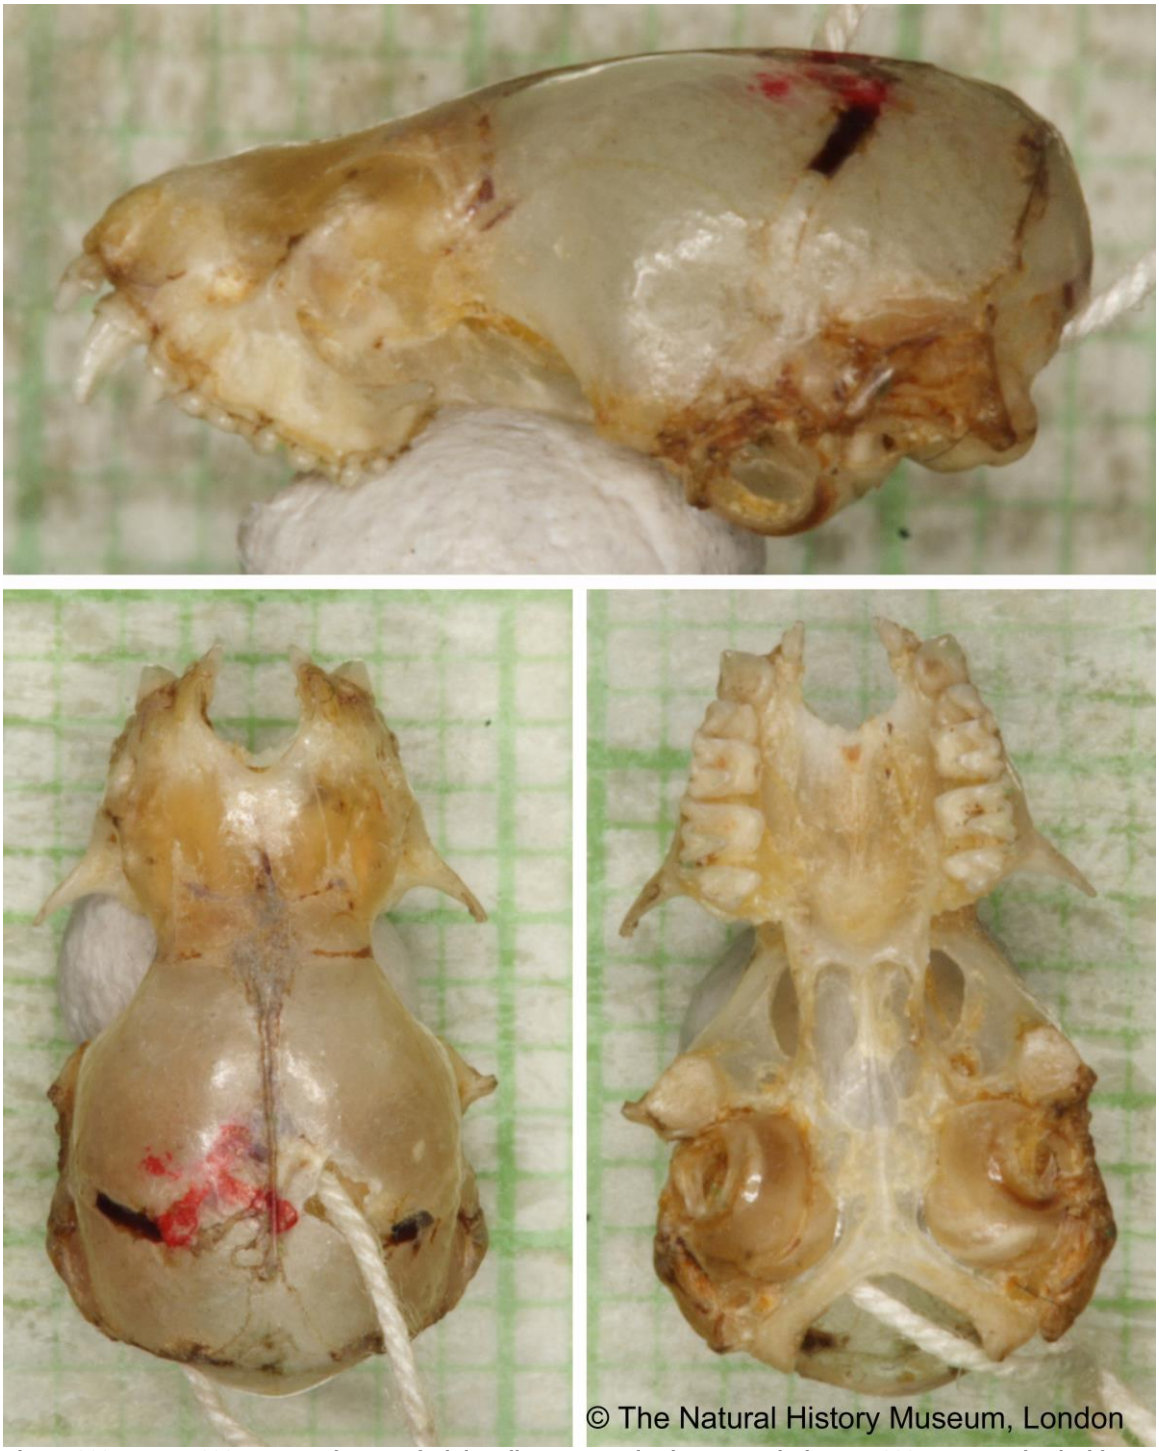

Figure 366 BMNH 1823.1.1.15 Holotype of *Pipistrellus marrensis* Thomas and Hinton, 1923, synonomized with *P. rusticus* (Tomes, 1861).

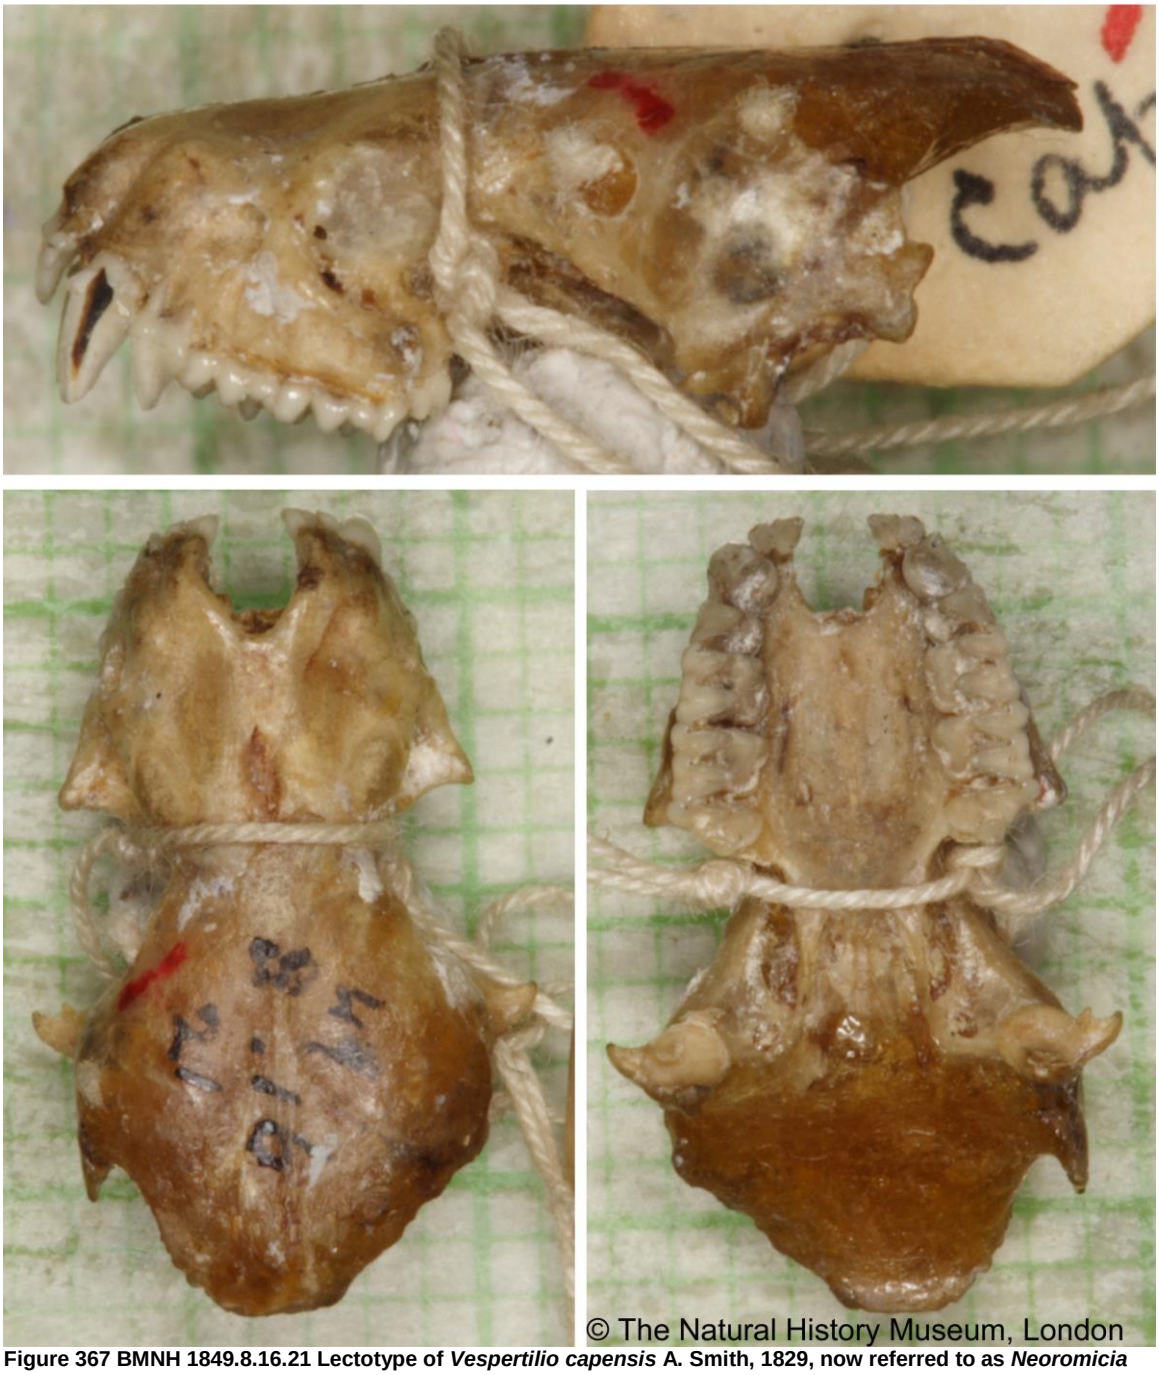

Figure 367 BMNH 1849.8.16.21 Lectotype of *Vespertilio capensis* A. Smith, 1829, now referred to as *Neoromicia capensis*.

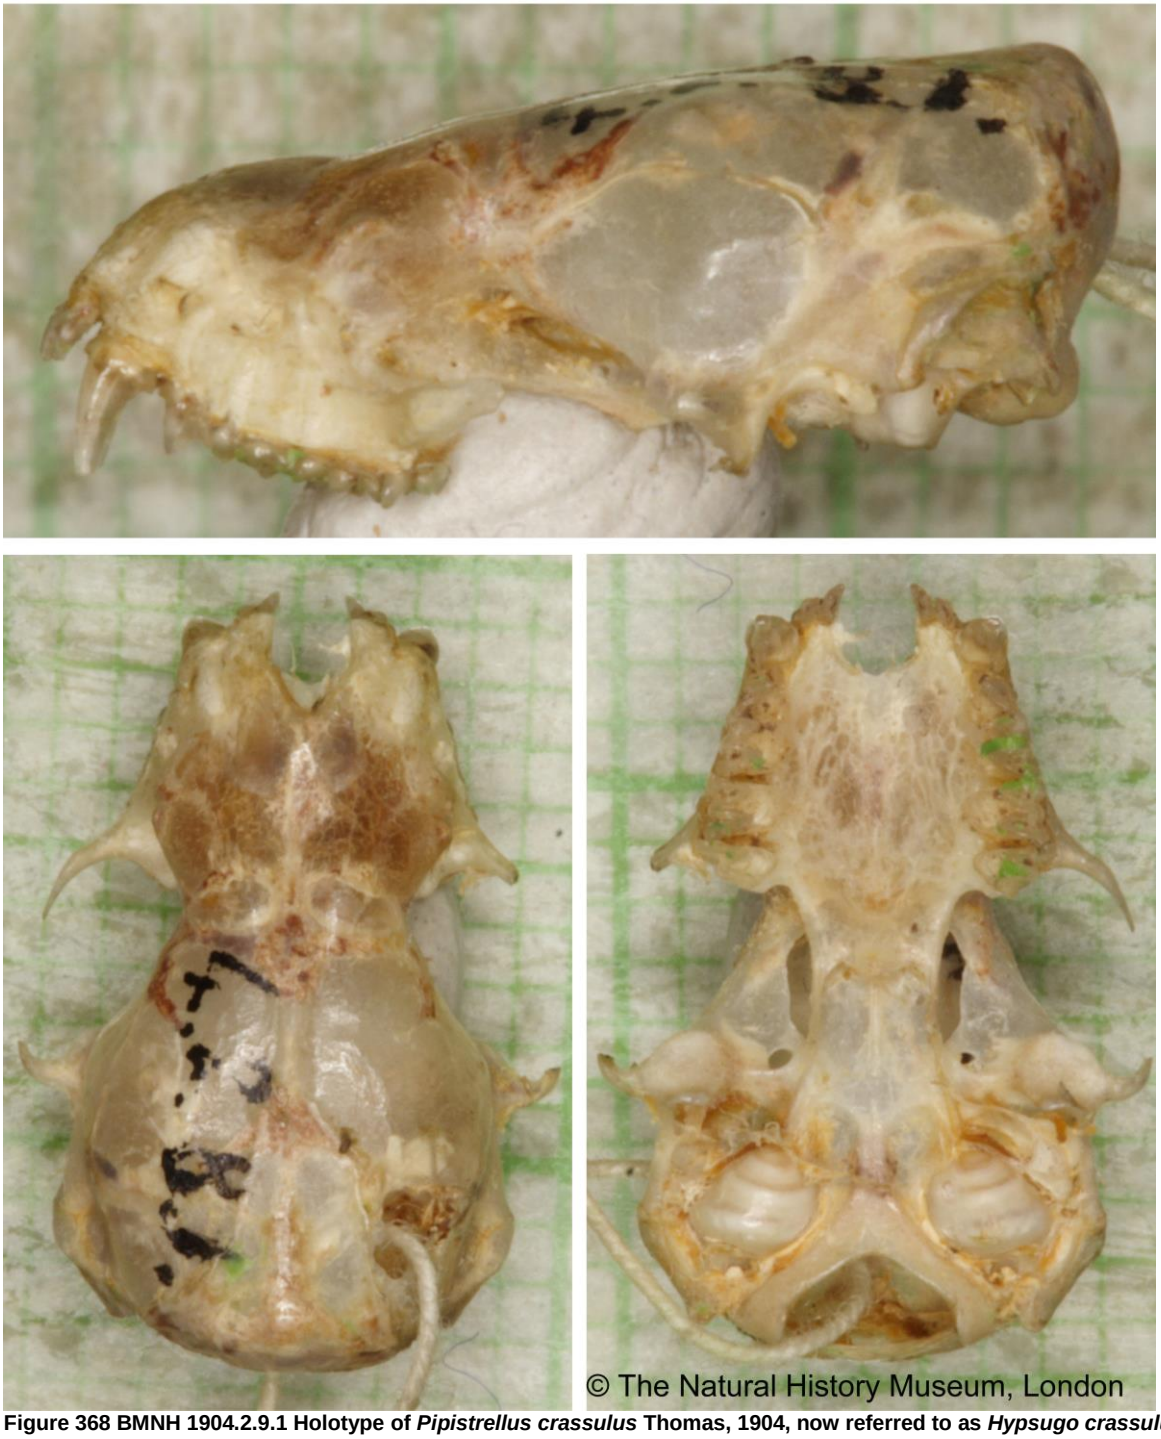

Figure 368 BMNH 1904.2.9.1 Holotype of *Pipistrellus crassulus* Thomas, 1904, now referred to as *Hypsugo crassulus*.

Figure 369 BMNH 1880.7.21.7 Holotype of *Vesperugo (Vesperus) brunneus* Thomas, 1880, now referred to as *Neoromicia brunneus*.

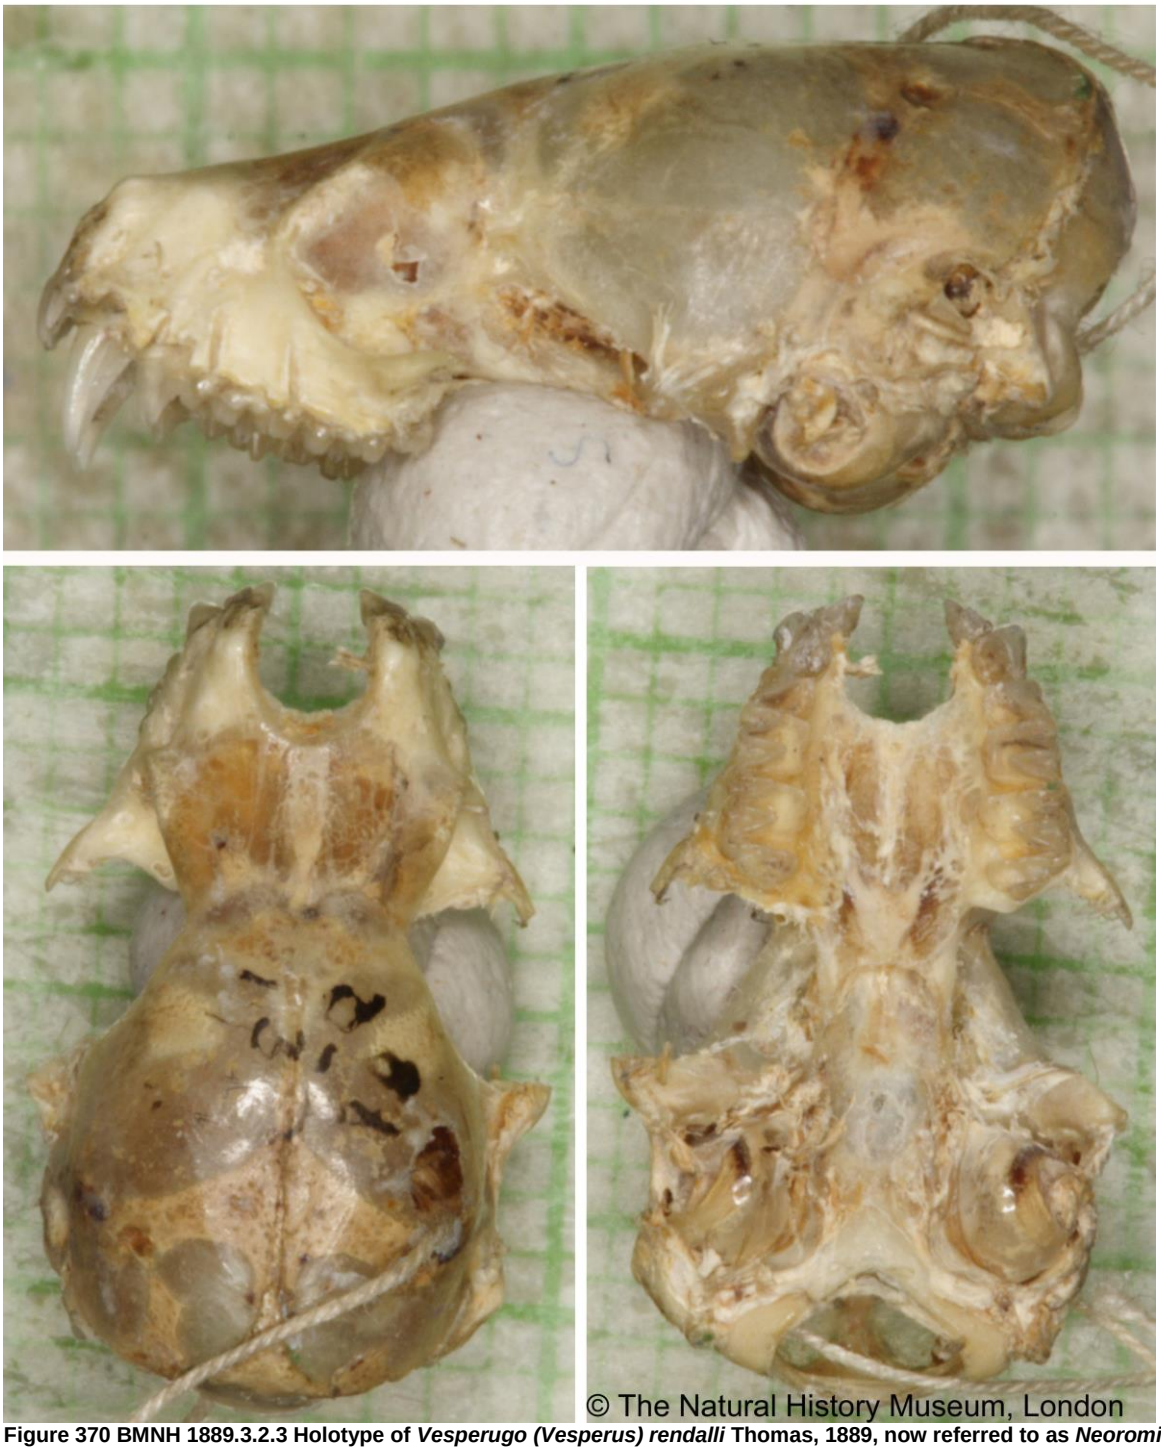

Figure 370 BMNH 1889.3.2.3 Holotype of *Vesperugo (Vesperus) rendalli* Thomas, 1889, now referred to as *Neoromicia rendalli*.

Figure 371 BMNH 1889.5.1.3 Syntype of *Vesperus bicolor* Bocage, 1889, now a synonym of *Neoromicia tenuipinnis* (Peters, 1872).

Figure 372 BMNH 1898.6.9.1 Holotype *Vespertilio minutus somalicus* Thomas, 1901, now referred to as *Neoromicia somalicus*.

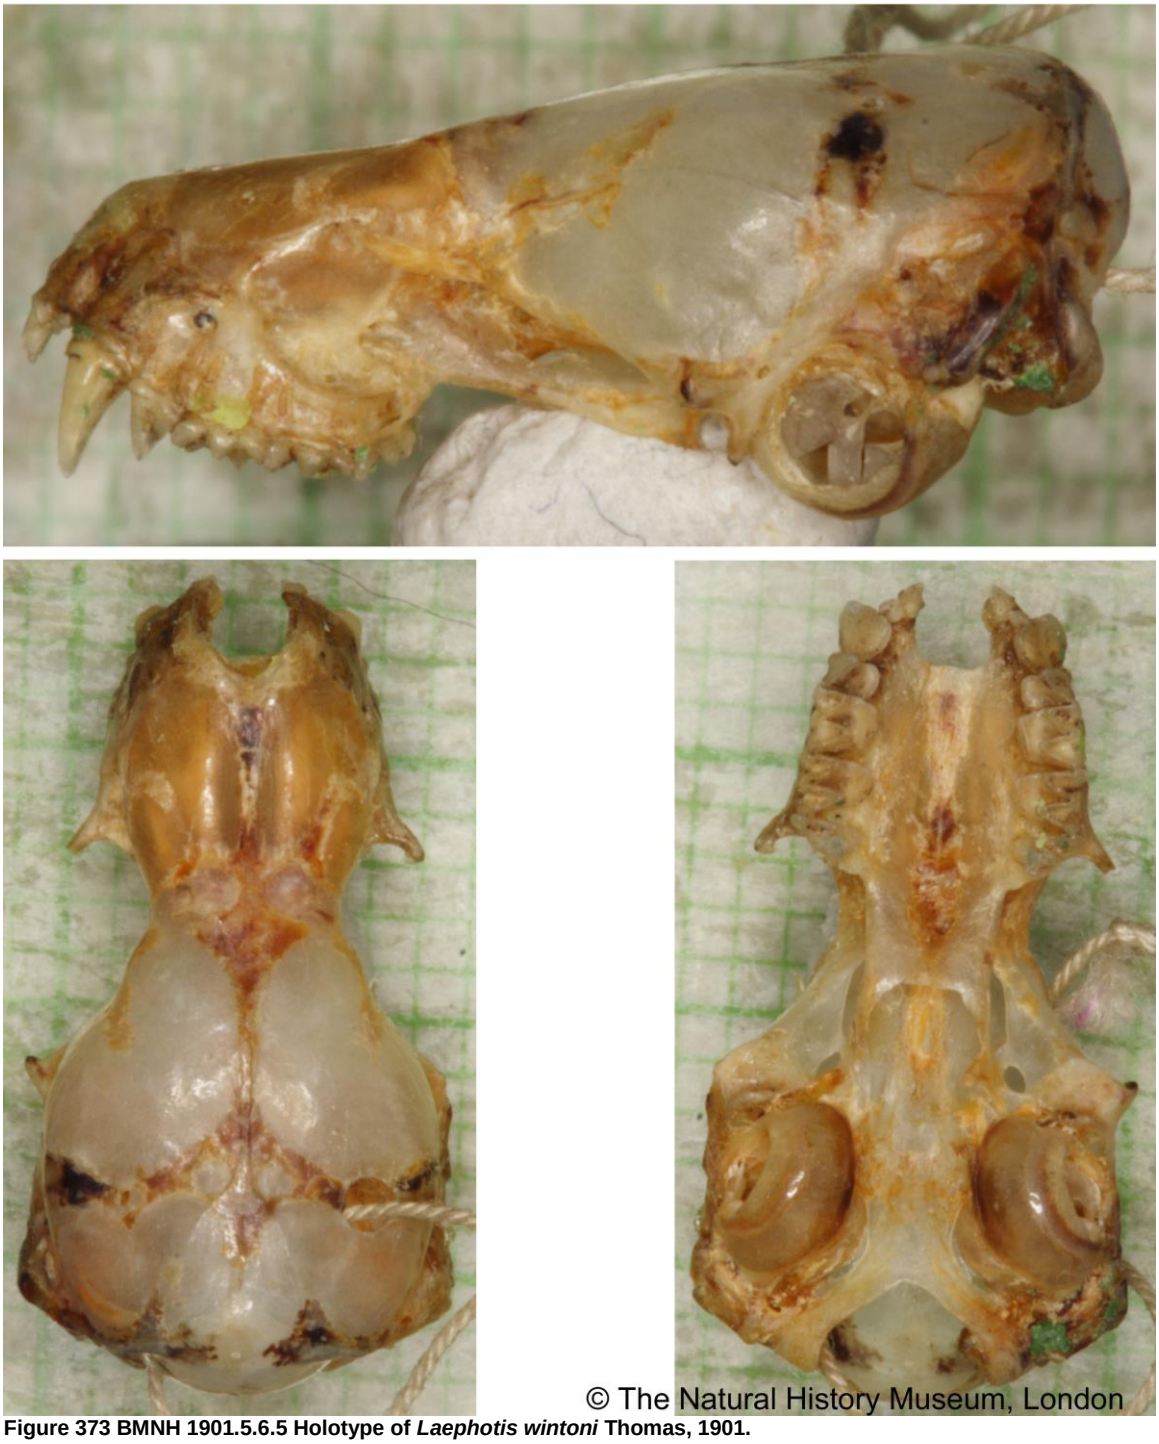

Figure 373 BMNH 1901.5.6.5 Holotype of *Laephotis wintoni* Thomas, 1901.

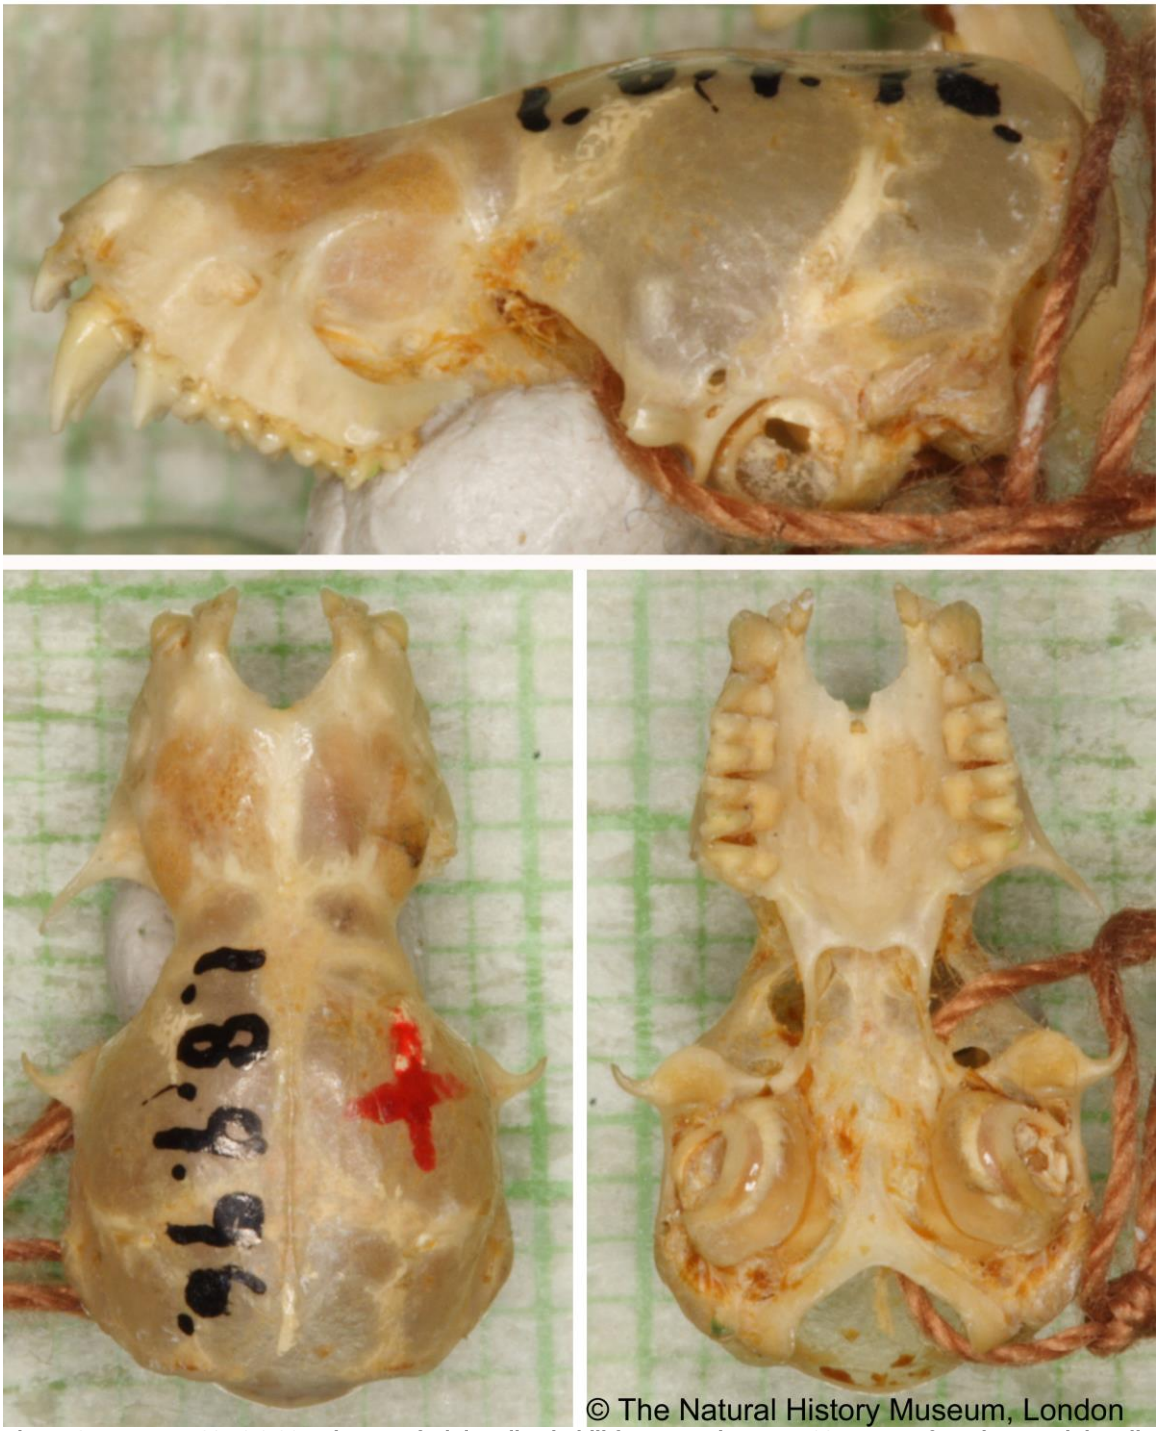

Figure 374 BMNH 1901.8.9.96 Holotype of *Pipistrellus kuhlii fuscatus* Thomas, 1901, now referred to as *Pipistrellus hesperidus*.

Figure 375 BMNH 1902.11.4.1 Holotype of *Pipistrellus deserti* Thomas, 1902.

Figure 376 BMNH 1903.2.7.14 Holotype of *Glauconycteris floweri* de Winton, 1901, now referred to as *Eptesicus floweri*.

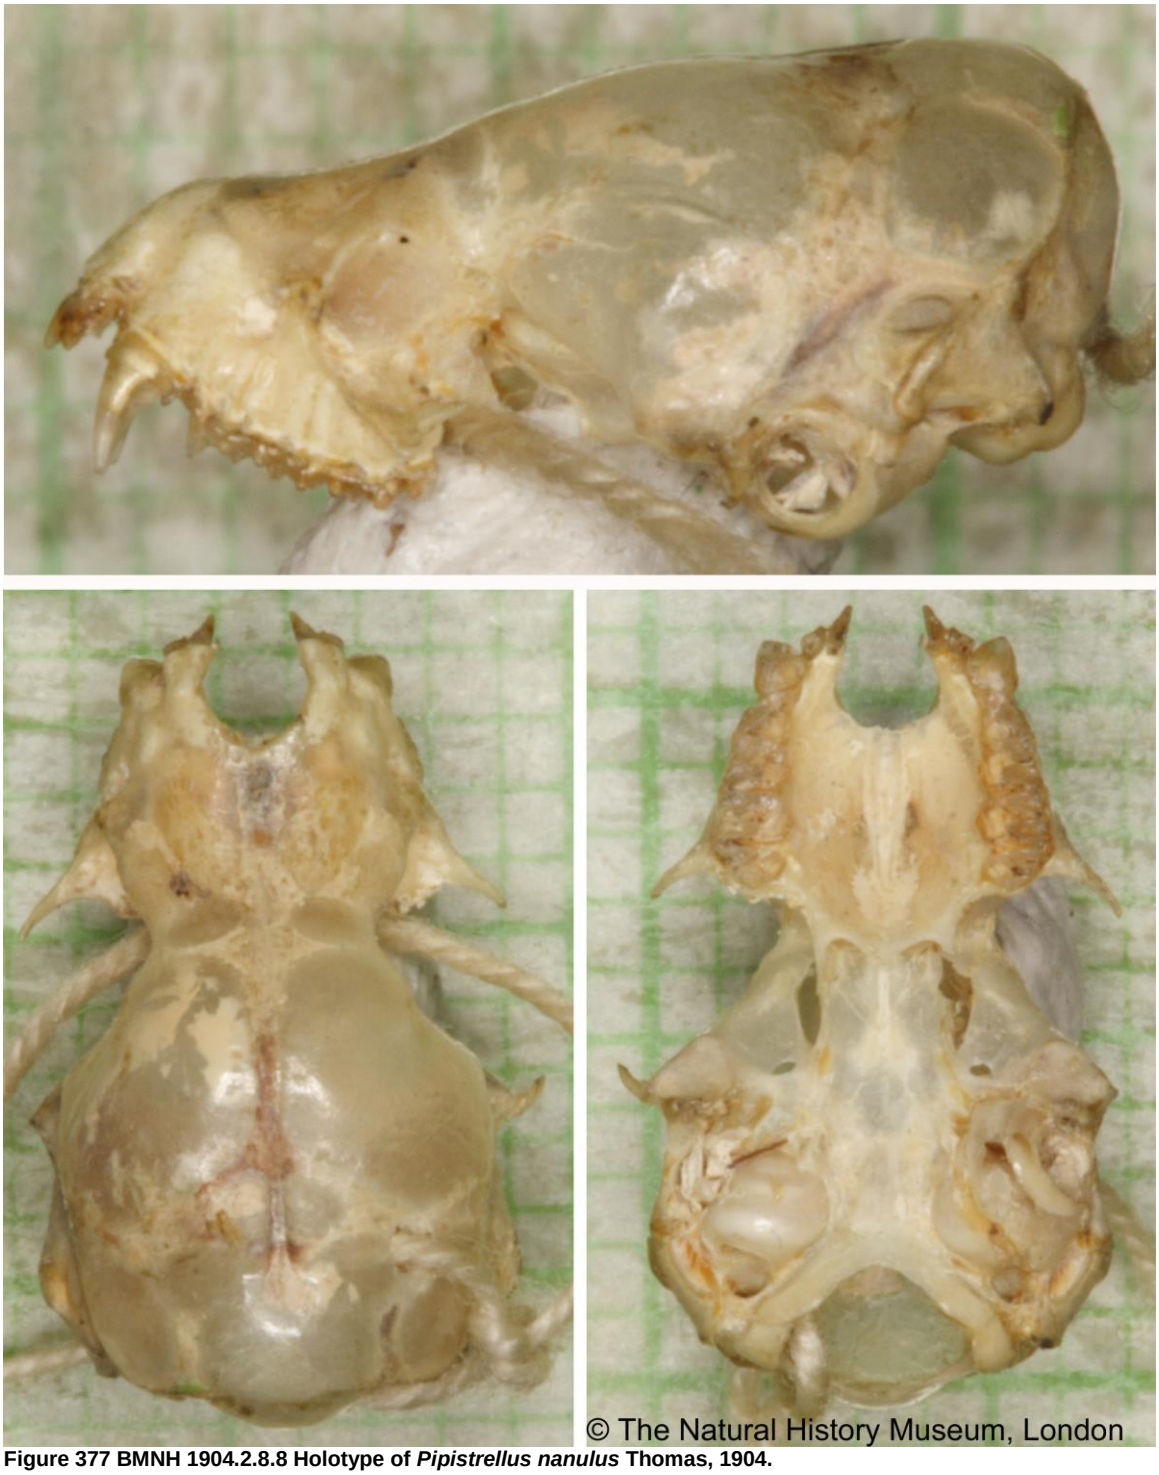

Figure 377 BMNH 1904.2.8.8 Holotype of *Pipistrellus nanulus* Thomas, 1904.

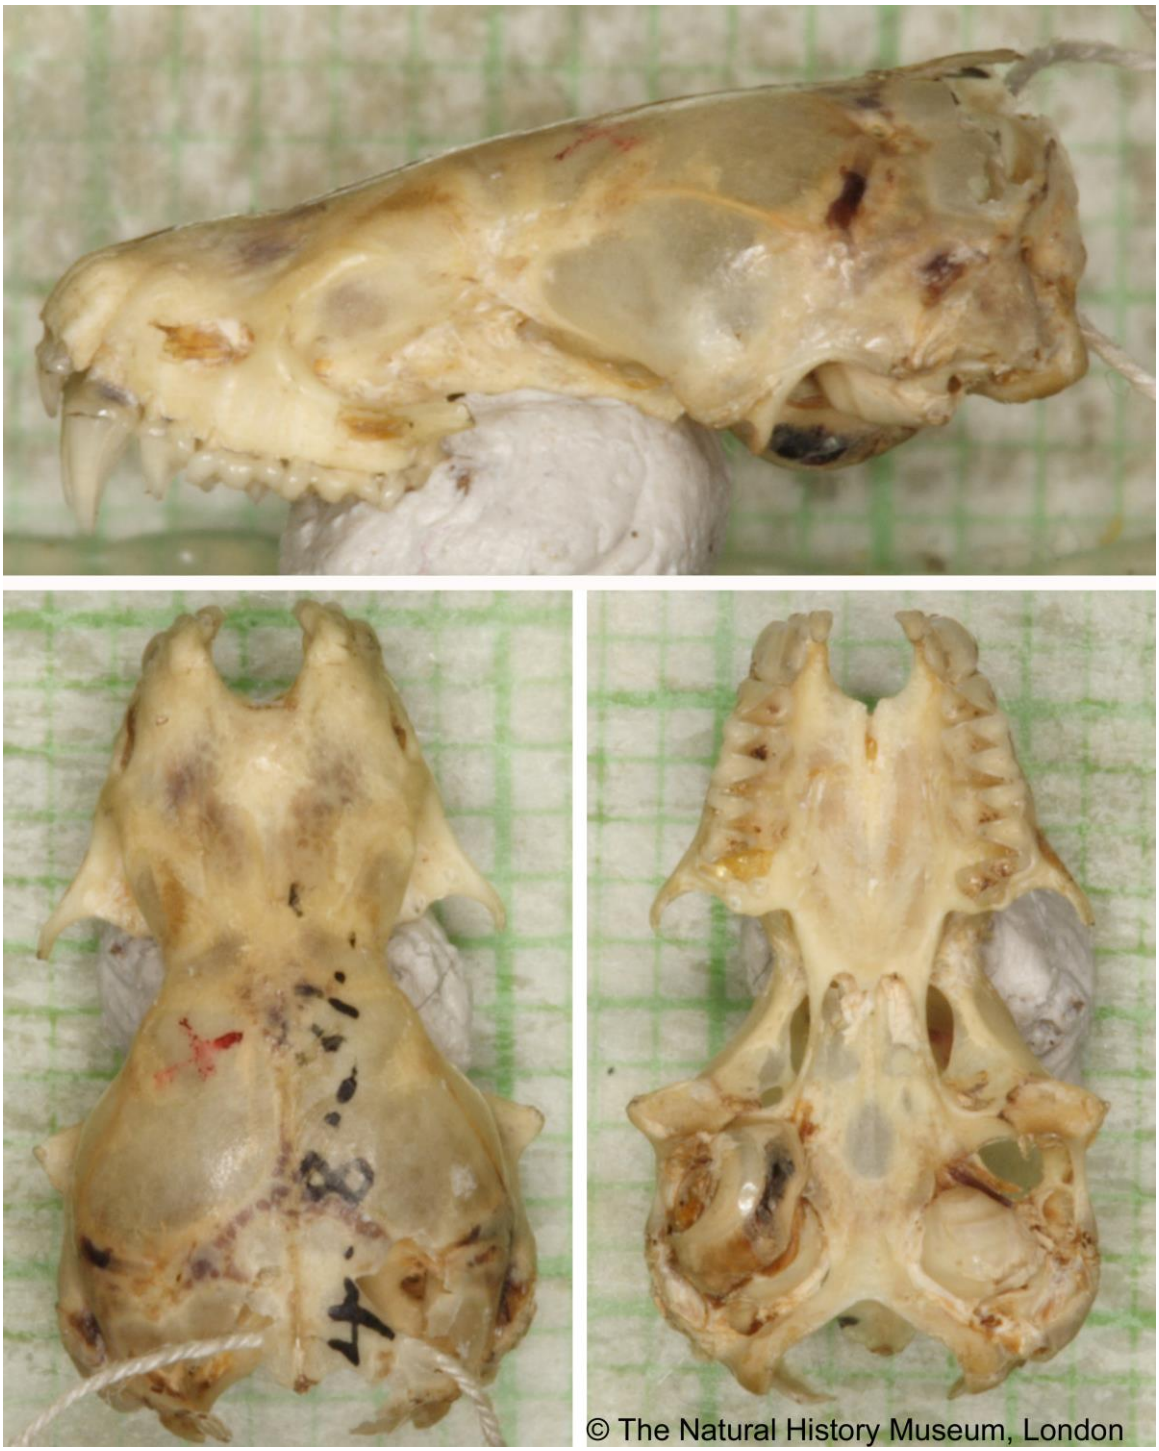

Figure 378 BMNH 1904.8.31.3 Holotype of *Vespertilio capensis gracilior* Thomas and Schwann, 1905, the species is now referred to as *Neoromicia capensis*.

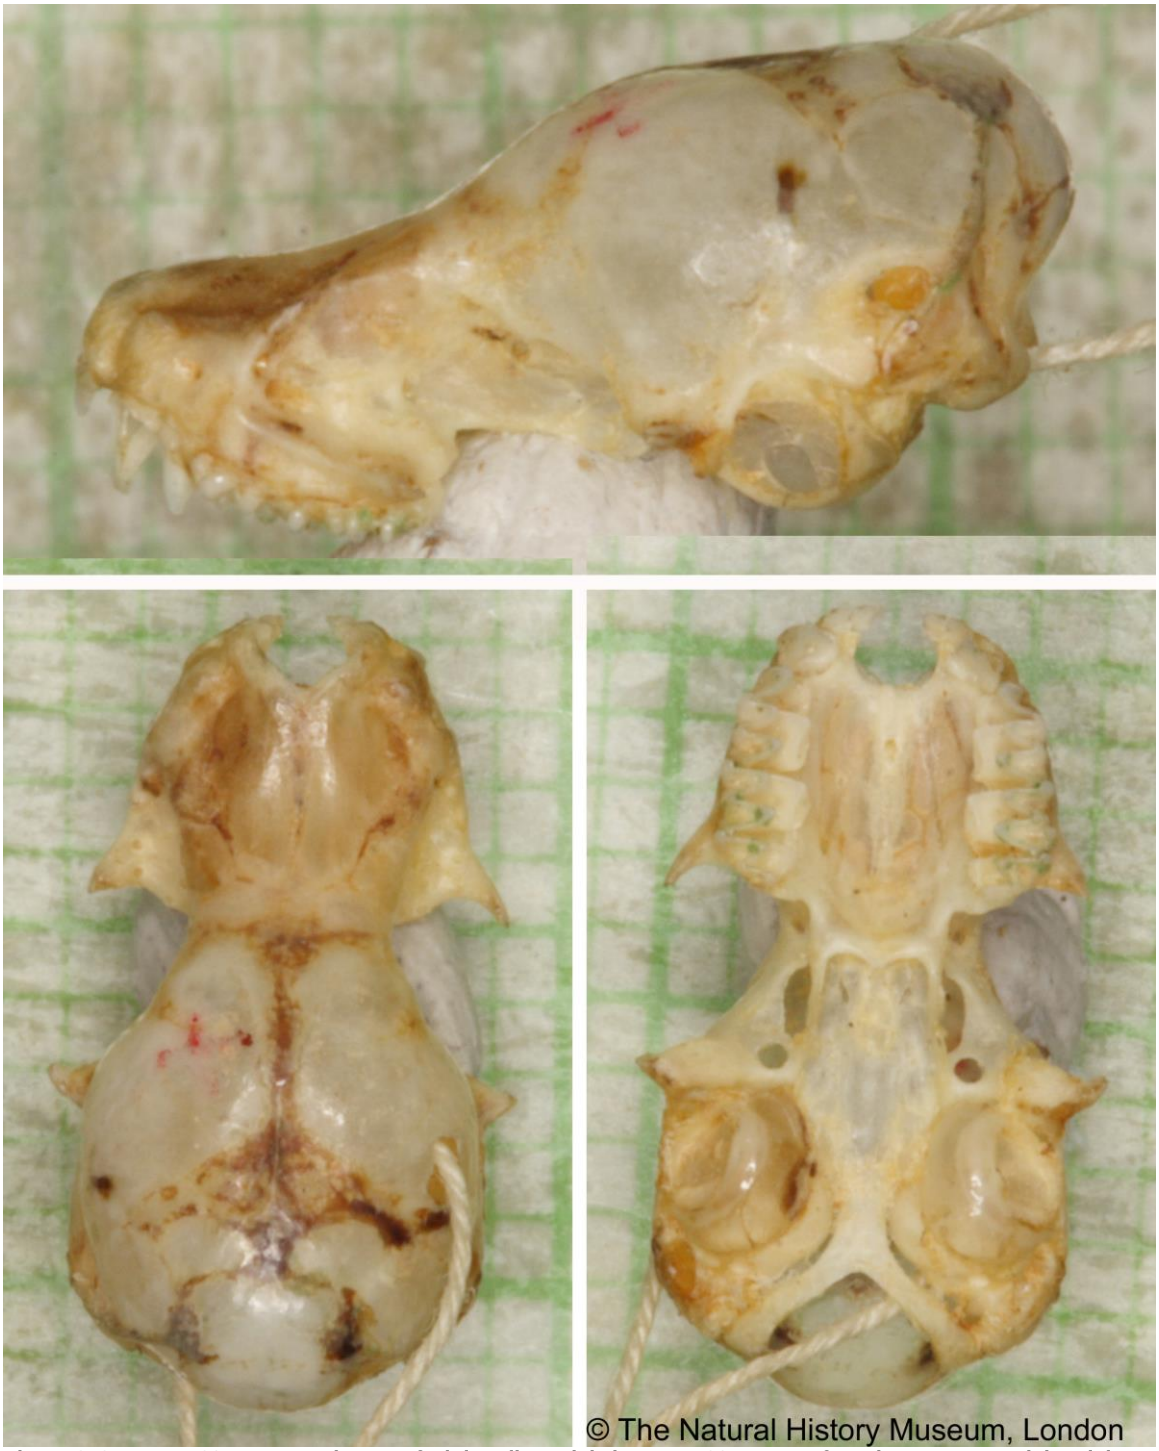

Figure 379 BMNH 1904.11.4.7 Holotype of *Pipistrellus ariel* Thomas, 1904, now referred to as *Neoromicia ariel*.

Figure 380 BMNH 1906.1.3.1 Syntype of *Vesperugo anchieta* de Seabra, 1900, now referred to as *Hypsugo anchietae*.

Figure 381 BMNH 1906.7.1.5 Holotype *Pipistrellus fuscipes* Thomas, 1913, currently recognised as *Pipistrellus rueppellii fuscipes*.

Figure 382 BMNH 1907.1.1.392 Holotype *Ptergistes madeirae* Barrett-Hamilton, 1906, currently recognised as a synonym of *Nyctalus leisleri* (Kuhl, 1817).

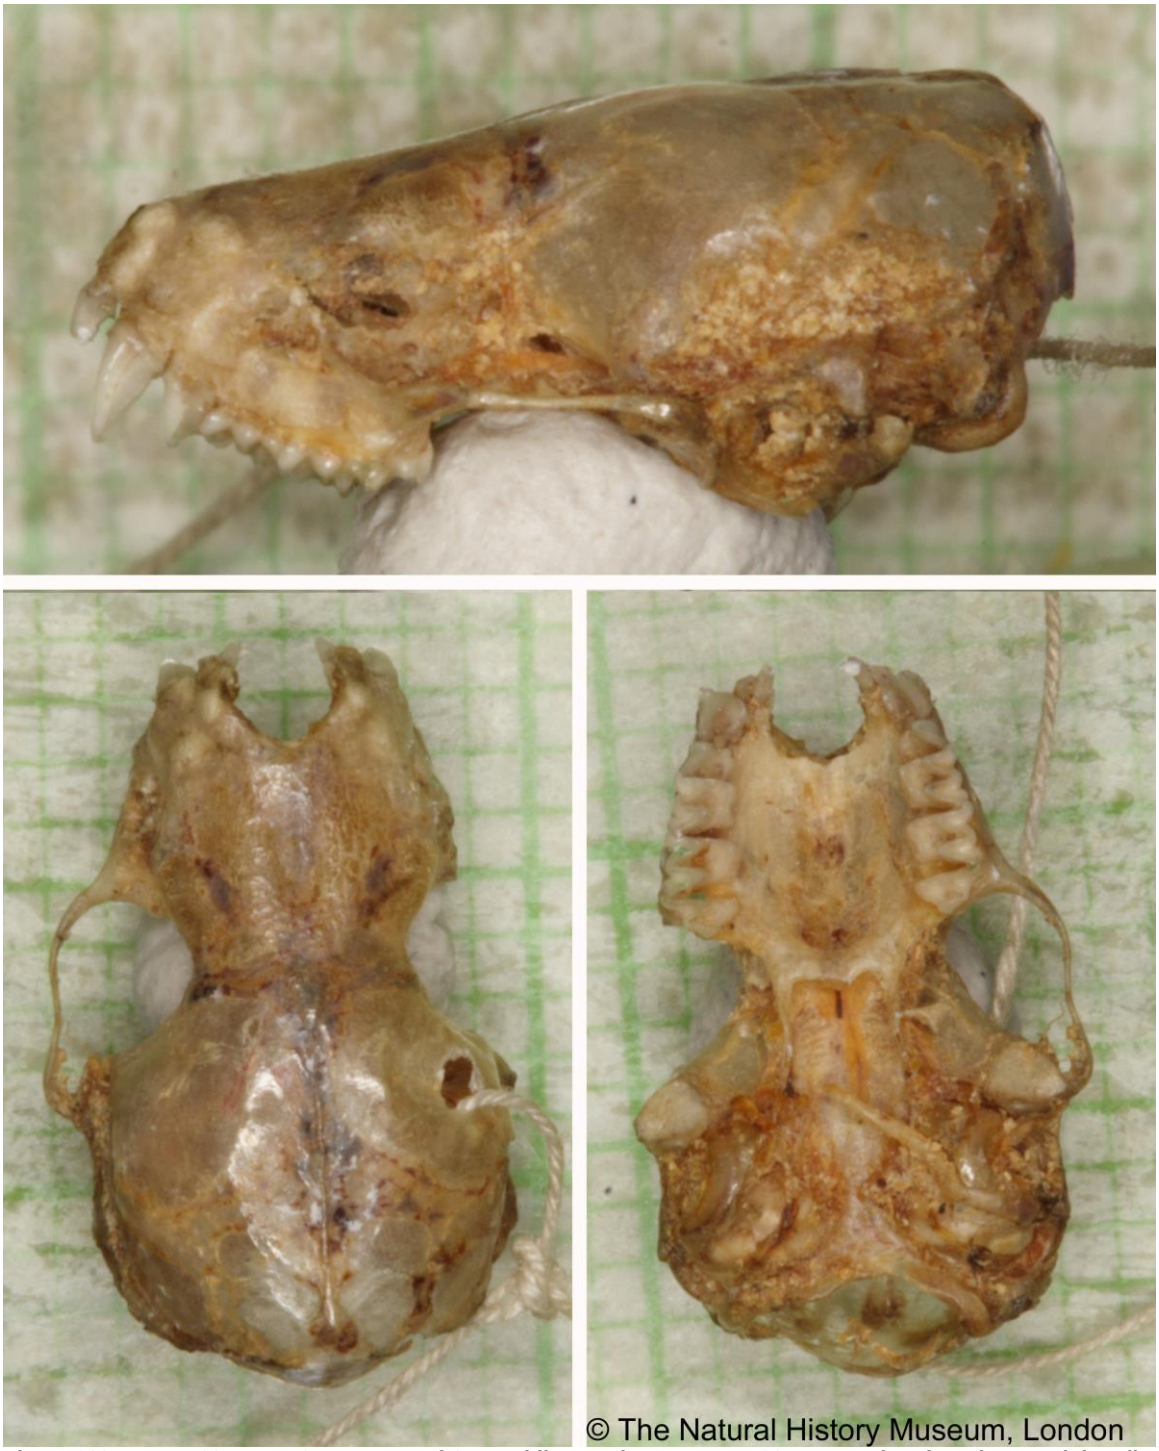

Figure 383 BMNH 1907.1.1.419 Lectotype of *Scotophilus rusticus* Tomes, 1861, currently referred to as *Pipistrellus rusticus*.

Figure 384 BMNH 1907.1.1.420 Paralectotype of *Scotophilus rusticus* Tomes, 1861, currently referred to as *Pipistrellus rusticus*.

Figure 385 BMNH 1907.1.1.422 Syntype of *Vespertilio nanus* Peters, 1952, currently referred to as *Pipistrellus nanus*.

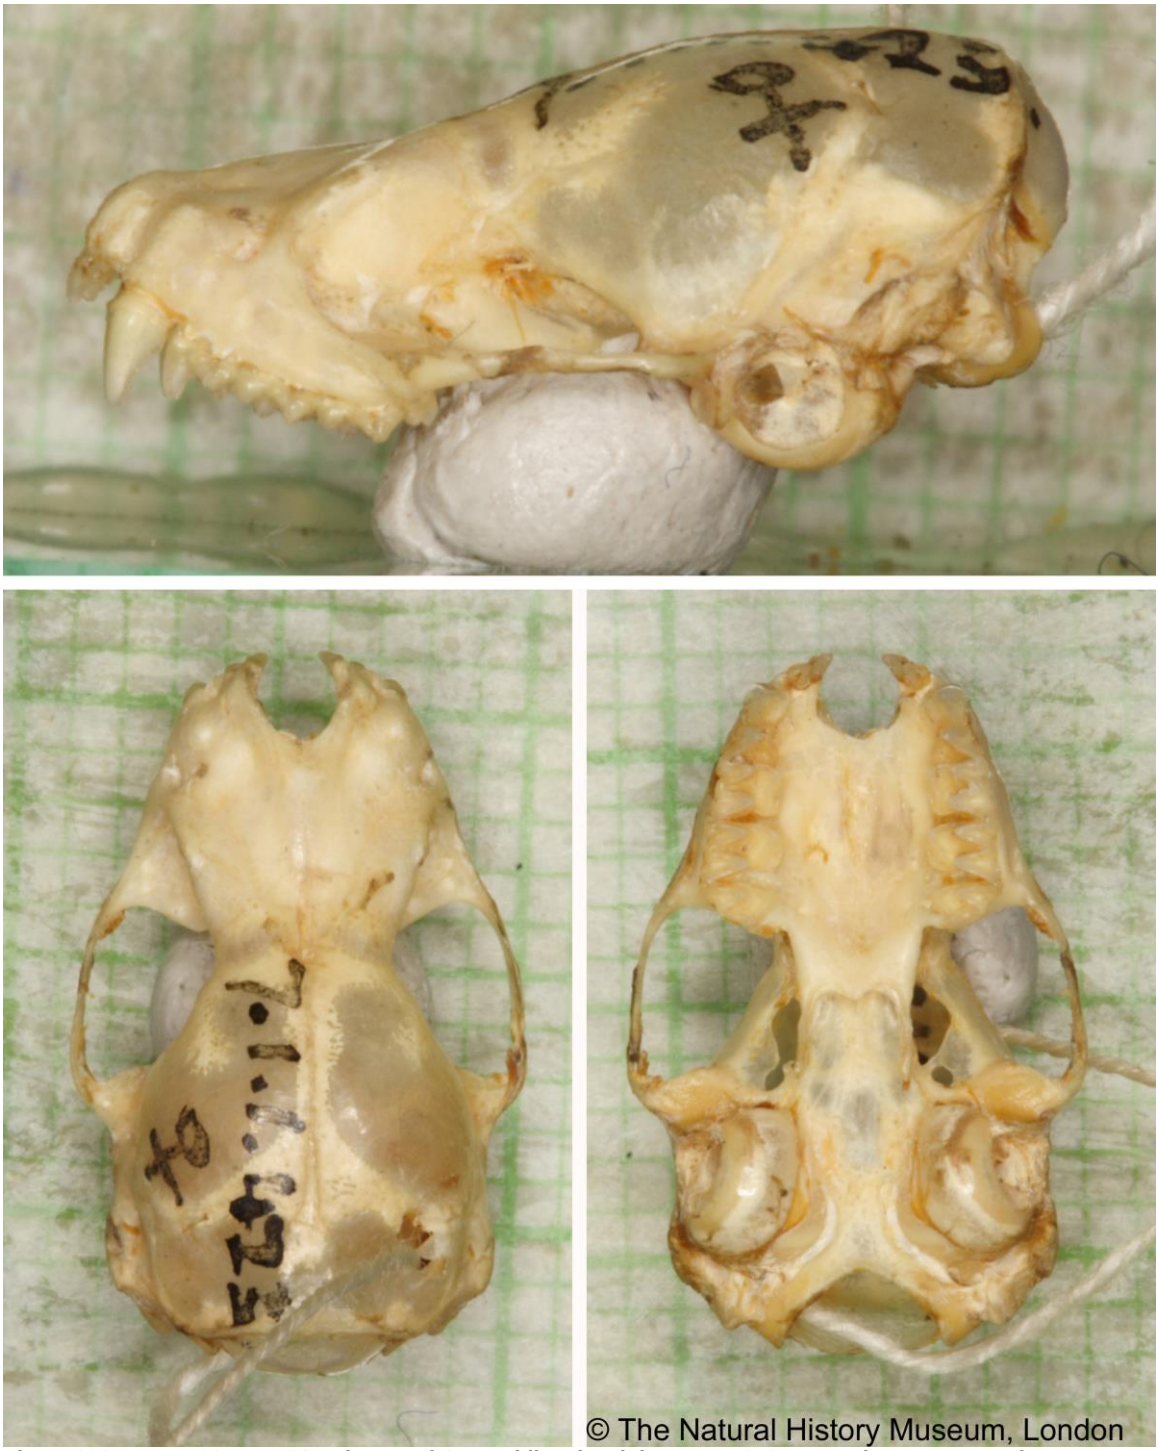

Figure 386 BMNH 1907.1.1.423 Holotype of *Scotophilus darwini* Tomes, 1859, currently a synonym of *Hypsugo savii* (Bonaparte, 1837).

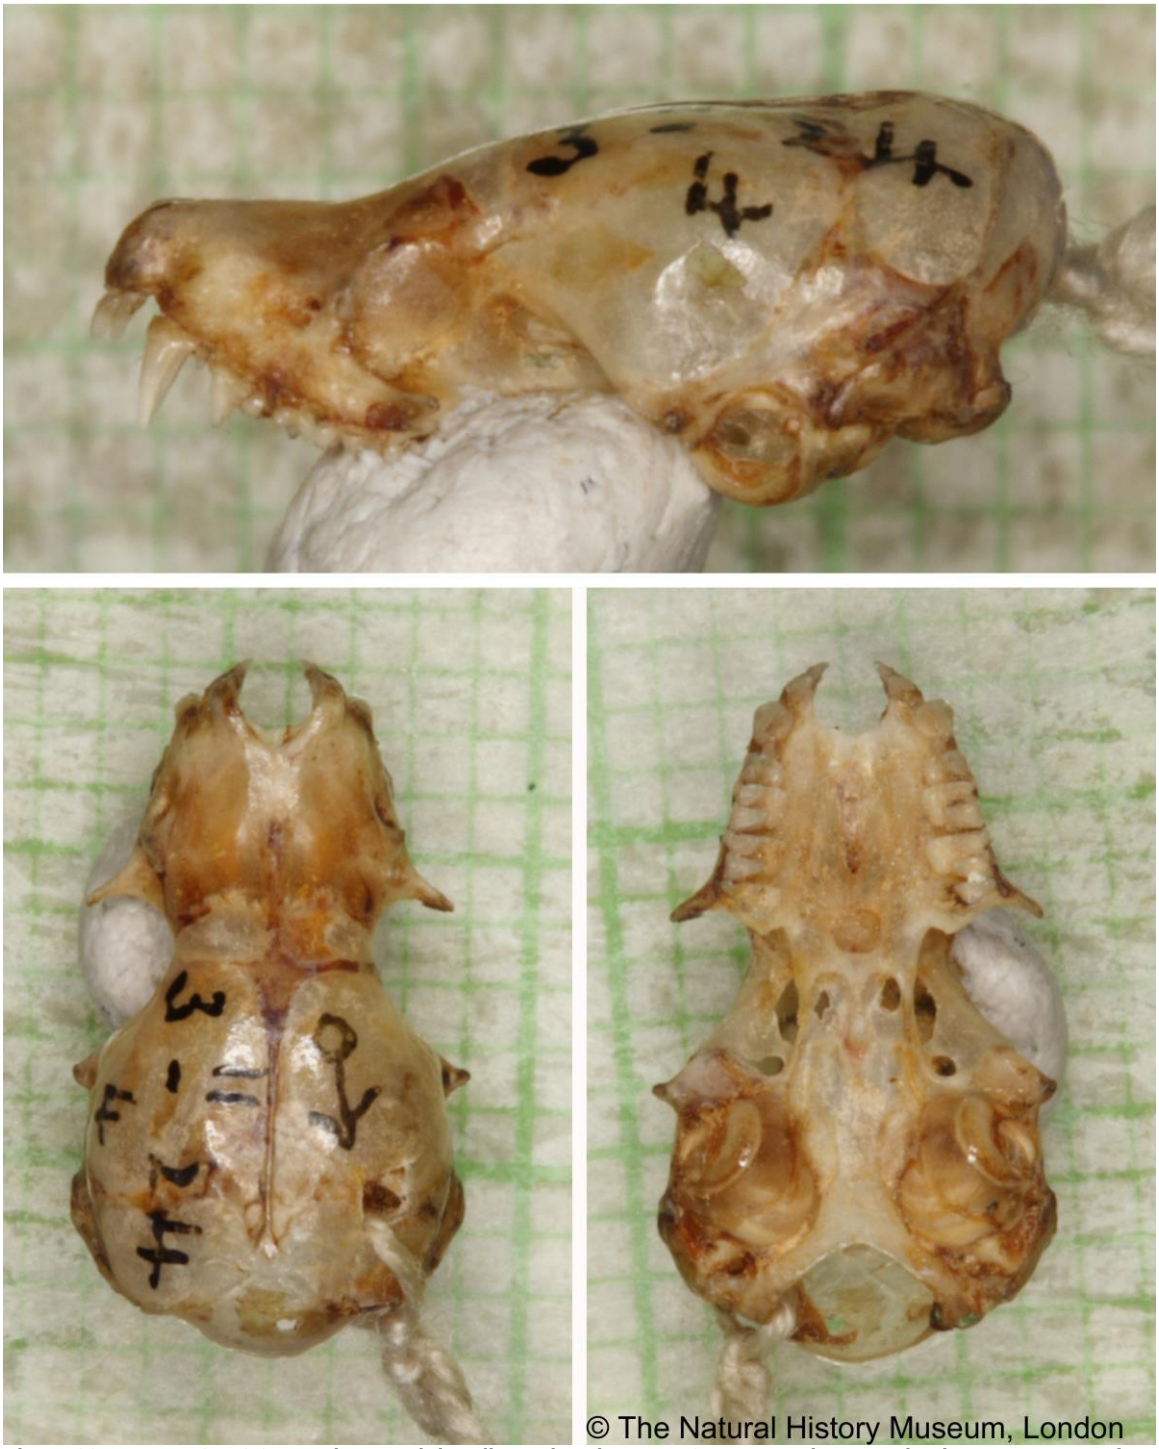

Figure 387 BMNH 1911.3.24.4 Holotype *Pipistrellus culex* Thomas, 1911, currently recognised as a synonym of *Pipistrellus nanus* (Peters, 1852).

Figure 388 BMNH 1913.2.8.1 Holotype of *Pipistrellus musciculus* Thomas, 1913, currently referred to as *Hypsugo musciculus*.

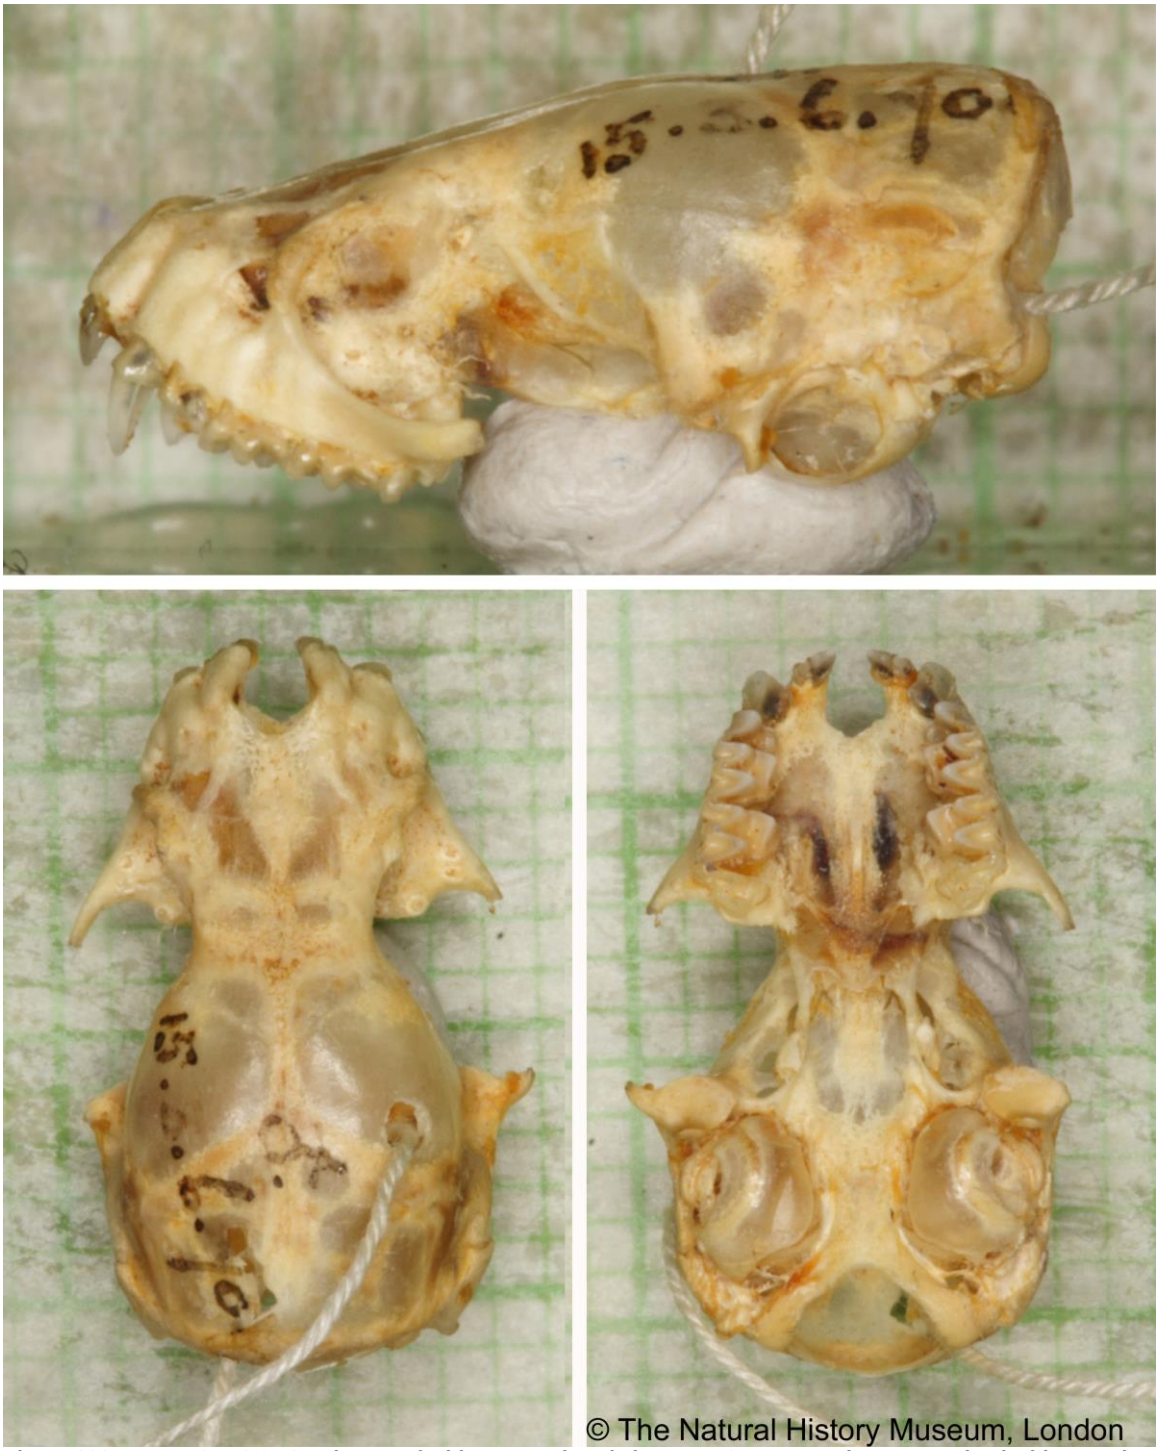

Figure 389 BMNH 1915.3.6.70 Holotype of *Rhinopterus lowei* Thomas, 1915, currently synonomised with *Eptesicus floweri* (de Winton, 1901).

Figure 390 BMNH 1919.7.7.3528 Holotype of *Vesperugo (Vesperus) innesi* Lataste, 1887, currently synonymised with *Eptesicus bottae* (Peters, 1869).

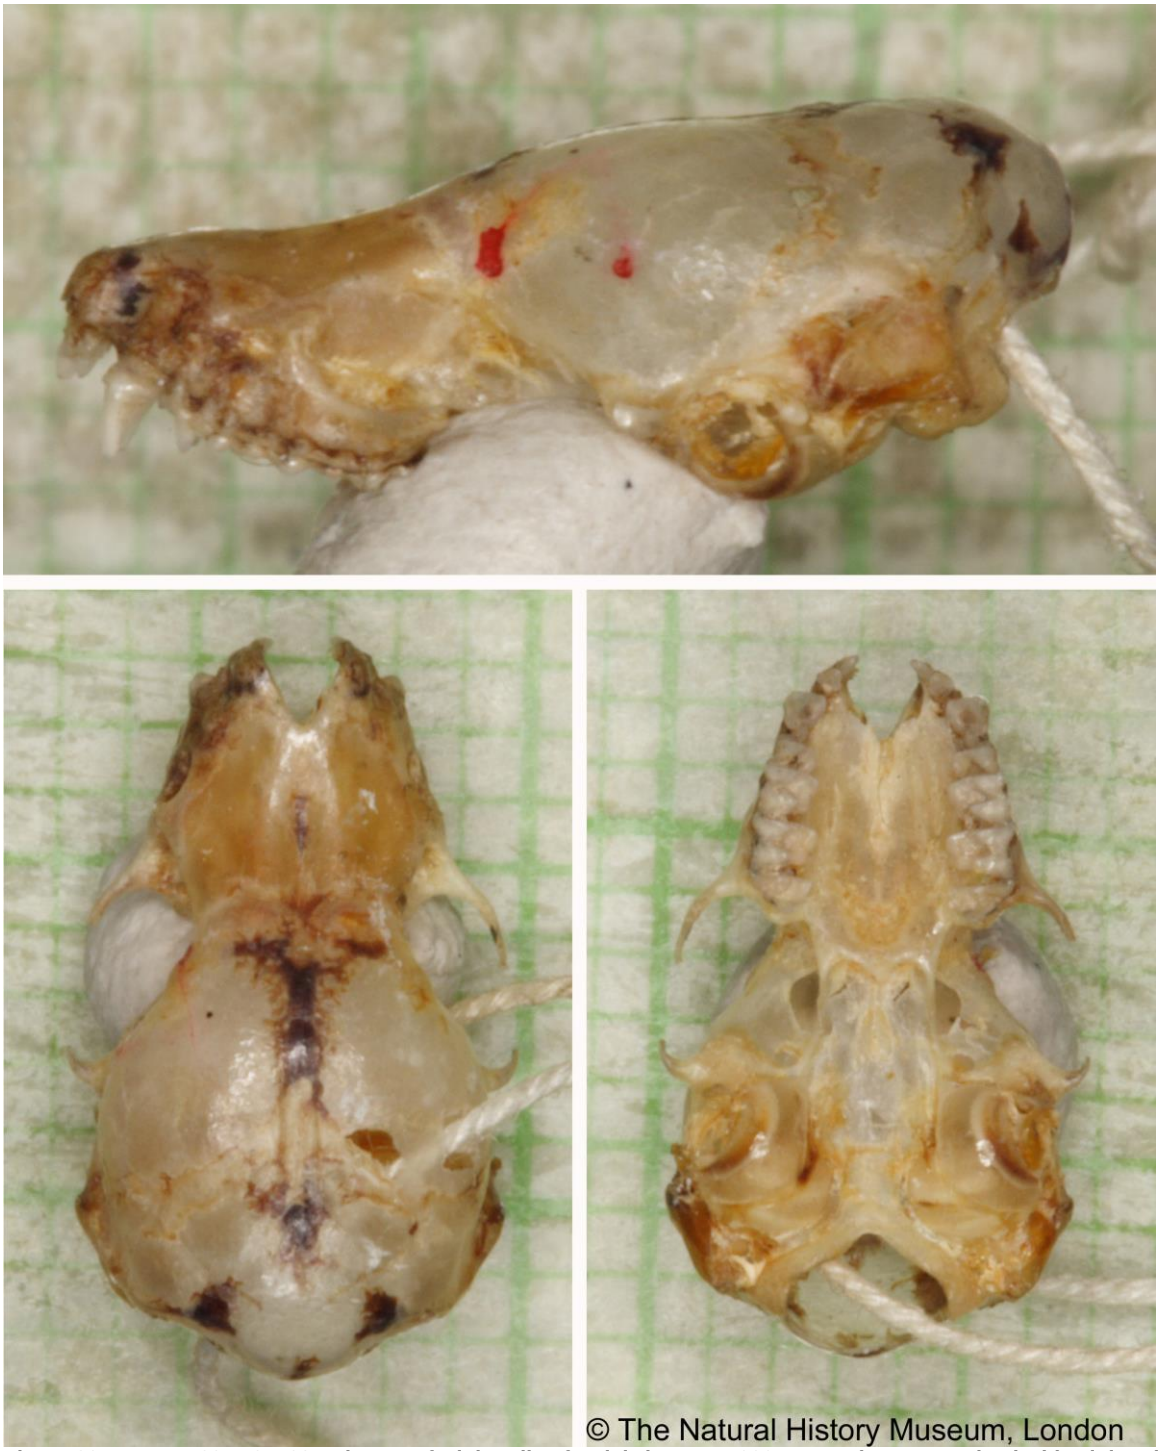

Figure 391 BMNH 1925.12.4.20 Holotype of *Pipistrellus fouriei* Thomas, 1926, currently synonymised with *Pipistrellus nanus* (Peters, 1852).

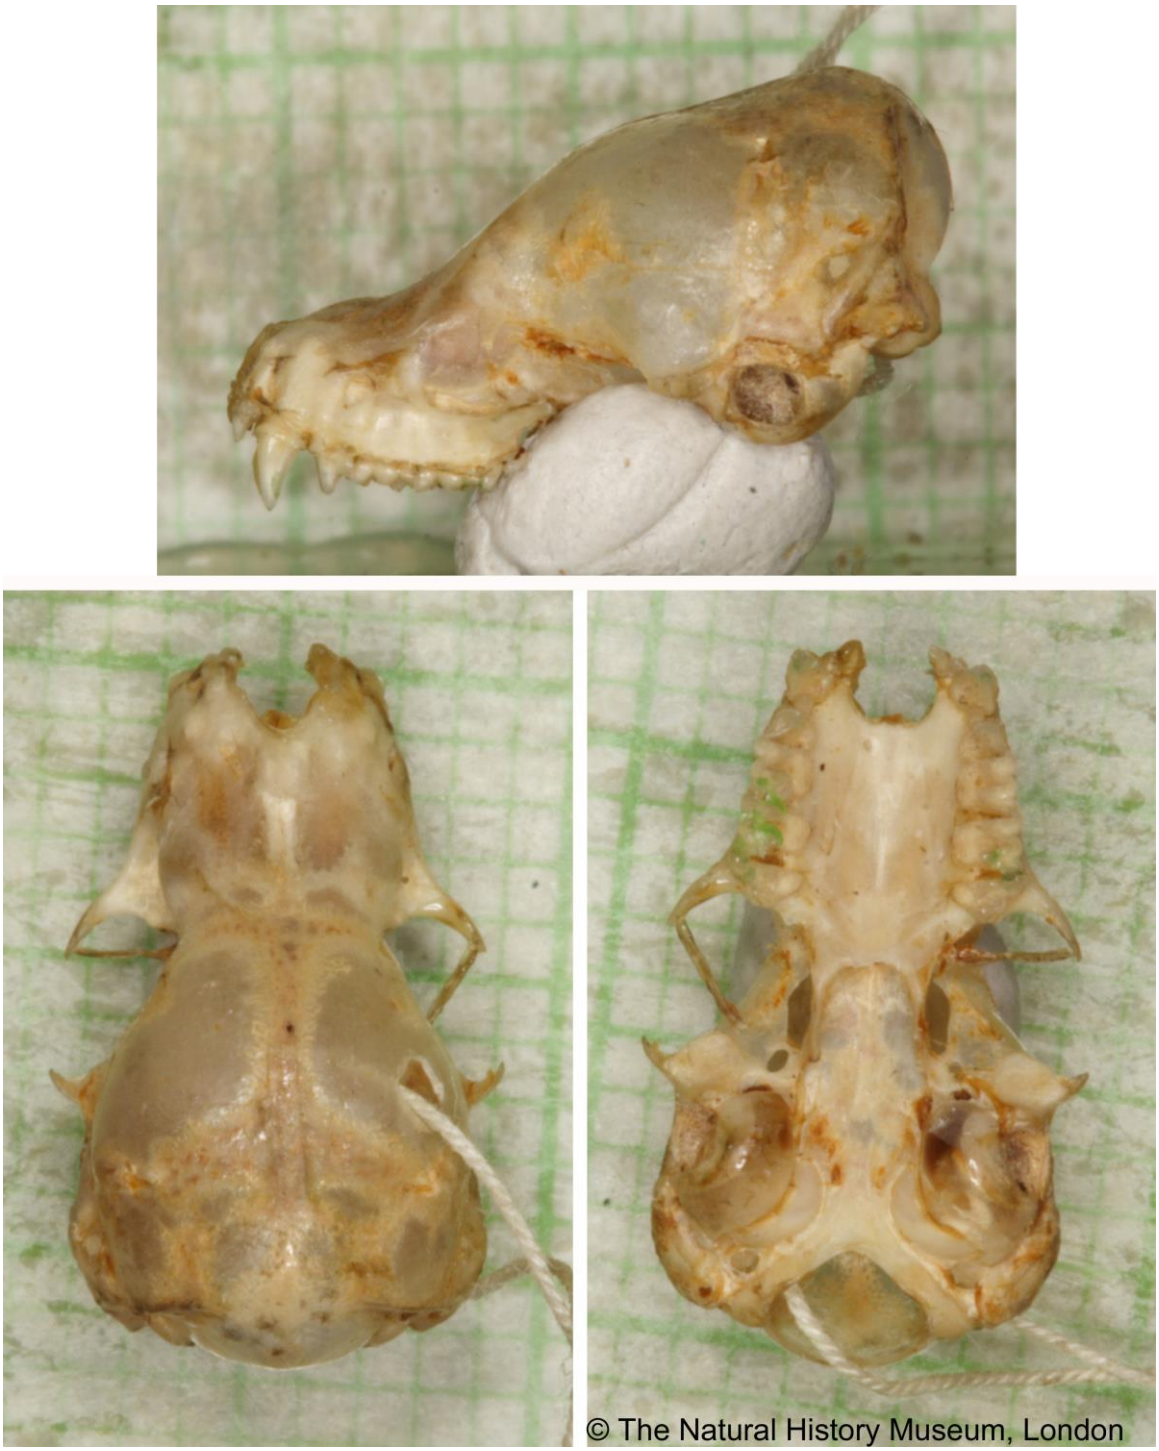

Figure 392 BMNH 1955.8.16.34 Holotype of *Vesperugo maderensis* Dobson, 1878, currently known as *Pipistrellus maderensis*.

Figure 393 TM 1021 Holotype of *Rhinolophus swinnyi* Gough, 1908.

Figure 394 TM 2286 Holotype of *Cistugo lesueuri* Roberts, 1919

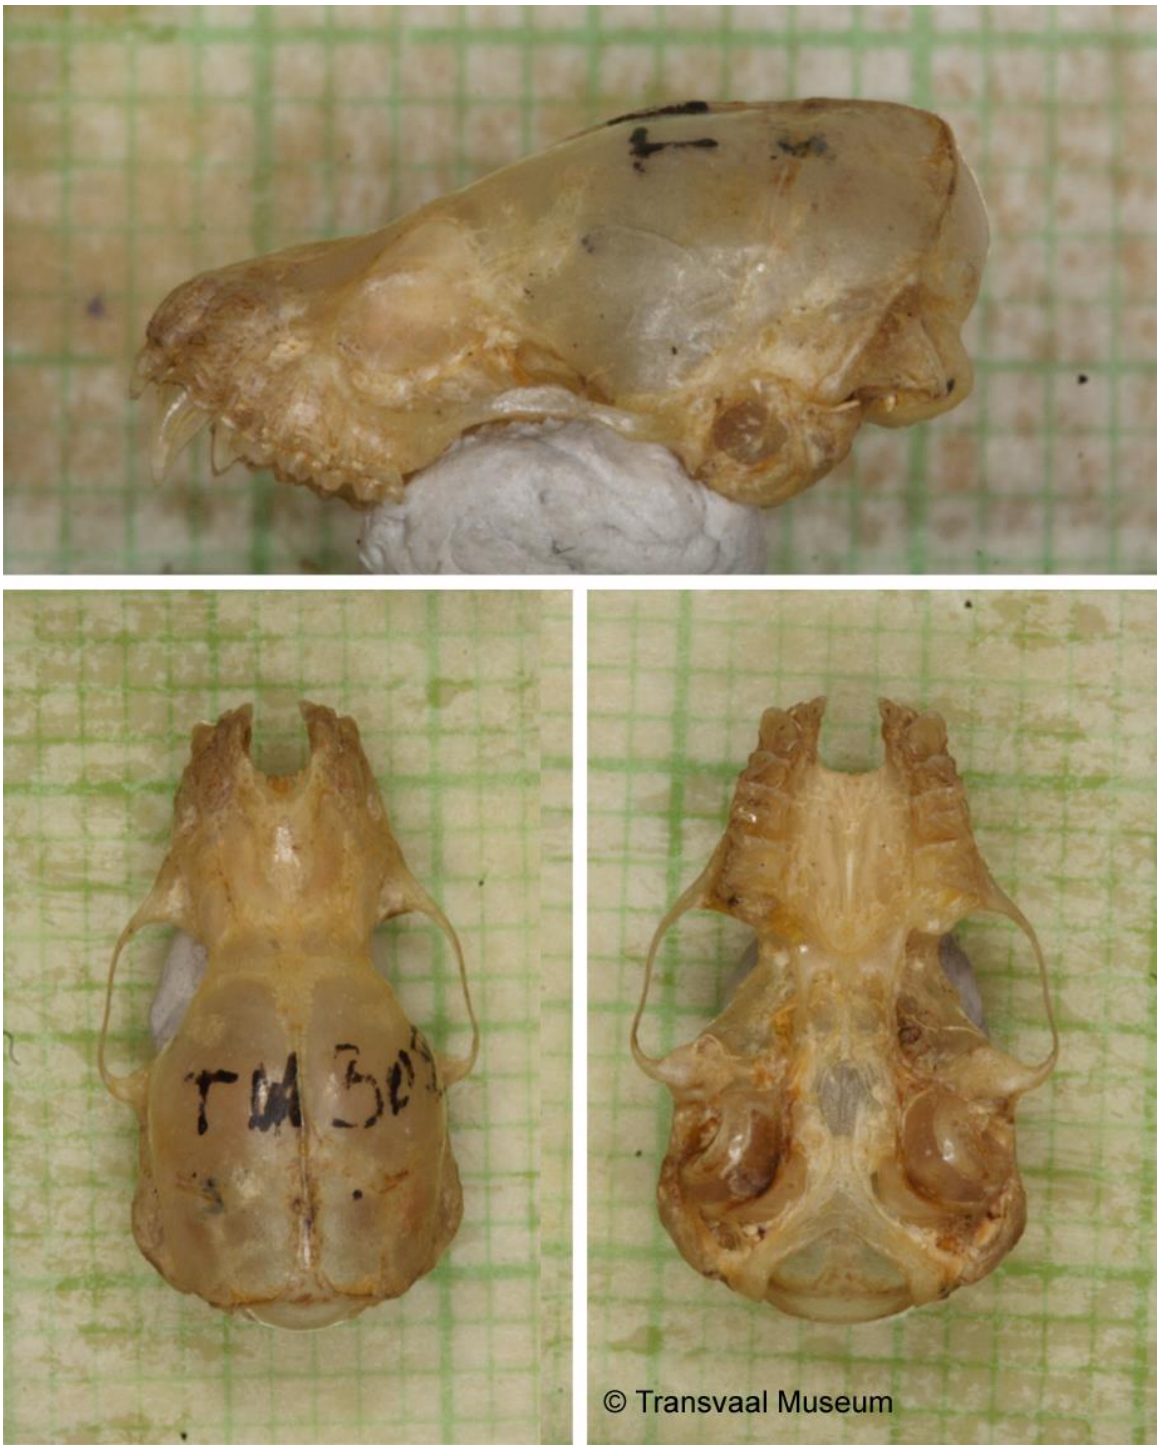

Figure 395 TM 3024 Holotype of *Eptesicus zuluensis* Roberts, 1924, now referred to as *Neoromicia zuluensis*.

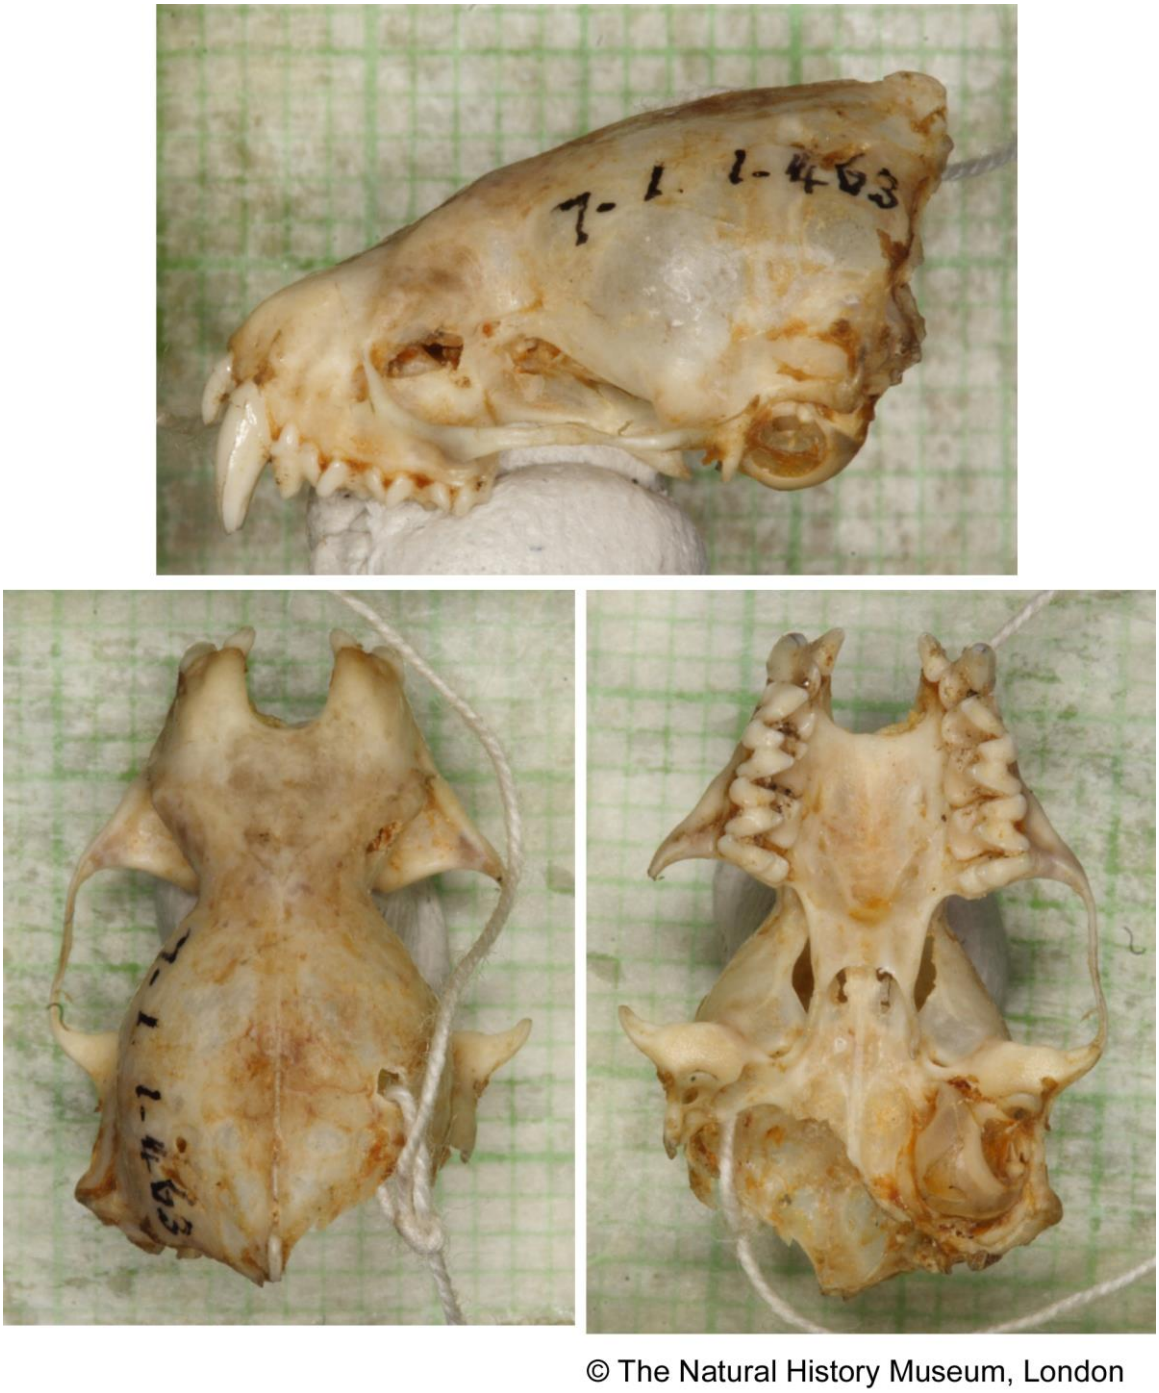
Figure 396 BMNH 1872.10.24.5 Type of *Scotophilus gigas* Dobson, 1875, now referred to as *Scotophilus nigrita* (Schreber, 1774).



© The Natural History Museum, London

Figure 397 BMNH 1907.1.1.463 Holotype of *Scotophilus damarensis* Tomas, 1906, now referred to as *Scotophilus leucogaster* (Cretzschmar, 1826).

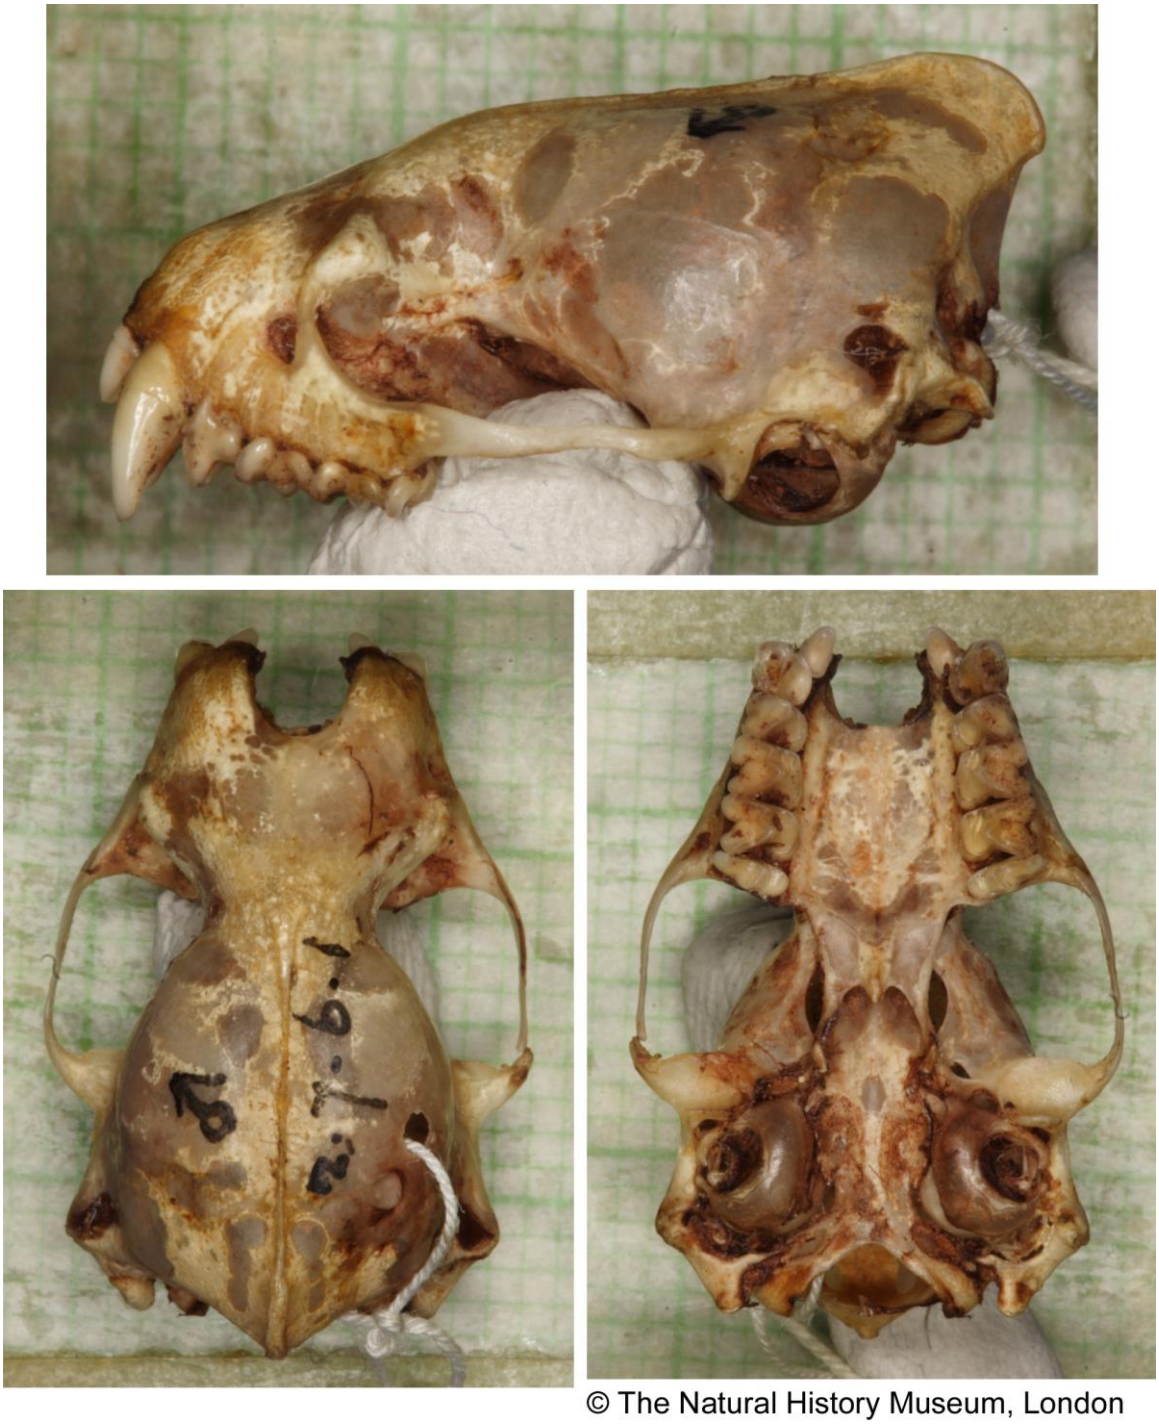


Figure 398 BMNH 1902.7.6.11 Holotype of *Scotophilus nigrita colias* Thomas, 1904, now referred to as *Scotophilus dinganii* (A. Smith, 1833).

Figure 399 BMNH 1903.2.4.5 Holotype of *Scotophilus nigrita nux* Thomas, 1904, now referred to as *Scotophilus nux* (Thomas, 1904).

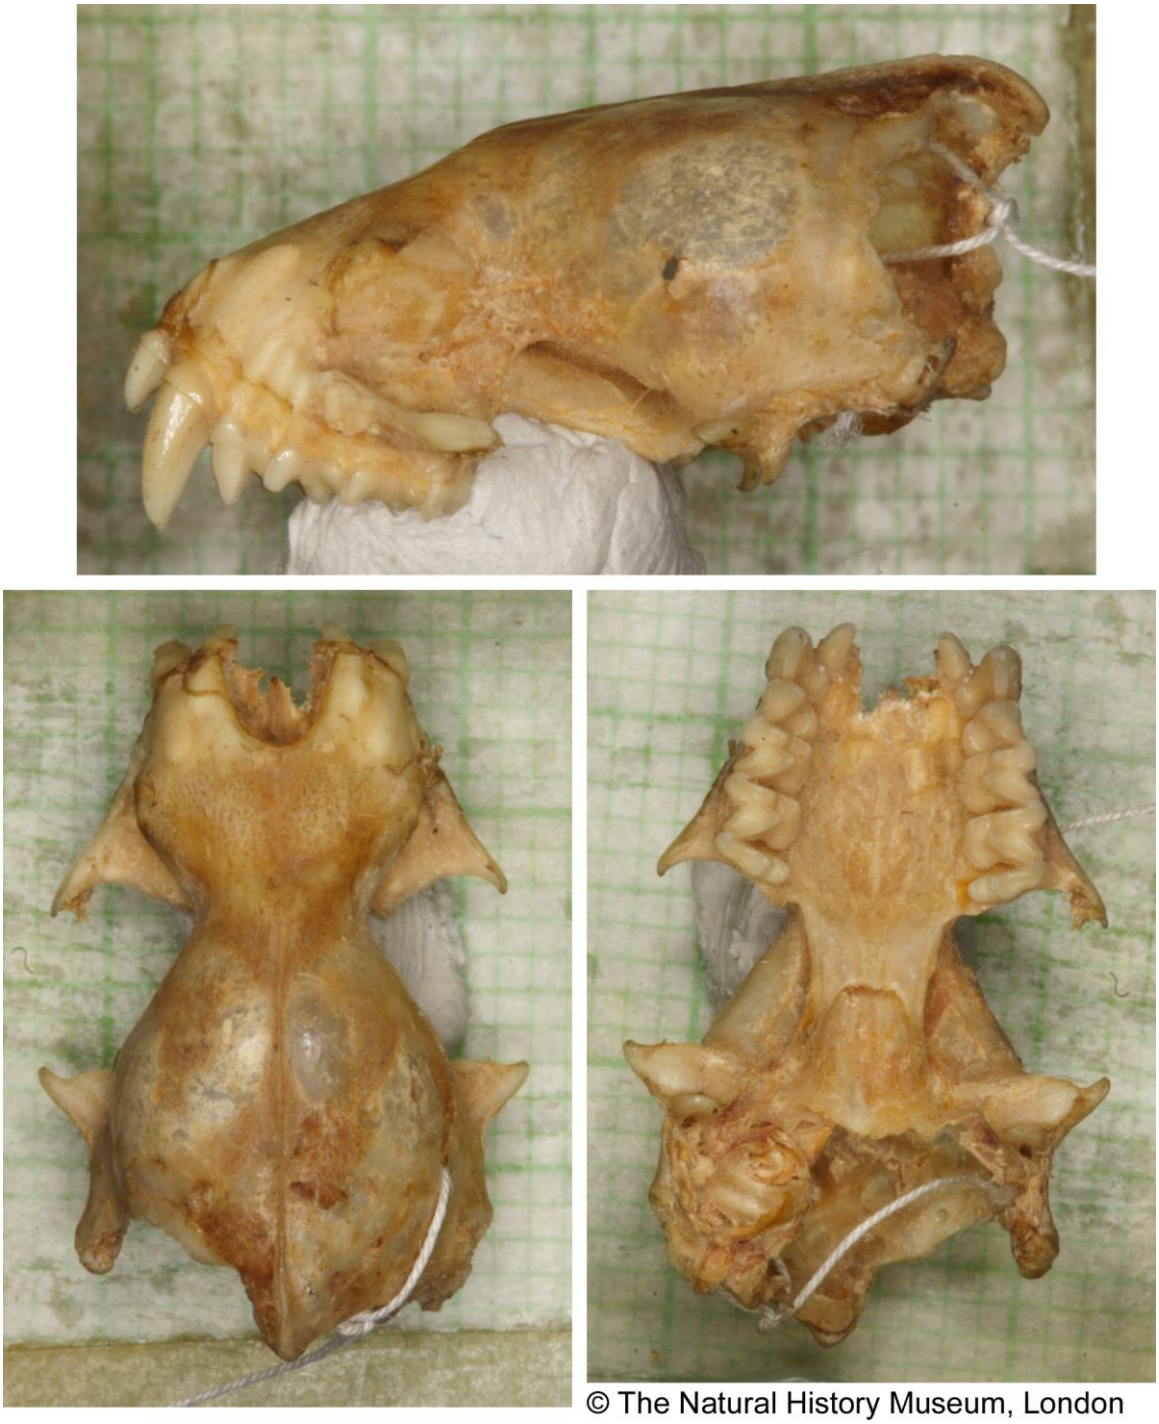

Figure 400 BMNH 1903.1.1.449 Holotype of *Scotophilus nigrita herero* Thomas, 1906, now referred to as *Scotophilus dinganii* (A. Smith, 1833).

Appendix 7: Summary of Characteristic Information

Appendix 7a: Echolocation call Parameters from Literature

ACR taxon - the taxon names as used in the current African Chiroptera Report.

ind.: the number of individuals used to record echolocation from, if indicated the number recorded in different contexts is shown, and what sex and age (j. = juvenile, a. = adult, f = female, m = male) the individuals where.

calls: the number of calls on which the analysis of the different echolocation parameters was based.

Duration of the call and interpulse interval in milliseconds.

Lowest and highest frequency, frequency with the most energy and bandwidth in kHz. * - fundamental frequency not first harmonic. ** - frequency at the knee values from Anabat recordings.

Band: frequency bandwidth.

Where available the call parameter information given is the mean, in brackets the standard deviation, then the range.

Reference of the publication from which the information was taken.

ISSN 1990-6471

Appendix 7b: Methods used in Echolocation Literature

Reference	Sound detector type	Analysis hardware / software	Sound transfer method	Analysis parameters	Notes
Aspetsberger et al. (2003)	Anabat II	ANALOOK (version 4.8b)	Sony cassette recorder TCM-17 (frequency response 0.09-8 kHz)	Recorded a calibration tone of 40 kHz with each train of bat calls to standardize for variation in tape speed. Only search phase calls, i.e.calls with 100 ms separating them, that were clearly defined. Call parameters were measured from a sonogram after reduction of noise and elimination of echos using the ANALOOK filters.	ANABAT uses a frequency division combined with zero crossing analysis (ZCAIM), which captures information about the harmonic with the most energy, information on other harmonics is lost, as is all information about signal strength.
Fahr and Ebigbo (2003)	Pettersson D 240 (10x & 20x time expansion mode)	Avisoft-SASLab Pro 4.2	Sony Walkman Professional WM-D6C	Measured CF frequency (maximum amplitude, second harmonic) with spectrograms (Hanning window, FFT length 512)	
Fenton (1975)	Holgate ultrasonic sensor (tunable from 10-180 KHz)				
Fenton and Bell (1981)	Broadband microphone (Non Linear Systems Miniascope, Model MS-15), zero crossing period meter & portable oscilloscope	Kay Sonograph model 7029A & Princeton Applied Reseach model 4513	Lockheed (Racal) Store 4D tape recorder operating at 76 cm/s or 152 cm/s	Only search phase calls analysed. Oscilloscope settings usually 2 ms or 5 ms per division, but for 10 ms better for molossids or rhinolophids. Calls slowed down appropriately for analysis. Fast Fourier transform (FFT), real time spectrum analyzer (2048 lines, alias filter in, flat weighting). FFT provides machine averaged spectra with no statistical output.	Analysis of recorded calls of known individuals before identified free flying bats from period meter display of calls. Low end frequency modulated calls more reliable as less subject to atmospheric attenuation than higher frequencies.
Fenton et al. (2004)	Pettersson D980	BatSoundPro	Ines DAQ i508 high speed card to a Dell Latitude PC	Sampling at 250 kHz, 16 bit, recording 60s intervals separated by 10s to reset the system. Interval between calls was recorded from the frequency change of time plot - threshold 16. Duration was measured from the time-amplitude plot. Frequency information was recorded from the power spectrum. Highest and lowest frequencies were recorded as the kHz at - 55 dB levels, and frequency with the most energy was recorded from FFT 512, Hanning window. Up to 10 calls were analysed from any train of calls recorded.	Orientation of the detector to the bat maximised to account for distance limitations in detecting calls.

Reference	Sound detector type	Analysis hardware / software	Sound transfer method	Analysis parameters	Notes
Taylor et al. (2005)	Pettersson D980	BatSoundPro	Acer Pentium 2 notebook computer	First 10-20 calls in a release sequence ignored if looked atypical to rest of sequence. Sampling at 22 050 Hz for calls <100kHz, at 44 100 Hz for calls >100kHz. Measured duration and inter-call interval from combined time-amplitude and time-frequency displays. Time-amplitude plots with saturated calls were excluded. Frequency information taken from FFT power spectrum (size 512, Hanning window) with - 55 db threshold. Calls of lower intensity were analysed directly from the sonogram, usually at a threshold of 3.

Appendix 8: Abstracts

Adam, F., V. Aellen and M. Tranier (1993). Nouvelles données sur le genre *Myopterus*. Le statut de *Myopterus daubentonii* Desmarest, 1820 (Chiroptera: Molossidae).

New data on the genus *Myopterus*. The status of *Myopterus daubentonii* Desmarest 1820 (Chiroptera: Molossidae) - Five specimens of *Myopterus*, caught in Sénégal in 1973, allow to clarify the taxonomical status of *Myopterus daubentonii* Desmarest, 1820 (Chiroptera: Molossidae). A neotype is designated, housed in the Muséum national d'Histoire naturelle (MNHN), in Paris. Relationships between the so-called *M. daubentonii, M. albatus* and *M. whitleyi* are discussed; it is suggested that *M. albatus* might be a mere subspecies of *M. daubentonii*. New localities are given - or even resurrected - for this rare and poorly known genus: i.e. Gaboon and Uganda (*M. whitleyi*), Central African republic (*M. daubentonii albatus*).

Adam, F. and B. Hubert (1972). Chiroptères nouveaux pour le Sénégal.

Les auteurs donnent une liste de six espèces de chauves-souris nouvelles pour le Sénégal: *Epomophorus anurus, Lissonycteris angolensis smithi, Rhinopoma microphyllum, Eptesicus tenuipinnis, Glauconycteris poensis, Gauconycteris variegata*. Les mensurations externes et crâniennes des spécimens sont données.

Un spécimen de Richard-Toll est référable à *Pipistrellus rueppelli senegalis*, confirmant ainsi la validité de la sous-espèce créée par Dorst sur les caractères d'un seul spécimen de même origine.

Une étude biométrique de spécimens rapportés à *Hipposideros caffer tephrus* et à *Hipposideros caffer guineensis*, capturés ensemble dans un arbre creux,
démontre qu'*Hipposideros tephrus* est une espèce distincte.

Adam, F. and B. Hubert (1976). Les Nycteridae (Chiroptera) du Sénégal: Distribution, biométrie et dimorphisme sexuel.

Cinq espèces de Nycteridae sont présentes au Sénégal: *Nycteris hispida, N. grandis, N. macrotis, N. thebaica* et *N. gambiensis*. Les auteurs fournissent pour chacune leur distribution connue dans ce pays; pour les trois dernières, une étude biométrique montre l'existence d'un dimorphisme sexuel. La synonymie de *Nycteris aethiopica* avec *N. macrotis* est confirmée, tandis que celle de *N. thebaica* avec *N. gambiensis* est infirmée.

Adam, J. P. (1973). Hematozoaires des Chiroptères en Afrique Centrale.

D'assez nombreux hématozoaires ont été signalés ou décrits chez les chiroptères. En Afrique centrale le sang de plusieurs centaines de chauves-souris a été examiné par l'auteur. Ces animaux appartenaient à une vingtaine d'espèces réparties en dix huit genres. Ils provenaient, pour la plupart du Congo (Brazzaville) et quelques-uns de R.C.A., du Gabon et du Cameroun.

Au Congo, des infections par *Plasmodium voltaicum* ont été trouvées chez *Lissonycteris angolensis*. Trois espèces de Megachiroptères du Congo et de R.C.A. hébergent *Hépatocystis perronae* n. sp., *Polychromophilus* sp., parasite , au Congo, six espèces, de Microchiroptères appartenant à quatre genres. *Trypanosoma megadermae* existe chez *Roussettus aegyptiacus unicolor* et important des microchiroptères appartenant à cinq espèces différentes.

Adam, J. P. and I. Landau (1973b). *Polychromophilus* sp. Haemoproteidae parasite de Microchiroptères au Congo (Brazzaville).

Polychromophilus sp. a été trouvé par les auteurs au Congo-Brazzaville dans le sang de Microchiroptères troglophiles appartenant à cinq espèces (3 genres). L'hôte vertébré est porteur de gamétocytes toute l'année, mais la recherche des schitontes est restée infructueuse. La dissection de nombreux arthropodes sanguisuges (neuf espèces) a permis de trouver et décrire oocystes et sporozoïtes chez une Nycteribie dont le taux d'infection est élevé.

Polychromophilus s.p. was found by the authors in Congo-Brazzaville in the blood of troglophilous microchiroptera belonging to five species (three genera). The vertebrate host is bearing gamétocytes all year long but the search for schizonts remained unsuccessful. The dissection of many haematophagous arthropods (9 species) allowed us to find and describe oocysts and sporozoits in a nycteribiid fly whose rate of infection is high.

Adam, J. P. and F. LePont (1974). Les chiroptères cavernicoles de la république populaire du Congo. Notes bioécologiques et parasitologiques.

Dans un travail publié en 1968, AELLEN et BROSSET donnaient une étude systématique des chiroptères récoltés par nous au Congo entre 1961 et 1968. Aux quatorze espèces étudiées alors par ces auteurs, nos prospections permettent d'en ajouter deus autres ainsi que des localisations nouvelles pour plusieurs des espèces citées. Nous rapportons également les observations que nous avons eues l'occasion d'effectuer sur la bioécologie souvent peu connue des chiroptères et sur les hématozoaires qui les parasitent.

In 1968 AELLEN and BROSSET published a work on the systematics of the Chiropterans collected by us between 1961 and 1968 in the Congo. Two additional species and several new collecting sites for some of the fourteen species studied by these authors are given in the present paper. We also report observations on the bioecology of the chiropterans which is little known and on their hematozoa.

Aellen, V. (1956a). Speologica africana. Chiroptères des grottes de Guinée.

L'étude de la faune des Chiroptères de la Guinée française a été fort négligée jusqu'à ces dernières années. Aussi, lorsque M. A.VILLIERS m'a proposé d'examiner une série de Chauves-Souris qu'il avait capturées dans des grottes de ce pays. J'ai accepté d'emblée. en pensant qu'il y avait certainement des espèces intéressantes.

La collection comprend 52 spécimens appartenant à 5 espèces. Toutes sont nouvelles pour la Guinée française, sauf *Rhinolophus maclaudi* qui n était connu que par un seul individu. Une des formes est nouvelle pour la science et je me fais un plaisir et un devoir de la dédier au collecteur.

Ces Chiroptères sont tous conservés en alcool. Ils sont déposés dans les collections zoologiques de l'IFAN à Dakar.

Aellen, V. (1956b). Le Parc National du Niokolo-Koba. (Premier fascicule). II. Chiroptères.

Les Chiroptères faisant l'objet de cette étude sont au nombre de 58 et représentent 15 espèces. La plupart proviennent de Badi (Sénégal, Haute-Gambie, 13°15' N, 8°20 W), à la limite des savanes guinéennes et soudanaises. Ils ont été obtenus par des indigènes dans des cases ou des arbres creux.

L'intérêt de cette collection réside dans le fait que son étude apporte 9 espèces nouvelles pour le Sénégal et permet de mettre quelques formes en synonymie:

Hipposideros gigas viegasi MONARD = *Hipposideros commersoni gambiensis* ANDERSEN.
Hipposideros braima MONARD = *Hipposideros caffer tephrus* CABRERA.
Mops osborni occidentalis MONARD = *Tadarida condylura wonderi* (SANBORN).

La position systématique de "*Nycticeius leucogaster* CRETZSCHMAR" est revue. Cette forme, qui était considérée jusqu'à présent comme une sous-espèce de *Scotophilus nigrita* (SCHREBER), devient maintenant une espèce nominale dont *Scotophilus viridis* (PETERS) est une sous-espèce.

Aellen, V. (1957). Les Chiroptères africains du Musée zoologique de Strasbourg.

Les collections du Musée Zoologique de Strasbourg renferment 30 espèces (34 formes) de Chiroptères africains représentés par 55 spécimens.

Aellen, V. (1963). La réserve naturelle intégrale du Mont Nimba. XXIX. Chiroptères.

Les Chiroptères de la République de Guinée (ancienne Guinée française) sont relativement mal connus, malgré quelques travaux récents (AELLEN, 1956 a ; EISENTRAUT et KNORR, 1957). Aussi les récoltes du professeur M. LAMOTTE, au Mont Nimba, à l'extrême Sud-Est du pays, sont-elles particulièrement précieuses.

On ne connaissait, dans ce massif montagneux, que quelques espèces signalées par M. LAMOTTE (1942) (*Hipposideros fuliginosus, Eptesicus grandidieri, ? Xiphonyderis spurrelli*), A. VILLIERS (1948) (*Eidolon helvum*) et M. EISENTRAUT (1959) (*Rousettus aegyptiacus occidentalis*). Les identifications des trois premières espèces avaient été faites par P. Rode et devraient être vérifiées avant d'être acceptées; elles me paraissent douteuses. Ce matériel avait été récolté par le professeur LAMOTTE, en 1942, et aurait été déposé au Muséum de Paris, mais il n'y en a plus trace actuellement (in litt. prof. LAMOTTE, 30-IX-1960).

Les Chauves-Souris dont j'ai disposé pour cette étude proviennent d'une part, d'une récolte de MM. A. VILLIERS et P. L. DEKEYSER (IFAN) et, d'autre part, des captures de M. LAMOTTE et de ses collaborateurs qui ont été déposées en partie dans les collections de l'IFAN (récoltes de 1951) et en partie dans celles du muséum de Paris (récoltes de 1956, 1957 et 1958).

Parmi les 30 spécimens que j'ai examinés, j'ai identifié 10 espèces, dont 7 sont nouvelles pour la Guinée. Malgré cet apport important, il est encore prématuré de vouloir dresser une liste des Chiroptères du Mont Nimba et encore moins de la Guinée, dont on connaît actuellement 25 espèces.

Je remercie très vivement M. le professeur TH. MONOD, directeur de l'IFAN, de m'avoir confié l'étude des Chiroptères africains de cet institut et M. le professeur M. LAMOTTE de m'avoir adressé ses dernières récoltes de chauves-souris du Mont-Nimba.

Aellen, V. (1973). Un *Rhinolophus* nouveau d'Afrique centrale.

Espèce apparentée à *ruwenzorii* et à *maclaudi*, mais plus proche du premier, dont elle diffère par une taille plus faible, le connectif de la feuille nasale bien développé et la boîte crânienne et le rostre plus larges.

Les 3 espèces représentent probablement des types archaïques reliques maintenant isolés, mais ayant une origine commune avec les espèces orientales du groupe *philippinensis*.

Aellen, V. and P. Strinati (1970). Chauves-souris cavernicoles de Tunisie.

Etude de 6 espèces de chauves-souris observées lors d'un voyage spéléologique en Tunisie en octobre 1967. Une espèce est nouvelle pour le pays: *Rhinolophus blasii*. Localités nouvelles pour d'autres espèces. Précisions taxonomiques, en particulier sur la forme *Rhinolophus euryale tuneti*.

Aggundey, I. R. and D. A. Schlitter (1984). Annotated checklist of the mammals of Kenya. I. Chiroptera.

A list of 95 species in nine families of bats known by Kenyan specimens is annotated with records of museum specimens or with references to the literature. A gazetteer of collecting localities is included.

Aggundey, I. R. and D. A. Schlitter (1986). Annotated checklist of the mammals of Kenya. II. Insectivora and Macroscelidae.

Four families of Insectivora (Tenrecidae, Chrysochloridae, Erinaceidae, Soricidae) and one of Macroscelidea (Macroscelididae) are known from Kenya. Of these families, only the Soricidae, with 31 species, and the Macroscelididae, with five species, are known from more than a single species. Records of occurrence are annotated by museum specimens or with references to the literature. *Suncus murinus* seems to be the only introduced species in the insectivore fauna of Kenya. Distributional records of insectivores in Kenya are poor as 13 species of the 39 reported are known from only a single locality in Kenya. A gazetteer of collecting localities is included.

Aghomo, H. O., A. K. Ako-Nai, O. O. Oduye, O. Tomori and C. E. Rupprecht (1990). Detection of rabies virus antibodies in fruit bats (*Eidolon helvum*) from Nigeria.

Fruit bats (Eidolon helvum) were collected from three different localities in Western Nigeria: Oti, Ibadan and Idanre. Fifty Serum samples were analyzed using a modified rapid fluorescent focus inhibition technique against rabies, Mokola, Lagos bat and Duvenhage viruses. Twenty-five brain samples were screened for rabies and related lyssavirus antigens by direct fluorescent antibody microscopy and by an indirect fluorescent antibody technique with rabies anti- nucleocapsid monoclonal alltibodied. All brain samples were negative. Two serum samples had relatively high anti-rabies activity; no neutralizing activity was detected against Mokola, Lagos bat or Duvenhage viruses.

Aldridge, H. D. J. N. and I. L. Rautenbach (1987). Morphology, echolocation and resource partitioning in insectivorous bats.

(1) Two hypotheses are tested in this paper: (i) wing morphology and echolocation-call 'design' can determine foraging site selection and foraging behaviour in bats, (ii) echolocation-call 'design' should be compatible with wing morphology (because some combinations of morphology and echolocation call would be maladaptive).

(2) In support of our first hypothesis, significant correlations were established between wing morphology, echolocation call design, manoeuvrability and habitat use.

(3) In support of our second hypothesis, significant correlations were established between those morphological parameters that improve manoeuvrability (low wingloading, low aspect ratio and high wingtip shape index) and echolocation calls that are resistant to acoustic clutter in support of our second hypothesis.

(4) There was an association between foraging habitat and diet: bats that fed in the same habitats tended to take the same types of prey, while species foraging in different habitats had significantly different diets.

(5) There was also a significant correlation between prey and predator size; large bats took insects over a range of sizes while small bats fed only on small prey.

Allen, G. M. (1908). Notes on Chiroptera.

The collection of bats in the Museum of Comparative Zoology contains upwards of 190 species, represented by skins, skeletal parts, and alcoholic specimens. Many of these specimens are of unusual interest. I have made the following notes while studying this material recently. In the case of certain imperfectly known species detailed series of measurements or other data of interest are given, and five species are described as new.

Of especial note are the collections received from the Thayer Expedition to Brazil, made in 1865, under the direction of Louis Agassiz ; also a considerable number of Indian bats sent at about the same time by Rev. M. M. Carleton from northern India and the Koolloo Valley. More recently a valuable series of alcoholic specimens from Java and Japan was presented by Mr. Thomas Barbour, in part collected by himself in 1906-07. I am indebted to the authorities of the Museum of Comparative Zoology for the privilege of making this report, and to the United States National Museum, through Dr. M. W. Lyon, Jr., for the loan of certain specimens.

All measurements are in millimeters, and colors are after Ridgway's Nomenclature of colors. I have followed the nomenclature and order adopted by Miller in his monograph on "The families and genera of bats" (Bull. 57, U. S. Nat. Mus., 1907).

Allen, G. M. (1923). New Chinese bats.

Over five hundred bats have been thus far sent back by the Asiatic Expeditions under the leadership of Mr. Roy C. Andrews. These are chiefly from Fukien, Szechwan, southeastern Yunnan, and North China. The series of skins is well supplemented by specimens in alcohol, and in many cases wide-ranging species are represented by a number of skins from the coastal regions as well as by others from the higher or more inland provinces, so that an unusual opportunity is afforded for a comparison of the lowland and the upland members of a species. This is undoubtedly the.largest single collection of bats yet obtained by any one expedition in China, and my thanks are due The American Museum of Natural History for the opportunity to study this important series.

Al-Safadi, M. M. (1991). Chiropteran fauna of Yemen Arab republic.

The chiropteran or bat fauna is the first group of the mammalian fauna of the Yemen Arab Republic to be considered. Four types of bats are recorded from Yemen Arab Republic; two of them identified to subspecies, *Tadarida pumila pumila* and *Scotophilus leucogaster leucogaster*; one identified to species, *Tadarida aegyptiaca*; and one to genus, *Pipistrellus*. The present additional records of bats from Yemen Arab Republic bring the total number of Yemen Arab Republic bats to seven species.

La faune de chauves-souris constitue le premier groupe de mammifères étudié en République Arabe du Yemen. Quatre taxons de chauves-souris ont été recenses: *Tadarida p. pumila, Scotophilus I. leucogaster, Tadarida aegyptiaca* et *Pipistrellus* sp.

Actuellement sept espèces de chauves-souris sont connues en République Arabe du Yemen.

Amr, Z. S. and M. B. Qumsiyeh (1993). Records of bat flies from Jordan, Libya and Algeria.

Eight species of bat flies (Insecta: Diptera: Streblidae and Nycteribiidae) collected from bats from Jordan, Libya and Algeria are listed along with their respective hosts. *Brachytarsina flavipennis, Stylidia biarticulata, Stylidia integra* and *Basilia nana* are new records for Jordan.

Anciaux de Faveaux, M. (1965). Les Parasites de Chiroptères. Rôle épidémiologiques chez les animaux et l'homme au Katanga.

Le but de cette étude est de passer en revue les infections et le maladies provoquées directement ou indirectement, par les Chiroptères et leurs parasites.

Nous examinerons surtout les résultats obtenus dans une région bien déterminée: le Haut-Katanga (République du Congo).

Anciaux de Faveaux, M. (1973). Essai de synthèse sur la reproduction de chiroptères d'Afrique (région faunistique éthiopienne).

Les cycles annuels de Chiroptères de l'Afrique Ethiopienne sont basés sur trois principaux types: monooestrien, polyoestrien à reproduction saisonnière, polyoestrien à reproduction continue; les diverses espèces de chauves-souris sont classées en fonction de ces trois modes de reproduction.

La périodicité des mises bas est établie d'après quatre grandes aires climatologiques d'Afrique centrale; elle est variable suivant les familles et les genres.

Le concept d'équateur biologique est défini avec plus de précision; ses limites nord et sud sont liées aux lieux de reproduction.

Les variations de la latitude exercent une influence sur la périodicité et sur la durée du cycle reproductif; elles ne semblent pas avoir d'action positive sur le degré de fécondité.

La reproduction est déterminée en partie par des facteurs climatologiques (relation saison des pluies - régime alimentaire); elle dépend également de facteurs internes dont l'action est plus ou moins prépondérante dans certains cas qui sont précisés.

Anciaux de Faveaux, M. (1976a). La léthargie chez les chiroptères cavernicoles d'Afrique Centrale.

From his personal research undertaken in the subterranean field (natural and artificial cavities) in Shaba (ex-Katanga, in S.E. Zaïre) and Rwanda, the author briefly defines the macroclimate of the prospected regions as wel] as the microclimate of the subterranean habitat (humidity and temperature).

A reversible hypothermia has been noticed in the dry season only (from May till August) in eleven species of troglophile Chiroptera belonging to the following families: Rhinolophidae (7 species of Rhinolophus), Hipposideridae (only *Hipposideros ruber*) and Vespertilionidae (*Miniopterus inflatus rufus, Miniopterus schreibersi arenarius* & *M.s. natalensis, Myotis tricolo*r).

No sign of lethargy has been noticed in the Megachiroptera (*Lissonycteris angolensls, Rousettus aegyptiacus leachi*), Emballonuridae (*Taphozous perforants sudani*), Hipposideridae (*Cloeolis percivali australis*) or Nycteridae (3 species of *Nycteris*).

There could be correlations between lethargy and breeding if one takes into account the phenomena of late ovulation and delayed implantation.

The entry into lethargy is not caused by the scarcity of food. It does not concern ail the individuals of a colony or in various populations of a cave. The degree of humidity appears to be more important than the temperature as far as the conditions for hibernation are concerned.

Anciaux de Faveaux, M. (1978a). Définition de l'Equateur Biologique en fonction de la reproduction de Chiroptères d'Afrique Centrale.

Étude de la biologie reproductrice chez 18 espèces monooestriennes de Chiroptères, en Afrique Centrale, parmi lesquelles la périodicité est évidente, suivant des cycles de type boréal ou de type austral, en fonction des saisons.

A partir de ses observations personnelles au Rwanda et en se basant sur une étude critique de la littérature, l'auteur propose une définition plus précise de l'équateur biologique: ses limites septentrionales et méridionales où se manifestent les deux cycle (boréal et austral) sont comprises entre les latitudes 04°13' N et 01°32' S.

Anciaux de Faveaux, M. (1978b). Notes éco-éthologique et parasitologiques sur les Chiroptères cavernicoles du Shaba (Zaïre).

After a brief analysis of the elements of the cavernicolous rnicroclimate in Shaba, the aulhor emphasizes the possibility of relations between ecology and parasitism. He then reviews the 19 species of Chiroptera that live in the subterranean field in Shaba, pointing out their environmental habitat, behaviour and parasites.

Anciaux de Faveaux, M. (1978c). Les cycles annuels de reproduction chez les chiroptères cavernicoles du Shaba (S.E. Zaïre) et du Rwanda.

Les recherches menées au Shaba (ex Katanga) et au Rwanda concernent ici les observations faites dans le domaine souterrain (cavités naturelles et artificielles); elles portent sur un total de 24 espèces de Chiroptères parmi lesquelles 4 ont été trouvées par d'autres zoologistes: *Hipposideros commersoni* (E. Geoffroy, 1813) au Katanga, *Rhinolophus hilli* Aellen, 1973 et *Hipposideros caffer* (Sundevall, 1846) au Rwanda, et *Otomops martiensseni* (Matschie, 1897) au Katanga et au Rwanda.

Les cycles annuels de reproduction sont classés en 3 principaux types : monooestrien, polyoestrien saisonnier et polycestrien continu.

Les conclusions de l'auteur sont comparées avec celles d'autres chercheurs; un examen critique approfondi des données de la littérature a permis de préciser les modalités de la reproduction chez quelques espèces sur lesquelles l'auteur n'a pu obtenir aucun renseignement positif.

Pour chaque espèce, l'auteur présente les dates (celles concernant ses récoltes personnelles et celles publiées dans des travaux antérieurs sur les Chiroptères d'autres régions d'Afrique) et propose une interprétation de la biologie reproductrice.

Anciaux de Faveaux, M. (1981). Cycles de reproduction chez des Chiroptères phytophiles du Shaba (Zaïre) et du Rwanda. Abstract.

The research undertaken in Shaba (ex-Katanga) and Rwanda and set forth in this article concern the studies carried out in the trees and bushes of African savanna.

It covers 34 species of Chiroptera among which 20 have been found by other zoologists : *Epomophorus wahlbergi haldemani* (Halowell,1846), *Micropteropus pusillus* (Peters, 1867), *Plerotes anchietae*

(Seabra, 1900), *Megaloglossus woermanni* Pagenstecher, 1885, *Nycteris arge* Thomas, 1903, *Chalinolobus (Glauconycteris) variegatus papilio* Thomas, 1905, *Eptesicus capensis* (A.Smith, 1829), *Eptesicus rendalli* (Thomas, 1889), *Mimetillus moloneyi thomasi* Hinton, 1920, *Myotis (M.) welwitschi* (Gray, 1866), *Nycticeius schlieffeni* (Peters, 1859), *Scotoecus hirundo hindei* Thomas, 1901, *Scotoecus albofuscus woodi* Thomas, 1917, *Scotophilus gigas* Dobson, 1875, *Kerivoula harrisoni lucia* Hinton, 1920 and *Tadarida (Xiphonycteris) nanula* (J.A.Allen, 1917) in SHABA; *Chalinolobus (Glauconycteris) argentatus* (Dobson, 1875) and *Tadarida (Mops) midas* (Sundevall, 1843) in RWANDA; *Nycteris hispida* (Schreber,1 775) and *Eptesicus tenuipinnis* (Peters, 1872) in SHABA and RWANDA.

The 14 species found by the author are: *Eidolon helvum* (Kerr, 1792), *Epomophorus labiatus* (Temminck, 1837), *Lavia frons* (E. Geoffroy, 1810) and *Tadarida (Xinhonycteris) thersites* (Thomas, 1903) in RWANDA; *Epomophorus gambianus* (Ogilby, 1835), *Epomophorus crypturus* Peters, 1852, *Taphozous mauritianus* E. Geoffroy, 1818, *Laephotis angolensis* Monard, 1935, *Scotophilus dinganii* (A. Smith, 1833), *Kerivoula argentata* Tomes, 1861 and *Tadarida (Chaerephon) nigeriae spillmanni* (Monard, 1932) in SHABA; *Epomops dobsoni* (Bocage, 1889), *Myotis (M.) bocagei* (Peters, 1870) and *Pipistrellus nanus* (Peters, 1852) in RWANA and SHABA.

The annual breeding cycles are classified in 3 main types: monooestrian, seasonal polyoestrian and continual polyoestrian. The author's conclusions are compared with those of other research workers; a thorough critical investigation of the literature has given more precise details about the breeding modalities in some species on which the author has been unable to get any positive information.

For every species, dates are presented (those concerning the author's personal research and those published in previous works on the Chiroptera in other African areas) and an interpretation of breeding biology is advanced.

Anciaux de Faveaux, M. (1983). Les cycles annuels de reproduction chez les Chiroptères phytophiles au Shaba (S.E. Zaïre) et au Rwanda.

The research undertaken in Shaba (ex-Katanga) and Rwanda and set forth in this communication concern the studies carried out in the trees and bushes of savanna. It covers 34 species of Chiroptera among which 20 have been found by other zoologists.

The annual breeding cycles are classified in 3 main types: monooestrian, seasonal polyoestrian and continual polyoestrian. The author's conclusions are compared with those of other research workers; a thorough critical investigation of the literature has given more precise details about the breeding modalities in sorne species on which the author has been unable to get any positive information.

For every species, dates are presented (those concerning the author's personal research and those published in previous works on the Chiroptera in other African areas) and an interpretation of breeding biology is advanced.

Ando, K., F. Yasuzumi, A. Tagawa and T. A. Uchida (1983). Further study on the karyotypic evolution in the genus *Rhinolophus* (Mammalia: Chiroptera).

A detailed karyotype comparison among *R. cornutus cornutus, R. ferrumequinum nippon* and *R. luctus formosae* are made on the basis of relative length, G- and C-band patterns. The data presented here suggest strongly M.SM-1 and 2 in *R. f. nippon* were formed by centric fusion of four of five small A-autosome pairs such as those in A-23~25, 27 and 28 of *R. c. cornutus*, while occurrence of M-SM-3 in the former was caused by pericentric inversion of a small A-pair such as that in A-24 or 25 of the latter, confirming the assumption described in our previous report (ANDO et al. 1980a). On the other hand, appearance of the secondary short arms of A-autosomes in *R. f. nippon* is attributable to the C-band material added to the telomeres of A-autosomes. Addition of heterochromatin is considered to have taken place also in the short arm of the ST-X chromosome in *R. f. nippon*, and to have brought about the morphological difference of the Y chromosome within *Rinolophus*.

Andral, L., P. Brès, C. Sérié, J. Casals and R. Panthier (1968). Études sur la fièvre jaune en Ethiopie. 3. Étude sériologique et virologique de la faune sylvatique.

L'étude des réservoirs sylvatiques du virus de la fièvre jaune est une des préoccupations essentielles de l'épidémiologiste.

Une enquête sérologique portant sur une population simienne de la forêt de Manéra a mis en évidence des modifications qualitatives de la répartition des anticorps entre 1962 et 1964, avec diminution importante du nombre de sérums positifs pour le virus amaril et apparition d'une notable proportion de sérums positifs pour les antigènes Zika et chikungunya. Chez les chauves-souris, un faible pourcentage de sérums renfermaient des anticorps. L'étude des rongeurs et des oiseaux n'a fourni que peu d'informations.

Sur le plan virologique, deux souches de virus amaril ont été isolées, l'une chez un jeune colobe, l'autre chez une chauve-souris du genre *Epomophorus*.

As part of the epidemiological investigation of the 1960-62 yellow-fever epidemic in Ethiopia, the authors carried out serological and virological studies of the silvatic reservoir of virus, largely among animals shot or captured in the forest near the Manera experimental station. In this area, all of 16 monkey sera from the Chouchouma valley in 1962 contained yellow-fever antibody; this was the only arbovirus antibody in 50 % of the sera and it was found together with Zika or group A antibody in the remainder. In 1964, 25 % of monkey sera were devoid of all arbovirus antibody, and a mere 18 % and 25 %, respectively, had only yellow-fever antibody or mixed antibody. The number of sera positive for group A had doubled in 1964.

Similar serological study of 140 bat sera showed only 3.5 % to harbour any arbovirus antibody, and only 4 sera to have yellow-fever antibody. Sera from rodents, other forest animals and birds gave almost uniformly negative results, antibody for arboviruses being found in only a civet and 2 birds (one of these, a guinea-fowl, had a 1/40 HI titre for yellow-fever virus).

Attempts to isolate yellow-fever virus were successful in 2 instances-once from the brain of a bat, and once from the brain of a month-old *Colobus* monkey that was captured alive and died 8 days later apparently of gastroenteric infection.

Ansell, W. F. H. (1967). Additional records of Zambian Chiroptera.

Additional records of Zambian Chiroptera are listed. Four species, *Lissonycteris angolensis, Myonycteris torquata, Nycteris grandis*, and *Rhinolophus capensis* are recorded from Zambia for the first time. *Tadarida niveiventer* (which includes *chitauensis*) is considered a valid species distinct from *T. condylura*.

Ansell, W. F. H. (1969). Addenda and corrigenda to "Mammals of Northern Rhodesia" Number 3.

Recent records of Zambian mammals are listed, including two bats, *Rhinolophus swinnyi* and *Eptesicus rendalli*, recorded for the first time in the country, and *Hipposideros ruber* is confirmed in Zambia for the first time as a species separate from *H. caffer*. Other data include discussion of the range of *Kobus ellipsiprymnus* in Zambia, description of the preputial gland of *Oreotragus oreotragus*, and of the pedal glands of *Alcelaphus lichtensteini* and *Connochaetes taurinus*.

Ansell, W. F. H. (1973). Addenda and Corrigenda to "Mammals of Northern Rhodesia", Number 4.

Further records and data on Zambian mammals are listed. *Suncus varilla* is recorded in the country for the first time. *Crocidura katharina* is regarded as conspecific with *C. cyanea*, which latter is therefore recorded authentically for the first time north of the Zambezi River. Data- are also given on various Chiroptera, *Galago* spp., *Manis*-spp., Carnivora, ungulates and rodents.

Ansell, W. F. H. (1974). Some mammals from Zambia and adjacent countries.

Information is given on mammals from Zambia, together with some from adjacent countries. *Erinaceus albiventris, Micropteropus pusillus, Miniopterus inflatus, Cephalophus natalensis, Anomalurops beecrofti*, and *Hybomys univittatus* are recorded for the first time in Zambia. The only authentic Zambian specimen of *Colobus angolensis* was obtained in Mwinilunga District. A pygmy shrew, genus *Crocidura*, similar in size to *C. bicolor*, and a forest species of *Graphiurus* have had for the present to be left indeterminate. A neotvpe is designated for *Cobus robertsi* (= *Kobus leche robertsi*), *Aethomys dolmanni* is removed from *A. chrysophilus* and placed as a subspecies of *A. nyikae*. *Thamnomys cometes* and *T. dolichurus* are accepted as separate species, though they are allopatric in Zambia. Collecting in 1973 confirmed all four Zambian species of *Dendromus* in the Northwestern Province. Other-data are recorded for various Insectivora, Chiroptera, Primates, Pholidota, Carnivora, Artiodactyla, and Rodentia. A list of specimens received by the National Museum of Zambia. Livingstone from other institutions is given in an appendix.

Ansell, W. F. H. (1985). Mammals from Malawi, Part I.

This paper reports on observations made in the course of preparing a new list and atlas of Malawi mammals, outlined by Ansell and Dowsett (1980).

The object is to cover a number of taxonomic and distributional matters which are more appropriately dealt with separately from the check list itself, and it is intended that other species will be similarly treated in a subsequent paper. This present paper is based on specimens in the Museum of Malawi (MM) examined during my visits to Blantyre in 1980 and 1983, and some subsequently borrowed for further study; also loans from the Transvaal Museum (TM), British Museum (Natural History) (BM), the National Museum, Bulawayo (NMB) and the American Museum of Natural History (AMNH). Flesh measurements and, where applicable, weight are from the species label, cranial measurements by me.

Ansell, W. F. H. (1986). Some Chiroptera from South-central Africa.

Data, including a number of breeding records, are given for several species of Chiroptera, supplementing previous information. *Tadarida ventralis* is recorded in Zambia for the first time, but *Rhinolophus capensis* has to be deleted due to previous misidentification. Successive pregnancies are confirmed in *Tadarida pumila*.

Des compléments d'information, y compris un certain nombre de données sur la reproduction, sont fournis pour plusieurs espèces de Chiroptères. *Tadarida ventralis* est mentionnée pour la première fois dans la faune de Zambie, mais *Rhinolophus capensis*, qui avait été mal identifiée, doit en être supprimée.

Anthony, H. E. (1926). Preliminary report on Ecuadorean mammals. No 7.

This is the seventh short paper in a series of preliminary reports upon the mammals of Ecuador. The purpose of these papers is the description of new forms which are discovered as material is gradually accumulated from the field.

In a collection of mammals made near the Rio Curaray, in eastern Ecuador, by Olalla e Hijos for the American Museum, are two specimens of the interesting marsupial genus *Glironia*, the first to be received at any institution in this country; and, as far as I can ascertain, the only specimens taken since the type and one other recorded by Thomas in 1912. These two specimens represent different species, one quite closely related to *venusta* Thomas, the other apparently quite distinct.

Arata, A. A. and B. Johnson (1978). Approaches towards studies on potential reservoirs of viral Haemorrhagic Fever in southern Sudan (1977).

This study was carried out in Nzara, W. Equatorial Province, Sudan, (in January-February, 1977) following the protocol agreed upon at the meeting at the London School of Hygiene and Tropical Medicine, 4-5 January 1977.

Mammals having the highest possible contact with humans in the Nzara cotton factory and agricultural environs where primary cases were noted were studied (Table 1). Although primates have been suggested as reservoirs, these were not collected because of the difficulties involved in collecting adequate samples in such a short period.

Organ and tissue samples were collected, frozen in liquid N2 and sent to Porton Down, U.K., for virological and serological studies on 13 February, 1977 (Table 2). Voucher specimens of the animals collected, preserved in formalin, were sent at the same time to the British Museum (Natural History), London, for confirmation of field identifications.

Data on sex, age and habitats (including human contacts) of all potential hosts were recorded to be correlated with virological and serological results. As the virology and serology are not yet available, the paper emphasizes the rationale used in establishing a survey for potential reservoirs of a disease of unknown aetiology.

Archer, A. L. (1977). Results of the Winifred T. Carter Expedition 1975 to Botswana, Mammals - Chiroptera.

A collection of 133 bats representing 20 species was made between 15 November and 15 December 1975 within a 25 km radius of Xugana, Botswana. Three species obtained, *Epomorphons gambianus, Nycteris hispida* and *Tadarida chapini* are new records for Botswana. Some observations and breeding data are given together with a systematic list of the species collected, numbering 84, which were made up as study skins. The remaining 49 specimens consisting of duplicates, were preserved in formalin.

Arlettaz, R. and S. Aulagnier (1988). Statut de trois espèces de chiroptères rares au Maroc: *Nycteris thebaica*, *Hipposideros caffer* et *Pipistrellus rueppelli*.

Discussed is the occurrence of three rare species of bats in Morocco. *Nycteris thebaica* and *Hipposideros caffer* originate from Africa, south of the Sahara; in Morocco they live exclusively along the Atlantic coast. *Pipistrellus rueppelli* which was caught in the presaharian area (Tafilalt) is reported for the first time in Morocco. The populations of ail three species arc considered as remnants.

Arlettaz, R., G. Dändliker, E. Kaybekov, J. M. Pillet, S. Rybin and J. Zima (1995). Feeding habits of the Long-eared Desert bat, *Otonycteris hemprichtii* (Chiroptera: Vespertilionidae).

We studied food habits of the long-eared desert bat, *Otonycteris hemprichi*, in a subdesert area of Kirghizstan (central Asia) by fecal analysis and light-tagging. The bulk of the diet of 13 individuals in September consisted of arachnids (Solifugae, Scorpiones, and Araneae; 49.9% of total volume) and orthopterans (Acrididae, Gryllidae, and Tettigoniidae; 34.7%). Visual nocturnal observations confirmed that this species captures its prey from the surface of the ground.

Arlettaz, R., M. Ruedi, C. Ibañez, J. Palmeirin and J. Hausser (1997). A new perspective on the zoogeography of the sibling mouse-eared bat species *Myotis myotis* and *Myotis blythii*: morphological, genetical and ecological evidence.

The actual geographic distribution of the two sibling mouse-eared bat species Myotis myotis and Myotis blythii, which occur widely sympatrically in the western Palaearctic region, remains largely controversial. This concerns particularly the specific attribution of marginal populations from the Mediterranean islands and from adjacent areas of North Africa and Asia, which are morphologically intermediate between continental *M. myotis* and *M. blythii* from Europe. This study attempts to clarify this question by using four different approaches: cranial morphology, external morphology, genetics and trophic ecology. The three latter methods show unambiguously that North Africa, Malta, Sardinia and Corsica are presently inhabited by monospecific populations of *M. myotis*. In contrast, cranial morphometrics do not yield conclusive results. These results contradict all recent studies, which attribute North African and Maltese mouse-eared bats to *M. blythii* and consider that Sardinia and Corsica harbour sympatric populations of the two species. As concerns south-eastern populations, doubts are also expressed about the attribution of the subspecific taxon *omari* which may actually refer to *M. myotis* instead of *M. blythii*. Protein electrophoresis is presently the only absolute method available for determining *M. myotis* and *M. blythii* throughout their distribution ranges. However, species identification may be approached by relying on less sophisticated morphometrical methods as presented in this study. Species-specific habitat specializations are probably responsible for the differences observed between the geographic distributions of *M. myotis* and *M. blythii*, as they provide a logical groundwork for a coherent model of speciation for these two bat species.

Aulagnier, S. (1989). Les Chauves-souris (Chiroptera) dans le régime alimentaire des Rapaces nocturnes (Strigiformes) au Maroc.

An extensive material of owl pellets (8 owl species), collected in Morocco (96 localities) has been analyzed. However bats represent a minor part of the material (60 individuals of 11 species), the investigation revealed both the valuable faunal records (e.g. the first Moroccan record of *Otonycteris hemprichi*, a record of *Rhinopoma microphyllum*) and the data on factors influencing predation of bats by owls. In Morocco, Bubo ascalaphus was found to be the most important predator of bats (nearly 1 % of prey). In general, there is no relation between size of predator and prey but the habitat type is significant.

Aulagnier, S. (1990). Zoogeography of Moroccon bats. Abstract.

Among Moroccan mammals, Bats were still poorly known until recently for lack of investigations in the whole country. In 1932 Cabrera, who gathered informations mainly in the north, listed 8 species only. After some southern prospections, the list of Heim de Balsac (1948) reached 16 species. In the fifties, J.B. Panouse and A. Brosset initiated the first works on Moroccan bats, studying biometrics and reproduction of the 23 species they recorded. After Hill (1964) bat research were suspended during twenty years. Recently 3 species were added to the Moroccan fauna, so now 27 species are listed (Aulagnier and Thevenot 1990), that is the highest diversity in North Africa.

Although data are sparse, the distribution of Bats was mapped by Aulagnier and Thevenot (1986), and some zoogeographical features are prominent Some species as *Myotis emarginatus, M. nattereri, Pipistrellus pipistrellus, Nyctalus leisleri* and *Barbastella barbastellus* occur only in the north of the country or the Middle Atlas, while some other ones live only in presaharan and saharan areas south of the High Atlas: *Rhinopoma microphyllum, R. hardwickei, Asellia tridens, Pipistrellus rueppelli* and *Otonycteris hemprichi*. In addition, coastal areas provide suitable environments for some mediterranean (*Myotis capaccinii*) or african (*Nycteris thebaica, Hipposideros caffer*) Bats.

On the whole, Moroccan Bats are mainly palearctic taxa with 11 widely palearctic species and 8 "mediterranean" species (including the african extralimital *Rhinolophus blasii* and *Pipistrellus kuhli*, and the asiatic extensive *Tadarida teniotis* and *Myotis blythi*). Saharo-sindian Bats are not very numerous contrary to Rodents (4 species versus 17 species). Paleotropicai taxa are scarce too (only 3 Bats versus 11 Carnivores).

The present settlement of Moroccan Bats seems recent in spite of the lack of paleontological clues. African taxa such as Megadermatidae (and probably Emballonuridae) flew away south of the Sahara during the Pleistocene while European species crossed the Straight of Gibraltar or even other parts of the Mediterranean Sea (siculo-tunisian way for example).

Moreover the Moroccan bat fauna looks more like south-european fauna than north-east-african or subsaharian faunas. Maghreb, at least in its northern part, belong to the mediterranean biozone and Bats appear to be good current zoogeographical informers (unfortunately they are often excluded from this kind of study).

Aulagnier, S. (1991). Zoogeographical notes on Moroccan bat fauna.

Twenty seven species of bats are presently listed from Morocco. Five main pattern of distribution are observed, they can be sensibly linked with the main climatic zones of the country. The biogeographical origin of the moroccan bat fauna is diversified (8 faunic types), but there are mainly palaearctic-boreal (11) and - mediterrean (8) species according to the general climate. Concerning bats, Morocco, and the whole Maghreb, is closely similar to Western Europe. Bats are really good zoogeographical informers.

Aulagnier, S. and R. Destre (1985). Introduction à l'étude des Chiroptères du Tafilalt (sud-est marocain).

After some geographical and climatic data about Tafilalt (southeastern Morocco), the Chiroptera of this country are listed. An eco-ethological study was undertaken in a famous cave: Kef Azigza, where are living seven species removing all year long. Various observations all over the studied area are also discussed with reference to the biogeography of bats. There, between Atlas mountains and Sahara, palearctic species are the most numerous, nevertheless three afro-eremic ones were found, and especially *Rhinopoma microphyllum* (second data for Morocco).

Après une brève introduction géographique et climatologique sur le Tafilalt, les Chiroptères de cette région sont présentés à l'issue du suivi d'un site particulièrement favorable: le Kef Azigza. Quelques données d'ordre éco-éthologique ainsi que des observations recueillies sporadiquement complètent l'étude de ce peuplement régional qui compte onze espèces essentiellement paléarctiques, avec cependant la présence remarquable de *Rhinopoma microphyllum*.

Avenant, N. L. (1997). Mammals recorded in the QwaQwa National Park (1994 - 1995).

Distribution, relative abundance, and habitat preference of mammals were studied in the newly proclaimed QwaQwa National Park (QQNP) and compared with those of the adjacent 33 year-old Golden Gate Highlands National Park, a nearby protected area in the KwaZulu-Natal Drakensberg,

Lesotho, and the rest of the Free State Province. In total, 53 mammal species were recorded inside the park and the probability of another 14 likely inhabitants, discussed. The fact that the QQNP contains ca. 70% of mammalian fauna recorded in the Free State and between five and 10 Red Data species stresses the importance of this park and the necessity for correct management of this ca. 21 000 ha conservation area. The low, small mammal numbers, variety, and mean diversity found on 17 transects in the QQNP is attributed to previous human habitation and activities - some of which are still present in the park.

Avery, D. M. (1991). Late Quaternary incidence of some micromammalian species in Natal.

Information on the distribution in Natal of various micromammalian species during the late Quaternary is presented, based on the evidence of remains recovered from the archaeological sites of Border Cave in the Lebombo Mountains, Umhlatuzana near Durban and nine sites in or near the Tugela Basin, is presented. Many species have occurred at present locations for some considerable period. There are notable exceptions; *Mus triton*, which now occurs no closer than Tete District in Mocambique, was present at Border Cave up to about 60 000 years ago. *Pelomys fallax, Rhinolophus hildebrantii* and *Malacothrix typical* have also not recently been reported from Natal. *Georychus capensis* is shown to have been more widely distributed in the past.

Avery, D. M. (1998). An assessment of the lower Pleistocene Micromammalian fauna from Swartkrans Members 1-3, Gauteng, South Africa.

An assessment of the micromammalian fauna from Swartkrans Cave, Gauteng, South Africa reveals the presence of at least 29 species, comprising four insectivores, four bats, three elephant-shrews and 18 rodents. *Proodontomys cookei* seems to be the only definitely extinct taxon represented. All the other taxa may be modern and require re-analysis using current taxonomic methods. A review of the status of Lower Pleistocene micromammalian taxonomy in South Africa indicates the need for a complete revision. This, in turn, brings with it the opportunity to develop species definitions that apply equally to fossil and extant material. It is argued that such an approach is essential if the fossil data are to aid our understanding of the history of biodiversity and endemism. The present paper begins the exercise by providing a general background for future detailed studies of the individual taxa.

Une évaluation de la faune de la grotte de Swartkrans, Gauteng, Afrique du Sud, révèle la présence d'au moins 29 espèces dont quatre insectivores, quatre chauves-souris, trois macroscelidides et dix-huit rongeurs. Il semble que *Proodontomys cookei* soit la seule espèce définitivement disparue. Toutes les autres peuvent être actuelles et nécessitent une nouvelle analyse en utilisant des méthodes modernes. La taxinomie des micromammifères sud-africains du Pleistocene inférieur requiert une révision complète. Celle-ci, en retour, constitue une excellente occasion pour développer les définitions des espèces que l'on peut appliquer également aux spécimens fossiles et actuels. Il est soutenu qu'une telle approche est essentielle pour que les données fossiles contribuent a notre compréhension de l'histoire de la diversité biologique et de l'endémisme. La présente étude entame un tel exercice en fournissant une base pour des études détaillées futures des taxons.

Avery, D. M., I. L. Rautenbach and R. M. Randall (1990). An annotated check list of the land mammal fauna of the West Coast National Park.

Some 4000 Barn Owl pellets with small mammal remains have been collected over a period of nine year from two locations at the south end of the Langebaan lagoon. Two small samples of bones from archaeological sites on the Churchhaven peninsula provide evidence for past mammal occurrences. The remains of small mammals from the owl pellet collection provide an initial list of 18 species that occur within the West Coast National Park. Subsequent conventional censusing by means of trapping and observational techniques to assess the small and large mammal species divesity of the area were conducted during 1989. This study documents the definite occurrence of 63 mammal species in the park, seven of which are exotics. The presence of a further five species require confirmation.

Interesting insight is gained into how direct censusing and owl pellet analyses augment each other in establishing the presence of small mammal taxa of an area.

Ayala, S. C., J. Bradbury and S. Bradbury (1981). *Hepatocystis* in *Hypsignathus monstrosus* (Pteropinea) in Gaboon. I. *Hepatocystis* malaria in a hammerhead bat population in Gaboon, West Africa.

Blood smears from 142 *Hypsignathus monstrosus* collected from one site in Gaboon were examined ; 139 bats showed *Hepatocystis* infection ; it seems that all animals have acquired *Hepatocystis* infection by the time they are 6 months of age. Intensity of parasitemias varies according to age, sex and for females to their reproductive status.

Les frottis sanguins de 142 *Hypsignathus monstrosus* capturés au Gabon dans un même gîte ont été examinés; 139 individus étaient parasités par *Hepatocystis*; tous les animaux semblent avoir acquis leur infection avant l'âge de 6 mois. L'intensité de la parasitémie varie en fonction de l'âge, du sexe et des phases de reproduction chez la femelle.

Ayensu, E. S. (1974). Plant and bat interactions in West Africa.

One of the most dramatic plant and animal relationships in the West African ecosystem is that which takes.place between such frugivorous bats as *Epomophorus gambianus* and *Eidolon helvum* and the introduced neem tree, *Azadirachta indica*. While earlier studies on bat behavior were carried out by personal observation and ordinary photographic means, recently developed night vision equipment has allowed the author to make nocturnal observations previously not possible. New observations, using this equipment, have now been made on bats and their interaction with trees of the following species: *Mangifera indica, Anacardium occidentale, Ficus umbrellata, Psidium guajava, Carica papaya, Kigelia africana, Spathodea campanulata, Parkia clappertoniana, Ceiba pentandra*, and *Adansoni digitata*. Observations are reported on the roosting characteristics of bats of the genus *Epomophorus*. The effect of feeding by bats on the fruits of various trees and the resulting dispersal of seeds on the coastal savannah-grasslandsl, (Accra Plains) of Ghana, are discussed. The effect of introduced plants on the bat population and disadvantages to the West African ecosystem which are attributable to the plant and bat interactions are summarized.

Azzaroli Puccetti, M. L. and B. Zava (1988). Nouvelles données sur les chiroptères des îles du Cap-Vert.

As a consequence of the recent capture of three bats in the Cape Verde Islands as well as of the study of the chiroptera specimens from this part of the world which are present in the collections of the Natural History Museums of Florence, Genoa, London and Paris, sixteen specimens of bats have been identified, belonging to five different species: *Taphozous nudiventris* (4 specimens from São Tiago and 2 from Maio), *Pipistrellus savii* (4 specimens from Fogo and 2 from São Vicente), *Plecotus austriacus* (1 specimen from Maio), *Pipistrellus kuhli* (1 specimen from São Vicente), *Miniopterus schreibersi* (2 specimens from Santo Antão). The last two species are new for the archipelago. The geographical, geological, climatic, ecological and historical aspects of the islands are also briefly considered.

Baeten, B., V. Van Cakenberghe and F. De Vree (1984). An annotated inventory of a collection of bats from Rwanda (Chiroptera).

Ce travail concerne l'etude de 1735 spécimens de Chiropteres, appartenants à 24 espèces différentes et collectés au Rwanda. Sept espèces nouvelles pour la faune du Rwanda ont été trouvées: *Rousettus lanosus, Hipposideros ruber, Myotis welwitschii, M. tricolor, Pipistrellus kuhlii, Eptesicus somalicus et*

Miniopterus inflatus. Par cet apport, on connaît actuellement 41 espèces de chauves-souris du Rwanda.

Pour chaque espece, des notes sur la distribution geographique, les gites diurnes, les biotopes preferes ou la position taxonomique ont ete donnees. Des mensurations ont parfois ete ajoutees pour des raisons de comparaison.

Baker, R. J. and J. W. Bickham (1980). Karyotypic evolution in bats: evidence of extensive and conservative chromosomal evolution in closely related taxa.

G- and C-band data for seventy-eight species of bats from four families were subjected to a cladistic analysis to determine the number of chromosomal rearrangements required to convert the karyotype proposed as primitive for a family into the karyotype of extant species in that family. The number of rearrangements ranged from 0 to 36, and if the age of families is 60 million years, average rate of incorporation of rearrangements per million years ranged from 0 to 0.6. When chromosomal variation in congeneric species were subjected to a similar-cladistic analysis, most (34 of 54) species had undergone no chromosomal rearrangements; however, some species had undergone from 14 to 20 rearrangements and the types of rearrangements that were incorporated in species having the largest amount of change were generally rearrangements that should produce considerable reduction in gamete fertility in individuals heterozygous for such rearrangements. Radically reorganized karyotypes appear not only in bats but in a wide variety of vertebrates. Factors related to demography, breeding structure, and speciation do not appear adequate to explain the occurrence of such radically reorganized genomes. Factors less related to demographic and vagility characteristics, such as mutation rate and mechanisms which reduce the meiotic constraints on the heterozygote, are phenomena which may be involved in evolving a radically reorganized karyotype.

Baker, R. J., B. L. Davis, R. G. Jordan and A. Binous (1974). Karyotypic and morphometric studies of Tunisian mammals: Bats.

Les caryotypes et les mensurations de 8 espèces de Chiroptera de Tunisie sont présentés dans ce travail. *Asellia tridens* et *Rhinolophus mehelyi* montrent une variation sexuelle secondaire significative. Les mesures des *Plecotus austriacus* de Tunisie sont comparées à celle des *P. austriacus* et *P. auritus* de Hollande. Les auteurs donnent des indications sur la reproduction des chauves-souris de Tunisie.

Les caryotypes de *Rhinolophus ferrumequinum, Pipistrellus kuhli, Eptescisu serotinus, Plecotus austriacus* et *Miniopterus schrelbersi* sont identiques en Tunisie et en Europe. *Rhinolophus mehelyi* a le même nombre diploïde qu'en Roumanie, mais le nombre fondamental est différent. Le caryotype de *Myotis blythi* de Tunisie est différent de celui de Tchécoslovaquie, mais il est semblable à ceux des *Myotis* de l'Ancien et du Nouveau Monde. Le caryotype d'*Asellia tridens* est 2N = 50, NF = 62.

Baker, R. J., R. L. Honeycutt and R. A. Van den Bussche (1991a). Examination of monophyly of bats: restriction map of the ribosomal DNA cistron.

Two opposing hypotheses concerning the origin of bats, as well as flight in mammals, have been proposed. In one, all bats shared a common ancestor after diverging from the remainder of extant Mammalia, whereas in the other, Megachiroptera, Primates, and Dermoptera shared a common ancestor after diverging from the Microchiroptera. In the latter hypothesis, flight in mammals would have evolved twice. To discriminate between the two competing hypotheses, we mapped 52 restriction sites for the ribosomal cistron (rDNA) for representative taxa using a mole, a shrew, and Mus as outgroups. We examined 14 genera representing 13 families of Microchiroptera, 5 genera of Megachiroptera, *Cynocephalus* (order Dermoptera), and *Homo* and *Lemur* (order Primates). Of the 52 mapped restriction sites, 24 were shared among all taxa. Resolution of the two alternative hypotheses was not found within these data. The only potentially resolving site was a *Pvu* II site in the nontranscribed spacer that united Dermoptera with the five genera of Megachiroptera. No

synapomorphic site linked all bats, all Microchiroptera, or Megachiroptera, Dermoptera, and Primates. It is Hypothesized that the lack of resolution from these molecular data originates from these taxa sharing a common ancestor for a relatively short time after diverging from the remainder of extant Mammalia. Such a short time in a common ancestor would permit few molecular events in conservatively evolving DNA sequences to become established to document a common origin. Alternatively, events that became established in rapidly evolving molecules would be lost or obscured due to extensive evolution over the long term since the Primates, Megachiroptera, Microchiroptera, and Dermoptera separated from each other.

Baker, R. J., C. S. Hood and R. L. Honeycutt (1989). Phylogenetic relationships and classification of the higher categories of the new world bat family Phyllostomidae.

A new classification of the higher taxonomic levels within the New World bat family Phyllostomidae is presented which designates evolutionary relationships, provides a phylogenetic framework upon which modifications can be made as new comparative data are produced, and resolved certain obvious unnatural taxa that exist in the traditional classification. This new classification is a synthesis of classical morphological, chromosomal, and biochemical data. Within the family three subfamilies, the Desmodontinae, Phyllostominae, and Vampyrinae are recognized. The Desmodontinae includes the three genera of vampires, the Vampyrinae includes *Vampyrum, Trachops*, and *Chrotopterus*, and the Phyllostominae contains three tribes, the Phyllostomini (including *Phyllostomus, Tonatia, Mimon, Lonchirhina*, and *Macrophyllum*), the Glossophagini (including genera of the previously recognized Glossophaginae and Brachyphyllinae), and Stenodermatini (including genera of the previously recognized Stenodermatinae and Carolliinae). Two genera (*Macrotus* and *Micronycteris*), do not share synapomorphies with any of these subfamilies, but have retained a large number of plesiomorphic features and are placed as incertae sedis.

Baker, R. J., M. Maltbie, J. G. Owen, M. J. Hamilton and R. D. Bradley (1992). Reduced number of ribosomal sites in bats: evidence for a mechanism to contain genome size

To better understand the organization of the genome of bats, we examined by in situ hybridization, the number of ribosomal DNA sites in 50 species of bats representing both suborders, 7 families, and 38 genera. Number of sites ranged from one to four pairs (average, 1.76) in bats, whereas the number of sites in 40 species of rodents ranged from two to ten pairs (average, 4.19). The possible relationship of a reduced number of sites to a smaller amount of DNA in the genome of bats is explored. We find little evidence to support the hypothesis that bats are retaining a fixed primitive condition of a low number of sites and we conclude that the most probable explanation is that bats, like other groups of mammals, have mechanisms that tend to increase the number of sites. However, the balance between mechanisms that increase and those that reduce the number of sites is more strongly in favor of reduction of sites than is characteristic of other mammals such as rodents.

Baker, R. J. and J. L. Patton (1967). Karyotypes and karyotypic variation of North American Vespertilionid Bats.

Karyotypes of 32 species of North American vespertilionid bats are described. Individual, population, subspecific, specific, and generic karyotypic variation are discussed. The use of karyotypes as a taxomomic tool and phylogenetic indicator in bats is discussed.

Barak, Y. and Y. Yom Tov (1989). The advantage of group hunting in Kuhl's bat *Pipistrellus kuhlii* (Microchiroptera).

Group hunting by *Pipistrellus kuhli* (Microchiroptera) was observed in Kibbutz Sde Eliyahu, Israel. The bats are attracted to aggregations of phototactic insects, mainly moths, which were found near street

lights. While flying near aggregations the bats emitted mainly the searching component of their calls, which caused the insects to disperse, apparently in order to escape predation. A negative correlation was found between the number of bats present near a light and percentage of insects grouped together. Group hunting seems to be beneficial for bats; there was a high correlation between bats' group size and the incidence of 'feeding buzzes'.

Barak, Y. and Y. Yom-Tov (1991). The mating system of *Pipistrellus kuhli* (Microchiroptera) in Israel.

The mating system, of the microchiropteran bat *Pipistrellus kuhli*, was studied in kibbutz Sde Eliyahu, Israel. These bats roost during the day under roofs and in wooden huts and attics and hunt in uncluttered environments (e.g., fields) to which they fly along permanent routes. From the beginning of March the females aggregate, in hundreds, at maternity colonies. Pregnant females are found between March-May and lactating females from May-July. Maximal body weight is reached in autumn (October-November) before hibernation, and in spring, due to pregnancy.

Two types of males were observed: those which roost singly all year round in permanent places located along the females' flying routes, and those which roost in small groups (7-16 individuals), which are located elsewhere. Single males are characterized by attaining maximal body weight in March and minimal body weight in October, having larger testes and exhibiting song-flight and false landing displays. In contrast, the body weight of grouped males fluctuates like that of the females. They have much smaller testes and do not exhibit mating displays. It is concluded that the system of *P. kuhli* might be categorized as female resource polygamy, where females are highly social and travel over a large area but along permanent routes, and the reproductive males roost and court along these routes.

La reproduction de *Pipistrellus kuhli* a été étudiée en Israel. Ces chauves-souris se reposent le jour sous des toits et chassent pendant la nuit sur des parcours constants dans un environnement ouvert. Au début de mars, les femelles se réunissent par centaines dans des colonies de maternité. Les femelles gestantes se voient de mars à mai et les femelles allaitantes de mai à juillet. Le poids maximal du corps est atteint en automne (octobre-novembre), avant l'hibernation, et au printemps à cause de la gestation.

Deux types de males ont été observés: ceux qui se reposent isolement toute l'année dans le même endroit, près des parcours de vol des femelles, et ceux qui se reposent en petits groupes (7 à 16) qui sont localises ailleurs. Les mâles solitaires atteignent leurs poids maximal en mars et leur poids minimal en octobre: ils ont des gros testicules et un vol bruyant et des parades de faux atterrissage. Par contre, le poids des males groupes fluctue comme celui des femelles. Ils ont des testicules plus petits et ne montrent pas de parades d'atterrissage. On en conclut à une polygamie des femelles; les femelles sont hautement sociales et voyagent sur une grande surface, mais selon des parcours constants, et les mâles reproducteurs se reposent et paradent le long de ces routes.

Baranga, J. and B. Kiregyera (1982). Estimation of the fruit bat population in the Kampala Bat Valley, Uganda.

A population estimate of fruit bats was carried out in the Kampala Bat Valley roost. The model used was a single-stage systematic sampling of unequal primary units (trees). The trees were first listed in a 'serpentine manner' with neighbouring trees having contiguous serial numbers. After a random start, every seventeenth tree was selected so that a sample of fourteen out of a total of 238 trees were counted. The exercise was carried out over 3 months, January, February and March, in 1979.

Information was gathered on the number of branches with bats, the number of bat clusters and cluster size. From the analysis of the data, the following monthly averages were obtained: total number of bats in the colony = 70,388; average number of bats on each tree = 310; average number of clusters per branch=4; average cluster size = 7.8. Measures of reliability of the estimates were made. The implications of these results and the conservation of the habitat are adjusted.

Une estimation de la population de chauve-souris frugivores a été menée dans les dortoirs devla 'Kampala Bat Valley'. Le modèle utilisé est un échantillonnage systématique en un temps d'unités primaires inégales (les arbres). La liste des arbres fut d'abord établie suivant un trajet en zig-zag. Apres un point de départ aléatoire, on a sélectionné chaque dix-septième arbre de telle façon qu'un échantillon de quatorze sur un total de 238 arbres fut compté. Ce travail fut entrepris pendant trois mois: de janvier à mars 1979. Des informations furent récoltées sur le nombre de branches portant des chauve-souris, le nombre de grappes et la taille des grappes. Les moyennes mensuelles suivantes ont pu être obtenues par l'analyse de ces données: nombre total de chauve-souris dans la colonie: 70.388, nombre moyen de chauve-souris sur chaque arbre: 310, nombre moyen de grappes par branche: 4, taille moyenne d'une grappe: 7.8. Les implications de ces résultats sur la conservation de l'habitat sont discutées.

Barlow, K. E. and G. Jones (1997a). Function of pipistrelle social calls: field data and a playback experiment.

The study aimed to determine whether the so-called social calls that are produced by foraging bats of two phonic types of *Pipistrellus pipistrellus* serve a social function. First, the relationship between insect availability and the rate of production of social calls was measured at a foraging site of both phonic types. Second, playback experiments of social calls of the two phonic types were conducted in the field to determine the response of foraging bats to these calls, and to determine whether the calls are used in communication within or between phonic types. Two hypotheses are suggested for the function of social calls: that they may be used either to attract other bats to a food patch, or in agonistic interactions between bats in defense of a food patch. At relatively low insect densities, the rate of social call production of both phonic types increased significantly as insect density decreased. When social calls of each phonic type were broadcast, there was a significant reduction in bat activity of the same phonic type. In contrast, playbacks of social calls resulted in no change in activity of the other phonic type. The results supported the food patch defense hypothesis, that social calls are used to warn off other bats of the same phonic type when insects are scarce. The results also supported the hypothesis that the two phonic types are sibling species. Social calls were shown to serve a social function in intraspecific communication, but there was no communication between phonic types.

Barlow, K. E. and G. Jones (1997b). Differences in songflight calls and social calls between two phonic types of the vespertilionid bat *Pipistrellus pipistrellus*.

The pipistrelle (*Pipistrellus pipistrellus*) occurs as two phonic types in Britain, its echolocation calls falling into two distinct frequency bands, with mean frequencies of maximum energy at 55 kHz and 46 kHz. These are termed the 55 kHz and 45 kHz phonic types here for simplicity. Songflight calls produced by males in the mating season, probably to attract females, differed between the two phonic types in the number of components in the calls and the call parameters measured. Songflight calls of the 55 kHz phonic type, which generally consisted of three components, were of higher frequencies than those of the 45 kHz phonic type, usually of four components. There were also significant differences in call parameters among individuals. A discriminant analysis of songflight calls classified 100% of individuals to the correct phonic type. The relationships between echolocation call frequency and songflight call frequency differed significantly between phonic types. Social calls produced during flight also differed between phonic types, in the number of components and call parameters measured. Social calls were compared to songflight calls of each phonic type. Social calls of the 55 kHz phonic type did not differ significantly from songflight calls: there were small but significant differences between the two types of calls of the 45 kHz phonic type. The study provides support for the hypothesis that the phonic types should be treated as sibling species. If songflight calls are used for male choice, the differences may allow reproductive isolation between the two phonic types. The functions of songflight calls and social calls need to be investigated through experimental studies to explain the implications of the differences between phonic types.

Barlow, K. E., G. Jones and E. M. Barratt (1997). Can skull morphology be used to predict ecological relationships between bat species? A test using two cryptic species of pipistrelle.

Can ecological relationships between bat species be predicted largely on the basis of morphology? This question was addressed by investigating skull morphology of two cryptic species of the pipistrelle bat. Since 45 *Pipistrellus pipistrellus* apparently eats larger prey than 55 *P. pipistrellus*, we predicted that it would have a larger overall skull size, a larger dentary apparatus, and a larger gape. To test these predictions, variables were measured from skulls of the two cryptic species, and comparisons made between them. In accordance with our predictions, overall skull size was larger in 45 *P. pipistrellus* than in 55 *P. pipistrellus*, and 45 *P. pipistrellus* had a longer lower jaw and the distance between the jaws at maximum gape was larger. In addition, 45 *P. pipistrellus* had longer upper canines, which may allow it to pierce harder prey items than 55 *P. pipistrellus*. Only some aspects of dietary differences between the two cryptic species could be explained by differences in skull morphology, and we suggest that empirical data, at least on diet and habitat use, are also required to explain mechanisms of resource partitioning among species in bat communities.

Barnett, A. A. and M. L. Prangley (1997). Mammalogy in the Republic of Guinea: an overview of research from 1946 to 1996, a preliminary check-list and a summary of research recommendations for the future.

The mammal fauna of Guinea is one of the least well-known in West Africa. This review has been prepared to bring together the scattered literature, and in the hope of stimulating research and identifying topics, geographical localities and habitats where knowledge is most limited. It covers some 411 biological publications, attempting to review all relevant material concerning terrestrial and freshwater aquatic mammals of Guinea published between 1946 and July 1996. Veterinary papers and those on domestic or introduced species have been excluded, as have those on Cetacea. Taxonomic literature is considered only insofar as it is relevant to biogeographical matters.

The paper is divided into two parts: the first reviews information on the biology, ecology, natural history and biogeography of Guinea's mammals; the second part looks at threats, conservation measures and laws, and summarizes recommendations for future research. A preliminary check-list and a list of suggested priorities for future mammalogical research are provided.

Barraclough, D. A. (1998). *Katacamilla* Papp, 1978, a genus of Camillidae (Diptera: Schizophora) associated with the dung of bats, birds and hyraxes in Africa and the Arabian Peninsula.

Katacamilla Papp, 1978, hitherto a monotypic genus of Camillidae known only from Namibia, is revised to include five species from Africa and the southern part of the Arabian Peninsula. The revision is based on more than 400 specimens. The placement of *Katacamilla* in the Camillidae is confirmed. A revised diagnosis of the genus is given. *Katacamilla* is distinguished from all other camillid genera by at least 10 character states, six of which are autapomorphies. A key to the species is presented. Illustrations of head profiles, male forefemur and terminalia are provided for all species. *Katacamilla cavernicola* Papp is redescribed from three Namibian localities. Four new species are described: *K. braacki* from northeastern South Africa, *K. ctenidia* from northern Nigeria, *K. gallagheri* from eastern Oman and *K. procavia* from central Namibia. *Katacamilla cavernicola* is known only from caves, where it exhibits both parietal and troglophilic habitat preferences; it has been reared from dung of the rock pigeon, *Columba guinea* Linnaeus (parietal), and of the common slit-faced bat, *Nycteris thebaica* Geoffroy (troglophilic). *Katacamilla braacki* has been collected in close association with dung of the Egyptian fruit bat, *Rousettus aegyptiacus* (Geoffroy), in a troglophilic habitat. *Katacamilla procavia* has been reared from the dung of the rock hyrax, *Procavia capensis* (Pallas), taken from the shelter of a rocky overhang. *Katacamilla ctenidia* and *K. gallagheri* are probably associated with the dung of birds and/or small mammals in relatively exposed habitats. A preliminary cladistic analysis suggests that the clade comprising the bat-associated (cavernicolous) sister species, *K. cavernicola* and *K. braacki*, is the most highly derived in the genus and, consequently, that association with bats is a recent specialization.

Barratt, E. M., M. W. Bruford, T. M. Burland, G. Jones, P. A. Racey and R. K. Wayne (1995). Characterization of mitochondrial DNA variability within the microchiropteran genus *Pipistrellus*: approaches and applications.

Past systematic studies of the genus *Pipistrellus* have used either morphological or karyological characters to reconstruct phylogenetic relationships. We provide a new molecular perspective on the relationships of *Pipistrellus* species through a phylogenetic analysis of mitochondrial cytochrome *b* DNA sequence data. We have used the polymerase chain reaction to amplify DNA of individuals from both living populations and museum collections. Our results show that *Pipistrellus* is a diphyletic grouping, containing two distinct clades that differ by about 12% in mitochondrial DNA sequence. Surprisingly, we find that genotypes from the UK population of *P. pipistrellus* are found in both clades. Three possible explanations for this observation are (1) that hybridization has occurred between species from both clades, (2) that two distinct ancestral lineages have been retained in the species, or (3) that the lineages comprise separate species.

Barus, V. (1973). The finding of nematods and Acanthocephalans in Egyptian bats.

A description is given of four nematode species recovered from Egyptian bats, i.e., *Spinostrongylus spinosus, Rictularia rnacdonaldi, Physaloptera* sp. (larvae), *Cyrnea* sp. (larvae), and of two acanthocephalans - *Pachisentis* sp. and *Moniliformis* sp. (both acanthellae). Characteristics of the morphology and measurements are given for *S. spinosus* and *R. macdonaldi*, with an evaluation of their range of hosts and their geographical distribution (including a list of genera and species of the subfamily Spinostrongylinae). In addition, an evaluation is given of the phenomenon of reservoir parasitism of larval nematodes and acanthellae in the bat.

Bauer, K. (1992). *Laephotis botswanae* - a bat new for Tanzania.

A small collection of bats obtained in Tanzania in the 1930s includes a specimen of Laephotis botswanae, a rare from until now not known from Tanzania. This record enlarges the list of Tanzanian bats to 79 species.

Baum, D. A. (1995). The comparative pollination and floral biology of baobabs (*Adansonia* - Bombacaceae).

The baobabs comprise eight species with large, spectacular, nocturnal flowers. The African baobab, *Adansonia digitata*, has long been known to be bat-pollinated. In this paper I document the floral biology and pollination systems of the remaining seven species. The two species in section *Brevitubae*, both endemic to Madagascar, are pollinated by nocturnal mammals (fruit bats and lemurs). In contrast, the five species in section *Longitubae*, four endemic to Madagascar an one to Australia, are pollinated by long-tongued hawkmoths. In all cases, animals besides the legitimate pollinators also exploited nectar and pollen. The two pollinator systems occurring in the genus correlated closely with differences in the floral morphology, phenology, and nectar production.

Beaucournu, J.-C. and D. Kock (1996). Notes sur les Ischnopsyllinae du continent Africain, III. Compléments à la répartition des espèces (Insecta: Siphonaptera: Ischnopsyllidae).

First records of bat fleas are reported for Burkina Faso (*Lagaropsylla anciauxi* on *Tadarida major*), Eritrea (*Chiropteropsylla brockmani* on *Scotophilus dinganii flavigaster*; *L. anciauxi* on *T. bivittata*), Ethiopia (*L. idae* on *T. condylura* and *T. pumila*), Kenya (*L. idae* on *T. condylura* and *T. pumila*), Malawi (*Ischnopsyllus emminus* on *Pipistrellus rueppelli* and *P. kuhlii*; *Dampfia grahami equatoris* on *Eptesicus*

capensis; *L. consularis* on *T. pumila*) and Senegal (*L. idae* on unidentified bat). New host species for bat fleas are *T. bivittata* for *L. anciauxi* (in Eritrea); *Rhinolophus aethiops* for *Rhinolophopsylla ectopa* (in Kenya); *P. rueppelli* (1st African record) and *P. kuhlii* for *I. emminus* (in Malawi); the genus *Scotophilus* (1st African record) is a new host for *C. brockmani* (in Eritrea). Collection records are also given for: *L. incerta* on *T. condylura* in Madagascar; *Araeopsylla scitula* on *Otomops martiensseni* and *Triaenops persicus* in Kenya; *I. octactenus* on *P. kuhlii* in Tunisia; *R. capensis* on *Rhinolophus clivosus* in South Africa; and *Rhinolophopsylla unipectinata arabs* on *Rhinolophus mehelyi* and *R. ferrumequinum* in Algeria.

Beaucournu, J.-C. and J.-F. Noblet (1985). Une Nyctéribie (Diptera, Pupipara) nouvelle pour la faune Française: présence de *Basilia mediterranea* Hurka, 1970 en Corse.

A l'occasion d'une capture faite sur 2 *P. pipistrellus* de Corse, la femelle encore non étudiée de *B. mediterranea* est brièvement décrite et comparée à celle des autres *Basilia* apparentées ou sympatriques.

A Nycteribid (Diptera, Pupipara) new to the french Fauna: *Basilia mediterranea* Hurka, 1970 in Corsica.

On the occasion of the capture from 2 Corsican *P. pipistrellus*, the female of *B. mediterranea* is briefly described and compared with related or sympatric *Basilia*.

Behrensmeyer, A. K., N. E. Todd, R. Potts and G. E. McBrinn (1977). Late Pliocene faunal turnover in the Turkana Basin of Kenya and Ethiopia.

Analysis of a large sample of well-dated fossil mammals from localities in the Turkana Basin of Kenya and Ethiopia revealed sampling biases that affect patterns of faunal turnover during the late Pliocene. When these biases were accounted for, results indicated that 58 to 77 percent of the mammal species were replaced between 3.0 and 1.8 million years ago (Ma). Overall diversity increased from 3.0 to 2.0 Ma but then declined. No distinct turnover pulse is seen between 2.8 and 2.5 Ma; instead, the most significant period of faunal change began after 2.5 Ma and continued through 1.8 Ma.

Bell, G. P. and M. B. Fenton (1984). The use of Doppler-shifted echoes as a flutter detection and clutter rejection system: the echolocation and feeding behavior of *Hipposideros ruber* (Chiroptera: Hipposideridae).

Hipposideros ruber use CF/FM echolocation calls to detect the wing flutter of their insect prey. Fluttering prey were detected whether the insects were flying or sitting on a surface, and prey in either situation were captured with equal success (approximately 40% of capture attempts). Stationary prey were ignored. The bats did not use visual cues or the sounds of wing flutter to locate their prey. Wing flutter detection suggests that *H. ruber* exploit the Doppler-shifted information in echoes of their echolocation calls. These bats fed primarily upon moths, usually those of between 10 and 25 mm wingchord, although moths of less than 5 mm and greater than 40 mm wingchord were also attacked and captured. They showed no evidence of selecting moths on the basis of species or other taxonomic distinction, and occasionaly captured other insects.

Benda, P. (1994). Biometrics of *Myotis myotis* and *Myotis blythi*: age variation and sexual dimorphism.

A large sample of *Myotis myotis* and *M. blythi* was investigated to evaluate the role of age dependent variation and the amount of sexual dimorphism in the total variation of morphometric characters. Growth of some cranial dimensions continued up to the age of 2-3 years. In comparison with *M. blythi*,

this process is delayed in *M. myotis*. Sexual dimorphism was found in external measurements (females being larger) and some cranial ones (males being larger), the overall pattern being the same in both species.

Benda, P. and I. Horácek (1995). Biometrics of *Myotis myotis* and *Myotis blythi*.

Myotis myotis and *M. blythi* differ in pattern of both ontogenetic and geographic variation. Cline increase in body size (from West to East) was found in *M. myotis*. In *M. blythi*, such a trend is restricted onto the zones of sympatry only. Such a parallelism and an inverse skewenes of morphometric variation in sympatric populations may indicate a character displacement in these species. *M. myotis* seems to be resident in the W-Mediterranean, including whole the N-Africa. *M. blythi* is expected to spread into the W-Mediterranean as late as during the late Holocene and supposedly it did not reach Africa at all.

Benedict, F. A. (1957). Hair structure as a generic character in bats.

Since Cook's work (1868) on the hair of Indian bats, few studies have been made on the hair of the Chiroptera. Cole (1924) and Nason (1948) have stated that hair structure is of little taxonomic value in bats. Mayer (1952), however, has shown that hair structure can be used in distinguishing bats of the California fauna, and Volshina's (1951) preliminary study has also shown differences of hair structures in a few pteropids and in one emballonurid. The present study of bat hair is more extensive than any previous one and indicates clearly that hair structure can be a useful taxonomic tool, particularly for categories above the species level.

Benoit, P. L. G. (1958a). Les Polyctenidae du Congo Belge (Hemiptera - Cimicoidea).

Après avoir été négligée durant de longues années, la famille des Polycténides, composée exclusivement d'espèces parasites de Chauves-souris, a connu les faveurs de divers chercheurs au Congo Belge durant les dix dernières années. Jusque là, deux spécimens seulement avaient été récoltés dans nos Territoires d'Outre-Mer: -un spécimen par J. RODHAIN en 1920, un par A. COLLART en 1926.

A partir de 1948 par contre nos collections se sont enrichies de plus de vingt-cinq spécimens grâce aux recherches de N. LELEUP, M. LIPS, F. ANCIAUX DE FAVEAUX et finalement A. FAIN.

Dans leur excellente monographie de la famille G. F. FERRIS et R. L. USINGER (*Microentomology, vol. IV, 1939, contrib. number II* citent quatre espèces africaines: *Eoctenes intermedius* SPEISER, *E. nycteridis* HORVATH, *Adwoctenes horvathi* JORDAN et *Hypoctenes clams* JORDAN; aucune de ces espèces n'y est signalée du Congo Belge. COOREMAN en 1951 *Rev. Zool. Bot. Afr., 44, pp. 339-341* consacre une première publication à l'existence de la famille au Congo Belge pour les deux espèces africaines du genre *Eoctenes*. Quelques années plus tard le même auteur *Rev. Zool. Bot. Afr., 51, 1955, pp. 107-108* signale la capture d'*Adroctenes horvathi* JORDAN au Congo Belge.

Depuis ces deux publications de nombreux spécimens sont parvenus au Musée du Congo Belge; ils nous fournissent d'utiles précisions sur la distribution géographique et le choix de l'hôte.

Tous les spécimens originaires du Congo Belge cités dans cette publication font partie des collections du Musée Royal du Congo Belge.

Benoit, P. L. G. (1958b). Contribution a l'étude de Spinturnicidae du Congo Belge.

Dans l'état actuel de nos connaissances, les Spinturnicides, parasites du cheiropatagium des Chauves-souris, 'n'ont pas souvent été signalés du Congo Belge.

On ne sait pas encore si ces Acariens jouent un rôle dans la transmission de germes pathogènes. Ils sont incontestablement hématophages et la présence de sang dans le tractus digestif de la plupart des spécimens constitue d'ailleurs un obstacle au montage direct des spécimens en préparations microscopiques. Il est presque toujours indispensable de les faire bouillir dans une solution de KOH à 5-7 % puis d'expulser le contenu liquifié du corps par de légères pressions. Ces pressions se font de préférence à l'aide d'un objet obtus à l'extrémité. Après un passage d'environ dix minutes dans l'acide acétique cristallisable, le montage en milieu de Hoyer m'a donné toute satisfaction. Il est préférable de colorer les nymphes à l'éosine en solution chlorhydrique. L'emploi de KOH en solution supérieure à 7 % est à proscrire; à cette concentration la microsculpture cutanée est entamée, elle devient indistincte et disparaît parfois entièrement.

Bergmans, W. (1975). On the differences between sympatric *Epomops franqueti* (Tomes, 1860) and *Epomops buettikoferi* (Matschie, 1899), with additional notes on the latter species (Mammalia, Megachiroptera).

The approximate limits of the region of sympatric occurrence of the West African fruit bats *Epomops franqueti* (Tomes, 1860) and *Epomops buettikoferi* (Matschie, 1899) are discussed. Series of the two species from that region are compared and a key is given to identify adult specimens. Notes are added on the distribution, ecology and biology of *E. buettikoferi*.

Bergmans, W. (1976). A revision of the African genus *Myonycteris* Matschie, 1899 (Mammalia, Megachiroptera).

The fruit bat genus *Myonycteris* Matschie, 1899, is considered to contain only two valid taxa: the species *M. torquata* (Dobson, 1878) inhabiting the forest blocks in West Africa and Central Africa, and *M. brachycephala* (Bocage, 1889) from the island of São Tomé. *M. wroughtoni* Andersen, 1908, and *M. leptodon* Andersen, 1908, are considered synonyms of *M. torquata*. The subgenus *Phygetis* Andersen, 1912, proposed for the species *brachycephala* only, is sunk into the synonymy of *Myonycteris*. A number of new (collecting) localities for *torquata* is recorded, among which the first one in Nigeria. Data are included on morphological variability, sexual dimorphism,ecology and biology. The possible type locality of *torquata*, and some evolutionary trends within the genus are discussed.

Bergmans, W. (1977a). Notes on new material of *Rousettus madagascariensis* Grandidier, 1929 (Mammalia, Megachiroptera).

Seize spécimens de *Rousettus madagascariensis* Grandidier, 1929, ont été étudiés et mesurés. La position et les affinités du taxon sont discutés.

Biometrics of 16 specimens of *Rousettus madagascariensis* Grandidier, 1929, are given. Characters and affinities, distribution, and habitat of the species are discussed.

Bergmans, W. (1977b). An annotated inventory of three small collections of Nigerian Microchiroptera (Mammalia, Chiroptera).

The Nigerian Microchiroptera in the natural history collections of the universities of Ibadan, Ife and Amsterdam are listed. Important data and some measurements of each specimen are given. Some species are discussed in detail. *Myotis bocagei cupreolus* Thomas, 1904, and *Tadarida (Mops) congica congica* (Allen, 1917) are first records for Nigeria. The occurrence of *Rhinolophus landeri* Martin, 1838, in Nigeria is suggested. Some *Eptesicus* specimens are assigned to the species

capensis (Smith, 1829) and *somalicus* (Thomas, 1901). Four hitherto unknown specimens of *Scotophilus gigas gigas* Dobson, 1875, are recorded, and the type locality of this species is discussed.

Une liste a été dressée des Microchiroptères de la Nigérie, qui font partie des collections d'histoire naturelle des universités d'Ibadan, d'Ife et d'Amsterdam. Des données générales sont mentionnées pour tous les spécimens dont quelques-uns sont traites plus amplement. *Myotis bocagei cupreolus* Thomas, 1904, et *Tadarida (Mops) congica congica* (Allen, 1917), représentent des espèces nouvelles pour la Nigérie. On a conjecture la présence possible en Nigérie de *Rhinolophus landeri* Martin, 1838. II a été fait mention de quatre spécimens de *Scotophilus gigas gigas* Dobson, 1875, qui étaient inconnus jusqu'a présent; tous les quatre sont originaires de localités situées soit tout près de Lagos, soit au Lagos même, la localité-type alléguée.

Die nigerianischen Microchiropteren in den Museumssammlungen der Universitäten von Ibadan, Ife und Amsterdam werden aufgelistet. Daten und einige Maße werden für verschiedene Arten angegeben. Für Nigeria sind *Myotis bocagei cupreolus* Thomas, 1904 und *Tadarida (Mops) congica congica* Allen, 1917 erstmals nachgewiesen. Ferner kann das Vorkommen von *Rhinolophus landeri* Martin, 1838, für Nigeria angenommen werden. Einige *Eptesicus*-Exemplare werden den Arten *capensis* (Smith, 1829) und *somalicus* (Thomas, 1901) zugeordnet. Weiterhin sind vier bislang unbekannte Exemplare von *Scotopbilus gigas gigas* Dobson, 1875 belegt und diskutiert.

Bergmans, W. (1978a). Rediscovery of *Epomophorus pousarguesi* Trouessart, 1904 in the Central African Empire (Mammalia, Megachiroptera).

Three recently collected specimens of the fruit bat *Epomophorus pousarguesi* Trouessart, 1904, hitherto only known from the type specimen, are described. In the author's view they confirm the specific status of the taxon; the type locality and distinguishing characters of the species are discussed.

Bergmans, W. (1978b). Review of drinking behavior of African Fruit Bats (Mammalia: Megachiroptera).

Certain captive African Megachiroptera drink regularly from a hanging posture. There are very few reports of these animals drinking in the wild, nearly all claiming that they would drink by skimming over open water surfaces and scooping water or wetting their fur and licking water from this afterward. This paper summarizes and critically deals with the literature on the subject, and presents some new evidence suggesting that the skimming maneuvers of some fruit bats might serve a purpose other than drinking. The discussion includes some related observations on Australasian Megachiroptera.

Bergmans, W. (1979a). Taxonomy and zoogeography of the fruit bats of the Peoples Republic of Congo, with notes on their reproductive biology (Mammalia, Megachiroptera).

This study deals with 272 Megachiroptera from the People's Republic of Congo, belonging to 13 taxa: *Eidolon helvum helvum* (Kerr), *Rousettus aegyptiacus unicolor* (Gray), *Lissonycteris angolensis angolensis* (Bocage), *Myonycteris torquata* (Dobson), *Hypsignathus monstrosus* Allen, *Epomops franqueti franqueti* (Tomes), *Epomophorus* cf. *labiatus* (Temminck), *Epomophorus wahlbergi haldemani* (Halowell), *Micropteropus grandis* Sanborn, *Micropteropus pusillus* (Peters), *Scotonycteris zenkeri zenkeri* Matschie, *Scotonycteris ophiodon* Pohle, and *Megaloglossus woermanni* Pagenstecher.

Of these, *Epomophorus* cf. *labiatus* and *Micropteropus grandis* are recorded from this country for the first time. The known ranges of *Epomophorus* cf. *labiatus* and *Micropteropus grandis* are greatly extended towards the west. In morphology and zoogeography ten species correspond with populations to the north and, with the possible exception of both *Scotonycteris* species, to the south; towards the east the distribution of *Rousettus aegyptiacus* and both *Scotonycteris* species is possibly

discontinuous. The two *Epomophorus* species and *Micropteropus grandis* are linked with populations towards the south and east only.

Seasonal biannual reproduction is assumed for *Epomophorus wahlbergi, Epomops franqueti*, and *Micropteropus pusillus*. Data on reproduction in other species are scarce or lacking.

Bergmans, W. (1980). A new fruit bat of the genus *Myonycteris* Matschie, 1899, from eastern Kenya and Tanzania (Mammalia, Megachiroptera).

Myonycteris relicta n. sp. is described from the Shimba Hills in southeast Kenya and from the Usambara Mountains in northeast Tanzania. The species is larger than the only other known African mainland species of the genus, *Myonycteris torquata* (Dobson, 1878), from the Central and West African rain forests and, if compared to *M. torquata* and the only other species in the genus, *M. brachycephala* (Bocage, 1889) from São Tomé, has a relatively longer rostrum, a more deflected cranial axis, and further differs in number, shape and position of its teeth. The new species provides new arguments for the relationship between the genera *Myonycteris* Matschie, 1899, and *Lissonycteris* Andersen, 1912. It is believed that *Myonycteris relicta* may be a forest species and as such restricted to isolated East African forests.

Bergmans, W. (1982). Noteworthy extensions of known ranges of three African fruit bat species (Mammalia, Megachiroptera).

True *Nanonycteris veldkampii* (Jentink, 1888) is recorded from the Central African Republic for the first time. The disputed occurrence of *Epomops buettikoferi* (Matschie, 1899) in Nigeria is confirmed. *Rousettus lanosus* Thomas, 1906, is added to the faunal list of Sudan.

Bergmans, W. (1988). Taxonomy and biogeography of African fruit bats (Mammalia, Megachiroptera). 1. General introduction; Material and methods; Results: The genus *Epomophorus* Bennett, 1836.

This first part of a revision of African fruit bats contains a short general Introduction and a section Materials and Methods, both pertaining to all parts -as are the first remarks under Results -, and a study of the genus *Epomophorus* ~ Bennett, 1836. Prior important descriptions of *Epomophorus* are reviewed and current concepts of the generic characters .~ relative rostrum length; relative palatal length; depression ofpostdental palate; palatal ridge pattern; and sexual dimorphism are modified.

Bergmans, W. (1989). Taxonomy and biogeography of African fruit bats (Mammalia, Megachiroptera). 2. The genera *Micropteropus* Matschie, 1899, *Epomops* Gray, 1870, *Hypsignatus* H. Allen, 1861, *Nanonycteris*, Matschie, 1899 and *Plerotes* Andersen, 1910.

The genera *Micropteropus* Matschie, 1899, *Epomops* Gray, 1870, *Hypsignathus* H. Allen, 1861, *Nanonycteris* Matschie, 1899 and *Plerotes* Andersen, 1910 and the species assigned to them are reviewed. All the currently recognized taxa are main- tained except subspecific partitions in *Epomops .franqueti* (Tomes, 1860). The known characters are reviewed and dis- cussed, and new characters presented, and their possible taxonomical implications mentioned. Of the skull characters traditionally used to

---

Bergmans, W. (1994). Taxonomy and biogeography of African fruit bats (Mammalia, Megachiroptera). 4. The genus *Rousettus* Gray, 1821.

The concept of the genus *Rousettus* Gray, 1821 as established by Andersen (1912) is revised to accommodate *R. madagascariensis* Grandidier, 1929, *R. obliviosus* Kock, 1978 and *R. spinalatus* Bergrnans & Hill, 1980, and to reflect the following mutations. Following Bergmans et al. (1988), the genus *Boneia* Jentink, 1879 is treated as a synonym of *Rousettus*, which adds to that genus the species *B. bidens* Jentink, 1879. The subgenus *Stenonycteris* Andersen, 1912 is considered a synonym of *Rousettus* and the subgenus *Lissonycteris* Andersen, 1912 a full genus, to be reviewed in the next part of this series. All African *Rousettus* species are characterized and their distributions, including many new records, and geographical variation are analyzed. Following Eisentraut (1960), *R. egyptiacus* (E . Geoffroy-St. Hilaire, 1810) is divided into four, geographically disjunct, subspecies: *egyptiacus* from southern Egypt northward to and along the Mediterranean coast, including Cyprus, into southern Turkey; *leachii* (Smith, 1829) from southern Sudan and Ethiopia through East Africa to the Cape; *unicolor* (Gray, 1870) from northwest Angola to the Mount Cameroun region and from there to Senegal; and the extralimital *arabicus* Anderson & de Winton, 1902 from the southern half of the Arabian Peninsula to southern Iran and Pakistan (*arabicus* records from East Ethiopia are thought to be based on small-skulled *leachii*). All four subspecies are shown to vary geographically. The differences between *arabicus* and *R. leschenaultii* (Desmarest, 1820), which both inhabit Pakistan, are discussed at length. Notwithstanding several recent publications, *Rousettus lanosus* O. Thomas, 1906 is considered very distinct from *Rousettus madagascariensis*. Its scattered highland distribution has given rise to appreciable geographic variation. Three rough divisions are described but for the present no subspecies are recognized: East Zaïre, adjoining Uganda and (probably) Rwanda; (probably) West Ethiopia, South Sudan, East Uganda and Kenyan highlands; and Northeast Tanzania to Malawi. The Malawi records are the first for that country. Of *R. madagascariensis*, many new specimens have come to light, and its diagnosis is adapted accordingly. Its association, as a subspecies, with *R. lanosus* by some recent authors is based on a misinterpretation of its original description and other literature, and rejected as untenable. Its differences from *R. obliviosus* are described in detail for the first time. Some previously unrecorded specimens of *R. obliviosus* are reported. It is suggested that sexual dimorphism may be at least partly responsible for the "geographic" variation noted by Kock (1978).

Bergmans, W. (1997). Taxonomy and biogeography of African fruit bats (Mammalia, Megachiroptera). 5. The genera *Lissonycteris* Andersen, 1913, *Myonycteris* Matschie, 1899 and *Megaloglossus* Pagenstecher, 1885; General remarks and conclusions; annex: Key to all species.

This is the last part in a series comprising all Megachiroptera known from mainland Africa and its islands. The concept of the genus *Lissonycteris* Andersen, 1912 is reviewed and adapted. For the first time, its differential characters vis-à-vis the genera *Rousettus* Gray, 1821, and *Myonycteris* Matschie, 1899 as described in the literature have been checked against material of all the species involved. As a consequence, a number of these characters are considered of no taxonomic value and have not been retained, while some new differential characters are described. *Lissonycteris* and *Myonycteris* are considered different from *Rousettus* on generic level, while *Lissonycteris* and *Myonycteris* are more closely related to one another than each of these to *Rousettus*. New observations on all African and extralimital species of *Rousettus* are reported and the retention of *Boneia* Jentink, 1879 as a subgenus by Corbet et al. (1991, 1992) is rejected. *Lissonycteris* is considered a monotypic genus, with as single species the polytypic *L. angolensis* (Bocage, 1898). The subspecies *angolensis, smithii* (O. Thomas, 1908) and *ruwenzorii* (Eisentraut, 1965) are recognized, and two new subspecies, *petraea* and *goliath*, are described. *Myonycteris* consists of three species, *torquata* (Dobson, 1878), *brachycephala* (Bocage, 1889) and *relicta* Bergmans, 1980. Their present taxonomy is conform earlier reports (Bergmans, 1976, 1980a). *M. torquata* is considered a monotypical species. *M. relicta* is reported from Zimbabwe for the first time, extending its known distribution 1400 km southwards. Following Kirsch et al. (1995) and Springer et al. (1995), the subfamily Macroglossinae is considered a synonym of the subfamily Pteropodinae. The taxonomy and distribution of *Megaloglossus woermanni* Pagenstecher, 1885 are reviewed. In a final section, general remarks and conclusions are presented on the supraspecific taxonomy of the Megachiroptera and a classification is proposed which includes the raise to subfamily rank of the Rousettinae and Epomophorinae and the recognition of the new tribes Scotonycterini and Plerotini; some recent publications bearing on African species taxonomy are reviewed; and an appraisal is made of the distribution patterns found throughout this series. A vicariance model is proposed to explain the occurrence in Asia and Africa of both *Pteropus* Brisson, 1762 and *Rousettus* Gray, 1821. For woodland species, the regions SE Tchad/E

Central African Republic/W Sudan; N half of Tanzania; and E Angola/adjoining Zaïre have been identified as having (had) a barrier effect on dispersal. For forest species, important divides appear to be in the regions Volta River/Dahomey Gap; SE Nigeria; C and S Gabon; C Zaïre, from N to S; the Western Rift system; several barriers in E Africa. Finally, an illustrated key to all African Megachiroptera is given, primarily based on externally visible characters and designed for use in the field.

Bergmans, W., L. Bellier and J. Vissault (1974). A taxonomical report on a collection of Megachiroptera (Mammalia) from the Ivory Coast.

Ce travail concerne l'étude de 209 spécimens de Megachiroptères de la République de Côte-d'Ivoire. Ils appartiennent à 11 espèces différentes (les chiffres entre parenthèses indiquent le nombre d'individus de chaque espèce): *Eidolon helvum* (8), *Rousettus aegyptiacus* (2), *Hypsignathus monstrosus* (12), *Epomops franqueti* (27), *Epomops buettikoferi* (66), *Micropteropus pusillus* (30), *Nanonycteris veldkampi* (20), *Scotonycteris zenkeri* (1), *Lissonycteris angolensis* (5), *Myonycteris torquata* (35) et *Megaloglossus woermanni* (3).

Les positions taxonomiques de certaines espèces et sous-espèces ont été discutées, en se fondant sur les mensurations et la coloration des spécimens.

Bergmans, W. and H. Jachmann (1983). Bat records from Malawi (Mammalia, Chiroptera).

Five species of bats are recorded from Kasungu National Park, Malawi: *Eidolon helvum* (Kerr, 1792); *Epomophorus anurus* Heuglin, 1864; *Epomophorus minor* Dobson, 1880; *Epomops dobsonii* (Bocage, 1889); and *Scotoecus hindei* Thomas, 1901. Some other Malawian records of these species, based on literature and specimens in collections, have been included. *Epomophorus anurus, Epomops dobsonii* and *Scotoeous hindei* are recorded from Malawi for the first time.

Bernard, R. T. F. (1980a). Reproductive cycles of *Miniopterus schreibersi natalensis* (Kuhl, 1819) and *Miniopterus fraterculus* Thomas and Schwann, 1906.

The reproductive cycles of *Miniopterus schreibersi* and *Miniopterus fraterculus* were investigated histologically using specimens collected in the Natal Midlands (c. 29° S 30° 15' S).

In both species the gestation period was extended by a period of delayed implantation. In *M. fraterculus* the period of delayed implantation was two-and-a-half months, one-and-a-half months shorter than this period in *M. schreibersi*. In both species the period of active fetal growth was approximately four months.

Copulation in *M. schreibersi* from the Natal Midlands began one month after copulation in the same species from southern and northern Transvaal (c. 25° S and c. 24° S), and it is suggested that this is the result of summer in the Transvaal ending approximately one month earlier than in the Natal Midlands.

On the basis of the reproductive cycle and winter behaviour, the difference between the reproductive cycles of *M. schreibersi* and *M. fraterculus* is explained by suggesting that *M. fraterculus* migrated southwards from the tropics after *M. schreibersi*, that *M. fraterculus* has a shorter history at southern latitudes, and as such its reproductive cycle is intermediate between that of *M. schreibersi* from the same latitude, and the typical tropical reproductive pattern.

Bernard, R. T. F. (1980b). Female reproductive anatomy and development of ovarian follicles in *Miniopterus fraterculus*.

The uterus of *Miniopterus fraterculus* (Thomas & Swan 1906) is bicornuate and asymmetrical, the right uterine horn being larger than the lett in parous and nulliparous females. Ovarian and uterine function is asymmetrical; 94 % of observed ovulations originated in the left ovary and all implantations occurred in the right uterine horn. Growth and development of ovarian follicles follow the typical eutherian mammalian pattern. The preovulatory Graafian follicle differs from that of most hibernating verspertilionids in that the cumulus oophorus is relatively small. Two types of follicular atresia occur. The first type, in which the stratum granulosum degenerates before degeneration of the oocyte, occurs in multilaminar follicles. The second type occurs in primary and early secondary follicles and is characterized by the oocyte showing the first signs of regression.

Miniopterus fraterculus (Thomas & Swann 1906) het 'n bikornaatuterus wat asimmetries is met die regterhoring groter as die linker een. Die funksie van beide ovarium en uterus is asimmetries, deurdat 94 % van die waargenome ovulerings in die linker ovarium ontstaan het, en alle implanterings in die regterhoring van die uterus plaasgevind het. Groei en ontwikkeling van die follikels in die ovarium kom ooreen met die kenmerkende patroon in die eutheria. Die preovulatoriese follikel van Graaf verskil van die van meeste hibernerende vespertilionidae daarin dat dié cumulus oophorus relatief klein is. Twee tipes follikulêre atresia kom voor in *M. fraterculus*. Die eerste tipe is waar die stratum granulosum degenereer voordat degenerasie van die oösiet plaasvind, en word aangetref in multilaminêre follikels. Die tweede tipe kom voor in primêre en vroeë sekondêre follikels en hier word die eerste tekens van regressie in die oösiet gevind.

Bernard, R. T. F. (1982a). Female reproductive cycle of *Nycteris thebaica* (Microchiroptera) from Natal, South Africa.

Investigated monthly changes in the female reproductive organs and the reproductive cycle of *Nycteris thebaica*. Monthly changes in ovarian and vaginal activity were characterized by two peaks. The first, between April and early June, culminated in estrus, while the second, occurred between July and August during pregnancy and is thought to be a relict from polyestrous ancestors. The reproductive cycle was characterized by copulation and fertilization in early June, a five month gestation with parturition in early November, approximately two months of lactation, and a period of anestrus between termination of lactation and onset of proestrus in April.

Bernard, R. T. F. (1982b). Monthly changes in the female reproductive organs and the reproductive cycle of *Myotis tricolor* (Vespertilionidae: Chiroptera).

Myotis tricolor was monoestrous and monotocous. The oestrous cycle was characterized by a prolonged period of oestrus between mid-April and mid-September and a short period of anoestrus between the termination of lactation and the onset of pro-oestrus. The female reproductive cycle was characterized by copulation in mid-April and ovulation and fertilization in mid-September. The gestation period was estimated to have been 63 days and parturition occurred between mid-November and mid-December. Parturition was followed by a six-week period of lactation. It is assumed that between mid-April and mid-September the female stored spermatozoa in the uterine horns, a reproductive strategy previously reported for north-temperate members of this genus.

Maandelikse veranderinge in die vroulike voortplantingsorgane van *Myotis tricolor* is gekenmerk deur 'n kort ontwikkelingsperiode van die follikels van Graaf sowel as die vaginale epiteel gedurende pro-estrus. Die estrussiklus is gekenmerk deur 'n uitgerekte estrus en 'n kort anestrus tussen die einde van laktasie en die begin van pro-estrus. Die vroulike voortplantingsiklus is gekenmerk deur kopulasie in middel April, ovulasie en bevrugting in middel September en geboorte tussen middel November en middel Desember. Dit word vermoed dat spermatozoa tussen middel April en middel September in die uterushorings gestoor word, 'n voortplantingstrategie reeds voorgestel vir noord-gematigde lede van hierdie genus.

Bernard, R. T. F. (1984). The occurrence of spermiophagy under natural conditions in the cauda epididymidis of the Cape horseshoe bat (*Rhinolophus capensis*).

In Cape horseshoe bats large numbers of spermatozoa remain in the cauda epididymidis after copulations have ceased in September. Light microscopy has shown that for 5 months after September phagocytes are present in the lumen of the cauda epididymidis and electron microscopy has shown these cells to be active spermiophages. The large numbers of spermiophages present suggests that these cells could be responsible for removal of most of the excess spermatozoa. Spermiophagy by the epididymal epithelial cells occurs rarely and is not significant in the treatment of excess spermatozoa.

Bernard, R. T. F. (1985). Reproduction in the Cape horseshoe bat (*Rhinolophus capensis*) from South Africa.

Structure of the reproductive organs and the processes of spermatogenesis and follicular development are described and are·similar to those described for other members of the genus *Rhinolophus*. The reproductive cycle of the Cape horseshoe bat is characterized by spermatogenesis between October and May (spring to autumn) with sperm released to the cauda epididymis in April and May. At this time the females are in oestrus or submaximal oestrus but copulation and ovulation are delayed until August and September (the end of winter hibernation). Between May and September spermatozoa are stored in the cauda epididymis where they show no positive association with the epididymal epithelium. Parturition occurs in November and December after a three to four month gestation.

Die struktuur van die voortplantingsorgane en die prosesse van spermatogenese en follikulere ontwikkeling word beskryf en is soortgelyk aan die van ander lede van die genus *Rhinolophus*. Die voortplantingsiklus van die Kaapse saalneusvlermuis word gekenmerk deur spermatogenese wat tussen Oktober en Mei (Iente en somer) plaasvind met saad wat teenwoordig is in die cauda epididimis gedurende April en Mei. Die wyfies is in estrus of submaksimale estrus gedurende hierdie tydperk maar paring en ovulasie word tot Augustus en September (die einde van die winterslaap) vertraag. Tussen Mei en September word spermatozoa in die cauda epididimis gestoor waar hulle geen positiewe verbintenis met die epididimale epiteel vertoon nie. Geboorte vind plaas gedurende November en Desember na 'n dragtydperk van drie tot vier maande.

Bernard, R. T. F., C. Bojarski and R. P. Millar (1991). Plasma progesterone and luteinizing hormone concentrations and the role of the corpus luteum and LH gonadotrophs in the control of delayed implantation in Schreibers' long-fingered bat (*Miniopterus schreibersii*).

In Schreibers' long-fingered bat from South Africa (~ 33 °S) copulation, ovulation and fertilization occurred in April and May, implantation was delayed until August, and parturition occurred in December. Delayed implantation coincided with winter, during which the bats remained active, only entering prolonged periods of torpor during particularly cold spells. Plasma progesterone concentration was low during non-pregnancy (1.54 ng/ml) and during delayed implantation (1.67 ng/ml), and thereafter increased to reach a peak mean of 64.82 ng/ml in late pregnancy. Changes in size and ultrastructure of the luteal cells indicated periods of steroidogenesis just after formation of the corpus luteum, and for about 2 months after implantation; reduced steroidogenic activity during delayed implantation; and luteolysis in the last 2 months of pregnancy. Plasma luteinizing hormone (LH) concentration and pituitary LH-ß immunoreactivity were highest during follicular development and peaked just before ovulation. During early delayed implantation, plasma LH concentration was low, and both plasma LH and pituitary LH- ß immunoreactivity increased from July, reaching peaks in late pregnancy. LH may be required to activate the corpus luteum and terminate delayed implantation, or, as in some small carnivores, it may be required for luteal maintenance.

Bernard, R. T. F. and G. S. Cumming (1997). African bats: evolution of reproductive patterns and delays.

Patterns of reproduction in African bats can be compared in three taxon-based groups: fruit bats (Megachiroptera), freetailed bats (Microchiroptera: Molossidae) and the nonmolossid Microchiroptera. In the fruit bats and nonmolossid Microchiroptera there is a trend from either seasonal or aseasonal polyestry, with prolonged or continuous spermatogenesis in the tropics, towards seasonal monestry and seasonal spermatogenesis at more temperate latitudes. Reproductive delays (sperm storage, delayed implantation and delayed development) are rare at tropical latitudes, but are the norm in the nonmolossid Microchiroptera away from the tropics. The molossids are mostly polyestrous at tropical and temperate latitudes, although the duration of the reproductive season decreases with increasing latitude. The molossids appear to have escaped the constraints that affect reproduction of the other Microchiroptera. We propose that this may be due to their flight capabilities and foraging behavior, which give them access to year-round food, and to the thermal characteristics of their roosts. We suggest that the ancestral reproductive pattern of the Chiroptera was probably aseasonal or seasonal polyestry, as seen in extant tropical species, and therefore that reproductive cycles have evolved from the polyestrous to the monestrous condition. Short periods of reproductive delay occur in some species of tropical bats; we suggest that these reproductive delays originally were not adaptations to temperate latitudes but rather to the long dry season, which is characteristic of African tropical latitudes. With the move away from the tropics, selective pressures, acting on the timing of lactation and spermatogenesis, would have ensured that these processes continued to occur in the warm wet season, and that the length of the reproductive delay increased. This model accommodates the probable evolutionary origin of bats and links the evolution and development of reproductive delays to the differences in climate that occur with changes in latitude. There is evidence that mate choice and sperm competition may be important to modem bats, but we believe that they need not be invoked as causal factors in the evolution of reproductive delays, which can be adequately explained using purely energetic arguments.

Bernard, R. T. F. and A. Davison (1996). Does calcium constrain reproductive activity in insectivorous bats? Some empirical evidence for Schreibers' longfingered bat (*Miniopterus schreibersii*).

Insects are a poor source of dietary calcium and since they are seasonally abundant, it has been suggested that calcium availability may play a significant role in controlling the timing of reproduction in insectivorous bats. To assess the possible role of dietary calcium, we have measured bone calcium concentrations in female and male long-fingered bats (*Miniopterus schreibersii*) through a full reproductive cycle. The results indicate that winter was not a period of calcium stress and, therefore, that seasonal changes in insect abundance and dietary calcium availability are not a satisfactory explanation for the occurrence of delayed implantation in the long-fingered bat. Bone calcium concentrations of females did not differ significantly throughout pregnancy, indicating that the insects available in winter and early summer were sufficient to meet the calcium demands of pregnancy. Lactating females had the lowest bone calcium concentrations of all specimens, supporting the suggestion that lactation is indeed a period of severe calcium stress in aerial insectivores. We conclude that parturition is probably timed so that lactation coincides with the period of maximal insect abundance and corresponding dietary calcium availability.

Bernard, R. T. F., D. C. D. Happold and M. Happold (1997). Sperm storage in a seasonally reproducing African vespertilionid, the banana bat (*Pipistrellus nanus*) from Malawi.

Spermatogenesis in the banana bat (*Pipistrellus nanus*) from southern Malawi began in the hot, wet season (February to April) and spermatozoa were released to the cauda epididymides at the beginning of the cool, dry season (May). Mating occurred between mid-June and early July, in the middle of the cool, dry season. After mating, spermatozoa were stored by the female until ovulation in August and by the male until at least September. The period of female sperm storage effectively lengthened the reproductive cycle so that early spermatogenesis occurred during the second half of one hot, wet season and births at the beginning of the following hot, wet season. During the period of sperm storage, males and females roosted together and group membership was labile, suggesting that the mating

system may be promiscuous (both males and females mating with more than one partner) and that sperm competition may occur. The similarity between the chronology of reproduction in Malawi, Kenya, and South Africa leads us to propose that sperm storage occurs at all three localities.

Bernard, R. T. F. and J. A. J. Meester (1982). Female reproduction and the female reproductive cycle of *Hipposideros caffer caffer* (Sundevall, 1846) in Natal, South Africa.

Female reproduction and the female reproductive cycle of *Hipposideros caffer* from three disused mines in Natal (c. 29 °S) are described.

The uterus of *H. caffer* was bicornuate with sinistral structural and functional asymmetry. The corpus uteri and caudal ends of the uterine horns differed from the general mammalian pattern, being lined by stratified epithelium. Growth, development and atresia of ovarian follicles were typically mammalian. The corpus luteum of *H. caffer*, which was extruded from the ovary, disappeared within one month of ovulation.

H. caffer was monoestrous and monotocous. Follicular development began in February, with copulation and ovulation occurring in late April (early winter). The gestation period was estimated to have been approximately 220 days of which the period of the zygote accounted for 21 days or 9,5 per cent, the period of the embryo 123 days or 55,9 per cent and the period of the foetus 76 days or 34,5 per cent. Development from fertilization to implantation was normal but embryonic development was retarded during winter. Parturition occurred in early December and was followed by a period of lactation/anoestrus during December and January.

The oestrous cycle, including pregnancy, was characterised by a relatively long pregnancy stage and the absence of a separate period of anoestrus.

H. caffer did not hibernate throughout the winter period but entered short periods of torpor during particularly cold spells.

Results from the present study support the trend seen in the genus *Hipposideros* and other microchiropteran genera of increasing gestation length with increasing latitude.

Bernard, R. T. F., J. Paton and K. Sheppey (1988). Relative brain size and morphology of some South African bats.

Measures of relative brain size and brain macromorphology are described for four species of Microchiroptera, two from the Vespertilionidae and two from the Rhinolophidae, and two species from the pteropodidae (Megachiroptera). Four brain parameters (brain length, hemisphere length, brain width and brain height) were measured, and converted to indices of proportion to allow interspecific comparison. The megachiropteran species have relatively larger brains than the microchiropteran species, this being primarily a result of the greater development of the cerebral hemispheres in the former group. Of the microchiropteran species, *Miniopterus schreibersii* has the highest value for comparative brain size and its brain shows several characteristics of the more encephalized Megachiroptera such as reduced exposure of the mesencephalic tectum, and the presence of prominent cerebral sulci. The possibility that the differences in brain size and development between the Megachiroptera and the Microchiroptera, may be related to diet, or that they may be of phylogenetic origin, is discussed.

Relatiewe breingrootte en brein-makromorfologie word beskryf vir vier spesies van die Vespertilionidae en Rhinolophidae (Microchiroptera) en twee spesies van die pteropodidae (Megachiroptera). Vier breinparameters (breinlengte, hemisfeerlengte, breinbreedte, en breinhoogte) is gemeet en omgesit na indekse van eweredigheid om interspesifieke vergelyking toe te laat. Die Megachiroptera-spesies het relatief groter breine as die Microchiroptera-spesies, wat primer te wyte is aan die groter ontwikkeling van die serebrale hemisfere van die eerste groep. Van die Microchiroptera-spesies het *Miniopterus schreibersii* die hoogste waarde vir relatiewe breingrootte en sy brein wys verskeie

kenmerke van die meer ontwikkelde brein van die Megachiroptera soos verminderde ontbloting van die mesenteriese tektum en die teenwoordigheid van prominente serebrale sulci. Die moontlikheid dat die verskille in breingrootte en -ontwikkeling tussen die Megachiroptera en Microchiroptera verwant mag wees aan dieet, of dat hulle van genetise oorsprong mag wees, word bespreek.

Bernard, R. T. F. and J. N. Tsita (1995). Seasonally monoestrous reproduction in the molossid bat, *Tadarida aegyptiaca* from low temperate latitudes (33°S) in South Africa.

A histological study of reproduction in Egyptian free-tailed bats (*Tadarida aegyptiaca*) from the Eastern Cape Province of South Africa (c. 33° S) showed that females were seasonally monoestrous. Copulation, ovulation and fertilization occurred in August, at the end of winter. and births in December, after a four-month pregnancy. These results are compared with those of other molossid bats from lower latitudes in Africa. We conclude that the monoestrous habit of the Egyptian free-tailed bat at 33° S may be due to its relatively long pregnancy, and to the short summer period during which minimum temperatures are high enough to ensure an abundance of nocturnal flying insects.

'n Histologiese ondersoek van Egiptiese losstertvlermuise (*Tadarida aegyptiaca*) van die Oostelike Kaap Provinsie van Suid-Afrika (c. 33° S) toon dat dear slegs 'n enkele estrus per jaar is en dat dit seisoensgebonde is. Paring, ovulasie en bevrugting vind plaas gedurende Augustus, aan die einde van die winter, met geboortes gedurende Desember na 'n dragtigheidsperiode van vier maande. Die resultate word vergelyk met die van ander molossiede vlermuise van laer breedtegrade in Afrika. Ons maak die gevolgtrekking dat die enkele estrus van Egiptiese losstertvlermuise teen 33° S verklaar kan word deur 'n lang dragtigheidsperiode en die kort tydperk gedurende die somer wanneer die minimum temperature hoog genoeg is om te verseker dat daar 'n oorvloed vlieende naginsekte is.

Best, T. L., B. A. Milam, T. D. Haas, W. S. Cvilikas and L. R. Saidak (1997). Variation in diet of the Gray bat (*Myotis grisescens*).

During spring and summer 1991, a total of 1,476 fresh fecal pellets of gray bats, *Myotis grisescens*, was collected at Blowing Wind Cave, Jackson Co., Alabama. Fourteen orders of Insecta, unidentified Insecta, an unknown organism (possibly Insecta), two orders of Arachnida, and hair from gray bats were recovered; in decreasing order, the most common taxa were Lepidoptera, Diptera, and Coleoptera. Food categories exhibited significant variation among sampling sessions, nights within sampling sessions, and hours within sampling sessions. When quantity of each food category in fecal pellets was compared with quantity of potential prey available for consumption, there was no statistically significant correlation. There was significant variation in diet over time, but bats did not select prey in proportion to availability.

Bhatnagar, V. S. and G. Parveen (1985). Karyomorphology of an Indian rat-tailed bat, *Rhinopoma microphylum kineari* Wroughton.

The diploid chromosome number and the details of the karyotype of an Indian bat, *Rhinopoma microphylum kineari* Wroughton is being reported for the first time (2n = 36).

Bhide, S. A. (1979). Observations on the anatomy, histology and histochemistry of the stomach of the vespertillonid bat *Miniopterus schreibersii* (Kuhl).

Both the openings of the stomach of *Miniopterus schreibersii* are directed cranially and the fundus is large and rounded. The longitudinal layer of muscles is thin but the circular layer is thick particularly at the apex of the fundic caecum. In addition to the usual types of cells, namely pepsinogen cells, parietal cells, surface mucous cells and neck mucous cells, a new type of cell, the interstitial cell of the gastric mucosa, which stains intensely pink with PAS, has been identified for the first time in the gastric glands.

In general there is a predominance of neutral mucins particularly in the pyloric region where blebs of mucus are seen to ooze out into the lumen. Acidic mucins are present in moderate amounts in the surface mucous cells at the apex of the fundic caecum.

Bickham, J. W. (1979). Chromosomal variation and evolutionary relationships of Vespertilionid bats.

Intergeneric evolutionary relationships were studied in vespertilionid bats using G- and C-band data. In most cases, chromosomal variation can be explained by Robertsonian changes, centric fusions being by far the most numerous. There appear to be three karyotypic, evolutionary trends among vespertilionids. The first is to remain karyotypically primitive by retaining a high diploid number with many acrocentric chromosomes. The second is to become karyotypically specialized by a process of centric fusion leading to lower diploid numbers with many biarmed chromosomes. The third is to reduce greatly the diploid number by centric fusions and translocations. The latter is seen only in *Lasionycteris* (2n = 20), which evolved from an ancestor with a karyotype like that of *Myotis* (2n = 44). A phylogenetic sequence is proposed based on banding patterns. A Myotis-like group including *Myotis, Pipistrellus, Lasiurus, Plecotus, Idionycteris*, and *Lasionycteris* evolved from an ancestor with the *Myotis* karyotype. An *Eptesicus*-like group including *Eptesicus, Rhogeessa, Antrozous*, and *Nycticeius* evolved from an ancestor with a karyotype like that of *Eptesicus*. *Miniopterus* represents a karyological intermediate between the two groups. The ancestral karyotype for the family is hypothesized to have been similar to that of *Myotis*.

Bigalke, R. C. (1968). Evolution of mammals on southern continents. II. The contemporary mammal fauna of Africa.

Africa and the Oriental Region are probably the areas from which mammals radiated into the rest of the world. Both regions have rich and diverse mammalian faunas. That of Africa, composed purely of placentals, is most closely related to the Oriental fauna and has very little in common with the faunas of the other southern continents. About one quarter of the families are endemic. Approximate numbers of species and superspecies are given for each family. Africa has about one-quarter of the mammal species of the world; rodents, bats, insectivores, artiodactyls, carnivores and primates, in that order, are the largest groups. Endemism at the generic level is high except in the bats. The main features of speciation, radiation, ecology and geographical distribution are discussed for each order. Outstanding features are the radiation of insectivores with the evolution of three endemic families, (the aquatic otter shrews, subterranean golden moles and bipedal elephant shrews); the great diversity of rodents, with endemic families resembling "flying" squirrels (anomalurids), moles (bathyergids), hyraxes (ctenodaclylids), cavies (thrynomyids) and kangaroos (*Pedetes*); extensive speciation in the Viverridae, and unparalleled radiation in the Bovidae to fill all available herbivorous niches. Regional faunas of the main biotic zones (Lowland Forest; Southern and Northern Savanna; South West, Somali and Sudanese Arid; and the Abyssinian Highlands) are described. The basic dichotomy is between forest and non-forest forms. A consideration of centers of endemism, mainly in the lowland forest and arid zones, leads to the conclusion that they were isolated as a result of fluctuations in climate and the resulting displacement of vegetation zones during the Quarternary. The faunas of Madagascar and of the Comoro, Seychelle and Mascarene Islands are described. Madagascar has a peculiar, ancient, typically unbalanced, island fauna with African affinities. The other islands have small faunas, composed only of bats in the case of the farthest ones.

Birch, J. M. (1997). Comparing wing shape of bats: the merits of principal-components analysis and relative-warp analysis.

Size and shape are fundamental features of organisms. Ideally, the methods used to describe size and shape must be sensitive enough to detect small differences, and at the same time provide interpretation that is visually satisfying. I compared shape of wings among *Eptesicus fuscus, Myotis lucifugus, Pipistrellus hesperus*, and *Tadarida brasiliensis* using three methods of morphometric

analysis; principal-components analysis on traditional measures of lengths and areas, principal-components analysis of interlandmark distances, and relative-warp analysis. These species were chosen to test the efficacy of each morphometric analysis at discovering and describing differences in both size and shape. Although principal-components analyses provided similar aggregations of species based on variable loadings, only relative-warps analysis provided clear pictures as to how species differ. The molossid bat, *T. brasiliensis*, had narrower wings than the vespertilionid bats; this shape was not due to compression of the entire wing, but to a complicated rotation around the fifth digit. The vespertilionid bats were difficult to discern based on wing shape alone, but the warp analysis showed that *P. hesperus* and *M. lucifugus* are more similar in shape of wing than either is to *E. fuscus*. Each method of analysis of shape has strengths, but relative-warp analysis provided both the power to discriminate among minor differences in shape of species within families, and the graphical capability to display those differences in a visually pleasing way.

Black, H. L. (1979). Precision in prey selection by the trident -nosed bat (*Cloeotis percivali*).

Stomach samples from 55 African trident-nosed Bats (*Cloeotis percivali*), collected in Zambia over a 12 month period, were analyzed for prey remains. Lepidoptera were identified in all stomachs. Only seven bats had eaten prey other than lepidopterans. The width of the food niche for *Cloeotis* is compared with that of a temperate insectivorous species, *Pipistrellus Hesperus*, and is shown to be narrower. Data are presented on the size distribution of selected insect taxa collected by light trapping. Seasonal aspects of prey abundance in relation to rainfall patterns is also presented. It is hypothesized that *Cloeotis percivali* is a specialist on lepidoterans irrespective of seasonal or short term changes in their abundance.

Le contenu des estomacs de 55 *Cloeotis percivali*, collectés en Zambie pendant une période de 12 mois, a été examiné pour déterminer la nature des proies ingérées. Des Lépidoptères ont été identifiés dans tous les estomacs et seulement 7 chauves-souris ont ajouté d'autres insectes à leur menu. La niche alimentaire de *Cloeotis* comparee à celle d'une espèce insectivore de région tempérée, *Pipistrellus hesperus*, est plus étroite. L'auteur donne des indications sur la répartition de la taille des insectes collectés à la lampe. Il donne aussi des indications sur la variation saisonnière de l'abondance des proies en relation avec les pluies. *Cloeotis percivali* pourrait être specialisée dans la prédation des Lépidoptères, quelle que soit la saison et quelles que soient les variations temporaires d'abondance des papillons.

Black, H. L., G. Howard and R. Stjernstedt (1979). Observations on the feeding behavior of the bat hawk (*Macheiramphus alcinus*).

A foraging bat hawk (*Macheiramphus alcinus*) was observed for six consecutive nights near a cave in Zambia. Feeding bouts lasting an average of 18.3 minutes per night caught an average of seven insectivorous bats (average percent success was 49.3 per attempt). Average weight of meals was 56.3 g. Kill-ingestion rates averaged 6.0 sec. Bats were the only observed prey. The morphological and behavioral adaptations of bat hawks are discussed and interpreted as strategies that are a sensitive reflection of the biology, behavior, and ecology of small, insectivorous bats.

Blackwell, M. (1980). Incidence, host specificity, distribution, and morphological variation in *Arthrorhynchus nycteribiae* and *A. eucampsipodae* (Laboulbeniomycetes).

Nycteribiidae (Diptera) are ectoparasites of bats in the Old and New World. Some Old World nycteribiids are hosts for *Arthrorhynchus* (Laboulbeniomycetes). Thirty-five additional collections of *A. nycteribiae* and *A. eucampsipodae* greatly extend the known host and distributional range of these two species. In addition, it has been found that although morphological similarity exists within fungal thalli of the same collection, both species are marked by a great degree of intraspecific variation which usually cannot be correlated with climate, geographical location, host species, host sex, or other

factors. It is suggested that low population densities and partial isolation of populations may contribute to intraspecific variation.

Bobrinskoj, N. (1929). Bats of Central Asia.

Though the study of the systematic and geographical distribution of Bats of Siberia and Turkestan develops rapidly as a result of the recent research of Russian explorers and those of Near Asia, India and China thanks to the work of English and American scientists, the vast area of Central Asia remains quite unexplored.

There is however in the Zoological Museum of the Academy of Sciences a not very numerous but most valuable material of Chiroptera from Central Asia formed by different renowned Russian explorers, beginning with the famous N. PRZEVALSKIJ. It is therefore quite clear that I first paid attention to this collection when delegated by the Trustees of the Zoological Museum to revise their Collection of Bats.

In my article "Preliminary information on Bats of Central Asia" I gave: 1) a list of the Central Asiatic forms, according to the very poor literary information that is available, 2) a catalogue of the Collection mentioned after arranging it as I considered advisable, and 3) diagnoses of new species and subspecies. Being very restricted in print I could mention only very briefly the most important indications, and the diagnoses of the new forms were published only in Russian.

In the present article under the term „ Central Asia" I include the territory that borders on the USSR to the West and the North, . . .

Bocage, J. V. B. (1889b). Mammifères d'Angola et du Congo.

Sous ce titre j'ai l'intention de publier, dans une série d'articles, les résultats d'une première révision de nombreux matériaux déposés dans le Muséum de Lisbonne, qui me semblent destines à donner une idée plus exacte et plus complète des espèces de mammifères qui habitent les territoires d'Angola et du Congo.

La plupart de ces matériaux ont été récueillis par notre zélé naturaliste M. José de Anchieta, qui depuis 1867 s'occupe incessamment, sans un moment de défaillance, de l'exploration zoologique de ces possessions portugaises. Grace à lui, nos connaissances sur la faune de cette intéressante partie du continent africain ont fait de rapides progrès dans ces dernières années. Les territoires d'Angola et du Congo ne sont plus une *terra incognita* sous le point de vue de la zoologie.

D'autres personnes ont également droit à la reconnaissance de tous ceux qui s'intéressent aux progrès de la zoologie comme ayant contribué, quoique en proportions plus modestes, à la prospérité actuelle de nos collections africaines. J'aurai souvent l'occasion de citer leurs noms dans le cours de cette publication, mais je tiens à leur exprimer d'avance mes sincères remerciments pour leur généreux concurs.

Bogdanowicz, W. (1990). Phenetic relationships among bats of the family Rhinolophidae. Abstract.

Sixty-two species of rhinolophid bats were analyzed phenetically under the common-part-removed transformation of Wood C1983). Two ordination methods, one clustering technique, and a minimum spanning tree were employed to assess patterns of overall similarity among species. Two major phonetic groupings were revealed. One grouping was generally formed by Oriental and Australian species, while the second by Ethiopian and Palaearctic ones. Phenetic relationships between and within these groupings were discussed.

Bogdanowicz, W. (1992). Phenetic relationships among bats of the family Rhinolophidae.

Phenetic analyses, using the common-part-removed transformation of Wood (1983), were performed on 2.5 - 6.4% of the variance that describes morphometric differences among bats of the family Rhinolophidae. Two ordination methods, one clustering technique, and a minimum-spanning tree were employed to assess patterns of similarity among 62 species. Two major phenetic groups were revealed. One comprised Oriental and Australian species, whereas the other contained Ethiopian and Palaearctic taxa. On the basis of morphological similarity, all but one species were provisionally arranged in 11 phenetic groups: *megaphyllus, rouxii, euryotis, pearsonii, philippinensis, trifoliatus, fumigatus, ferrumequinum, capensis, euryale*, and *hipposideros*. Mensural data were not sufficient to clarify the status of *R. maclaudi*. Based on the morphological dispersion analysis, the Oriental region should be regarded as the center of origin of the family. On the basis of phylogenetic and functional factors, a close ancestor of rhinolophids probably lived in tropical rain forests, flew slowly emitting low-frequency sounds, and caught relatively soft but large prey.

Bogdanowicz, W., S. Kasper and R. D. Owen (1998). Phylogeny of Plecotine bats: reevaluation of morphological and chromosomal data.

Recent systematic studies of the tribe Plecotini have generated two alternative phylogenetic hierarchies: *(Barbastella (Corynorhinus (Plecotus (Idionycteris Euderma))))*; and *(Euderma* [including *Idionycteris (Barbastella (Plecotus Corynorhinus)))*. To test these hypotheses we examined 44 - 45 morphological and 11 karyological characters of 10 plecotine species, including *Otonycteris hemprichii*. Character states for the hypothetical ancestor were inferred by evaluation of selected outgroup taxa: *Rhogeessa tumida, Nycticeius humeralis, Eptesicus fuscus, Myotis lucifugus, M. ciliolabrum*, and *Miniopterus schreibersi*. The most parsimonious trees, identical in topology but different in character-state optimization, were congruent with the systematic hierarchy of Plecotini suggested by the first hypothesis. *Otonycteris* branched off before *Corynorhinus*. These results strongly support separation of *Corynorhinus* as an independent genus and limitation of *Plecotus* to Palaearctic species. The two highly derived taxa, *Idionycteris phyllotis* and *Euderma maculatum*, seem to be sufficiently different from each other to be regarded as generically distinct. It is proposed that the tribe Plecotini originated in the eastern hemisphere.

Bogdanowicz, W. and R. D. Owen (1990). Phylogenetic analyses of the bat family Rhinolophidae. 1. Metrical characters. Abstract.

The continuous morphological data set representing 64 Operational Taxonomic Units of *Rhinolophus* sp. was analyzed by the maximum likelihood method (size-free and common-partremoved transformations). Of several groups of species recognized by Andersen (1905 a, b, 1918), Tate and Archbold (1939), only a few were well defined and supported phylogenetically. The majority, like the *philippinensis* group of Tate and Archbold (1939), for example, did not represent natural assemblages. The results suggested eastern part of the Oriental Region or "Australo-Indo-Malayan Tract" as a center of origin for Rhinolophidae.

Bogdanowicz, W. and R. D. Owen (1992). Phylogenetic analyses of the bat family Rhinolophidae.

The 35 mensural traits of 62 species from the family Rhinolophidae were analyzed by the maximum likelihood method using data matrices after size-free and common-part-removed transformations. Of several groups of species recognized by most earlier researchers, only a few are well defined and supported phylogenetically. The majority, like the philippinensis group of TATE (1943), for example, do not represent natural assemblages. The results suggest south-east Asia as a centre of origin for the family. The extreme morphological similarity among horseshoe bats appears to reflect the monophyly of the genus *Rhinolophus*.

Bogdanowicz, W. and R. D. Owen (1996). Landmark-based size and shape analysis in the Plecotine bats.

Morphometric divergence among the skulls of 10 species of plecotine bats (n = 105) was studied using x, y-coordinates of 11 homologous landmarks recorded from the left half dorsal view of each skull. Univariate and multivariate analyses of shape coordinates provided estimates of differences among taxa and between sexes. The differences in size among species were correlated with uniform shape differences. The centroid size to uniform factor allometry was more pronounced longitudinally (i.e., along the midline of the skull) than it was laterally. Significant shape differences among species were also detected in both uniform and non-uniform components. Non-uniform shape variation involved lateral rather than longitudinal displacement of landmarks on the skull. Sexual dimorphism was reflected by centroid size and was seen only in *Otonycteris hemprichi*, in which females were about 4.4 % larger than males. The UPGMA phenograms of Mahalanobis D^2 of shape coordinates and of relative warp scores (in which the uniform shape component had been removed) revealed two consistent phenetic clusters. One was formed by *O. hemprichi*, with the remaining genera grouping in a second cluster. The relationships among genera in this second cluster varied depending on the phenogram generated. Nevertheless, the UPGMA phenogram derived from Mahalanobis D^2 computed on Bookstein shape coordinates (sexes combined) was entirely congruent with the current systematic hierarchy and phylogenetic hypothesis of the Plecotini sensu stricto recently put forward based on a parsimony analysis of 32 skin and skull characters. In our analysis, the most divergent species group was the monotypic *O. hemprichi*. A second group was formed by the genus *Barbastella*. The remaining clusters were composed of species of *Corynorhinus; Plecotus*; and a cluster containing *Idionycteris* and *Euderma*.

Böhme, W. and R. Hutterer (1979). Kommentierte Liste einer Säugetier Aufsammlung aus dem Senegal.

Pendant une excursion de trois mois au Sénégal une collection de 290 petits mammifères en 39 espèces a été recolté. Des resultats écologiques et faunistiques seulement les derniers sont résumés ici.

La présence de *Gerbillus pyramidum* au Sénégal est démontrée pour la première fois, c'est aussi la première trouvaille de ce genre dans ce pays. Deux autres espèces sont trouvées pour la deuxième fois au Sénégal: *Rhinolophus guineensis* (élevé ici au rang d'espèce) et *Hipposideros cyclops*.

Vu sous l'aspect historique de la faune, les espèces traités ici, peuvent être séparés en trois groupes:

1. Espèces répandues dans toute la savane soudanienne et sahélienne de la Mer Rouge jusqu'ä l'Ocean Atlantique. Leur Invasion très récente dans cette région peut être documentée par l'existence de plusieurs complexes d'espèces, très difficile dans leur taxonomie et démonstrants qu'ils sont encore en voie de spéciation.

2. Espèces distribués dans toute la région saharienne jusqu'ä l'Afrique du Nord, mais aujourdhui séparés dans des aires de répartition disjonctes: par example *Asella tridens, Gerbillus pyramidum, Lemniscomys barbarus, Mastomys erythroleucus* et *Lepus whytei*. Ce dernier est traité plus au fond quant à sa répartition actuelle en Algérie du Nord. Que la disjonction est assez récente, est démontré par le fait que les populations concernées sont encore conspécifiques.

3. Le dernier groupe est constitué de formes relictes qui sont en même temps d'espèces forestières. Leur plupart est bien defini taxonomiquement, ce que signifie que ces formes ont eu leur proces de spéciation avant les espèces savanicoles du groupe 1: *Rhinolophus guineensis, Hipposideros cyclops, Heliosciurus rufobrachium* et *Funisciurus anerythrus*.

During a three-months-excursion to Senegal 290 smaller mammals representing 39 species have been collected. From the reported ecological and faunistical data only the last named are summarized here.

Gerbillus pyramidum is recorded for the first time from Senegal representing also the first record of the genus for this country. Two further species were recorded for the second time: *Rhinolophus guineensis* (raised to specific rank in this paper) and *Hipposideros cyclops*.

Considering the aspect of faunal history the species discussed here can be grouped into three categories:

1. Species distributed throughout the savanna belt from the Red Sea to the Atlantic Ocean. The relatively recent date of invasion into the study area is documented by the existence of taxonomically difficult species complexes conclusive for the fact that their speciation process is not yet finished.

2 .Species formerly continiuously distributed throughout the Saharan region to North Africa, the area of which has been interrupted by the desertification. Examples given here are: *Asellia tridens, Gerbillus pyramidum, Lemniscomys barbarus, Mastomys erythroleucus* and *Lepus whytei*. The latter is discussed more extensively as regards to its recent distribution also in Northern Algeria. The relatively recent date of disjunction is documented by the conspecifity of the mentioned forms.

3. A last group can be characterised as relict group containing forest species. They are mostly well definable species thus supporting the view that they are older forms which have passed through their speciation phase earlier than the savanna forms of group 1: *Rhinolophus guineensis, Hipposideros cyclops, Heliosciurus rufobrachium* and *Funisciurus anerythrus*.

Bojarski, C. (1990). Immunolocalisation of, and ultrastructural changes in the LH gonadotropes of *Miniopterus schreibersii* and *Rhinolophus capensis* (Mammalia: Chiroptera) in relation to their reproductive cycles.

LH gonadotropes are successfully identified in the anterior pituitary of *Minioptems schreibersii* and *Rhinolophus capensis*, using immunogold labelling at the light and electron microscopy level. The gonadotropes are oval to polygonal in shape and possess numerous small secretory granules, which contain LH throughout the year. Their distribution is similar in both species, although the abundance varies slightly between species and sexes. Seasonal changes are detected in gonadotrope ultrastructure, pituitary LH levels, and plasma hormone levels, and activity pattern of LH gonadotropes generally coincide with reproductive activity in both bat species.

In female *M. schreibersii* gonadotrope activity, and high pituitary LH, and plasma LH levels coincide with follicular development, implantation and gestation. During the period of delayed implantation gonadotropes are inactive and plasma LH levels are low, coinciding with corpus luteum inactivity and low plasma progesterone levels. Implantation coincides with increased activity of the gonadotrope activity, increased plasma LH levels, reactivation of the corpus luteum and elevated plasma progesterone levels. Activation of LH gonadotropes towards the end of hibernation may be initiated by the winter solstice, which marks the change to increasing daylength.

In female *R. capensis* gonadotrope activity and high pituitary and plasma LH levels occur towards the end of follicular development. During hibernation gonadotrope activity and plasma LH levels decrease. Ovulation coincides with increasing gonadotrope activity (which follows the winter solstice), although a preovulatory peak in plasma LH is not detected.

In male *M. schreibersii* and *R. capensis*, gonadotrope activity and high plasma LH and testosterone levels coincide with spermatogenesis, except during a period of reproductive inactivity in spring in male *M. schreibersii*, where gonadotropes appear active and plasma LH and testosterone levels are high. The reason for this apparent activity is not known. Male sperm storage during hibernation in male *R. capensis* coincides with low gonadotrope activity and low plasma LH and testosterone levels. Factors initiating gonadotrope activity and hence spermatogenesis are probably decreasing daylength (summer solstice) in *M. schreibersii* and increasing ambient temperatures and food abundance (following the hibernation period) in *R. capensis*.

Bojarski, C. (1993). Seasonal changes in pituitary and plasma prolactin concentrations, and the role of prolactin in the control of delayed implantation in female *Miniopterus schreibersii*.

Mammotropes were successfully identified in the anterior pituitary gland of *Miniopterus schreibersii* using immunocytochemical (ICC) staining at the light and electron microscopy level. Mammotropes were distributed throughout the gland, were polygonal in shape and during secretory activity contained numerous large secretory granules (350 - 800 nm). Using double ICC labelling, prolactin and growth hormone were never co-localiszed and found in individual cells only. Plasma prolactin levels were successfully measured on a monthly basis using radioimmunoassay and monthly pituitary prolactin levels were quantified using morphometric analysis of immunogold ICC staining and densitometry with polyacrylamide gels.

Seasonal changes in the ultrastructure of mammotropes, and pituitary and plasma prolactin concentrations in female *Miniopterus schreibersii* indicated that there was an increase in prolactin secretion during the second half of the period of delayed implantation and that prolactin secretion remained elevated during normal embryonic development and lactation. This suggests that prolactin may be part of the luteotropic and lactogenic complex, and that the hormone might be responsible for terminating the period of delayed implantation. The latter is supported by experiments, where exogenous prolactin initiated precocious implantation during early delayed implantation, and treatment with bromocryptine (which inhibits prolactin synthesis) retarded implantation.

Activation of mammotropes to synthesise prolactin and an increase of plasma prolactin levels occurred shortly after the winter solstice (21 June), suggesting that increasing daylength may be the environmental cue, which terminates the period of delayed implantation in *Miniopterus schreibersii*.

Bojarski, C. and R. T. F. Bernard (1988). Comparison of the morphology of the megachiropteran and microchiropteran eye.

The structure of the eyes of two South African bat species, *Rousettus aegyptiacus* (Megachiroptera: Pteropodidae) and *Rhinolophus capensis* (Microchiroptera: Rhinolophidae) was examined and compared by means of light microscopy. The eyes of both species exhibit characteristics of a typical 'noctumal eye' (presence of only rods in the retina; the cornea shows a marked curvature and occupies about one third of the globe; the anterior and posterior chambers are very large in relation to the vitreous) and neither possess a fovea. The main difference occurs in the choroid and the retina. The fruit bat *R. aegyptiacus* shows a marked folding of the retina, as a result of papillae that project inwards from the choroid. This does not occur in the insectivorous bat *R. capensis*, where the choroid and the retina form a smooth layer. It is suggested that this unique feature of the fruit bat, and the associated increase in surface area and hence the number of photoreceptors is probably responsible for its good nocturnal vision.

Die struktuur van die oë van twee Suid-Afrikaansa vlermuis-soorte, *Rousettus aegyptiacus* (Megachiroptera: Pteropodidae) en *Rhinolophus capensis* (Microchiroptera: Rhinolophidae) is ondersoek en vergelyk deur middel van die ligmikroskoop. Die oë van albei soorte toon kenmerke van 'n tipiese 'nagtelike oog' (teenwoordigheid van slags stawe in die retina; die horingvlies vertoon 'n duidelik waameembare geboë vorm en beslaan omtrent een derde van die oogbol; die voorste en agterste kamers is baie groot in vergelyking met die glasige deel) en nie een besit 'n fovea nie. Die belangrikste verskil kom voor in die choroïed en die retina. Die vrugtevlermuis *R. aegyptiacus* toon opmerklike voue in die retina as gevolg van papillae wat vanuit die choroïed na binne uitsteek. Dit kom nie voor in die insekvretende vlermuis *R. capensis* nie waar die choroïed en die retina 'n gladde laag vorm. Daar word aan die hand gedoen dat hierdie unieke kenmerk van die vrugtevlermuis, met sy gepaardgaande vergroting vav die oppervlakte en die gevolglike groter aantal foto-reseptore waarskynlik verantwoordelik is vir die vrugtevlermuis se goeie nagvisie.

Bonhote, J. L. (1910). On a small collection of mammals from Egypt.

The following is an account of a small collection of Mammals brought home from Egypt. It was made up partly of a few skins and skulls which Capt. S. S. Flower had brought together, chiefly those of animals that had died in the Gisai Zoological Gardens or had been killed as vermin, partly of animals brought in from the district by natives, whom Capt. Flower had commissioned on my behalf, and lastly of specimens collected by myself. Unless otherwise mentioned the specimens came from near Cairo.

The collection contains some 28 species, of which one (*Dipoclillus mariæ*) is new to science, in addition to which I have been enabled to resuscitate the name *Procavia burtoni* for the Egyptian Hyrax, which is quite distinct from both the Sudan and Palestine species. An example of *Acomys russatus*, a very rare species, which has hitherto only been found locally in Palestine and Syria, was procured within a short ride of Cairo. The material has also enabled the range of other and commoner species to be extended, e. g. *Gerbillus mackilligini, Lepus innesi*.

I must acknowledge my indebtedness to Messrs. Oldfield Thomas, R. C. Wroughton, and K. Andersen, who have given me much help in the working out of the collection, which is now in the British Museum, and lastly to Capt. Flower, who is doing so much for the Zoology of Egypt and without whose kind cooperation this collection would never have been brought together.

Booth, A. H. (1956). Some Gold Coast mammals not included in Cansdale's "Provisional Checklist".

CANSDALE'S (1948) checklist of Gold Coast mammals is still, within its small compass, by far the most informative publication on the subject. A new checklist is being prepared by the writer, incorporating nomenclatorial and other data, but will not be available for some time. This interim publication is designed merely to add to Cansdale's list some forms which have since been discovered or which Cansdale omitted. The nomenclature is consistent with Candale's throughout.

Booth, A. H. (1958). The Niger, the Volta and the Dahomey Gap as geographic Barriers.

1. The distribution of species-groups of Primates, Sciuromorpha, Artiodactyla and Hyracoidea in West African High Forest is given in detail.

2. Four types of distribution are recognized:
a) *ambisilvan*, groups which occur both east of the Niger and west of the Volta.
b) *central*, groups which occur only east of the Niger.
c) *occidental*, groups which occur only west of the Volta.
d) *inter fluvial*, groups which occur between the Niger and the Volta, and which may have their origin from groups of type a), b) or c).

3. The central fauna is much richer than the occidental, which, though it contains a small number of endemic groups, is nevertheless thought to have been derived originally from the former.

4. The interfluvial fauna is remarkably poor. The zoogeographic data tend to corroborate geological evidence for the periodic deterioration of the climate between the Niger and the Volta during the 'Quaternary, which probably deprived the area of its High Forest several times, either partially or completely.

5. Climatic fluctuation has resulted in the Dahomey Gap acting as an important isolating mechanism in the past. Today, it is probably less important than the Volta and Niger rivers.

Booth, A. H. (1959). On the mammalian fauna of the Accra Plain.

The known mammalian fauna of the Accra Plain is listed. There are 75 species, 30 forest origin, 29 of savannah origin, and 16 which occur both in forest and in savannah. The forest fauna is limited by the 'thicket' type of closed cover which is virtually all that available. The savannah fauna is limited only partly by ecological considerations: geographic factors are also important. While some 15 of the savannah species could have penetrated forest from the north, 14 almost certainly could not. It is concluded that they do not represent a relic fauna, but have invaded the area from the Trans-Volla Togoland Region, following changes in the vegetation of the of the Plain.

Boulger, L. R. and J. S. Porterfield (1958). Isolation of a virus from Nigerian fruit bats.

A virus which is pathogenic for mice has been isolated from a pool containing the brains of six fruit bats (*Eidolon helvum*). The virus is not a strain of rabies virus. Serological tests indicate that it is probably a previously undescribed agent for which the name of Lagos Bat Virus is proposed.

Bown, T. M., M. Kraus, S. Wing, J. Fleagle, B. H. Tiffney, E. Simons and C. F. Vondra (1982). The Fayum Primate Forest revisited.

In Oligocene times, the Fayum area of northern Egypt was a subtropical to tropical lowland coastal plain with damp soils and seasonal rainfall that supported an abundance and variety of vegetation, including lianes (large vines), tall trees, and possibly mangroves, and a large and varied vertebrate fauna. The Oligocene marine strandline was close by and principal Jebel Qatrani Formation streams were probably brackish several kilometers inland due to tidal incursions. Sediments of the Jebel Qatrani Formation were deposited by several large meandering streams, associated with minor but sometimes extensive flood basin ponds. These rocks provide no evidence for the former existence, in early Tertiary time, of a "Proto-Nile" River. Large accumulations of silicified fossil logs in the Jebel Qatrani Formation are autochthonous and the logs were transported only a short distance before burial. The Oligocene higher primates *Aegyptopithecus, Propliopithecus, Parapithecus*, and *Apidium* lived in this paleoenvironment and postcranial remains of *Aegyptopithecus* and *Apidium* demonstrate that these animals were arboreal. This scenario for the paleoenvironment of the Fayum area in Oligocene times differs greatly from the nearly treeless, sparsely vegetated, semiarid sahélien Oligocene Fayum paleoenvironment populated by terrestrial primates that was recently proposed by Kortlandt (1980).

Braack, L. E. O. (1989). Arthropod inhabitants of a tropical cave 'island' environment provisioned by bats.

The arthropod community assoc&ted with an estimated population of 8000 *Rousettus aegyptiacus* fruit bats is described. The bats are permanent residents within a 64-m deep split in a sandstone cliff, the average width of the cave thus formed being 1.5 m and average height about 13 m. Transect sampling suggested a floor population in excess of 80000 *Gyna* spp. cockroaches. Other cave inhabitants included reduviid bugs preying on the cockroaches, parasitic evaniid and chalcidoid wasps, trogid beetles utilizing dead bats, tenebrionid and ptinid beetles, thysanurans, as well as numerous haematophagous argasid ticks and nycteribiid flies using the bats as food source. A simple food-chain depicts trophic relations in the cave.

Bradbury, J. W. (1977). Lek mating behavior in the hammer-headed bat.

Calling assemblies of *Hypsignathus monstrosus* were studied for 17 months in the field to determine if they were “leks” or mating arenas. Direct observations, netting of animals at the assembly sites, and radio-tracking of both ?? and ?? at the assembly sites, foraging grounds, and day roosts were all utilized to make this determination. Captive animals were maintained to establish growth rates. It is concluded

that *Hypsignathus* exhibit lek behavior even by the most conservative definition and share many features with other avian and mammalian lek species.

Bræstrup, F. W. (1935a). Remarks on climatic change and faunal evolution in Africa.

1) There is direct evidence of a steppe fauna in South West Africa as early as Lower Miocene.

2) The moister climate in Egypt during Tertiary is most satisfactorily explained as a result of equator movement, being in accordance with a southwards movement of all climatic zones in Europe as seen in the palaeoclimatic maps of KOPPEN-WEGENER. This means that Central Africa was in Early Tertiary within the southern dry belt, while South Africa was most probably covered by deciduous forest.

3) There is nothing in the recent fauna opposable to this view. The fact that some steppe types have been derived from forest types; does not demand such a theory as that advocated by LÖNNBERG.

Bræstrup, F. W. (1947). Remarks on faunal exchange through the Sahara.

The presence of Ethiopian faunal elements north of the western Sahara and of Palaearctic elements south of it is not exhaustively explained by former connections by river beds across the desert during periods of increased rainfall. There is also a question of temperature. This is seen by the following facts the significance of which seems to have been overlooked by previous authors:

1. Several tropical organisms in northern Egypt show a large break in their distribution further south. - This is probably owing to infavourable temperature conditions, and the inference is that they are survivors from a warmer period, probably the postglacial warm period, which would also allow ithe spreading of certain tropical snakes from western Sudan to Morocco, since it was accompanied by increased rainfall.

2. The few Palaearctic elements which are found in the western Sudan are restricted to the southern, more moist, parts near the forest border, where they are apparently rare. This occurrence is no doubt due to the less extreme heat In the south, and we may regard these species as survivors from a cooler period, probably the last Glacial Epoch, during which a combination of increased rainfall and low temperature favoured the southward spreading of Palaearctic elements.

3. The occurrence in North Africa of certain birds otherwise characteristic of The East African highlands is probably also to be explained by the cooler climate during the Glacial Epochs during which highland species could expand their ranges in the lowlands.

Bray, R. S. (1958). On the parasitic Protozoa of Liberia. I. Coccidia of some small mammals.

Four new species of *Eimeria* are described from small mammals in Liberia. These are: *E. levinei*, sp. nov. from a free-tailed bat, *E. firestonei*, sp. nov., and *E. milleri*, sp. nov., from a shrew, and *E. putevelata*, sp. nov., from a striped grass mouse.

Breitwisch, R. (1983). Fructivores at a fruiting *Ficus* vine in a southern Cameroon tropical wet forest.

A fruiting *Ficus* sp. vine in a southern Cameroon tropical wet forest was monitored for 57.75 hours over a 9-day period in early February 1979. Avian frugivores observed eating figs included one fruit pigeon, four hornbill, and three greenbul species. Two species each of monkeys and squirrels also ate figs. Greenbuls were present at 59 percent of the censuses, fruit pigeons at 12 percent, and hornbills at 11 percent. Mean foraging group sizes for greenbuls. fruit pigeons, and hornbills were 1.7, 2.3, and 2.0,

respectively. Greenbuls ate an estimated 17,332 fruits over an 8 day period, fruit pigeons 4769, hornbills 253-*. and Greater White-nosed Monkeys 811.

Bronner, G. N. (1990). New distribution records for four mammal species, with notes on their taxonomy and ecology.

New distribution record for four mall mammal species (*Georychus capensis, Galerella pulverulenta, Rhinolophus swinnyi* and *Amblysomus julianae*) are presented, along with relevant notes on the taxonomy, karyology and ecology of these species.

Brosset, A. (1961). L'hibernation chez les chiroptères tropicaux.

L'auteur étudie l'hibernation chez les Chiroptères de l'Inde occidentale, dont il a envisagé 29 espèces à ce propos. Cette étude porte sur des observations dans la nature et sur une expérimentation en laboratoire. Les résultats montrent que les *Taphozous, Megaderma* et *Hipposideros* ne sont pas capables d'hiberner, alors que les Vespertilionidés et les Rhinolophidés hibernent parfaitement. L'hibernation des Chiroptères tropicaux paraît avoir un déterminisme interne, car elle intervient souvent quand la nourriture est abondante et la température élevée. L'incapacité d'entrer en hibernation de certains groupes de Chiroptères explique leur répartition géographique.

Brosset, A. (1968). La permutation du cycle sexuel saisonnier chez le chiroptère *Hipposideros caffer*, au voisinage de l'équateur.

La reproduction du Chiroptère *Hipposideros caffer* a été étudiée au cours de cinq années (1963 - 1967) dans 8 grottes situées dans le nordest du Gabon (0° 32' - 1° 08' lat nord, 13° 3' - 13° 5' long. est). Bien que vivant sous l'Equateur les femelles sont strictement monoestriennes, et toutes celles d'une même colonie mettent bas simultanément, à date fixe chaque année. Le cycle des mâles, relativement contracté, et marqué par une longue période de quiescence, est synchrone de celui des femelles.

Le phénomène le plus remarquable mis en évidence par cette étude est le suivant: à l'intérieur d'une population sympatrique, il existe des colonies de cycle boréal (mise bas (in mars), tandis que l'immense colonie de la grotte du Faucon (500.000 individus au moins) est de cycle austral (mise bas en octobre). Le cycle de la mue s'accorde avec le cycle sexuel.

Une revue générale de ce qui est connu de la biologie d'*Hipposideros caffer* dans son aire immense de répartition, suggère que les populations situées au nord de l'Equateur se reproduisent suivant un rythme boréal, celles situées au sud suivant un rythme austral. Il apparaît que la permutation des cycles se situe légèrement au nord de l'Equateur géographique (probablement entre 1° et 4°), et que nos recherches ont porté précisément sur une population à cheval sur la ligne de permutation.

A notre connaissance, l'effet de l'isolement sexuel - non point dû à l'isolement géographique, mais à des rythmes incompatibles dans une même population - n'avait été étudié chez aucune espèce de Vertébré. Aussi nous sommes-nous appliqué à soumettre un échantillonnage de spécimens appartenant pour partie au rythme sexuel austral et pour partie au rythme boréal à l'analyse statistique. Les résultats sont hautement significatifs. Les individus appartenant au cycle boréal sont plus grands. Nous avons ici un cas où la ségrégation sexuelle, due à des rythmes biologiques distincts, conduit à une ségrégation morphologique de deux types d'individus à l'intérieur d'une même population. Dans l'immense colonie de Belinga existe, chez les femelles seulement, deux groupes de taille différente, phénomène difficile à interpréter pour le moment.

L'aire de répartition de l'espèce *Hipposideros caffer* couvre la plus grande partie de l'Afrique, et ce Chiroptère est probablement le Mammifère le plus nombreux de ce continent. Il compte des populations dont la morphologie varie considérablement, ce qui suggère une espèce en pleine phase évolutive. La permutation du rythme de la reproduction sur l'Equateur, avec les conséquences qui en

découlent: isolement de populations sympatriques, et différenciation morphologique en fonction du rythme, contribue-t-elle à une explication de l'instabilité typologique chez *Hipposideros caffer*? Ce n'est pas évident. En général, les populations de grands individus se situent au voisinage de l'Equateur. Les populations de petits individus seraient principalement périphériques, et situées aussi bien au sud qu'au nord de la ligne équatoriale. Il est possible aussi que les populations grandes soient plus particulièrement liées aux régions forestières, les petites aux régions découvertes.

The reproduction of the bat *Hipposideros caffer* had been studied over a 5 year period (1963 - 67) in 8 caves localized in the north-east of Gabun (0° 52' - 1° 08' lat. north - 13° 3' - 13° 5' long. east). The females are strickly monoestrous, and all members of each colony give birth to one youg at the same time each year. The cycle of the males, which is relatively compressed, and characterized by a long inactive period, is synchroneous with the cycle of the females. The most remarkable result obtained is the following: within one population, some colonies show a boreal cycle (birth of the youg in March), whereas the enormous colony of the "falken cave", containing probably more than 500.000 individuals, shows an austral cycle (birth of the young in October). The moulting cycle is synchroneous with the cycle of the reproduction.

A general review of what is known about thy biologie of *Hipposideros caffer* suggests that populations localized to the north of the Equator follow a boreal cycle, althroug population localized in the south follow an austral cycle. It seems that the inversion of the sexual cycle is situated between the latitude 0° - 4° North, and that my observation concerne precisely one population sitting astride the transition zone.

The resultant sexual isolation - not due to geographical gap, but due to incompatible rythms within sympatric populations - seems to be a novel phenomenon in our knowledge of vertebrates. Samples of populations exhibiting the austral or the boreal cycle were subjected to statistical analysis. The results are highly significant. Individuals of boreal cycle are larger than those of austral cycle, irrespectively of the situation of the colony from where they have been taken. We have here a case where sexual segregation due to distinct biological rythms induces morphological differenciation of two types inside the same population. In the huge colony of the falken cave, there exists - only among the females - two size groups. This is a very interesting fact, which cannot be explained at the moment.

The range of *Hipposideros caffer* covers almost the whole Africa. This bat is probably the most numerous Mammals of this continent. Populations are highly variables, a fact witch suggests a species at present in the course of evolution. Does the inversion of the sexual rhythm - in the equatorial zone, together with the consequent effect on the size of the individual thus isolated provide a valuable explanation for the typological instability in *Hipposideros caffer*? It seems not. Generally speaking, the populations with large specimens are observed around the Equator. The populations with small individuals are peripheral, and situated both to the north and to the south of the area. It is possible that the populations of large individuals are linked to' equatorial forest, and the populations of small individuals are linked to open countries.

Brosset, A. (1976). Social organization in the African bat, *Myotis boccagei*.

In northeastern Gabon (lat.: 0.4° north; long.: 12.5), the social organization of the vespertilionid bat *Myotis boccagei* was studied. In four groups, all individuals (55) were marked and monitored regularly for 38 months. The basic social organization in *Myotis boccagei* is the "harem". In each group, a single adult ? is invariably found, accompanied by from 2 to 7 adult ?? and recent young.

Résumé
Le Vespertilion africain *Myotis boccagei*, gîte pendant le jour dans le bourgeon terminal des bananiers. En fermant brusquement l'extrémité du cornet formé par la jeune feuille, on capture facilement le groupe entier de Chauves-souris gîtant à l'intérieur. Comme ces groupes sont sédentaires, chacun d'eux occupant la même plantation de bananier pendant plusieurs années, le contrôle régulier d'une population marquée est relativement facile pour cette espèce.

Dans le Nord du Gabon (lat.: 0.4° Nord; long.: 12.5) 10 groupes de *M. boccagei* ont été étudiés. Dans 4 groupes, tous les individus (55) furent marqués et régulièrement contrôlés au cours de 38 mois. L'organisation sociale de base chez *M. boccagei* est le "harem". Dans chaque groupe, on trouve invariablement un unique ? adulte, avec de 2 à 7 ?? adultes et leur jeune. Des ? ? solitaires ont été trouvés 9 fois.

L'élément stable des harems est constitué par quelques ?? reproductrices. Certaines d'entre elles furent revues sur place à tous les contrôles pendant plus de 3 ans. La rotation des mâles "chefs de harem" est au contraire rapide: un harem eut successivement 5 ? ? différents en 3 ans, un autre 3 en 2 ans. Un troisième harem eut le même ? de Juin à Juillet 1974, et de Novembre 74 à Août 75, le harem dans sa totalité ayant été absent de la plantation de bananier pendant cet intervalle. Un mâle chef de harem en Juin 1973 fut déplacé de son harem par un autre ? en Août 75, et fut retrouvé solitaire à environ 40 m de distance de ce harem.

Tous les juvéniles nés dans ces harems en disparurent à l'âge de 4–5 mois. De 11 ?? marquées étant juvéniles, aucune ne fut recapturée à l'àge adulte. Par contre, de 9 ? ? marquées étant juvéniles, 2 revinrent à l'àge d'un an comme chefs de harem, l'un d'un harem voisin de celui de ses parents, l'autre du propre harem où il était né.

Peut-être y a-t-il corrélation entre ce type de structure sociale - le harem - et le déséquilibre du "sex ratio" chez les adultes. Durant cette étude, 61 ?? adultes furent capturées pour seulement 26 ? ?.

Zusammenfassung

Die afrikanische Glattnasenfledermaus *Myotis boccagei* verbringt den Tag in den noch gerollten jungen Bananenblättern. Mehrere Jahre lang wurden beringte Individuen im Freiland regelmäßig wiedergefangen.

Die Tiere leben in Gruppen (Harems) aus 2 bis 7 ?? mit ihren Jungen und einem adulten ?. Daneben gibt es Junggesellengruppen. Die geschlechtsreifen ?? einer Gruppe bleiben beisammen, das Harems-? wechselt in Abständen von weniger als 12 Monaten, alle Jungtiere verlassen die Elterngruppe, wenn sie etwa 4–5 Monate alt sind. Von 9 markierten Jung-? ? übernahmen 2 im Alter von 1 Jahr einen der bekannten Harems; ein ? übernahm die ?? seines Elternharems.

Brosset, A. (1982). Structure sociale du chiroptère *Hipposideros beatus*.

Une population de *H. beatus* a été marquée et contrôlée pendant 3 ans sur une île du fleuve Ivindo (Gabon). La structure sociale est la famille monogamique : une paire d'adultes, suivie du jeune de l'année. Ces familles sont sédentaires sur des territoires qui saturent le biotope spécifique.

Brosset, A. (1985). Chiroptères d'altitude du Mont Nimba (Guinée). Description d'une espèce nouvelle, *Hipposideros lamottei*.

La prospection des prairies d'altitude du Mont Nimba (zone guinéenne) a permis la capture de 4 Rhinolophidés nouveaux pour cette région, ce qui porte à 39 le nombre d'espèces de Chiroptères connus du Mont Nimba. Description d'une espèce nouvelle, *Hipposideros lamottei*.

Brosset, A. and B. Caubère (1960). La colonie d'*Asellia tridens* de l'oasis de Figuig (Chiroptères).

Les auteurs évoquent l'écologie d'*Asellia tridens* dans l'oasis de Figuig, Maroc; la colonie se tient dans une galerie souterraine (fogara) où règne une humidité extrême et une forte chaleur. Cette population appartient à la sous-espèce *Asellia tridens diluta* Andersen (coloration, mensurations).

Brosset, A. and H. Saint Girons (1980). Cycles de reproduction des microchiroptères troglophiles du nord-est du Gabon.

In north eastern Gaboon (Lat. 0.1° - Long. 12°), the Microchiroptera living in caves show a rhythm of reproduction strictly seasonal and monoestrous. In the three species concerned, all the females give birth, once a year, in October, to a single young. In *Hipposideros caffer*, the females of some populations give birth in March (boreal cycle) although other populations, living in neighbouring caves, give birth in October (austral cycle).

A histological study confirms the field data, and gives precise results on the sexual cycle of both sexes. In the male, spermatogenesis immediately precedes the mating season. In the female, contrary to what occurs in temperate countries, ovulation takes place a short time after. Implantation is not delayed, but follows fecundation. The annual sexual cycle (pregnancy and lactating period) is 6 months in *Miniopterus inflatus* and *Hipposideros caffer*, and 12 months in *Hipposideros commersoni*. The cycle of sexual activity in the male is shorter than the cycle of similar species in temperate countries.

Sous équateur (O°4' N), une étude de terrain poursuivie pendant 14 ans montre que le cycle de reproduction des Microchiroptères troglophiles du nord-est du Gabon est monoestrien saisonnier. Toutes les femelles mettent bas une fois par an la même date. L'étude histologique précise que le cycle sexuel des males est synchronise avec celui des femelles qui ne présentent ni ovulation, ni implantation différées.

Brosset, A. and R. Vuattoux (1968). Redécouverte du "rat volant" de Daubenton *Myopterus senegalensis* Oken (Chiroptera), en Cote-d'Ivoire.

The bat *Myopterus senegalensis* was discovered by Adanson in Senegal about 1750 and called a "flying rat". Daubenton described it briefly in 1765. Later on the type was lost and the species was not found again. Its existence has just been confirmed by the capture of 5 specimens in a lontar palm at Lamto, in the Ivory Coast. Redescription of this very particular species, and which cannot be confused with any other.

Le Chiroptère *Myopterus senegalensis* avait été découvert par Adanson au Sénégal vers 1750. Sous le nom de "rat volant", Daubenton en avait donné une sommaire description en 1765. Par la suite, le type fut perdu, et l'espèce jamais retrouvée. Son existence vient d'être confirmée par la capture de 5 spécimens dans un palmier Ronier à Lamto, en Côte d'Ivoire. Redescription de cette espèce très particulière, et qui ne peut être confondue avec aucune autre.

Bruton, M. N. (1978). Recent mammal records from eastern Tongaland in Kwazulu, with notes on Hippopotamus in Lake Sibaya.

Distribution records of 36 mammal species in eastern Tongaland are given based on specimens, photographs and sight records collected during the period 1970 to 1976. The distribution of hippopotami in the coastal lakes of eastern Tongaland is outlined and aspects of their ecology in Lake Sibaya are described. The hippopotamus population in Lake Sibaya has doubled since 1958 despite the removal of at least 25 individuals for management purposes. The number of hippopotami in the lake itself decreases at high lake level when a large part of the population inhabits adjacent lakelets and swamps.

Burgess, N. D., L. B. Mwasumbi, W. J. Hawthorne, A. Dickinson and R. A. Doggett (1992). Preliminary assessment of the distribution, status and biological importance of coastal forests in Tanzania.

The lowland forests of coastal Tanzania comprise small and geographically isolated remnants of evergreen or semi-evergreen forest vegetation of the Zanzibar-Inhambane regional mosaic-undifferentiated forest type. Most of these 'coastal forests' are located at less than 600 m altitude and within 50 km of the coast. They have been isolated from other forest-blocks in Africa for perhaps the past 30 million years and have considerable biological importance, with high levels of endemism.

This paper presents a preliminary assessment of the distribution, status and biological importance of those Tanzanian coastal forests over 2 km^2 in extent. Twenty-four definite and 17 probable forests are identified. The largest are located on the Matumbi Massif to the southeast of Utete (c. 25 km^2), Zaraninge Plateau to the east of Sadaani (c. 20 km^2), Gendagenda to the west of Pangani (c. 26 km^2), Pugu Kazimzumbwi (c. 30 km^2) and inland from Kilwa (up to 100 km2). However, individual forests generally occupy less than 20 km^2, and the total area of forest remaining may be under 400 km^2.

Collectively these forests support many rare and poorly known plant species, including around 50 believed to be endemic to a single forest, seven bird species and subspecies of global conservation significance, several rare mammals, reptiles and amphibians, and an invertebrate fauna with many rare and undescribed species.

All Tanzanian coastal forests are being destroyed by unsustainable human actions generally following the sequence (a) logging for timber and fuel; (b) pole-cutting to build houses; (c) wholesale burning for charcoal; (d) wholesale conversion to agriculture. At the present rate of destruction the Tanzanian coastal forests and their globally important flora and fauna may be completely removed.

Butinsky, T. M. (1984). Ecological survey of the Impenetrable (Bwindi) Forest, Uganda, and recommendations for its conservation and management.

The primary goal of most national parks is to maximize the number of species contained therein. This goal is likely to be most successfully achieved where (1) a large array of habitat types are retained, (2) where habitat corridors are established, (3) where large numbers of individuals of each species are maintained, (4) where disturbances caused by human activities are minimized and (5), most importantly, where large tracts of land are incorporated into national parks.

Butler, P. M. (1984). Macroscelidea, Insectivora and Chiroptera from the Miocene of East Africa.

The East African Miocene Macroscelidea, Insectivora and Chiroptera are revised on the basis of new material. New taxa proposed are: *Miorhynchocyon*, n. gen, (Macroscelididae); *Miorhynchocyon meswae*, n. sp.; *Pronasilio ternanensis*, n. gen., n. sp. (Macroscelididae); *Hiwegicyon juvenalis*, n. gen. n. sp. (Macroscelididae); *Parageogale*, n. gen. (Tenrecidae); Prochrysochlorinae, n. subfam. (Chrysochloridae); Propottininae, n. subfam, (Pteropodidae); *Chamtwaria pickfordi*, n. gen., n. sp. (Vespertilionidae). *Gymnurechninus songhorensis* is synonymised with *G. camptolophus*.

The new material provides additional information on the dentition, especially of *Myohyrax oswaldi, Galerix africanus, Amphechinus rusingnsis, Protenrec tricuspis* and *Parageogale aletris*. Parlial skulls are described of *Amphechinus rusingensis, Protenrec tricuspis, Prochrysochloris miocaenicus* and *Taphozous incognita*.

The oldest member of the Macroscelidinae (*Pronasilio*) is described from Fort Ternan. *Galerix africanus* is closely related to *G. exilis* from Europe. *Amphechilnus rusingenesis* is compared with Asiatic Oligocene Erinaceinae. The Miocene age of *Crocidura* is rejected. On the evidence of humeri, the following families of Chiroptera are newly reported: Pteropodidae, Nycteridídae, Vespertilionidae, Molossidae. *Propotto* is regarded as an offshoot from the Pteropodidae, not ancestral to modern forms. *Chamtwaria* is a primitive vespertilionoid, provisionally placed in the Kerivoulinae.

Erinaceidae probably entered Africa at the beginning of the Miocene, before 20 Ma. Faunistic differences between deposits are largely to be ascribed to differences in local environment.

Cabrera, A. and A. E. Ruxton (1926). On mammals from Luluabourg, Southern Congo.

The present paper is based on three collections of small and middle-sized mammals obtained in Luluabourg, on the Lulua River, Kasai, Southern Belgian Congo, by Father R. Callewaert, of the Catholic mission of Saint Joseph de Luluabourg. The two larger collections, containing in all 678 specimens, were sent to the British Museum of Natural History, where, at the request of Mr. M. A. C. Hinton, we have examined them. A third arid smaller series, consisting of 76 specimens, was acquired by the National Museum of Natural Science at Madrid, Spain, and has been studied by only one of us (Cabrera); the authorities of that institution have kindly consented to incorporate the results of his work with the observations made in London. In this way we have been able to form a list of no less than 74 species collected in the same spot by the same collector, giving a very exact idea of the mammalian fauna of the Lulua region. The character of this fauna is in the main intermediate between that of Angola and that of Rhodesia, with several peculiar South Congolese forms, some of which appear to be undescribed. Among the material examined figures the type of the new genus and species of rodent *Hylenomys callewaerti* - recently described by Mr. Thomas.

Cagnolaro, L. (1976). Catalogo dei tipi del Museo civico di Storia naturale di Milano. III. I tipi dei mammiferi, con un profilo storico sulla collezione mammalogica.

L'autore traccia un profilo storico delle collezioni dei mammiferi del Museo Civico di Storia Naturale di Milano, raccolte per gran parte distrutte nel 1943 a seguito del bombardamento, tranne quelle dei micromammiferi in pelle, la sala dei Mammiferi italiani e pochi altri esemplari. Si considera brevemente l'entità ed il valore scientifico delle principali acquisizioni in base ai documenti d'archivio ed alla letteratura pubblicata sui materiali in oggetto; è pure ricordata l'attività degli Zoologi del Museo che si occuparono anche di Mammiferi, quali Jan, Cornalia, Bordelli e soprattutto Parisi. E' sommariamente descritta anche la fisionomia delle esposizioni dei Mammiferi al pubblico, mutata lungo il corso degli anni nelle tre diverse sedi in cui è statò sistemato il Museo.

L'entità attuale delle collezioni dei Mammiferi è di circa 5700 pezzi (2960 in pelle, 1400 in alcool, 900 montati e 450 tra crani e scheletri), ascrivibili ad oltre 400 specie. L'importanza della collezione concerne essenzialmente la Fauna italiana; le raccolte in estensione espongono tutti gli ordini con una significativa rappresentanza della teriofauna mondiale, con particolare riguardo al Sudamerica.

Nella seconda parte del lavoro è steso l'elenco dei Tipi dei Mammiferi del Museo, concernenti 13 *taxa*: i tipi di 4 sono ancora esistenti, mentre 9 sono andati distrutti durante l'incendio del 1943. Di ogni *taxon* sono riportati i riferimenti bibliografici essenziali e lo stato sinonimico 9 entità sono ritenute ancora valide. I Tipi furono descritti: 5 da CORNALIA e 8 da DE BEAUX; 8 Tipi riguardano la fauna africana, 4 quella sudamericana e 1 l'Italia.

L'ampia Bibliografia di 109 titoli riporta i lavori sui Tipi, le pubblicazioni sulle collezioni dei Mammiferi del Museo, comprese le raccolte d'ostensione, pubblicazioni mammalogiche del personale del Museo, nonché le biografie dei principali zoologi che si sono occupati dei materiali considerati.

The Author draws the historical outline of the collection of the Mammals of the Civic Museum of Natural History of Milan, from its foundation (1838) till now. Since in 1943 thé Museum was almost destroyed by a bombardment, most of the collections were lost, except those of micromammals skins, the Hall of Italian Mammals and few other specimens. Today the theriological collections include almost 5700 specimens (2960 skins, 1400 specimens in alcohol, 900 mounted specimens, 450 skeletons and skulls), belonging to over 400 species.

The Author considers the main acquisitions, studying historical records and the specific literature on Museum's collections. Among others it is related about the collections of G. Osculati from South America (CORNALIA, 1849 and OSCULATI, 1860 and 1854), from Eritrea of Dr. P. Magretti (BORDELLI, 1902), from Somaliland of V. T. Zammarano (PARISI, 1923 a), from Abyssinia of U. Ignesti (DE BEAUX, 1925 b), from Congo of Dr. A. Rossi (DE BEAUX, 1925 a), from Africa too of Baron L. Franchiti and L.

Tonker (DE BEAUX, 1923 a), from Haiti of the brothers R. and E. Ciferri (1927 - 1930), from the expeditions of Prof. G. Scortecci in Somaliland (1931: DE BEAUX, 1934), in Fezzan (1936: PARISI, 1938) and in Migiurtinia (1954; TOSCHI, 1956). From the Italy important are the collections of micromammals, especially of Trentino and the larger Festa Collection, both saved from fire.

The Author remembers the activity of the zoologists who worked in the Museum of Milan also in mammalian field, the founder G. Jan, Cornalia, Bordelli and above all Parisi. He briefly describes the disposition of the mammalian exhibition opened to the public during the years of history of Museum of Milan, in its three different buildings.

In the second part of this work the Types of Mammals of Museum of Natural History of Milan are listed, regarding 13 *taxa*; 4 Types still exist (*Scotoecus artinii* De Beaux, 1923; *Arvicanthis abyssinicus rossii* De Beaux, 1925; *Acomys bovonei* De Beaux, 1934; *Heterooephalus glaber scorteccii* De Beaux, 1934), 9 were destroyed by a fire in the 1943 (*Vespertilio Osculati* Cornalia, 1849; *Lepus De-Filippi* Cornalia, 1849; *Bradypus trivittatus* Cornalia, 1849; *Felis jacobita* Cornalia, 1865; *Sorex intermedius* Cornalia, 1870; *Petalia (Nycteris) thebaica aurantiaca* De Beaux, 1923; *Cercopithecus (Insignicebus) albogularis zmnmarmioi* De Beaux, 1923; *Petalia parisìi* De Beaux, 1923; *Genetta dongolana tedescoi* De Beaux, 1923. Among our Types, 5 taxa were described by Prof. Emilie CORNALIA, 8 by Prof. Oscar DE BEAUX. Their geographical distribution is: 8 from Africa, 4 from South America and 1 from Italy.

The Bibliography at the end-.of the work embraces 109 titles: the papers which contain the originai description of the listed Types, the papers on the mammalogical collections of the Museum of Milan, as well as the biographies of the zoologists, who worked on this field.

Capanna, E. and M. V. Civitelli (1964a). Contributo alla conoscenza della cariologia dei rinolofidi (Mammalia - Chiroptera).

In this paper the Authors show the results of a comparative analysis between the karyotype of two species of bats: *Rhinolophus ferrumequinum* and *Rhinolophus euryale*. Tissue colture tecnique has been employed.

The chromosomes number of *Rhinolophus ferrumequinum* in somatic mitoses is 2n=58. The karyogram of this species shows 24 pairs of acrocentric chromosomes, among which one medium-sized pair is provided with satellites, 2 pairs of metacentric chromosomes and 2 pairs of very small chromosomes. The X chromosome is a large submetacentric (centromeric index 30) and the Y chromosome is a very small one.

The chromosomes number of *Rhinolophus euryale* is also 2n=58; the karyogram shows 24 pairs of acrocentric chromosomes (no one with satellites), 2 pairs of metacentric chromosomes, but only one of these is morphologically similar to a pair of metacentric of the karyotype of *Rhinolophus ferrumequinum*, and 2 pairs of very small chromosome. The X chromosome of *Rhinolophus euryale* is a large submetacentric (centromeric index 25) and the Y chromosome a very small one.

A comparison between the karyotypes of the species has been made and the probable phylogenetic relationships have been discussed.

Sono stati esaminati, con la tecnica delle culture dei tessuti, i cromosomi somatici di *Rhinolophus ferrumequinum* (Schr.) e di *Rhinolophus euryale* Blasius.

Il numero dei cromosomi di *R. ferrumequinum* e risultato 2n=58; e stato inoltre definito il cariogramma di questa specie, comprendente 24 coppie di cromosomi acrocentrici, delle quali una di medie dimensioni con satelliti, due coppie di cromosomi metacentrici e due coppie di cromosomi puntiformi. L' eterocromosoma X e un grande metacentrico a braecia ineguali con in dice centromerico 30; I' eterocromosoma Y e un cromosoma puntiforme.

Il numero di cromosomi di *R. euryale* e risultato 2n=58; anche di questa specie e stato definito il cariogramma, comprendente 24 coppie di cromosomi acrocentrici (a differenza della specie precedentemente descritta, nessuno di questi e satellitato), due coppie di metacentrici e due coppie di

cromosomi puntiformi. L'eterocromosoma X e un grande metacentrico a braccia ineguali, con indice cenb·omerico 25; l'eterocromosoma Y e un cromosoma puntiforme.

E stato effettuato un confronto tra i cariogrammi delle due specie e sono stati discussi i possibili rapporti filogenetici.

Capanna, E. and M. V. Civitelli (1965). Cariologia e cariometria del miniottero (Mammalia - Chiroptera).

The karyogram of a bat, *Miniopterus schreibersii* (Natt. in Kuhl) has been defined, on the basis of an accurate karyometric analysis. The karyogram shows 22 pairs of autosomes and one pair of heterochromosomes; among the 22 autosimic pairs, 3 are metacentric, clearly different from each other for average length and situation of the centromere; 17 pairs are acrocentric and 2 pairs are formed by very small chromosomes. The X chromosome is a medium sized metacentric and the Y a very small one.

In base ad una precisa analisi cariometrica, e stato definito il cariogramma di *Miniopterus schreibersii* (Natt. in Kuhl). Il cariogramma comprende ventidue coppie di autosomi ed una coppia di eterocromosomi; delle ventidue coppie autosomiche, tre sono di cromosomi metacentrici, tra loro chiaramente differenziabili per la lunghezza media e la posizione del centromero, diciassette coppie sono di cromosomi acrocentrici e due coppie di puntiformi. Il cromosoma X e un metacentrico di medie dimensioni, il cromosoma Y e un puntiforme.

Capanna, E. and M. V. Civitelli (1966). I cromosomi del pipistrello abolimbato.

The karyogram of a bat, *Pipistrellus kuhli* (Natt. in Kuhl) has been defined on the basis of a karyometric analysis. The karyogram shows 21 pairs of autosomes and one pair of heterochromosomes; among 21 autosomic pairs, 3 are large metacentric, 1 small metacentric, 15 acrocentric and 2 pairs are of very small chromosomes. A pair of acrocentric chromosomes shows a large achromatic region. The X chromosome is a medium sized metacentric and the Y a very small one.

A comparison has been made between the karyogram of *Pipistrellus kuhli* and those of *P. pipistrellus, P. nathusi* (BOVEY 1949) and *Miniopterus schreibersii* (CAPANNA e CIVITELLI 1965).

In base alla analisi cariometrica, e stato definite il cariogramma di *Pipistrellus kuhli* (Natt. in Kuhl). Il cariogramma comprende 21 coppie di autosomi ed una coppia di eterocromosomi; delle 21 coppie autosomiche, tre sono di metacentrici grandi, una di piccoli metacentrici, 15 di acrocentrici, di cui una coppia mostra chiaramente una zona eterocromatica, 2 di cromosomi puntiformi. Il cromosoma X e un metacentrico di medie dimensioni, il cromosoma Y un puntiforme.

È stato fatto inoltre un confronto tra il cariogramma di *Pipistrellus kuhli* e quelli di *P. Pipistrellus* e *P. Nathusi* (BOVEY 1949). È stato anche fatto un confronto con i dati della cariometria di *Miniopterus schreibersii* (CAPANNA e CIVITELLI 1965).

Capanna, E., M. V. Civitelli and C. Spagnuolo (1968). Contributo alla cariologia del genere Myotis. Considerazioni sulla evoluzione del cariotipo dei Vespertilionidi (Mammalia-Chiroptera).

The karyogram of two Vespertilionid bats pertaining to the genus *Myotis* has been studied. In *Myotis myotis* (BORKHAUSEN) (vel *oxignatus* (MONTICELLI) the diploid number is 2n = 44 and the number of autosomic arms is 50. Indeed three pairs of autosomes are large metacentric chromosomes (average length = 1,7; centromere index = 44); all the remaining autosomes are acrocentric. No

autosome with an heterochromatic zone has been observed. The X heterochromosome is a medium sized metacentric chromosome, the Y heterochromosome is a small acrocentric one.

The karyogram of Myotis capaccinii (BONAPARTE) is very similar and the karyometric differences were not regarded as meaningful. Also in this latter species the diploid number is 2n = 44, and three pairs of large metacentric and one pair of small metacentric autosomes have been found. The remaining autosomes are acrocentric. No autosomes have been observed in the karyogram of *Myotis capaccinii* presenting an heterochromatic zone. X heterochromosomes present, in this species, the same morphology as in *Myotis myotis*. The Y chromosome is again a small acrocentric one.

A comparison between the karyograms of the mentioned two species pertaining to the genus *Myotis* with those of the species studied by BOVEY (1949) and by BAKER and PATTON (1967) gives prominence to the close similarity of the karyotypes of all the *Myotis* so far investigated, whether paleartic or neartic.

The comparison among the karyometric values gathered by us in the Vespertilionid bats stresses a cytotaxonomic difference, noticeable from the difference in the average length of the aploid female set, between Miniopterinae and Vespertilioninae.

The small metacentric chromosomes, that has been found in many other Vespertilionid bats, has been found again in the two species studied here. This observation confirms its place as a "morphologically identical" chromosome for the Vespertilionid bats. Another "morphologically identical" chromosome has not been observed here, that is the acocentric chromosome, showing an heterochromatic zone, which on the contrary was observed by us in *Pipistrellus savii* and *Pipistrellus kuhli* and also by DULIC et al. (1967) in *Nyctalus*.

E. stato esaminato il cariotipo di due Chirotteri: *Myotis (Myotis) myotis* (BORKHAUSEN) (vel *oxignatus* (MONTICELLI) e *Myotis (Leuconoe) capaccinii* (BONAPARTE).

Il cariogramma delle due specie viene ritenuto uguale e cosl composto:

1) Gruppo di 6 grandi cromosomi metacentrici
2) Gruppo di 18 cromosomi acrocentrici
3) 1 coppia di piccoli cromosomi metacentrici
4) Gruppo di 12 cromosomi acrocentrici
5) Gruppo di 4 cromosomi puntiformi.

Il cromosoma X che e un metacentrico medio e l'Y che e un piccolo acrocentrico.

Dei cromosomi acrocentrici nessuno presenta zone eterocromatiche.

Sono stati anche discussi i rapporti citotassonomici nell'ambito della famiglia dei Vespertilionidi.

Capanna, E. and M. G. Manfredi Romanini (1971). Nuclear DNA content and morphology of karyotype in certain Paleartic Microchiroptera.

Histophotometric evaluation of the DNA content of the post-kinetic nuclei (lymphocytes) has been performed in 8 species of Palearctic Microchiroptera: *Rhinolophus ferrumequinum, R. euryale, R. hipposideros, Miniopterus schreibersi, Pipistrellus savii, P. kuhli, Myotys myotis* and *M. capaccinii*. The results obtained are compared with the known data (CAPANNA and CIVITELLI 1970) on the morphology of the karyotype of these species and are discussed whith a view to explaining the relationships between chromosome transformations and variations in DNA content.

Considering the entire field studied, the nuclear DNA content is found to be fairly homogeneous: a fact that has been interpreted as proof that this taxonomic group has attained evolutional stability.

E stato valutato con il metodo istofotometrico il contenuto in DNA dei nuclei postcinetici (linfociti) di 8 specie di Microchirotteri Paleartici: *Rhinolophus ferrumequinum, R. euryale, R. hipposideros,*

Miniopterus schreibers, Pipistrellus savii, P. kuhli, Myotis myotis and *M. capaccinii*. I dati ottenuti sono stati confrontati con quanto e noto (CAPANNA e CIVITELLI 1970) sulla morfologia del cariotipo delle stesse specie e discussi in ordine a chiarire i rapporti tra trasformazioni cromosomiche e variazione di quantita di DNA.

Considerando l'intero ambito studiato il contenuto nucleare di DNA e risultato abbastanza omogeneo fatto che e stato interpretato come prova di una raggiunta stabilita evolutiva di questo gruppo tassonomico.

Carpenter, R. E (1986). Flight physiology of intermediate-sized fruit bats (Pteropodidae).

Up to eight physiological parameters were measured on members of four species of fruit bats with a size range of 0.188 - 0.650 kg as they flew in a wind tunnel. Regression lines were calculated for the relationships between body masses of bats and their power inputs (P_1), heart and respiratory rates. These were compared to similar relationships for flying birds.

Respiratory evaporation dissipated only 10% of the heat produced. At ambient temperatures (T_a) above 15°C, heat loss was facilitated by vasodilation of feet and wing membranes, but this mechanism became less effective at high T_a when thermal differential between wings and air was reduced. Bats are apparently unable to increase greatly their respiratory evaporation, and overheated at T_a of 25 - 30°C. At low T_a) the flight ability of two bats was reduced, suggesting that reduced coordination or even freezing of wings might be a general problem for bats flying at T_a close to 0°C.

The endurance of three bats was so much greater near the middle of their speed ranges that the maximum flight distances ought to be achieved at these velocities, even though the cost of transport would be lower at higher speeds. Endurance at an airspeed was proportional to the relative power input (P_i/P_{min}) raised to the power of -7.45; flying at a speed that raised P_i/P_{min} by 10 % reduced endurance by half.

Carroll, J. B. and A. T. C. Feistner (1996). Conservation of western Indian Ocean fruit bats.

The fruit bats of the western Indian Ocean islands are important components of these island ecosystems. Since fruit bats play key roles in the maintenance of tropical ecosystems as pollinators and seed dispersers, their continued survival may be of crucial significance for the maintenance of island forests. In turn the forests are important resources for the people of the region and protect vital watersheds. Continued survival of the western Indian Ocean fruit bats may thus be imperative for the conservation of the region's biodiversity. Many island endemics are susceptible to human-induced environmental degradation. In addition, most of the western Indian Ocean islands are affected by cyclones. These factors have led to the extinction of one species and five of the remaining 11 are threatened. Various strategies are being used to aid their conservation including captive breeding, education programmes and protection of wild populations.

Cassel-Beraud, A. M., D. Fontenille and L. Rabetafika (1989). Etude bactérienne, virale et parasitaire d'une population de chauves-souris *Chaerophon pumila* à Ahjiro, Madagascar.

Cette triple étude bactérienne, virale et parasitaire des chauves-souris *Chaerophon pumila* à Madagascar a permis aux auteurs de dénombrer, des feces de 88 de ces chauves-souris, 115 souches bactériennes appartenant à la famille des Enterobacteriaceae dont certaines sont très atypiques, rares ou potentiellement pathogènes pour l'homme.

La recherche de virus dans les glandes salivaires, le cerveau et le sang a permis l'isolement de 13 souches virales dont 8 au moins sont identiques au virus Dakar-bat.

Aucun parasite sanguin n'a été observé.

Bacterial, viral and parasitical study of the insect eater bats *Chaerophon pumila* in Anjiro, Madagascar.

This bacterial, viral and parasitical study of the insect eater bats *Chaerophon pumila* allowed to isolate, from stools of 88 of them, 115 bacterial strains to Enterobacteriaceae family : some of them were identified as very atypical, rare or potentially pathogenic for man.

From salivary glands, brain and blood, 13 viral strains were also isolated: 8 of them were less identified as Dakar-bat virus.

Any parasite was observed.

Chapman, R. F. (1958). Some observations on the food of a bat.

The food of a bat, probably *Nycteris thebaica* Geoffrey, in Tanganyika was determined by collecting the remains from beneath a roost. A wide variety of insects were eaten, depending on what was available. The number of insects eaten varied according to their abundance.

Chari, G. C. and A. Gopalakrishna (1984). Morphogenesis of the foetal membranes and placentation in the bat, *Miniopterus schreibersii fuliginosus* (Hodgson).

The development of foetal membranes and the changes in the structure of the placenta in the bat *Miniopterus schreibersii fuliqinosus* is described. The study reveals that *M. schreibersii fuliqinosus* exhibit developmental characters not matched by any other mammal let alone any other bat.

Chastel, C., H. Launay, G. Le Lay, H. Bailly-Choumara, H. Hellal, M. Valle, D. Bach-Hamba and J.-C. Beaucournu (1986). Petits mammifères sauvages et arbovirus dans la région du bassin méditerranéen occidental.

Les sérums de 1 083 petits mammiferes sauvages capturés entre 1976 et 1983 en Tunisie, Maroc, Espagne, Italie et Corse, ont été examinés pour rechercher la présence d'anticorps vis-à-vis de différents arbovirus. Ils ont été recueillis sur des bandelettes de papier buvard et traités au laboratoire en vue des réactions d'inhibition de l'hémagglutination et de fixation du complément.

Les résultats font apparaître un certain déclin de l'activité du virus West Nile dans l'ensemble de la région, alors que trois autres arbovirus se manifestent activement (virus Tahyna, de la fièvre à phlébotomes type Sicile et Arumowot).

De façon plus ponctuelle, on décèle aussi quelques réactions positives pour quatre virus transmis par des tiques (virus Bhanjà, Uukuniemi, Quaranfil et de l'encéphalite européenne à tiques).

Au point de vue mammalogique, les Muridae, Gerbillidae et Talpidae sont les plus fréquemment interessées par les réactions sérologiques positives. Ctenodactylus gundi et Pipistrellus kuhli, bien que capturés en nombre plus restreint, sont également souvent positifs.

Between 1976 ans 1983, we have studied sera from 1 083 small wild mammals trapped in Tunisia, Morocco, Spain, Italia and Corsica, in order to search for antibody against a number of arboviruses, belonging to several genera and serogroups.

The blood from trapped mammals was collected on blotting paper strips and was sent to the virus laboratory at ambient temperature. After that, the dessicated blood was eluted and treated for haemagglutination inhibition and complement fixation tests.

Results indicated that in the area as a whole, the activity of West Nile virus is somewhat declining, whereas three other arboviruses were emerging: Tahyna, Sicilian Sandfly fever and Arumowot.

Antibody for four tick-borne arboviruses: Bhanja, Uukuniemi, Quaranfil and Tick-borne encephalitis (european type) were alro detected but with a more restricted distribution.

From a zoological point of view, the species the most frequently found positive belong fo the Muridae, Gerbillidae and Talpidae families which were also the most frequently trapped. Ctenodactylus gundi and Pipistrellus kuhli, though trapped in a few specimens, were also frequently found positive. In epidemiological study of arbovirus infections, serosurveys in small wild mammals with blood collection using blotting paper strips, appeared as an interesting field method, easy to perform, not expensive and reliable. In countries where arboviruses were not previous!y studied, this method is able ta quickly supply basic informations, and in others where virological studies were more completely achieved, it may improve the inventory of the mammalian species involved in arbovirus circulation.

Cheesman, R. E. and M. A. C. Hinton (1924). LXII. On the mammals collected in the desert of Central Arabia by Major R.E. Cheesman.

The collection of mammals described in this paper was made by Major R. E. Cheesman in the Hasa Province and in the Jafura and Jabrin Deserts which form part of the Great South Desert of Arabia. The expedition was arranged by Sir Percy Cox, and was undertaken in response to an invitation from H.H. the Sultan of Nejd, with the object of investigating the desert-fauna of Central Arabia, which, owing to the inaccessibility of the country and the fanaticism of its inhabitants, was unknown. As might be expected in a district so widely different from the surrounding areas, many forms have proved to be new.

Generally speaking, the exceptionally pale desert-coloration is the most striking feature of the collection as a whole, and to match it to some degree one has to proceed far to the west, where, in the Air district of the Central Sahara, Capt. Angus Buchanan found some little time ago an extraordinarily pale assemblage of mammals. It is of interest, perhaps, to note that certain inferences as to the special habits of some of the numerous and competitive species of *Meriones* and *Jaculus*, found living together in close local association, derived independently from a study of the skull-structure, find confirmation in and in turn confirm the observations made in the field to a remarkable degree.

There is reason to suppose that the list given below would apply to the whole of the Great South Desert, there being, so far as is known, no physical barrier until the confines of the mountains, such as Aden and Yemen to the south and Muscat to the east, are reached, where markedly darker forms are known to replace the desert fauna. The entire absence of the mungoose, so plentiful in Iraq, and the replacement of the big dark Iraq hare by the small pale desert-coloured hare, give definite evidence as to the limits of range of each of the species concerned.

The types of all the new forms have been presented to the British Museum by Major R. E. Cheesrnan.

Cheke, A. S. and J. F. Dahl (1981). The status of bats on western Indian Ocean islands with special reference to *Pteropus*.

L'histoire et la condition actuelle des chauves-souris des îles de l'Ocean Indien occidental à l'exception de Madagascar, sont passées en revue. L'attention est attirée sur l'extinction total de *Pteropus subniger*, qui habitait l'Ile Maurice et l'Ile de la Réunion, et sur la rareté critique de *P. rodricensis* (Rodrigues) et de *Coleura seychellensis* (Seychelles granitiques). On n'a pas constaté l'existence de *Scotophilus borbonicus* (La Réunion) depuis un siècle mais l'espèce pourrait y exister toujours. *Pteropus livingstonii*, également fort rare, est signalé pour la première fois de l'Ile de Mohéli, archipel des Comores. Nous n'avons pas pu confirmer l'existence actuelle aux Comores de l'espèce endémique *Rousettus obliviosus* qui a été collectée pour la dernière fois en 1903.

Child, G. S. (1965). Some notes on the mammals of Kilimanjaro.

In this article a list of mammals recorded from the locality Kilimanjaro is presented. The locality Kilimanjaro includes a wide range of altitudes and habitats. The Kilimanjaro Game Reserve falls within the locality Kilimanjaro and is considered to be a unit whose mammal fauna is worthy of closer examination. The Reserve includes all that part of the mountain lying above the lower edge of the forest. Two main habitats are recognised within the area. The mammals occuring in each of the habitats are dealt with in more detail and information on their present status given where available. The validity of two previous occurence records from the higher altitudes is questioned.

Some larger species of restricted habitat occuring in the Kilimanjaro forest are listed and the probability of finding certain mammals recorded on other East African mountains is examined. Reference to such aspects as climate, vegetation, geography and geology of the mountain are purposely omitted or kept to a minimum as it is assumed that they will be the subjects of other papers in this Journal.

Chubb, E. C. (1908). 5. On some little-known South African mammals recently obtained in Rhodesia.

Among the 200 or so mammals that have been collected near Bulawayo or sent from further afield to the Rhodesia Museum during the last year are representatives of several rare species and one additional to the South African list.

Chubb, E. C. (1910). A revised list of the mammals of South Africa.

During the last ten years a considerable amount of attention has been paid by systematic mammalogists to South Africa and a number of valuable papers have been published. The most important of these is a series of ten based upon collections made by Mr. C. H. B. Grant in various parts of the sub-continent, and presented to the British Museum by Mr. C. D. Rudd, while our knowledge of the Chrysochloridæ has been greatly augmented by Dr. R. Broom's valuable monograph of the family.

This work has rendered Sclater's volumes on "The Mammals of South Africa," published in 1901, altogether out-of-date by the discovery of a number of new forms, and many names, which at that time were regarded as synonyms of others, have been shown to belong to distinct species; while not a few have been altered in order to conform to now recognised rules of nomenclature.

The object of the present paper is to give a list of the species at present known to occur in South Africa, south of the Zambesi and Cunene Rivers, with references to the original descriptions of all forms not recognised by Sclater. It comprises no less than 373 species and sub-species, (exclusive of the order Cetacea) which is 152 more than the number given in Sclater's work.

It is true that many of these recently described forms have been separated on somewhat slight differences, and many represent only local varieties; but it must be borne in mind that the work has been done on large series of excellently prepared material, carefully labelled with measurements taken in the flesh, when constant differences become apparent which would be taken for individual variation on single specimens from different localities.

Churchill, S. (K.), R. Draper and E. Marais (1997). Cave utilisation by Namibian bats: population, microclimate and roost selection.

Ten caves in central Namibia were searched for cave bats during May and June 1996. Up to seven species were found sharing a single cave. Different species of bats were found to select roost sites with significantly different microclimates, based on temperature and relative humidity. Bats were using

these caves as over-wintering sites and were selecting either cool microclimates in which to enter daily torpor or warm microclimates to enable them to remain active with minimal energy expenditure. *Hipposideros commersoni* was observed to remain inactive at the roost for days without entering torpor or leaving the cave to forage. This large bat appears to over-winter by relying on its considerable fat store at this southern limit of its distribution. Roost behaviour, colony size and roost location within the cave was examined for each of the nine bat species encountered.

Claessen, C. J. and F. De Vree (1990). Systematic and distributional notes on the larger species of the genus *Epomophorus* Bennet, 1836 (Chiroptera: Pteropodidae).

Based on morphologic, biometric and zoogeographic characters, *E. gambianus, E. crypturus* and *E. angolensis* are considered to be well defined species. *E. gambianus parvus* is a junior synonym of *E. crypturus* and *E. pousarguesi* is a junior synonym of *E. gambianus*. *E. wahlbergi* is first recorded for Sudan.

Claessen, C. J. and F. De Vree (1991). Systematic and taxonomic notes on the *Epomophorus anurus-labiatus-minor* complex with the description of a new species (Mammalia: Chiroptera: Pteropodidae).

Two groups are present in the *E. anurus-labiatus*-minor complex: a first group with an obvious clinal size variation, consisting of specimens formerly identified as *E. anurus, E. labiatus* and partly as *E. minor*, and a second group with no geographic variation in size consisting of specimens formerly identified as *E. minor*. These two groups obviously belong to two different species, mainly differing in body measurements. We identified the first group as representatives of *E. labiatus*. Since the type specimen of *E. minor* also belongs to this group, we concluded that E. minor DOBSON 1879 is a junior synonym of *E. labiatus* (TEMMINCK 1837). As a consequence no valid name is available for the second group. *E. minimus* n. sp. is described for this second group and a holotype is appointed with type locality Bahadu, Ethiopia.

Cockle, A., D. Kock, L. Stublefield, K. M. Howell and N. D. Burgess (1998). Bat assemblages in Tanzanian coastal forests.

Bat species lists were compiled in 17 small coastal forests of Tanzania, eastern Africa, between 1990 and 1992. Forty-six bat species were recorded, with up to 15 species in a single forest. Eight forests were sufficiently studied for comparisons to be made on species frequencies and species diversity. Regional diversity was 2.74, and local diversities ranged between 1.55 to 1.97. Many species were remarkably unevenly distributed. Records of biogeographical significance for Tanzania were: confirmations of *Myotis tricolor, Tadarida brachyptcra, Myonycteris relicta, Rhinolophus deckenii* and *Kerivoula Africana*, and first records of *Scotoplrilus nigrita alvenslebeni, Hipposideros Cyclops* and *Cloeotis percivali*.

Des Chiroptères ont été capturés dans 17 petites forêts côtières de Tanzanie, en Afrique de l'Est, entre 1990 et 1992. Quarante-six espèces ont été mises en évidence, avec jusqu'à 15 espèces dans une seule foret. Huit îlots forestiers ont été suffisamment étudies pour que des comparaisons des fréquences locales des espèces et des indices de diversité puissent être effectués. L'indice de diversité régional est de 2,74 et les indices locaux se situent entre 1,55 et 1,97. Beaucoup d'espèces sont reparties de façon remarquablement irrégulière. Les captures les plus intéressantes pour la Tanzanie sont: la confirmation de *Myotis tricolor, Tadarida brachyptera, Myonycteris relicta, Rhinolophus deckenii* et *Kerivoula africana*, et les premieres observations de *Scotophilus nigrita alvenslebeni, Hipposideros cyclops* et *Cloeotis percivali*.

Coe, M. (1972). The South Turkana Expedition. Scientific Papers IX. Ecological studies of small mammals of South Turkana.

During the three seasons of the RGS South Turkana Expedition the zoological party conducted an ecological survey of the small mammals. Other aspects of this programme will be described elsewhere. The main habitat types are described and the small mammal fauna is shown to be segregated between them. The role of microclimate in this habitat segregation is described. Breeding records indicate that the number of young produced by rodents may be dictated by rainfall and available food quality. An attempt is made to calculate the small mammal biomass for South Turkana, and the figure obtained (500 kg/km^2) represents 24 per cent of the large mammal biomass reported by Watson (1969). The zoogeography of the small mammal fauna indicates a strong connection with that of the Somalian arid zone.

Coe, M. (1976). Mammalian ecological studies on Mount Nimba, Liberia.

Le Mont Nimba est situé aux confins du Libéria, de la Guinée et de la Côte d'Ivoire. En 1964 et 1966, un relevé de la fauna de Mammifères a été réalisé sous les auspices de l'U.I.C.N. et de la L.A.M.C.O. qui est en train d'exploiter le mineral de fer à ciel ouvert et de faire disparaïtre ainsi une grande partie de la montagne. La géologie, le climat et les différents types de végétation sont décrits. Des mammifères vivants et morts on été pris au piège; certaines des plus grandes espèces ont été achetées à des chasseurs Mano. Les mégachiroptères ont été capturés à l'aide de filets fins. 8 327 pièges ont été posés et 55 espèces (sur 88 qui existent probablement) ont été observées ou capturées. L'auteur décrit l'habitat des différentes espèces de rongeurs; il pense que les habitats secondaires créés par l'homme sont responsables de l'accroissement marqu" de la densité de certaines espèces.

Sous forme d'une liste systématique, l'auteur donne des informations sur la répartitlion géographique, le régime alimentaire et la reproduction des espèces collectées. Il discute l'influence de la pression humaine et des exploitations minières et forestières sur la faune endémique.

La structure de la faune des mammifères est étudiée en fonction des principaux régimes alimentaires. L'auteur montre que les espèces prédatrices peuvent représenter 40 % de l'ensemble de la faune comme c'est le cas dans les habitats semblables des forêts hygrophiles de Malaisie, de Bornéo et d'Australie.

Des informations numériques sur les collections de mammifères libériens du Mont Nimba sont données en appendice.

Coetzee, C. G. (1981). Distribution patterns of terrestrial mammals in South West Africa / Namibia. Abstract.

In order to obtain a better understanding of the distribution patterns of the different mammal species and their zoogeographical affinities, necessitates a comparison between the faunal composition of the different ecogeographical areas. Twelve ecogeographical areas were identified which include one semi-isolated mountain area. The riverine growths of the four bordering river complexes were additionally considered as being corridors that lead from adjoining regions into vastly different geomorphological and climatic areas.

Delimitation of the ecogeographical zones are based on plant communities (Giess, 1971 and Keay, 1959) and on geographical and physiographical features (sand cover, gravel plains, saline desert, the Karstveld, mountain ranges and swamps). The different species of terrestrial mammals, with the exclusion of the bats, were used in a matrix showing the relationship between the faunas of the areas by listing the species common to the different areas. These values were used to calculate the different correlation coefficients in determining the Faunal Resemblence Factor of Duellman (1965).

SWA/N falls within three of the zoogeographical zones of southern Africa as defined by Rautenbach (1978). The validity of and relationship between the different ecogeographical areas as faunistic

entities are being questioned, both on an interarea basis and in relation to the three zoogeographical zones.

Constantine, D. G. (1998). An overlooked external character to differentiate *Myotis californicus* and *Myotis ciliolabrum* (Vespertilionidae).

The observation of a perceived 4-mm tail extension beyond the border of the interfemoral membrane of the western small-footed myotis, *Myotis ciliolabrum*, and the absence of the free tail in the California myotis, *Myotis californicus*, stimulated a quantitative study to determine if the tail character could be verified as a consistent external criterion to differentiate these similar species. Existing study skins were unsuitable for this purpose, because the tail character had been destroyed or distorted by replacement of the tail vertebrae with wire. Twenty-three *ciliolabrum* and 22 *californicus* were collected in the Mojave Desert of California and prepared as study skins with tail vertebrae in situ. Examination of these specimens, identified by conventional methods, confirmed that the exserted tail was characteristic of *ciliolabrum*. Original descriptions, usually based on specimens preserved in alcohol, indicated that the tail character was recognized in ciliolabrum over a century ago.

Corbet, G. B. (1984). The mammals of the Palaearctic region: a taxonomic review. Supplement.

Published information supplementing that given in *The mammals of the Palaearctic Region: a taxonomic review* (London: British Museum (Natural History), 1978) is summarized, including details of all new names not included in that work, revisionary work affecting the delimitation of species, comprehensive accounts of subspecific variation and major revisions of distribution. No new names are proposed in this work.

Corbet, G. B. and J. E. Hill (1992). The mammals of the Indomalayan Region: A systematic review.

The Indomalayan (Oriental) Region has been recognized for over a century as one of the major zoogeographical regions of the world, with about a thousand species of mammals, over 20 per cent of the world's mammalian fauna. However, there appears to have been no previous attempt to produce a comprehensive, integrated account of its mammal fauna. Hitherto, four separate nomenclatorial lists have together covered the region, all of them now very out of date but nevertheless providing a valuable foundation for the present work. These are:

Ellerman & Morrison-Scott (1951, 1965): *Checklist of Palaearctic and Indian mammals 1758-1946*, which covers the region north of 10°N, i.e. north of the Isthmus of Kra in peninsular Thailand.

Chasen (1940a): *A handlist oj Malaysian mammals*, covering the Malayan peninsula and the Greater Sunda Islands except Palawan.

Laurie & Hill (1953): *List of land mammals of New Guinea, Celebes and adjacent islands, 1758-1952*, covering all the Indonesian islands not dealt with by Chasen.

Taylor (1934): *Philippine land mammals*.

Except for Taylor's work on the Philippines these did not purport to provide descriptions nor, with some exceptions, keys to identification, but they did provide a valuable stimulus for further taxonomic work by postulating the limits of species, by pinpointing gaps and by erecting hypotheses of relationships that could be subjected to testing as new information became available. However, the research that has been conducted during the past 50 years has for the most part been highly fragmented and localized. Some of the results have been summarized in a few important regional works but there are many gaps.

Our objective in compiling this work has been to bring together in one place an account of every species of mammal in the region, documenting the names and synonyms in full, and placing them within a taxonomic framework that takes account of all relevant published research. The order Chiroptera (bats) has been dealt with by JE Hill, based largely upon research undertaken while on the staff of The Natural History Museum, London. The remaining orders and the Introduction have been dealt with by GB Corbel, based primarily upon a critical review of the existing literature, but the results have been tested and many gaps filled by use of the extensive collections of The Natural History Museum, supplemented by visits to many other museums with important collections of Indomalayan mammals. We have scrutinized and criticized each other's text but the taxonomic opinions expressed are those of the individual author.

About 7000 scientific names are documented (including c.340 based upon fossils described in Recent genera), with type localities in the case of species-group names. These are backed up by a bibliography of about 3000 items covering the original citation of all names as well as relevant, recent research.

Ideally, this kind of synthesis should be based upon more detailed syntheses of the component countries of the region and upon more detailed revisions of particular taxa, without artificial geographical limitations. Very few modern sources of this kind exist and for many groups we have had to depend upon a mixture of primary, and more or less obsolete and incomplete, secondary sources.

There is nothing definitive about this volume - it is a presentation of the current state of our knowledge, using our personal judgement and experience to choose the 'most probable' solution where alternative views have been expressed or where, as is so often the case, there are many alternative ways of combining the scattered data into an integrated whole. We hope that it will serve a useful purpose for reference and also act as a stimulus to further research that will show where we have gone wrong.

Cosson, J. F., M. Tranier and F. Colas (1996). On the occurrence and possible migratory behaviour of the fruit bat *Eidolon helvum* in Mauritania, Africa.

The pteropodid bat *Eidolon helvum* (Kerr 1792) is recorded for the first time in Mauritania, this is one of the northernmost record for a member of this family in West Africa, and add some information on its probable migratory behaviour.

Distribution et comportement migratoire possible de la chauve-souris *Eidolon helvum* en Mauritanie Afrique.• Cette espèce de Pteropodidae est signalée pour la première fois en Mauritanie, c'est un des point les plus au nord pour un membre de cette famille en Afrique de l'Ouest. Des informations sur son comportement migratoire probable sont ajoutées.

Cotterill, F. P. D. (1996a). New distribution records of insectivorous bats of the families Nycteridae, Rhinolophidae and Vespertilionidae (Microchiroptera: Mammalia) in Zimbabwe.

The distributions of twelve species of insectivorous bats in Zimbabwe are reviewed in light of numerous new specimens which constitute significant range extensions. The first known specimens of *Pipistrellus anchietai* and *P. melckorum* are reported from Zimbabwe.

Cotterill, F. P. D. (1996b). New distribution records of free-tailed bats (Microchiroptera: Molossidae) in Zimbabwe.

New distribution records are presented for five species of free-tailed bats from Zimbabwe; and many of the specimens examined constitute significant range extensions. These include the first known specimens of *Tadarida ventralis* from Zimbabwe and two additional specimens of *T. lobata*.

Cotterill, F. P. D. (1998). Female reproduction in two species of tropical horseshoe bats (Rhinolophidae) in Zimbabwe.

Female reproduction was studied in sympatric populations of two species of African horseshoe bats in a seasonal tropical environment of central Zimbabwe. Both *Rhinolophus simulator* and its largest African congener, *R. hildebrantii*, were monotocous and monestrous, and reproduction was highly seasonal. In 3 consecutive years, *R. simulator* gave birth consistently later (15 - 20 days) than *R. hildebrantii*, and early embryonic development was retarded in the smaller *R. simulator*. Copulations occurred during June and July of the cool-dry season, and both species gave birth to single offspring during separate synchronized periods of parturition at the start of the wet season. Lactation in both species coincided with the period of maximal rainfall, but the weaning period of *R. hildebrantii* was distinctly long.

Cotterill, F. P. D. and R. A. Fergusson (1993a). Capturing free-tailed bats (Chiroptera: Molossidae): the description of a new trapping device.

This paper reviews methods suitable for the capture of African free-tailed bats. The most successful approach is to trap molossids as they leave their daylight roosts. Traps constructed from polythene sheeting on an aluminium frame are most suitable. This design permits flexibility: traps can be easily constructed and rapidly adapted to different situations. The construction and operation of a new mobile trap is described in detail. The effectiveness of this technique for capturing some *Tadarida* species from their inaccessible roosts is discussed and compared with conventional methods.

Cotterill, F. P. D. and S. R. Giddings (1987). Observations on the activity patterns of the lesser yellow house bat, *Scotophilus viridis*.

The activity patterns of the lesser yellow house bat, *Scotophilus viridis*, were observed during December 1984. Whilst the activity patterns of the species as a whole were in agreement with published data, significant differences between the activity patterns of males and females were found. The majority of females were active between 19h00 and 21h00, whilst the activity of males peaked between 21h00 and 22h00.

Die aktiwiteitspatrone van *Scotophilus viridis* is gedurende Desember 1984 waargeneem. Hoewel die aktiwiteitspatrone van die spesies in geheel in ooreenstemming was met gepubliseerde data, is betekenisvolle verskille gevind tussen die aktiwiteitspatrone van mannetjies en wyfies. Die meerderheid wyfies was aktief tussen 19h00 en 21h00, terwyl die mannetjies tussen 21h00 en 22h00 aktief was.

Coulanges, P., Y. Robin, G. Le Gonidec, A. Mayoux and R. Bordahandy (1974). Chiroptères et arbovirus à Madagascar (Isolement de souche de virus Dakr-bat, etude sérologique de Chauves-souris frugivores).

Les auteurs rapportent l'isolement de (leux souches de virus-Dakar-bat, à Madagascar, à partir de chauves-souris insectivores. Ce virus a pu être adapté sur cellules (BHK.21.C.13 et HeLa). L'étude en inhibition de l'hémagglutination de 101 sérums de chauves-souris frugivores *Pteropus rufus* a également permis de montrer la circulation des arbovirus Sindbis et Chikungunya dans le' groupe A et West-Nile, Wesselsbron dans le groupe B.

Courts, S. E. (1996). Insectivory in two species of fruit bat: *Pteropus livingstonii* and *P. rodricensis*. Abstract.

Two fruit bat species of the genus *Pteropus*. Livingstone's fruit bat *P. livingstonii* and the Rodrigues fruit bat *P. rodricensis* have been observed in captivity actively catching and eating insects. Both species adopt the same technique to trap flying insects using their wings to envelop them. The capture position was assumed within 0.84 seconds (± 0.09) of the bat becoming aware of the insect, and its spontaneity indicates that the response is not an artefact of captivity. The behaviour was observed in captive-bred *P. rodricensis* which had no prior access to insects, suggesting that it is innate. A higher rate of successful captures was recorded for an older. wild-caught *P. livingstonii* female, indicating that the effectiveness of the technique used improves with age. Significant differences in the amount of time spent catching insects by males and females were evident in this species. This study supports suggestions that insects are eaten by some megachiropterans in order to supplement their protein intake, and has implications for the behavioural enrichment and nutrition of captive bats.

Cowles, R. B. (1936). Notes on the mammalian fauna of Umzumbe Valley, Natal, South Africa.

The following data were collected during a stay of 18 months in the Umzumbe Valley, where the writer was engaged in procuring detailed information regarding the life histories of certain birds and one reptile, the Nile monitor. While continuing this work, especial efforts were made to obtain as complete an understanding of the vertebrate fauna as possible, and it was in the pursuit of this objective that the present data were accumulated.

South Africa is an exceedingly large territory and while the topography and possibly the smaller mammals will remain unchanged for many decades, some of the sections, notably those in the less desirable locations that have been allotted to the natives, are undergoing a process of rapid alteration, because of the activities of the inhabitants in building houses, cultivating the hillsides, and herding grazing animals over the steep slopes. In many areas erosion is becoming a serious menace.

The studies here set forth were made in the confines of the Umzumbe River Valley in a section approximately 12 miles by road from the railway station named after the river. The Umzumbe River flows in a northwesterly direction. Twelve to 16 miles from the river mouth the valley lies behind high barriers of hills which cut off the tempering winds of the sea. Although rainfall is somewhat less abundant in these protected valleys, the xerophytic character of the vegetation is predominantly the result of insolation, the closed nature of these deep valleys, the consequent heating of the air, and the presence of strong reflections from neighboring surfaces.

The sections of the Umzumbe Valley allocated to natives (and they are badly over-crowded) are rapidly being denuded of all cover, either by direct human action or indirectly by the herds of cattle and the far more pernicious flocks of goats. As cattle suffer from depletion of their food supply, the natives keep an increasing proportion of goats, thus starting a vicious cycle which only can terminate in complete denudation of these areas. Other valleys and other native locations are faced with the same problems.

The native faunas of these districts suffer from the changes even before they become obvious to those interested only in the economic phases, and when these notes were being compiled, it was observed by native helpers that many animals which they had considered common a few years before, had practically disappeared.

During the 7 years that have elapsed between the collection of my specimens and notes, and the date of this writing (1935), floods and drought have played their part in affecting the terrain, and where dense bush once formed ample cover to shelter bush-buck and duiker, there remain now only small remnants through which a man can walk erect and see clearly for many yards in every direction. Only on the private estates farther inland, on crown lands, and along the valley nearer the sea, are conditions at all comparable to those once found in the area under consideration.

Crawford-Cabral, J. (1966). Quatro formas de mamíferos novas para Angola.

O autor cita *Eptesicus hottentotus pallidior* pela primeira vez para Angola. Cita também o género *Pronolagus*, classífica os animais dos distritos da Huila e de Moçâmedes na subespécie *Pronolagus*

caucinus waterbergensis e resume a situação taxonómica das formas deste género no Sudoeste Africano. Descreve para as planícies do Morro do Camelo, distrito do Moçâmedes, uma nova subespécie, *Petromus typicus coetzeei*. Cita, por último, a Suricata para a regíão que se situa entre os rios Curoca e Cunene, classificando a na forma. *Suricata suricatta hahni*.

L'auteur cite l'*Eptesicus hottentotus pallidior* pour la première fois en .Angola. II cite aussi le genre *Pronolagus*, classifie les animaux des districtes d'Huila et de Moçâmedes dans la sous-espèce *Pronolagus caucinus waterbergensis*, et fait un abrégé sur la situation taxanomique de ce genre dans le Sudouest Afrícain. L'auteur décrit une nouvelle sous-espèce, *Petromus typicus coetzeei*, pour les plaines de "Morro do Camelo", dans le district de Moçâmedes. Enfin, il cite la Suricate pour la. région que se trouve entre les fleuves Curoca et Cunene et la classifie de *Suricata suricatta hahni*.

Eptesicus hottentotus pallidior is recorded for the first time, from Angola. *Pronolagus* occurs in Angola, the specimens from the Huila, and the Moçâmedes districts beeing regarded as to belong to the subspecies *Pronolagus caucinus waterbergensis*, and a summing up on the taxonomíc situation of *Pronolagus* in the South-West Africa is done. A new subspecies *Petromus typicus coetzeei*, is described from the "Morro do Camelo" plains, in the Moçâmedes district. Finaly. the Suricate is recorded from the country between the Curoca and Cunene rivers, under the name of *Suricata suricatta hahni*.

Crawford-Cabral, J. (1989). A list of Angolan Chiroptera with notes on their distribution.

Sixty one taxa of bats (most of them species) are listed for Angola. The collecting localities cited in the literature are mentioned for each of them, as well as the material examined, housed in the ex-Centro de Estudos do Lubango, Angola (a department of the ex-Instituto de Investigação Científica de Angola), and in the Centre de Zoologia of the Institute de Investigação Científica Tropical, in Lisbon. Notes on distribution are also given for many of the taxa. The list is accompanied by distributional maps and is preceded by some introductory zoogeographical considerations.

Constam desta lista sessenta e um táxones de morcegos de Angola (a maior parte dos quais são espécies), sendo mencionadas, para cada um deles, as localidades de colheita citadas na literatura, assim como o material observado, pertencente ao ex-Centro de Estudos do Lubango, Angola (departamento do ex-Instituto de Investigação Científica de Angola), e ao Centro de Zoologia do Institute de Investigação Científica Tropical, Lisboa. Para muitos desses táxones foram acrescentadas notes sobre a sua distribuição. A lista é acompanhada de mapas de distribuição e precedida de algumas considerações introdutórias de ordem zogeográfica.

Crick, J., G. H. Tignor and K. Moreno (1982). A new isolate of Lagos Bat virus from the Republic of South Africa.

In 1980, a virus isolated from a bat in Natal, Republic of South Africa, was initially identified in the fluorescent antibody test as rabies virus. We have now shown this isolate to be Lagos bat virus. The possible epizootiological significance of this finding is discussed.

Cumming, G. S. and R. T. F. Bernard (1997). Rainfall, food abundance and timing of parturition in African bats.

We used published results from studies in Africa to test the hypothesis that the timing of parturition in the Chiroptera is constrained by rainfall. Comparison of year-round rainfall and insect data at various latitudes showed that insect abundance peaks approximately a month after peak rainfall. A similar comparison of parturition time to rainfall showed that with the possible exception of the molossids, the Microchiroptera commonly give birth a month before peak rainfall. With an average 6-week lactation period in the Microchiroptera, the timing of parturition is such that young bats are weaned just before the period of maximum insect abundance. We suggest that the needs of the young in this post-weaning

period may be more important than the energetic demands of lactation on the mother in determining the timing of parturition on an evolutionary scale. A similar conclusion is implied for the African Megachiroptera, but there is insuffient information on their reproduction to adequately test the main hypothesis for these bats.

Cunneyworth, P. [Ed] (1996a). Kwamarimba Forest Reserve. A biodiversity survey.

Kwamarimba forest reserve is situated in the East Usambara mountains in north-east Tanzania. The East Usambaras form part of the mountain chain called the Eastern Arc which ranges from southern Kenya to southern Tanzania. These mountains are known for their rich floral and faunal diversity and high levels of species endemism (Hamilton, 1989). To investigate further this biodiversity, a biological survey of Kwamarimba forest reserve was conducted with a socio-economic component between October and December 1995 for a total of 51 research-days.

This report summarises the findings of the survey in terms of floral and faunal inventories. Notes on ecological requirements and degree of endemism for each species is presented to provide an indication of the number of (a) forest dependent species as opposed to forest non-dependent and non-forest species; (b) threatened and rare species (based on IUCN 1994 criteria) and (c) endemics and near-endemics to the Usambara mountains. These are presented so as to highlight the importance of Kwamarimba forest reserve in a national and international context. These three categories are then combined to assess which species are considered at high risk of becoming locally extinct if the forest continues to be further degraded and fragmented.

The survey identified 165 species of tree and shrub, 16 species of mammal, 11 species of bird, 17 species of reptile and 11 species of amphibian.

Flora

Four tree species are endemic to the Usambara mountains and 39 which have restricted ranges limited to the Eastern Arc and/or East African lowland forests. Thirty-seven species are dependent on primary forest, and of these species, 14 were also endemic or near endemic to the Usambara mountains. Twenty non-forest tree and shrub species are established within the reserve boundaries.

Species of particular interest encountered during this survey included:

Cola usambarensis, Cynometra brachyrrhachis, and *Cynometra longipedicellata* are wet evergreen forest trees, endemic to the East Usambara mountains recorded in the reserve. The first two were recorded twice and the latter 15 times;

Rinorea angustifolia, a wet evergreen forest tree, endemic to the East and the West Usambara mountains was recorded once in the reserve;

Sapium armatum, a small dry forest tree, previously recorded as a coastal endemic, is a new record for the region (FTEA);

Nesogordonia holtzii is considered a coastal endemic tree. The occurrence of this species in the Usambaras may represent a range extension however the full description of this species has yet to be published.

Fauna

Three faunal species were recorded which are endemic to the Usambara mountains and fourteen species were recorded as near-endemics, having restricted ranges limited to the Eastern Arc and/or East African lowland forests. Twenty species are dependent on primary forest, and of these species, 15 are also endemic or near endemic to the Usambara mountains. One non-forest species is established in the reserve.

Species of particular interest encountered during this survey include:

Typhlops pallidus, the pallid blind snake, known from Sudan, Kenya and Zanzibar. This is the first record from the Tanzanian mainland;

The Usambara eagle owl, *Bubo vosseleri*, and the Southern hyliota, *Hyliota australis* spp. *usambarae*, were recorded in the reserve. Both are endemic to the Usambara mountains. The former, is a CITES II species, also considered 'Vulnerable' by IUCN;

Mertensophryne micranotis is listed as 'Endangered' by IUCN;

Sheppardia gunningi, Bubo vosseleri, Philothamnus macrops, Elapsoidea nigra, Rhampholeon brevicaudatus, Bufo brauni, Leptopelis barbouri, and *Scolecomorphus vittatus* are listed as 'Vulnerable' by IUCN;

Chamaeleo melleri, Swynnertonia swynnertoni and *Rhynchocyon cirnei* spp. *petersi* are listed as 'Near-threatened' by IUCN.

Soils

The soils of Kwamarimba are typical of other soils studied in the East Usambaras. Human disturbance was found to be a major contributing factor to the differences in soil type. These differences are mainly in respect to nutrient status. Due to the tight nutrient cycle of the forests, this likely affects the vegetation the soil is able to sustain.

Disturbance

The highest level of pole and timber extraction recorded in the reserve was located on the transect which runs near to the central area of the reserve. This transect is characterised as mature mixed forest away from the reserve boundaries with areas of grassland and open/disturbed forest toward the boundaries. Trapping was not conducted on this transect therefore it is not possible to determine the extent the disturbance has on presence or absence of zoological species.

Socio-economics

The people living in the area of Kwamarimba forest reserve do not appear to understand the advantages of the forest reserves. They are given little information and education about the reserves and are thus unlikely to change their attitudes and consequently behaviour which have a direct impact on the forest, its' quality and long-term sustainability.

Cunneyworth, P. [Ed] (1996b). Kambai Forest Reserve: A biodiversity survey.

Kambai forest reserve is situated in the East Usambara mountains in north-east Tanzania. The East Usambaras form part of the mountain chain called the Eastern Arc which ranges from southern Kenya to southern Tanzania. These mountains are known for their rich floral and faunal diversity and high levels of species endemism (Hamilton, 1989). To investigate further this biodiversity, a biological survey of Kambai forest reserve was conducted with a socio-economic component between January and March 1996 for a total of 52 research-days.

This report summarises the findings of the survey in terms of floral and faunal inventories. Notes on ecological requirements and degree of endemism for each species is presented to provide an indication of the number of (a) forest dependent species as opposed to forest non-dependent and non-forest species; (b) threatened and rare species (using IUCN 1994 criteria) and (c) endemics and near-endemics to the Usambara mountains. These are presented to highlight the importance of Kambai forest reserve in a national and international context. These three categories are then combined to assess which species are considered at high risk of becoming locally extinct if the forest continues to be further degraded and fragmented. The survey identified 162 species of tree and shrub, 36 species of mammal, 11 species of bird, 18 species of reptile and 15 species of amphibian.

Czekala, N. M. and K. Benirschke (1974). Observations on a twin pregnancy in the African Long-tongued fruit bat (*Megaloglossus woermanni*).

This paper presents the findings of twin embryos of differing size in *Megaloglossus woermanni*. The possibilities for the cause of this unusual size difference are explored. Due to the excellent preservation of tissues in both embryos, the lack of any serious abnormalities in the small twin, and the age difference as determined by kidney sections, we have concluded the small twin to be superfetated.

Dalquest, W. W. (1965). Mammals from the Save River, Mozambique, with descriptions of two new bats.

During October 1963, 325 specimens of mammals were obtained from the Save River area, Mozambique, mostly near the hunting camp of Zinave, midway between the Indian Ocean and the Southern Rhodesian boundary. *Nycteris vinsoni* and *Scotophilus alvenslebeni* are described as new, *Triaenops persicus* is recorded from southern Africa for the first time, and data are provided concerning 51 other kinds of mammals, most of which are represented by specimens.

Dalquest, W. W. (1968). Additional notes on the mammals from Mozambique.

In October 1963, an expedition sponsored by Mr. Jerry Vinson obtained a collection of mammals from the Save River region of Mozambique. The bulk of this collection was taken at Zinave, a hunting camp on the south side of the river located approximately midway between the Indian Ocean and the Rhodesian boundary. The results of the first collection have been reported (Dalquest, J. Mamm., 46: 254-264, 1965).

In October 1965, a second expedition to the Save River was sponsored by Mr. Vinson. Personnel included Mr. and Mrs. Vinson, the writer, several white hunters, and numerous native helpers in the employ of Mozambique Safarilandia. Baron Werner von Alvensleben, Director of Mozambique Safarilandia, offered every assistance in making our work successful.

The base camp was again at Zinave, and additional mammals were taken there. Major efforts were directed to collecting at Panzila, a hunting camp midway between Zinave and the Rhodesian boundary. The specimens taken there are labeled "Panzila, 166 km S, 200 km W Beira, Mozambique." Although Panzila is at a considerable higher elevation than Zinave, it is still well east of the highlands along the Rhodesian boundary. Surroundings are essentially similar to those at Zinave. Major differences are the higher gradient of the Save River, low riverside cliffs of conglomerate, and some extensive but low cliffs of conglomerate capping the hills.

Large and small mammals were abundant both at Zinave and at Panzila. However, little time was spent in preparation of the specimens that duplicated the 1963 collection, so that more time might be spent in the field. The following specimens were obtained.

Davis, D. H. S. (1957). Studies on Arthropod-borne viruses of Tongaland. III. The small wild mammals in relation to the virus studies.

Fifteen species of small mammals were studied in the Lake Simbu area of Tongaland during April and May, 1955. Blood specimens were obtained from 10 of these species for immunological studies. Neutralisation tests with 4 viruses isolated in Tongaland gave negative results. Owing to the small number of samples tested no conclusion can be drawn from these results.

Dean, W. R. J. (1975). *Tyto alba* prey in South West Africa and the Northern Cape.

Ten collections of barn owl (*Tyto alba*) pellets from four localities in South West Africa and four collections from three localities in the northern Cape have been analyzed. Localities of the barn owl roosts and pellet collection sites are listed below.

De Beaux, O. (1922a). Mammiferi abissini e somali.

Ho riunito I mamm. Riportati dal Cap. Carlo Citerni, comandante la missione par la delimitazione tra la Somalia e l'Etiopia, V. 1908 - I. 1912, con quelli donati dal sig. Virginio Romano Scotti, del Setit, Eritrea, 1908. Questi ultimi, contrassagnati con R., constituiscono una lodevolissima raccolta di caccia grossa; i primi comprendono 41 specie o sottospecie, 4 della quali appaiono nuove. È nuova anche la decriz. del cranio di *Galao gallarum*, Thos.. La località "Dolo" va intesa in senso molto ampio e prevalentemente come "in marcia verso o da D."

De Beaux, O. (1922b). Collezioni zoologiche fatte nell'Uganda dal Dott. E. Bayon. XVII. Mammiferi. Parte II. Chiroptera.

I Chirotteri trattati nel presente lavoro constituiscono un contributo alla conoscenza della Mammalofauna del Lago Vittoria e particolarmente delle sue isole. Il materiale risulta di 23 specie o sottospecie in 1172 esempl., interni in alcool. Numero di catalogo tra parentesi.

De Beaux, O. (1923). Di alcuni Chirotteri africani del Museo civico di Milano.

Il presente lavoro è basato su alcuni Chirotteri africani che il Dott. B. Parisi, Direttore della Sezione di Zoologia, gentilmente mi affidò in istudio. Sentitamente ringraziando, sono lieto di potere constatare che la piccola, ma fortunata raccolta, dovuta in massima parte al BARONE L. FRANCHETTI et al COMM. L. TONKER, serve ad amplificare le cognizioni in materia. Le due località spesso citate di *Archers Post* et *Bulessa* si trovano sul fiume Guaso Nyiro settentr. Vicino allo sbocco del fiume Lakiundu, a Nord del monte Kenia nell'Africa orient. Inglese.

De Beaux, O. (1924). Mammiferi della Somalia Italiana raccolta del maggiore Vittorio Tedesco Zammarano nel museo civico di Milano.

Le spedizioni del Maggiore Vittorio Tedesco Zammarano Vittorio nella Somalia meridionale 1915-16 e 1921-22 (vedi ZAMMARANO, Impressioni di caccia in Somalis Italiana, Milano, 1921, e PARISI, Natura, Milano, XIV, Fasc. 1, 1923, p. 17-19) hanno dato un validissimo contributo alle nostre cognizioni sui mammiferi della Somalia italiana.

Mentre infatti, in base a materiale riportato da precedenti esploaratori non si registravano per il territorio italiano che 21 specie, oggi se ne elencano 87, delle quali 78 sono accuramente studiate su materiale assicurato in Musei italiani.

Mi è grato porgere al Dott. Bruno Parisi, l'attivo Direttore delle Sezione Zoologica del Museo Civico di Storia Naturale in Milano, i miei sentiti ringraziamenti per l'incarico affidatomi di studiare il cospicuo materiale mammalogico, dall'intelligente ed instancabile raccoglitore donato a codesto Museo.

Delle 43 forme riportate dallo Zammarano, 1 specie e 2 sottospecie risultatno nuove per la scienza. Molte altre porsero occasione a numerose ed utili considerazioni.

De Beaux, O. (1934). Mammiferi raccolti dal Prof. G. Scortecci nella Somalia Italiana Centrale e Settentrionale nel 1931.

La spedizione Scortecci nella Somalia Italiana (Bibl. 45 e 36) può dirsi molto fruttuosa per la conoscenza della Mammalofauna di questa nostra colonia, risultato particolarmente meritorio, se si riflette che la Somalia centrale e settentrionale costituiscono una zona faunisticamente piuttosto povera.

Lo Scortecci ha riportato 39 specie o sottospecie di Mammiferi cosi suddivise : 2 Primati, 13 Chirotteri, 5 Carnivori, 15 Roditori, 4 Ungulati.

Di questi 39 Mammiferi, 12 provengono dalla Somalia Italiana meridionale e precisamente 2 Primati, 6 Chirotteri, 1 Carnivoro, 3 Roditori.

Tra i 12 Mammiferi somali meridionali si trovano: 1 nuova specie di Topo spinoso, dono di E. Bovone (*Acomys bovonei*, spec. nova); "1 "bell'esemplare del notevole Chirottero *Glauconycteris*, dono del Governatore di allora Dott. G. Corni (*Gl variegata phalaena*, Thomas), 1 *Epomohiorus anurus*, Heuglin, ed 1 *Jaculus jaculus vulturnus* Thomas, che rappresentano 4 nuove acquisizioni per la Mammalofauna di quella zona.

Dei 27 Mammiferi riportati dalla Somalia Italiana centrale e settentrionale, 1 risulta appartenere ad una sottospecie nuova : *Heterocephalus glaber scorteccii*, fatto assai notevole, in quanto che questa forma sembra essere in realtà l'unica che non rientra nella tipica *glaber glaber*, Rüppell.

Dei rimanenti 26 Mammiferi non meno di 14 rappresentano acquisizioni nuove per la Mammalofauna della nostra Colonia, 12 delle quali sono da ritenersi proprie della Somalia Italiana centrale e settentrionale, in comune colla Somalia Britannica.

Le 18 forme che col presente lavoro vengono introdotte nella Mammalofauna della Somalia Italiana sono:

DeBlase, A. F. (1972). *Rhinolophus euryale* and *R. mehelyi* (Chiroptera, Rhinolophidae) in Egypt and southwest Asia.

Various criteria which have been used to distinguish between *Rhinolophus euryale* and *R. mehelyi* are presented. Of these lancet shape and certain cranial measurements (particularly zygomatic width) are shown to be the most reliable for specimens from southwest Asia. Both species are shown to be present in the USSR, Turkey, Iran, and Israel and both are shown to occur in the same caves in Iran. Only *R. mehelyi* is reported from Egypt and Cyprus. Several new locality records are given for Iran and *R. mehelyi* is reported for the first time from Iran, Israel and Jordan.

Decher, J. (1997). Bat community patterns on the Accra Plains of Ghana, West Africa.

Bat communities were sampled with mist nets at eight localities on the Accra Plains and two localities in the Northern Region of Ghana. I encountered five species of fruit bats (Pteropodidae) and 26 species from seven families of Microchiroptera in a total of 252 bats netted.

Glauconycteris poensis, Hipposideros cyclops, and *H. abae* were caught only in sacred groves protected by traditional law, whereas *Taphozous perforatus* was netted only near rocky cliffs in the legally protected Shai Hills Resource Reserve. *Myonycteris torquata* and *Myotis bocagei* were caught only at the edge of experimental forest plots in the northeastern part of the Accra Plains near the lower Volta River. There was a statistically significant negative correlation between canopy cover and bat species abundance and diversity.

Relatively open savanna at Shai Hills located close to bodies of water apparently had the greatest diversity and abundance of bats. The diversity of bats on the Accra Plains slightly exceeded published data from other savanna regions in West Africa.

Decher, J., D. A. Schlitter and R. Hutterer (1997). Noteworthy records of small mammals from Ghana with special emphasis on the Accra Plains.

In this paper we describe new or additional records of four species of shrews (Soricidae), nine species of bats (Hipposideridae, Vespertilionidae, Molossidae), and one species of rodent (Muridae) from Ghana. These records add to our knowledge of the distribution of small mammals in Ghana especially those occurring on the Accra Plains. A zoogeographic explanation for these distributional data is sought in the context of the Dahomey Gap phenomenon

---

De Graaff, G. and R. B. Martin (1972). A survey of existing sound recordings of mammals and birds of southern Africa (during the period December 1971 - February 1972).

The present status of sound recording of mammals and birds in Southern Africa is assessed. It is clear that the most significant collections of recording are the result of private initiative by a very small number of individuals. Only some 9 % of mammals and 61 % of birds have been recorded. Possible ways and means to overcome hazards for recording unrecorded species are indicated. The idea of a national wildlife sound collection is supported and recordists are encouraged to place their recordings (or copies) with the South African Broadcasting Corporation Sound Archives.

De Graaff, G. and J. A. J. Nel (1970). Notes on the smaller mammals of the eastern Cape National Parks.

During November/December 1965, at the invitation of the National Parks Board a survey was made of small mammals (insectivores, bats, smaller carnivores, rodents and lagomorphs) occurring in the National Parks of the eastern Cape. The aim was threefold: to determine which smaller, and therefor less conspicuous mammal species were present and to assess their relative abundance and distribution in the various habitats available in each park. Parasites were also collected. The following is a preliminary note on the small mammals of the Mountain Zebra National Park, the Addo Elephant National Park, and the Tsitsikama Forest and Coastal National Park. The survey was undertaken by using various types of traps, sight records, owl pellet analyses (when available) and published sources. Further visits are envisaged. Trapping was undertaken at localities which seemed typical of the various habitat, and no line transects were used.

De Graaff, G. and I. L. Rautenbach (1983). A survey of mammals in the newly proclaimed Karoo National Park, South Africa.

The African continent covers an area of 28,672,000 km^2 and carries the most diverse mammal fauna in the world (Cae, 1980). At the southern tip of this continent, the Republic of South Africa (RSA) with its diversity of abiotic and biotic factors, is rich in natural assets, thus challenging the conservation conciousness of man (de Graaff, Robinson,van der Walt, Bryden & van der Hoven, 1979). A well-known area of the Republic of South Africa encompasses the Karoo, covering a large portion of the South African land surface. It is a region with a harsh climatic and environmental regime, necessitating a high degree of adaptability of its faunistic and floristic components. In the RSA a ± 3,000,000 ha National Park movement exists. An important gap was present in the National Parks system in the absence of any conserved area representative of the Karoo. Such an area can be thought of as an area of land which has effectively been removed from the development stream for the purpose of perpetuating natural conditions (Pyle, 1980). The underlying concept of the National Parks Act of 1926 (as amended in 1962) is the establishment of a worthy National Park in each of South Africa's diverse

ecosystems. The direction of the National Parks Board and the management policy thereof is steadily progressing towards the conservation of ecosystems, rather than the manipulation of populations of individual species.

In 1972 the International Union for the Conservation of Nature (IUCN) urged member countries to set aside additional areas as National Parks. The relevant South African authorities consequently proposed the proclamation of the Karoo National Park (KNP). Subsequent surveys by the National Parks Board, in close cooperation with the South African Nature Foundation (SANF) endeavoured to determine the most appropriate region to establish the envisaged conservation resource. It was decided to accept an offer of 7,209 ha of commonage by the Municipality of Beaufort West (a town proclaimed in 1818) while the SANF proceeded with a nationwide fund raising campaign. To date the Park comprises some 23,000 ha (eventual aim at least 100,000 ha) and was officially proclaimed and opened on 12 September 1979 (de Graaff *et al.*, 1979).

This paper is the first detailed survey on mammals occurring in the KNP and as such it seems to be the first detailed account of an assemblage on mammals typical to the Karoo. Notes are presented on some 50 odd species, either occurring naturally in the area, or on those reintroduced into the new park (mainly larger mammals) whose reintroductions are based on earlier and reliable references in the literature. The information presented in this paper forms part of data required for management procedures.

Deleuil, R. and A. Labbe (1955a). Contributions à l'étude des chauves-souris de Tunisie.

Ces quelques recherches, qui seront suivies d'autres, jettent une lueur nouvelle sur l'étude des chauves-souris de Tunisie. Nous constatons que le *Myotis myotis oxygnathus* est extrêmement répandu et abondant dans les galeries de mines et dans les grottes de la Tunisie du Nord; le *Miniopterus schreibersii* et le *Rhinolophus euryale* se trouvent dans les mêmes gîtes mais en quantités beaucoup moindres; le *Rhinolophus ferrumequinum* semble relativement abondant dans certaines galeries de mine. Quant à *Pipistrelles kuhlii*, cette espèce paraît extrêmement abondante dans les villes, au moins celles du Nord. L'*Eptesicus isabellinus* et le *Plecotus auritus* n'ont été capturés que dans le Sud et en quantité relativement minime.

Delfinado, M. D. , Baker, E. W. (1963). Mites of the family Spinturnicidae from the Philippines (Acarina).

Four genera in Spinturnicidae are recognized from bats collected in the Philippines. Among the 7 species treated in this paper, 1 belongs to *Spintumix* von Heyden, 3 to *Meristaspis* Kolenati, 2 to *Ancystropus* Kolenati, and 1 to *Oncoscelus*, n. gen. The species described and illustrated are *Spinturnix verutus*, n. sp., *Meristapis calcaratus* (Hirst), *Meristaspis mindanaoensis*, n. sp., *Meristaspis lateralis* (Kolenati), *Ancystropus eonycteris* n. sp., *Ancystropus palawanensis*, n. sp., and *Oncoscelus kanheri* (Hiregaudar and Bal) n. comb.

Demeter, A. (1982). Prey of the Spotted Eagle-Owl *Bubo africanus* in the Awash National Park, Ethiopia.

The prey composition of *Bubo africanus* is reported as determined by analyses of prey remains from a roosting site in the Awash National Park of Ethiopia. Mammals accounted for 88 % of the total number of prey items, in particular *Tatera robusta, Arvicanthis somalicus, Cerbillus pusillus* and *Crocidura fuscomurina* were the most frequent prey. By mass *Tatera robusta* and *Arvicanthis somalicus* made up over 60 % of the total mass of mammalian prey. *Crocidura* cf. *lusitania, C.* cf. *viaria, C. pasha* and *Steatomys* sp. are first recorded for the whole of Ethiopia. In addition to these, *Myotis tricolor* and *Praomys* cf. *fumatus* are first recorded for the Awash National Park.

Es wird fiber das Beutespektrum der Eule *Bubo africanus* im Awash Nationalpark in Athiopien berichtet. Dazu wurden Beutereste aus einem Nestplatz analysiert. Sauger bildeten 88 % der Gesamtzahlvon Beuteresten, am haufigsten waren *Tatera robusta, Arvicanthis somalicus, Gerbillus pusillus* und *Crocidura fuscomurina*. Die zwei Ratten *Tatera robusta* und *Arvicanthis somalicus* machten 60 % des Gesamtgewichtes an Saugern aus. *Crocidura* cf. *lusitania, C.* cf. *viaria, C. pasha* und *Steatomys* sp. werden erstmals fur Athiopien nachgewiesen, *Myotis tricolor* und *Praomys* cf. *fumatus* erstmals fur den Awash Nationalpark.

Demeter, A. and G. Topál (1982b). Ethiopian mammals in the Hungarian Natural History Museum.

A collection of 418 specimens belonging to 78 species of Ethiopian mammals is deposited in the Hungarian Natural History Museum. These are identified and notes on taxonomical aspects, distribution and field observations are included. A number of collecting localities are additional to the already known distributions of the species. *Myotis bocagei* is recorded for the first time for the country, and the second full specimen available for a rare genus, *Megadendromus*, is reported.

---

de Roguin, L. (1988). Notes sur quelques mammifères du Baluchistan iranien.

A small collection of mammals from Iranian Baluchistan is studied. New localities are given for several species, and a new species of microtine rodent and a new subspecies of vespertilionid bat are described.

Une collection de mammifères du Baluchistan iranien est étudiée. De nouvelles localités sont données, une nouvelle espèce de *Microtus* et une nouvelle sous-espèce d'*Eptesicus* sont décrites.

De Sousa Dias, A. (1970). Mamiferos de Moçambique.

A lista que segué, representa apenas o agrupamento de espécies de mamíferos identificados em Moçambique, na sua maior parte por naturalistas estrangeiros que aquí se deslocaram ou que aquí enviaram colectores.

Calcula-se que falte um número considerável de espécies, dado que nunca foi feita uma verdadeira prospecção zoológica da Provincia, assim como é possível também que alguns animáis mencionados já não existam nos días de hoje.

Os trabalhos realizados vêm da segunda metade do século XVIII e incidiram principalmente sobre os territórios da África do Sul, Rodésias e Niassalandia.

Tudo leva a crer que as penetrações em terras de Moçambique se devem a ocasional curiosidade dos investigadores e não a acções prèviamente programadas. Assim, além de reconhecimentos da fronteira, apenas foram atingidas regiões de fácil acesso, tais como: Maputo, Lourenço Marques, rio Limpopo, Inhambane, Coguno, rio Save, Beira, Sena, Marromeu, Gorongosa, Boror, rio Zambeze e Tete. Existcm, portanto, áreas imensas sern qualquer prospecção realizada até hoje.

Na lista que apresentamos mencionam-se também: algumas espécies estucladas pelo médico-veterinário Dr. Travassos Dias, outras que se encontam no Museu Álvaro de Castro de Lourenço Marques e outras ainda que, por existirem junto às nossas fronteiras, tudo leva a crer que tenham também representação em Moçambique.

Este trabalho poderá interessar futuras campanhas zoológicas, pois marca segundo eremos, ponto de partida a investigações que devem ser efectuadas quanto antes, dada a missão cultural que nos cumpre levar a cabo nesta Provincia Ultramarina de Moçambique.

De Vree, F. (1969). Notes on *Xiphonycteris spurrelli* Dollman from the Togo Republic (Microchiroptera - Molossidae).

Recently the Koninkllijk Museum voor Middem-Afrika (Tervuren) (KMMA) received a large collection of bats collected by Mr. C. VERONESE in the Republic of Togo (West Africa). Among the Microchiraptera I found four interesting mollosids, belonging to a species of extreme rarity in collections: *Xiphonycteris spurrelli* DOLLMAN. Two are adult females, the first known.

Up to now only two specimens were known with certainty, namely the type and the topotype, both - males collected in the closed forest zone in Ghana (Bibiamiaha). The female thus far remained unknown. In the British Museum (Natural History) however there is a female specimen (BMNH N° 53.556), also from Ghana (Achimota), which HAYMAN (1967: 121) tentatively assigned to *X. spurrelli*. ROSEVEAR (1965 : 351) on the contrary came to the conclusion that the Achimota specimen can not be regarded as the female of this species, the skull and especially the teeth being too different.

Other possible records of this rare molossid have been reported by BASILIO (1962: 53) from Rio Muni and Fernando Poo (Banapa). This latter specimen, also mentioned by EISENTRAUT (1964: 545) and HAYMAN (1967: 122) has been sent to the American Museum of Natural History by BASILIO, but the determination has not yet been confirmed. Also KOOPMAN (1965: 31) tentatively allocated a specimen (a skin without a skull) from Congo Kinshasa (Luluabourg) to *X. spurrelli*.

De Vree, F. (1972). Description of a new form of *Pipistrellus* from Ivory Coast (Chiroptera).

A small bat was obtained by the author on the 19th November 1969 at Adiopodoumé, about 20 km west of Abidjan, Ivory Coast. It is a pipistrelle of moderate size, which is related to *Pipistrelllus eisentrauti* HILL from Cameroun, but differs sufficiently to warrant subspecific recognition. I propose to name the new form in honour of Louis BELLIER, who made such ar great contributoin to the knowledge of Ivory Coast Mammals.

De Vree, F. (1973b). New data on *Scotophilus gigas* Dobson, 1875 (Microchiroptera - Vespertilionidae).

The cranial and external measurements of twenty-one specimens of *Scotophilus gigas*, including the holotype and most of the hitherto reported specimens, were analysed to establish the range of size variation as well as the sexual variation. The taxonomy of the species is discussed and it is proposed that the specimens from Zaire, Malawi, Rhodesia and Mozambique may be provisionally differentiated as a subspecies, *S. gigas alvenslebeni* Dalquest.

Schadel- und äußere Maße von 21 Exemplaren von *Scotophilus gigas* wurden analysiert, um das Ausmaß der Großenvariaten und der Geschlechtsunterschiede festzustellen; zu dem untersuchten Material gehoren der Holotypus und die meisten bisher beschriebenen Exemplare. Die Taxonomie der Exemplare wird diskutiert, und es wird vorgeschlagen, die Exemplare von Zaire, Malawi, Rhodesien und Mozambique provisorisch als Unterart zu differenzieren: *S. gigas alvenslebeni* Dalquest.

Les mensurations crâniennes et corporelles de vingt et un spécimens de *Scotophilus gigas*, y compris le type et la plupart des spécimens antérieurement signalés, ont été analysées à fin de pouvoir déterminer la variation et le dimorphisme sexuel. La taxonomie de cette espèce est discutée et en conclusion il est proposé de considérer provisoirement les spécimens provenant de Zaire, Malawi, Rhodésie et Mozambique comme une race orientale *S. g. alvenslebeni* Dalquest.

De Vree, F., J. Hulselmans and W. N. Verheyen (1970). Contribution à l'étude des Chiroptères de la République du Togo. 2. Liste préliminaire des Chiroptères récoltés par la deuxième mission zoologique belge au Togo.

La presente note donne l'inventaire des Chauves-souris récoltées par la Deuxième Mission zoologique belge au Togo. Elle fait suite a une première contribution, qui inventorait les Chiroptères rapportés par la Première Mission belge au Togo (fin juin a debut septembre 1968) et ceux réunis par M. CARLO VERONESE en région d'Atakpame (septembre 1968 à mars 1969) (voir DE VREE, DE ROO et VERHEYEN *in Rev. Zool. Bot. Afr.*, LXXX, 1 - 2, 1969).

La présente collection a été réunie pendant les mois de juillet, août et septembre 1969. Les spécimens ont été fixes au formol et sont conservés en alcool au Musée Royal de l'Afrique Centrale à Tervuren.

Cette collection comprend 675 spécimens appartenant à 29 espèces. Parmi celles-ci figurent 4 espèces non encore signalées dans la première liste (1969): *Taphozous mauritianus, Nycteris grandis, Hipposideros caffer tephrus* et *Eptesicus capensis*.

Il nous est agréable de remercier toutes les personnes qui ont contribué a la réussite de l'expédition. La bienveillante collaboration de toutes les autorités toigolaises a rendu notre séjour au Togo des plus agréables. Qu'elles veuillent trouver ici l'expression de toute notre gratitude.

---

de Winton, W. E. (1899b). XXXVIII. On mammals collected by Lieut.-Colonel W. Giffard in the Northern Territory of the Gold Coast.

The mammals contained in the following list were obtained by Lt.-Col. (then Capt.) W. Giffard, while serving in an expedition with Lt.-Col. H. P. Northcott lately operating in the northern territory of the Gold Coast. Several of the smaller species are new to science, while all add to our knowledge of the genera to which they belong. The specimens are in excellent condition and carefully labelled, showing the care and trouble that was taken in making the collection. Considering the nature of the operations, which kept the column constantly on the move, the number of specimens brought home is very creditable.

Colonel Giffard has presented the whole of his collection of small mammals to the British Museum, and Col. Northcott has also added some of his larger trophies and a number of birds to the National Collection.

---

de Winton, W. E. (1900). 3. On the mammals obtained in Southern Abyssinia by Lord Lovat during an expedition from Berbera to the Blue Nile.

Lord Lovat's party consisted of five Europeans, including Mr. H. Weld Blundell, and Mr. Harwood as Naturalist. Starting from Berbera about the middle of December 1898, and travelling via Machanis Hill and Fijambiro, they reached Harrar towards the end of the month, and continuing almost west via Shola, Laga Hardim, and Jifia. Densa, they arrived at Addis Abeba towards the end of January 1899.

During February an expedition was made to the northward via Wogodi and Kooaa to Borameda, only some. 20 miles south of Magdala; then turning a little to the eastward, they returned by way of the Djimma Valley via Kombolsha, Ticka Chika, and Angolala.

Finally leaving Addis Abeba at the end of February, the expedition travelled due west via Managasha, Sellen, Goodur, Chellika, Bilo, and Lekemti to about 35° E., then turning to the north via Mendi, they crossed the Dabus River at about 10° N., and so on through the Beni Schongul, crossing the Blue Nile at Fainaka, and following the eastern or right bank of the river past Roseires, they reached Karkjof towards the end of May 1899, whence a passage was obtained in a boat to Khartoum.

The valuable collection of Birds brought home by the expedition will be found fully described by Mr. W. R. Ogilvie Grant in the 'Ibis' for January 1900, where- a map of ,the route is also given. The collection

of Birds has been presented to the British Museum, together with all the small mammals and some of the most interesting of the Antelopes.

---

de Winton, W. E. (1901a). V. Notes on Bats of the genus *Nyctinomus* found in Africa.

The working out of the species of *Nyctinomus* in connexion with Dr. Anderson's ' Fauna of Egypt' has necessitated looking through the whole of the specimens of this genus contained in the collection of the British Museum. In several instances the determination arrived at by Dobson in his 'Catalogue of the Chiroptera' has been found to require amendment, and the examination of the skulls has brought out additional facts of importance. This communication is confined only to those species, found principally on the continent of Africa and the island of Madagascar, which have the ears joined or rising close together from the centre line of the face, and does not deal with that section of the genus with smaller and more widely-separated ears which form the subgenus *Mormopterus*.

---

de Winton, W. E., H. O. Forbes and W. R. Ogilvie-Grant (1903). Mammalia.

The Mammalian Fauna of Sokotra had been very cursorily examined by former expeditions, and, with the exception of a Bat, all the Mammals hitherto recorded were such as had undoubtedly been introduced by man. It was therefore thought that some species truly indigenous might be discovered; for it seemed to many highly improbable that an island in such a position could have been so long separated from the mainland of both Africa and Asia as would be suggested by the absence of all Mammals.

The present Expedition has failed in adding to the list, so it may now be said, with a fair amount of certainty, that Sokotra has no indigenous Mammals, and that with the exception of one or two Bats, which may occasionally find their way from the mainland, all the Mammals living on the island have been introduced by man.

The first list of the Mammals of Sokotra of modern times was given by Heuglin in Petermann's *Mittheilungen*, 1861, p. 149, in a general description of the island and its products. Camels, goats, wild or feral asses, and civets are mentioned as those most worthy of record, while jackals and gazelles are said to be found in the middle of the island. The two latter may now be disregarded, as no explorer has been able to find either on the island.

The small Mammals were first noticed in a report on Dr. E. Riebeck's collection by Dr. O. Taschenberg in the *Zeitschrift für Naturwissenschaften*, Halle, 1883, Vol. Ivi. p. 160. In this list the Free-tailed Bat (*Rhinopoma microphyllum*) is recorded with a rat (*Mus albipes*), and a mouse (*Mus gentilis*).

The following notes on the Mammals obtained by the present Expedition suggest themselves to me; the full list, with field notes, I leave in the hands of the collectors.

The Rasse (*Viverricula malaccensis*) is of the form common to Java and Madagascar, distinguished under the subspecific name of *V. malaccensis rasse*, Horsf. (see J. L. Bonhote, *Ann. Mag. Nat. Hist.*, Ser. VII., Vol. i., 1898, p. 119). This animal is now found almost everywhere in the islands of the Indian Ocean and Malayan seas, being carried in ships and dhows for the sake of the civet which it yields:

The Rat (*Mus rattus*), of which a large series was obtained, varies in the shade of colour between the two forms found in India, *Mus flavescens* of Elliott and *M. rufescens* of Gray. This is no doubt the *Mus albipes* of Dr. O. Taschenberg's list.

The House Mouse may have found its way on to the island, but it is just possible that young specimens of the last mentioned species were taken by Dr. Taschenberg for *Mus gentilis*, the pale form of *Mus musculus* found on the borders of the Red Sea.

The African Ass (*Equus asinus*) was found in a perfectly wild state, and probably has lived thus for some thousands of years. Failing wild killed specimens of the true wild Ass from Africa, it is impossible to say whether the Sokotran animal has undergone any modification from the ancestral form.

The Mammalian Fauna of Sokotra, so far as known, comprises eleven species.

Didier, R. (1965). Etude systematique de l'os penien des mammiferes (suite). Chiropteres, megachiroteres: Fam. des Pteropodidae.

Description anatomique et figurations de l'os pénien de chiroptères de la famille des Pteropodidae.

Dieckmann, R. C. (1979). Note on the smaller mammals of the Hester Malan Nature Reserve, Springbok, Namaqualand.

A survey of the smaller mammals of the Hester Malan Nature Reserve resulted in a checklist as well as information on the habitat in which the mammals occurred. Of the 38 species listed, 31 were collected or seen in the Reserve and seven on the neighbouring farms and surrounding district.

'n Opname is gemaak van die kleiner soogdiere wat in die Hester Malan Natuurreservaat aangetref word en het gelei tot die saamstel van 'n spesielys. Inligting oor die habitat van die soogdiere is ook verkry. Van die 38 spesies in die lys genoteer, word 'n totaal van 31 in die Reservaat aangetref. Hierbenewens is 'n verdere sewe spesies op naburige plase en omliggende distrik waargeneem.

Dippenaar, N. J., J. Meester, I. L. Rautenbach and D. A. Wolhuter (1983). The status of southern African mammal taxonomy.

The most recent review of the state of mammal taxonomy in southern Africa, is that of Meester & Eloff (1973). They, in agreement with authors of earlier similar reviews, stressed the need for continued and more detailed taxonomic work. Since then some powerful taxonomic procedures (viz. multivariate morphometric analyses, and cytotaxonomy) have been incorporated into local taxonomic research efforts. In the light of such demandlng but more exact procedures, the current status of southern African mammal taxonomy is reexamined.

This discussion concludes that the tempo and standards of local taxonomic research not only fail to keep up with contemporary work on European and North American mammals, but are in fact falling progressively further behind. Possible reasons for this situation are discussed.

Dobson, G. E. (1875e). XLVII. Conspectus of the suborders, families and genera of Chiroptera arranged according to their natural affinities.

The system of classification described in this paper having been adopted by me in the MS. of my descriptive Catalogue of the Asiatic Chiroptera, I here anticipate its publication, with the view of expressing more fully my reasons for classifying the genera according to a plan differing in some important points from those previously used, and also for the purpose of pointing out some important structural characters, of great value in the systematic arrangement of the families and genera, hitherto either unnoticed or insufficiently recognized.

The Chiroptera fall naturally into two subdivisions which may be called suborders, hitherto known as *Chiroptera frugivora* and *Chiroptera insectivora*; but as those names have not been framed in accordance with the accepted rules of zoological nomenclature, and as, moreover, the second part of the name of the second suborder has been previously applied to an order of Mammals, I use here instead the terms *Megachiroptera* and *Microchiroptera* to express these divisions respectively.

These terms are relatively correct; for, although some species of the Carnivorous Bats very much exceed in size many species of the Frugivorous, nevertheless the Frugivorous Bats taken collectively are very much larger than the Carnivorous, contrasting with them in size almost to the same extent as, among other Mammals, the Ungulata contrast with the Carnivora.

Dobson, G. E. (1876a). 8. A monograph of the genus *Taphozous* Geoff.

In 1872 I published some notes on the Asiatic species of *Taphozous*, giving a short synopsis of the species, in which they were divided into two groups. Since that time I have examined the types and large collections of specimens of the species of this genus in the British Museum, in the Museum of the East-India Company; in the Leyden, Berlin, and Paris Museums, also the collection in the Liverpool Museum and that of Sir Walter Elliot (most kindly forwarded from Scotland for my examination), as well as some private collections. Adding to these the large collection in the Indian Museum, Calcutta, I have thus examined a great number of specimens of the species of this genus, including the types, and am enabled to remove some nominal species from the list, to describe in detail, and to exhibit, in tabular form, according to their natural affinities, all. the species of *Taphozous*.

Dobson, G. E. (1880b). Sur quelques espèces de chiroptères provenant d'une collection faite en Algérie par M. Fernand Lataste.

M. Lataste a bien voulu m'envoyer quelques exemplaires de Chiroptères en bon état, conservés en esprit de vin, qu'il a recueillis en Algérie.

Les espèces représentées sont au nombre de huit: *Otonycteris Hemprichi* Ptrs., *Vesperugo (Vesperus) serotinus*, sous-esp. *Isabellinus* Temm., *Vesperugo pipistrellus* Schreb., *Vesperugo Kühli* Natt., *Vespertilio murinus* Schreb., *Vespertilio Capaccinii* Bonap., *Miniopterus Schreibersi* Natt., *Rhinolophus euryale* Blas. Je vais les passer successivement en revue.

Dobson, G. E. (1880c). Report on accessions to our knowledge of the chiroptera during the past two years (1878 - 1880).

One of the chief results hoped for from the publication of my natural history of the order Chiroptera, as stated in the preface to that work, was that it would be 'a stimulus to collectors and students to pay more attention to this difficult and obscure group of animals than, has been the case hitherto.' How fully this hope has been realised has been abundantly shown, not only by the publication of numerous papers on the subject in various scientific journals, both home and foreign, contrasting remarkably in number and quality, and especially in the number of different writers, with those recorded in any previous period of like duration, but also by the activity which has been displayed by collectors, as evidenced by the contributions received at the different museums, and by the numerous letters received by the writer from almost all parts of the world from those whose interest in the Chiroptera has been at length awakened.

To enumerate, classify, and correct these contributions; to add some remarks, supply a few omissions, and correct one or two errors since discovered in the work referred to above, is the object of this paper.

I commence by re-defining the suborders into which I have divided the Chiroptera, adding some important characters previously omitted.

Dobson, M. (1998). Mammal distributions in the western Mediterranean: the role of human intervention.

The natural distribution of the 17 non-flying mammal species occurring wild in both the Maghreb (north-west Africa) and Iberia (south-west Europe) is considered. It is concluded that only four species - Red Fox *Vulpes vulpes*, Wild Boar *Sus scrofa*, Wild Cat *Felis silvestris* and Otter *Lutra lutra* - are native to both regions, while another three - Red Deer *Cervus elaphus*, Brown Bear *Ursus arctos* and Aurochs *Bos primigenius* - were native to North Africa until the mid-Holocene but have probably died out naturally. Algerian Hedgehog *Atelerix algirus*, Barbary Ape *Macaca sylvanus*, Genet *Genetta genetta* and Egyptian Mongoose *Herpestes ichneumon* are widely accepted as introductions to Europe from North Africa. The remaining six species, and Red Deer now found in Africa, were also probably introduced - Rabbit *Oryctolagus cuniculus*, Weasel *Mustela nivalis*, Wood Mouse *Apodemus sylvaticus* and Lesser White-toothed Shrew *Crocidura russula* from Europe to Africa; Algerian Mouse Mus spretus from Africa to Europe; Savi's Pygmy Shrew *Suncus etruscus* perhaps from the eastern Mediterranean to both Iberia and the Maghreb.

There are two Maghrebi species which, although not found in Europe, are more closely related to Palaearctic than to Afrotropical species: Garden Dormouse *Eliomys melanurus*, probably native to north-west Africa, although possible augmentation of the natural population cannot be ruled out, and Whitaker's Shrew *Crocidura whitakeri*, a North African endemic.

Removal of so many species of European provenance from the list of mammals native to northwest Africa should not be considered to weaken its position as part of the Palaearctic zoogeographical region. Bats and other, non-mammalian, taxa illustrate the clear faunal relationship between the Maghreb and south-west Europe, whilst emphasizing its distinction from subsaharan Africa.

Dollman, G. (1908). On a collection of bats from Yola, Northern Nigeria, collected by Mr. G.W. Webster.

The British Museum owes to the generosity of Mr. Gr. W. Webster a collection of bats from Northern Nigeria, and, being the first collection received from this region, it proves of very great interest. In addition to some extremely rare bats, it contains one new species, and there can be little doubt that when the Nigerian fauna is thoroughly worked out many other new forms will be discovered.

Dollman, G. (1909). XLV. On mammals collected by Mr. S.A. Neave, M.A. B. Sc (Oxon.) in Katanga, Congo Free State.

The collection is of interest both on account of the new geographical ranges established for many of the species and, in addition, for the discovery of a new form of Anomalurus allied to A. cinereus, Thos.

Dollman, G. (1910). XXV. On a collection of mammals made by Mr. S.A. Neave during his expedition in Northern Rhodesia.

The area in which Mr. Neave collected is situated between Lake Bangweolo and Lake Mweru, bounded on the west by the Luapula River, and on the east by the Mchinga Escarpment, extending as far north as the southern end of Lake Tanganyika and as far south as Mpika. No collection of mammals of any importance has ever been received from this district before, and therefore it is not surprising to find that some of the specimens represent new and hitherto undescribed forms. The mammalian fauna of this area would appear to be very similar to that of North Nyasaland, and .though a few of the species show a distinct relationship with the West African fauna, the majority of forms are East African. The mammals of the Kalungwisi and Chambezi Rivers appear very much the same as those that occur on the Nyika Plateau, mixed with a sprinkling of South Nyasa forms, such as the small Zomba dormouse, *Graphiurus johnstoni*, Thos., a specimen of which Mr. Neave obtained from the Chambezi River District. Some of the species would appear to indicate a relationship with the Tanganyika and Uganda faunæ. Thus we

find in the collection both the Marungu dormouse *Graphiunis microtis*, Noack, and the v' East African *Mus jacksoni*, de Wint.

Of the novelties, the Shrews are perhaps the most interesting. One of the forms, *Crocidura luna*, was obtained by Mr. Neave during his earlier expedition in Katanga. Since my paper on the Katanga mammals, the series of Central and East African *Crocidura* in the British Museum collection has been considerably increased, and it is now evident that these Katanga specimens ought to be considered as representing a distinct species. The series of *Lophuromys* from Mporokoso would appear to be new, being unlike any of the East or West African forms at present known. This species was also represented in the Katanga collection, and it is one of these Congo specimens that has been chosen as the type.

In addition to the descriptions of the new forms, a complete list of all the mammals obtained by Mr. Neave in Northern Rhodesia is here given, as so many of the species are of interest from a distributional point of view.

Dollman, G. (1911). Description of a new genus of molossine bats from West Africa.

Among a collection of West-African mammals recently presented to the British Museum by Dr. H. G. F. Spurrell is a bat representing a new genus of the family Molossidæ.

Dollman, G. (1914a). Notes on a collection of East African mammals presented to the British Museum by Mr. G.P. Cozens.

I have the pleasure of furnishing a report on the Mammals obtained by Mr. Willoughby P. Lowe during the recent East Africam Expedition organized by Mr. G. P. Cosens. The entire collection, some two hundred specimens in all, has been presented by Mr. Cosens to the British Museum.

In working out this collection I have found it necessary to describe six new forms, the most interesting of which, the new Gerbil (*Gerbillus cosensi*), I have named in honour of the generous donor. Another interesting novelty, *Taterillus lowei*, I have called after Mr. Willoughby Lowe, the collector.

The East African mammals were obtained in the Naivasha and Nyanza Provinces. The route taken was from Kijabe to Mt. Suswa, where the first collecting was done, then westwards across the Loita Plains and Lemek Valley to the Amala or Mara River. After ten days collecting along the Amala River the expedition turned south towards the Anglo-German Boundary and then eastwards, via Leganisho, to Lengototo, the Narossura and Southern Guaso Nyiro Rivers. Further collecting was done along the southern Guaso Nyiro, and the party then proceeded northwards as far as the Mau Escarpment, returning to the railway at Naivasha.

The Uganda Expedition started from Baringo in December, 1912, and travelled in a north-easterly direction across the Kerio and Wei Wei Rivers, and then along the Turkwel as far north as Ngamatak. Turning westwards the party reached the Kozibir Hills on January 22nd, 1913, and Mt. Maroto on January 28th. Proceeding in an easterly direction, via the Nakwai Hills and Lobor Mountains, Kamchuru was reached on February 9th, and here the greater part of the collecting was done. Other mammals were obtained on the journey from Kamchuru, via Pader and Falabek, to Nimule.

In the following list the East African and Uganda Collections are not treated of separately, as it seems more convenient, the two areas not being faunistically distinct, to consider the collections together.

Dorst, J. (1947). Les chauves-souris de la faune malgache.

II n'existe à notre connaissance aucun travail d'ensemble sur les Chauves-Souris de Madagascar; le bel ouvrage de GRANDIDIER et PETIT (Zoologie de Madagascar, 1932), laisse volontairement ce groupe

un peu en oubli. La révision et le classement de la collection de Chauves-Souris du Muséum, qui possède d'assez belles séries rapportées en particulier par MM. GRANDIDIER, HUMBLOT, DECARY et la Mission DELACOUR, m'ont permis de faire ce travail qui ne vise qu'à présenter ce que l'on connaît actuellement sur ce groupe de Mammifères malgaches.

Les affinités des Chauves-Souris de Madagascar sont plutôt à chercher en Afrique. On trouve des animaux absolument identiques à ceux que l'on trouve dans ce continent, tels que *Taphozous mauritanius, Hipposideros Commersoni, Eptesicus pusillus, Pipistrellus nanus, Chaerephon limbatus*. D'autres sont à peine différenciés: tels *Mormopterus albiventer* et *Nyctinomus fulminans* dont de proches parents habitent le continent voisin. Par contre nous signalerons la présence de *Pteropus*, les Rousettes de ce genre étant abondamment représentées en Indo-Océanie et par contre absentes d'Afrique. Une affinité du même ordre est indiquée par *Emballonura atrata* dont les proches parents habitent les régions malaises et papoues, .aucun n'ayant atteint l'Afrique. Madagascar montre aussi un caractère négatif très net vis-à-vis du continent: c'est l'absence de Chauves-Souris frugivores du groupe de *Epomophorus*, celles-ci étant caractéristiques de la région éthiopienne.

Nous trouvons dans la Grande Ile une espèce endémique, *Myzopoda aurita*; on en a fait le type d'une famille dont elle est l'unique représentant; ses affinités sont lointaines et incertaines, nous aurons l'occasion d'en reparler.

Signalons également l'absence de *Rhinolophus*, ce genre si bien représenté tant en Asie qu'en Afrique.

Nous donnerons une liste des espèces rencontrées jusqu'à ce jour dans l'île, indiquant les renseignements résumant ce que l'on connaît .sur chacune d'elles.

Dorst, J. (1960). A propos de quelques chiroptères du Sénégal, et description d'une forme nouvelle du genre *Pipistrellus*.

Au cours de sa dernière mission au Sénégal pendant l'automne de 1958, M. Francis Roux a bien voulu collecter à notre intention quelques chiroptères venus se faire prendre dans les filets tendus en vue de la capture des oiseaux. En dépit du petit nombre d'individus collectés, ces chauves-souris présentent cependant un grand intérêt en raison du peu de renseignements concernant les Chiroptères du Sénégal.

La petite série rapportée par M. Roux comprend 5 espèces. Si deux d'entre elles sont banales, les autres sont par contre nouvelles pour le Sénégal, et l'une d'entre elles pour l'Afrique occidentale toute entière. L'intérêt biogéographique de leur présence dans cette partie de l'Afrique est d'ailleurs variable suivant les espèces.

Tous les spécimens ont été capturés à Richard-Toll, Sénégal, au moyen de filets tendus aux alentours de mares.

Dorst, J. and R. de Naurois (1966). Présence de l'oreillard (*Plecotus*) dans l'archipel du Cap-Vert et considérations biogéographiques sur le peuplement de ces iles.

A Long-eared Bat is recorded from the Cape Verde Archipelago. On the basis of one specimen collected on I. do Maio; others are recorded from Santiago where bats were discovered in rocky cliffs but not collected. Description of the specimen which probably is to be considered as *Plecotus austriacus* subsp. Although accidental transport by man cannot be excluded, the occurence of this Bat on these islands seems in accordance with their affinities, a high proportion of the species being obviously from palearctic origin, as shown by the Birds and Reptiles.

Dorst, J. and J. Prévost (1972). Notes sur quelques chiroptères collectés en Ethiopie.

Liste commentée de 12 espèces de Chiroptères collectées dans diverses régions d'Ethiopie. *Rhinolophus hildebrandti* est signalé pour la première fois de ce pays. Les captures permettent de préciser et d'étendre la répartition de plusieurs autres espèces, parmi lesquelles *Myotis scotti*.

Annotated list of 12 specles of Chiroptera collected in varions habitats in Ethiopia. *Rhinolophus hildebrandti* is recorded for the flrst time from this country; wide extensions of range are reported for several other bats, including *Myotis scotti*.

Doutre, M. P. and H. Sarrat (1973). Sérotypes de salmonelles isolées chez les chiroptères frugivores et insectivores du Sénégal. Importance épidémiologique.

Une enquête portant sur 646 chiroptères porteurs sains, prélevés principalement dans les environs de Dakar (Sénégal), est effectuée.

Elle intéresse 264 individus appartenant à des espèces frugivores (*Eidolon, Roussettus, Epomophora*), 382 exemplaires d'espèces insectivores (*Tadarida, Nycteris, Hipposideros*) et 106 prélèvements de guano (*Tadarida*).

A partir des coprocultures, 83 souches de *Salmonella* sont isolées chez les chiroptères, ce qui correspond à un taux d'infestation moyen de 12,8 p. 100. Les ensemencements de guano fournissent 48 souches.

64 sérotypes différents sont mis en évidence au cours de cette étude (4 souches sont encore en cours d'examen).

3 sérotypes nouveaux sont découverts: *S. taset, S. bambylor, S. sangalkam*, et 11 sérotypes rapportés pour la première fois au Sénégal: *S. vom, S. goma, S. umhlali, S. angers, S. miami, S. bolombo, S. uzaramo, S. blukwa, S. doorn, S. windermere, S. gokul*.

Les chiroptères constituent donc un réservoir animal de *Salmonella* dont l'incidence su les risques de contamination humaine et animale est discutée.

A survey dealing with 646 healthy carrier bats, collected mostly in the surroundings of Dakar (Senegal), was carried out.

The specimens consisted of 264 frugivorous species (*Eidolon, Roussettus, Epomophora*), 384 insectivorous bats (*Tadarida, Nycteris, Hipposideros*) and 106 samples of guano (*Tadarida*).

From the intestinal contents, 83 strains of *Salmonella* were isolated in chiroptera (infestation rate: 12,8 per cent). The seedings of guano gave 48 strains.

64 different serotypes were demonstrated during the whole of the study (the examinaiion of 4 strains is still in process).

3 new serotypes were discovered: *S. taset, S. bambylor, S. sangalkam*.

11 serotypes were recorded for the first time in Senegal: *S. vom, S. goma, S. umhlali, S. angers, S. miami, S. bolombo, S. uzaramo, S. blukwa, S. doorn, S. windermere, S. gokul*.

From the study, it seems that chiroptera constitute an important animal "reservoir" of *Salmonella*. The incidence on human and animal contamination is discussed.

Dowsett, R. J., D. L. Harrison and L. Granjon (1991). Bats (Chiroptera) from the Mayombe and lower Kouilou (with a checklist for Congo).

Cet article décrit une collection de 80 spécimens de chiroptères (appartenant à 14 espèces) obtenus dans le Bas-Kouilou et le Mayombe (Congo). Deux espèces sont nouvelles pour la faune congolaise (*Rhinolophus alcyone, Hipposideros cyclops*) et une troisième (*Scotonycteris ophiodon*) est l'une des plus rares espèces africaines. En outre quatre espèces sont signalées pour la première fois aus Mayombe. Les particularlités du crâne sont décrites pour certaines Mégachiroptères (*Scotonycteris, Megaloglossus*). Les activités reproductrices observées sont mentionnées. Nous donnons également la distribution des espèces ailleurs au Congo et la liste complète des espèces pour le pays (soid 34 au total).

A collection of 80 specimens of bats (of 14 species) is described from the lower Kouilou and Mayombe (Congo). Two species are new to the Congo fauna (*Rhinolophus alcyone, Hipposideros Cyclops*) and a third (*Scotonycteris ophiodon*) is one of the rarest African bats. Four other species have apparently not previously been reported from the Mayombe. Interesting skull characters are descrbed in some Megachiroptera (*Scotonycteris, Megaloglossus*). Breeding data are presented and species' distributions discussed. Reference is made to the other species of bats reported elsewhere in Congo, and achecklist presented of the 34 species known to date.

Dubois, G. (1955). Les Trematodes de chiroptères de la collection Villy Aellen. Etude suivie d'une revision du sous-genre *Prostodendrium* Dollfus 1937 (*Lecithodendriinae* Lühe).

Les Lecitkodendriinae Lühe font l'objet d'une étude spéciale. *Lecithodendrium linstowi* Dollfus 1931, *Prosthodendrium ascidia* (Van Beneden 1873) et *P. chilostomum* (Mehlis 1831) sont redécrits d'après des matériaux de la collection AELLEN.

Le sous-genre *Prosthodendrium* Dollfus 1937, revisé, groupe dix-neuf espèces (voir clé de détermination, p. 498). Le type est *P. dinanatum* (Bhalerao 1926) par désignation originale.

Sur la base d'un examen du matériel original le statut d'espèce est conféré à "*Lecithodendrium cordiforme parvouterus*" Bhalerao 1926, avec la dénomination de *Prosthodendrium parcouterus* (Bhalerao) comb. nov. "*Lecithodendrium cordiforme* Môdlinger 1930, nec Braun, *Prosthodendrium pushpai* Bhalerao 1936, *Prosthodendrium cordiforme* Bhalerao 1936, nec Braun, *Prosthodendrium pyramidum* subsp. *orientale* Yamaguti et Asada 1942, nec Lopss, et *Prosthodendrium pyramidum* forma *maroccana* Dollfus 1954, nec -Loess, sont considérés comme synonymes. L'espèce *parvouterus* a une distribution géographique étendue: Birmanie, Mandchourie, Europe, Maroc.

P. bhaleraoi (Pande 1935) tombe en synonymie avec *P. longiforme* (Bhalerao 1926) dont là var. *allahabadi* Pande 1935 est supprimée.

P. loossi (Pande 1935) devient une variété de *P. urna* (Looss 1907), dénommée *P. urna loossi* (Pande), et *P. luzonicum* (Tubangui 1928) une variété de *P. orospinosum* (Bhalerao 1926), désignée sous le nom de *P. orospinosum luzonicum* (Tubangui).

P. piriforme Yamaguti 1939 est considéré comme synonyme de *P. chilostomum* (Mehlis 1831), avec lequel "*Lecithodendrium cordiforme laxmii*" Bhalerao 1926 est également identifié.

P. Scabrum [= *Limatulum scabrum* Caballero 1940] Caballero 1943 et *P. paeminosum* Caballero 1943 sont indifîérenciables de *P. naviculum* Macy 1936, lui-même n'étant qu'une variété géographique de *P. ascidia* (Van Beneden 1873), dénommée *P. ascidia navicula* Macy.

P. mizellei Seamster et Stevens 1948 est rejeté comme synonyme de *P. macnabi* Macy 1936.

Les *species inquirendae* sont: *P. posticum* (Stafford 1905) et *P. lilliputianum* (Travassos 1928).

Le sectionnement du sous-genre ou la création de genres pour certaines de ses espèces ne sont pas approuvés.

Đulic, B. and F. A. Mutere (1973a). Comparative study of the chromosomes of some Mollosid bats from eastern Africa.

By the analysis of bone marrow cells, the chromosomes of three East African Molossid bats e. g. *Otomops martiensseni, Tadarida condylura* and *T. pumila* were studied. It was found that the diploid chromosome number for all three species was 48. The autosomal fundamental number for the first two species was 56 and for *T. pumila* 58. The presence of an autosomal pair with secondary constriction in *O. martiensseni* suggests its closer relationship with *Eumops perotis* from Mexico. The pair XY differs mostly in *T. pumila*, whereas its morphology is similar in the other two species. It is evident that the African representatives of the family Molossidae are chromosomally quite similar to their American counterparts in diploid number and fundamental number. The presence of "marker-pair" in the family Molossidae was discussed too.

Đulic, B. and F. A. Mutere (1973b). Les chromosomes de trois espèces des Megachiroptères (Mammalia, Chiroptera) d'Afrique orientale.

Dans le présent travail on décrit les caryotypes de *Rousetlus aegyptiacus leachi, Epomophorus wahlhergi wablbergi* et *Epomophorus anurus* et on trouve que leur nombre diploïde est de 2n = 36, et que leur nombre fondamental varie très peu. L'hétérochromosome X de *R. aegyptiacus* et de *E. wablbergi* est un élément submétacentrique de la taille moyenne, tandis que l'Y est un petit chromosome punctiforme chez la première, et un petit acrocentrique chez la seconde espèce. Dans le caryogramme femelle de *E. anurus* on a pas pu identifier les chromosomes sexuels. Le trait commun du caryotype de toutes les trois espèces de Megachiroptères est la présence d'une paire d'autosomes avec la constriction centrale. On compare la morphologie des chromosomes des espèces africaines avec les mêmes données sur les réprésentants de l'Inde.

The chromosomes complement of *Rousettus aegyptiacus leachi, Epomophorus wahlbergi wahlbergi* and *Epomophorus anurus* was determined and a diploid number of 36 has been found. There is a very little variability in fundamental number (66 in *R. aegyptiacus* and 68 in *E. wahlbergi wahlbergi*, the arms of sex chromosomes have not been counted, and in female karyotype of *E. anurus* including sex chromosomes FN is 72). The X sex chromosome is a medium sized submetacentric element in *R. aegyptiacus* and in *E. wablbergi wahlbergi*, and the Y sex chromosome is a small punctiform chromosome in the first mentioned and a small acrocentric in the second one. In all three species one pair of medium autosomes is provided with a rather long centric constriction of different appearance in each species. A comparison of chromosome morphology among the African and the Indian species of fruit bats is given.

Đulic, B. and F. A. Mutere (1977). Chromosomes of some East African bats.

The description of karyotypes in 21 species of African bats predominantly from Kenya, Uganda and Rhodesia, was given by DULIC & MUTERE (1973a, 1973 b, 1974), WARNER, PATTON, GARDNER & BAKER (1974) and PETERSON & NAGORSEN (1975). During the excursions in the caves south of Mombasa in September 1975 some species were collected, the chromosomes of which were either not known or were described from populations caught in far off localities.

Đulic, B. and B. Soldatovic (1969). Les chromosomes de *Rhinolophus mehelyi* Mastchie, 1900 (Mammalia, Chiroptera).

The chromosome complement of somatic cells of *Rhinolophus mehelyi* has been determined. The karyotype is characterized by a diploid number of 58. Of 28 pairs of autooomes 4 are metacentric, two

of them are small-sized, and 24 are acrocentric. One pair of middle-sized acrocentric autosomes is provided with satellites, and among small elements only one pair is punctiform. The X chromosome is a large submetacentric one: its average centromere index is 2,89. The Y chromosome is small and oblong. A comparison has been made between the karyogram of *Rhinolophus mehelyi* and those of *Rh. ferrumequinum, Rh. euryale, Rh. blasii* and *Rh. hipposideros*. The results speak in favour of the opinion of CAPANNA and CIVITELLI (1964), and CAPANNA, CIVITELLI and CONTI (1967) on the significance of the morphologically identical chromosomes: their role in the phylogeny of Rhinolophid bats was discussed.

Dans le présent travail on décrit le caryotype de *Rhinolophus mehelyi*, et on trouve que le nombre diploide est de 2n=58. Le caryogramme comprend 28 autosomes dont 4 paires de métacentriques et 24 paires d'acrocentriques. Une paire d'acrocentriques est avec le satellite. L'heterochromosome X est un élément submétacentrique avec l'index centromérique 2,89, l'Y est un petit chromosome de forme ovale. En comparant le caryotype de *Rhinolophus mehelyi* avec ceux de *Rh. ferrumequinum, Rh. euryale, Rh. blasii* et *Rh. hipposideros* on supporte l'opinion de CAPANNA et CIVITELLI (1964), et CAPANNA, CIVITELLI et CONTI (1967) sur l'importance des chromosomes morphologiquement identiques et on discute le rôle de tels chromosomes dans la phylogénie des Rhinolophes.

Duncan, F. M. (1937). On the dates of publication of the Society's 'Proceedings,' 1859-1926. With an appendix containing the dates of publication of 'Proceedings,' 1830-1858, ..., and of the 'Transactions,' 1833-1869, ..., originally published in P.Z.S. 193, 1913.

As requests for information concerning the dates of publication of early parts of the Society's ' Proceedings ' are occasionally received, it appeared desirable to place on record what information still exists relating to the volumes printed in the years following those given in the list of dates - 1830 to 1858 - already published in the Society's ' Proceedings ' for 1893, p. 436.

Why Dr. P. L. Sclater, who communicated that list, and Mr. F. H. Waterhouse, who had compiled it with the help of the Society's printers, did not apparently consider it worth while to carry the record down to 1893, I have never been able to understand. That they did not do so has proved most unfortunate, as Day-books and Receipt-books which were available at that time, belonging to the Society and to Messrs. Taylor and Francis, no longer exist.

For some years past I have, as opportunity presented itself, gathered together from various sources notes which appeared likely to throw some light on doubtful dates, and as but little further definite information is likely in the future to come to hand, it would seem best to place on record now what has been accomplished.

My chief sources of information have been our own ledgers and Day-books, and those of the Society's printers, Messrs. Taylor and Francis, to whom I would express my most grateful thanks for their unfailing courtesy and invaluable help in making repeated searches through their archives, and in checking, so far as was possible, uncertain dates. To my Assistant, Mr. G. B. Stratton, I must also extend my thanks for much help in the collation of volumes and parts.

From an examination of the available account-books it appears that up to, and including the year 1860, payments were made always for sheets, and presumably the 'Proceedings' were available in that form as well as in the three paper-bound annual parts. Beginning with the year 1861, payments were made only for each completed part, and the issue of separate sheets seems to have ceased.

Dunning, D. C. and M. Krüger (1995). Aposematic sounds in African moths.

In response to tactile stimulation and to ultrasonic pulses such as those of attacking bats, many moths of the family Arctiidae produce ultrasonic clicks. To test the hypothesis that these clicks are aposematic sounds, warning bats of unpalatable prey, African moths of these two families were captured at lights, assayed for clicking responses to tactile and ultrasonic stimulation and placed, together with moths of similar body sizes and other families captured at the same time, in a small cage with sympatric *Tadarida*

pumila bats. Arctiid fragments were sought among the insect remains (mostly moth wings) dropped by free-foraging *Hipposideros caffer* bats. There were no arctiid wings among them, and the captive bats ate a significantly larger proportion of control moths than arctiids. There were no significant differences by species or sex in the arctiids' clicking responses to either stimulus or in their palatability to bats. Since the arctiids did dick in response to bat-like stimuli and were clearly less palatable to the bats than the control moths, we conclude that the sounds of these moths can act as aposematic sounds.

Dunning, D. C. and M. Krüger (1996). Predation upon moths by free-foraging *Hipposideros caffer*.

Predation upon insects by the bat *Hipposideros caffer* was studied at Skukuza in the Kruger National Park of South Africa. These bats, whose echolocation calls are inaudible to moths, fed overwhelmingly upon tympanate Lepidoptera, although insects of other orders frequently dominated the local light-responsive, flying, nocturnal insect community. The relative numbers of noctuid, pyralid, and arctiid moths taken by the bats were proportional to the representation of these families in the general population of moths, but they took disproportionately fewer moths of the family Geometridae. The bats also ate significantly fewer arctiid moths of those species capable of clicking than of those species that could not. Because the arctiids could not hear approaching *H. caffer*, these moths did not click before contact with an attacking bat, and their clicks could not protect them by interfering with echolocation by the predators. These results are consistent with the startle and acoustic-aposematism hypotheses for the bat-protective function of arctiid clicks.

Dupuy, A. P. (1973). Premier inventaire des mammifères du Parc Nationale de Basse-Cassamance (Sénégal).

Avec, la création récente du Parc national de basse Casamance (décret n° 70 319 du 10 avril 1970), l'étude des groupes zoologiques connait un renouveau dans cette région. Cela ira sans .aucun doute en s'amplifiant dans les années à venir, mais auparavant, les spécialistes de l'ÏFAN s'étaient intéressés dès 1946 à la faune de basse Casamance. P.-L. DEKEYSER et A. VILLIERS firent à cette époque une mission vers Bignona (voir bibliographie). Leurs recherches permirent de mettre en évidence le caractère guinéen accentué de cette partie du Sénégal. Puis, en 1961, A. VILLIERS, R. ROY et M. CONDAMIN firent, plutôt des prospections entomologiques. La forêt de Santiaba Mandjak (comprise actuellement dans le Parc) apparut particulièrement intéressante lors de cette mission, ce qui amena M. CONDAMIN à y faire l'année suivante des prospections plus poussées, G. MOREL de l'ORSTOM effectua une mission ornithologique au printemps 1969 ; enfin J. M. THIOLLAY, ornithologue du C.N.R.S., 0. FOURNIER, B. HUBERT et F. ADAM, de l'ORSTOM, entreprirent plus récemment des recherches sur les Vertébrés sous la direction de; F. PETTER, du Muséum national d'Histoire naturelle de Paris.

Nous-même, depuis quatre ans. dans le cadre d'inspections dans la région en vue de connaître les limites du nouveau l'arc, travaillons aux inventaires ornitho-mammalogiques du Parc national de basse Casamance et de sa région. Depuis février 1970, une brigade de surveillance a été installée en permanence sur place dans le Parc, ce qui a permis de faire de nombreuses et intéressantes observations sur la faune. C'est l'ensemble des résultats ainsi obtenus pour les Mammifères qui fait l'objet de la présente note.

Durette-Desset, M.-C. and A.-G. Chabaud (1975). Nématodes Trichostrongyloidea: Parasites de Microchiroptères.

1. a) Liste des Nématodes, parasites de Chiroptères européens récoltés par le Pr Aellen: compléments à l'étude morphologique de *Molinostrongylus alatus, M. panousei, M. skrjabini*; description de *M. aelleni* n. sp.

b) Description de *M. richardae* n. sp., *M. benexae* n. sp. et *M. bauchoti* n. sp. parasites de Molossidae malgaches.

c) Description de *M. colleyi* n. sp. et *M. owyangi* n. sp., parasites de Vespertilioninae malais, et d'*Allintoschius dunni* n. sp., trouvé chez *Myotis mystacinus* en Malaisie et *Pipistrellus nanus* en Afrique.

2. D'après le synlophe, les 17 espèces du genre *Molinostrongylus* semblent se répartir en cinq groupes d'espèces, chacun d'eux étant assez caractéristique d'un genre déterminé de Chiroptères.

3. La composition de la nématofaune (Trichostrongyloidea) des Chiroptères est analysée, ainsi que ses rapports avec les Trichostrongyloidea d'autres Mammifères (Tupaiidae, Pholidotes, Primates, Sciuridés). Six groupes sont individualisés, constituant deux ensembles bien distincts: genre *Strongylacantha*, d'une part; 12 genres plus ou moins directement issus des Molineinae, d'autre part.

4. Les trois pointes de l'extrémité caudale des femelles, qui définissent actuellement les Anoplostrongylinae par rapport aux Molineinae, se révèlent un caractère insuffisant. Les deux sous-familles forment un ensemble complexe, qui ne pourra être interprété qu'en tenant compte également de l'évolution du synlophe et de celle des bourses caudales des mâles.

Trichostrongyloidea Nematodes parasites from Microchiroptera.

1. a) List of Nematodes collected by Professor Aellen in european Microchiroptera. Additionnai morphological data to the study of *Molinostrongylus alatus, M. panousei, M. skrjabini*. Description of *M. aelleni* n. sp.

b) Description of *M. richardae* n. sp., *M. henexae* n. sp. et *M. bauchoti* n. sp., parasites of malagasian Molossidae.

c) Description of *M. colleyi* n. sp. and *M. owyangi* n. sp., parasites of Malaysian Vespertilioninae, and of *Allintoschius dunni* n. sp. discovered in *Myotis mystacinus* from Malaysia and *Pipistrellus nanus* from Africa.

2. Taking into account the characteristics of the synlophe, the 17 species of the genus *Molinostrongylus* may be divided into five groups, each one being reasonably well characteristic of the genus of their Chiropteran host.

3. The composition of the Trichostrongyloidea fauna of Chiroptera and its relationship with Trichostrongyloidea from other Mammals (Tupaiidae, Pholidotes, Primates, Sciuridés) are analysed. Six groups are separated and divided into two well defined lines: 1) genus *Strongylacantha*, and 2) 12 genera stemming more or less directly from the Molineinae.

4. The three conical outgrowths at the tip of the female tail which differenciate presently the Anoplostrogylinae from the Molineinae appear to be an unreliable characteristic. The two subfamilies form a complex group which will be better understood if the evolution of the synlophe and that of the caudal bursa of the males are taken into account.

Dusbábek, F. and W. Bergmans (1980). Spinturnicid mites from some Nigerian bats (Acarina, Spinturnicidae).

Five species of mites "belonging to three genera of the family Spinturnicidae are reported from six species of bats in Nigeria. The species are *Menstaspis kenyaensis* (Radford), *Ancystvopus aethiopicus* Hirst, *Spintumix walkerae* Zumpt & Till, *S. scotophili repens* ssp.n., and *S. intectus* sp.n. Male and female specimens of the two new taxa are fully described and figured. Zoogeographical and taxonomical implications of the results of this study are discussed.

Eger, J. L. and R. L. Peterson (1979). Distribution and systematic relationship of *Tadarida bivittata* and *Tadarida ansorgei* (Chiroptera: Molossidae).

Morphologically similar *Tadarida bivittata* and *T. ansorgei* inhabit dry, woodland savannah areas of central Africa, where they are partially sympatric. Specimens of these species were divided into population samples based on geographic proximity. Multivariate analysis of variance indicated that both species are sexually dimorphic. Results of principle components analysis illustrated interspecific differences. In areas of sympatry, specimens were subjected to discriminant analysis to confirm their identity. Based on this analysis, classification functions are provided as a useful aid for identifying the two species.

Les espèces morphologiquement semblables *Tadarida bivittata* et *T. ansorgei* habitent les régions sèches des savanes boisées du centre de l'Afrique ou elles sont partiellement sympatriques. Des spécimens de ces espèces ont été divisés en échantillons de population, selon leur proximité géographique. L'analyse multidimensionnelle de la variance indique que les deux espèces font preuve de dimorphisme sexuel. Les résultats de l'analyse des composantes principales illustrent les différences interspécifiques. Dans les régions ou les deux espèces sont sympatriques, les spécimens ont été soumis à une analyse discriminatoire permettant d'en confirmer l'identite. Cette analyse a permis d'établir des fonctions de classification qui facilitent la séparation des deux espèces.

Eisenberg, J. F. and D. E. Wilson (1978). Relative brain size and feeding strategies in the Chiroptera.

Brain weights were estimated from the cranial volumes of 225 species of Chiroptera. The log of the average cranial volume was regressed against the log of the average body weight and the results analyzed for correlations with phylogenetic affinity and foraging strategy. It is concluded that the family Phyllostomatidae shows a strong convergence of brain to body weight ratios toward the patterns shown by the Pteropidae. Foraging strategies involving the location of rich food resources which are isolated in small pockets seem to require a large brain weight relative to body mass. If we assume the ancestral chiropteran had a brain structured more like a terrestrial insectivore, then the highly specialized aerial insectivores with the lowest relative brain to body weight ratios of the extant chiroptera reflect an evolutionary tendency to maintain the brain mass at a minimum weight.

Eisentraut, M. (1942). Beitrag zur Oekologie Kameruner Chiropteren.

Während eines 6 wöchigen Aufenthaltes in Kamerun wurden 10 Chiropterenarten beobachtet, davon zwei Vertreter der Flughunde und 8 Vertreter der Kleinfledermäuse. Es werden u. a. das Vorkommen, die Tagesquartiere, ernährungs- und fortpflanzungsbiologische Eigentümlichkeiten behandelt, insbesondere Unterschiede zwischen Frucht- und Insektenfressern und die Fortpflanzungszeiten. Ferner wird auf die Variation der Fellfärbung bei einigen Arten eingegangen.

Eisentraut, M. (1945). Biologie der Flederhunde (Megachiroptera). Nach einem hinterlassenen Manuskript von Dr. Heinrich Jansen.

Im Anschluß an meine biologisch-ökologischen Arbeiten über heimische Fledermäuse entstand der Plan, diese Studien auch auf fremdländische Vertreter auszudehnen. Unter anderem war beabsichtigt, die Ernährungsbiologie der gesamten Chiropteren zu bearbeiten. Eine im Jahre 1938 unternommene Reise nach Kamerun sollte mit dazu dienen, tropische Vertreter, insbesondere auch Megachiropteren, an Ort und Stelle kennenzulernen und sowohl Beobachtungs- wie auch anatomisches Material zusammenzubringen. Mit den nahezu abgeschlossenen Literaturstudien wurde die geplante Arbeit dann bei Ausbruch des zweiten Weltkrieges zwangsläufig unterbrochen.

Unterdessen übersandte mir nun Herr Prof. Dr. H. WEBER aus dem Nachlaß des am 23.9.1933 verstorbenen Zoologen Dr. HEINRICH JANSEN ein umfangreiches, noch nicht veröffentlichtes Manuskript über die "Biologie der Flederhunde" zur Durchsicht. Bei einer eingehenden Prüfung erschien die Arbeit in der vorliegenden Form recht wenig zum Druck geeignet. Die bisweilen allzu ausführliche Wiedergabe von nebensächlichen oder gar falsch gedeuteten, in der Literatur niedergelegten Beobachtungen beeinträchtigte erheblich die geschlossene Darstellung und ließ die tatsächlichen Gegebenheiten nicht klar hervortreten. Auch die Einteilung des Stoffes erschien nicht immer glücklich. Im Hinblick auf meine eigenen Pläne entschloß ich mich daher gern, die mir von Herrn Prof. Dr. WEBER in liebenswürdiger Weise angebotene Umarbeitung des JANSENschen Manuskriptes zu übernehmen. Es mußte dabei außer zahlreichen textlichen Veränderungen an vielen Stellen eine erhebliche Kürzung vorgenommen werden. Einige Kapitel erforderten eine weitgehende Neubearbeitung. Bisweilen waren auch ergänzende morphologisch-anatomische Untersuchungen notwendig, für die mir von Herrn Prof. Dr. POHLE in dankenswerter Weise das entsprechende Material aus der Säugetierabteilung des Zoologischen Museums Berlin zur Verfügung gestellt wurde. Wohl annähernd vollständig waren in dem Manuskript die bis zum Jahre 1932 vorliegenden Arbeiten berücksichtigt. Dies war um so erfreulicher, als durch die kriegsbedingten Umstände die Beschaffung der Literatur sehr erschwert war, so daß meist auch keine Nachkontrolle der, von JANSEN angeführten Stellen vorgenommen werden konnte. Nach Möglichkeit aber wurde versucht, die nach 1932 erschienenen Arbeiten, soweit diese mir nicht schon durch die früheren Literaturstudien bekannt waren, einzusehen. Die Absicht, dem Text geeignete Abbildungen beizugeben, konnte infolge der erwähnten Schwierigkeiten nur in begrenztem Umfange zur Ausführung kommen.

Zu besonderem Dank verpflichtet bin ich den Herren Professor Dr. EIDMANN und Prof. Dr. KENSCH für Überlassung von Photos aus eigenem Besitz, ferner Herrn Prof. Dr. POHLE für Photos aus der Bildersammlung der Säugetierabteilung des Zoologischen Museums Berlin. Herrn Prof. Dr. O. v. WETTSTEIN danke ich herzlich für seine Bemühungen um Beschaffung einiger Abbildungen aus der Literatur und Nachkontrolle einer mir nicht zugänglichen Literaturstelle.

In vielen Punkten ist unsere Kenntnis von der Biologie der Flederhunde noch sehr lückenhaft, besonders hinsichtlich der feineren Unterschiede bei den einzelnen Arten. Dies ist mir bei Abschluß der Durcharbeitung immer mehr zum Bewußtsein gekommen. Die vorliegende Zusammenstellung kann daher keine abschließende Biologie sein. Weitere intensive Forschung und mühevolle Kleinarfbeit sind notwendig, um immer tiefer in die Lebensäußerungen dieser durch ihre vornehmlich nächtliche Lebensweise der Beobachtung oft nur schwer zugänglichen Tiere einzudringen

---

Eisentraut, M. (1956a). Der Langzungen-Flughund, *Megaloglossus woermanni*, ein Blütenbesucher.

Auf Grund von Pollenfunden im Magen muß der einzige in Afrika heimische Vertreter der Langzungen-Flughunde, *Megaloglossus woermanni*, als Blütenbesucher angesehen werden. Es werden kurz die morphologisch-anatomischen Merkmale, die eine Anpassung an den Blütenbesuch erkennen lassen, beschrieben.

Eisentraut, M. (1956b). Beitrag zur Chiropteren-Fauna von Kamerun (Westafrika).

Während zweier Reisen in das britische Mandatsgebiet von Kamerun, 1938 und 1954, wurden 273 Chiropteren gesammelt, die sich auf 4 Megachiropterenarten (dazu eine nur beobachtete Art) und 14 Microchiropterenarten verteilen. Die systematische Bearbeitung ergab die Aufstellung einer neuen Spezies, *Hipposideros camerunensis*, die mit *Hipposideros cyclops* nahe verwandt ist und sich in erster Linie durch bedeutende Körpergröße auszeichnet. Die bisher als Unterart zu *Rhinolophus alcyone* gestellte Form *alticolus* muß als selbständige Spezies angesehen werden. *Pipistrellus culex, Eptesicus tenuipinnis* und *Rhinolophus landeri* wurden erstmalig für Kamerun nachgewiesen. Für die einzelnen Arten werden morphologische Besonderheiten hervorgehoben und ökologische Daten angegeben.

Ferner wird ein Überblick über das Vorkommen der Fiedertiere in dem engeren Gebiet und ihre Verbreitung in den Höhenstufen des Kamerungebirges gegeben. In diesem Zusammenhang werden auch die Tagesquartiere und das nächtliche Treiben der Fledermäuse behandelt. Die gesammelten Beobachtungen über die Fortpflanzungstätigkeit sprechen für begrenzte Fortpflanzungszeit. Die bei Megachiropteren festgestellten Zahnanomalien (Auftreten überzähliger Zähne) dürften im Zusammenhang mit den bei ihnen auftretenden Funktionsverminderungen infolge Anpassung an Frucht- und Blütennahrung stehen.

Eisentraut, M. (1958). Beitrag zur Chiropterenfauna Ostafrikas. (Ergebnisse der Deutschen Zoologischen Ostafrika-Expedition 1951/52. Gruppe Lindner, Stuttgart, Nr 28, und Gruppe Knipper, Bremen).

Die von den beiden getrennt operierenden Gruppen der Deutschen Zoologischen Ostafrika-Expedition 1951/52 im Tanganyika-Gebiet gesammelten Chiropteren verteilen sich auf 13 Arten, und zwar 10 Fledermäuse und 3 Flughunde; dazu kommen 2 jugendliche Exemplare von Epomorphoriden, deren genaue Artzugehörigkeit aus Mangel an geeignetem Vergleichsmaterial zunächst offenbleiben muß. Die meisten Arten sind zwar für das Gebiet bekannt (vgl. G. H. SWYNNERTON & R. W. HAYMAN: A Check List of the Land Mammals of the Tanganyika Territory and the Zanzibar Protectorate. J. East Africa nat. Hist. Soc., 1950, Vol. XX), doch wird unsere Kenntnis von ihrer Verbreitung durch die neuen Fundorte ergänzt. Eine Art, *Nycteris aurita*, ist für Tanganyika neu. Im Hinblick auf die noch immer recht mangelhaften Angaben über die Ökologie vieler Arten sind die während des Aufenthaltes in Afrika von H. KNIPPER und G. ZINK (als Teilnehmer der Gruppe LINDNER und von Ende Juni 1952 ab als alleiniger Bearbeiter) gesammelten biologischen Beobachtungen beigefügt.

Für einen Vergleich und eine Nachbestimmung einer Reihe von Arten bin ich Herrn Dr. V. AELLEN (Genf) zu herzlichem Dank verbunden. Ebenso danke ich Herrn R. W. HAYMAN (London) für die Begutachtung einiger Arten.

Eisentraut, M. (1960a). Der Rassenkreis *Rousettus aegyptiacus* E. Geoff.

Im Gebiet des Kamerangebirges leben zwei *Rousettus*-Arten: der kleine *R. angolensis* Bocage und eine größere Art, die bisher nur in wenigen Stücken gesammelt und von den einzelnen Autoren systematisch, verschieden eingruppiert wurde. Von ihr erwähnt wohl als erster Matschie (1891) ein Exemplar von Buea (1000m hoch am SO-Hang des Kamerungebirges gelegen), das er anfänglich als *Cynonycteris (= Rousettus) unicolor* bestimmte. Diese Form wurde von Gray (1870) unter dem Namen *Eleutherura unicolor* für Gabun beschrieben, später aber als Synonym zu dem in Ägypten und den angrenzenden Gebieten heimischen *R. aegyptiacus* gestellt. Sjöstedt (1897) sammelte einige Exemplare von den Orten Bibundi, N'dian, und Bonge am Fuße und nordwestlich vom Kamerungebirge. Er stellte sie zu *Cynonycteris collaris (= Rousettus leachi)*, einer Form, die in Ost- und Südafrika verbreitet ist. Gleichzeitig teilte er mit, daß sich Matschie bei einem Vergleich dieser Stücke mit seinem Buea-Exemplar überzeugt habe, daß letzteres ebenfalls zu *collaris (= leachi)* gehöre. 1936 erwähnt Sanborn drei Stücke, wiederum von Buea, und stellt sie zu *R. aegyptiacus*. Das gleiche tat Sanderson (1940) mit seinem aus dem nördlich vom Kamerungebirge gelegenen Mamfe-Gebiet mitgebrachten *Rousettus*. Jeannin (1936) nimmt an, daß *Rousettus aegyptiacus* wahrscheinlich in ganz Kamerun vorkomme, aber sehr selten sei, und Aellen (1952) führt neben *angolensis* auch *aegyptiacus* für Kamerun an.

Nachdem ich von meinen beiden ersten Kamerunreisen (1938 und 1954) nur *R. angolensis* gesammelt hatte, gelang es mir, während meiner dritten Reise (1957/58), die ausschließlich der Erforschung der Wirbeltierfauna des Kamerungebirges gewidmet war, auch von der zweiten größeren Art eine stattliche Serie von 83 Exemplaren zusammenzubringen. Sie gehören zweifellos in den *aegyptiacus*-Rassenkreis, sind aber keineswegs identisch mit der Rasse *aegyptiacus* und auch nicht mit dem ost- und südafrikanischen *leachi*, so daß eine Abtrennung als Subspezies gerechtfertigt erscheint. Ihre genauere Bearbeitung veranlaßte mich, die verwandtschaftliche Beziehung und geographische Verbreitung der für Afrika und einige angrenzende Gebiete bekannten Formen des Rassenkreises *R. aegyptiacus* näher zu untersuchen.

Eisentraut, M. (1960b). Zur Kenntnis der westafrikanischen Flughundgattung *Scotonycteris*.

Die Gattung *Scotonycteris* mit der Art *zenkeii* wurde von Matschie (1894) nach einem von Zenker bei Yaunde (Süd-Kamerun) erbeuteten Stück (? ad) aufgestellt. Ein Weiterer Fundort für diesen bemerkenswerten Vertreter der Flughunde ist der Elefanten-See (Barombi Lake) bei Kumba, den Sjöstedt (1897) erwähnt. Ein von der Insel Fernando Poo stammendes Stück (? ad) wurde von Thomas (1904) als besondere Art, *Sc. bedfordi*, beschrieben, dann aber von Andersen (1912) mit Recht zu *zenkeri* gestellt, so daß *bedfordi* als Synonym zu gelten hat. Als besondere Unterart, *occidentalis*, beschrieb schließlich Hayman (1946) ein von Cansdale bei Oda im Gebiet der Goldküste gesammeltes Exemplar, wiederum ein ? ad.

Die zweite, bedeutend größere Art, *ophiodon*, wurde erst 1943 von Pohle nach einem im Berliner Museum befindlichen, von Zenker 1898 bei Sipindi (Kribi-Bezirk, Süd-Kamerun) gesammelten und bis dahin in Alkohol aufbewahrten Exemplar (? subad.) beschrieben. Bald danach gelang es wiederum Cansdale und ebenfalls bei Oda (Goldküste), ein erwachsenes ? von *ophiodon* mit dazugehörendem Pullus zu erbeuten. Das Stück kam in das Britische Museum nach London und wurde von Hayman (1945) als neue Subspecies, *cansdalei*, beschrieben. Dies ist im wesentlichen alles, was wir bisher über das Vorkommen der beiden *Scotonycteris*-Arten wissen.

Während meiner 3. Kamerunreise (1957/58) gelang es, von beiden Arten einiges Material zu sammeln. Die Erbeutung von 3 Exemplaren von *Sc. Ophiodon* und 4 Exemplaren von *Sc. Zenkeri* verdanke ich der Methode des Netzfanges. Offenbar leben die Tiere am Tage sehr versteckt im Niederungswald. Die erwähnten Stücke fingen sich über Nacht in den zwischen Bäumen oder Stangen am Waldrand ausgespannten Nylonnetzen (sogenannten Japannetzen) und kamen auf diese Weise lebend und unverletzt in meine Hand. Damit sind nun sowohl von *ophiodon* als auch von *zenkeri* beide Geschlechter in adultem Zustand vertreten; ferner liegt mir je ein subadultes Stück vor. Zur Abrundung unserer Kenntnis von dieser in Museen so überaus selten vertretenen Gattung möchte ich im folgenden, unter Beifügung der Maßangaben, die Beschreibung einiger Details bekanntgeben. Die charakteristischen Merkmale der Gattung sind in der Literatur hinreichend gekennzeichnet.

Eisentraut, M. (1960c). Zwei neue Rhinolophiden aus Guinea.

Bei der Bearbeitung der von Herrn HANS KNORR 1956 in Guinea (ehemals Französisch-Guinea) gesammelten Fledermäuse (EISENTRAUT und KNORR 1957) war bereits auf zwei Rhinolophiden hingewiesen, deren genaue Determination auf Grund einiger abweichenden Merkmale auf Schwierigkeiten stieß. Die eine Form, zweifellos in die nächste Verwandtschaft von *alcyone-landeri* gehörig, wurde zunächst als *Rhinolophus landeri* Martin subsp. ? geführt, eine Art, deren Nominatrasse für Westafrika bekannt ist. Die zweite Form, die sich durch besondere Kleinheit auszeichnet, steht der in Süd- und Südwestafrika verbreiteten Art *Rhinolophus denti* Thomas sehr nahe. Nachdem ich inzwischen im British Museum (Natural History) in London Gelegenheit hatte, dort befindliches Vergleichsmaterial, insbesondere auch das Typenmaterial von *Rh. Denti* zu vergleichen, ist es mir nunmehr möglich, eine abschließende Bearbeitung des KNORR'sehen Materials vorzunehmen und die beiden Formen zu beschreiben. Den Herren Dr. CROWCROFT und R. W. HAYMAN (London) bin ich für die Erlaubnis, im Britischen Museum arbeiten und das dortige Material untersuchen zu können, zu besonderem Dank verpflichtet. Ebenso danke ich herzlich den Herren Dr. V. AELLEN (Genf) und Dr. J. DORST (Paris) für die Begutachtung der ihnen übersandten Sammlungsstücke.

Eisentraut, M. (1964). La faune de chiroptères de Fernando-Po.

Etude comparative de collectes de Chiroptères de l'île de Fernando-Pô et de la région continentale la plus voisine, les monts Cameroun, à la suite de missions de terrain dans les deux régions. La faune de l'île est un peu plus pauvre et ne comprend pas de représentants des genres *Epomophorus* et *Micropterus*, ni la Roussette *Epomops franqueti*. Il n'y a pas, contrairement à ce qui a été dit, de formes

- espèces, sous-espèces ou races - endémiques de l'île. La détermination de races n'est d'ailleurs pas valable pour les Chiroptères. Certaines espèces n'étaient pas jusqu'alors connues de l'île: *Rhinolophus alcyone, Hipposideros curtus*. L'auteur a obtenu du Père Basilio des données sur d'autres espèces non encore signalées: *Xiphongcteris spurrelli, Hipposideros cyclops*. Chaque espèce fait l'objet de remarques sur sa position taxinomique et d'observations sur son abondance, son habitat, son comportement, sa nourriture, sa reproduction.

Eisentraut, M. (1965). Der Rassenkreis *Rousettus angolensis* (Bocage).

Die im British Museum (Nat. Hist.) in London befindlichen Stücke von *Rousettus angolensis* zeichnen sich durch besondere Größe aus. Sie müssen als östliche Rasse, die unter dem Namen *ruwenzorii* näher beschrieben wird, von den westlichen Vertretern des Rassenkreises, nämlich *angolensis* und *smithi*, abgetrennt werden. Letztgenannte Form ist die kleinste. Der Rassenkreis gibt ein schönes Beispiel für Größenzunahme von West nach Ost, die vor allem beim Vergleich der Schädelmaße zum Ausdruck kommt.

Eisentraut, M. (1968). Die tiergeographische Bedeutung des Oku-Gebirges im Bamenda-Banso-Hochland (Westkamerun).

Nach einer erstmaligen Zusammenstellung aller für das Oku-Gebirge im Bamenda-Banso-Hochland nachgewiesenen Säugetiere werden die Säuger- und Vogelarten dieses Gebietes herausgestellt, die teils eine enge Beziehung zu ostafrikanischen Vertretern erkennen lassen, teils als endemische Formen auftreten. Für diese tiergeographischen Gegebenheiten dürften in erster Linie die pleistozänen Klimaschwankungen von besonderer Bedeutung gewesen sein.

Eisentraut, M. (1969). Gibt es in West-Afrika eine auf Montangebiete beschränkte Säugetierfauna?

Die Bearbeitung einer umfangreichen Säugetieraufsammlung von W-Kamerun und Fernando Poo hat ergeben, daß wir in diesen gebirgigsten Teilen W-Afrikas einen hohen Prozentsatz von Formen finden, die in ihrer vertikalen Verbreitung auf Montangebiete beschränkt sind. Es handelt sich teils um Montanarten, teils um Montanrassen weiter verbreiteter und in anderen Rassen auch im Tiefland vorkommender Arten. Wir können daher - gegenüber der von manchen Autoren vertretenen gegenteiligen Ansicht - auch bei Säugetieren ebenso wie z. B. bei Vögeln und Schmetterlingen von einer Montanfauna und einer Tieflandfauna sprechen. In dem im Kameruner Hinterland gelegenen Oku-Gebirge ist sogar die Mehrzahl der bisher von dort bekanntgewordenen Säuger als montan anzusehen.

Eisentraut, M. (1974). Mammalogische Notizen aus Kamerun.

Es wird über eine kleine Aufsammlung von Säugetieren aus der Sudanzone in Nord-Kamerun und aus dem Waldgebiet von Süd-Kamerun berichtet. Einige bemerkenswerte fortpflanzungsbiologische Beobachtungen an den beiden Flughundarten *Epomops franqueti* und *Megaloglossus woermanni* betreffen die bisher noch ungenügend geklärte Frage des Mitnehmens der Neugeborenen durch die Mutter während des nächtlichen Nahrungsfluges und das Auftreten von verschieden weit entwickelten dizygoten Zwillingen.

Eisentraut, M. (1975). Weiterer Beitrag zur Saugetierfauna von Kamerun.

A report on a collection of mammals from the savanna region of northern Cameroon is given. There are represented almost exclusively savanna dwellers typical of the Sudan and Guinea zones; only a few forms are to be found in the region of tropical rain-forest, too. In a supplement a list is given of mammals collected in the mountain forest region of Mt. Lefo near Bamenda, the mammal fauna of which had not yet been studied. Among the species listed there, *Colomys gosling* is of particular interest, its area of distribution being extended to western Cameroon.

Eisentraut, M. and H. Knorr (1957). Les Chauves-souris cavernicoles de la Guinée française.

Notre connaissance des chauves-souris habitant la partie côtière occidentale de la Haute-Guinée est encore très incomplète. Les prospections ont cependant déjà conduit à de nombreux résultats surprenants. Ce district est en effet remarquable au point de vue biogéographique et faunistique, en ce qu'il forme une zone de passage entre la zone côtière couverte de forêt primaire à l'est et les savanes du nord et du nord-ouest et que les éléments faunistiques correspondants s'y mélangent. De nombreux éléments propres à la forêt, d'origine orientale, atteignent ici leur limite occidentale de dispersion. En outre, on rencontre une série de formes endémiques, propres à ce district d'après nos connaissances actuelles.

Nous faisons une allusion particulière au Rhinolophe géant, *Rh. maclaudi*, que Pousargues a déjà décrit en 1897 de Guinée française, d'après un exemplaire unique, et qui fut retrouvé en 1954 - un exemplaire unique lui aussi - par A. Villiers (voir V. Aellen 1956). En 1939, Monard a décrit l'Emballonuridé qu'il avait trouvé en Guinée portugaise, *Coleura kummeri*, et en 1954 Villiers retrouva celui-ci en Guinée française. Cette espèce est jusqu'à présent le seul représentant en Afrique occidentale de ce genre dont on ne connaissait jusqu'alors que plusieurs espèces des Séchelles et d'Afrique orientale. De plus Monard a trouvé en Guinée portugaise un nouvel Hipposidériné, *Hipposideros braima*. Une espèce remarquable, très différente des autres espèces du genre, est par ailleurs *Hipposideros jonesi*. Cette chauve-souris a été décrite en 1947 du Sierra Leone par Hayman et n'était connue que par trois exemplaires jusqu'à présent. Des cinq espèces collectées en 1954 par Villiers en Guinée française et étudiées par Aellen, pas moins de quatre étaient nouvelles pour ce district.

De nouvelles connaissances sur la faune des Chiroptères furent acquises par les récoltes que l'un de nous (Hans Knorr) a faites au cours d'un récent voyage en Guinée française. Celui-ci a visité, en compagnie de Mr. Klaus Noack, de septembre à décembre 1956, la partie méridionale du district de Kindia en partant de Conakry, et a collecté dans la région de Yembéré-Tahiré, sur le plateau de Kelesi et dans le district situé entre Nerebily et Kolenté, sur les plateaux de Salung et de Kankuya. Le territoire de collecte est compris dans le triangle Kindia-Mambia-Kolenté. Une attention spéciale a été consacrée aux nombreuses grottes, pour une grande part encore inconnues, de cette région. Le matériel fut acquis par le *Staatliches Museum für Naturkunde* de Stuttgart. Dans ce travail, nous donnons les résultats acquis sur le plan systématique en même temps que les observations biologiques que nous avons pu recueillir. La détermination subspécifique de deux Rhindlophes (*landeri* et *denti*) et d'un *Hipposideros (caffer)* ne peut être donnée avec certitude et est réservée pour un travail ultérieur.

Nous sommes reconnaissants au Dr. Jean DORST et au Dr. V. AELLEN (Genève) pour les déterminations et l'examen de quelques espèces. Nous remercions en outre le premier pour la traduction du texte en français.

Elbl, A., U. H. Rahm and G. Mathys (1966). Les mammifères et leurs tiques dans la forêt du Ruggege (République Rwandaise).

This study presents the result of a three week period of intensive collection and examination of mammals in the Forest of Ruggege, a primary mountain forest on the western border of the Republic of Rwanda, from the viewpoint of ecology, of the mammals and of the Ixodid ticks found on these mammals. The study covers 16 ecologically different trapping areas, five hunting areas and four areas of large mammal examination which can be divided into three categories - virgin (primary) forest,

secondary forest, zone of cultivation and human activity - and in which a total of 203 small mammals were trapped, nine large wild mammals were killed and 66 domestic animals were examined.

These mammals belong to 44 different species and subspecies, of which one species and one subspecies are new to science: *Lophuromys rahmi* n. sp. Verheyen, 1964, *Lophuromys luteogaster* Hatt n. ssp. Verheyen (in press) and 18 species are reported for the first time from this region of Rwanda. A total of 107 of these mammals were found to be parasitized by Ixodid ticks (Ixodoidea, Ixodidae) while 166 had various other acarines (gamasids and trombiculids), 70 had fleas and 48 had lice.

The ixodid ticks collected, belong to five genera (*Amblyomma, Boophilus, Haemaphysalis, Ixodes, Rhipicephalus*) and represent 14 species. Five of these species are reported for the first time from Rwanda while the male of one species, *Ixodes muniens*, is reported for the first time ever. The tick species can be divided into species apparently indigenous to the forest as well as species apparently introduced into the forest by the passage of domestic animals.

Während einer driewöchigen, intensiven Fang- und Sammeltätitgkeit wurden im Gebirgswald von Ruggege, einem Urwald, der sich an der Westgrenze der Rwanda-Republik hinzieht, alle, meist kleinen Säugetiere und die darauf parasitierende Zecken zwecks ökologischer Studien untersuche. Die Erhebungen beziehen sich auf 16 ökologisch verschienden Fangzonen, fünf Jagdgebiete und vier Zonen, in dene Große Säugetiere untersucht wurden. Man kann diese verschiedenen Zonen in drei Hauptgruppen aufteilen: Urwals, sekundärer Wald und kultivierte Zonen, die direkt unter dem Einfluß des Menschen stehen. Insgesamt konnten 203 kleine Säugetiere, neun große Säugetiere und 66 Haustiere erfaßt werden.

Diese Säugetiere gehören 44 verschienden Arten und Unterarten an, wovon eine Art und eine Unterart neu sind: : *Lophuromys rahmi* n. sp. Verheyen, 1964, und *Lophuromys luteogaster* Hatt n. ssp. Verheyen (im Druck). Daneben sind 18 Arten erstmals aus diesem Gebiete des Rwanda erwähnt. Insgesamt waren 107 dieser Säugetiere durch Ixodes-Zecken (Ixodoidea, Ixodidae) befallen und 166 Tiere waren Träger von andern Milben (Gamasiden und Trombiculiden). Im übrigen zeigten sich auf 70 Tieren Flöhe und auf 48 Individuen Läuse.

Ellerman, J. R., T. C. S. Morrison-Scott and R. W. Hayman (1953). Southern African Mammals 1758 to 1951: a reclassification.

Notes in REFN 43

Elliot, D. G. (1897). List of mammals obtained by the Field Columbian Museum East African Expedition to Somali-land in 1896.

The chief reason that induced the Field Columbian Museum to send an expedition to Africa was the knowledge that the large wild animals were rapidly becoming extinct, and that no time was to be lost if examples of these still living species were to be procured for the Institution, to show to those who come after us the creatures that once in countless numbers roamed over the plains and in the forests of the Dark Continent. The Expedition was uncommonly successful in obtaining ample series of nearly all the species inhabiting the country it traversed, and beside the specimens themselves there were brought back photographs, casts of the head and muscles, and ample measurements of the Specimens obtained. Unfortunately, on account of the illness of members of the Expedition, it was unable to penetrate as far into the interior as was intended, so a few species that would undoubtedly have been obtained are omitted from the list. Many more examples of the different species could easily have been procured, but after what was considered to be a sufficient number had been secured no more weru killed, no matter how often the animals were encountered.

Elliot, D. G. (1907). A catalogue of the collection of mammals in the Field Museum of Natural History.

The present Catalogue purports to give the names and the number of specimens of Mammals in the Field Columbian Museum up to the date of issue. When the Author took charge of the Department of Zoology, as constituted in this Institution, the collection of Mammals was composed of a limited number of mounted examples furnished by the Ward Natural Science Establishment of Rochester, New York, many of them not freshly prepared, and nearly all with unreliable data of locality, causing them to be practically of little scientific value specifically, but useful to a certain degree as representatives of genera. There were no mammal skins, and consequently a study collection did not exist. At the present time a fair start has been made, and about fifteen thousand specimens are now in the Museum collection, the major portion, as is proper, being unmounted and reserved for scientific study and comparison. Knowing that the value of a museum's material depends greatly upon how much is available for scientific research, it has been the Author's policy to restrict the number of mounted specimens to as few as would give a proper conception as possible to the visitor, of the Order, Family, and usually the species, represented. To go beyond this would be but the production of useless repetitions, wearying to the observer and profitable [to no one. Naturally, when beginning the formation of a collection, the material nearest at hand was sought, and consequently the mammalian fauna of the United States occupies the largest portion of the Catalogue. The Author has not, however, been unmindful of exotic forms, and as many foreign species have been procured as possible, rather special attention having been given to Wild Horses and African Antelopes, - important and beautiful creatures advancing rapidly toward extinction. Although purchases have been liberally made, yet by such means the making of a collection would be necessarily slow and unsatisfactory, for the main dependence for achieving success and a collection at the same time is, of course, work in the field. The expedition to Africa under the Author's leadership produced large results, and numbers of valuable specimens were secured, the majority being various species of Antelopes. By keeping collectors constantly at work, mostly thus far in North America, it has been possible to bring together a sufficiently large number of specimens to constitute a nucleus for the grand collection it is hoped the Museum may eventually possess, and cause it to take its position in the front rank of the great world-embracing Institutions devoted to the scientific study of Natural History, and whose influence is felt and recognized throughout the earth. In the exhibition of mammals much attention, and, it may be added space also, has been given to groups, and specimens of single species of different ages and sexes have been brought together and placed in a miniature landscape of the country in which they once dwelt. Their environment was thus the natural one. When practicable this is the most satisfactory method of exhibiting specimens ; but it is limited, for no matter how large the museum building may be, only a very small portion of a collection could be so arranged, and if continued to any excess, other and equally important exhibits could not be shown. Mounting specimens in groups, therefore, must from sheer necessity be always limited.

Every example in the Museum that has passed through the Author's hands is contained in this Catalogue, together with all the information possessed regarding it; commencing with the sex, whether collected, purchased, presented, or exchanged, followed by the locality in which it was taken, the person or institution from which it was procured, ending with the name of the collector. The signs and abbreviations used are: ?, male; ?, female; Coll., collected; P., purchased; Pres., presented; and Exch., exchanged. The arrangement is that of the Check-List of Mammals of the North American Continent and West Indies, as far as that work goes, viz.: for the mammals of the North American fauna, the exotic species being relegated to their various positions in accordance with the system of classification adopted by the Author. One species is described, a bat, Uroderma validum, on page 538, the discovery that the specimens represented a new form having been made too late for the Author to avail himself of any of the usual channels of publication and include it at the same time in the present work. In conclusion, it gives me much pleasure to acknowledge my indebtedness to Mr. W. J. Gerhard, Assistant Curator of Entomology, for his valuable aid in reading the proofs as the work passed through the press, and also for constructing the index, in which task considerable help was rendered by my assistant, Mr. E. B. Chope.

El-Rayah, M. A. (1980). Systematics of African molossid bats of the subgenus *Xiphonycteris* of the genus *Tadarida* (Molossidae: Chiroptera)

The morphological variations of the taxa of African molossid bats (genus *Tadarida* Rafinesque, 1814) included by Koopman (1975) in his proposed subgenus *Xiphonycteris* were analysed and compared with five representative taxa of the subgenus *Mops*.

Sexual dimorphism, geographic variation and phonetic similarities were assessed using 31 morphometric characters of 586 specimens utilizing univariate and multivariate analyses. Eight of the taxa tested for sexual dimorphism showed a clear statistical separation of the sexes, with *Tadarida spurrelli* being the most dimorphic (in more than 80 per cent of the characters measured) and *T. midas* the least dimorphic (in 45 per·cent of the characters). Accordingly, males and females were analysed separately.

Phenetic similarities were assessed by cluster analysis using correlation coefficients, average taxonomic distance, subsets and minimum spanning trees together with principal component analysis and nonmetric multidimensional scaling.

Geographic variation in female *T. (X.) nanula*, male and female *T. (X.) leonis* male and female *T. (X.) thersites* and female *T. (X.) spurrelli* was examined by generalized discriminant function analysis. Morphologic similarities among geographic samples, as indicated by the minimum spanning trees computed from the matrices of the square root of the Mahalanobis' generalized distances and superimposed on the discriminant configurations, were compared with geographic distances.

Character variations in geographic samples were tested by univariate analysis using Gabriels' sum of the square simultaneous test procedure (SS-STP) and Power's ranked means. Although character variations are clinal in *T. (X.) leonis*, they are mostly erratic and do not show a clear clinal trend in other taxa. Taxa known as *T. (X.) calabarensis, T. (X.) ochraceus* and *T. (X.) occipitalis* are shown to be synonyms of *T. (X.) nanula, T. (X.) leonis* and *T. (X.) thersites* respectively. Specimens of a previously undescribed taxon were compared with other taxa, diagnosed and named as a new species.

The five taxa found to be valid in the subgenus *Xiphonycteris* (*T. spurrelli, T. nanula, T. leonis, T. thersites* and the new species) were compared phenetically with representative taxa in the subgenus *Mops* (*T. demonstrator, T. condylura, T. trevori, T. congica* and *T. midas*). Results of cluster analysis, principal component analysis and non-metric multidimensional scaling showed that members in both subgenera are phenetically similar.

From a comparison of morphological characters and original descriptions of *T. thersites* (Thomas, 1903), *T. leonis* (Thomas, 1908) and *T. brachyptera* (Peters, 1852), it is shown that *T. brachyptera* is the earliest available name that includes *T. leonis* as a synonym. As the holotype of *T. brachyptera* has been lost and no lectotype or syntype exists, a neotype is designated and described according to article 75 of the International Commission of Zoological Nomenclature, 1964.

Based on number of lower incisors, the reduction of the last upper molar and the palatal emargination, characters on which the genus *Xiphonycteris* and later the subgenus were established, *Xiphonycteris* is shown to be invalid as a genus or as a subgenus. Accordingly, species previously included in the subgenus *Xiphonycteris* are reassigned to the subgenus *Mops*.

Les variations morphologiques des taxa des chauve-souris molossides de l'Afrique (genre *Tadarida* Rafinesque, 1814) comprises par Koopman (1975) dans le sous-genre *Xiphonycteris*, propose par lui, sont analysées et comparées avec cinq taxa typiques du sous-genre *Mops*.

Le dimorphisme sexuel, la variation géographique et les similitudes phénétiques sont évaluées suivant 31 caractères morphométriques de 586 spécimens, en utilisant des analyses autant univariées que multivariées. Parmis les taxa mis à l'épreuve concernant leur dimorphisme sexuel, huit font clairement preuve d'une distinction entre les sexes, dont *Tadarida spurrelli* parait être le plus dimorphique (dans 80 % caractères mesurées) et *T. midas* le moins dimorphique (dans 45 % des caractèrs). C'est pourquoi les mâles et femelles sont séparément analysés.

Les similitudes phénétiques sont évaluées au moyen d'analyse par groupes en utilisant les coefficient corrélatifs, les distances taxonomiques moyennes, les sous-groupes et les arbres d'embranchement

minimal, ainsi que l'analyse des composantes principales et la graduation multidimensionnelle non-mesurée.

La variation géographique de la femelle de la *T. (X.) nanula*, du mâle et de la femelle de la *T. (X.) leonis*, du mâle et de la femelle *T. (X.) thersites* et de la femelle *T. (X.) spurrelli* est examinée par analyse des fonctions discriminantes généralisées. Les similitudes morphologiques entre les échantillons géographiques impliquées par les arbres d'embranchement minimal calculées à partir des matrices de la recine carée des distances généralisées selon Mahalanobis, surimposées sur les configurations discriminantes, sont comparées avec les distances géographiques.

ca Les variations des caractères des échantillons géographiques sont mises à l'épreuve au moyen d'analyse univariée, en utilisant le procédé de tests simultanés de la somme des carrés, selon Gabriel (SS-STP) et des moyennes classées de Power. Quoique les variations des caractèrs soient déclives chez la *T. (X.) leonis*, elles sont pour la plupart erratiques et ne montrent pas une tendance déclive nette pour les autres taxa. Les taxa connus sous les noms de *T. (X.) calabarensis, T. (X.) ochraceus* et *T.(X.) occipitalis* s'avèrent être des synonymes de *T. (X.) nanula, T. (X.) leonis* et *T. (X.) thersites* à leur tour. Un taxon, non décrit jusqu'ici est comparé avec d'autres taxa, diagnostiqué et désigné comme nouvelle espèce.

Les cinq taxa démontrés être valables dans le sous-genre *Xiphonycteris* (*spurrelli, nanula, leonis, thersites* et la nouvelle espèce) sont soumis à une comparison phénétique avec les taxa·représentatif s du sous-genre *Mops* (*domonstrater, condylura, trevori, congica* et *midas*). Les résultats de l'analyse en groupe, de l'analyse des composantes principales et la graduation multidimensionnelle non-mesurée démontrent que les membre des deux sous phénétiquement semblables.

La comparaison des caractèrs morphologiques et descriptions originales de la *T. thersites* (Thomas, 1903), la *T. leonis* (Thomas, 1908) et la *T. brachyptera* (Peters, 1852), démontre que le nom *T. brachyptera* est le nom le plus ancien disponible, et que ce nom comprend la *T. leonis* comme son synonyme. Alors que l'holotype *T. brachyptera* est perdue et qu'apparemment aucun lectotype, ni syntype n'est pas en existence, un néotype est désigné et décrit, d'après l'art. 75 du Comite International de la Nomenclature Zoologique de 1964.

D'après le nombre des incisives inferieures, la réduction de la dernièr molaire supérieure et l'émargination palatine, caractères à la base desquels le genre *Xiphonycteris* et, plus tard, le sous-genre ont été établis-il est maintenant prouvé que la désignation *Xiphonycteris* n'est pas valide, ni comme genre, ni comme sous-genre. Par conséquent, l'espèces auparavant comprises dans le sous-genre *Xiphonycteris* sont maintenant assignées de nouveau au sous-genre *Mops*.

El-Rayah, M. A. (1981). A new species of bat of the genus *Tadarida* (family Molossidae) from West Africa.

As a result of a systematic analysis and review of the nominal species included in the proposed subgenus *Xiphonycteris* (Family Molossidae, Order Chiroptera), a distinct new taxon from West Africa has been confirmed and described.

Entwistle, A. and N. Corp (1997). Status and distribution of the Pemba flying fox *Pteropus voeltzkowi*.

The Pemba flying fox *Pteropus voeltzkowi* is a fruit bat endemic to the island of Pemba, off Tanzania. A total of 41 reported roosting areas were visited in June and July 1995, and 19 occupied roosts were located, most of them in the west of the island, and on small islets off the west and south of Pemba. Roost were situated in primary forest, secondary forest (overgrown clove plantations), traditional graveyards and mangrove areas. A range of sizes and species of trees were used as roosts. The minimum population of *P.voeltzkowi* was estimated to be between 4600 and 5500 individuals. In total 94 per cent of the population was located at 10 roost sites. Larger colonies were associated with roosts located in forests, which together supported 75 per cent of the total bat population. Colonies were of

mixed sex, but no young or obviously pregnant females were observed. Major threats to this species appeared to be hunting and deforestation (both logging and clearing for agriculture) and *P. voeltzkowi* is considered to be endangered.

Erasmus, B. H. and I. L. Rautenbach (1984). New records of occurrences of six species of small mammals in the northern Cape Province.

The occurrence of two rodent species (*Steatomys krebsii* and *Dendromus melanotis*) and four species of bats (*Scotophilus dinganii, Hipposideros caffer, Taphozous mauritianus* and *Rhinolophus darlingi*) is recorded in the northern Cape Province for the first time. The difficulties in positively identifying *R. darling* specimens necessitated a karyological overview and morphometric multivariate analyses of selected representatives of the ten southern African species of *Rhinolophus*.

Die voorkoms van twee knaagdierspesies (*Steatomys krebsii* en *Dendromus melanotis*) asook vier spesies van vlermuise (*Scotophilus dinganii, Hipposideros caffer, Taphozous mauritianus* en *Rhinolophus darlingi*) word vir die eerste keer bevestig vir die noordelike Kaapprovinsie. Die heersende probleme met die positiewe identifikasie van R. darlingi-eksemplare het 'n kariologiese oorsig en morfometriese meervariantanalises van geselekteerde verteenwoordigers van die tien suider-Afrikaanse Rhinolophus-spesies genoodsaak.

Estrada-Peña, A. and C. Sanchez (1988). Two new species of *Steatonyssus* (Acarina: Macronyssidae) from bats in the Canary Islands. with the description of male and protonymph of *Parasteatonyssus hoogstraal* (Keegan).

Two new species of Pataearctic *Steatonyssus* (Acarina; Macronyssidae) parasitinq vespertilionine bats from the Canarv Islands are described: *S. (S.) balcellsi* and *S.(S.) teidae*. The female of *S. (S.) balcellsi* has 11 pairs of podonotal setae none of which are reduced, peritrernal plate divided, sternal plate with posterior margin strongly sclerotized, first pair or sternal setae clearly reduced, and terminal setae on opisthonotal plate longer than other marginal setae. The female of *S. (S.) teidae* is very similar to *tibialis* Till and Evans, but it can be readily separated by a combination of critical characters in the length of tarsus I and peritreme. The male and protonymph of *Parasteatonyssus hoogstraali* (Keegan) from a molossid bat from the Canary Islands are also described.

Se describen dos nuevas especies de *Steatonyssus* Paleárticos (Acarina: Macronyssidae) recogidos sobre rnurciélaqos Vespertiliónidos de las Islas Canarías: *S (S.) balcellsi* y *S. (S.) teidae*. La hembra de *S. balcellsi* tiene 11 pares de sedas podonotales. de las cuales ninguna está reducida, placa peritremal dividida, placa esternal con margen posterior fuertemente esclerotizado. Primer par de sedas esternales claramente reducido y sedas terminales en la placa opistonotal más largals que las otras sedas marginales. La hembra de *S. teidae* es muy similar a *tibialis* Till y Evans, pero puede ser rápidarnente separada por una combinación de caracteres críticos en la longitud del tarso y del peritrerna. Se describen asimismo, el macho y la protoninfa de *Parasteatonyssus hoogstraali* (Kaeqan), recoqidos sabre un murciélago Molosido de las Islas Canarias,

---

Estrada-Peña, A. and J. Serra-Cobo (1991). The Acarinia and Nycteribidia zones of *Miniopterus schreibersi* Kuhl (Mammalia: Chiroptera) in the northeast of Spain.

Acarinia and nycteribidia zones of the bat species *Miniopterus schreibersi* Kuhl are studied in an area of northeast of Spain, where captures over a period of five years have been carried out. The species that characterize the mite-tick spectrum are *Ixodes (Pomerantzevella) simplex, Macronyssus longimanus, Macronyssus granulosus* and *Spinturnix psi*; nycteribidium is determined mainly by the presence of *Nycteribia schmidlii*. The life cycle, prevalence, curves of parasitation, and other notes on these most abundant ectoparasites are provided, as well as observations on other ticks, mites, and nycteribiid species found on this bat.

Fa, J. E. (1991). Conservación de los ecosistemas forestales de Guinea Ecuatorial.

1. Guinea Ecuatorial comprende tres entidades geográficas:

a) Una zona continental, la región de Mbini (anteriormente Río Muni), delimitada al norte por la frontera con Camerún (210'N), al este (11) y al sur (1S) por Gabón y al oeste por el océano Atlántico.

b) La isla de Bioco (Fernando Poo), más al norte (330'N) en el Golfo de Guinea.

c) La isla de Pagalu (Annobón), al sur de Santo Tomé y Príncipe, en el océano Atlántico.

2. La región de Mbini es la más importante en cuanto a los recursos forestales pero se encuentran bosques de sumo interés biológico en la isla de Bioco.

3. Guinea Ecuatorial se encuentra en su totalidad dentro del área de la vegetación ecuatorial. La formación vegetal que predomina en la región de Mbini es la pluvisilva tropical densa. Generalmente es una formación arbórea de gran porte, donde es posible encontrar de 70 a 80 especies de árboles, siempre dependiendo del suelo, la pendiente o la acción antropogénica. Esto último es un factor que lleva al bosque a ser un mosaico de formaciones vegetales que refleja el estado de recuperación de la tala y la quema hecha por el hombre. Una proporción importante del territorio de Mbini es utilizado para la agricultura itinerante y está ocupado por diversas etapas de vegetación secundaria, aunque todavía es posible encontrar importantes extensiones de bosque primario.

4. Los mapas (1:100.000) del Servicio Cartográfico del Ejército Español de 1959/1960 y estimaciones hechas en 1980 y 1985 por la FAD, sugieren una reducción notable de la superficie del bosque primario, el que ocupaba más del 50% del país en 1959 y sólo el 28% en 1985. La extensión de bosque secundario ha disminuido de 10% a 8%. La parte occidental de Mbini ha sido la más explotada a causa de su proximidad a la costa. La Cadena de Niefang, por su inaccesibilidad, y la zona oriental, por su lejanía de la costa, particularmente la parte sureste, nunca han sido afectadas.

5. La diversidad biológica del país es alta por su localización en el trópico y debido a que fue un área de refugio Pleistocénico. Hay una gran falta de información en cuanto al número de especies de la fauna y flora del país. Los taxa mejor documentados son los mamíferos. Aún existen en Mbini importantes poblaciones de mamíferos grandes como el búfalo forestal, el gorila, el chimpancé y el elefante de selva. No existen datos exactos sobre la condición de la vida silvestre en Bioco y Pagalu. Por lo menos 18 subespecies de mamíferos y 45 de aves son endémicas de Bioco.

6. El problema más inmediato del país es el de la obtención de divisas que le permitan hacer frente a las importaciones necesarias para la subsistencia de la población, servicios básicos y bienes de capital, así como el pago de la deuda externa. El sector forestal es el que más contribuye a la economía del país. Más del 50% del ingreso nacional proviene de la exportación de la madera. El sector opera por medio de la concesión de bosques a compañías madereras. En la actualidad, hay 15 compañías con concesiones. Anualmente, se exportan aproximadamente 100.000m^3.

7. A pesar de la importancia económica del sector forestal, éste se caracteriza por:

• Una administración forestal con carencia de personal con preparación en la conservación de bosques y uso racional de los recursos naturales. Hay una carencia absoluta también de recursos materiales.

• Una gran escasez tanto de información cartográfica como de inventarios forestales que permitan la evaluación correcta de las tendencias actuales de la explotación o de la planificación de la misma hacia el futuro.

• La presencia de una industria forestal predominantemente empírica.

• La ausencia total de planes de ordenación y reforestación.

8. La creciente demanda de tierras para cultivo en el país se debe al incremento en la población rural. La práctica usual de la agricultura itinerante trae consigo cambios significativos en los bosques del país. Esto representa una fuerte presión sobre los ecosistemas forestales y se calcula que ha significado la desaparición de 65.000 ha de bosque en los últimos 25 años, según datos de la FAO. El bosque es transformado en plantaciones de corta duración de maíz, yuca y cacahuete que de hecho no satisfacen los requerimientos nutritivos dz la población local. En todo el país la caza es una actividad importante. La carne de monte se consume localmente pero también se vende en los centros urbanos y carreteras. Los aldeanos ponen trampas en la proximidad de sus cultivos para atrapar pequeños animales, pero los que poseen armas entran al bosque a cazar antílopes, monos, chimpancés y gorilas.

9. En la actualidad operan tres proyectos directamente relacionados con la conservación de los recursos naturales en Guinea Ecuatorial. El primero, de la FAO y con financiamiento del PNUD, atañe al manejo y la explotación racional de los recursos forestales de Mbini. El proyecto incluye un inventario del bosque, un banco de datos de concesiones forestales, un plan de manejo para los bosques de la región, la capacitación de personal forestal y la implementación de un proyecto piloto cerca de Bata. El segundo programa tiene como enfoque la investigación biológica y la conservación de la naturaleza, goza del apoyo financiero de la Cooperación Española y es llevado a cabo por científicos de la Estación Biológica de Doñana. El tercer proyecto forma parte del programa indicativo de la CEE y su objetivo es encontrar maneras de incrementar la aportación del sector forestal a la economía del país. El programa forestal abarca tres elementos principales: construcción de carreteras forestales, la comercialización de la madera y la conservación de los recursos forestales.

10. El sistema legal del país está en revisión y no existe todavía un marco jurídico que reglamente adecuadamente el uso racional de los recursos naturales de la nación.

Fahmy, M. A. M., A. M. Abdel-Rahman and R. Khalifa (1978). *Trypanosoma (Schizotrypanum) assiutis* sp. nov. from the house mouse *Mus musculus*, with a comparative study on *Trypanosoma (Schizotrypanum) vespertilionis* of the Egyptian bat *Vesperugo kuhli*.

On examination of a house mouse (*Mus musculus*) trapped in Rifa village (Assiut Governorate), a *Trypanosoma cruzi*-like trypanosome was encountered which differed from the *cruzi*-like trypanosomes of local bats. It appeared to be a hitherto unknown species for which the name *Trypanosoma (Schizotrypanum) assiutis* sp.nov. is suggested.

Fain, A. (1959e). Les Acariens psoriques parasites des chauves-souris. XII. Deux nouvelles espèces des genres *Teinocoptes* et *Chirobia* chez des Rousettes africaines (Sarcoptiformes - Teinocoptidae).

Dans la muqueuse buccale de 4 Chauve-souris *Myotis myotis* capturées dans les grottes de Han le 25-9-58, nous avons découvert 5 Acariens mâles, une nymphe et une larve appartenant à un nouveau genre et une nouvelle espèce de la famille *Sarcoptidae*. Tous les mâles et la nymphe étaient localisés dans la profondeur de la muqueuse de la lèvre inférieure, tout près de son bord libre. L'unique larve fut trouvée dans la muqueuse du palais. Aucune femelle ne put être mise en évidence ni dans la muqueuse, ni sur le reste du corps. Ces Chauve-souris étaient également parasitées par de nombreux spécimens, à tous les stades, de *Nycteridocoptes poppei* Oudemans

---

Fain, A. (1967). Les Acariens psoriques parasites des chauves-souris XXVIII. *Teinocoptes ituriensis* sp. n., avec une clé et une liste des espèces du genre *Teinocoptes* (Teinocoptidae: Sarcoptiformes).

Dans cette note nous décrivons une nouvelle espèce du genre *Teinocoptes* et nous indiquons un nouvel hôte pour *Teinocoptes auricularis* FAIN.

Fain, A. (1978). Les Myobiidae d'Afrique au sud du Sahara et de Madagascar (Acarina - Prostigmata).

During 1972, 1973 and 1974, I had the opportunity to collect an interesting series of parasitic mites from various mammals in the collection of the British Museum (Natural History). Among this collection I found a number of new species belonging to several new genera of Myobiidae. The present paper provides detailed descriptions and figures of these species, preliminary diagnoses of all but one of which have been given in previous papers (Fain, 1972, 1973). In addition, three species found on bats preserved in the Institut royal des Sciences naturelles de Belgique, Bruxelles, and one species from a bat in the collection of the U.S. National Museum, Washington, are described.

Types have been deposited in the respective institutions where the mites were collected. In the following descriptions the length of the body includes that of the gnathosoma but not of the palps.

Fain, A. (1994). Adaptation, specificity and host-parasite coevolution in mites (Acari).

Parasitism by mites is widespread and involves all the classes of vertebrates, from fishes to mammals. Owing to their small size and their great plasticity, mites are able to adapt to a wide range of habitats. Most of the species are ectoparasites but endoparasitism, especially in the respiratory tract, is common in birds and mammals. The morphological modifications appearing during the process adaptation to parasitic life, especially in Myobiidae, are analysed. Two kinds of characters are particularly important: the constructive specialized characters, consisting of the production of new structures, especially attachment organs allowing the mite to attach to the skin and the hair of the host, and regressive characters. Regression of the external structures is the most important phenomenon appearing in the process of evolution of parasitic mites. The importance of the regression in the parasite is correlated with the degree of evolution of the host. Host and parasite have a parallel evolution, but they go in opposite directions. The author surmises that the regressive evolution is related to the immunological reactions of the host that tend to reject the parasite. To escape from this rejection the parasite tends to select the less antigenic and therefore the most regressed phenotype. Specificity is generally strict in permanent parasites. Coevolution of host and parasite is studied in the family Myobiidae which parasitizes marsupials, insectivores, bats and rodents. The concordance between the radiations of the mites and that of their hosts is very high.

Fain, A. and V. Aellen (1994). Notes sur une petite collection d'acariens (Acari) parasites récoltés sur des chiroptères de la collection du Muséum d'histoire naturelle de Genève.

Notes on a small collection of parasitic mites (Acari) collected from bats deposited in the Museum of natural History of Geneva.

A small collection of pilicolous (Acari: Chirodiscidae and Myobiidae) or skin mites (Sarcoptidae), collected from bats deposited in the Museum of natural History of Geneva, is studied. Thirteen species were identified and among them a new genus and species, *Eurolabidocarpus helveticus*, collected from *Myotis daubentoni* from Switzerland. *Pseudoalabidocarpus secus* MacDaniel, 1972 is synonymized with *Pseudoalabidocarpus phyllostomi* Fain, 1972.

Fain, A. and P. Elsen (1972). Un nouveau Cimicide du Cameroun: *Stricticimex puylaerti* sp.n.

Cette nouvelle punaise fut récoltée au cours d'une Mission Parasitologique effectuée au Cameroun (juillet à octobre 1971), sur deux chauves-souris de la famille Emballonuridae. Elle est représentée par un mâle, une femelle et des nymphes.

Cette nouvelle espèce présente des caractères intermédiaires entre les genres *Stricticimex* d'une part et *Crassicimex* d'autre part, elle est cependant plus proche du premier genre.

Le rostre est nettement plus court que la longueur de la tête sans le labre. Dans les deux sexes le segment apical du rostre n'est que légèrement plus long que large, la *ratio* longueur : largeur est de 1,6 pour la femelle et de 1,4 pour le mâle.

Les yeux sont plus proéminents que chez *Crassicimex* et ressemblent à ceux des espèces du genre *Stricticimex*.

Les tibias II et III portent dans les 2 sexes de nombreux poils courts et sur leur bord dorsal un certain nombre de poils beaucoup plus longs et forts. Ce caractère n'a été signalé jusqu'à présent que chez *Crassicimex*. Notons cependant que KLEIN (1969) a rangé dans le genre *Crassicimex* une nouvelle espèce dont tous les tibias ne portent que des poils courts.

Notons encore que les tibias I et II portent une petite touffe à base étroite, formée d'une vingtaine de poils à sommet recourbé. Cette touffe n'a pas été signalée dans les genres *Crassicimex* et *Stricticimex*.

Nous voudrions remercier ici M. P. BASILEWSKY, Directeur du département d'Entomologe et M. G. SCHMITZ, Chef de la section des Hémiptères, du Musée royal d'Afrique Centrale, qui ont aimablement mis leurs collections à notre disposition pour notre étude.

Cette nouvelle espèce est dédiée à son récolteur M. F. PUYLAERT du Musée royal de l'Afrique Centrale.

Falcoz, L. (1931). Matériaux pour la connaissance des Diptères Pupipares. I.

Parmi le nombre des Diptères Pupipares de provenances diverses que j'ai eu l'occasion d'étudier récemment, certains, jugés nouveaux, seront décrits ici, d'autres, déjà connus, mais offrant quelques intérêt aux divers poins de vue systématique, éthologique ou géographique, feront l'objet d'une mention spéciale.

Farhang-Azad, A. and D. A. Schlitter (1978). *Capillaria hepatica* in small mammals collected from Shoa province, Ethiopia.

A total of 1,110 small mammals has been examined for *Capillaria hepatica* in Shoa Province, Ethiopia. Nineteen of 308 (6.2%) *Rattus rattus* and 1 of 212 (0.5%) *Praomys albipes* were infected. The data indicate that *C. hepatica* was essentially limited to commensal rats (*R. rattus*).

Farney, J. and E. D. Fleharty (1969). Aspect ratio, loading, wing span, and membrane areas of bats.

NOTE: Total loading is defined as the weight divided by the area of the wings and tail membranes. Aspect ratio is the wing span squared, divided by the area of the wings.

Fedyk, A. and S. Fedyk (1970). Karyotypes of some species of Vespertilionid bats from Poland.

Chromosomes ot 5 species of Vespertilionidae are described: *Plecotus auritus* - 2N = 32, NF = 54, *Plecotus austriacus*,- 2N = 32, NF = 54, *Myotis daubentoni* - 2N = 44, NF = 54, *Nyctalus notula* - 2N = 46, NF = 54, and *Eptesicus serotinus* - W = 50, NF = 52. The obtained results were compared with earlier data to show geographic variability of the chromosome formula in *M. daubentoni*, and differences in the morphology of Y chromosome in *Eptesicus serotinus*. Possible mechanisms of

differentiation of karyotypes in Vespertilionidae were also discussed and some phylogenetic conclusions presented.

Feiler, A. (1984). Ueber Säugetiere der Insel Sao Tomé (Mammalia).

During a stay for three weeks in June 1983 on Säo Tomé *Rousettus aegyptiacus* subsp. could be detected for the first time, and *Myonycteris brachycephala* has been found in a second specimen since its description by BOCAGE (1889). Besides, other mammals could be watched.

Feiler, A. (1986). Zur Faunistik und Biometrie angolanischer Fledermäuse (Mammalia, Mega- et Microchiroptera).

Data on faunistics and biometry of the following Megachiroptera: *Hypsignathus monstrosus, Epomophorus wahlbergi, Epomophorus angolensis, Epomops iranqueti, Micropteropus pusillus, Plerotes anchietae, Eidolon helvum, Rousettus aegyptiacus, Lissonycteris angolensis*, are given, gained by self-collected materials from Uige, Luanda and its surroundings as well as from materials of other Angolian places which exist in the collections of the University of Angola and in the Museum für Naturkunde Berlin. Besides, several collected Microchiroptera are discussed. *Triaenops persicus* were found in Angola for the first time.

Feiler, A. (1988). Die Säugetiere der Inseln im Golf von Guinea und ihre Beziehungen zur Säugetierfauna des westafrikanischen Festlandes (Mammalia).

A short survey is given on the mammal fauna of the islands in the Gulf of Guinea evaluating the literature and a short trip of the author to São Tomé in 1983:

(1) Endemic species (*Crocidura thomensis, Myonycteris brachycephala*) are existing only on the Island of São Tomé.

(2) Non-endemic species are originally wild-living species, or species spread by man.

(2a) Among the originally wild-living species one species (*Eidolon helvum*) occurs on all Islands without intraspecific differentiation.

(2b) The other species do not live on all islands, only on some of them. There are as well species forming special subspecies on the islands (*Hipposideros commersoni*), as species having the same subspecies like the animals in the nearby situated continental forest areas (*Hipposideros ruber guineensis*). *Rousettus aegyptiacus* was detected for the first time 1983 on São Tomé by the author.

(2c) Among the species spread by man there are: cosmopolits (*Rattus rattus, Rattus norvegicus, Mus musculus*), intentionally introduced species (*Viverra civetta, Mustela nivalis numidica*), and species which are secundarily wild-living (pig).

(2d) Concerning the occurrence of the species *Cercopithecus mona* and *Miniopterus minor newtoni* the human influence is uncertain.

The reasons for the occurrence of the different species on the islands are discussed.

Feiler, A. (1990). Distribution of mammals in Angola and notes on biogeography.

A brief review is given on faunal investigations in Angola including the author's results in the years 1982/83. All Angolan terrestrial mammal species are listed and their distributions are compared with neighbouring countries. Previously proposed zoogeographical borders are discussed.

Feiler, A., J. Haft and P. Widmann (1993). Beobachtungen und Untersuchungen an Säugetieren der Insel Sao Tomé (Golf von Guinea) (Mammalia).

All wild living mammal species evident on Säo Tome, are demonstrated. Remarks on distribution, biology, ecology and morphology are given. There are the following species respectively subspecies: *Crocidura thomensis, Eidolon helvum, Rousettus aegyptiacus thomensis* subsp. n., *Myonycteris brachycephala, Hipposideros commersoni thomensis, Hipposideros ruber, Miniopterus minor, Cercopithecus mona, Sus scrofa* (forma domestica), *Canis lupus* (forma domestica), *Mustela nivalis, Civettictis civetta, Rattus rattus, Rattus norvegicus* and *Mus musculus* (?).

Feiler, A. and A. L. Pires (1984). Ueber *Chaerophon pumila* (Cretzschmar) in Angola (Mammalia, Chiroptera, Molossidae).

Some observations concerning distribution, biology, and reproduction äs well several body measures of the bat species *Chaerephon pumila* from Angola are dealt with.

Felten, H. (1962). Bemerkungen zu Fledermäusen der Gattungen *Rhinopoma* und *Taphozous* (Mammalia, Chiroptera).

Das Senckenberg-Museum erhielt kürzlich einige Fledermäuse aus der Rajasthan-Wüste in NW-Indien, die taxionomische und tiergeographische Bemerkungen zu Arten der Gattungen *Rhinopoma* (Rhinopomatidae) und *Taphozous* (Emballonuridae) erlauben.

Felten, H. (1971). Eine neue Art der Fledermaus-Gattung *Eptesicus* aus Kleinasien (Chiroptera: Vespertilionidae).

Specimens of the genus *Eptesicus* from Europe, USSR, Asia Minor, Iraq, Iran and Afghanistan are compared (measurements, skull, colour) to describe a new species of this genus. Members of other species are treated under distributional and taxonomic points of view.

Felten, H., F. Spitzenberger and G. Storch (1977). Zur Kleinsaugerfauna West-Anatoliens. Teil IIIa.

On small mammals from Western Asia Minor. Part IIIa.- Samples of the Horseshoe Bats (Chiroptera: Rhinolophidae) *Rhinolopbus ferrumequinum, R. hipposideros, R. euryale, R. mehelyi*, and *R. blasii* (with description of a new subspecies from Afghanistan) from Western Asia Minor have been investigated in relation to populations from the Mediterranean region and other parts of their total ränge. Data are given on systematics, variability and distribution. Two closely related species (*R. bocharicus* and *R. lepidus*) have been treated similarly. - Of Vespertilionidae (Chiroptera), the two closely related Mouse-eared Bats *Myotis myotis* and *M. blythi* are treated in a similar way. The possibilities of their distinction are discussed, and a new subspecies of *M. blythi* is described from N-Africa.

Fenton, M. B. (1972). The structure of aerial-feeding bat faunas as indicated by ears and wing elements.

Structure in the aerial-feeding bat faunas of southeastern Ontario, southern British Columbia, Cameroun, Guyana, and the Philippines is demonstrated on the basis of wing shape and relative ear size. The former is derived from the ratio of the length of the third digit metacarpal to the length of the fifth digit metacarpal (III/V) and the latter from the ratio of the length of the ear to the length of the forearm (E/FA). It is assumed that these characters affect flight pattern and echolocatory characteristics and thus prey selection in the aerial-feeding, echolocating bat. On the basis of these characteristics some Emballonurinae and the Mormoopidae are thought to replace the Vespertilionidae in the neotropics, and some Phyllostomatinae may be neotropical counterparts of the Rhinolophidae, Nycteridae, and Megadermatidae. The Diclidurinae seem to parallel the old world *Taphozous* in wing shape and ear size.

La forme de l'aile et la taille relative de l'oreille ont servi a établir la structure des faunes de chauves-souris se nourrissant au vol dans le sud-est de l'Ontario, le sud de la Colombie-Britannique, le Cameroun, la Guyane et les Philippines. Pour connaitre la forme de l'aile, on a calculé le rapport entre les longueurs des metacarpes des troisième et cinquième doigts (III/V) et, dans le cas de l'oreille, on a calculé le rapport entre la longueur de celle-ci et la longueur de l'avant-bras (E/FA). On émet l'hypothese que ces caractères affectent le vol et la faculté d'écholocation, et, par consequent, la sélection des proies, chez la chauve-souris se nourrissant au vol, par echolocauon. D'apres ces caractéristiques, il semble que les Emballonurinae et les Mormoopidae remplacent les Vespertilionidae dans la zone neotropicale et que certains Phyllostomatinae soient les equivalents neotropicaux des Rhinolophidae, des Nycteridae et des Megadermatidae. De la meme façon, les Diclidurinae paraissent remplacer le *Taphozous* du vieux monde.

Fenton, M. B. (1975). Observations on the Biology of some Rhodesian bats, including a key to the Chiroptera of Rhodesia.

Weights of 359 bats of 25 species are presented with vocalization frequencies for 14 species of Microchiroptera. Circumstantial evidence of visual orientation while bats were producing echolocation cries was obtained for eight species of microchiropterans. Insect wings obtained under roosts used by *Rhinolophus landeri* (Rhinolophidae) and *Nycteris thebaica* (Nycteridae) indicate differential use of Noctuidae and Sphingidae (Lepidoptera) as food, and selective feeding on particular prey species. Higher levels of flight activity of bats were found near buildings than over adjacent habitats. Frequencies of capture of 264 bats of 20 species in nine habitats at the Hostes Nicolle Institute of Wild Life Research are analysed; brachystegia woodland and areas over large rivers (the Sengwa and the Manyoni) had, respectively, the most and least diverse bat faunas. Availability of roosts affects the bat fauna of an area by selectively excluding species with specific roost requirements, where those requirements are not met. Partitioning of food resources by food type, size of bats, and, for insectivorous forms, wing shape and relative car size, is discussed. *Laephotis angolensis* (Vespertilionidae) is reported for the first time from Rhodesia. Included here is a key to 61 species of bats known (57) or expected (4) to occur in Rhodesia.

Fenton, M. B. (1983). Roosts used by the African bat, *Scotophilus leucogaster* (Chiroptera: Vespertilionidae).

The roosts of *Scotophilus leucogaster* were located by radio-tracking in Mopani woodland in the Sengwa Wildlife Research Area in Zimbabwe between 14 January and 12 February 1982. Bats changed roost trees from one day to the next, usually staying within relatively small areas of woodland. Bats frequently moved between night and day roosts. This behavior made it impossible to predict the location of bats from one day to the next.

Fenton, M. B. (1985). The feeding behaviour of insectivorous bats: Echolocation, foraging strategies, and resource partitioning.

This paper uses the results of work on temperate and tropical Microchiroptera to explore the relevance of ideas about interspecific competition to faunas of insectivorous bats. The bat fauna of the Sengwa Wildlife Research Area in Zimbabwe is the focus of much of the work reviewed here. The value of echolocation as a window on the behaviour and foraging ecology of Microchiroptera is considered, and some apparatus and approaches for exploiting this avenue of investigation are reviewed. A tentative association between different foraging strategies and the basic design of echolocation calls is proposed. Some insectivorous bats pursue flying prey, hunting in continuous flight or from perches; others are gleaners, taking prey from surfaces. Bats that hunt flying prey may operate at long or short range. Another group of bats, including rhinolophids, hipposiderids. and the mormoopid *Pteronotus parnellii* use echolocation to detect fluttering targets. In spite of many assertions to the contrary, evidence for insectivorous bats partitioning resources (food or roosts) remains ambiguous, overwhelmed by variation in prey selected and lack of data. African bats are ideal subjects for further studies of the dynamics of interactions between sympatric species, including the possible effect of limiting (?) resources.

Fenton, M. B. (1986b). *Hipposideros caffer* (Chiroptera: Hipposideridae) in Zimbabwe: morphology and echolocation calls.

The results of this study of morphological variation and variation in echolocation calls indicate that only specimens with narrow lateral nasal inflations (=*Hipposideros caffer*) have been reported from Zimbabwe to date. In both Zambia and Mocambique, single localities yielded both specimens with narrow or wide lateral nasal inflations (nominally, *H. caffer* and *H. ruber*, respectively). There are significant differences in echolocation calls between one site in Zimbabwe and another near the Zimbabwe South Africa border that are not paralleled by significant morphological differences.

Fenton, M. B. (1992). Pelage pattern and crypsis in roosting bats: *Taphozous mauritianus* and *Epomophorus* species.

The grizzled dorsal pelage of *Taphozous mauritianus* (Emballonuridae) contributes to the camouflage of these bats when they are roosting on natural surfaces. The white ear spots of *Epomophorus* spp. (Pteropodidae) represent disruptive patterns contributing to the cryptic appearance of these bats when they are roosting in foliage.

Fenton, M. B. (1994). Echolocation: its impact on the behaviour and ecology of bats.

Echolocation is an active system of orientation involving the production of pulses of sound which are compared to echoes returning from the surroundings. Bats comprise the order Chiroptera, and while echolocation is a feature apparently common to all species in the suborder Microchiroptera, only one species in the suborder Megachiroptera is known to echolocate. Furthermore, not all echolocating bats use the same specific approach to echolocation. The short range nature of echolocation may be the reason why most Microchiroptera are small. Small size has metabolic consequences such as high metabolic rates and high energy demands. This, in turn, means that bats eat a great deal and many species exploit concentrations of food. Species in two families, the Rhinolophidae and Vespertilionidae, use heterothermy to minimize thermoregulatory costs and this affects the reproductive patterns of these bats. While echolocation does not appear to be energetically expensive in terms of sound production, the signals make bats conspicuous to other bats and to their prey. Information leakage affects many aspects of bats' behaviour. Bat morphology often reflects echolocation, from pinnae that may be tuned to the frequencies in echolocation calls, to species with large ears for collecting low frequency sounds associated with the movements of prey. Noseleafs affect the patterns of sound emission. Bats that depend upon the sounds of prey often do not rely on echolocation for locating and assessing targets, and the role of echolocation in the lives of fruit, nectar and pollen, and blood feeding bats remains unclear. Echolocation and its attendant specializations are components in the ongoing debate about whether or not bats are monophyletic.

L'écholocalisation est un système d'orientation mettant en jeu la production de vibrations sonores qui sont comparées aux échos réfléchis par le milieu. Les chauves-souris font partie de l'ordre des Chiroptères et, bien que l'écholocalisation soit une caractéristique apparemment commune à toutes les espèces du sous-ordre des Microchiroptères, on ne connaît qu'une seule espèce du sous-ordre des Mégachiroptères qui écholocalise. De plus, les chauves-souris qui écholocalisent n'utilisent pas toutes la même technique. Le fait que l'écholocalisation serve à la communication à faible portée pourrait expliquer la petite taille de la plupart des Microchiroptères. Une petite taille a des conséquences sur le métabolisme, comme des taux métaboliques et des besoins énergétiques élevés. Cela signifie donc que les chauves-souris mangent beaucoup et que de nombreuses espèces profitent de concentrations de nourriture. Les espèces appartenant aux familles des Rhinolophidea et des Vespertilionidea peuvent minimiser les dépenses entraînées par la thermorégulation grâce à l'hétérothermie, laquelle influence leur comportements de reproduction. Bien que l'écholocalisation ne semble pas entraîner une dépense énergétique élevée, les signaux rendent les chauves-souris repérables par d'autres chauves-souris ainsi que par leurs proies. La fuite d'information influence plusieurs aspects du comportement des chauves-souris. Le type d'écholocalisation est reflété dans la morphologie des chauves-souris, des espèces dotées de pavillons d'oreilles s'ajustant aux fréquences des émissions d'écholocalisation, aux espèces dotées de grandes oreilles captant les basses fréquences associées aux mouvements des proies. Les appendices nasaux influencent les patrons d'émission des sons. Les chauves-souris qui dépendent des sons émis par leurs proies ne se servent pas toujours de l'écholocalisation pour situer et localiser les cibles. Le rôle de l'écholocalisation chez les chauves-souris frugivores, nectarivores, pollinivores, ainsi que hématophages reste à élucider. L'écholocalisation et les spécialisations connexes font partie du débat inachevé visant à savoir si les chauves-souris sont monophylétiques ou non.

Fenton, M. B. (1997). Science and the conservation of bats.

The conservation implications of some recent advances in our knowledge about the ecology and behavior of bats are presented. A central question facing bat biologists is the relative importances of roosts and food as limiting factors in the population biology of bats. There is no reason to presume that the answer is the same for all species and the available data suggest intraspecific variation. This question is important for either conservation or behavior and ecology. Eavesdropping on the species-specific echolocation calls of bats has allowed documentation of distribution and habitat use by some bats although variability of calls complicates this picture. Radiotracking and surveys have produced data on use of space by bats. Although foraging areas and roosts are vital resources for bats, the associations between species of bats and habitats are not always clear. The mobility of bats and the low cost of flight together blur the link between bats and particular habitats. Radiotracking demonstrates how mobility gives bats access to mosaics of habitats, partly reflecting their size and flight characteristics, and the scale of habitat availability. For some species, access to mosaics of habitats for foraging is critical. Activities of humans influence the habitats available to bats and can generate feeding and roosting opportunities. The use that roosting bats make of buildings is an obvious example of bats benefitting from activities of humans. Another is bats feeding in the concentrations of insects at lights. In promoting the conservation of bats, it is important to consider people's perceptions of these animals, which are colored by the impact of bats on public health. Public interest in bats has vastly outstripped scientific research about them, presenting interesting challenges and opportunities for bat biologists.

Fenton, M. B., N. G. H. Boyle, T. M. Harrison and D. J. Oxley (1977a). Activity patterns, habitat use, and prey selection by some African insectivorous bats.

Between 10 January and 14 February 1976, activity patterns, habitat use, and selection of prey by some insectivorous bats were studied in mopane and brachystegia deciduous woodlands in the Sengwa Wild Life Research Area of the Hostes Nicolle Institute of Wild Life Research in Rhodesia (18°10' S, 23°13' E), using ultrasonic (=bat) detectors, light tags, and analysis of insect remains from bat feces. Some bats were active throughout the night, in part feeding, but in general bat activity was reduced from around midnight until just before dawn. Rain tended to suppress bat activity, although

the timing of the rain was important. Since insects remained active in the rain, we suspect that the responses of the bats to rain reflected problems of thermoregulation associated with wet fur, and the effect of multiple echoes and atrenuation of high-frequency sound on echolocation. Bright moonlight suppressed bat activity and altered the foraging patterns of light-tagged *Scolophilus viridis, Eptesicus capensis*, and *Nycticeius schlieffeni* which on dark nights fed above the canopy and along the grassland sides of meadow/woodland interfaces, but which were mainly restricted within the woodland on bright moonlight nights. Since a pair of bat hawks (*Macheiramphus alcinus*) nested near the study area and fed mainly on bats, we suggest that the bats' responses to moonlight are predator-avoidance behaviors. *S. viridis* (15 - 20 g), *E. capensis* (5 - 6 g), and *N. schlieffeni* (5 - 6 g) appeared to feed on concentrations of insects, and responded quickly to aggregations of insects around lights. These bats fed mainly on beetles (*S. viridis* - 85%; *E. capensis* - 68%; *N. schlieffeni* - 72%), although *E. capensis* also took moths (18.5%) and *N. schlieffeni* took flies (19%). Other insectivorous bats in the study area fed mainly on moths (*Hipposideros caffer, Laephotis angolensis, Glauconycteris variegate* or beetles (*Scotopbilus nigrita*), or both (*Rhinolophus hildebrandti, Pipistrellus nanus*). Data for some insectivorous bats from the vicinity of Salisbury, Rhodesia, indicated a similar separation for some bats (moths - *Nycteris thebaica, Rhinolophus landeri*; beetles - *Rhinolopus clivosus*) in addition to two species of *Miniopterus* which took mainly aquatic Diptera. The data from this study, with those from other works, are used to illustrate partitioning of insect prey by the species of bats known to occur in the Sengwa Wild Life Research Area.

Fenton, M. B., R. M. Brigham, A. M. Mills and I. L. Rautenbach (1985). The roosting and foraging areas of *Epomophorus wahlbergi* (Pteropodidae) and *Scotophilus viridis* (Vespertilionidae) in Kruger National Park, South Africa.

In April 1984, in Kruger National Park, we used radio tracking to study the roosting and foraging behavior of *Epomophorus wahlbergi* and *Scotophilus viridis*, two bats known to roost in trees. Most *E. wahlbergi* roosted in foliage in riverine forest, although some roosted in a shelter cave; the *S. viridis* invariably roosted in hollow mopane trees along the steep sides or tops of ridges. Neither species showed any strong evidence of changing the day roosts they used to minimize commuting distance to foraging areas, although both species regularly switched locations of day roosts within localized areas. Switching day roosts may reduce predation

---

Fenton, M. B., D. H. M. Cumming, J. M. Hutton and C. M. Swanepoel (1987a). Foraging and habitat use by *Nycteris grandis* (Chiroptera: Nycteridae) in Zimbabwe.

This study describes the foraging strategies, foraging areas, and roosts used by four female radio-tagged *Nycteris grandis* along the Zambezi River in Mana Pools National Park in Zimbabwe. The bats exhibited two foraging strategies, sometimes hunting from perches, other times flying continuously close to the ground. Some individuals used one strategy more than the other. During the study, the bats fed mainly on frogs, selecting only *Ptychadena anchietae*; they also took crickets, moths and cicadas. Each bat usually consumed two frogs each night and patterns of occupation of feeding perches suggest that their foraging efficiency was between 21 and 36%. The marked bats roosted in an old water tower or in a hollow *Acacia albida*. Four of five marked females were nursing young during this study.

Fenton, M. B., D. H. M. Cumming, I. L. Rautenbach, G. S. Cumming, M. S. Cumming, G. Ford, R. D. Taylor, J. Dunlop, M. D. Hovorka, D. S. Johnston, C. V. Portfors, M. C. Kalcounis and Z. Mahlanga (1998a). Bats and the loss of tree canopy in African woodlands.

We studied the activity patterns, abundance, diversity, and diets of bats, along with the abundance of nocturnal volant insects, at 30 sites in Miombo woodland in northern Zimbabwe. The woodland at 50 M of the sites had been disturbed by high elephant densities to the extent that the tree canopy was greatly reduced. The tree canopy was intact at the other sites. Intact and impacted sites differed significantly in tree (> 3 m t all; > 15 cm basal diameter) and shrub (1 - 3 m tall; < 1 m tall) diversity

and cover. At each site we used ultraviolet lights to sample insects and mist nets and bat detectors to sample bats. To assess their diets we collected and analyzed feces from captured bats. We caught 343 bats representing the families Pteropodidae (1 species), Vespertilionidae (11 species) and Molossidae (3 species). The molossids and vespertilionids are all aerial feeders taking airborne insects. Bat species richness, abundance, and activity were greater at intact than at impacted sites, but these differences were statistically significant only at adjacent sites (< 5 km apart) not at more distant intact and impacted sites (> 20 km apart). At the adjacent sites we caught a significantly greater proportion of small (< 10 g) bats at intact than at impacted sites. These dat and a signifantly greater proportion of *Scotophilus* species (> 10 g) caught during the early evening at intact than at impacted sites suggested that the removal of canopy trees affected roost availability for the bats. Although larger species may have commuted between intact and impacted sites, smaller species did not. In contrast, the availability of prey did not appear to have been significantly affected by the removal of the canopy trees, as indicated by the light-trap catches of insects and the bat's diets. Most bats ate mainly beetles and moths, the most abundant insects samples at the ultraviolet lights. Our findings suggest that aerial-feeding bats such as vespertilionids and molossids do not appear to be useful indicators of disturbance in this habitat, even in the face of significant loss of tree canopy.

Estudiamos los patrones de actividad, abundancia, diversidat y dietas de murciélagos, al igual que la abundancia de insectos voladores nocturnes en 30 sitios en el bosque de Miombo al norte de Zimbabwe. El bosque ha sido impactado en un 50 M de los sitios por densidades altas de elefantes, a tal grado que el dosel de árboles ha sido reducido grandemente. El dosel estuvo intacto en los otros sitios. Sitios intactos e impactados difieren significativamente en diversidad y cobertura de árboles (> 3 m de altura; > 15 cm de diámetro basal) y arbustos (1 - 3 m de altura; < 1 m de altura). En cada sitio usamos luz ultravioleta para musestrear insectos y redes y dectores de murciélagos para muestrear murciélagos. Para determinar sus disetas, colectamos y analizamos heces de los murciélagos capturados. Capturamos 343 murciélagos representando a las familias Pteropodidae (1 especie), Vespertilionidae (11 especies) y Molossidae (3 especies). Los molósidos y vespertiliónidos son todos consumidores aéreos, altimentándose de insectos voladores. La riqueza de especies, abundancia y actividad de murciélagos fue mayor en sitios intactos, pero estas diferencias fueron estadísticamente significantivas solo en sitios intactos e impactados adyacentes (> 5 km aparte) pero no cuando eran mas distantes (> 20 km aparte). En sitios adyacentes capturamos une proporción significativamente mayor de murciélagos pequeños (< 10 g) en sitios intactos que en sitios impactados. Estos datos y une proporción significativamente mayor de especies de *Scotophilus* (> 10 g) durante el atardecer en sitios intactos comparados con sitios impactados sugiere que la remoción del dosel afecta la viabilidad de perchas para los murciélagos. A pesar de que especies mas grandes podrían viajar diariamente entre sitios intactos e impactados, la especies pequeñas no lo hicieron. En contraste, la viabilidad de presas aparentemente no fue significativamente afectada por la remoción del dosel, a como lo indicaron la captura de insectos en trampas de luz y las dietas de los murciélagos. La mayoría de los murciélagos se alimentaron principalmente de escarabajos y mariposas nocturnas, siendo los insectos mas abundantes capturado en las trampas de luz ultravioleta. Nuestros resultados sugieren que los murciélagos de alimentación aérea como son los vespertiliónidos y molósidos, no aparentan ser indicadores útiles de disturbación en este tipo de hábitat, a pesar de une evidente pérdida significativa del dosel.

Fenton, M. B. and J. H. Fullard (1979). The influence of moth hearing on bat echolocation strategies.

The ears of moths we tested in Canada and Côte d'Ivoire are most sensitive to sounds between 20 and 40 kHz, and much less sensitive to sound over 65 kHz. The insectivorous bats most commonly encountered in these (and other) locations use high intensity, frequency modulated echolocation calls with frequency components in the 20 - 40 kHz range, making them detectable by the most sensitive tympanate moths up to 40 m away. In Africa bats such as species in the Nycteridae, Megadermatidae, and some in the Hipposideridae, use low intensity calls with high frequency components, and these species are not detectable by moths at over 2 m. The hearing ability of moths may significantly influence the feeding efficiency of bats, and changes in the intensity and frequency components of bat echolocation calls can drastically reduce the range at which bats are detected, and thus the time available to the moths for evasive behaviour (Fig. 4). The use of low intensity, high frequency echolocation calls may constitute a bat counter-maneuver against insects tuned to bat calls.

Fenton, M. B., C. L. Gaudet and M. L. Leonard (1983). Feeding behaviour of the bats *Nycteris grandis* and *Nycteris thebaica* (Nycteridae) in captivity.

The feeding and hunting behaviour of *Nycteris grandis* and *N. thebaica* was observed in captivity at the Sengwa Wildlife Research Area in Zimbabwe in January and February 1982. Both species preferentially selected katydids and beetles over moths, and relied heavily on acoustic stimuli emanating from prey to detect targets. *Nycteris grandis* readily consumed frogs and bats and appeared not to use the calls of male frogs or the echolocation calls of other bats to locate prey. Both species produced echolocation calls during attacks on prey, increasing the rates of pulse repetition as they closed with targets and suggesting the use of echolocation in hunting. The echolocation calls of *N. grandis* are described along with general observations of the behaviour of both species.

Fenton, M. B. and D. R. Griffin (1997). High-altitude pursuit of insects by echolocating bats.

Bat detectors on helium-filled kite balloons revealed echolocating bats active at altitudes <= 600 m above the ground over *Brachystegia* woodland in the Sengwa Wildlife Research Area, Zimbabwe. Feeding buzzes indicated that bats were actively foraging to 600 m. At least seven species of bats were detected, including six molossids and one emballonurid.

Fenton, M. B. and R. L. Peterson (1972). Further notes on *Tadarida aloysiisabaudiae* and *Tadarida russata* (Chiroptera - Molossidae - Africa).

Eleven additional specimens of *Tadarida aloysiisabaudiae* and one of *T. russata* extend the known range of both species westward to Ghana. Their allopatric ranges appear to be restricted to a narrow zone extending at least 3300 km (2100 mi) just north of the equator. *Tadarida russata* has been taken only in or adjacent to the "invasive Guinea woodland," whereas all *T. aloysiisabaudiae* have been collected peripheral to it. Recent specimens taken in association with *T. russata* were *T. (Xiphonycteris) spurrelli* and *T. thersites*. Measurements of the *T. russata* from Ghana are compared with those from previously recorded specimens, and a statistical summary for the measurements of *T. aloysiisabaudiae* is given. In addition, other morphological comparisons including the first illustrations of the palatal ridges of both species are provided.

Onze spécimens additionnels de *Tadarida aloysiisabaudiae* et un de *T. russata* étendent l'aire de répartition de ces espèces vers l'ouest du Ghana. Leurs répartitions allopatriques semblent être restreintes à une bande éroite d'au moins 3300 km (2100 mi) située juste au nord de l'equateur. *Tadarida russata* a été prise seulement dans, ou adjacente à, la "région boisée envahissante de la Guinée" alors que tous les *T. aloysiisabaudiae* ont été pris dans une zone périphérique à cette région. Des spécimens de *T. (Xiphonycteris) spurrelli* et de *T. thersites* ont été trouvés récemment, associés avec *T. russata*. Les mesures prises sur les *T. russata* du Ghana sont comparées avec celles des spécimens pris précédemment et un sommaire statistique des mesures faites sur *T. aloysiisabaudiae* est donné. D'autres comparaisons morphologiques sont données, parmi lesquelles on trouvera les premières illustrations des crêtes palatales des deux espèces.

Fenton, M. B., C. V. Portfors, I. L. Rautenbach and J. M. Waterman (1998b). Compromises: sound frequencies used in echolocation by aerial-feeding bats.

Hunting aerial-feeding bats, species that take airborne prey (usually flying insects), use echolocation to detect, track, and assess targets. The echolocation calls of aerial-feeding bats at sites in Canada (British Columbia and Ontario), Mexico, Brazil, and Zimbabwe were significantly dominated by frequencies between 20 and 60 kHz, although at the more tropical locations some aerial-feeding bats

used echolocation calls with most energy < 20 or > 60 kHz. The impact of frequency-specific attenuation, perhaps combined with frequency-specific, hearing-based defenses of some insects, suggests that by using echolocation calls < 20 kHz, bats could both extend the effective range of echolocation and make their calls less conspicuous to insect ears. Bats using calls > 60 kHz would be less conspicuous to the insects. We found two patterns of echolocation-call behaviour. Most adjacent echolocation calls, and all that were dominated by sounds > 20 kHz, showed large (80%) overlap in bandwidth. The other pattern involved much less overlap in bandwidth (0 - 30%) between adjacent calls and was evident in the calls of the molossid *Tadarida midas*, which used echolocation calls dominated by sounds < 20 kHz. This behaviour would allow the echolocating bat to extend its effective range of perception by separating in frequency the echoes returning from adjacent calls.

Les chauves-souris qui se nourrissent au vol, donc de proies qui volent (généralement des insectes), utilisent l'echolocation pour détecter, suivre et évaluer leurs cibles. Les cris d'écholocation de chauves-souris au vol à divers sites au Canada (Colombie-Britannique et Ontario), au Mexique, au Brésil et au Zimbabwe sont dominés de façon significative par les frequences situées entre 20 et 60 kHz, quoique, dans les plus tropicales de ces régions, certaines chauves-souris utilisent plus souvent des cris < 20 kHz ou > 60 kHz. Les effets de l'attenuation du son en fonction de la fréquence, peut-être en combinaison avec la nature du système de défense acoustique de certains insectes base sur la fréquence des sons, permet de croire qu'en utilisant des cris d'écholocation < 20 kHz, les chauves-souris peuvent augmenter l'étendue efficace de leurs cris et les rendre moins audibles aux insectes. Les chauves-souris qui émettent des cris > 60 kHz sont moins susceptibles d'être perçues par les insectes. Nous avons constate l'existence de deux types de comportemems d'écholocation. La plupart des cris adjacents dominés par des sons > 20 kHz se chevauchent largement (80%) sur la bande de frequence. Dans l'autre type de comportement, il y a beaucoup moins de chevauchement des cris adjacents sur la bande de fréquence (0 - 30%) et ce comportement a été observé chez le molosse *Tadarida midas* qui utilise surtout des cris < 20 kHz. Ce comportement peut permettre à la chauve-souris émettrice d'augmenter l'étendue efficace de sa perception en émettant ses cris de façon à ce que les échos des cris adjacents qui lui reviennent n'aient pas des fréquences voisines.

Fenton, M. B. and I. L. Rautenbach (1986). A comparison of the roosting and foraging behaviour of three species of African insectivorous bats (Rhinolophidae, Vespertilionidae, and Molossidae).

We used radio tracking to study the roosting and foraging behaviour of *Rhinolophus hildebrandti, Scotophilus borbonicus* (=*S. viridis* and *S. leucogaster*), and *Tadarida midas* in the Pafuri Region of Kruger National Park, South Africa in November 1985. Although the species roosted in different locations (*S. borbonicus* in hollow mopane trees, *R. hildebrandti* in a hollow baobab tree, and *T. midas* in buildings), roost temperatures and the bats' body temperatures were generally similar. The *S. borbonicus* and *T. midas* flew continuously while foraging in pursuit of flying prey; the *R. hildebrandti* switched between continuous flight, and hunting from a perch also in pursuit of flying prey. All three species foraged for about 60 min nightly, but the *T. midas* ventured at least 10 km from their roosts, while for *S. borbonicus* and *R. hildebrandti*, comparable figures were 4 and 2 km, respectively. The three species showed a spectrum of wing morphology and echolocation call design features from clutter resistant (*R. hildebrandti*) to relatively clutter resistant (*S. borbonicus*) and clutter intolerant (*T. midas*) and the foraging areas used by the bats corresponded to these features. *Rhinolophus hildebrandti* foraged below the canopy in riverine forest and deciduous woodland, while *S. borbonicus* foraged around the canopy but not closer than 0.5 m to it, while *T. midas* foraged in the open well above the canopy. These differences are discussed along with variations in foraging behaviour in insectivorous bats.

La radiotélémetrie a permis d'étudier les comportements de rassemblement au dortoir et de recherche de nourriture chez *Rhinolophus hildebrandti, Scotophilus borbonicus* (=*S. viridis* et *S. leucogaster*) et *Tadarida midas* dans la région Pafuri du Pare National de Kruger, Afrique du Sud, en novembre 1985. Les trois espèces utilisaient des dortoirs differents (*S. borbonicus*, les troncs creux de bois de fer, *R. hildebrandti* le tronc creux d'un baobab et *T. midas* les édifices), mais la température etait à peu près la même dans les trois types de dortoirs et celle des chauves-souris etait generalement semblable

chez les trois especes. Les *S. borbonicus* et les *T. midas* chassaient leurs proies volantes en vol continu; les *R. hildebrandti* utilisaient en alternance le vol continu et la chasse à partir d'un perchoir, également à la poursuite de proies volantes. Les trois espèces chassaient durant environ 60 min par nuit, mais les *T. midas* s'aventuraient parfois jusqu'a 10 km de leur dortoir, alors que les*S. borbonicus* ne s'en éloignaient pas de plus de 4 km et les *R. hildebrandti*, pas de plus de 2 km. Chez les trois espèces, il y a tout un spectre de morphologie des ailes et les cris d'écholocation varient selon l'espece: resistants a la confusion chez *R. hildebrandti*, relativement résistants à la confusion chez *S. borbonicus* et intolerants à la confusion chez *T. midas* et les territoires de chasse utilisés par les trois espèces variaient en fonction de ces caractéristiques. *Rhinolophus hildebrandti* chassait sous la couverture d'arbres dans les forêts ripariennes et les bois décidus, *S. borbonicus* chassait autour de la couverture d'arbre, mais en restait toujours éloigné d'au moins 0,5 m, alors que *T. midas* chassait en terrain ouvert, bien au-dessus de la couverture d'arbres. Ces differences et les variations des comportements de recherche de nourriture chez les chauves-souris insectivores font l'objet d'une discussion.

Fenton, M. B., I. L. Rautenbach, D. Chipese, M. B. Cumming, M. K. Musgrave, J. S. Taylor and T. Volpers (1993). Variation in foraging behaviour, habitat use, and diet of Large slit-faced bats (*Nycteris grandis*).

Examined the diet of *Nycteris grandis*, a 30 - 35 g African nycterid which varied significantly from year to year, season to season and roost to roost, suggesting flexible foraging behaviour and opportunism. Frogs, insects, and bats formed the bulk of the bats' diet. Although five species of frogs were consumed, two dominated the diet. Insect prey were mainly larger Lepidoptera and Orthoptera with occasional consumption of smaller species (< 10 g) of bats. Diurnal insects (butterflies - Lepidoptera; dragon flies - Odonata) and small (< 10 g) birds also were eaten. Over 14 nights in June 1990, prey taken by *N. grandis* did not reflect the availability of frogs, bats or insects. Radio-tagged *N. grandis* showed significant variation in approach to foraging, including the use of woodland or river habitat, and two foraging techniques, namely hunting from continuous flight or from a perch.

Fenton, M. B., I. L. Rautenbach, S. E. Smith, C. M. Swanepoel, J. Grosell and J. van Jaarsveld (1994). Raptors and bats: threats and opportunities.

To quantify the opportunity that emering bats present to raptors and the risks that hunting birds pose to these bats, predator-prey responses were documented by (1) counting emerging bats and recording their emergence patterns and (2) monitoring the presence of raptors and quantifying the incidence of raptor attacks on bats. Hobby falcons, *Falco subbuteo*, African goshawks, *Accipiter tachiro*, and Wahlberg's eagles, *Aquila wahlbergi*, succeeded in 51 % of 59 attacks on bats. The attacks occurred in woodlands (two attacks in 10 samples), and as bats emerged from colonies in buildings (three in 39 samples) and bridges (54 in 32 samples). Wahlberg's eagles hand hobby falcons attacked by stooping at flying bats whil African goshawks pursued them in flight. The birds usually took each captured bat to a perch to consume it, achieving handling times (from capture to eating to resumption of hunting) of 30 - 300 s. The raptors could maximize their use of bats by rapid handling of captures and by hunting at sites where bats were most numerous. This combination of factores meant that bats could form a siginificant portion of the diet of opportunistic raptors. Flying and emerging bats responded to attacks of potential attacks. For colonies of less than 100 bats, there was no relationship between emergence time and colony size, while bats tended to emerge significantly earlier from colonies of greater than 100 individuals. In all colonies, increasing numbers of bats decreased the risk of raptor attack by any individual. In colonies of less than 100, individuals could decrease their risk of attach by switching roosts, and by adjusting the times and duration of their emergences. Bats emerged earlier from larger colonies despite the increased risk of attack by raptors.

Fenton, M. B., C. M. Swanepoel, R. M. Brigham, J. Cebek and M. B. C. Hickey (1990). Foraging behavior and prey selection by large Slit-faced bats (*Nycteris grandis*; Chiroptera: Nycteridae).

Analysis of prey remains from beneath feeding perches in Mana Pools National Park in Zimbabwe between 1 Match 1987 and 30 April 1988, showed that *Nycteris grandis* fed mainly on frogs, bats, and arthropods, and occasionally took birds and fish. There was marked seasonal variation in the prey taken, with bars and frogs dominating the biomass at different times. In November 1987, all-night radio-tracking over 15 bat nights revealed significant differences in habitat use between individuals, with one bat foraging along and over the Zambezi River, and another foraging in *Acacia albida* woodland and over the river. The bats alternated between foraging from continuous flight and making short flights from perches, although foraging over the river usually entailed continuous flight. Significant differences in the use of these foraging strategies between 1987 and an earlier study coincided with differences in November rainfall, and a drastic reduction in the amount of food the bats consumed daily.

Fenton, M. B. and D. W. Thomas (1980). Dry-season overlap in activity patterns, habitat use, prey selection by sympatric African insectivorous bats.

We used mist nets, ultrasonic sensors, light tags, and analysis of feces to examine habitat use, activity patterns, and prey selection of some insectivorous bats during the dry season at the Sengwa Wild Life Research Area (18°10'S; 28°13'E) between 7 and 28 June 1977. The results show broad overlap in all parameters investigated for the 13 species present in the area during the dry season. During the wet season, some species of insectivorous bats relied more on beetles than on moths as food, or vice versa. The lack of food partitioning, particularly in the dry season, appears to conflict with theories of niches and competitive exclusion, but it is in accord with predictions based on optimum foraging strategy. We conclude that most insectivorous bats are opportunistic feeders, a strategy which results in a mosaic of specialized and generalized diets and which is compatible with their energetic demands. We report the first record of *Tadarida chapini* from Zimbabwe (Rhodesia).

Fenton, M. B., D. W. Thomas and R. Sasseen (1981). *Nycteris grandis* (Nycteridae): an African carnivorous bat.

Nycteris grandis in Mana Pools National Park in Zimbabwe regularly include a variety of vertebrates and arthropods in their diet, ranging from fish through frogs, bats and birds, to different Orthoptera, Lepidoptera and Coleoptera. Analysis of the faeces of these bats suggests a considerable range in size of prey taken, from the 10 g birds and bats to caddis flies 15 mm long.

Fenton, M. B., J. M. Waterman, J. D. Roth, E. Lopez and S. E. Fienberg (1998c). Tooth breakage and diet: a comparison of bats and carnivores.

Species of carnivorans that eat bone are believed to break teeth more often than those eating mainly meat. Two predictions that arise from this hypothesis are that bats, which do not eat bone, will have a lower incidence of broken teeth than carnivorans and that smaller carnivorans, which often feed heavily on arthropods and other insects, will exhibit less tooth damage than larger carnivorans. We found no difference between bats and carnivorans in the proportion of skulls with broken or missing teeth in a sample including 10 species of carnivorans from ermines to bears, and 13 species of bats including some that eat insects, fruit, nectar and pollen, and blood. When the sample is expanded to include larger carnivorans studied by Van Valkenburgh (1988), there is a significant difference in the incidence of tooth breakage, indicating that the selection of species in the sample affects the results. Tooth breakage was strongly influenced by body size in carnivorans but not in bats. This evidence suggests that factors other than diet influence tooth breakage in mammals. We propose that lifespan, which increases with body size in carnivorans but not in bats, is a better predictor of tooth breakage than diet.

Ferris, G. F. (1930). Some African Diptera Pupipara.

For the material herein dealt with, I am indebted principally to Mr G. A. H. Bedford of the Division of Veterinary Services of South Africa. Other material collected by the writer from bats in the United States National Museum some years ago and a specimen received from Dr C. R. Kellogg of Foochow, China, are also recorded.

In this paper, as in others by the writer, the policy is followed of describing as new everything that cannot definitely be connected with named forms.

Findley, J. S. (1972). Phenetic relationships among bats of the genus *Myotis*.

A numerical taxonomic analysis of the species of the chiropteran genus *Myotis* revealed the existence of three major phenetic groupings. These may correspond to three feeding-foraging modalities. Phenetic evidence suggests the Oriental Region as a center of origin for *Myotis*, and a *Myotis goudoti*-]ike bat as a likely myotine prototype.

Findley, J. S. and H. Black (1983). Morphological and dietary structuring of a Zambian insectivorous bat community.

Diet and external morphology of nine species of insectivorous bats from Zambia, East Africa, were compared using multivariate methods. Morphological and dietary resemblance between species were positively correlated; that is, taxa which resembled each other most strongly morphologically were also most similar in dietary intake. The degree of morphological and dietary distinctiveness of a species was positively correlated with its morphological and dietary variability. For example, species which are quite distinct from others in morphology or diet tend also to be quite variable in those two attributes. Morphology of the bats was strongly,predictive of their diets; most dietary variance was accounted for by morphological variance, and the first morphological principal component predicted the presence in the diet of Lepidoptera, beetles, and Orthoptera with a high level of significance. These results led to a model of community organization for closely related species in which a relatively large number of specialists with invariant attributes are clustered near the community centroid and a smaller number of distinctive, variable species occupy niches more distant from the centroid.

Findley, J. S., E. H. Studier and D. E. Wilson (1972). Morphologic properties of bat wings.

A method was devised for estimating aspect ratio, wing ratio, wing area, wing loading, and wing length from study skins of bats. These measures were taken of 136 species representing 15 families. Wing area and loading are positively, and wing length negatively, correlated with size. Aspect and tip ratios are independent of size and of each other. Distinctive combinations of some of these variables characterize groups of bats that presumably have similar flight modes. Speed is positively correlated with aspect ratio and tip index, but regresses significantly only on the former. Long tips coupled with low aspect ratio may characterize hoverers. Long wings and short tips may characterize bats that are capable of remaining airborne at slow speeds. Most bats with low aspect ratios are forest dwellers, whereas species with high aspect ratios are migrants and foragers in open areas.

Findley, J. S. and G. L. Traut (1970). Geographic variation in *Pipistrellus hesperus*.

Geographic variation in *Pipistrellus Hesperus* consists of an eastern series of populations of large individuals and a western series of populations of small individuals, this situation perhaps resulting from historical changes in the distribution of deserts. Other facets of geographic variation involving color, sexual dimorphism, and variability are discussed in relation to climate, rainfall, and sexual differences in behavior.

Flower, S. S. (1901). 1. Notes on the fauna of the White Nile and its tributaries.

No Europeans having been able to visit the "White Nile for many years owing to the Mahdist insurrection, these notes on the animals seen during an expedition up this river may be of interest. The following itinerary will help to localize the places mentioned in this paper, which are not marked in the ordinary atlases available:

11th March, 1900. Leave Omdurmau and proceed up the White Nile.
12th. Pass El Duem, and later Kowa.
13th. Cross 14° North lat. in morning, pass Goz Abu Grorna, and arrive at Abu Zeit.
16th. Leave Abu Zeit.
17th. Pass Jebel Ain in morning.
18th. Reach Eenk in evening.
19th. Reach Long Tom in evening.
20th. Pass Jebel Ahmed Agar.
21st. Pass Kaka.
22nd. About 5 A.M. reach Fashoda, and about 9 P.M. the Sobat.
23rd. Reach the base-camp of the sudd-cutting expedition near Gabt-el-Meghahid; about 5 P.M., mouth of the Bahr-el-Zeraf.
24th-26th. Proceed about 50 miles up the Zeraf and back again.
27th. Proceed west along the White Nile, pass the mouth of the Bahr-el-Jebel, reach Lake No.
28th. Leave Lake No, proceed up the Bahr-el-Ghazal.
29th. Visit tributaries of the Bahr-el-Ghazal (the Bahr-el-Arab, proceeding about 12 miles up and back again ; the Bahr-el Homar found unnavigable).
30th. On Lake Ambadi, near Meshra er Rek.
31st March-2nd April. Return down the Bahr-el-Ghazal to Lake No.
3rd April. Proceed up the Bahr-el-Jebel.
5th. Pass Heliat Nuer (=Meshra Nuer, or Eljab Dok).
8th. Reach neighbourhood of Shumbe (=Schambeh), about 7° 20' North latitude, and about 830 miles from Omdurman, and turn back on account of shallow water and want of fuel for the steamer.
14th. Get back to mouth of the Bahr-el-Jebel, and 11 P.M. reach Gabt-el-Meghahid.
16th. Proceed about 12 miles up the Sobat and down again.
17th. Reach Fashoda.
26th. Arrive back at Omdurman.

I have to acknowledge my deep sense of obligation to Sir William Garstin, K.C.M.G., and to Mr. C. Crawley for their assistance in noting facts of interest and in securing specimens during the two months I had the privilege of travelling with them on the Nile; and to the officials of the British Museum of Natural History for their invariable kindness in helping me to work out the collections brought home. I am particularly indebted to Mr. Oldfield Thomas and to Mr. W. E. Ogilvie Grant.

The nomenclature of the birds in this paper is according to the British Museum Catalogue, but the Orders are arranged as far as possible as in the Exhibition Bird Gallery, and not according to the volumes of the Catalogue.

Flower, S. S. (1932). 22. Notes on the recent mammals of Egypt, with a list of the species recorded from that kingdom.

Many Egyptian mammals had been described, especially by Cretzschmar, F. Cuvier, E. Geofiroy, Hemprich & Ehrenberg, Lichtenstein, and Linnaeus, but a general account of the Mammals of Egypt was much needed.. Dr. John Anderson, F.R.S. (1833-1900) had set his heart on bringing out a complete and useful book; his whole energy was concentrated on his self-imposed task, when the work was cut short suddenly by his death on 15 August, 1900.

After Andersen's death his widow decided to publish a book as complete as could be made from her husband's notes, and, at the joint request of herself and W. T. Blanford (1832-1905), W. E. de Winton (1856-1922) undertook the revision and completion, as far as possible, of the work, the result being

the publication in 1902 (Hugh Rees, Ltd., London) of the 'Zoology of Egypt: Mammalia,' a magnificent quarto volume of 391 pages, with, besides other illustrations, fifty-five hand-coloured plates which have seldom been equaled either for zoological accuracy or artistic merit, the artist being P. J. Smit.

Everyone interested in zoology or Egypt must be grateful to the liberality of the late Mrs.- Anderson and to the perseverance of de Winton in producing this interesting volume, and it seems almost invidious to make any criticisms.

However, it is easily understood that the editing of a posthumous work, based on incomplete and often undated memoranda (written in this case during a period of eight years), is a difficult task, and everyone will agree that de Winton did all he could under the circumstances.

The result was a valuable contribution to Mammalogy, but hardly a natural history of the Mammals of Egypt. 138 out of 363 pages of text (38 per cent.) and 30 out of 66 plates (45 per cent.) refer to animals of tropical Africa which do not occur in Egypt - that is to say, in the country that is usually called Egypt as apart from the Anglo-Egyptian Sudan. On the other hand, such species of Egyptian mammals as the -Leopard, Seal, and Bottle-nosed Dolphin are not mentioned.

Before even a complete nominal list of the Mammals of Egypt can be written very much more field-work remains to be done, especially in the great tract of hilly country that lies between the Nile and the Bed Sea, and also to a lesser extent on the eastern side of the Sinaitic Peninsula and in the oases of the western desert. This paper, will show how little is yet known, and how the very existence of several species rests on the evidence of even less than half-a-dozen individual specimens of each.

The conditions under which wild animals live in Egypt are altering so rapidly through modern changes, especially in irrigation and communication, that it may be useful to put on record the notes now presented by one who was fortunate enough to be able to walk and ride about the country before the internal-combustion engine brought havoc in its train.

Foley, H. (1922). Contribution a l'étude de la faune saharienne (Première Note).

Nous avons examiné, de 1907 à 1920, pour la recherche de leurs parasites songuicoles, un assez grand nombre d'animaux appartenant à la faune saharienne. Ils ont été rencontrés, soit à Beni-Ounif de Figuig pendant un séjour de 8 années, soit au cours d'explorations scientifiques que nous avons faites, seul ou avec le Dr Edmond SERGENT, dans le Sud Algérien. D'autres nous ont été envoyés de divers postes des Territoires du Sud par des médecins militaires, qui nous ont aimablement prùeté leur concours.

La première liste que nous donnons ci-dessous - simple contribution à l'inventaire de la saune saharienne - ne comprend que les Vertébrés. Elle n'a pas été établie par une recherche systématique, mais au hasard des déplacements et des circonstances: elle est donc fort incomplète. Elle pourra, cependant, fournir aux spécialistes quelques indications utiles de géographie zoologique, grâce à l'exactitude des déterminations que nous devons à savants autorisés: MM. Le Dr. TROUESSART, professeur au Muséum, et SEURAT, professeur à la Faculté des Sciences d'Alger, pour les Mammifères; MENEGAUX et KOLLMANN, du Muséum, pour les Oiseaux; Dr. PELLEGRIN, du Muséum, pour les Poissons; DOUMERGUE (d'Oran), pour les Reptiles. Nous leur exprimons nos vifs remerciements.

Le lieu et la date de la capture sont indiqués pour chaque espèce. Les remarques biologiques qui suivent ces indications sons dues le plus souvent aux spécialistes qui ont fait les déterminations.

Fontenille, D., F. Rodhain, J. P. Digoutte, C. Mathiot, J. Morvan and P. Coulanges (1989). Les cycles de transmission du Virus West-Nile a Madagascar, Ocean Indien.

Des recherches virologiques, sérologiques et entomologiques entreprises à Madagascar, depuis 1975 ont permis de mettre en évidence la large répartition du virus West-Nile sur l'île. Cet arbovirus a été isolé chez l'homme, les perroquets et les aigrettes. Les vecteurs appartiennent au genre *Culex*, mais

le virus a été également isolé chez des *Aedes* et des *Anopheles*. Les sérologies pratiquées sur plus de 1600 sérums humains et près de 1000 sérums animaux, ont montré que l'homme peut être contaminé dans toute l'île. Les autres hôtes vertébrés possibles mis en évidence, en plus des oiseaux, sont les bovins et les chauves-souris. Les insectivores, les rongeurs et les lémuriens jouent probablement un rôle très faible.

Forman, G. L. (1973). Studies of gastric morphology in North American Chiroptera (Emballonuridae, Noctilionidae and Phyllostomatidae).

Stomachs of 12 species of Neotropical bats were examined grossly and histologically. Those of stenodermines (family Phyllostomatidae) were highly variable in configuration between species, and even congeneric kinds were distinguishable. The stomachs of stenodermines varied in elongation of the caecum or elongation of the pyloric region, both of which provided for accommodation of large quantities of food. Structural peculiarities, especially in the stenodermines, were considered with respect to their possible relationship to diet.

Francis, C. M. and J. E. Hill (1998). New records and a new species of *Myotis* (Chiroptera, Vespertilionidae) from Malaysia.

The status of *Myotis ater* and *Myotis muricola* in south-east Asia is reviewed. Both species appear to occur sympatrically in several localities including Sulawesi, Borneo and peninsular Malaysia. Peninsular Malaysian specimens referred to *M. ater* are larger than those from elsewhere and are allied with *ater* with some doubt. *M. ater nugax* from Borneo appears be the Bornean representative of *M. ater*, but specimens formerly referred to that form by Hill and Francis (1984) and Payne *et al.* (1985) prove to be a previously undescribed species which described here. *M. oreias* from Singapore is quite distinct from any of these species, but the type and only known specimen is in poor condition, and its true affinities are difficult to determine.

Le statut de *Myotis ater* et de *Myotis muricola* en Asie du Sud-Est est évalué. Les deux espèces sont trouvées en sympatrie dans plusieurs localités incluant Sulawesi, Borneo et la Malaisie peninsulaire. Les spécimens de la peninsule malaise considérés comme *M. ater* sont plus grands que partout ailleurs, et sont associés à *ater* avec quelques doutes. *M. ater nugax* de Borneo est bien le répresentant local de *M. ater*, mais des spécimens attribués précédemment à cette forme par Hill et Francis (1984) et Payne *et al.* (1985) representent en fait une espèce nouvelle, décrite ici. *M. oreias* de Singapour est nettement distincte de ces autres espèces, mais le spécimen-type, qui est le seul spécimen connu de l'espèce, est en mauvais état, et ses réelles affinités sont difficiles à determiner.

Freeman, P. W. (1979). Specialized insectivory: beetle-eating and moth-eating molossid bats.

The jaw structure and mechanics of insectivores have been little studied. An efford is made here to compare and contrast jaw characteristics of insectivorous bats with thos of herbivores and carnivores. Further, in one particular family of bats (Molossidae) jaw modifications are such that animals that take hard-shelled insect prey can be distinguished from thos that take soft-shelled insect prey. Beetle-easters generally have thick jaws, well-developed cranial crests, and fewer but bigger teeth, whereas moth-eaters have thin jaws, little crest build-up, and more but smaller teeth.

Freeman, P. W. (1981b). A multivariate study of the family Molossidae (Mammalia, Chiroptera) morphology, ecology, evolution.

The primary goal of my study, determining natural morphological groups of molossid bats, isccomplished by defining exactly the variation which occurs among the extant molossid species. I attempted to include as many of the species in the family as was possible.

To do this, I used principal components, distance (size-in and size-out), and correlation analysis on 80 species. Morphological trends that emerge from the data are size, as indicated by the first component; a suite of jaw characters, by the second; several facial features, by the third; and a few less important features, but particularly a wing characteristic, by the fourth. Each of the groups of phonetically similar molossids which appear in the PCA and in the distance and correlation analyses are described in terms of characters which are most highly correlated with the components. In particular, the second component, concerned with jaw structure, divides the species in the following way: *Cheiromeles, Molossus, Promops, Mops, Myopterus, Molossops* (including *Neoplatymops* and *Cynomops*), and several species of *Mormopterus* (including *Platymops*) and *Eumops* are located on the positive side of this axis, meaning these molossids have relatively thick jaws and robust skulls; molossids on the negative side *Tadarida, Nyctinomops, Chaerephon, Otomops*, and several species of *Mormopterus* (including *Sauromys*) and *Eumops*, have thin jaws and less robust skulls. I use the suite of jaw characters to predict what molossids are eating and give data to support the predictions: bats with thick jaws eat hard-shelled insects like beetles, and bats with thin jaws eat soft-shelled insects like moths. Likewise, I predict where molossids may be roosting or flying based on the shape of their wing tips. Bats with broad (relative to other molossids) wing tips may be slower and mor emaeuverable than molossids with narrow tips, and the few data available support this notion. Molossids tend to have two kindes of appearances: one with large, anteriorly directed ears which are joined over the nose, lips that are wrinkled, and basisphenoid pits that are medium or deep; and the other with short, laterally directed ears which are widely separated, lips that are unwrinkled, and basisphenoid pits that are shallow or nonexistent. I suspect that the two different appearances indicate two different ways in which molossids detect and consume prey, but I have no data to support or refute this thought.

Ecologically, both New and Old Worlds contain molossids with thick and thin jaws, *Molossus* in the New World and *Mops* in the Old World are probably ecological counterparts in that both probably concentrate on hard-shelled foods. The same is true of several molossids with thin jaws in both the New and Old Worlds; these bats are probably concentrating on soft-shelled prey. However, in another morphological characteristic, the width of the wing tip, the fauna in the New World contains most of the species with narrow wing tips. As for general size in molossids, the percentage of medium-sized bats is approximately the same in both New and Old World; but th Old World tends to have a greater percentage of large molossids, whereas the New World has a greater percentage of small ones.

The evolutionarey or phylogenetic relationships among the species and the genera are examined phonetically and with the use of several primitive-derived characters. Twelve genera are delineated:

Chaerephon (formerly *Tadarida [Chaerephon]*)
Cheiromeles
Eumops
Molossops (including *Neoplatymops* and *Cynomops* as subgenera)
Molossus
Mops (formerly *Tadarida [Mops]*; includes *Xiphonycteris*)
Mormopterus (formerly *Tadarida [Mormopterus]*; including *Sauromys* and *Platymops* as subgenera)
Myopterus
Nyctinomops (including four New World species formerly assigned to *Tadarida*)
Otomops
Promops
Tadarida

Three of these genera, *Tadarida, Mormopterus*, and *Eumops*, are more dispersed morphologically than the other nine. I think all 12 form natural groups based on morphological similarity.

In terms of primitive-derived traits, two groups emerge: the *Mormopterus*-like bats and the *Tadarida*-like bats. *Tadarida* and *Mormopterus* are the two most primitive genera to which all other genera can be related. The two groups differ primarily in ear design, separated or joined, and associated characters mentioned above and represent two basically different ways of detecting and consuming prey. Parallel trends of tooth loss and increased robustness of the skull occur in both groups. Genera

in the *Mormopterus* group are *Mormopterus, Molossops, Myopterus*, and *Cheiromeles*; and genera in the *Tadarida* group are *Tadarida, Nyctinomops, Chaerephon, Mops, Otomops, Eumops, Promops*, and *Molossus*. These last three genera are the most derived in the family.

Geographically, the Indo-Australian molossid fauna is the most dispersed morphologically followed by the Neotropical and Ethiopian faunas. Good cases can be made for all three being the oldest molossid fauna: morphologically, the most distinctive genus, *Cheiromeles*, is found in the Indo-Australian fauna; ecologically, the Ethiopian molossids seem to fill more completely the available niches; and phylogenetically, the most derived genera are in the New World.

Freeman, P. W. (1984). Functional cranial analysis of large animalivorous bats (Microchiroptera).

Large animalvorous bats include carnivorous, piscivorous and insectivorous microchiropterans. Skull proportions and tooth morphology are examined and interpreted functionally. Four wide-faces bats from four families are convergent in having wide skulls, large masseter muscle volumes and stout jaws, indicating a powerful bite. Three of the four also have long canine teeth relative to their maxillary toothrows. Carnivorous bats have more elongate skulls, larger brain volumes and larger pinnae. The wide-faces bats are all oral emitters and have heads positively tilted relative to the basicranial axis. The carnivorous species are nasal-emtting bats and have negatively tilted heads. The orientation of the head relative to the basicranial axis affects several characters of the skull and jaws and is not correlated with size. The speculation that the type of echolocation may be more of a determinant of evolutionary change than the feeding mechanism is addressed. Wide-faced bats are thought to be capable of eating hard prey items (durophagus) and are probably non-discriminating, aurally less sophisticated insect generalists while the carnivorous and non-durophagus insectivorous bats may be more discriminating and aurally more sophisticated in what they eat.

Freeman, P. W. (1988). Frugivorous and animalivorous bats (Microchiroptera): dental and cranial adaptations.

The most derived fruit-eating bats have small canines, wide palates and molars with a distinctive labial rim. Paracone and metacone have moved from a dilambdodont position in the middle of the tooth the labial side of the tooth where they form the labial cutting edge. Along with the well-developed and close fitting labial cutting edges of the premolars and canines, this cutting edge skurts nearly the entire perimeter of the palate. The labial rim of the lower teeth fit inside the labial rim of the upper teeth like two cookie cutters nesting one inside the other. Frugivores have a greater allocation of tooth area at the anterior end of the toothrow. The area occupied by canines of predators of struggling prey is greater than that for bats that eat non-struggling prey leke fruit. In addition, frugivores have wider palates than long while many carnivores have longer palates than wide. Omnivores appear to have a more equal allocation of space to more kninds of teeth, particularly the incisors and non-molariform premolars, on the toothrow than do frugivores or animalivores. The mechanical nature of different food items is discussed and the suggestion made that describing foods in terms of their texture may be more important in tooth design than whether they are fruit or insect or vertebrate.

Freeman, P. W. (1992). Canine teeth of bats (Microchiroptera): size, shape and role in crak propagation.

Upper canines in microchiropteran bats show a variety of cross-sectional shapes. A consistent feature of all species studied here is that the tooth is edged and not simply round or oval. Prominent sharp edges are positioned in several directions but particularly antero-medially toward the incisors and posteriorly toward the premolars. These edges appear to direct the cracks made in food items to the incisors or to the premolars. A continuous cutting edge is apparent in the occlusal view of the palate running from tip of canine to the ectoloph of the molars. Size and shape analysis indicates that larger bats have slender, rather than stouter, canines for their height, a condition that may be attributable to

the nature of the prey. Most bats take prey that have little hard substance imbedded within. The compromises in tooth shape may vary between that of a terrestrial predator with short, conical canines for processing endoskeletal prey to that of a small flying predator with long, slender, edged canines for capturing and processing exeskeletal prey. Unicuspid teet and how they might function in food break-up have been overlooked to the literature; such a study could lead to an understanding of how more complex teeth function.

Freeman, P. W. (1995). Nectarivorous feeding mechanisms in bats.

Cranio-dental characteristics are quantified between micro- and megachiropteran nectarivores and compared with microchiropteran animalivores, frugivores, and megachiropteran frugivores. Microchriopteran nectarivores share many characteristics with megachiropteran nectarivors and frugivores, but differ in having a long, narrow head. Megachiropterans have wide zygomata, which would allow for more jaw musculature. Diminutivfe cheekteeth are characteristic of nectarivory in both suborders, but both have relatively large canines. Teeth in nectarivores can occupy as little as a tenth of the palatal area compared to nearly two-thires in microchiropteran animalivores. The proportion that the dilambdodont stylar shelf occupies of molars in microchiropteran nectarivores can be as much as that in microchiropteran animalivores (insectivorous and carnivorous bats) or a little as that in microchiropteran frugivores but not as extreme as either. In addition to diminutive teeth, nectarivores have fused mandibles and upper canines that are worn from contact with the lower canines (thegosis). These characteristics may be necessary for the lower jaw to support an elongated, mobile tongue. While microchiropteran nectarivory, frugivory, and carnivory probably evolved independently from an insectivorous microchiropteran ancestor, megachiropteran nectarivory probably evolved from megachiropteran frugivory or the reverse.

Freeman, P. W. and C. A. Lemen (1992). Morphometrics of the family Emballonuridae.

Morphometric analysis reveales three distinctive groups among the genera of emballonurids. *Taphozous* - *Saccolaimus* is a group distinctive in size and shape, particularly cranially. Diclidurids are distinctive in appendicular characters only, especially those in the wing. The third group includes all other emballonurids. Phylogenetic studies also separated *Taphozous* - *Saccolaimus* as distinctive but included diclidurids among other New World species. Compared with molossids, emballonurids are morphologically quite homogeneous.

Freeman, P. W. and W. N. Weins (1997). Pucturing ability of bat canine teeth: The tip.

Casts of upper canine teeth of 15 species of microchiropteran bats were fixed securely into a testing machine and made to puncture the bloom side of an appel. The force necessary to break through the surface of an appal was regressed against both shape of the tip of the canine and the size of the animal. Sharper tips require less force to puncture than blunt ones. Results were also verified using giant two-dimensional models of Plexiglas™ with sharp and blunt tips that were loaded onto a Plexiglas™ beam. Fringes, or stress lines, are more highly concentrated at the point of contact for a smaller radius than for a larger radius under the same loading conditions, indicating that stress in the beam is higher and more concentrated at the sharper tip. Ours is some of the first experimentatl work to quantify apical sharpness of a tooth and performance as it punctures a substance.

Freitas, T. R. O., M. R. Bogo and A. U. Christoff (1992). G-, C-bands and NOR studies in two species of bats from Southern Brazil (Chiroptera: Vespertilionidae, Molossidae).

Described the karyotypes of two species of bats from Southern Brazil, *Eptesicus brasiliensis* (2n = 50; AN = 48) and *Molossus molossus* (2n = 48; AN = 54). The study of *E. brasiliensis* was based in seven males and seven females, while that of *M. molossus* included three males and 13 females. All

autosomal chromosomes of *E. brasiliensis* are acrocentric, while *M. molossus* presents four pairs of submetacentric and 19 pairs of acrocentric chromosomes. Both species present an acrocentric Y chromosome; the X is submetacentric in *E. brasiliensis* and metacentric in *M. molossus*. The G-bands of *E. brasiliensis* do not differ markedly from those reported for other species of *Eptesicus. M. molossus*, however, presents a rather different G-pattern from those of other species of the same family. As for the C-bands, the results for both species are not remarkably different from those of other species of the same families. *E. brasiliensis* and *M. molossus* show a nucleolus organizing region (NOR) in only one pair, the one that presents a secondary constriction near the centromere.

Es werden Standardkaryogramme sowie G-, C- und NOR-gefarbte Metaphasen von zwei Fledermausarten aus Südbrasilien beschrieben. Je 7 Männchen und Weibchen von *Eptescus brasiliensis* (Vespertilionidae) und 3 Männchen und 13 Weibchen von *Molossus molossus* (Molossidae) wurden untersucht. Die cytogenetische Analyse ergab 2n = 50 und AN = 48 für *E. brasiliensis* und 2n = 48 und AN = 54 für *M. molossus*. Bei *E. brasiliensis* sind alle Autosomen akrozentrisch; *M. molossus* weist 4 Paare submetazentrischer und 19 Paare akrozentrischer Chromosomen auf. Beide Arten haben ein akrozentrisches Y-Chromosom, das X-Chromosom ist submetazentrisch bei *E. brasiliensis* und metazentrisch bei *M. molossus*. Die Muster der G-Bander bei *E. brasiliensis* unterscheiden sich nicht von denen anderer *Eptesicus*-Arten. Dagegen unterscheidet sich *M. molossus* deutlich von anderen Arten der Familie. Bei den C-Bandern ergaben sich keine wesentlichen Unterschiede. Bei beiden Arten ließen sich NORs nur in einem Chromosom anfarben, welches eine sekundare Einschnurung in der Nahe des Centromers aufweist.

Friant, M. (1951). La dentition temporaire, dite lacteale, de la Rousette (*Rousettus leachi* A. Sm.), Chiroptère frugivore.

La dentition temporaire du genre *Rousettus*, qui était, jusqu'ici, inconnue, est plus régressée encore que celle des Chiroptères insectivores: elle comporte une seule molaire, Mt2; à la mâchoire supérieure, les dents, en forme, de crochets simples et aigus, montrent, par leur position, le rôle qu'elles jouent, durant les premiers mois de la vie, alors que le jeune demeure accroché à la fourrure de sa mère.

Frost, D. R. and R. M. Timm (1992). Phylogeny of Plecotine Bats (Chiroptera:"Vespertilionidae"): Summary of the evidence and proposal of a logically consistent taxonomy.

Using standard phylogenetic techniques, 25 transformation series of morphological characters and 11 of karyological characters are evaluated in an attempt to recover the phylogenetic history of plecotine vespertilionid bats. Plecotini contains four genera in the topology (*Euderma (Barbastella (Plecotus Corynorhinus*))). The Plecotini of Hill and Harrison (1987), including *Rhogeessa, Baeodon, Nycticeius*, and *Otonycteris*, is rejected because this view is based solely on subjective evaluations of bacular overall similarity, and is clearly in disagreement with other lines of evidence from anatomy and karyology. *Idionycteris* is synonymized with *Euderma* because *I. phyllotis* and *E. maculatum* are sister species. *Corynorhinus* is removed from the synonymy of *Plecotus*. The relationships within *Corynorhinus* and *Plecotus* are not resolved.

Funaioli, U. (1959). I mammiferi della Somalia. Cenni al loro intreesse nell'economia del Paese. Primo elenco.

In una mia precedente nota dedicata all'esame del problema faunistico e venatorio della Somalia (1) auspicavo una sollecita e più realistica revisione dell'Ordinanza A.F.I.S. N. 26 rep. del 6 dicembre 1951 che regola attualmente l'esercizio della attività venataria, in quanto rivelatasi in molti punti inadeguata ad un sano sfruttamento del patrimonio faunistico, mentre per altri lascia adito a dubbi per i cacciatori e per i tutori della Legge.

Un elemento fondamentale di questa revisione è rappresentato dalla conoscenza degli animali che compongono il patrimonio faunistico, della loro distribuzione geografica e del loro ruolo attuale nell'economia agraria e generale del Paese.

Ho creduto pertanto opportuno compilare, sulla base degli studi italiani e stranieri che ho potuto rintracciare e con l'aggiunta di qualche elemento acquisito direttamente in Somalia, un primo elenco dei mammiferì di questo Paese, nei suoi confini politici, accennando a problemi attuali vari ad essi inerenti, all'interesse che essi rivestono per cacciatori (costituendo essi il maggiore oggetto dell'attività venataria), commercianti ed agricoltori della Somalia, e coll'intento di fornire una prima base aggiornata a studiosi ed a legislatori nel campo faunistico e venatorio somalo.

L'ordine sistematico seguito è quello di-ALLEN M.G. (1939), mentre le notizie relative alla distribuzione degli animali, alla loro biologia ed alla loro importanza economica sono ricavate da numerose pubblicazioni nonchè dalla esperienza personale di alcuni, anni di soggiorno in Somalia

---

Funaioli, U. and B. Lanza (1968). On some bats from Somalia.

We have some time ago begun a detailed study of the Chiroptera from Somalia. This study considers chiefly specimens in the collections of the Museo Zoologico of the University of Florence, the Museo di Storia Naturale "Giacomo Doria" of Genoa and the Museo di Storia Naturale of Milan, which house particularly rich collections from this region. However, as a considerable time will lapse before this extensive research will be completed, we deem it useful to publish now some particularly significant finds. We are grateful, for the valuable assistance given us by Dr. V. AELLEN (Muséum d'Histoire Naturelle, Genève), Dr. D. L. HARRISON (British Museum of Natural History, London) and Dr. K. F. KOOPMAN (American Museum of Natural History, New York).

Funaioli, U. and A. M. Simonetta (1966). The mammalian fauna of the Somali Republic: Status and conservation problems.

The present report is, in some ways, a follow-up of our paper "Statut actuel des Ongules en Somalie" (FUNAIOLI & SIMONETTA, 1960); the Mammalian Fauna of Somalia is, indeed, among the less known of Africa both in its composition and in distribution, so that both mammalogists and the Somali and International Authorities concerned with the conservation and scientific exploitation of wildlife are greatly interested in obtaining information on the present status of the Mammals of Somalia and on possible future developments of the situation.

We have been asked by colleagues working at the Smithsonian African Project, as well as by F.A.O. Offices and by Officers of the Somali Government to make available the information we had gathered in these years of study of the Fauna of the Somali Republic and to give advice as to the more effective measures to take for its conservation.

Indeed, such a report, if it could combine the more relevant data on the whole Mammalian Fauna of the Republic (within its present political borders), with and objective evaluation of the present and possible future economic significance of wildlife for the People of Somalia, might prove of some use to the pure zoologists as well as to those involved in planning the economic development of Somalia. It might also disoblige us a little of the assistance and hospitality which the People and the Government of the Somali Republic have offerec to our expeditions.

Moreover, though our research plans have always been primarily aimed at pure research, in the present stage of social and economic development, it is mandatlory that whenever in the course of research the scolar collects data which may be of practical use, he makes tham promptly available to whoever may be concerned with their use.

Funakoshi, K., A. Zubaid and S. Matsumura (1995). Regular pulse emission in some megachiropteran bats.

We recorded vocalizations of megachiropteran bats, *Cynopterus brachyotis, C. horsfieldi, Megaerops ecaudatus* and *Macroglossus sobrinus* as they were held in our hands, in a hanging position or moved up and down, simulating flight. All four species produced regular audible tone pulses with a frequency spectrum of less than 9 kHz (peak at 4 - 6 kHz). The duration of a single pulse varied from 14.9 to 23.6 msec on average among these species. The interpulse interval was between 108.3 and 127.7 msec. In *M. ecaudatus* and *M. sobrinus*, double pulses were occasionally emitted, with interpulse intervals averaging 39 msec and 31 msec, respectively. The regular pulse emission may indicate that the bats studied use sounds to probe space.

Gaisler, J. (1970). The bats (Chiroptera) collected in Afghanistan by the Czechoslovak expeditions of 1965-1967.

The present paper is based on a total of 748 specimens of 17 species of bats, collected in Afghanistan during several shorter periods in 1965 to 1967. In taxonomical evaluation of the material - being the core of the study - a thorough comparison has been made with the material of the British Museun (Natural History). Evidence has been obtained of the presence of following species and subspecies in Afghanistan: *Rhinopoma microphyllum microphyllum, Rhinopoma hardwickei hardwickei, Rhinopoma hardwickei seianum, Taphozous nudiventris kachhensis, Megaderma lyra lyra, Rhinolophus ferrumequinum irani, Rhinolophus hipposideros midas, Hipposideros fulvus pallidus, Myotis longipes, Eptesicus nasutus nasutus, Eptesicus serotinus turcomanus, Eptesicus serotinus pashtonus, Nyctalus montanus, Pipistrellus pipistrellus bactrianus, Pipistrellus pipistrellus mediterraneus, Pipistrellus coromandra coromandra, Pipistrellus kuhli lepidus, Scotophilus heathi heathi, Plecotus austriacus wardi, Miniopterus schreibersi fuliginosus* and *Miniopterus schreibersi pallidus*. A revision has been made of the subspecies of *Eptesicus serotinus* and a new ssp. *pashtonus* described. *Myotis longipes, Eptesicus walli* and *Nyctalus montanus* are valid species. The systematics of *Pipistrellus coromandra* is unclear; it is possible that the specimens, tentatively arranged under the nominates subspecies . . . new species. *Pipistrellus aladdin* appears to be synonymous with *Pipistrellus pipistrellus bactrianus*. Apart from the distribution and systematics of individual species, also their sex dimorphism, ecology and reproduction has been investigated.

Gaisler, J. (1983). Nouvelles données sur les Chiroptères du nord algérien.

Myotis nattereri est signalé pour la première fois en Algérie. *Myotis capaccinii* et *Pipistrellus pipistrellus* ont été retrouvés dans ce pays après une centaine d'années. *Pipistrellus savii*, provenant de trois régions d'altitude (entre 1050 et 2004 m), fait l'objet de précisions sur son écologie et sur son comportement. La distribution de 10 autres espèces, *Rhinolophus ferrumequinum, R. hipposideros, R. euryale, R. mehelyi, R. blasii, Myotis blythi, M. emarginatus, Pipistrellus kuhli, Plecotus austriacus* et *Miniopterus schreibersi*, est complétée par quelques données faunistiques. Le peuplement d'une grotte au cours de l'année et l'activité saisonnière des Chiroptères dans une ville sont étudiés.

Myotis nattereri is recorded for the first time in Algeria and for the second time in Africa. *Myotis capaccinii* and *Pipistrellus pipistrellus* are rediscovered in the country after a hundred years. *Pipistrellus savii* is recorded in two Algerian National Parks and in one town, at the elevations ranging from 1050 to 2004 m; data are given on its ecology and behaviour. The other ten species, *Rhinolophus ferrumequinum, R. hipposideros, R. euryale, R. meheleyi, R. blasii, Myotis blythi, M. emarginatus, Pipistrellus kuhli, Plecotus austriacus* and *Miniopterus schreibersi*, are recorded for new locations. Chiropteran community in a cave on the Mediterranean coast was explored during 11 successive visits. Bats hunting in a town were netted and their activity registered and correlated with some climatic parameters.

Gaisler, J. (1984). Bats of northern Algeria and their winter activity.

Twenty-six species of 6 families of bats are recorded in Algeria, 17 of which occur in the northern (mediterranean) zone of that country. *Myotis nattereri* and *Nyctalus leisleri* are added to the fauna list of Algerian mammals. *Pipistrellus savii* appears to be a common bat in the Algerian mountains. Winter activity of Pipistrelle and Longeared bats was studied in the town of Setif. These bats seem to hibernate but their lethargy is often interrupted by periods of hunting activity.

Gaisler, J. and K. Kowalski (1986). Results of the netting of bats in Algeria (Mammalia: Chiroptera).

Three hundred seventeen bats of 20 species were taken by nets at 26 localities, most of them in northern Algeria, in the years 1980 - 1983. This sample has been evaluted with regard to faunal size, relative abundance, species diversity in areas, and the foraging diversity of the species. The species diversity corresponds in a certain degree to the diversity of environment, and on the whole it is higher in samples from western Algeria than from the east of the country. The highest foraging diversity has been found in *P. kuhli*, the only species caught both in the Mediterranean zone and in the desert; a high foraging diversity is also shown by *M. blythi, P. pipistrellus, E. serotinus, R. ferrumequinum* and *P. austriacus*. The bats are less active in the Meditenramean zone as well as in oases in the Sahara in winter. Two peaks of nocturnal activity, with the maximum after sunset, have been ascertained in three most abundant species.

Gaisler, J., G. Madkour and J. Pelikán (1972). On the bats (Chiroptera) of Egypt.

The present paper is based on a total of 236 specimens of 11 species of bats, collected in Egypt (A. R. E.) during April and May, 1969. In taxonomical evaluation of the material - being the core of the study - evidence has been obtained of the presence of the following species and subspecies in Egypt: *Rousettus aegyptiacus aegyptiacus, Rhinopoma hardwickei sennaariense, Rhinopoma hardwickei cystops, Taphozous perforatus perforatus, Taphozous nudiventris nudiventris, Nycteris thebaica thebaica, Rhinolophus clivosus clivosus, Rhinolophus clivosus brachygnathus, Asellia tridens tridens, Pipistrellus kuhli marginatus, Pipistrellus deserti, Plecotus austriacus christiei* and *Otonycteris hemprichi hemprichi*. Particular attention is paid to *P. deserti*, a species new for the fauna of Egypt, evidence being forwarded of this species being different from the sympatric forms of the genus *Pipistrellus*. Remarks on the ecology of each of the species collected are attached. A systematic review is given of 8 families, 13 genera and 21 species of bats hitherto recorded in Egypt, with notes on their occurrence. In zoogeographical respect, most of the species (76.2 %) are Palaearctic, those of Afro-eremic origin predominating. The rest (23.8 %) are Ethiopian species. The chiropteran fauna, of Egypt is related especially to that of the Arabian Peninsula and also to that of the Maghreb region.

Gallagher, M. D. and D. L. Harrison (1988). The small mammals of the Wahiba Sands, Oman.

The results are presented of a survey to establish what species of small mammals occur in the Wahiba Sands, and to provide preliminary evidence of their distribution and behaviour. Ten bats (Chiroptera) of three species were collected (Trident bat *Asellia tridens*, Persian Leaf-nosed Bat *Triaenops persicus*, and Kuhl's Pipistrelle *Pipistrellus kuhli*); and eight rats and mice (Rodentia: Muridae) of two species (Black Rat *Rattus rattus*, House Mouse *Mus musculus*; and 18 specimens of Cricetidae: Sundevall's Jird *Meriones crassus* and Cheesman's Gerbil *Gerbillus cheesmani*). The pipistrelle, jird and gerbil were found in the Sands, the remainder on the border. Evidence is given of other species which may occur. Further behavioural studies are suggested.

Garnham, P. C. C. and R. B. Heisch (1953). On a new blood parasite of insectivorous bats.

(1) A new blood parasite - *Nycteria medusiformis* n.gen.n.sp. - of insectivorous bats (*Nycteris capensis*) is described.

(2) Gametocytes only are present in the blood, and infected erythrocytes show filaments protruding from the surface.

(3) Tissue schizonts are found in parenchyma cells of the liver, superficially resembling, the pre-crythrocytic schizonts of *Plasmodium falciparum*, but differing essentially in the structure of the nuclei.

Gautier-Hion, A. and G. Michaloud (1989). Are figs always keystone resources for tropical frugivorous vertebrates? A test in Gabon.

This paper evaluates the suggestion of Terborgh (1986) that figs constitute "keystone plant resources" for frugivorous mammals and birds in African rain forests as they appear to do in South America and Asia. From studies of the diets of monkeys and other mammals and birds in Gabon, we show that figs are infrequently eaten by most species, and are always eaten in small amounts. Figs in Gabon occur at very low densities and have unpredictable fruiting patterns and relatively low crown production. Thus, fig fruits are not staple foods and cannot sustain most populations of frugivorous species during periods of low fruit availability. In Gabon, monkeys and large birds depend on the fruit of two species of Myristicaceae and of one species of Annonaceae. These regularly bear ripe fruit during the lean period and are abundantly consumed. Figs occur in such distant patches that they are mainly fed on by wide-ranging animals such as large frugivorous bats.

Gelderblom, C. M., G. N. Bronner, A. T. Lombard and P. J. Taylor (1995). Patterns of distribution and current protection status of the Carnivora, Chiroptera and Insectivora in South Africa.

Geographic patterns of species richness and endemism in three mammalian orders (Chiroptera, Insectivora and Carnivora) were studied in relation to the biomes and existing protected areas of greater South Africa (including Lesotho and Swaziland). Locality data for 21500 specimens representing 124 species were analysed with a geographical information system. Species richness of Chiroptera is high in the savanna biome, particularly in the north-east of the country, owing to the marginal intrusion of 14 tropical species. Endemism in Chiroptera is low, however, with only two endemic species in the fynbos and Karoo biomes. The Carnivora display less biome specificity and endemism than the Chiroptera. Whereas the north-eastern savannas have the highest species richness, the transition between the Nama-Karoo and grassland biomes is an important southern African centre of endemism for the Carnivora, particularly the smaller species. In addition to being an important centre for species richness in the Carnivora and Chiroptera, the Kruger National Park is also particularly important for Red Data Book species in both orders. The Insectivora display both high species richness and endemism. Species richness of the Insectivora is greatest in the mesic south-east of the country, whereas endemism is most pronounced in the forest and grassland biomes. Differences in biome specificity and endemism between these orders reflect not only phylogenetic divergence, but also variation in body size, vagility and life-history strategies. Most of South Africa's endemics are small mammals and many of them are listed in the Red Data Book. Distributions, life-history strategies and trends in man-induced habitat degradation were used to re-evaluate the protection status of the 124 species. We conclude that at least 11 endemic species are not adequately protected by existing publicly owned protected areas and consequently identify several areas which need to be added to the existing protected area system.

Die geografiese patrone van spesiesverskeidenheid en endemisme in drie soogdier ordes (Chiroptera, Insectivora en Carnivora) is bestudeer in verhouding tot die biome en bestaande beskermde areas van groter Suid-Afrika (insluitend Lesotho en Swaziland). Lokaliteitdata vir 21500 eksemplare verteenwoordigend van 124 spesies is geanaliseer met behulp van 'n geografiese informasiesisteem. Spesiesverskeidenheid van Chiroptera is die hoogste in die savanna-bioom, veral in die noord-oostelike dele van die land as gevolg van die marginale indringing van 14 tropiese spesies. Endemisme in Chiroptera is laag, met slegs twee endemiese spesies, een elk in die fynbos- en Karoo-

biome. Die Carnivora vertoon minder bioomspesifisiteit en laer endemisme as die Chiroptera. Terwyl die noord-oostelike savannas die hoogste Carnivora spesiesverskeidenheid het, is die oorgang tussen die Nama-Karoo- en grasland-biome belangrik vir die endemiese Carnivora van suidelike Afrika, veral wat betref die kleiner spesies. Die Nasionale Kruger Wildtuin is nie net 'n belangrike sentrum vir spesiesverskeidenheid wat betref die Carnivora en Chiroptera, maar ook vir Rooi Data Boek-spesies van die twee ordes. Die Insectivora vertoon beide hoe spesiesverskeidenheid en endemisme, met die hoogste spesiesverskeidenheid in die mesiese suid-oostelike dele van die land, terwyl endemisme meer algemeen voorkom in die woud- en grasland-biome. Hierdie verskil in bioomspesifisiteit en endemisme reflekteer nie slegs filogenetiese divergensie tussen die ordes nie, maar ook variasie in liggaamsgrootte, verspreidingsvermoe en historiese lewensstragtegiee. Meeste van die Suid-Afrikaanse inheemse fauna is kiein soogdiere en bale van hulle is gelys in die Rooi Data Boek. Die bewaringstatus van 124 spesies is geherevalueer met inagneming van verspreidings, lewensgeskiedenis- strategies en verskynsels soos habitats wat deur die mens gedegradeer is. Ons gevolgtrekking is dus dat ten minste 11 van die endemiese spesies nie genoegsaam deur die bestaande reservaate beskerm word nie. Gevolglik het ons verskeie gebiede geïdentifiseer wat by die bestaande reservaatsisteem gevoeg moet word.

Genov, T., R. Stoykova-Hajinikolova and R. Mészáros (1992). *Molinostrongylus* spp. (Nematoda: Molineidae) from bats in Bulgaria, with a review of European species.

Four species of *Molinostrongylus* are recorded in bats in Bulgaria: *M. alatus* in *Myotis myotis* and *M. blythi*, *M. panousei* (= *M. ornatus* sensu Yanchev and Stoykova 1973) in *Miniopterus schreibersi* (new geographical record), *M. skrjabini* in *Nyctalus noctula*, and *M. vespertilionis* in *Pipistrellus pipistrellus* (new geographical record). The species are redescribed and figured. A survey of European *Molinostrongylus* spp. is presented. A total of 8 nominal species has been recorded in European bats; lists of records, hosts and localities are given for every species. *M. tipula* is regarded as species inquirenda; *M. morosovi* is considered nomen nudum. A key to *Molinostrongylus* spp. in Europe is included.

Genoways, H. H. and D. A. Schlitter (1985). Survey of the recent mammal collections of the world.

Survey of collections of recent mammals reveal that there are 706 of these collections located in 78 countries. These collections hold 4 874 954 specimens. There are 19 collections that hold 50 000 or more specimens of recent mammals.

Gerell, R. and K. Lundberg (1985). Social organization in the bat *Pipistrellus pipistrellus*.

The social organization of the pipistrelle bat *Pipistrellus pipistrellus* was studied by means of bat boxes in southern Sweden. The males set up territories around a roosting site in the beginning of the summer at the same time as the females formed nursing colonies. After breeding, the females joined the single males in their day roosts establishing transient mating harems. Subsequently, immatures arrived at the mating grounds. The immature females, which probably attained sexual maturity during their first autumn, were admitted to the day roosts of the harem males, in contrast to the immature males. The size of the harem was dependent on the total number of females present on the mating grounds. The size, however, was also restricted hy some factor, presumably the quantity of food resources in the surroundings of the specific roost site, or the capability of the . . . A resource defense polygyny, . . . Other related temperate species indicate a similar social organization in *Pipistrellus nathusii* and *Nyctalus noctula*.

Gerlach, J. (1993). The conservation of Silhouette Island, Seychelles. II. Animals.

Silhouette is the third largest of the granitic islands of Seychelles and, as such, supports a wide variety of localized plants and animals. The extensive ecological damage by forest clearance that occurred historically on other Seychelles islands has been prevented by the steepness of the terrain on Silhouette. Recent studies of the island's habitats have confirmed its great conservation value. The status of the species of animals recorded on the island are discussed below and specific conservation problems are described.

Gharaibeh, B. M. (1997). Systematics, distribution, and zoogeography of mammals of Tunisia.

The taxonomic identity of each species of mammals that occurs in the Republic of Tunisia, North Africa has been determined to the subspecific level. History of names was followed and descriptions of types were studied to better provide opinions on the nomenclature and minimize the confusion existing in the literature concerning the taxonomic identity of many Tunisian species. Keys to distinguish related taxa were constructed and maps depicting the distribution of species within the borders of Tunisia and in the whole North African region were drawn. These maps show original records obtained during this study as well records reported in the literature. Furthermore, the available natural history information on the Tunisian mammal fauna and background information on the vegetation, rainfall, topography, and land forms of the country were presented.

Chromosomal G-band data for *Meriones shawi* from Tunisia, hitherto unavailable, was used to reexamine proposed chromosomal homologies and update the phylogenetic tree of Family Gerbillidae. G-banded chromosomal complement for *Jaculus orientalis* was reported. Notable differences in pelage color were seen between populations of the North African elephant shrew, *Elephantulus rozeti* in northern and southern Tunisia. However, no disjunction was seen in morphometric measurements analyzed using principal components analysis (PCA).

Differences in pelage color between 5 populations of *Gerbillus campestris* are discussed. Two populations of this gerbil, one on the Island of Djerba and the other around Medenine deserve systematic studies using molecular data or multivariate analyses of morphometric measurements. Differences in pelage color, mandibular foramina number, color of foot pad hair and other characters between 2 populations of *Jaculus jaculus* were also noted and further investigation of the taxonomic status recommended.

Zoogeographical analyses of the mammalian faunal elements in Tunisia and the whole area were made. Two groups of bats were recognized. Bat fauna that invaded Tunisia from the north, and one that invaded from the south. Land mammals were in three groups: strictly Mediterranean zone, widely-distributed Mediterranean, and Saharan mammals. Species richness in quadrates 1° latitude X 1° longitude spanning Tunisia was discussed. The species richness provided evidence to areas of high biodiversity. Areas that deserve conservation are Djebel Zaghouan, Ghardimaou, Tamerza-Kasserine, and Dahar-Djeffara plain. Finally, conclusions and recommendations for future mammalian studies in the area were suggested.

Giglioli, E. H. (1888). Note intorno agli animali vertebrati raccolti dal Conte Augusto Boutourline e dal Dr. Leopoldo Traversi ad Assab e nello Scioa negli anni 1884-87.

Nell'estate del 1884 il Conte Augusto Boutourline ed il Dr. Leopoldo Traversi frequentarono assiduamente il laboratorio tassidermico annesso al mio Gabinetto, per porsi in grado di saper raccogliere e conservare animali; e ciò in occasione di una esplorazione nell'Africa N. E. che avevano divisato di fare insieme.

Nel settembre 1884 il Conte Boutourline lasciò Firenze per Assab, ove fu raggiunto dal Dott. Traversi nel seguente novembre. Dopo breve soggiorno in quel nostro possedimento essi andarono a Massaua, accampando nelle vicinanze di Monkullo. Qui il Conte Boutourline venne colto da febbri ostinate e molto a malincuore si vide costretto a rimpatriare. Con rara generosità egli volle lasciare al Dott. Traversi una porzione non piccola del suo bagaglio speciale e delle sue armi e provviste; ed il Traversi potè così avviarsi subito verso l'interno. Egli tentò di penetrare nell'Abissinia per la via

dell'Asmara, e difatti vi era entrato, quando il *Negus* colto da uno dei suoi capricci e forse insospettito per avere saputo che egli era medico militare, lo mandò indietro. Per nulla scoraggiato il Dott. Traversi ritornò ad Assab e per la via allora poco praticata dell'Aussa penetrò nello Scioa ove ebbe buona accoglienza dal Re Menilek. Ora da quasi tre anni vi soggiorna, amato e stimato da tutti ; fa il medico, raccoglie animali e studia gli indigeni. Da solo o accompagnando il Re Menilek in qualcuna delle sue scorrerie guerresche, il Dott. Traversi ha già potuto compiere importanti esplorazioni, delle quali la nostra Società Geografica ha già pubblicato varii resoconti, ed egli ha tale fibra e tale energia che ben altre cose potrà fare prima di tornare in patria.

Mi sia concesso nel chiudere questa breve introduzione di tributare un voto di ben meritato elogio al modesto quanto bravo ed intrepido nostro esploratore e di augurargli un glorioso successo nell' ardua impresa da lui assunta.

Godawa-Stormark, J. (1998). Phenetic analysis of Old World *Myotis* (Chiroptera: Vespertilionidae) based on dental characters.

Similarities between 42 taxa of genus *Myotis* were studied based on 11 dental characters. The most primitive conditions were found in subgenus *Leuconoe* and in most taxa of subgenus *Selysius*. No clear differences between subgenera *Leuconoe* and *Selysius* were found. Only *Myotis altarium, M. ikonnikovi, M. mystacinus*, and *M. hosonoi* were found to be distinct from the 13 species studied within subgenus *Selysius*. The subgenus *Myotis* was distinct from the other subgenera in having the most derived conditions.

Goff, M. L. (1982). Two new species of chiggers (Acari: Trombiculidae) from East African bats (Chiroptera).

Microtrombicula (Eltonella) tanzaniae is described from specimens collected from Noack's African Leaf-nosed Bat, *Hipposideros ruber ruber*, Persian Leaf-nosed Bat, *Triaenops persicus afer*, and Egyptian Slit-faced Bat, *Nycteris thebaica*, and *Whartonia novemsetosa* from Egyptian Fruit Bat, *Rousettus aegyptiacus*, taken in Tanzania, Africa. New host and locality records are given for *Whartonia oweni*.

Goodman, S. M. (1993). A reconnaissance of Ile Sainte Marie, Madagascar: the status of the forest, avifauna, lemurs and fruit bats.

Between 26 March and 3 April 1991 a reconnaissance of Ile Sainte Marie, Madagascar, was conducted to determine the condition of the remaining forests and the species of birds occurring on the island. Specific information was sought on the snail-eating coua *Coua delalandei*, a species known only from lie Sainte Marie, but which had not been reported for over 150 years. Sight observations and interviews with local people were used in this investigation. The only remaining forest on laterite soil, Foret de Kalalao, has been severely degraded and is now a series of small disjunct blocks. One area of littoral forest, Foret d'Ambohidena, is relatively intact. A single obligate forest bird is known still to occur on the island. There is a high correlation between the species of birds observed during the reconnaissance and those recognized from pictures by local inhabitants of the island. On the basis of the extent of habitat destruction, the condition of the remaining forest, and information from local people, the snail-eating coua is presumed to be extinct. Incidental information was also obtained about lemurs and fruit bats occurring on the island.

Entre 26 mars et 3 avril 1991, un reconnaissance de l'île Sainte Marie, Madagascar, a été conduit, pour déterminer les conditions écologiques de la reste de forêt et les espèces d'oiseaux existantes dans l'île. Une information spécifique a été poursuivi sur le coua de Delalande (*Coua. Delalandei*), une espèce qui est connue seulement dans cet île, mais qui n 'a pas été reconnue depuis environ 150 années. Des observations et des enquêtes locales ont été faites, et qui nous ont permis d'avancer sur

cette recherche. La seule foret restante a sol latéritique - foret de Kalalao - a été en partie dégradée, et qui se présente sous forme de série de petites bloques disjointes; et une partie de la foret littorale - foret d'Ambohidena - qui est relativement intacte. II existe une haute corrélation entre les espèces d'oiseaux observées pendant la reconnaissance faite sur terrain et celles reconnues par les habitants locaux. Cornpte tenu de l'extension de la destruction forestière par les gens du village, la variation des conditions écologiques du milieux, et des informations prises, le coua de Delalande est considère comme disparu. Une information incidente a été aussi obtenue a propos des lémurs et des chauves souris,

---

Goodman, S. M. (1996). Results of a bat survey of the eastern slopes of the Réserve Naturelle Intégrale d'Andringitra, Madagascar.

Four bat species were recorded in the Réserve Naturelle Intégrale d'Andringitra: *Rousettus madagascariensis, Hipposideros commersoni. Myotis goudoti*, and *Miniopterus minor*. The greatest species richness was at 720 and 810 m. Evidence was found that *Myotis* and *Miniopterus* occupy the same day-roosts. There was also the indication that *Miniopterus minor* has synchronized breeding and delayed embryonic development.

Quatre espèces de chauve-souris ont été recensées dans la Réserve Naturelle Intégrale d'Andringitra: *Rousettus madagascariensis, Hipposideros commersoni, Myotis goudoti* et *Miniopterus minor*. La plus grande richesse spécifique a été constatée entre 720 m et 810 m d'altitude. La preuve que les especes *Myotis* et *Miniopterus* occupent des mêmes reposoirs diurnes a été établie. On a aussi relevé l'indication que *Miniopterus minor* a une reproduction synchronisée et un développement embryonnaire retardé.

Goodman, S. M. (1998). Notes on the bats of the Réserve Spéciale d'Anjanaharibe-Sud, Madagascar.

Three bat species were collected in the Reserve Speciale d'Anjanaharibe-Sud at 650 m: *Rousettus madagascariensis, Myotis goudoti*, and *Miniopterus fraterculus*. These species are broadly distributed across the island in both forested and disturbed areas.

Trois espèces de chauve-souris ont été collectées dans la Réserve Speciale d'Anjanaharibe-Sud a 650 m d'altitude: *Rousettus madagascariensis, Myotis goudoti*, et *Miniopterus fraterculus*. Ces espèces présentent une large distribution a travers toute l'île au sein de zones boisées et dégradées.

Goodman, S. M., A. Andrianarimisa, L. E. Olson and V. Soarimalala (1996). Patterns of elevational distribution of birds and small mammals in the humid forests of Montagne d'Ambre, Madagascar.

Les résultats obtenus le long d'un transect altitudinal réalisé sur les versants de la Montagne d'Ambre, dont le sommet culmine à 1475 m, localisée dans l'excrême nord de Madagascar sont ici presentés. La forêt est de type humide sempervirent au-dessus de 600 m d'altitude et est de type transitionnel ou de type sec caducifolié au dessous de 600 m. Les insectivores, les rongeurs et les oiseaux ont fait l'objet d'une étude au niveau de trois paliers altitudinaux localisés à 340 m, 1000 m et 1340 m sur le versant nord est du massif. Les mammifères et les oiseaux présentent une diversité spécifique relativement faible comparée à celle constatée 2e au niveau d'autres sites forestiers humides de Madagascar. Plusieurs éventuelles raisons sont évoquées pour expliquer ces différences. La forêt humide sempervirente de la Montagne d'Ambre, qui se développe sur un substrat géologique récent, est actuellement isolée d'autres blocs forestiers du même type localisés au sud de ce dernier. Au cours du Pleistocene Ancien et de l'Holocene, le massif de la Montagne d'Ambre était connecté à d'autres blocs de forêt localisés au sud de ce dernier par l'intermédiaire de corridors forestiers. A la

suite de changements climatiques, les zones forestières de basse altitude de cette région ont considerablement évoluées. Aujourd'hui, les forêts de basse altitude du versant sous le vent sont des forêts de transition entre la forêt pluviale sempervirente et la forêt sèche caducifoliée. De plus des éruptions volcaniques intervenues au Quaternaire ont probablement considérablement affectées l'habitat naturel de la zone sommitale du massif de la Montagne d'Ambre. Enfin, *Rattus rattus* a colonisé en masse la forêt humide sempervirente, et a travers la competition qu'elle a établie, ou de par un processus direct de prédation, cette espèce pourrait eêre responsable de la disparition de certains éléments de la faune locale.

Results are presented of an elevational transect of the slopes of Montagne d'Ambre (summit at 1475 m), extreme northern Madagascar. The forest is classified as humid on the higher slopes above about 600 m and as transitional or dry deciduous below 600 m. Insectivores, rodents, and birds were surveyed at three sites (340, 1000, and 1350 m) along the northeastern slope. Mammals and birds had relatively low species richness when compared to other humid forest sites on Madagascar. Several possible reasons are presented for these differences. The humid forests on Montagne d'Ambre, a geologically recent formation, are currently isolated from similar habitats to the south. During the Late Pleistocene and Holocene Montagne d'Ambre was connected to areas further south by corridors of humid forest. As a result of climatic shifts there has been a drastic change in the lowland habitats of this region. The remaining lowland forests on the moist side of the mountain are transitional between dry deciduous and humid forest. Further Quaternary volcanic eruptions may have greatly altered the habitat on the upper portion of the mountain. Finally, *Rattus rattus* has colonized the humid forest en masse and through competitive exclusion or direct predation may be displacing some of the native fauna.

Goodman, S. M., G. K. Creighton and C. Raxworthy (1991). The food habits of the Madagascar Long-eared Owl *Asio madagascariensis* in southeastern Madagascar.

A collection of regurgitated pellets and food remains was found below an occupied roost of the Madagascar Long-eared Owl *Asio madagascariensis* in southeastern Madagascar. The owls are taking a wide variety of prey including insects, frogs (*Boophis*), geckos (*Uroplatus*), birds (*Eurystomus, Hypsipetes*), bats (large *Hipposideros*), rodents (*Eliurus* spp., *Rattus*), and lemurs (*Microcebus*). This is the first quantitative information on the food habits of this owl species.

Goodwin, G. G. (1953). Catalogue of type specimens of recent mammals in the American Museum of Natural History.

This is the first attempt to bring together and publish a catalogue of the type mammal specimens in the American Museum of Natural History.

The types, with the exception of those in the Archbold Collections, are kept in special locked storage cases in the Department of Mammals and are marked with red labels.

The present list records all the type specimens of recent mammals up to December 31, 1952, a total of 944, in the Museum collections. The skins of many of the earlier types have been made over or are in the process of renovation.

In the list of type specimens the order of arrangement follows the principles of classification of mammals by George G. Simpson (1945).

The species and subspecies are arranged in taxonomic order based on published records and on an examination of the specimens.

The name of each genus, species, and subspecies is recorded as in the original description, followed by a reference to the place and date of publication. A later name is preceded by an equals sign,

followed by a citation of the authority for its use. Where the original name appears to be outdated but not so recorded in the literature, a more recent name is substituted, followed by comments on its use.

Where generic and specific names have been changed but not recorded for the particular species and subspecies listed here, a later name is added in brackets.

An author's name is placed in parentheses when the generic name that was used in the original description has been changed. A dagger, placed before the name, indicates that the type is fossil.

Citations are followed by the American Museum of Natural History catalogue number; the nature of the specimen, whether it is skin, skull, skin and skull, or preserved in alcohol (omission of mention of skin or skull indicates that it did not reach the museum); sex and age (omission of sex indicates that it is not definitely known); locality where taken; date when caught; name of collector; the original or field number; and condition of the specimen. Measurements are given as a means of identification. Where possible the field measurements of the skin are given. The three principal dimensions of the skull given have been checked and obvious errors corrected.

The type specimens are reserved for the use of qualified scientists at the Museum and are not permitted out on loan.

Granvik, H. (1924). On mammals from the eastern slopes of Mount Elgon, Kenya Colony. Mammals collected by the Swedish Mount Elgon Expedition 1920.

During the stay of the Swedish Mount Elgon Expedition 1920 on and around the giant extinct volcano Elgon in Kenya Colony a collection of mammals was made, but as most of the time was devoted to studying and collecting birds, we did not succeed in getting such a good picture of the mammal life as that of the bird life.

The greater part of the large mammals was shot by the leader of the expedition. Director S. A. Loven, Stockholm, who also contributed a lot of the smaller mammals. The natives around Elgon - as in other parts of the country - were very interested in our doings and arrived sometimes with Rodents and other small creatures, taken in their own traps.

I should here have given a short description of the nature and the different geographical zones of Mount Elgon but as I have already written about these matters in my work on the bird life, I refer to that paper.

I take this opportunity of expressing my grateful thanks to Professor P. Matschie, Berlin, who saved me much time and trouble when I worked at the Museum in Berlin by giving me good advice and who always helped me in so many ways. - I am also much indebted to Mr. J. Hinton - keeper of the Mammal room at the British Museum, London - for all his kindness and assistance. - For valuable hints and help during my stay at the British Museum I also wish to thank Mr. J. G. Dollman and Mr Kershaw.

From the Royal Physiographical Society at the University of Lund I have twice received pecuniary assistance for my studies at the Museums in foreign countries, and it is an exceedingly pleasant duty for me to acknowledge here my very deepest gratitude.

To my respected teacher, Professor H. Wallengren, who kindly allowed me to use a room for my work at the Zoological Institute and who always followed my work with interest, I wish to offer my most sincere thanks.

For valuable assistance in translating this work into English I beg to thank my friend Mr. Owen Morton, Malmo.

Gray, J. E. (1825). XIII. A list of the species of Vespertilionidæ found in Great Britain.

Merret in his *Pinax* led the way to the study of the animals of a peculiar country; and Linnæus in his *Fauna Suecica* following up the subject, shewed the manner in which it ought to be treated. But this kind of study, which since the time of the latter great naturalist, has become so fashionable, is now fortunately on the decline, and is giving way to the study of natural groups, or the monography of particular genera; a mode of illustration which is much better adapted to the improvement of science. But yet as it is certainly both interesting and useful to the student, to be acquainted with what are the native inhabitants of his own country, especially when that country is such an insulated place as Great Britain; and as I consider that a list of the Species of a group from a systematic author, with a few of the principal Synonyma is as useful for that purpose as a more enlarged description; I have drawn up such a list of the Species of Bats found in this country, which are preserved in the British Museum, with an account of their habitation when they appeared local.

Gray, J. E. (1839). I. Descriptions of some mammalia discovered in Cuba by W.S. MacLeay, Esq. With some account of their habits, extracted from Mr. MacLeay's notes.

The small collection of Mammalia made by Mr. MacLeay during his stay in Cuba consisted of the following species of Cheiroptera, and a foetal specimen of a Dolphin (*Delphinus*), which I have not been able to determine on account of its youth.

The bats, besides adding to our knowledge, are very interesting forms, and several hitherto unrecorded species are particularly interesting, as enabling me to locate with certainty, according to my present views, the genus *Mormoops* of Dr. Leach, of which only a single dried specimen was before known, and which had always been placed among the anomalous genera of this interesting family. It is curious, as regards the geographical distribution of these animals, which have usually been considered very local, that out of this small collection of eight species five should prove to be new to science and one of them an entirely new form, and that the other three should be common to Cuba and Jamaica.

Gray, J. E. (1866b). A revision of the genera of Rhinolophidae, or Horseshoe Bats.

At the preceding Meeting I gave an account of the genera of *Pteropidæ*. I have lately been revising my former manuscript on the Horseshoe Bats, and adding descriptions of the specimens which have been received at the British Museum since it was composed.

The family *Rhinolophidæ* is characterized as containing Leaf-nosed Bats, which have only rudimentary intermaxillary bones, suspended in the nasal cartilages. They sometimes have upper cutting-teeth; but these are generally early deciduous. The hinder, erect portion of the nose-leaf is often complicated and divided by septa into cells.

Green, A. A. (1983). Rodents and bats of Arli and Pendjari national parks, Upper Volta and Benin.

The small mammals have often been ignored in the early stages of national park development in West African national parks. Nevertheless, they play important, roles in the savanna ecology. The first step to remedy this situation of ignorance is to determine what species are present and what are their distributions. This can be done by collecting.

I came to Upper Volta in November 1971 as an American Peace Corps Volunteer to perform a game census of larger mammals for the forestry service. I lived at Arli Village at the edge of Arli Park throughout the year, remaining there until June 1975. In addition to game censusing, I performed an ecological survey of Arli Park. The data were later used by an FAO (United Nations) project for park development.

In late 1974 an FAO project for park development and wildlife management was begun for Pendjari Park in Benin. I worked in this project from September 1976 through December 1979, living in a camp

on the Pendjari River at Mare (lake) Diwouni, 30 kilometres from Arli village in Upper Volta. I was a Smithsonian Institution-Peace Corps Volunteer serving as ecologist with the FAO project team. Although I did reconnaissance surveys elsewhere in Benin, my principal concern was with Pendjari Park.

Because of limited time and resources, I seldom collected small mammals far from either Arli village or my camp at Mare Diwouni. The lists themselves are quite incomplete, and data on migration (in the cases of bats), distribution and habitat preference are limited. Nevertheless, I hope these short lists may be of help to later researchers in the region and be of general interest to those who may visit these parks.

Griffin, M. and H. J. W. Grobler (1991). Wetland-associated mammals of Namibia - a national review.

Namibia is primarily an arid country (estimated 3 % wetlands) and the majority of its mammal fauna is also arid-adapted. Thirty-eight species (20 %) are dependent on free water and/or associated wetland habitats to the extent that their distributions in Namibia may be effected by this dependence. Half of these species are only dependent on drinking water, thus 19 species or 10 % of Namibian mammals are dependent on wetland habitats. The highest species diversity of wetland-dependent mammals is in the Kavango-Caprivi area, where 92 % of Namibian wetland-associated species occur to some extent, and 40 % occur nowhere else in Namibia.

There is a general paucity of information on the smaller mammals. However, there is presently no evidence that they suffer from any conservation problems, other than general reductions in critical habitat. The hippopotamus has suffered major range reductions; it is extinct in the Orange, and nearly so in the Cunene River. Of Namibian wetlands, the Kavango River and associated riparian growth has been effected most. Only about 35 km of the original 400 km has not been heavily altered by an ever-encroaching human population. Human pressure is the critical factor throughout the Kavango-Caprivi region and this can be expected to increase in the future, with a subsequent increase in conservation problems for the six Iocal wetland habitat-dependent antelope species. Waterbuck and puku numbers are already down to critical levels. A high proportion of Namibian wetland habitat-dependent mammals are of national conservation concern. This is because these species suffer from both direct exploitation and habitat-altering human practices. However, as Namibia is an end user of these major river systems, the major effort in the future will have to be split between preserving the species and critical habitats that still remain in Namibia and, through neighbourly cooperation, assuring the quantity and quality of these waters at their sources.

Griffiths, T. A. (1994). Phylogenetic systematics of Slit-faced bats (Chiroptera, Nycteridae), based on hyoid and other morphology.

The hyoid musculature and hyoid apparatus of bats of the family Nycteridae are described and compared with the hyoid morphology of other bat families described elsewhere. Four hyoid and four nonhyoid apomorphic character states are described within the family. All nycterids share the apomorphic hollowing ofthe rostrum into a basin, covered by a dermal vertical slit ornamented with the distinctive nycterid "noseleaf." All nycterids also possess a distinctive T-shaped terminal caudal vertebra. All nycterids except *N. arge* share a reduced ceratohyoid insertion and a reduced hyoglossus origin. All nycterids except *N. tragata* and *N. arge* share an epihyal that is reduced in length, a smaller lower second premolar, and a loss of the posterior tragus constriction. A cladistic analysis of the data suggests that the African *hispida, macrotis*, and *thebaica* groups form a clade. The Asian bats of the *javanica* group are a sister group to the *hispida-macrotis-thebaica* clade. Bats of the African *arge* group are the most basal lineage within the Nycteridae. This analysis supports separating the more primitive nycterids into an *arge* group and a *javanica* group rather than combining them in a single group.

Griffiths, T. A. (1997). Phylogenetic position of the bat *Nycteris javanica* (Chiroptera: Nycteridae).

Eleven of the thirteen species of bats within the family Nycteridae are African and two are Southeast Asian in distribution. Dissection of the hyoid apparatus and musculature of the Southeast Asian bat *Nycteris javanica* and analysis of other non-hyoid morphology reveal that it shares five derived morphological characters with the previously described species *N. tragata*, also from southeastern Asia. In particular, the two Asian species share a morphologically distinctive post-laryngeal chamber that is different in shape from that of other nycterids. Cladistic analysis suggests that *N. javanica* and *N. tragata* are more closely related to each other than either is to any African species of nycterid.

Griffiths, T. A., K. F. Koopman and A. Starrett (1991). The systematic relationship of *Emballonura nigrescens* to other species of *Emballonura* and to *Coleura* (Chiroptera: Emballonuridae).

Dissection of the hyoid musculature and examination of ear, penial, and skull morphology of eight species of *Emballonura* and one species of *Coleura* reveal that, with the exception of *Emballonura nigrescens*, all species share a derived character of the hyoid region. The stemohyoid muscle in all species except *nigrescens* is deflected dorsally and laterally by a prominent postlaryngeal tracheal expansion. Additionally, *E. nigrescens* is clearly derived in having a distinctive penis, in contrast with other species of *Emballonura* as well as *Coleura*. These observations strongly suggest that non-*nigrescens* species of *Emballonura* are more closely related to species of *Coleura* than either is to *Emballonura nigrescens*. We conclude therefore that the available generic name *Mosia* Gray, 1843, should be used for the species currently called *Emballonura nigrescens*. We continue to recognize *Coleura* as a valid third genus.

Griffiths, T. A. and A. L. Smith (1991). Systematics of Emballonuroid bats (Chiroptera: Emballonuridae and Rhinopomatidae) based on hyoid morphology.

The hyoid musculature and hyoid apparatus of bats of the families Emballonuridae and Rhinopomatidae are described and compared with the hyoid morphology of selected specimens of bats of the families Nycteridae, Megadermatidae, and Rhinolophidae. The hyoid region of rhinopomatids is slightly modified, and the hyoid region of emballonurids is markedly modified from the primitive chiropteran hyoid morphology. In both families (and in nycterids and megadermatids), the omohyoid has shifted its origin medially from the scapula to the mid-clavicle. This permits the omohyoid to act as a primary tongue retractor, relieving the sternohyoid of this function. In rhinopomatids, the sternohyoid has been reduced to a weak, narrow muscle. In emballonurids, the sternohyoid has remained robust, but has developed a unique attachment to the posterior larynx. It appears to function in emballonurids as an extrinsic laryngeal muscle. A cladistic analysis of the hyoid data reveals two major clades within the Emballonuridae: the first contains *Taphozous* and *Saccolaimus* and the second contains *Emballonura, Mosia, Coleura*, and all New World genera. Within the latter clade, the genera *Emballonura, Mosia*, and *Coleura* compose a clade distinct from the New World genera. Within the New World clade there are two major lines: a line leading to *Rhynchonycteris* and *Diclidurus*, and a line leading to *Balantiopteryx, Saccopteryx, Cormura, Peropteryx*, and *Peronymus*. The phylogeny presented here agrees well with a recently published emballonurid phylogeny produced from karyotypic and electrophoretic/immunological data.

Griffiths, T. A., A. Truckenbrod and P. J. Sponholtz (1992). Systematics of Megadermatid bats (Chiroptera, Megadermatidae), based on hyoid morphology.

The hyoid musculature and hyoid apparatus of bats of the family Megadermatidae are described and compared with the hyoid morphology of bat families described elsewhere. Megadermatids share an apomorphic character state with nycterids, rhinopomatids, and emballonurids in that the omohyoid muscle has shifted its origin from the scapula to the mid-clavicle. We suggest that because of the

omohyoid shift, megadermatids have been able to develop a morphological condition described previously only in New World phyllostomid bats. The sternohyoid, hyoglossus, and geniohyoid muscles have partially detached from the basihyal, retaining a connection only through a tendon and a few deep fibers of the geniohyoid. The styloglossus muscle has a posteriorly shifted insertion, as in phyllostomids. Within the Megadermatidae, there is morphological variation in the origin of the sternothyroid, hyoglossus, and sphincter colli profundus muscles, in the morphology of the styloglossus, and in the insertion of the geniohyoid and ceratohyoid muscles. A cladistic analysis ofthe data suggests that *Lavia frons* is closely related to *Megaderma spasma* and *M. lyra*. *Cardioderma cor* is a sister species to the *Lavia-Megaderma* group. *Macroderma gigas* is the most distantly related of the four megadermatid genera.

Grimshaw, J. M., N. J. Cordeiro and C. A. H. Foley (1995). The mammals of Kilimanjaro.

This paper presents an up to date account of 154 mammal species recorded on Mount Kilimanjaro, Tanzania, and the surrounding area, from 1883 to the present, when 128 species are known to occur. Old records are reviewed and several new records added, while four recorded species have been excluded. One species, the black rhinoceros, is reported to have become extinct; another, the klipspringer, does not now occur in the area. Evidence for its alleged former presence and extinction is assessed. Red deer, introduced to Kilimanjaro during the German colonial period, is now extinct on the mountain. Other reported extinctions and colonisations of mammal species on Kilimanjaro are discussed and 19 marginal species or taxa for which further information is needed are mentioned for completeness.

Grubb, P. (1971). Further records of mammals from Ghana, based on the collections of Angus Booth.

There is still a great shortage of information on the Ghanaian mammal fauna. Several collections of specimens from Ghana remain inadequately reported, the last to receive full notice being that resulting from the LOWE-WALDRON expedition (HAYMAN, 1935). The faunal list for the country remains incomplete. Distributional data from Ghana have not been adequately collated though they could contribute to an understanding of fauna! changes across the stratified West African vegetation zones. The present paper provides further locality records and draws attention to the collection made by Angus BOOTH which might otherwise be neglected. BOOTH died before being able to report fully on the results of his efforts. It is especially unfortunate that his field notes are not available. Most of his primate specimens are now in the British Museum (Natural History), London. A few rodents and bats were also sent there for identification and are referred to incidentally by ROSEVEAR (1965, 1969). The rest of the collection is in the Department of Zoology, University of Ghana. Over 530 specimens can now be traced, and they are listed below, but some others have been mislaid.

As far as possible I have employed the scientific names accepted in the Smithsonian Institution's Preliminary Identification Manual for African mammals (MEESTER, 1966-1968). Reference should be made to ALLEN (1939) for nomenclatural history. No attempt has been made to discuss infraspecific categories, except in the case of tree squirrels. Geographical coordinates have been taken from the Official Standard Names Gazeteer for Ghana (U.S. Board on geographic names, 1967).

Grubb, P. (1978). Patterns of speciation in African mammals.

The distribution and speciation of African mammals can be interpreted in terms of both isolation and dispersal associated with Quaternary climatic and vegetational changes. Patterns of faunal diversity and endemism suggest the former existence of refugia in Forest Regions and dispersal between these Regions. Isolation has also been significant in savanna, but dispersal patterns are less easily assessed here. In certain superspecies, the directions involved in dispersals can be ascertained from the distribution of primitive and derivative character states, which in turn imply the cotemporal existence of ancestral and descendant taxa. Long term "ecological translation" in speciation appears to have

occurred down the faunal diversity gradient, especially across the forest-savanna boundary, but also from savanna to arid zones. Different mammalian taxa have speciated in different ways and there are other impediments to the reconstruction of speciation patterns.

Grubb, P. (1983). The biogeographic significance of forest mammals in eastern Africa.

A distinctive mammalian forest fauna occurs in Africa east of the Great Lakes and the Kenya Rift Valley. The distribution of species which are confined to this area defines an Eastern Forest faunal Region. The fauna is characterised by a low species diversity, the absence of many otherwise widespread forest species, and a high proportion of endemic taxa yet it has a close phyletic relationship with the Central Forest fauna. Species confined to montane habitam often have very restricted distributions in the Region, where there are several centres of endemism. Evolution of the fauna has involved shifts in habitat tolerance; successional and centrifugal dispersal along mountain chains and bands of coastal forest; and isolation of populations in forest refuges,

---

Grünmeier, R. (1996). Flower-visiting bats and their role as pollinators in the African Rain Forest. Abstract.

The pollination of flowers by bats (chiropterophily) is widely spread in the tropics and subtropics of both hemispheres. In contrast to America and Asia, few field observations have been carried out in Africa.

Own studies of the biology and pollination ecology of rain forest trees and lianas are presented from Cameroon. Their flowers - variable in morphology and blooming strategy - are characterized by a typical feature syndrome attractive to bats. Several fruit bat species (Pteropodidae) are found to pollinate them. The bats differ profoundly in their ability to utilize these flowers (e.g. in terms of their activity and behaviour in the trees, at the flowers, and in their diet), including large and middle-sized species of the genus *Eidolon, Rousettus* and *Micropteropus*, which have more or less frugivorous feeding habits, as well as the tiny long-tongued *Megaloglossus woermanni*, the only highly specialized flower-bat in Africa, but still poorly known.

Gustafson, Y. and H.-U. Schnitzler (1979). Echolocation and obstacle avoidance in the Hipposiderid bat *Asellia tridens*.

The echolocation sounds of the hipposiderid bat *Asellia tridens* consist of a constant frequency (cf) component followed by a frequency modulated (fm) terminal downward sweep of 19-21 kHz. The cf-part constitutes about 7/10 of the entire signal. In individual roosting animals the frequencies of the cf-part of consecutive sounds (resting frequency) is kept very constant but varies from bat to bat. In 18 *Asellia tridens* resting frequencies between
111 - 124 kHz have been measured.

The sound duration in roosting and free flying bats is between 7 - 10 ms. In the approach and terminal phase of bats landing on a perch or flying through obstacles, the sound duration is reduced and the repetition rate increased the nearer the bat approaches the target. At the end of the terminal phase sound durations of a minimum of 3 ms have been measured.

Flying bats lower their emission frequency in order to compensate for Doppler shifts caused by the flight movement. The echofrequency is therefore kept constant about 150 - 200 Hz above the resting frequency.

In flights through obstacles consisting of vertically stretched wires with different diameters, the bats were able to avoid wires down to a diameter of 0.065 mm whereas at 0.05 mm the percentage of flights without collisions is far below the chance level. The results demonstrate that the echolocation behavior of the hipposiderid bat *Asellia tridens* does not differ fundamentally from that of rhinolophid bats. As a result, a new suggestion for categorization of bats producing cf-fm orientation sounds is put forward.

Gyldenstolpe, N. (1928). Zoological results of the Swedish Expedition to Central Africa 1921. Vertebrata. 5. Mammals from the Birunga Volcanoes, north of Lake Kivu.

The following paper contains an account of the Mammals collected by the Swedish Zoological Expedition among the different mountains of the Birunga Range. At least as far as I know, no comprehensive work has ever been published about the Mammalian Fauna of this most interesting region in the heart of Central Africa, and the following notes may therefore give some idea about the Mammals of the Range. In all we spent a little more than two months among these beautiful mountains and during the whole time we collected assiduously.

Although we made our camps at several places and at different altitudes it is, however, most certain that a few more species than those, obtained, or observed by us still remain to be discovered. But on the whole I believe, that our collection of Mammals is fairly complete and representative of the Range. A noteworthy fact was, however, the almost total absence of *Chiroptera*. A single specimen of a small Bat was seen circling in the air near our highest camp on the saddle between Mikeno and Karissimbi, but- unfortunately we -did not succeed in obtaining it. Some small caves were also explored, but no signs of Bats were found in them.

The maiority of the species enumerated below were collected on the different mountain peaks, but a few specimens from the lava plains surrounding the actual Volcanoes are also included in the list. In my previous paper on the Birds obtained by the Expedition (Kungl. Sv. Vet. Akad. Handl., Bd. 1, No. 3, 3rd. series, 1924) I have already given some notes about the physical features and the vegetation of these Volcanoes accompanied by a sketch-map of the region in question.

In the Appendix a nominal list of the Mammals collected by the Expedition in the Western parts of Uganda and in Eastern Belgian Congo is published.

Habersetzer, J. (1981). Adaptive echolocation sounds in the bat *Rhinopoma hardwickei*.

1. *Rhinopoma hardwickei* were studied under natural conditions in the Madurai region of southern India.
2. Frequency modulated (FM) sounds of 3 ms duration were emitted shortly before landing and during times when 10 - 70 individuals were flying in clusters as they left their roosts.
3. Constant frequency (CF) sounds of 48 ms duration were produced in open space by single flying bats and by bats flying in a group. At these times the most intense component was the second harmonic.
4. When bats flew in a group the frequencies of the CF-sounds emitted by different individuals were in three different bands (30.0, 32.5, and 35.0 kHz) whereas single flying bats used only 32.5 kHz. Evidence is presented that shows that *Rhinopoma hardwickei* flying in groups regulate the frequency of their individual CF-components and in this way they avoid jamming one another.
5. After landing a pure tone multi-harmonic sound of long duration (maximally 100ms) is emitted. In this sound the fundamental frequency is dominant. Its significance, either communicative and/or echolocative, is not clear.
6. The possible role of different types of sounds recorded in different orientation situations is discussed.

Haffner, M. and V. Ziswiler (1989). Tasthaare als diagnostisches Merkmal bei mitteleuropäischen Vespertilionidae (Mammalia, Chiroptera).

Vibrissae as a taxonomie character in palaeartic Vespertilionidae (Mammalia, Chiroptera).

The arrangement and number of facial vibrissae were investigated for several species of vespertilionid bats. Although bats have a small number of vibrissae, a determination key could be obtained. While some genera and species can be separated macroscopically by the arrangement and number of long

vibrissae, the identification of others is based on histological investigations to distinguish the short vibrissae from adjacent facial hairs.

In addition to the taxonomic relevance of the vibrissae, phylogenetic conclusions could be drawn. The arrangement and number of vibrissae in *Pipistrellus savii* support the hypothesis of Horacek & Hanak (1986) of combining this species with other species of the genus *Pipistrellus* that have characters in common with *Eptesicus* in a new genus *Hypsugo*. The fact that the examined vespertilionid bats have less vibrissae in comparison with their phylogenetic related Insectivora can be explained as an adaptation to flight ability and echolocation.

Die Frage, ob Tasthaare in der Säugetiertaxonomie als diagnostisches Merkmal verwendet werden können, wurde in der Literatur nur selten aufgegriffen. Vor allem bei der Identifikation von Jungtieren, die noch nicht auf Grund von Zahnmerkmalen und Körpermassen determiniert werden können, wäre es wünschenswert, wenn man auf andere Merkmale zurückgreifen könnte. Tasthaare würden sich dazu eignen, da sie zu den prominenten und in der Ontogenese zu den sich früh entwickelnden Haaren gehören.

Anhand von grobmorphologischen und histologischen Untersuchungen der Kopfhaut von Glattnasenfledermäusen (Vespertilionidae) bestimmten wir die Anordnung und Anzahl der Tasthaare bei 134 Individuen aus 15 Arten und 6 Gattungen. Obwohl diese Fledermausarten eine geringe Anzahl Tasthaare und Tasthaargruppen aufweisen, konnte ein Bestimmungsschlüssel erstellt werden. Während sich einzelne Gattungen anhand von langen Tasthaaren bereits makroskopisch voneinander unterscheiden lassen, sind vor allem auf Artniveau histologische Untersuchungen nötig, um die kurzen Tasthaare von normalen Gesichtshaaren zu unterscheiden.

Zusätzlich zur taxonomischen Relevanz der untersuchten Tasthaare können auf Grund der erfassten Verhältnisse auch phylogenetische Schlüsse gezogen werden. So unterstützen Anordnung und Anzahl der Tasthaare bei *Pipistrellus savii* das Postulat von Horacek & Hanak (1986), die Art zusammen mit anderen Pipistrellusarten, die Affinitäten zur Gattung *Eptesicus* aufweisen, in einer neuen Gattung Hypsugo zu vereinigen.

Die bei den untersuchten Fledermausarten im Vergleich zu den phylogenetisch nahestehenden Insektivoren geringe Anzahl Tasthaare kann als Anpassung an die Flugfähigkeit und die Echoorientierung angesehen werden.

Haiduk, M. W., R. J. Baker, L. W. Robbins and D. A. Schlitter (1981). Chromosomal evolution in African Megachiroptera: G- and C-band assessment of the magnitude of change in similar standard karyotypes.

Differential staining (G- and C-banding) is used to assess magnitude of chromosomal variation in eight species of African megachiropterans. These data are compared with those suggested by standard karyotypic studies, and it is concluded that in this example standard methods underestimate chromosomal variation by a factor greater than 4.5. The implication of these data is that models constructed from patterns of chromosomal evolution in standard karyotypes need to be evaluated in light of in-depth studies based on G- and C-bands.

Haiduk, M. W., L. W. Robbins, R. L. Robbins and D. A. Schlitter (1980). Karyotypic studies of seven species of African Megachiropterans (Mammalia: Pteropodidae).

Karyotypes of seven species of megachiropterans from Africa are described. *Epomops franqueti, Hypsignathus monstrosus, Lissonycteris angolensis*, and *Myonycteris torquata* have a 2n = 36 and karyotypes that are similar to each other in morphology. *Micropteropus pusillus* (2n = 35) is similar to the above four, but possesses what appears to be an X/Y,Y2 sex-determining system. *Scotonycteris ophiodon* (2n = 34, FN = 62) and *Megaloglossus woermanni* (2n = 34, FN = 62) are respectively distinctive from the other taxa studied, but may share several chromosomal characteristics with the other species.

Haiduk, M. W., L. W. Robbins and D. A. Schlitter (1983). Chromosomal banding studies and their systematic implications in African fruit bats (Chiroptera: Pteropodidae).

The bat family Pteropodidae is a diverse assemblage of approximately 150 species (Koopman & Jones, 1970). While much is known about morphological characteristics of taxa within this family, other characters of these organisms with potential systematic and evolutionary use have not been extensively explored. One such aspect is the study of the chromosomes, particularly the use of differential staining techniques, and the application of these data to resolve systematic and evolutionary questions. Studies utilizing non-differentially stained chromosomes have yielded data for 26 species of Pteropodids (see Haiduk et al., 1980), but only one study (Haiduk et al., 1981) has incorporated differentially stained material. On the basis of data from nondifferentially stained chromosomes, the megachiropterans are relatively conservative with most species possessing the same or similar diploid and fundamental numbers (Haiduk et al., 1980). G- and C-band data, however, have demonstrated that complex chromosomal differences do exist between several species with very similar standard karyotypes (Haiduk et al., 1981).

In this study, the examination of differentially stained chromosomal material is further pursued. Two species of *Epomophorus* (*wahlbergi* and *minor*) are examined and compared with those species reported previously (Haiduk et al., 1981). These data are then used to construct a cladogram depicting the evolutionary relationships of the taxa examined thus far.

Hammer, M. and R. Arlettaz (1998). A case of snake predation upon bats in northern Morocco: some implications for designing bat grilles.

During a study of North African mouse-eared bats in Morocco in August 1993 (Arlettaz et al., 1997) some accidental observations on chiropterophagy by the snake *Coluber hippocrepis* were made. This adds a new species to the list of bat-eating serpents documented so far (for a general review see Schätti, 1984). In addition, our observations lead to some recommendations for the construction of bat grilles at underground sites to minimize predation risk by snakes or other predators upon bats.

Hanák, V. (1964). Zur Kenntnis der Fledermausfauna Albaniens.

In der Arbeid sind die bisherigen faunistischen Untersuchungen der Fledermäuse Albaniens zusammengefasst. Es wurden 14 Fledermausarten gemeldet, von denen 8 Höhlenbewohner sind. Die Fundstellen der einzelnen Arten sind in einer Verbreitungskarte dargestellt.

Von den höhlenbewohnenden Arten ist in Albanien *Rhinolophus ferrumequinum* die häufigste. Ihre Wochenstuben (100 - 300 Ex.) wurden in 7 Höhlen festgestellt. In grösseren Höhlen würden auch *Miniopterus schreibersi, Rhinolophus euryale* und *Rhinolophus blasii* gefunden, die öfter Mischkolonien bildeten. Regelmässig wurden in den Höhlen auch *Myotis myotis* und *Myotis blythi oxygnathus* wie auch *Myotis capaccinii* und *Myotis emarginatus* gesammelt.

Zu den reichsten Fundorten gehören die Höhle Mezhgoranit bei Tepelene und die Höhle bei Koritë (Cerovoda), wo je 7 Arten gesammelt wurden.

Die übrigen aufgeführten Arten, *Nyctalus noctula, Pipistrellus nathusii, Pipistrellus kuhli, Pipistrellus savii, Plecotus austriacus* und *Eptesicus serotinus* wurden nur gelegentlich in anderen Biotopen erbeutet.

Bei den meisten angeführten Arten wurde auch die Analyse der Körper- und Schädelmasse des albanischen Materials und ein Vergleich mit den Werten einiger Populationen aus anderen Gebieten Süd- und Mitteleuropas durchgeführt mit dem Ziel, ihre subspezifische Stellung zu bestimmen. Die

Werte der Körper- und Schädelabmessungen und die Vergleichswerte sind in Tabellen zusammengefasst worden.

Herr Dr. G. H. W. Stein hat diese Arbeit gefällig durchgesehen und namentlich in sprachlichen Hinsicht verbessert, wofür ich Ihm meinen herzlichen Dank ausdrücke.

Hanák, V. (1966). Zur Systematik und Verbreitung der Gattung *Plecotus* Geoffroy, 1818 (Mammalia, Chiroptera).

Die systematisch-zoogeographiche Analyse von 318 Exemplaren von *Plecotus* aus verschiedenen Gebieten von Europa, Asien und Nordafrika ergibt folgende vorläufige Schlüsse:

(1) Das Areal von *Plecotus auritus* und *Plecotus austriacus* in Europa wird genauer umschrieben. Im augedehnten Gebiet von Mittel- West- und Südeuropa leben beide Arten gemeinsam, aber dennoch bleiben sie hypsometrisch und ökologisch gewissermassen getrennt.

(2) Im paläarktischen Raum leben offenbar nur zwei Arten der Gattung *Plecotus*: *Plecotus auritus* LINNÆUS, 1758, mit wahrscheinlich nur 2 Subspezien:

Plecotus auritus auritus LINNÆUS, 1758 im augedehnten Gebiet von Europa, Sibirien und Ost- sowie vielleicht auch nördlichen Teil von Zentralasien.

Plecotus auritus sacrimontis ALLEN, 1908 durch grössere Masse und dunklere Färbung gekennzeichnet, in Japan und vielleicht auch im östlichsten Teil des Festlandes von Asien. Die Populationen aus dem östlichen Teil der UdSSR (nach Westen bis zum Altai) weisen ebenfalls Merkmale dieser Rasse auf.

Plecotus austriacus FISCHER, 1829, umfasst folgende Subspezien:

Plecotus austriacus austriacus FISCHER, 1829, im europäischen Areal und im Kaukasus (*Plecotus austriacus hispanicus* BAUER, 1956 und *Plecotus auatriacus? tenerifæ* BARRETT HAMILTON, 1907 sind offenbar Synonymen).

Plecotus austriacus wardi THOMAS, 1911, naheverwandt mit der Nominatrasse, unterscheidet steh vor allem durch eine lichte Färbung, in den Gebirgs- und Tieflandsgebieten von Mittelasien.

Plecotus austriacus kozlovi BOBRINSKOJ, 1926, als grösste Rasse dieser Art, mit lichter Färbung; in den Wüstengebieten von Zentralasien (Südmongolei, West- und Mittelchina?) Zur Verwandschaft dieser Rasse gehört auch *Plecotus austriacus ariel* THOMAS, 1911, welche bloss durch dunkle Färbung unterschieden ist.

Plecotus austriacus christiei GRAY, 1838 (=*Plecotus austriacus ægyptius* FISCHER, 1829), eine kleine, licht gefärbte Form aus Nordafrika.

Die systematische Stellung der Form *homochrous* HODGSON, 1847 (= *puck* BARRETT-HAMILTON, 1907) bleibt bisher unklar.

Hanák, V. and A. Elgadi (1984). On the bat fauna (Chiroptera) of Libya.

The present paper is based on total of 73 specimens of 9 bat species, collected in Libya during two short-term visits in 1979 and 1980. The sample is completed by a small collection of bats from various museums and by all literary data available from this area. The result of this study confirms the occurrence of 13 species of three families in the studied area. Five species (*R. mehelyi, M. blythi, P. pipistrellus, N. leisleri* and *M. schreibersi*) and one subspecies (*P. a. austriacus*) are reported for the first time from Libya, other findings are additional distributional records. The main external and cranial measurements, ecological comments and a preliminary taxonomical evaluation of the studied material

are given. Provisionally zoogeographical analysis shows that the most of hitherto known Libyan bat fauna consist of species of Mediterranean and Palaearctic-arboreal origin.

Happold, D. C. D. (1967). The natural history of Khartoum Province: Mammals.

The mammals of Khartoum Province are less well known than the birds because most of them are nocturnal and rarely seen. But since there are only 30 species (Table 1), it is not difficult to know and recognise them all.

All mammals have hair or fur, are warm blooded, and produce milk to feed their young. The Class Mammalia, which includes all mammals, is divided into 18 Orders, 7 of which are represented in Khartoum Province. These are (1) Insectivora, insect eating mammals, e.g. hedgehogs and shrews; (2) Lagomorpha, the rabbits and hares; (3) Rodentia, one of the largest Orders, including mice, rats, squirrels, jerboas, and porcupines: (4) Chiroptera, the bats which are the only flying mammals; (5) Carnivora, the flesh eating mammals including cats, dogs and foxes, and mongooses; (6) Hyracoidea, the hyraxes or dassies; and (7) Artiodactyla, the even-toed ungulates which includes cows and antelopes.

In Khartoum Province there are two principal habitats: the vegetation and cultivated banks along the Nile where food and water are abundant; and the desert and jebels where trees and grass are rare, and where water is not readily available except after the rains. Mammals can be divided into 'riverain' or 'desert' species; some terrestrial mammals, and the bats, are found in both habitats (Table 2).

The desert is a difficult place to live in, and mammals living there show many interesting adaptations. The rodents spend the daytime in burrows several feet under the surface protected from the high temperatures arid low humidity. In these burrows the climate remains.- almost constant during the day and night. After sunset when the temperature drops, these small mammals emerge and stay above ground until just before sunrise. The desert rodents can exist and flourish without drinking water since they obtain sufficient from their food of seeds and grass, and because they produce only very small quantities of concentrated urine. Since they remain in their burrows during the heat of the day, they do not lose water trying to keep their body temperature constant; in fact these rodents do not possess sweat glands and so they would be unable to lose heat by sweating. Hedgehogs, hares, and the carnivores also have burrows, or remain hidden during the day in the shade of rocks and trees.

The desert appears to be lifeless during the day because it is essential that the mammals, and other animals, do not become overheated. All the special desert adaptations ensure that the heat and water balance of the mammals remains more or less constant. The largest mammal of Khartoum Province, the gazelle, rests in the shade but because of its larger size, special behaviour and physiology, it is able to live in the desert away from water for many days at a time. Species not adapted to desert conditions, e.g. the house mouse, the Nile rat, and the creambellied roof rat, can only live along the Nile banks and in houses.

The number of species, and individuals, of mammals in the desert is small compared with the rainforests and savannah to the south, and the temperate regions to the north. Only certain species are able to live under desert conditions and on the limited amount of food that is available. There is probably never a lack of food for the small rodents since some species store food after the rains, and grass and seeds are blown into holes and crevices where they remain as 'food stores' for many months. But the number of rodents is never large, and the number of predators (foxes, genets, etc.) which feed on them is even smaller.

There are other interesting features, other than physiological ones, shown by mammals in the Province. For example, many of the nocturnal mammals, especially the jerboas, have large eyes. Two groups of mammals, the hedgehogs and the spiny mice, have hairs which are stiffened and modified into spines. The jerboa is an extreme example of a jumping mammal with very long hindlegs and tail, and short forefeet used only for feeding and washing. The hyrax is adapted for life on rocks, and is capable of running up and down almost vertical rock cliffs.

The breeding season of desert mammals is short and well defined. Most species breed during, and just after, the rains from July to November. It is not known whether there are two seasons, one in July and another in October-November. It appears that, that there is a lot of variation from species to species. Rodents found in houses and along the Nile probably breed throughout most of the year.

Khartoum is in a transition zone between the extreme desert to the north and the woodland savannah to the south. There are many species in the northern Sudan, Egypt, and Libya which are not found near Khartoum, and similarly other species abundant in the savannah which are not found as far north as Khartoum. Probably there were more of these 'southern' species until the end of the last century when increased human population and disturbance altered the environment near Khartoum. More recently, the Gezira irrigation scheme acts as a barrier preventing southern species from moving northwards. The Nile acts as a link from Egypt through the northern Sudan, and some species, e.g. the Nile fox, are found along most of its length.

There are few publications on the mammals of the Khartoum region. The most comprehensive work on Sudanese mammals is that of Setzer (1956), but several species are omitted and it is of little use as a field guide. There are several old papers (e.g. Thomas 1901, 1903) recording species collected in various localities. Descriptions of game animals are given by Brocklehurst (1931), and the distribution of ungulates is reviewed by Mackenzie (1954). Other references which are useful are Anderson (1902), Flower (1932), and Owen (1953).

All the species described (Table 1) have been caught or seen during the period 1963-1966, so their presence is definitely confirmed. Other species not seen during 1963-1966 (Table 3) may have disappeared from the Province since the records were made. This is quite possible because of the vegetation changes described above; if these species are still present, they are probably rare. Some records may be incorrect.

The Arabic names for mammals are not. specific and it is impossible to use them to describe a species; e.g. 'abu gunfud' refers to 2 species, 'urn sisi' refers to 5 species, and 'watwat' or 'abul riggi'' refers to all the bats. The English names, too, are not always specific, but there is no confusion if the Latin names are used. Latin, English, and Arabic names for all species are included in Table 1.

The knowledge about mammals of Khartoum Province (and the rest of the Sudan) is very limited. The natural history of most species is unknown, and consequently there are many problems to be studied. But first it is essential to know exactly what species are likely to be found. Although this guide does not claim to be comprehensive, the following pages describe the mammals which are likely to be encountered in the Province.

Happold, D. C. D. (1981). Geographical ecology of Nigerian mammals. Abstract.

The mammalian fauna of Nigeria consists of 42 families, 133 genera and 241 species. This diversity is due, in part, to the prominent cline of vegetation, rainfall, temperature and seasonality from south to north. The fauna is composed mostly of widespread West African species, although others reach their eastern, western and southern limits in Nigeria.

The rainforest fauna is the most diverse of all the major biomes despite the relatively small area of rainforest. Species numbers in the different biomes show two distinct patterns: in general, rodents, bats and primates decrease in number from south to north, whereas carnivores and artiodactyls increase in number. When biomes are compared, there is little similarity between the rainforest and the savannas, and greater degrees of similarity within the four savanna zones.

In addition to the north-south cline, distribution patterns are also determined by the influence of the Niger river, the presence of relic forests in the savannas, the de-afforestation of the rainforest, and the montane environment of the Jos plateau. Species diversity indices indicate a higher diversity in the rainforest than in the savannas, and analysis of trophic relationships in selected communities suggest that rainforest communities differ from and are more saturated than savanna communities.

This study shows that a more representative system of reserved areas is necessary for adequate conservation of Nigerian mammal communities.

Happold, D. C. D. (1984). Chapter 17. Small Mammals.

It comes as rather a surprise to learn that most hot deserts of the world have a rich and diverse fauna of small mammals. These small mammals (adult weight up to 3 kg) are rarely seen by the casual observer as they are mainly nocturnal and widely dispersed. Some unfavourable parts of the Sahara are completely devoid of mammals while other favourable habitats support flourishing populations of several species. The most successful orders of small mammals are the rodents, carnivores and bats and, to a lesser extent, the hares and hyraxes. All of them are adapted to the harshness and unpredictability of the desert environment. Many of these adaptations, such as nocturnal activity, efficient water conservation, behavioural control of body temperature, and rapid initiation of reproduction after drought, are shared by similar species of small mammals in other hot deserts of the world. Hence, there appear to be only a limited number of evolutionary options for small mammals in deserts.

Happold, D. C. D. (1985). Geographical ecology of Nigerian mammals.

1. The vegetation zones of Nigeria replace each other with increasing latitude. Rainforest and swamp forest in the south are succeeded by derived savanna, Guinea savanna, Sudan savanna and finally Sahel savanna in the extreme north. Climatic characteristics such as mean annual rainfall, mean number of rainy days each year and mean monthly minimum temperatures decrease from south to north, whereas number of months with less than 25 mm of rain, mean monthly maximum temperatures and range of mean annual temperature increase from south to north . Associated with this clinal pattern is increased seasonality, decreased productivity and lower mean vegetation height from south to north.

2. Nigeria has a diverse mammalian fauna of 42 families, 133 genera and 241 species. The general distribution of each species according to vegetation zones is tabulated. The proportional representation of each order is about the same as found in other African countries, although Chiroptera and Primates are especially well represented. The number of mammalian species is close to the predicted number in relation to the surface area of the country. The greatest numbers are found in the rainforest (116 spp) despite the small area of this vegetation zone; numbers decline in each successive zone to the north. The numbers of species of Chiroptera, Primates and Rodentia decline in each successive vegetatlon zone from south to north, but the Carnivora and Artiodactyla attain their highest species numbers in Guinea and Sudan savannas. The species composition of the rainforest zone is essentially different to that of any other zone; in contrast, there is considerable similarity between the faunas of the savanna zones. The rainforest fauna has the highest number of endemic species whereas Sudan and Sahel savannas contain very few endemic species. Correlation between climatic factors and species numbers is rodents show that annual range of temperature and annual rainfall are the best predictors of species numbers; in contrast no significant correlations are apparent for all species of mammals probably because of the different responses of the major orders to changes within the vegetation zones.

3. The mammals of Nigeria are typical of West Africa. The affinities of the fauna show that the majority of mammals are those of 'savanna', 'rainforest' and 'widespread' origin. Other species are of 'Saharan', 'montane', 'western rainforest', and 'eastern rainforest' origins; and one species is endemic. Thus all except one species occur in other West African countries.

4. The mammals of the rainforest zone may be considered as two groups, divided by the Niger river; of the endemic rainforest species 60 occur west of the river and 69 occur east of the river. The Niger river appears to act as a dispersal barrier to 27 species (ie. 35 % of endemic rainforest species). The Jos plateau, forest relics in the savanna, and savanna-like habitats in the rainforest zone have influenced the distribution of some species.

5. Analysis of the distribution and proportional abundance of small terrestrial rodents shows that species diversity indices are highest in the derived savanna and lowest in the rainforest. Many of these species occur in only one vegetation zone and have small habitat breadths; only three species have wide habitat breadths.

6. Trophic levels and diversity are examined in relation to bats. Nigerian bats show the same pattern of diversity as those of Botswana and Zimbabwe. The majority are insectivorous and a small but significant proportion are fruit/nectar feeders.

7. Eight 'faunal regions' are recongnised for the purposes of conservation of Nigerian mammal communities. Most faunal regions are, or will be, adequately conserved in proposed or gazetted reserved areas except for 'rainforest' and the 'Jos plateau and relic forest' communities; additional conservation areas are required in these two faunal regions.

8. Geographical ecology of the mammals of Nigeria (as well as for many other African countries) is hampered by inadequate information on distribution patterns and an absence of quantitative and synecological studies. A community approach is necessary in order to understand many of the fascinating aspects of the geographical ecology of African mammals.

Happold, D. C. D. and M. Happold (1988). Renal form and function in relation to the ecology of bats (Chiroptera) from Malawi, Central Africa.

The ratio of the medulla to the cortex (M/C ratio) was determined for three species of Megachiroptera, and the ratio of the inner medulla to the cortex (IM/C ratio) was determined for 28 species of insect-eating Microchiroptera from diverse savanna and montane habitats within Malawi. Although all these species occur in the southern savanna biotic zone of Africa, each varies in its ability to exploit the African rainforest, arid and desert biotic zones. The kidneys of the Megachiroptera were very different to those of the insect-eating Microchiroptera, and these differences were related to the need of fruit-bats to excrete the surplus water associated with their diet. The urine concentrating capacity of each species of Microchiroptera was predicted from the IM/C ratio. Family characteristics were examined, and the urine concentrating capacities of the Malawian bats were compared with bats from elsewhere, and with some rodents. The insect- eating Microchiroptera exemplified a very diverse range of IM/C ratios. The IM/C ratio of each species was compared with its drinking behaviour in captivity, diet, foraging strategy, flight, aspect ratio, domicile, roosting behaviour and habitat. It was hypothesized that the ability of insect-eating Microchiroptera to conserve urinary water would be an advantage to species: (a) living in xeric habitats; (b) adapted for sustained high-speed flight; (c) roosting in hot dry domiciles; (d) roosting in solitude; and € living at high altitudes where seasonal low temperatures induce torpidity. These hypotheses were tested, and it was concluded that, while the ability to conserve urinary water may have been an advantage in most of these situations, it was not essential.

Happold, D. C. D. and M. Happold (1989a). The bats (Chiroptera) of Malawi, Central Africa: Checklist and keys for identification.

At the present time, 55 species of bats have been recorded in Malawi. and these comprise 30 % of the mammalian fauna of the country. The species of bats vary greatly in their distribution and abundance: some are widespread end very common while others are rare and recorded from very few localities. In spite of the large number of species and the abundance of some of them, the bats are one of the least known orders of mammals in Malawi, and in Africa as a whole.

Until recently, most of the knowledge of the bats of Malawi was derived from a few small collections, and from publIcatIons by Ansell (1974, 1978), Ansell & Ansell (1973), Ansell, Benson &; Mitchell (1962), Bergmans & Jachman (1983), Dowsett & Hunter (1980), Hanney (1961), Harrison (1959,1982), Kershaw (1922), Koopman (1966), Lawrence & Loveridge (1953), Morris (1964), Sweeney (1959) and Thomas (1894, 1896, 1897). Recently, a checklist of 55 species of bats of Malawi, with measurements, locality records and notes, was compiled by Happold, Happold & Hill (1987), and distribution maps and taxonomic notes for these species have been complied by Ansell & Dowsett (1988).

This paper presents keys for the identification of the 55 species of bats currently recorded for Malawi, and for 10 addittonal species (marked with an asterisk) which occur in adjacent countries and which may occur in Malawi. All measurements are in millimetres, and the ranges given are those for the spectes irrespectIve of locality. If possible, the mean derived from measurements of specimens from Malawi is added in parentheses (data from Happold et al. 1987).

The taxonomy of some species is controversial. In this paper, we have principally followed Hayman & Hill (1971), but have made some changes in response to the subsequent revisions of *Laephotis* (Hill, 1974a), *Scotoecus* (Hill, 1974b), *Scotophilus* (Robbins *et al.*, 1985), and *Nycteris* (van Cakenberghe & de Vree, 1985). Some controversial taxonomic Iisues, with the relevant references are mentioned in the notes on some genera.

Other keys are also useful for identifying bets in Malawi; however, their usefulness is limited because they either include many species which do not occur in Malawi (e.g. Hayman & Hill, 1971), or do not include all the species now known to occur in Malawi (e.g. Fenton, 1975; Smithers, 1983; Smithers & Labao
Tello, 1976; Smithers & Wilson, 1979). The present key is designed specifically for Malawi, and the information in the keys is correct for the subspecies, colour varieties, and forms found in Malawi. The key is based, as far as possible, on external characteristics and/or dentition which may be examined without harming the bat, and without special expertise. We have frequently used, or modified, definitive characteristics which have been used in previous keys by Fenton (1975), Happold (1987), Hayman & Hill (1971), Koopman (1966), Rosevear (1965) and Smithers (1983).

A glossary of terms used in the keys is given at the end of the paper, and the majority of characteristics are illustrated in Figs. 1 to 10.

Happold, D. C. D. and M. Happold (1989b). Reproduction of Angola free-tailed bats (*Tadarida condylura*) and little free-tailed bats (*Tadarida pumila*) in Malawi (Central Africa) and elsewhere in Africa.

Angola free-tailed bats and little free-tailed bats occur in diverse habitats throughout most of Africa south of the Sahara. This study investigated the reproductive strategies and related biology of these species in Malawi where they were sympatric, and analysed data from elsewhere in Africa to show how the strategies varied along a gradient of habitats from approximately 12° N to 25° S.

Both the Angola free-tailed bat and the little free-tailed bat were normally monotocous. Angola free-tailed bats invariably had 2 births/year, and the interval between consecutive births decreased with increasing latitude. When the interval was shortest
(~90 days) a post-partum oestrus occurred. Little free-tailed bats differed by having a shorter gestation (~60 days), and the ability to have up to 5 births/year with a postpartum oestrus after each birth. The extent to which this potential is achieved varies with latitude and rainfall, mainly so that lactation can coincide with peaks in the abundance of food. The interaction between rainfall and reproductive characteristics results in the two species having patterns of reproduction which are sometimes similar, but more often different. Competition between the species is unlikely to be affected by differences in their reproduction.

Happold, D. C. D. and M. Happold (1989c). The bats of Malawi. Abstract. Eigth International Bat Research Conference, Sydney, Australia, 9 - 15 July 1989.

The location of Malawi, midway between warm temperate South Africa and the equator, makes Malawian bats (55 species, 8 families) particularly interesting. Comparison of the bats of Malawi and other African countries revealed patterns and trends in community composition, species-latitude relationships, trophic diversity and domiciles. Comparison also showed how reproductive strategies vary interspecifically, intraspecifically, and in different African environments, and indicated that reproductive flexibility is sometimes likely to influence distribution. Two sympatric species of *Tadarida*

exemplify different reproductive chronologies in Malawi, and each modifies its chronology indifferent ways in other parts of Africa. Comparison of renal form in Malawian bats enabled relationships between renal function and ecology to be investigated. Comparison of the biology of the bananabat, *Pipistrellus nan us,* in Malawi,South Africa, Kenya and Zaire, revealed differences related to climate and the use of permanent or ephemeral domiciles.

Happold, D. C. D. and M. Happold (1990a). The domiciles, reproduction, social organisation and sex ratios of the Banana Bat *Pipistrellus nanus* (Chiroptera, Vespertilionidae) in Malawi, Central Africa.

Investigated were the domiciles, reproduction, social organisation and sex ratios of the Banana Bat, *Pipistrellus nanus* in Malawi. The bats were taken from furled banana leaves at fortnightly or monthly intervals from September 1984 to June 1985. The furled leaves were ephemeral domiciles lasting one to three days. A surplus of domiciles was always available. Females were monoestrus with the birth of twins in November and lactation lasted about eight weeks. The testes in males were scrotal from April to October, and attained maximal size in May. During lactation adult males roosted singly, while females with their young roosted singly or in maternity groups. Post-lactating females roosted singly or with groups of subadults and/or other post-lactating females, and the adult males continued to roost singly. In April, by which time the testes of all males have become scrotal, all bats were assumed to have reached sexual maturity and they began to live in harems (one adult male with one or more females). An equal number of males and females were born, but females outnumbered males for at least seven months of the year. The data from Malawi are compared with data from Kenya (O'SHEA 1980). South Africa (LAVAL and LAVAL 1977), and elsewhere. Geographical variation in domiciles and reproducrion, and the relationships between different aspects ot the biology of *P.nanus*, are discussed.

Happold, D. C. D. and M. Happold (1996). The social organization and population dynamics of leaf-roosting banana bats, *Pipistrellus nanus* (Chiroptera, Vespertilionidae), in Malawi, east-central Africa.

Banana bats were censused at their daytime roosts in furled leaves of bananas at fortnightly intervals from August 1993 to June 1994. The study area was a plantation of 138 numbered banana clumps arranged in a grid of 2 000 m^2 near Namadzi in the Shire Highlands of Malawi. Each bat (n = 125) was banded. At each census, every furled leaf in the plantation was examined and all of the bats within each occupied leaf were captured. The band number of each bat, its reproductive condition, the composition and membership of each group of bats, and the site of capture were recorded.

Bats were assigned to cohorts whose fates were followed; the population size ranged from 84 to about 45 during the study. Banana bats roosted in groups of 1 - 12 individuals. Mean group size ranged from 1.3 to 2.4, according to season. During parturition and lactation, females with young roosted separately from males, and the males roosted singly. At other times, adult males roosted singly or in larger groups composed of one (rarely two) male(s) and 1 - 10 females. Formation of groups of two or more bats was not attributable to a shortage of furled leaves. On most occasions, each male was found with a different group of females, and each female with a different male, showing that group membership is highly labile and suggesting that the mating system is promiscuous. Most males showed fidelity to a small number (< 5) of "reliable" banana clumps which were close together and which had one or more suitable furled leaves at all times. Females did not show such fidelity. The roosts, social behaviour, reproductive biology and sex ratios of leaf-roosting banana bats and thatch-roosting banana bats (considered to be conspecific), and two other species of bats, are compared so as to elucidate some of the environmental and phylogenetic factors which might have shaped the mating system of the leaf-roosting banana bats in Malawi.

Des chauves-souris des bananiers ont été recensées tous les quinze jours depuis août 1993 jusqu'a juin 1994 dans leurs refuges diurnes constitués par des feuilles de bananiers enroulées. La zone étudiée était une plantation de 138 bananiers numerates, sur une grille de 2 000 m^2, près de Namadzi dans les Highlands du Malawi. Chaque chauve-souris (n = 125) a été baguée. A chaque recensement,

chaque feuille enroulée de la plantation a été examinée et toutes les chauves-souris qui occupaient une feuille ont été capturées. Le numéro de chaque chauve-souris, son état génital, la composition de chaque groupe de chauves-souris et le site de la capture ont été enregistrés.

Ces chauves-souris ont été attributés à des cohortes dont le devenir a été suivi; la taille de la population a varié de 84 à environ 45 pendant l'étude. Elles se réfugiaient en groupes de 1 à 12 individus, en moyenne 1,3 à 2,4 selon la saison. Au cours de la parturition et de la lactation, les femelles restaient avec leurs jeunes, a l'ecart des mâles et les mâles restaient isolés. A d'autres moments, les mâles adultes étaient seuls ou en petits groupes composés d'un ou rarement deux mâles et d'une à dix femelles. La formation de groupes de deux, ou plus de deux chauves-souris, n'était pas attribuable au manque de feuilles enroulées. Dans la plupart des cas chacun des mâles a été trouvé avec un groupe différent de femelles, et chaque femelle avec un mâle different, ce qui montre que l'adhesion a un groupe est très fragile, et ce qui permet de penser que le système de formation du couple est la promiscuite. La plupart des mâles montrent de la fidelite à un petit nombre (< 5) de bananiers "fiables", proches les uns des autres, et ayant une ou plusieurs feuilles enroulées disponibles tout le temps. Les femelles ne montrent pas une telle fidélité. Les refuges, le comportement social, la biologie de la reproduction et les sex-ratios de ces chauves-souris qui se reposent dans les feuilles de bananiers et de celles qui trouvent refuge dans les chaumes (qu'on considère comme conspécifiques), et de deux autres espèces de chauves-souris, sont comparés de façon a élucider quelques-uns des facteurs environnementaux et phylogénétiques qui doivent avoir façonné le système de reproduction des chauves-souris qui se réfugient dans les feuilles de bananiers au Malawi.

Happold, D. C. D. and M. Happold (1997a). Conservation of mammals on a tobacco farm on the Highlands of Malawi.

The natural vegetation of the Shire Highlands of Malawi has become fragmented because of human activities. As a consequence, some species of mammals have become locally extinct and the population numbers and geographical ranges of other species have declined. This study investigated the species richness of mammals on a commercial tobacco farm, and the importance of remnants of natural vegetation on farms for the conservation of mammals. The farm covered 180 ha and supported 44 species of mammals (equivalent to 66 % of the species known to occur in the Shire Highlands at a similar altitude, and 24 % of the total mammalian fauna of Malawi). Most of the species were bats (22 species) and rodents (13 species). The largest remnants of natural miombo" woodland supported more species and more individuals than smaller remnants. The high species richness was due, in part, to the variety of different habitats on the farm ('miombo' woodland, riverine forest, grassland, swamp, streams and dams), as well as to good conservation practices. The farm is especially important for the conservation of 13 species which are rare and/or have limited geographical ranges in Malawi. It is suggested that well-managed farms which contain remnants of natural vegetation can play a significant role in the conservation of mammals, and other vertebrates, in Central Africa.

Happold, D. C. D., M. Happold and J. E. Hill (1988). The bats of Malawi.

This paper gives an account of the 55 species of bats currently known to occur in Malawi. Six species are recorded for the first time, together with 86 new species-locality records which increase the records for Malawi by approximately 44 percent. Data were obtained from 1489 specimens (36 species) collected from 13 localities by DCDH and MH (August 1984 to June 1985), and museum specimens in Malawi. The account of each species includes measurements, localities, and brief notes on distribution, status, habitat, domiciles and behaviour. The bat faunas of Malawi and 13 other African countries are compared to reveal patterns and trends in the zoogeography and geographical ecology of the bats of Malawi.

Liste commentée de 55 espèces de chauves-souris du Malawi. Six espèces sont citées pour la première fois au Malawi; 86 points de captures nouveaux pour les chauves-souris du Malawi permettent d'augmenter de 44 % les connaissances sur leur repartition dans ce pays. Toutes ces données proviennent de 1 489 specimens (36 especes) capturés dans 13 localites par DCDH et MH

d'août 1984 à juin 1985 et de specimens de musée au Malawi. Les renseignements donnés sur chaque espèce comprennent les mensurations, les localites de capture, et de breves notes sur la repartition, le statut, l'habitat, les domiciles et le comportement. La faune des chauves-souris du Malawi est comparée a celle de 13 autres pays africains pour mettre en evidence les caracteristiques zoogeographiques et ecologiques des chauves-souris du Malawi.

Happold, M. and D. C. D. Happold (1997b). New records of bats (Chiroptera: Mammalia) from Malawi, east-central Africa, with an assessment of their status and conservation.

This paper reports 97 new species-locality records of bats from Malawi. Of particular interest are four species of bats (*Rhinolophus swinnyi, Triaenops persicus, Eptesicus flavescens, Tadarida nigeriae*) which have not been recorded previously from Malawi. The relative status of bats in Malawi was estimated and the species were placed in five categories ranging from 'rarely-recorded' to 'very commonly-recorded'. Of the 59 species of bats known to occur in Malawi, 28 are rarely-recorded in Malawi. The relative status and species-locality records of bats were analysed to assess which species, and which localities, need special conservation effort. Seventeen species which are rare throughout their ranges in Africa as well as being rarely-recorded or seldom-recorded in Malawi, are considered to require special effort. Checklists of bats are given for 11 localities, including Liwonde NP in the Upper Shire Valley (29 spp.), two localities on the Shire Highlands (28, 22 spp.), Thyolo on the boundary between the Shire Highlands and Phalombe Plain (22 spp.), and Chiromo in the Lower Shire valley (30 spp.), which have particularly rich bat faunas. Localities in need of urgent conservation effort include Ntchisi FR in the Central Region, and Chiromo. Ninety-two percent of the species of bats known to occur in Malawi have been recorded from the Southern Region. Most of these species will probably continue to survive in southern Malawi provided that the National Parks (especially Liwonde NP) are maintained and well-managed, and there is no further destruction of the indigenous vegetation at Chiromo and Thyolo, and on the Shire Highlands.

Harmsen, R. and I. Jabbal (1968). Distribution and host-specificity of a number of fleas collected in South and Central Kenya (including the collection of the University College, Naitorib, Mount Kenya Expedition, March 1966).

During the years 1963 - 1966 a collection of fleas was made by various members of the Department of Zoology of University College, Nairobi (UCN). This collection was mainly based on Dr. J. B. Foster's trapping of small mammals, and on the fieldwork of Dr. J. B. Sa!e with hyrax. Some specimens, however, were collected occasionally from road kills and other incidental mammalian hosts. The collection culminated with the work of the University College Mount Kenya Expedition in March 1966. The collection was mounted and identified by members of the Division of Insect-Borne Diseases (DIBD), Medical Department, Kenya, and a number of specimens were sent to Mr. F. G. A. M. Smit, Zoological Museum, Tring, England, for confirmation of identification.

The present records of distribution and host-specificity are of interest for a variety of reasons. Fleas only spend their adult life in intimate contact with the mammalian host, the larva is a free living insect, feeding on proteinaceous detritus. It is, therefore, to be expected that fleas will be mainly found on those mammals which have permanent dwelling sites, and particularly on nest or den building animals. This is the immediate effect of the need of a freshly emerged adult flea to contact a new host. Flea eggs deposited in a nest or den have a much higher chance of developing into adults within the immediate reach of a new host than flea eggs deposited at random in the field. One other consequence of this necessity of the flea to locate a host within its life time after larval development away from the host, is a dependence on the climate.

It is, thus, to be expected that within the fairly narrow geographical confines of Kenya a number of flea species will be restricted to particular altitudinal levels in response to a climatic adaptation, even when suitable hosts are available at other altitudes. Alternatively, one would expect to find fleas restricted to particular hosts at one altitude, and to other hosts at another altitude, this in response to the combined effect of climate and nesting habits of different hosts. This form of ecologically based isolation could well become the basis of speciation.

Harrison, D. L. (1953). Some systematic notes on the Long-fingered Bats of the genus *Miniopterus* Bonaparte occurring in South Africa and Madagascar.

1. Two species of the genus *Miniopterus* are considered to exist in southern Africa and two on the island of Madagascar, these being *M. natalensis, M. fraterculus*, and *M. majori, M. manavi* respectively.

2. The original description of *M. fraterculus* Thomas and Schwann is amended with regard to colouration and cranial characters, and some cranial indices are employed for comparision of this species with *M. natalensis* and *M. schrebersii*.

3. The subspecies *M. n. smitianus* Thomas is considered valid, but the race *M. n. dasythrix* is not believed to be separable and is sunk into the synonymy of *M. n. natalensis*.

Harrison, D. L. (1956a). On a collection of mammals from Oman, Arabia, with the description of two new bats.

1. A collection of mammals made by the author in Oman is described and field notes on the various species given.

2. The collection includes two new subspecies *Triaenops persicus macdonaldi* and *Taphozous nudiventris zayidi*, which are here described.

3. The following six species are newly recorded from Oman; *Triaenops persicus, Asellia tridens, Pipistrellus kuhlii, Meriones crassus, Gerbillus cheesmani* and *Mus musculus praetextus*.

Harrison, D. L. (1956c). Mammals from Kurdistan, Iraq, with description of a new bat.

During 1954 a small collection of mammals was made by the author in the extreme north of Iraq, which forms part of Kurdistan. This is an extremely mountainous district and the mountain ranges are continuous with those of Asia Minor and Persia. The mammalian fauna is composed of animals which are quite different to those found in the lowlands and desert of which most of Iraq consists and includes many species which are found in Persia, Asia Minor and Syria. It appears to be a faunal element which has been but little studied in Iraq for a number of the species recorded here have not been previously noted as existing in that country. The collection here described was made in the mountains around Amadia, Kurdistan. In this area the mountains are quite extensively covered with scrub oak forest, while the valleys are very fertile and contain poplars and other trees (See Plate 1).

The mammals obtained are listed below, with notes on their characteristics and field habits and with a description of a new bat.

Harrison, D. L. (1956d). A key to the identification of the bats (Chiroptera) of the Arabian Peninsula.

During several years of field and museum research on Arabian bats it became abundantly clear that a comprehensive key to their identification would be of great value to workers in this field. Included in this attempt to provide such a key are all the forty-two species recorded up to the time of writing from any part of the peninsula including the northern part as far as the northern and eastern frontiers of Syria and Iraq, as well as Sinai. In compiling this key I have been fortunate to have at hand a copy of the late J. L. Chaworth-Musters's notes on the Arabian bats which he prepared for the use of collectors some time before his death, but never published. His notes included a key which did not however comprise the whole area dealt with here, whilst a number of species have been added to the list since

that time. The present key is partly based on his work, but differs in several respects, particularly in the vespertilionid group of bats, the largest single group and by far the most difficult to identify. The writer considers that the dentition provides the easiest primary division of these bats and accordingly places more emphasis on it in this key.

The purpose of a key is to provide an accurate identification of the species included in it, but unfortunately in the Chiroptera this cannot be done without recourse to details of cranial and dental anatomy, and this key being intended primarily for scientific workers it is where necessary based on such characters. Every endeavour has been made to make the characters employed as simple and " absolute " as possible.

It must be admitted that the taxonomy of several species groups of the bats in the peninsula area is still somewhat confused. The nomenclature here employed is based in the main upon Ellerman & Morrison-Scott (1951). In particular it is likely that further research will clarify the very confused position of the Arabian serotine bats (Genus *Eptesicus*) of which no less than five species are recorded. The characters of the last three forms here listed (*E. isabellinus, E. hingstoni* and *E. serotinus turcomanus*) appear doubtfully separable at a specific level and it may well prove that all three are in reality forms of *E. serotinus*.

No key can be absolutely reliable, since whatever characters are employed there will be occasional aberrant individuals which do not "fit". Thus for example, where the number of teeth is the criterion employed there will be occasional difficulties with supernumerary or absent teeth from the normal dentition of the species. Indeed it appears likely that in evolution the loss of teeth from the dentition is a very gradual process in which different members of the same generation may be at different stages in the process, with occasional " throw-backs " to the original formula. That final identification can often only be made by direct comparison with the relevant material in a museum collection must be admitted, but it is hoped that in many cases an individual bat could be confidently identified from the use of this key alone. Where special difficulty is likely to be encountered a second and occasionally a third character has been included to assist the worker. Where the subspecies in the area are known the key has been extended to include them but in many of these the subspecific status is still in doubt. The possibility of intermediation between these subspecific forms must also be borne in mind. The discovery of further species in the peninsula is more than likely and to include such additions modifications of the key may be necessary.

Harrison, D. L. (1956e). A new flat-headed bat of the genus *Platymops* Thomas from S.E. Sudan.

Amongst a number of bats received from Mr. John G. Williams of Nairobi, which he obtained in the extreme south-eastern part of Sudan during 1953, were two small Flat-headed Bats belonging to the genus *Platymops* Thomas. Bats of this genus seem to be extremely rare and hence material for comparison is very sparse. Direct comparison of these specimens with the type specimen of *Platymops macmillani* Thomas (1906), the type locality of which is between Addis Ababa and Lake Rudolph in Abyssinia, and study of Thomas' original description reveals that these specimens possess certain striking characters, from which I have concluded that they represent a new species, which I propose to name

---

Harrison, D. L. (1957a). Some systematic notes on the trident bats (*Asellia tridens* E. Geoffroy) of Arabia.

L'auteur décrit les différences existant entre *Aseltia t. tridens* et *A. t. muraiana*, race trouvée en Irak, en Iran et en Arabic, se manifestant surtout par une taille superieure et une oreille proportionnellement plus petite chez cette dernière sous-espèce. Après une étude morphologique, l'auteur discute la répartition géographique et émet l'hypothèse selon laquelle l'espèce serait migratrice dans le Nord de son habitat, ce qui expliquerait certains de ses caractères.

Harrison, D. L. (1957c). Notes on African Bats. 1. Some systematic and anatomical notes of the African bats of the genus *Otomops* Thomas. 2. Some observations on the relationship between the African slit-faced bats *Nycteris hispida* Schreber and *Nycteris aurita* K. Andersen.

1. Three topotypical specimens of *Otomops icarus* Chubb are here described. This form is now considered to represent a subspecies of *O. martiensseni* Matschie.

2. The histology of the gular sac of *O. m. icarus* is described and shown to differ from that of *Cheiromeles torquatus*.

Harrison, D. L. (1958b). A new race of tomb bat *Taphozous perforatus* E. Geoffroy, 1818 from northern Nigeria, with some observations on its breeding biology.

1. The species *Taphozous perforatus* E. Geoffroy, 1818, is recorded from north-western Nigeria for the first time, thus establishing it as a West African mammal.

2. The subspecies *Taphozous perforatus swira* is described, differing from the known subspecies in its greyish brown dorsal surface. The type-locality of the new race is Sokoto, north-western Nigeria.

3. Some observations are made on the breeding biology of the new subspecies, and it is shown that two seasons of parturition must occur in the Nigerian population during one year. In one female at least, the association of lactation with early pregnancy suggests that two pregnancies had occurred in rapid succession.

Harrison, D. L. (1959b). Report on the bats (Chiroptera) in the collection of the National Museum of Southern Rhodesia, Bulawayo.

A collection of bats from the National Museum of Southern Rhodesia, comprising seventy-nine identifiable specimens and including twenty-three species has been sent to the author for examination.

This collection includes several new geographical records and has provided the opportunity to make some systematic researches for which purpose material in the British Museum collection and in the author's collection has been examined also and the findings have been incorporated into the present report.

The identifiable material in the collection has been listed systematically, with the results of the systematic studies undertaken. The author is greatly indebted to Mr Reay H. N. Smithers, the Director of the National Museums of Southern Rhodesia, who has kindly made ;this collection available for study and to the staff of the Mammal Section of the British Museum (Natural History), for their kind co-operation, to Mr W. F. H. Ansell, Mr L. D. E. Vesey-Fitzgerald, Mr I. A. D. Robertson, Mrs P. Swire, Mr J. M. Start, Mr A. Start, Mr J. G. Williams, Mr C. J. P. lonides and Mr P. A. Clancey from whom the author has received material which has contributed considerably to some of the studies included in this report.

Harrison, D. L. (1960e). A checklist of the bats (Chiroptera) of Kenya Colony.

The known Chiroptera of Kenya comprise seventy-five named forms at the time of writing. There is at present no comprehensive work of reference to which the interested zoologist may turn to find an account of the available material and the literature dealing with this large and still growing assemblage of bats. The purpose intended in preparing this check list has been to provide such a basis for further work on the Chiroptera of Kenya, rather than to provide a final answer, which certainly cannot yet be given, to the many systematic difficulties still involved in the taxonomy of African Bats. Where special difficulties are likely to be encountered, notes have been appended explaining these difficulties and giving sometimes an opinion regarding their possible solution and lines for future research. It is hoped

that this list will provide as a first step a working guide to the status of the species known to exist in the area and to the literature about them. A key to their identification, suitably illustrated, will form a natural addition to the present groundwork.

The list has been based on material in the British Museum of Natural History, the Coryndon Museum in Nairobi and the author's personal collection as well as on the published literature. It cannot be hoped that all records will have been included, especially of the commoner species, but it is hoped that a fairly complete picture of their distribution so far as it is known will have emerged. The source of each locality record, either the collection in which the specimen is to be found, or a number referring to the publication in question as listed in the bibliography, will be found in brackets after the locality name. (Abbreviations employed are as follows - B.M.C. = British Museum Collection, C.M.C. = Coryndon Museum Collection, H.C = Harrison Collection). It is regretted that considerations of space have not allowed full details of the collector of each specimen to be given with each record. Locality names have been checked so far as possible against the Ordnance Survey Map of the Colony. A full synonymy of all the named forms has not been included.

The author is especially indebted to Mr. J. D. L. Fleetwood and Mr. J. G. Williams of the Coryndon Museum for all their efforts in stimulating interest in the collection of new material, which has added so much to our knowledge of the local bat fauna in recent years. Mr. Fleetwood has also given invaluable help with details" of the material in the Coryndon Museum. I would like to express my thanks also to the following, who have kindly provided specimens or information, which have been invaluable to this work - P. Bally, B. M. N. Brown, Mrs. P. Bowles, D. Brown, P. W. Barnley, Mrs. C. F. Christopher, A. Cole, J. L. Cruickshank, Mrs. M. Ellis, R. J. Evans, V. Fay, M. Fennessy, J. Fowler, J. Gosham, J. B. Hacker, C. Hagner, J. Hill, B. Hopkins, Col. R. A. F. Hurt, C. J. P. lonides, Dr. J. Leakey, Mr. Lumsden, C. Moore, I. Parker, R. Peake, Miss J. E. Proctor, Mrs. D.-Powles, A. H. Randall, K. Rawlins, D. Sheldrake, A. Start, J. Start, Lt. Col. H. F. Stoneham, Mrs. Tweedie, M. E. H. Vickers and J. D. Vinson. I am much indebted also to the staff of the Mammal Section of the British Museum of Natural History for their kind co-operation, to Dr. J. Dorst of the Paris Museum for his assistance and to Dr. V. Aellen of Geneva Museum for his assistance. Dr. E. Kulzer of the Zoophysiologisches Institute at Tubingen has kindly allowed me to examine some material in his care.

The surprising number of species added to the Kenya list in recent years and indeed the altogether new forms still being discovered as well as the very scanty knowledge of many others all point to the pressing need for further research and collecting. It is hoped that this list will provide a stimulus to that end and at the same time form a compact synthesis of our present factual knowledge.

Harrison, D. L. (1961a). On Savi's Pipistrelle (*Pipistrellus savii* Bonaparte, 1837) in the Middle East, and a second record of *Nycticeius schlieffeni* Peters, 1859 from Egypt.

1. *Pipistrellus savii* BONAPARTE is recorded from Lebanon and Cyprus. The characters of *P. s. caucasicus* SATUNIN are discussed and the Lebanese specimens are referred to this race, which averages larger than the typical one, is paler and usually lacks the small upper premolar.

2. The specimen from Suez obtained by RUEPPELL in 1832 and believed by him to be *P. savii* is shown to be the second Egyptian specimen of *Nycticeius (Scoteinus) schlieffeni*.

Harrison, D. L. (1962). On bats collected on the Limpopo river, with the description of a new race of the Tomb rat, *Taphozous sudani* Thomas, 1915. I. Systematic notes.

1. *Pipistrellus rusticus* Tomes is recorded from Southern and Northern Rhodesia.

2. *Platymops (Sauromys) petrophilus* Roberts is recorded from Southern Rhodesia. The characters of this species are compared in detail with those of *Platymops barbatogularis parkeri* Harrison & Fleetwood and *Tadarida aegyptiaca bocagei* Seabra and subgenus *Sauromys* Roberts is upheld.

3. *Taphozous sudani* Thomas is recorded from Southern Rhodesia and a new subspecies of it, *T. s. australis* is described.

Harrison, D. L. (1963a). Some observations on *Myotis dogalensis* Monticelli, 1887 (Mammalia: Chiroptera).

A complete re-examination has been made of the type specimen of *Myotis dogalensis* Monticelli, 1887, including extraction of the skull. It is concluded that this bat is an Arabian representative of the African *Myotis bocagei* and should accordingly be known as *Myotis bocagei dogalensis*. Satisfactory assessment of its subspecific characters must await the collection of fresh material.

L'esemplare tipo di *Myotis dogalensis* Monticelli, 1887, è stato sottoposto a un complete riesame, compresa l'estrazione del cranio. Si conclude che questo pipistrello e un rappresentante arabo dell'africano *Myotis bocagei* e deve perciò essere conosciuto come *Myotis bocagei dogalensis*. La definitiva precisazione dei suoi caratteri sottospecifici deve attendere la raccolta di materiale fresco.

Harrison, D. L. (1963b). Observations on the north African serotine bat, *Eptesicus serotinus isabellinus* (Temminck, 1840) (Mammalia: Chiroptera).

1. The original type material of *Eptesicus isabellinus* (Temminck, agrees with *Eptesicus serotinus* Schreber, 1774, in size and in all essential characters, the specimens differing only in their pallid colour. The thus regarded as a pale N. African desert subspecies of *E. serotinus*, should be known as *Eptesicus serotinus isabellinus* (Temminck).

2. A specimen of the original type series, now No. 17648 in the Rijksmuseum van Natuurlijke Historie, Leiden, is here selected as the lectotype and is described in detail.

3. *Eptesicus innesi* Lataste, 1887, is clearly a distinct species from *E. serotinus isabellinus*, being much smaller (forearm 40.3-42.3 mm, condylobasal length of the skull 15.2-16 mm).

Harrison, D. L. (1964b). Notes of some Southern Rhodesian Microchiroptera.

A large number of bat specimens recently collected in Southern Rhodesia have been sent to the author for determination by Mr. Reay H. N. Smithers, Director of the National Museums of S. Rhodesia. Amongst these, several species are represented that have not been hitherto recorded from S. Rhodesia and which are therefore worthy of note.

Harrison, D. L. (1965a). A note on the occurrence of the large free-tailed bat, *Otomops martiensseni* Matschie, 1897 (Chiroptera: Molossidae) in Rhodesia.

A specimen of *Otomops martiensseni martiensseni* is recorded from the Kariba Dam, Rhodesia. The characters of *O. m. icarus* are further discussed in the light of additional material of both races and the suggestion made that *icarus* averages smaller in external dimension, as well as differing slightly in colour from the typical form.

Harrison, D. L. (1965b). Remarks on some trident leaf-nosed bats, (genus *Asellia* Gray, 1838), obtained by the Israel South Red Sea expedition, 1962.

The little known Patrizi's Trident Bat, *Asellia patrizii* DE BEAUX, 1931, is recorded from Entedebir Is., S. Red Sea. The species was formerly only known from the mainland of Eritrea. The specimens from Entedebir Is. are slightly smaller than those described by DE BEAUX from the mainland, but otherwise agree closely with his description and differ strikingly from *Asellia tridens* in size.

Harrison, D. L. (1968a). On three mammals new to the fauna of Oman, Arabia, with the description of a new subspecies of bat.

Description d'un Mouflon (*Ovis ammon*) adulte mâle tué dans les montagnes d'Oman en novembre 1967. C'est la première fois que l'espèce est signalée dans la peninsule arabique en dehors de l'Irak. Sont également à ajouter à la faune de l'Oman deux espèces de Microchiropteres: *Eptesicus nasutus* (Vespertilionide) décrite comme une race locale *E. n. batinensis*, et *Taphozous perforatus* (Emballonuridé).

An adult male Wild Sheep, *Ovis ammon* (Artiodactyla: Bovidae) obtained in the mountains of Oman in November 1967 is described and illustrated. It is the first known occurrence of the species in the Arabian peninsula apart from Iraq. Two species of Microchiroptera are newly recorded from Oman: *Eptesicus nasutus* (Vespertilionidae) is here described as a new local race *E. n. batinensis, Taphozous perforatus* (Emballonuridae) is also added to the local fauna.

Harrison, D. L. (1968b). Further notes on African Microchiroptera.

Material of African bats recently sent to the author for examination includes several notable records, which help to complete our knowledge of the geographical ranges of the forms concerned. These are listed below and discussed.

Harrison, D. L. (1973). Checklist: Saudi Arabian mammals.

With the publication of Volume III of Dr. David L. Harrison's Mammals of Arabia (London, Ernest Benn, 1972), this authoritative work is complete. Volume I, 1964, and Volume II, 1968, were reviewed by J. Mandaville in the first issue of the Journal (July 1971; then called Report), and all three volumes are available in the Society's library.

We plan to publish articles on the various families and species from time to time, leaning heavily on Harrison, but adding such information as has been collected by local observers, hope these articles will heighten interest in this branch of the natural history of Saudi Arabia and encourage and assist other members in enjoying and sharing their increasing knowledge.

Mr. Mandaville, of Aramco, Dhahran, is the Society's consultant on mammals and reports may be sent to him. Cal Ham, Aramco, Jiddah, would be pleased to receive information here.

As an introduction to the subject, we are presenting herewith a check list drawn from Harrison. Extinct animals, marine mammals and domesticated species are not covered by Harrison and thus will not appear on the list. Harrison's "Arabia" includes the entire peninsula and, therefore, lists a number of species that are not found within the territorial bounds of the Kingdom. These are not included in our list.

Harrison, D. L. (1975a). A new species of African Free-tailed bat (Chiroptera: Molossidae) obtained by the Zaire River Expedition.

A collection of more than two hundred bats was recently obtained by Major M. D. Gallagher on the Zaire River Expedition. This collection will be fully documented elsewhere, but it contains one small Molossid bat presenting such unique features that it clearly represents a species unknown to science. This most interesting firid clearly demands special treatment and itf is here named in honour of its discoverer.

Harrison, D. L. (1975b). Scientific results of the Oman flora and fauna survey, 1975. Description of a new subspecies of Botta's Serotine (*Eptesicus bottae* Peters, 1869, Chiroptera: Vespertilionidae) from Oman.

Description d'une forme, propre à la région d'Oman, de la Serotine de Botta. Il s'agit de la plus petite forme de l'espece.

During the month of April 1975 a survey of the flora and fauna of the Jebel Akhdar in the Sultanate of Oman was carried out by a party of five naturalists at the invitation of the Oman Government and sponsored by the Ministry of Diwan Affairs.

Amongst 59 mammal specimens obtained by the author on this expedition are three examples of Botta's Serotine (*Eptesicus bottae* Peters, 1869). These specimens represent the first occurrence of this species in Oman, being known previously in the Arabian Peninsula from widely scattered localities in Yemen, Israel and Iraq (Harrison, 1964). They differ so strikingly from all previously described forms of this species that they clearly represent a form new to science which is here named.

Harrison, D. L. (1979). A new species of pipistrelle bat (*Pipistrellus*: Vespertilionidae) from Oman, Arabia.

Three small pipistrelle bats received from Northern Oman recently present a striking combination of external, cranial and dental features which together distinguish them quite sharply from all other bats of this genus. They are considered to represent a new species here named

---

Harrison, D. L. (1982). Observations on some rare Arabian *Pipistrellus* (Chiroptera: Vespertilionidae) with special reference to the external male genitalia.

Further material of the recently described and little-known *Pipistrellus arabicus* from Oman is here recorded. The external male genitalia and baculum are described and compared with those of *P. pipistrellus* and *P. bodenheimeri*, the latter also described in detail for the first time. Marked morphological differences are revealed.

Weiteres Material der kürzlich beschriebenen und wenig bekannten *Pipistrellus arabicus* aus Oman wird mitgeteilt. Das äußere männliche Genitale und Baculum wird beschrieben und mit dem von *P. pipistrellus* und *P. bodenheimeri* verglichen, wobei letztere Art erstmals im Detail beschrieben wird. Zwischen allen drei Arten bestehen markante morphologische Unterschiede.

Harrison, D. L. (1983). The mammal fauna of Oman, with special reference to conservation and the Oman flora and fauna surveys.

The terrestrial mammal fauna of the Sultanate of Oman, currently comprising fifty-six known species, is reviewed from a conservation viewpoint. A total of thirty-four species are of some conservation interest, but only eight species are considered to be threatened with local extinction at the present time. All are large artiodactyls or carnivores. One species is considered actually extinct locally but has been saved in captivity and is to be restored to the wild state soon.

A review of conservation progress and requirements shows that preservation of habitat is at least as important if not more vital than protection of the actual animals from hunting. Experience with the Oman Flora and Fauna Surveys and the WWF/IUCN Tahr Project have revealed the value of detailed scientific analysis of the whole 'ecosystem' in selection of sites for National Parks and in their management. A clear need emphasized by this review will be the establishment of a special Reserve in the mountains of Dhofar, where an altogether unique flora and fauna exist in a strictly limited area.

The ultimate success of any conservation policy in Oman will depend on education. A prime object of the recent Flora and Fauna Surveys has been to make more comprehensive information available to the Oman people as well as to the scientific world about the fascinating natural history of this ancient land. Already a splendid start has been made to this task with publications sponsored by the Government on the wild flowers of northern Oman (Mandaville, 1978) and wildlife in Oman as well as the interim reports of the Oman Flora and Fauna Surveys (Oman, 1976; 1979), all available in Arabic and English editions. Books on butterflies (Larsen & Larsen, 1980) and birds (Gallagher & Woodcock, 1980) of Oman have also been published. As stated by HM Sultan Qaboos bin Said in his Foreword to *The Scientific Results of The Oman Flora and Fauna Survey, 1975* 'the work of surveying the flora and fauna of the Sultanate must continue for some time. The *Journal of Oman Studies* will convey the results to the scientists and interested laymen of the world. As the teaching of science progresses in our schools this knowledge will be available also for the youth of Oman.' Only in this way will this priceless national heritage be preserved and cherished from one generation to the next

---

Harrison, D. L. and P. J. J. Bates (1989). Observations on two mammal species new to the Sultanate of Oman, *Vulpes cana* Blanford, 1877 (Carnivora: Canidae) and *Nycteris thebaica* Geoffroy, 1818 (Chiroptera: Nycteridae).

Blanford's Fox (*Vulpes cana* Blanford, 1877) is recorded for the first time from Oman. Recently recognised as a relict montane species in Israel, this is the first record of the species from the southern part of the Arabian peninsula. The baculum of the species is described and shown to be distinctively different from that of *Vulpes rueppelli*. Also the Slit-faced Bat, *Nycteris thebaica* Geoffroy, 1818, is recorded for the first time from Oman.

Harrison, D. L. and P. J. J. Bates (1991). The mammals of Arabia. Second edition.

Nearly twenty years have passed since the publication of the first edition of this work was completed in 1972. During that time considerable advances have been made in our knowledge of the mammalian fauna of the Arabian peninsula. Previously unknown species and subspecies have been described and new researches have necessitated changes in the status of some pre-existing taxa.

At the same time rapid development in the region has led to expanding interest in the Natural History of Arabia and to the foundation of many new Universities and Colleges with an interest in Zoology. Increased pressure on the environment has produced an urgent need for conservation of wildlife, especially of the large mammals, many of which are under serious threat of extinction. All these considerations indicate the need for an updated second edition of *The Mammals of Arabia* which we have jointly undertaken. Although some well illustrated books have appeared describing the mammals of various parts of the region and their general natural history, this is still the only comprehensive scientific reference work covering the whole peninsula. This edition is intended as an up-to-date revision of the taxonomic part of the first edition; its geographical scope is identical, including the entire peninsula, namely: Iraq; Syria; Lebanon; Jordan; Israel; Sinai; Kuwait; Saudi Arabia; Qatar; U.A.E.; Oman; North Yemen; South Yemen and the Arabian offshore islands. Its zoological scope is also similar, to include all wild terrestrial mammals occurring in the region; domesticated and marine mammals are excluded as well as those species that are definitely extinct.

Several changes in format and treatment of data have been introduced here in order to produce a compact and readily workable edition. Tables of measurements have been reduced to means, ranges and standard deviations, rather than tabulated data of individual specimens. Although in some ways regrettable this is an unavoidable necessity in a condensed edition. The treatment of subspecies is

less formal here than in the first edition; they are now assessed in the general context of intraspecific variation. The descriptive text has been condensed, but it has been felt essential to retain the important details of external, cranial and dental morphology, especially having regard to the very real difficulties involved in distinguishing between many of the extant species found within the region; it is hoped that it will also prove useful for those undertaking palaeontological studies within Arabia. Knowledge of ecology and habits has greatly increased and therefore discussion of these aspects of the fauna has been much expanded. Distribution maps have been updated and while every effort has been made to include all significant new range extensions it is clearly no longer practicable to list every known record of the more abundant species.

Illustrations have been reviewed and many new photographic plates have been introduced as well as some new line drawings. Keys to identification have been simplified and made dichotomous wherever possible; character matrix keys have also been employed in some of the more complex and taxonomically difficult groups. Knowledge of karyology is rapidly expanding and becoming established as a useful adjunct to conventional morphological taxonomy. Where known, the karyotypes of Arabian specimens are briefly discussed with reference to the original sources in the literature, to which interested workers can refer. Synonymies have been simplified, with the exclusion of all taxa not directly relevant to this region. With these changes incorporated it is hoped that this new edition will provide a useful working tool for the taxonomists, ecologists, conservationists and palaeontologists alike.

The Arabian peninsula is a vast region with habitats of many types, including some of the most harsh and exacting on our planet. Much basic research still needs to be done on its mammalian life, which is of unique interest, including Eurasian and African elements as well as local endemic species. Successful conservation of this fascinating fauna can only be achieved by detailed scientific analysis of the component species and their habitat requirements. This book has been designed to assist in achieving this important and increasingly urgent objective

---

Harrison, D. L. and I. P. Brownlow (1978). A comparative study of the baculum in bats of the genus *Scotophilus* (Chiroptera: Vespertilionidae).

Les os péniens des 5 espèces connues du genre *Scotophilus* sont étudiés et comparés dans cette note. Ils n'ont pas la valeur d'un caractère taxonomique pour reconnaltre les espèces de ce genre.

On constate une croissance post-natale de cet os; le baculum n'est pas ossifié chez les jeunes. Chez les adultes il est situé obliquement dans le gland. Un second specimen de *S. gigas* de Nigeria est signalé.

The baculum of all five recognised species of genus *Scotophilus* is studied and compared. It is of no value as a taxonomic character in distinguishing the species of this genus. Significant postnatal growth of the bone occurs; the baculum is unossifled in infants; in the adult it lies obliquely in the glans penis. The second specimen of *S. gigas* from Nigeria is recorded.

Harrison, D. L. and J. D. L. Fleetwood (1960). A new race of the flat-headed bat *Platymops barbatogularis* Harrison from Kenya Colony, with observations on the anatomy of the gular sac and genitalia.

Seven specimens of this remarkable bat, known hitherto by three individuals, were obtained on 12 February, 1958, at Lualeni Borehole, Maktau, southern Kenya Colony (03° 25' S., 38° 10' E.) by Mr. lan Parker, of the Kenya Game Department, thus extending the known distribution of the species from the type-locality, i.e. Lokomarinyang Marsh, Ilemi Triangle, south-eastern Sudan (*vide* Harrison, 1956), to southern Kenya Colony.

The material consists of three adult females, one adult male, two immature females and an immature male. The specimens were preserved in alcohol from which they have been relaxed and prepared.

They have been compared with the *Type* and paratypes of the species from Lokomarinyang, with which they agree in all essential characters, but they exhibit certain constant differences in size and colour, and we have concluded that they represent a new subspecies to science. This we propose to name in honour of its discoverer.

Harrison, D. L. and R. E. Lewis (1961). The large mouse-eared bats of the Middle East, with description of a new subspecies.

The greater mouse-eared bat, *Myotis myotis* Borkhausen, is recorded from Syria and Lebanon and a new subspecies is described, type locality 2 km east of Amchite, Lebanon. This bat exists together with the lesser mouse-eared bat, *Myotis blythi* Tomes, in certain localities in Syria and Lebanon. The forms *M. m. omari* Thomas (type locality Derbent, Iran) and *M. m. risorius* Cheesman (type locality Shiraz, Iran) are considered to be races of *M. blythi* Tomes, and it is considered likely that *risorius* is a synonym of *omari*.

Hatt, R. T. (1928). Note sur un chéiroptère nouveau du Soudan français (note presentée par M. Th. Monod). I. Introduction (par Th. Monod); II. *Chaerophon* (*Lophomops*) *nigri* sp. n.

(introduction written by Th. Monod.)

Deux faits intéressants ont été révélés par l'examen de la petite collection de Cheiroptères que j'ai recueillie au cours de la Mission Saharienne Augiéras-Draper. C'est d'abord la capture à Tamanrasset (Hoggar) de *Rhinolophus fumigatus* Rüppel (= *Rh.Antiornii* Dobson) (2) et la découverte, à; Bourem, en compagnie du banal *Pipistrellus Kuhli* Natterer, d'un *Chærophon (Lophomops)* nouveau pour la science.

J'ai communiqué les échantillons de cette dernière forme à M.le Dr Robert T. HATT qui à bien voulu rédiger la diàgnose que l'on trouvera plus loin.

Hayman, R. W. (1935b). On a collection of mammals from the Gold Coast.

The following report is based on a collection of 321 mammals from Ashanti and the Northern Territories of the Gold Coast, the result of an expedition to Ashanti in 1933-1934 by Mr. Willoughby P. Lowe and of a combined journey by Mr. Lowe and Miss F. Waldron through Ashanti and the Northern Territories in 1934-1935.

Four new forms are described, two of which represent genera not previously recorded from the Gold Coast (*Mylomys* and *Steatomys*), and the collection extends the known range of other West Coast species. Mr. Lowe was particularly successful in obtaining monkeys, and a striking red Colobus is now known to be peculiar to Ashanti.

I am greatly indebted to Mr. M. A. C. Hinton, F.R.S., Deputy Keeper of Zoology, for the opportunity to work out this important collection. Mr. R. I. Pocock, F.R.S., has been kind enough to contribute detailed notes on the leopards.

A note on the localities mentioned in this paper may be useful. Goaso and Mampong are entirely rain forest areas in Ashanti. Mr. Lowe informs me that Goaso, a particularly rich locality for the forest forms, was once the royal hunting ground of the kings of Ashanti. Ejura is just outside, the northern edge of the rain forest, but most of the obviously forest forms labeled Ejura come from a nearby strip of gallery forest. Farther north, Wenchi is hi the orchard bush country, and the remaining localities, Bole, Wa, Laura, Sicili River, Navarro, Tumu, and Tamale, are all in the Northern Territories, in the grass savannah areas.

Hayman, R. W. (1937). Postscript.

Some further specimens collected by the Lake Rudolf Rift Valley Expedition have come to hand since the author left England for a period of some months. At her request I have examined this material. It includes a new race of mouse-tailed bat (Rhinopoma), which Miss St. Leger asks me to describe, and a shrew and a spiny mouse not represented in the collection first received.

Hayman, R. W. (1938). A new Crested bat (*Chærephon*).

Among a small collection of mammals - chiefly bats - made recently in N.E. Rhodesia by Mr. D. Gordon Lancaster, and presented by him to the British Museum, there occurs a specimen of *Chærephon* with a long bicoloured crest and a pure white underside. Careful comparison with previously described forms shows that Mr. Gordon Lancaster's specimen belongs to an undescribed form, for which I now propose the name.

Hayman, R. W. (1941). British Expedition to South-west Arabia. 1. Mammalia: Chiroptera.

Examples of four species were brought back by Dr. Scott and Mr. Britton. One of them constitutes an addition to the list for Arabia, and the other three were found in places whence they had not previously been recorded. At the end of the paper is added a list of all the Chiroptera known from the area of the Expedition.

The specimens of the fruit-bat (*Eidolon sabaeum*) formed part of a colony which had previously rested in a cypress-tree within the walls of San'a. They alone, of the four species, were infested with insect-parasites, namely, a large species of *Cyclopedia* (Nycteribiidae). The examples of the three insectivorous bats were all found in a low cave, with roof sloping steeply upwards from the entrance, in sandstone rocks near the foot of Jebel Harir, in the Aden Protectorate.

Hayman, R. W. (1946). A new *Scotonycteris*, with notes on other Gold Coast bats.

Among the small mammals recently collected in the Gold Coast of West Africa by Mr. G. S. Cansdale for the British Museum are some interesting bats, one of them new, which add considerably to our knowledge of the Chiroptera of that region and demonstrate that we have much yet to learn about the.smaller mammals of the West African forest regions.

The new form is a small fruit bat, belonging to a genus of some rarity in collections, and may be known as

---

Hayman, R. W. (1947b). A new race of *Scotonycteris zenkeri* from the Gold Coast.

A collection of mammals recently received from Mr. G. S. Cansdale, of the Gold Coast, contains a single specimen of the dwarf fruit bat *Scotonycteris zenkeri* which differs sufficiently from the Cameroon form to warrant distinction as a local race, for which I propose the name

---

Hayman, R. W. (1947d). A new *Hipposideros* from Sierra Leone.

Among a collection of small mammals from Sierra Leone recently presented to the British Museum by Mr. T. S. Jones were three examples of a very distinct new bat of the genus *Hipposideros*, which may be described as

Hayman, R. W. (1951). A new African molossid bat.

I am indebted to Dr. H. SCHOUTEDEN for the opportunity to examine and describe what appears to be a new species of Molossid bat from the highlands west of Lake Albert, in the Belgian Congo. I propose to name the new form

Hayman, R. W. (1954). Notes on some African bats, mainly from the Belgian Congo.

I am indebed to Dr. M. POLL of the Musée Royal du Congo Beige for the opportunity to examine in London a large number (466) of unidentified bats from the collection in his care. Nearly all are in alcohol. Although many belong to comparatively well-known forms, others represent species either now recorded for the first time from the Belgian Congo, or presenting other points of special interest.

The following are new to the Belgian Congo, so far as I have been able to determine from available collections and literature.

Micropteropus grandis SANBORN.
Epomophorus gambianus OGILBY.
Rhinolophus hildebrandti PETERS.
Tadarida (Chaerephori) spillmanni MONARD.
Tadarida (Chaerephon) pumila CRETZSCHMAR.
Nycticeius (Scotoecus) hirundo hindei THOMAS. Genus and species.
Glauconycteris beatrix THOMAS.
Pipistrellus crassulus THOMAS.
Pipistrellus culex THOMAS.
Miniopterus minor PETERS.

The identifications of all the Congo Museum bats examined are given in the following list. The Congo Museum numbers are followed by localities, dates of collection where known, and the collector's name in parentheses. The localities are to be found on the accompanying map. Specimens are all in alcohol except where noted otherwise. Of the specimens listed, a set of duplicates has been generously presented to the British Museum by the authorities of the Congo Museum, but all unique specimens remain in the collection of the latter institution.

Hayman, R. W. (1957). Further notes on African bats.

The following brief notes on the distribution or status of some comparatively little-known African bats are based on specimens recently examined, the majority being among collections identified for the Congo Museum, Tervuren. I am indebted to Dr. M. POLL for the opportunity of studying these.

Hayman, R. W. (1960a). A note on the bat *Cloeotis percivali* Thomas.

(1) The characters distinguishing *Cloeotis percivali australis* have been examined and re-described in the light of additional material.

(2) The known range of *C. p. australis* has been extended by the recording of specimens from Bechuanaland, Northern Rhodesia, and Katanga, Belgian Congo.

(3) The noseleaf of *Cloeotis percivali australis* has been described in detail and is figured for the first time.

Hayman, R. W. (1960c). Notes on some small African mammals.

Among a number of small mammals from various localities in the highlands of Ethiopia, collected recently by Mr. F. R. ALLISON, there occurs a series of rats of an apparently undescribed race. They belong to the long-tailed, white-bellied group of *Rattus* formerly included in the *Myomys* subgenus by ELLERMAN (1941), but later, ELLERMAN, MORRISON-SCOTT and HAYMAN (1953), transferred to the subgenus *Praomys, Myomys* being considered unavailable because of uncertainty about the identification of its type species, *Mus colonus* BRANTS. This undescribed race is obviously closely related to *Rattus (Praomys) fumatus* of Kenya and to the form *brockmani* of Somaliland which is best regarded as a subspecies of *fumatus*.

Hayman, R. W. (1963). Mammals from Angola, mainly from the Lunda District.

Among the material results of the extensive biological investigations into the fauna and flora of the Lunda District of Northeastern Angola, initiated and sustained by the Dundo Museum, is a valuable collection of the smaller mammals of that district which has been entrusted to me for examination in London. This collection, totalling 602 specimens, has proved to include a number of forms of special interest; the present report lists fourteen forms new to Angola and adds two new species of bat to the Angolan list. The collection includes a few specimens from other regions of Angola, but the major part is from the Lunda District, from the Congo border in the north to the Kasai-Zambesi watershed in the south.

It should be stressed that this collection in no way represents the total mammal material preserved in the Dundo Museum. It represents rather a selection of forms which Dr. MACHADO considered to be worthy of further examination by a specialist. Dr.MACHADO informs me that it is intended to prepare at a later date a more comprehensive work on the mammal fauna of the Lunda District.

The Lunda District has been thoroughly described in all its aspects by Dr. A. DE BARROS MACHADO (1952) of the Dundo Museum. He has stressed the fact that, zoogeographically, this is a highly interesting region presenting, in close proximity, essential elements of both the Guinea-Congo and the Zambesian-Rhodesian faunas. This situation is accounted for by the fact that the district as a whole consists of a gentle slope to the northward of the typical Rhodesian-type savannah, deeply intersected by the numerous northward flowing rivers draining the region towards the lower Kasai and hence to the Congo. The courses of these rivers are marked by long narrow strips of gallery forest extending like long fingers from the Congo rain forests of the north deep into the savannah region. The result of this interlocking of two entirely distinct environmental regions is that in this area of Angola the distinction between the two faunas (so far as mammals are concerned, at least) is very clearly shown in spite of the often close approximation in actual territory. The collection itself illustrates the comparative numerical paucity of forest species (perhaps influenced also by the comparative difficulty of finding and collecting them) in that it contains representatives of only eleven forms which can be truly considered fully representative of forest environments, but of no less than sixty-eight forms associated mainly with the savannah environment, and indicating to a large extent affinity with the mammalian fauna of the Zambesi-Rhodesian-Katangan region. Thus this collection of mammals reinforces the views already clearly and fully expressed by Dr. A. DE BARROS MACHADO regarding the faunal relationships of the Lunda District.

The following forms are here listed for the first time from Angola.

Crocidura nigrofusca MATSCHIE
Crocidura cyanea electa DOLLMAN
Crocidura aff. denti DOLLMAN
Crocidura aff. roosevelti HELLER
Crocidura russula silacea THOMAS
Epomophorus crypturus PETERS
Scotophilus nigrita dingani A. SMITH
Nycticeius (Scotoecus) hirundo albigula THOMAS

Taphozous (Saccolaimus) peli TEMMINCK
Helogale parvula varia THOMAS
Heliosciurus gambianus rhodesiae WROUGHTON
Graphiurus (Claviglis) murinus lorraineus DOLLMAN
Rattus (Mastomys) natalensis bradfieldi ROBERTS
Dendrohyrax (Dendrohyrax) arboreus braueri HAHN

In addition, the following form, although reported by Dr. MACHADO (1952) was overlooked by ELLERMAN, MORRISON-SCOTT and HAYMAN (1953) and by the Zoological Record (Mammalia): - *Cercopithecus neglectus* SCHLEGEL.

The two new species of bat described below are *Micropteropus intermedius* and *Glauconycteris machadoi*.

Measurements. These are given throughout in millimetres, except where otherwise indicated.

Hayman, R. W. (1964). Notes on a West African bat *Hipposideros jonesi*.

La présence d'*Hipposideros jonesi* Hayman est. rapportée pour la première fois du Ghana. Des mesures comparatives de cette population et d'autres specimens montrent une variation selon un cline à travers l'aire géographique connue. L'existence de deux phases de coloration est discutée; des variations de structure dans la feuille nasale sont notées.

Hayman, R. W. and D. L. Harrison (1966). A note on *Tadarida* (*Chaerophon*) *bivittata* Heuglin.

A reexamination has been made of the original specimens of the little-known bat *Tadarida (Chaerephon) bivittata* Heuglin. Detailed external measurements and skull measurements are published for the first time. Further specimens from Kenya, Uganda and Northern Rhodesia (Zambia) are also reported on. It is concluded that the species is a very distinct one but that the colour pattern, particularly as regards the spotting or striping from -which the species takes its name, is very variable individually.

Hayman, R. W. and J. E. Hill (1971). Order Chiroptera.

The preparation of this work, in which 10 families, 46 genera and 212 species are keyed and annotated, has shown that the scope for further work on practically every aspect of African bat systematics and biology is unlimited. Basically, it has shown that:

1. although the total number of specimens reported on, either directly or in the available literature, is very considerable, it is true to say that in relation to the total land mass of Africa, viewed as possible bat habitat, the numerical representation in the world's museums is negligible;

2. the geographic gaps in the representation of even the commonest species are enormous, and are probably due to the purely accidental incidence of the location of many collector's stations and to the accessibility, or lack of accessibility, of many others;

3. the number of species, which in some cases were first made known to science half a century or more ago and which are even now represented in collections in no more than single figures, is surprisingly high;

4. the taxonomic status and affinities of many of the more abundant species, represented in museum collections by a considerable quantity of material, are still very frequently the subject of widely divergent views held even by present-day workers;

5. the total volume of reliable field data available for even the most abundant species is pitifully small.

In view of these facts it is not to be expected that anything approaching finality on many aspects of taxonomy and geographic distribution would be possible at the present time. It has been attempted here to bring together in an unbiased fashion the divergent views expressed in many cases, and to present such keys as are (a) possible in the present state of knowledge, and (b) practicable for use in the field with the minimum use of detailed dental and cranial examination. The notes supplied wherever considered necessary should be used in conjunction with the keys. They are intended to draw attention to the problems still awaiting an agreed solution, and to indicate how various authors have up till now dealt with them.

The bibliography is designed with two main objectives. One is to provide references to all bat names which have not already appeared in any one of the three standard check lists covering Africa either in whole or in part, namely Alien (1939), Ellerman and Morrison-Scott (1951) and Ellerman, Morrison-Scott and Hayman (1953), thereby bringing up to date (to the end of 1966*) the lists of African bat names already provided in those works. Such additional names in the text are provided with the page reference in addition to the author and year; the full references appear in the bibliography. The second main objective is to provide the full reference for every authority cited in the text.

All measurements in the text are given in millimetres.

It may be added that without the very full facilities available at the British Museum (Natural History), in the form of both the wide scope and historical importance of the rich collections, and the very comprehensive library resources, even a purely provisional work such as this would have presented yet more problems than did in fact arise during its compilation.

Since the retirement of the senior author in November, 1967, soon after the completion of the preliminary draft of this work, the arduous task of assessing, and where appropriate, incorporating the comments and criticisms of other workers, as well as the major points of a number of relevant works published after the completion of the draft and up to December 1968, has been willingly and conscientiously undertaken by the junior author, without whose whole-hearted co-operation the completion of this work would not have been possible.

Hayman, R. W., X. Misonne and W. N. Verheyen (1966). The bats of the Congo and of Rwanda and Burundi.

Historically, the beginning of published records of *Chiroptera* found in any part of the present Republique du Congo, formerly the Congo Belge (referred to subsequently herein as the Congo) appears to date from JOHNSTON (1884), who presented a short list of bats identified from the Congo River from its mouth to Bolobo. So far as appears from the literature examined, the next list of bats from any part of the region is included in the report by THOMAS (1888) on the mammals obtained by that indefatigable investigator Emin Pasha in the north-east of the Congo basin. Thereafter a long hiatus in the listing of Congo bats extended almost to 1915, when THOMAS recorded some of the interesting results of the collections made in the Ituri region by Dr C. CHRISTY on behalf of the Congo Museum, Tervuren.

The first real landmark in the literature on the subject, and a major contribution to knowledge of the bats of the north-east Congo in particular, especially the Ituri Forest and the Uele savannahs, was the detailed taxonomic report by J. A. ALLEN (1917) on the vast collections made by H. LANG and J. P. CHAPIN on behalf of the American Museum of Natural History. These consisted of nearly 800 specimens. ALLEN listed them as 68 forms, no less than 29 of which he described as new. As ALLEN was the first to admit, the difficulties due to the first World War made it impossible for him to compare this rich material with forms already described from neighbouring regions of Africa, mainly housed in European museums. The lack of so many of these forms in American museums at that time made reliance on descriptions in the literature inevitable. As a consequence, it is now known that a good proportion of ALLEN'S new names fall into the synonymy of earlier described species from outside the Congo. Nevertheless, ALLEN'S work remains an essential point of departure for all later investigators of Congo bats, although the status of a number of his new names is still in doubt. Further, the copious

field notes provided by the trained field workers LANG and CHAPIN contribute a very important part of the American Museum report.

From the date of ALLEN'S work stem more and more frequently local lists, taxonomic reports on collections, and extensions of range for many of the bats of the region. As a consequence of this stimulus to research, the list of forms recognised from the Congo has grown steadily; the list forming the basis of the present work catalogues 34 genera and approximately 120 species (allowing for the uncertain status of a few names).

This increase has been largely due to the intensive collecting carried out in the National Parks of the Congo, notably in the Parcs Nationaux Albert, Garamba, Upemba and Kagera, during the past three decades, by trained investigators working on behalf of the Institut des Parcs Nationaux du Congo. Among the names outstanding in this connection are those of G. F. DE WITTE, S. FRECHKOP and others. The results of most of these collections have been reported on mainly by Dr. H. SCHOUTEDEN and S. FRECHKOP. The outstanding work of Dr. SCHOUTEDEN in this field needs no stressing, and the appearance in 1947 of his invaluable work, De Zoogdieren van Belgisch Congo en van Ruanda-Urundi, marks the second landmark in the history of the cataloguing of the Congo bats (among other mammals). In particular, the synthesis of all recorded occurrences of Congo bats up to that date has provided an excellent view of the geographical distribution, so far as collecting has revealed. Apart from the special collections from the National Parks, very large collections of bats have been made in recent years in the Katanga region, where the abundance of mine shafts, old and new, has provided bat collectors with a fruitful source of supply. All these collections, totalling nearly 7000 specimens, have been preserved in Brussels; partly in the Musée Royal de l'Afrique Centrale (formerly the Musee Royal du Congo Beige) at Tervuren, partly in the Institut Royal des Sciences Naturelles de Belgique, partly in the Institut des Parcs Nationaux du Congo. The opportunity in 1962 to investigate personally a large part of these collections, at the invitation of the authorities concerned, proved of great assistance to the senior author of this list, and enabled a number of identification and taxonomic problems to be solved. In addition, over 500 Congo bats in the British Museum (Natural History) have been examined, and the report by J. A. ALLEN on the 794 specimens forming the American Museum of Natural History's north-east Congo collection has been made much use of.

The third landmark in the literature on the Congo bats was the publication in 1957 of the major work by J. VERSCHUREN on the ecology, biology and systematics of the bats of the Garamba National Park. The thoroughness of this work, and the light it threw on many aspects of bat life in this selected region of the Congo, set a pattern for the future which will be difficult to excel.

It is very much to be hoped that the political changes which have taken place recently, leading to the independence of the Congo, will not in the long run hamper unduly the further investigation of many parts of the territory, which, as the compilation of this list has shown, are still very poorly represented in museums. The comparatively intense collecting of bats in the north-east of the Congo and in the Katanga region has stressed by contrast the need for similar large scale collecting in most parts of the central Congo basin, in the Lower Congo region, and also in the highlands of the Albertine Rift borderlands.

Zoogeographically, the Congo basin occupies a unique position in Africa from many faunal aspects. Its central position in the continent, its immense size, and particularly the enormous extent of the tropical forest belt, all contribute to its importance. Particularly it is clear that the almost unbroken extent of rain forest extends the range of very many of the typically West African forest forms as far east as the eastern border of the forest zone, which partly coincides with the political boundary in the east along the Rift Valley. Further, both to the north and to the south, the open savannahs, intersected frequently by the gallery forests bordering the river systems draining towards the Congo, support a bat fauna consisting partly of the Sudanese-East African-Rhodesian savannah elements, partly of the West African element extending north and south of the central forest zone by way of the gallery forests. There is no doubt that further collecting in all regions will produce still more species not yet listed from the Congo, and there is also little doubt that undescribed forms still remain to be obtained. Modern methods of bat collecting, particularly .the use of mist nets which elsewhere have shown spectacular results in catching forms not normally collected by conventional methods, will undoubtedly play a large part in filling the gaps (still far too wide) in our knowledge of the bats of the region.

The present list, it has seemed to us, may fill a need in putting on record a summary of the present data on the taxonomy and particularly the distribution of the Congo bats. It is hoped that it may stimulate further interest among those in a position to carry the work further ; the distribution maps in particular will help to indicate where the greatest gaps lie. It should also be stressed that wherever keys are provided, it is not claimed that they are final or perfect; they are offered as some assistance to those wishing to develop their interest in the subject. It is, unfortunately, still not possible to be positive about the status of a number of Congo bat names, particularly in the difficult group Molossidae and in some of the Vespertilionidae. It must be left to future workers to complete the task.

Heim de Balsac, H. (1934a). Mission Saharienne Augiéras-Draper 1927-1928. Mammifères.

La collection de Mammifères recueillis, au cours de la Mission AUGIERAS-DRAPER, a déjà fait l'objet de plusieurs notes de la part de TH. MONOD. Néanmoins le sujet n'était pas épuisé et l'auteur nous a prié de bien vouloir examiner lé matériel dans son ensemble. L'intérêt que présentent les Mammifères de l'A'haggar et des régions situées au delà n'était pas douteux. Dans la littérature il n'existe que deux notes de première main concernant la faune mammalienne de ces régions, basées sur les récoltes de BUCHANAN, qui furent étudiées par O. THOMAS et M. HINTON: Comme il était à prévoir, nous avons trouvé des faits nouveaux dont certains présentent un intérêt biogéographique. Nous ne reviendrons pas ici sur le trajet effectué par la Misson, ni sur les localités traversées; ces détails se trouvent dans des publications antérieures et dans la note que nous avons consacrée ici même aux Oiseaux rapportés par la Mission.

Heller, E. (1912). New races of Insectivores, Bats, and Lemurs from British East Africa.

Further study of the collection of East African mammals in the U. S. National Museum has resulted in the discovery of several new races of insectivores, bats, and lemurs, which are described in the present paper.

Nearly all of these new forms have been detected in the collection recently made under the direction of Mr. Paul J. Rainey in British East Africa.

The new races described are chiefly from the summits of isolated mountains situated either in the northern desert of British East Africa near the Abyssinian border, or else in the Taru Desert near the coast.

The material has been compared directly with the types of the described species in the British Museum. For the privilege of examining the specimens, in the British Museum, and for facilities in the working out of the collection the writer is indebted to Mr. Oldfield Thomas, the curator of mammals.

Heller, K. G. (1992). The echolocation calls of *Hipposideros ruber* and *Hipposideros caffer*.

Bats of the *Hipposideros caffer/ruber* - group are the commonest representatives of this genus in many regions of Africa. In large parts of their range two morphologically very similar species, *H. caffer* and *H. ruber*, occur sympatrically. We studied the frequency in the constant frequency part of the echolocation calls of bats belonging to this group in Irangi (Prov. Kivu, Zaire). Here we found two forms with frequency bands of 132 - 138 kHz and 154 - 157 kHz, which also differed in forearm length (53 - 56 mm and 50 - 52 mm). Taking into account other acoustic and morphological data, our results indicates that *H. ruber* emits calls with frequencies between 130 and 140 kHz, whereas the calls of *H. caffer* are higher in frequency, especially in areas where both species occur sympatrically.

Heller, K. G. and M. Volleth (1984). Taxonomic position of "*Pipistrellus societatis*" Hill, 1972 and the karyological characteristics of the genus *Eptesicus* (Chiroptera: Vespertilionidae).

Recently collected material (five specimens from Ulu Gombak, Malaysia) shows that *Pipistrellus societatis* Hill 1972 has to be considered as a lowland form of *P. circumdatus* Temminck 1840. Chromosomal analysis (2n = 50, FN = 48) and examination of the baculum prove that *Pipistrellus circumdatus* be placed in the genus *Eptesicus*. Karyological and morphological differences of the genera *Vespertilio, Pipistrellus* and *Eptesicus* are discussed. Extension of the definitions of these genera is proposed, taking into consideration karyological characteristics and the form of the baculum. The number of premolars is considered less significant.

Anhand von neu gesammeltem Material (fünf Exemplare aus Ulu Gombak / Malaysia) wird gezeigt, daß *Pipistrellus societatis* Hill, 1972 als Tieflandform von *Pipistrellus circumdatus* Temminck, 1840 zu betrachten ist. Aus der Chromosomenanalyse (2n = 50, FN = 48) und der Untersuchung des Baculums geht hervor, daß *P. circumdatus* in die Gattung *Eptesicus* zu stellen ist. Die karyologischen und morphologischen Unterschiede der Gartungen *Vespertilio, Pipistrellus* und *Eptesicus* werden diskutiert. Es wird eine Erweiterung der Definitionen dieser Gattungen unter Einbeziehung der karyologischen Merkmale und der Baculumform vorgeschlagen. Der Anzahl der Prämolaren wird dabei weniger Wert beigemessen.

Heller, K. G. and M. Volleth (1995). Community structure and evolution of insectivorous bats in the Palaeotropics and Neotropics.

The most diverse known communities of insectivorous bats in the Palaeotropics and Neotropics are similar in alpha diversity (number of species). However, they show distinct differences with respect to wing morphology and the echolocation behaviour of their component species. In the Palaeotropics, most bat families are clearly separated in wing morphospace. The morphological niche of Rhinolophidae is vacant in the Neotropics, but primitive echolocators using sound primarily for scanning the environment rather than for prey capture are much more frequent there than in the Palaeotropics. In our opinion, a large portion of this difference can be traced to the different evolutionary histories of the respective communities. Bat families of different geographical origin are involved and their foraging styles obviously evolved differently in the Old and New World.

Heller, K. G., M. Volleth and D. Kock (1994). Notes on some vespertilionid bats from the Kivu region, Central Africa (Mammalia: Chiroptera).

Three species of rare vespertilionid bats were recorded in 1990 in the Kivu region (Rwanda and Zaire): *Hypsugo eisentrauti* (new for Rwanda), *Hypsugo crassulus* (additionally new for Ivory Coast) and *Glauconycteris beatrix*. The West African *H. eisentrauti bellieri*, according to the holotype skull and skin studied, is to be removed from *H. eisentrauti* and very probably represents a western subspecies of *H. crassulus*. Of all three species and some further *Glauconycteris* sp. Bacula are illustrated and for both *Hypsugo* species distribution maps are given. The taxonomic status of *G. beatrix, G. poensis* (1st record from Cameroon) and *G. humeralis* is discussed.

Herholdt, E. M. (1989). A new distribution record for the Botswana long-eared bat in South Africa.

A new distribution record for *Laephotis botswanae*, the Botswana long-eared bat, is reported from the Waterberg area of the north-western Transvaal, based on four specimens collected over seven months. Some observations on the natural history of this species are made.

'n Nuwe verspreidingsrekord vir *Laephotis botswanae*, die Botswana-langoorvlermuis, gebaseer op vier eksemplare versamel oor 'n termyn van sewe maande, word gerapporteer vanaf die Waterberg-

distrik van die noordwes-Transvaal. Waarnemings rakende hierdie spesies se algemene biologie word ook genoteer.

Herlant, M. (1953). Etude comparative sur l'activité génitale des cheiroptères.

Etude comparée du tractus génital et de l'hypophyse chez un Megacheiroptère congolais, *Epomophorus anurus* et chez quelques Microcheiroptères indigènes, en particulier, *Myotis myotis* et *Rhinolophus ferrum equinum*.

Epomophorus anurus ne parait pas présenter de phase d'activité sexuelle bien nette et en toutes saisons, on trouve des femelles à divers stades de la gestation. Chez le mâle, la spermatogénèse paraît constante. Il n'a pas été possible, d'autre part, d'étudier le comportement de femelles adultes en dehors de la gestation ou de la lactation. La phase oestrale est apparemment de courte durée.

Cette activité génitale contraste très fortement avec celle de *Myotis myotis* qui est monœstral. De nombreuses femelles au terme de la gestation ont été capturées à la fin du mois de mai et des femelles lactantes en juin. La lactation est encore active à la fin du mois de juillet mais la glande mammaire a complètement régressé chez des femelles capturées à la fin de septembre. A cette époque, la maturation des follicules s'accélère mais le follicule destiné à se rompre au printemps suivant ne se différencie de ses congénères que durant la phase d'hibernation. Néanmoins, dès la fin du mois de septembre, nous avons trouvé des femelles de *Myotis myotis* et de *Rhinolophus ferrum equinum* fécondées.

L'hypophyse des Chéiroptères constitue un matériel de choix pour l'étude de la deuxième forme de cellules acidophiles. En comparant ces éléments chez *Epomophorus* où elles sont peu chromophiles, et chez *Myotis* où elles manifestent une-forte affinité pour l'érythrosine, on peut aisément conclure que ces éléments se différencient à partir des chromophobes et forment une souche distincte des cellules acidophiles classiques.

Les cellules érythrosinophiles ont des rapports étroits avec la gestation et la lactation. Chez *Epomophorus* comme chez *Myotis*, elles.sont rares et mal développées chez le mâle et la femelle impubère tandis qu'elles constituent les cellules les plus nombreuses chez la femelle gravide ou lactante, en outre chez *Myotis*, il a été possible de suivre leur involution progressive au cours du post-partum et de la phase œstrale automnale. L'étude de ces éléments chez les Cheiroptères confirme l'hypothèse suivant laquelle ces cellules sécrètent la prolactine.

L'hypophyse des Vespertilionides se prête très favorablement à la distinction entre les deux formes de cellules basophiles. Cette distinction est plus malaisée chez les Rhinolophides et chez *Epomophorus* par suite de la faible chrômophilie de ces éléments. Chez *Epomophorus* adulte, en toute saison dans les deux sexes, les cellules basophiles manifestent des signes d'activité secrétpire intense mais chez *Myotis*, ces éléments ont une évolution cyclique très nette, ils augmentent considérablement de nombre en automne et montrent des images d'activâîion en rapport avec la phase œstrale. On voit de plus chez cette espèce, que ces phénomènes affectent uniquement l'une des formes basophiles.

Herreid, C. F. and R. B. Davis (1966). Flight patterns of bats.

The time of the evining emergence and return of Tadarida brasiliensis mexicana is correlated with light conditions. ..... three annual emergence patterns in bats: (1)species without seasonal differences in emergence time in relation to sunset, (2)species which leave relatively later in the spring and fall and (3)species which emerge relatively earlier in the spring and fall. ...

Herselman, J. C. and P. M. Norton (1985). The distribution and status of bats (Mammalia: Chiroptera) in the Cape Province.

Distribution maps with notes on taxonomy, distribution and status, habits, food and breeding are presented for 29 species of bats occurring in the Cape Province of the Republic of South Africa. Comparisons are made between data from the survey, which lasted from 1976 to 1979, and specimens examined in South African museums. The main motivation for the survey was the conservation of bats. A high priority was placed on collecting from roosts. Some very scarce and endemic species were collected and many interesting new localities were recorded.

Verspreidingskaarte met aantekeninge oor die taksonomie, verspreiding en status, gewoontes, voedsel en aanteel van 29 species vlermuise wat in die Kaapprovinsie van die Republiek van Suid-Afrika voorkom, word aangebied. Vergelykings word gemaak tussen gegewens wat versamel is tydens die intensiewe opname, wat vanaf 1976 tot 1979 geduur het, en monsters wat bestudeer is in die groter Suid-Afrikaanse museums. Die motivering vir die opname was die bewaring van vlermuise, en 'n hoê voorkeur is geplaas op die versameling van data in die skuilplekke van elke spesie. Sommige van die baie skaars en endemiese spesies is versamel, en interessante nuwe voorkoms lokaliteite is gevind.

Herzig-Straschil, B. and G. A. Robinson (1978). On the ecology of the fruit bat, *Rousettus aegyptiacus leachi* (A. Smith, 1829) in the Tsitsikama Coastal National Park.

Field observations were carried out on *R. aegyptiacus* in the Tsitsikama Coastal National Park in the winter of 1974 and the summers of 1975 and 1976. The roost of the fruit bat population was a cave in the narrow gorge of the Storms river. The population was estimated at 3 000 bats. Activity during the night was found to be significantly longer in summer than in winter. The possible reaction of these bats to the commencement of activity to moon light conditions at the cave is discussed.

Food items (*Ekebergia capensis, Cassine crocea, Acokanthera oppositifolia* and *Viscum obscurum*) were established by direct observations or by identification of food remains and seeds in the guano.

Time of birth of infants was calculated from the forearm length of captured bats. According to these calculations parturition takes place during October to June with a peak in December.

Heuglin, Th. von and L. J. Fitzinger (1866). Systematische Uebersicht der Säugethiere Nord-Ost Afrika's, mit Einschluss der arabischen Küste, des rothen Meeres, des Somáli- und der Nilquellen-Lander, südwärts bis zum vierten Grade nördlicher Breite.

Die vorliegende Arbeit enthält eine Zusammenstellung sämmtlicher Säugethiere, welche seither in Nordost-Afrika und dem an das rothe Meer angrenzenden Theile von Arabien von den verschiedenen Naturforschern, die jene weitausgedehnten Länderstrecken bereisten, aufgefunden, beschrieben oder beobachtet worden sind; somit eine vollständige Säugethier-Fauna jener Länder.

Es ist dieselbe das Werk des rühmlichst bekannten Naturforschers und Reisenden Herrn Dr. Theodor von Heuglin, und größtentheils auf seine eigenen Beobachtungen gegründet, die er während einer längeren Reihe von Jahren auf mehrfachen und in den verschiedensten Richtungen unternommenen Reisen in jenen Ländern zu machen Gelegenheit fand.

Schon im Jahre 1859 habe ich der kais. Akademie der Wissenschaften über dieses höchst verdiensthche und für den Zoologen so wichtige Elaborat Bericht erstattet und einen kurz gefaßten Auszug aus demselben mitgetheilt, Welcher auch im XXXVI. Bande der Sitzungsberichte der mathematisch-naturwissenschaftlichen Classe im Drucke erschien; indem ich die Absicht hatte, dasselbe nach der mir vom Herrn Verfasser übertragenen Richtigstellung der Bestimmungen nach den von ihm gesammelten Original-Exemplaren und Ergänzung mit seinen auf einer späteren Reise gemachten Entdeckungen und gewonnenen Erfahrungen, ehestens in den akademischen Schriften zu veröffentlichen.

Eine neuerliche Reise des Herrn Dr. v. Heuglin in den Südosten von Afrika, welche eben in jene Zeit fiel, war die Ursache, daß ich die Veröffentlichung jener Arbeit damals unterließ, um auch die

Entdeckungen auf dieser neuesten Reise in dieselbe einzuschalten und ihr dadurch eine um so größere Vollständigkeit zu geben.

Nachdem dies geschehen und ich sonach den Wunsch des Herrn Verfassers erfüllt habe, glaube ich nicht mehr zögern zu dürfen, jene Arbeit zu veröffentlichen, welche ihrer Wichtigkeit wegen gewiß bei allen Zoologen freundliche Aufnahme finden wird und denjenigen Naturforschern , welche in der Folge das nordöstliche Afrika und den westlichen Theil von Arabien bereisen sollten, von wesentlichem Nutzen sein dürfte.

Ich wiederhole, was ich schon in meinem im Jahre 1859 an die kais. Akademie der Wissenschaften erstatteten Berichte ausgesprochen habe, daß ich an dieser Arbeit kein anderes Verdienst habe, als die Richtigstellung der Bestimmungen nach den vom Herrn Verfasser gesammelten und nun größtentheils im kais. zoologischen Hofcabinete zu Wien aufbewahrten Original-Exemplaren, die Sichtung der Synonymie und die Einschaltung der mir von ihm zugekommenen brieflichen Mittheilungen, sowie auch die Einreihung der den genannten Ländern eigenthümlichen Raçen von Hausthieren. Schließlich muß ich noch bemerken, daß von den unter den Synonymen angeführten beiden Heuglin'schen Schriften jene, welche den Titel "Fauna des rothen Meeres und der Somali-Küste" führt, in "Petermann's geographischen Mittheilungen" 1861, Heft I, die andere aber, welche unter dem Titel "Beiträge zur Kenntniß der Säugethiere" citirt ist, der ungünstigen Zeitverhältnisse wegen bis jetzt noch nicht erschienen ist.

Hill, J. E. (1963a). A revision of the genus *Hipposideros*.

The genus *Hipposideros* presents a wide range of morphological variation, and the characters of its numerous species rarely combine to indicate clearly defined natural groups or evolutionary trends. This revision, based chiefly on the features of the ears, noseleaf and skull, discusses the morphological criteria within the genus and its supraspecific groupings, recognizing seven species groups containing a total of forty-three species. These groups and their included species are described in some detail, with keys, and their probable relationships have been defined and discussed. These studies have suggested a less diffuse classification of *Hipposideros* than those proposed by earlier revisers, and indicate that despite the wide morphological dissimilarity of many of its species, the genus includes but three major evolutionary trends.

Hill, J. E. (1963b). Some notes on the *Pipistrellus ceylonicus* group, with the description of a new subspecies.

Brief notes are given on the historical and current classification of the members of the *Pipistrellus ceylonicus* group. The named forms hitherto referred to the group are considered to constitute a single species. *Pipistrellus ceylonicus*, which is recorded for the first time from Borneo with the description of a new subspecies.

Hill, J. E. (1964). Notes on a collection of bats from Figuig, Morocco.

Cet article rapporte la présence de *Tadarida teniotis rueppelli* au Maroc et de *Pipistrellus savii* en Algérie, les deux apparemment pour la première fois. II indique de nouvelles captures au Maroc d'*Eptesicus serotinus isabellinus, Pipistrellus kuhli kuhli, Pipistrellus savii* et *Plecotus austriacus* (?) *christei*. Notes historiques et taxinomiques.

Hill, J. E. (1965). Asiatic bats of the genera *Kerivoula* and *Phoniscus* (Vespertilionidae), with a note on *Kerivoula aerosa* Tomes.

Etude des statuts respectifs des genres *Kerivoula* et *Phoniscus*, lequel mérite le rang de genre. Les 9 espèces de *Kerivoula* en Asie sont recensées et le genre *Phoniscus* est revisé. Etude plus approfondie de *K. aerosa*, dite d'Afrique du Sud mais qui s'avère être un *Phoniscus* peut-être d'origine asiatique.

The relative status of the nominal genera *Kerivoula* and *Phoniscus* is examined and *Phoniscus* accorded generic rank. Nine species of *Kerivoula* are recognised in the Asiatic part of its range and these are briefly reviewed, while the named forms referable to *Phoniscus* are reviewed and an outline of the probable classification of this comparatively little known genus is presented. A further examination is made of *Kerivoula aerosa* Tomes, reputedly from South Africa. It is shown to be a *Phoniscus* and possibly may be of Asiatic origin.

Hill, J. E. (1966). The status of *Pipistrellus regulus* Thomas (Chiroptera, Vespertilionidae).

L'auteur fait une étude critique des spécimens originaux de *Pipistrellus regulus* Thomas du sud-ouest de l'Australie. Le type est une peau de *Chalinolobus morio* associée a un crâne d'*Eptesicus pumilus*, tandis que l'autre spécimen est une peau et un crâne de *Chalinolobus morio*. Pour remédier à cette confusion, le crâne du "specimen type" est designé comme "lectotype" de *Pipistrellus regulus* qui devient synonyme d'*Eptesicus p. pumilus*. De même, *Registrellus* Troughton, dont *Pipistrellus regulus* est l''espece type, tombe en synonymie avec *Eptesicus*.

A critical examination is made of the original specimens of *Pipistrellus regulus* Thomas from southwestern Australia. The type specimen is found to consist of a skin of *Chalinolobus morio* in association with a skull of *Eptesicus pumilus*, while the other specimen proves to be a skin and skull of *Chalinolobus morio*. To resolve this confusion, the skull of the "type specimen" is designated as the lectotype of *Pipistrellus regulus* so that this name becomes a synonym of *Eptesicus pumilus pumilus* and *Registrellus* Troughton, of which *Pipistrellus regulus* is the type species, falls to the synonymy of *Eptesicus*.

Hill, J. E. (1968). Bats from the Cameroons, with the description of a new species of *Pipistrellus*.

The small collection of bats from the Western Cameroons reported in this paper is complementary to the earlier detailed studies of the area and its fauna by Professor Martin Eisentraut (1957, 1963), who obtained the present collection. The majority of the species represented have already been recorded from the region but the new material now reported adds *Rhinolophus clivosus, Pipistrellus kuhlii* and *Tadarida ansorgei* to the known bat fauna of the Cameroons and additionally includes three specimens of a novel *Pipistrellus*, here described as *Pipistrellus eisentrauti* in honour of its collector.

Hill, J. E. (1974a). A review of *Laephotis* Thomas, 1901 (Chiroptera: Vespertilionidae).

The majority of specimens of *Laephotis* hitherto reported in the literature are allocated to the appropriate one of the four species recognized in the most recent study of this genus, and these are briefly reviewed. Female specimens of *L. wintoni* are recorded from Ethiopia, whence until now the genus has been unreported.

Hill, J. E. (1974b). A review of *Scotoecus* Thomas, 1901 (Chiroptera: Vespertilionidae).

The vespertilionid genus *Scotoecus* is reviewed in detail, and is considered to include four species, one, *pallidus*, from India, having been referred at one time to *Scoteinus* and more recently to *Nycticeius*. The three remaining, *albofuscus, hirundo* and *hindei* are African: evidence is brought forward to support the view that *hirundo* and *hindei* are specifically distinct, not conspecific as thought by the majority of modern authors. Both are reported for the first time from the Cameroon and from Ethiopia.

Hill, J. E. (1976). A note on *Pipistrellus rusticus* (Tomes, 1861) (Chiroptera, Vespertilionidae).

The African vespertilionid species *Pipistrellus rusticus* (Tomes, 1861) is reviewed in some detail and the subspecies *P. r. rnarrensis* Thomas & Hinton, 1923 recorded for the first time from Ghana, Cameroon and Kenya.

Hill, J. E. (1977a). A review of the Rhinopomatidae (Mammalia: Chiroptera).

The major diagnostic features of the microchiropteran family Rhinopomatidae are reviewed, with a detailed account of the sole included genus, *Rhinopoma*. Current taxonomic opinion in the genus is synthesized with the recognition and definition of three species.

Hill, J. E. (1977b). African bats allied to *Kerivoula lanosa* (A. Smith, 1847) (Chiroptera: Vespertilionidae).

The smaller of the African forms of *Kerivoula* with fringed interfemoral membrane are reviewed and discussed. They are referred to one species, *K. lanosa* (A. Smith, 1847), with *K. l. harrisoni* Thomas, 1901, *K.ll. muscilla* Thomas, 1906 and *K. l. lucia* Hinton, 1920 as valid subspecies. *Kerivoula harrisoni bellula* Aellen, 1959 is considered a synonym of *K. lanosa muscilla*.

Hill, J. E. (1980). The status of *Vespertilio borbonicus* E. Geoffroy, 1803 (Chiroptera: Vespertilionidae).

The taxonomic history of *Scotophilus borbonicus* (E. Geoffroy, 1803) from Reunion Island is reviewed and summarised, with the designation of a lectotype. The insular form that it represents is considered conspecific with the small *Scotophilus viridis* (Peters, 1852) of southern Africa. As a result, *Scotophihis borbonicus* becomes the valid name for this species, and will also replace *Scotophilus leucogaster* (Cretzschmar, 1830), if the small members of the genus from more northerly localities in Africa are united with their southern congeners.

Hill, J. E. (1982a). Records of bats from Mount Nimba, Liberia.

The Oxford Expedition to Mount Nimba, Liberia in 1978 retained a limited selection of the many bats caught and examined so that the identities of the species studied might be confirmed. These have been presented to the British Museum (Natural History) : the majority belong to species already established from Liberia by Kuhn (1965), Coe and Curry-Lindahl (1965) or Verschuren (1976) but a few represent species that have not been recorded from that country or are uncommon in collections.

Hill, J. E. (1982b). A review of the leaf-nosed bats *Rhinonycteris*, *Cloeotis* and *Triaenops* (Chiroptera: Hipposideridae).

The major taxonomic features of three hipposiderid genera, *Rhinonycteris, Cloeotis* and *Triaenops* are described and discussed. Where appropriate, species and subspecies are diagnosed and defined, with an indication of geographic variation.

Hill, J. E. (1983). Further records of bats from the Central African Republic (Mammalia: Chiroptera).

These notes supplement the detailed and comprehensive survey of the known bat fauna of the Central African Republic by Schlitter et al. (1982), with records of four further species hitherto unreported from that country.

Hill, J. E. (1993). Long-fingered bats of the genus *Miniopterus* (Chiroptera: Vespertilionidae) from Madagascar.

This paper reports and reviews bats of the genus *Miniopterus* from Madagascar. Further specimens of *M. minor manavi* and *M. schreibersii majori* are discussed and measured, and earlier informal records of *M. fraterculus* and *M. inflatus* are substantiated.

Cet article fait le point sur les chauves-souris du genre *Miniopterus* de Madagascar. De nouveaux spécimens de *M. minor manavi* et *M. schreibersii majori* sont considérés et mésures et d'anciennes données concernant *M. fraterculus* et *M. inflatus* sont presentées et discutées.

Hill, J. E. and D. L. Harrison (1987). The baculum in the Vespertilioninae (Chiroptera: Vespertilionidae) with a systematic review, a synopsis of *Pipistrellus* and *Eptesicus*, and the description of a new genus and subgenus.

Current classification of the Vespertilioninae rests chiefly on a suite of mainly adaptive characters, among which facial shortening throughout the subfamily with consequent changes in the structure, size, relative position and number of the incisive and premolar teeth features prominently. Such characters may not necessarily reflect relationships or phyletic diversity, and sometimes do not serve properly to distinguish the genera that they purport to define, as in the distinction of *Pipistrellus* and *Eptesicus*, where generic boundaries remain unclear. The search for possibly less strongly adaptive features suggested the possibility that the morphology of the os penis or baculum might prove valuable in the study of the systematics of these genera and perhaps in the subfamily as a whole.

This paper reviews earlier studies of the baculum in the Chiroptera and their relevance to systematics in the Order, with an examination ofits gross morphology throughout the Vespertilioninae, especial attention being given to species currently allocated either to *Pipistrellus* or to *Eptesicus*. A synoptic review of the species content of these genera is presented, with the recognition and definition of subgenera and included species groups: three such (*pumilus, capensis* and *tenuipinnis*) currently referred to *Eptesicus* on dental grounds seem instead more closely related to *Pipistrellus* to which they are here transferred. One subgenus of *Pipistrellus* is described as new (p. 250).

The Vespertilioninae as a whole display a wide range of bacular variation, which falls into two major and several minor groups. This has suggested a revision of the current classification of the subfamily, combining bacular features with those conventionally in use. Bacular morphology provides a clear indication that the 'Nycticeini' (or 'Nycticeiini') is an artificial grouping and that the genus *Nycticeius* as presently understood is composite. Currently it is held to include two species, the North American *humeralis* and the African *schlieffenii*: these are here thought to be sufficiently characterised to justify generic separation and a new generic name is proposed for *schlieffenii* (p. 254).

A suggested classification of the subfamily is presented, with a tabulated review of earlier classifications; possible relationships between the constituent genera are discussed and the zoogeography of the bacular types within the subfamily is examined.

Hill, J. E., D. L. Harrison and T. S. Jones (1988). New records of bats (Microchiroptera) from Nigeria.

Specimens of bats accessed recently to the collections of the British Museum (Natural History), London (BM(NH)) and the Harrison Zoological Museum, Sevenoaks (HZM) include examples of three species hitherto not recorded from Nigeria, whence at least 71 species of Chiroptera are already known to occur (Happold 1987).

Hill, J. E. and P. Morris (1971). Bats from Ethiopia collected by the Great Abbai expedition, 1968.

The Great Abbai Expedition obtained 115 specimens of bats (including cave remains), chiefly from the Blue Nile Gorge or from the Awash National Park. One specimen from the Blue Nile Gorge proves to represent a new species closely allied to *Myotis tricolor*, for which the name *Myotis morrisi* is proposed. Specimens in the collections of the British Museum (Natural History) and also others collected by the Expedition confirm the presence of *Micropteropus pusillus* in Ethiopia; *Triaenops persicus afer* and *Glauconycteris variegata variegate* were obtained for the first time in Ethiopia by the Great Abbai Expedition, which also obtained further specimens of *Asellia patrizii* and *Tadarida nigeriae nigeriae*; a few specimens in the British Museum (Natural History) obtained from other sources and reported in this paper furnish the first Ethiopian records of *Rhinolophus simulator, Tadarida Africana* and *Tadarida acetabulosus*, and of *Otomops martiensseni* in French Somaliland (Territory Afars and Issas). The classification of *Taphozous perforatus, Hipposideros caffer* and *Hipposideros rubber* is reviewed. *Rhinolophus simulator* Andersen, 1904 and *Rhinolophus alticolus* Sanborn, 1936 are considered to be conspecific

---

Hill, J. Eric (1937). Two new bats, *Eptesicus* and *Mops*, from Angola.

In the collection of mammals from Angola, secured by the Vernay Angola and Phipps-Bradley Expeditions, are two bats apparently new to science.

Hill, J. Eric (1942). A new bat of the *Rhinolophus philippinensis* group from mount Ruwenzori, Africa.

In the collection secured by the Ruwenzori-Kivu Expedition (Chapin, Sage, Mathews) of the American Museum there is an undescribed horseshoe-nosed bat.

Hill, J. Eric and T. D. Carter (1941). The mammals of Angola, Africa.

The mammals collected by the Vernay Angola and the Phipps-Bradley Expeditions of the American Museum in Angola, add considerably to what was known of the fauna of that part of Africa. Several new forms have been described from these collections, and a number of hitherto unrecorded species have been discovered to occur in Angola, but one of the most important results of these collections was the securing of good series of many species and races that were previously poorly represented in the Museums of the world.

In addition to the material in the collections of the American Museum, a number of Angolan mammals were loaned for examination by the Carnegie Museum, Pittsburgh. During the autumn and winter of 1937-1938, Hill, assisted by Mrs. Hill, examined and photographed most of the types and other important material from Angola in five European Museums: The Rijksmuseum van Natuurlijke Historie, Leiden; the Zoologisches Museum der Universitat, Berlin; the Museum National d'Histoire Naturelle, Paris; the Musée du Congo Belge, Tervueren; and the British Museum (Natural History), London. This study, extremely helpful in the identification of questionable specimens, was undertaken under a grant from the Carnegie Corporation of New York.

Acknowledgments are due Dr. Harold E. Anthony, Curator of Mammals, The American Museum of Natural History, for the opportunity to work on these collections, and for helpful criticism and advice; Mr. Rudyerd Boulton of the Field Museum of Natural History, for assistance in identifying Angolan localities and photographs; Dr. A. Avinoff, Director, and Mr. J. Kenneth Doutt of the Carnegie Museum, for the loan of specimens from Angola. Dr. H. Boschma and Dr. G. C. A. Junge of the Leiden Museum; Dr. H. Pohle of the Berlin Museum; Professor E. Bourdelle and Dr. Paul Rode of the Paris Museum; Dr. H. Schouteden of the Congo Museum; Mr. Martin A. C. Hinton, Mr. T. C. S. Morrison-Scott, and Mr. G. W. C. Holt of the British Museum, extended every courtesy and assistance possible in the studying of type specimens in the collections of those institutions.

The Vernay Angola Expedition was given to the Museum by Mr. Arthur S. Vernay, who has done so much for this institution. Messrs. Herbert Lang and Rudyerd Boulton, collectors, went to Angola in April, 1925, and remained there for about three months. Landing at Lobito, near Catumbela, a few animals were secured here. The expedition went to Hanha Estate (not the Hanha usually given on maps), an oil palm plantation near the coast, some thirty-two kilometers north of Lobito. The party then went south by way of Huambo where they were joined by Messrs. A. S. Vernay, Alan and Charles Chapman. Mr. Vernay, with Lang and Charles Chapman, went to Mossamedes and collected at Pico Azevedo and 101 km. east of Mossamedes; they returned eastward over the high escarpment to Capelongo, and side excursions of 40 and 65 km. south of that locality were undertaken for large game by Mr. Vernay and C. Chapman. Mr. Boulton and Alan Chapman went to Quipungo, Chipopia, and Luvando. At the end of August the expedition united at Capelongo and returned by way of Caconda to Huambo, where several animals were secured. At Huambo the party again divided; Mr. Vernay, Lang, and Alan Chapman went to Chitau. Mr. Lang remained in Chitau and collected numerous specimens. Mr. Vernay and his guide, Alan Chapman, went across the Cuanzo and hunted sable antelope and other species in the region around Chissonque, 20 to 35 km. east of the river. A few small mammals were secured near this locality also. Meanwhile Boulton and Charles Chapman went to Namba in the Mombolo region.

The Phipps-Bradley Expedition was donated by Mr. John H. Phipps, who also organized and managed the expedition. Mr. Lee S. Bradley, collector, went first to Angola and began working at Caporolo, inland from- Bengela, July 2, 1932, and remained there for about two weeks. He went from Caporolo to Chitau, where he began collecting August 18. Leaving there near the end of September, he went to Mulondo and collected from October 17 to 24. From Mulondo, Mr. Bradley went to Humpata, where a large collection of small mammals was made in the period between October 26 and December 8. He returned to Chitau and stayed there from February 9 to March 17. Returning to the coast, Mr. Phipps joined the party and they went to Mossamedes region where a few gemsbok were secured. A trip was made to the higher part of Mount Moco the first part of June, and several specimens were collected at the Hanya River on July 2 and 3. In August the party hunted near Quissongo, Libolo region.

The Vernay Angolo Expedition secured approximately 1300 specimens, and the Phipps-Bradley Expedition brought back more than 1000. The two collections combined give a very representative picture of the mammalian fauna of Angola, at least of the southwestern quarter of that country. In addition several specimens were donated by Mr. H. F. Varian and fifty mammals were purchased from Mr. C. P. Chapman, collected at Chipepe, Namba, and Monte Victoria Verdun.

Throughout this paper the color nomenclature used is that of Ridgway, 1912, "Color Standards and Nomenclature," except for color names in lower case. Comparisons were made in diffused daylight with his standards. Measurements are of adults, unless otherwise noted, and were taken with dial calipers reading to tenths of a millimeter in the case of the smaller measurements (under 150 millimeters). Larger measurements were taken with outside calipers and steel tape. Measurements of head and body were usually obtained by subtracting tail length from total length as recorded by the collector. Where questions existed as to the accuracy of the original measurements of the hind foot, checks were made on the dried skins. And, if greater discrepency was found than that to be expected from shrinkage, the measurements from the dried specimen were substituted with a note to that effect.

Photographs of specimens and several of the types of country in which collections were made, were those taken by Mr. Herbert Lang, Mr. Rudyerd Boulton, and Mr. Arthur Vernay on the expedition. The line drawings were made by Miss Helen Hunt, and were made possible by generous financial assistance from Mr. Vernay.

Hodgson, B. H. (1835). Synopsis of the Vespertilionidae of Nipal.

I have the pleasure to forward to you herewith the names and characters, which I have provisionally affixed to the Vespertilionidæ of the central region of Nipal. Without access to large museums and libraries, it is scarcely necessary to observe that the naming and defining of species can be but very imperfectly performed.

Hoesch, W. and E. von Lehmann (1956). Zur Säugetier-Fauna Südwestafrikas.

Als erstes möchte ich allen denjenigen danken, die mir die Erfüllung eines langjährigen Wunsches ermöglichten, an der Bearbeitung einer von mir in Süd-Westafrika zusammengebrachten Kleinsäuger-Sammlung mitzuhelfen und die Ergebnisse für eine Untersuchung des Anpassungsproblems auszuwerten, Mein Dank gilt der Deutschen Forschungsgemeinschaft, die mir ein mehrmonatliches Arbeiten am Museum A. Koenig, Bonn, finanziell ermöglichte, dem Direktor dieses Museums, Herrn Prof. Dr. von Jordans, sowie dem Leiter der Säugetier-Abteilung, Herrn Dr. H. Wolf. - Eine Reihe wertvoller Literatur-Nachweise und sonstiger Informationen für den Teil meiner Arbeit, der sich mit dem Anpassungsproblem beschäftigt, verdanke ich dem Leiter der ornithologischen Abteilung des Museums A. Koenig, Herrn Dr. G. Niethammer, von dem auch ein Teil des bearbeiteten Balg-Materials gelegentlich eines früheren Aufenthalts in Südwest gesammelt wurde. Dank des Entgegenkommens des Leiters des Übersee-Museums in Bremen, Herrn Dr. H. O. Wagner, konnten die für dieses Museum von mir in Südwest gesammelten Bälge für die Arbeit ebenfalls mit herangezogen werden.

Der Stoff wurde so zwischen uns aufgeteilt, daß v. Lehmann die Systematik und Hoesch die Ökologie und Biologie der Säugetiere Südwestafrikas bearbeitete, ohne daß die betreffenden Abschnitte im speziellen Teil jeweils mit unseren Namen gekennzeichnet wurden.

Höhne, K., B. Loose and H. P. R. Seeliger (1975). Isolation of *Listeria monocytogenes* in slaughter animals and bats of Togo (West Africa).

Grâce à des cultures sur milieu d'enrichissement pendant six semaines à 4° C, l'examen des 342 animaux sains sacrifiés à l'abattoir municipal de Lomé a permis d'isoler 8 fois *L. monocytogenes* à partir de ganglions mésentériques (chez deux porcs, cinq petits ruminants et un bœuf). Toutes les souches ont été identifiées comme sérovar 1/2a. Par ailleurs, sur 236 chauves-souris examinées, trois se sont révélées porteuses de *L. monocytogenes*; ces souches ont été étiquetées sérovar 4b (deux souches) et sérovar 1/2a (une souche).

Une étude de la littérature disponible a montré que ces isolements de *L. monocytogenes* sont les premiers en Afrique de l'Ouest. Ils sont discutés à la lumière des connaissances actuelles sur la présence de *L. monocytogenes* chez certaines espèces animales et sur les conséquences qui peuvent en découler pour l'homme.

Listeria monocytogenes was isolated from the intestinal lymph nodes of 8 out of 342 apparently healthy slaughter animals at the municipal abattoir in Lome (Togo) and from the faeces of 3 out of 236 bats. Except two strains of serovar 4b isolated from bats, all the nine others belonged to serovar 1/2a. The positive findings of slaughter animals were made from the carcasses of 2 pigs, 5 little ruminants and 1 cattle.

The findings are discussed in the light of present knowledge on the occurrence of *L. monocytogenes* in some species of animals and its implications for the human being.

Listeria monocytogenes; Togo; Cattle; Chiroptera; Mesenteric lymph node; Isolation; Epidemiology

Hollar, L. J. and M. S. Springer (1997). Old world fruitbat phylogeny: Evidence for convergent evolution and an endemic African clade.

Knud Andersen (1912, *Catalogue of the Chiroptera in the Collections of the British Museum: I. Megachiroptera*, British Museum of Natural History, London) divided Old World fruitbats (family Pteropodidae) into the rousettine, cynopterine, epomophorine, eonycterine, and notopterine sections. The latter two sections comprise the subfamily Macroglossinae; members of this subfamily exhibit specializations for nectarivory (e.g., elongated, protrusible, brushy tongues) and cluster together in cladistic analyses based on anatomical characters. Other evidence, including single-copy DNA hybridization, suggests that macroglossines are either paraphyletic or polyphyletic; this implies that adaptations for pollen and nectar feeding evolved independently in different macroglossine lineages or were lost in nonmacroglossines after evolving in a more basal common ancestor. Hybridization data also contradict Andersen's phylogeny in providing support for an endemic African clade that includes representatives of three of Andersen's sections. Here, we present complete mitochondrial 12S rRNA and valine tRNA gene sequences for 20 pteropodids, including representatives of all of Andersen's sections, and examine the aforementioned controversies. Maximum likelihood, minimum evolution, and maximum parsimony analyses all contradict macroglossine monophyly and provide support for an African clade that associates *Megaloglossus* and *Lissonycteris* and those two with *Epomophorus*. In conjunction with the DNA hybridization results, there are now independent lines of molecular evidence suggesting: (i) convergent evolution of specializations for nectarivory, at least in *Megaloglossus* versus other macroglossines, and (ii) a previously unrecognized clade of endemic Africa taxa. Estimates of divergence time based on 12S rRNA and DNA hybridization data are also in good agreement and suggest that extant fruitbats trace back to a common ancestor 25 million to 36 million years ago.

Hollister, N. (1918). East African mammals in the United States National Museum. I. Insectivora, Carnivora and Chiroptera.

Many special papers on the extensive collection of mammals from Eastern Equatorial Africa preserved in the United States National Museum have been published since the accumulation of this material began. These papers have been written by various specialists, and for the greater part consist of descriptions of new forms or reports on the collections of certain expeditions. No attempt has before been made to furnish a list of all the material in the museum, based on what amounts to monographic work in each group and careful identification of every specimen. Such a list is the basis of the proposed work of which the present section is the first part. It is hoped that the entire East African collection can be listed in a similar manner in a bulletin completed in three parts. Part I consists of the reports on the insectivorous mammals (Order Insectivora), the bats (Order Chiroptera), and the carnivores (Order Carnivora).

In addition to the lists of specimens carefully determined according to modern standards of systematic mammalogy, pertinent notes which seem worthy of preservation for future workers on the taxonomy and life histories of East African mammals are presented under the various generic, specific, and subspecific headings. What it is hoped will prove even more useful to systematic mammalogists are the extensive tables of measurements of individual specimens which have been made as a basis for preliminary work in each group, and which are published with the report.

The material in the collection, consisting almost wholly of well-prepared specimens with accurate data, has been assembled during many years from numerous sources. While many sections of the area treated are almost unrepresented in the collection by specimens of most groups, the mass of material accumulated from certain large areas far surpasses in numbers and importance that preserved in any other museum. This is the natural result of the efforts of the competent field naturalists who accompanied the larger and more extensive expeditions, and the foresight and energy of the museum authorities in the organization and maintenance of the work.

Hood, C. S. and R. J. Baker (1986). G- and C-banding chromosomal studies of bats of the family Emballonuridae.

Extent and nature of chromosomal change among nine species representing six genera (*Saccopteryx, Rhynchonycteris, Diclidurus, Balantiopteryx, Cormura*, and *Taphozous*) were examined using data from G- and C-banded chromosomes. Heterochromatin was restricted to centromeric regions in most taxa; extensive additions of C-positive material occurred in *Balantiopteryx* and *Cormura*. Comparisons of G-bands of euchromatic arms revealed considerable variation in G-band pattern and imply extensive chromosomal evolution among emballonurid species. Outgroup comparisons of G-band karyotypes proposed as primitive for several families of bats failed to reveal conserved G-band patterns, thus limiting the usefulness of differentially stained chromosomal data for resolving phylogenetic relationships of the Emballonuridae. The karyotype of *Cormura brevirostris* includes an extraordinarily large X chromosome that is mostly euchromatic. Evolution of the X chromosome and the nature of the sex-determining system in *Cormura* are unclear, but the species appears to possess a unique sex chromosome mechanism

---

Hoogstraal, H. (1956). African Ixodoidea. I. Ticks of the Sudan. (With special reference to Equatoria Province and with preliminary reviews of the genera *Boophilus*, *Margaropus* and *Hyalomma*).

The primary objective of Volume I of this series of studies is to present our research on Sudanese ticks, including a critical survey of published worldwide information concerning each species. This has been attempted with reference to; (a) distribution in the Sudan and elsewhere, (b) hosts, (c) biology, and (d) identification. The secondary objective is to provide a suitable background for subsequent volumes presently in preparation. These studies will include all economically important tick species of Africa and all diseases and injuries associated with them.

The present report is intended to serve the tyro and specialist alike, and should provide a sound source of information for those who compile textbooks and review literature. Special attention is invited to the introductory paragraphs in section IV, pages 43 to 47, in which presentation methods and handling of data are elucidated, and to the fact that mention of disease relations herein are merely cross-referencing for subsequent volumes.

It should be stressed that most tick species of known or potential medical or veterinary importance of the Ethiopian Faunal Region (see Figure l) are found in the Sudan and are treated in the present report. Those few species that do not occur in the Sudan will be treated in a forthcoming volume, entitled "The Economically Important Ticks of Africa." Therefore, pertinent facts concerning all known species of medical and veterinary importance of continental Africa will be included in these two reports. Also included in the forthcoming volume will be maps of the distribution of each species in the Sudan, as well as in other African regions and elsewhere in the world. Subsequent volumes will be entitled: "Human Tick-Borne Diseases and Injuries in the Ethiopian Faunal Region" and "The Biological Relationships of African Ticks and Veterinary Diseases." Since a year or more will probably elapse between the publication of each volume, additional material concerning species previously treated will be presented in each new section in an effort to bring the pertinent information up-to-date.

The primary purpose of the report on veterinary diseases, mentioned above, is to present the biological relationships of ticks to these diseases in order to provide a better working knowledge for basic research in hviman diseases. It is also intended that this section will be of use to veterinarians in the area concerned.

Possibly one of the greatest general criticisms of contemporary literature on African ticks is that the reader obtains the impression that specialists' knowledge is usually more or less complete with respect to identification, biology, hosts, and distribution. When first considering the study of African ticks, I was told by several scientists that these parasites were so well known and so easily identified that there would be little to do that could not be accomplished in short order! Quite the contrary proved to be true; and it was soon realized how much specialized and practical information on African ticks is lacking. The best expectation for this undertaking is that the numerous indications for existing queries, problems, and lacunae in or information on African ticks will stimulate readers to seek out additional

data. It is also hoped that this work will provide a useful body of information for authors of textbooks and teaching manuals. Towards these ends, every effort has been made to present and review data as correctly as possible. Should errors occur, it will be appreciated if readers call them to my attention for inclusion in errata in subsequent volumes.

Hoogstraal, H. and G. M. Kohls (1967). Bat ticks of the genus *Argas* (Ixodoidea, Argasidae). 7. *A*. (*Chiropterargas*) *cordiformis*, new species, a heart-shaped parasite from South-West Africa.

Nymphs of *Argas (Chiropterargas) cordiformis*, new species, and larvae presumed to represent this species are described. Larval hosts were *Nycteris thebaica damarensis* Peters in the Uis tin mine, Omaruru District, South-West Africa. The larva resembles those of *A. (C.) boueti* Roubaud and Colas-Belcour and of *A. (C.) confuses* Hoogstraal. The nymph differs from those of these species chiefly in the remarkable cordiform body shape and in the absence of posterior paired organs

---

Hoogstraal, H. and R. Traub (1963). The fleas (Siphonaptera) of Egypt. Host-parasite relationships of Insectivora and Chiroptera.

Synosternus pallidus is the typical flea of all Egyptian hedgehogs (*Hemiechinus* and *Paraechinus*) practically wherever these animals occur. *Echidnophaga gallinacean* is also common on hedgehogs but more restricted in its geographis range. Infestation of these animals by other flea species is insignificant.

Host specific fleas of shrews (*Crocidura*) apparently are not present in Egypt and fleas are rare or absent on shrews here. *Crocidura olimeri* is infested by fleas usually parasitic on the Nile Grass Rat, *Arvicanthis n. niloticus*.

Only bats that rest in sizeable colonies have been found infested by fleas in Egypt and the rate and incidence of infestation is usually low. The four species of the Family Ischnopsyllidae parasitic on bats in and near the Nile Valley and Delta are *Chiropteropsylla aegyptia, C. brockmani, Araeopsylla gestroi*, and *A. wassifi*. Another, *Ischnopsyllus consimilis*, occurs chiefly in more humid coastal areas where it parasitizes *Pipstrellus k. kuhli*, Nile Valley colonies of which harbor no fleas.

Hoogstraal, H., K. Wassif and M. N. Kaiser (1957). Results of the Namru-3 Southeastern Egypt Expedition, 1954.

The following mammals were collected during the NAMRU-3 Southeastern Egypt Expedition, 1954: *Paraechinus a. aethiopicus, Asellia t. tridens, Ictonyx striatus erythreae, Vulpes r. rüppelli, Genetta g. senegalensis, Procavia capensis burtoni, Gazella dorcas* subsp., *Lepus capensis isabellinus, Jaculus j. elbaensis, Gerbillus (G.) pyramidum* subsp., *Gerbillus (G.) g. gerbillus, Gerbillus (Dipodillus) h. henleyi, Gerbillus (D.)* spp. (2), *Gerbillus (D.) calurus, Meriones crassus pallidus*, and *Acomys cahirinus dimidiatus*. In addition, records of the following mammals from this area are provided; *Felis caracal* and *Proteles cristatus*. Two others, *Dugong dugong* and *Capra ibex nubiana*, are known to exist here, while *Equus asinus taeniopus* is suspected to be present and legends of *Ammotragus lervia ornatus* and *Panthera pardus* exist among the tribes of this area. Also collected near Aswan but not in Southeastern Egypt were *Vulpes v. aegyptiaca* and *Gerbillus p. pyramidum*.

These mammals are mostly Palaearctic in ongin and the most valuable indicator species, rodents and insectivores, are entirely so. Only the more primitive hyrax and a few of the more mobile carnivores and the hare and bat are definitely Ethiopian.

Several of these mammals have not previously been recorded from Egypt and the known distributional range of others is considerably extended. Data for parasitism by ticks, fleas, streblids, and hippoboscides are presented and the potential of vector-borne diseases in Southeastern Egypt is briefly discussed.

Horácek, I. (1990). Enigma of *Otonycteris*: Relationship, phylogeny, ecology. Abstract.

The paper is intended to discuss what does genus *Otonycteris* represents in frame of the Palearctic bat fauna and which is its position among the vespertilionid bats. Some field experiences with *Otonycteris hemprichi* are reported together with results of morphometrical studies undertaken with extensive museum materials and fossils related to the genus.

The recent genus is apparently monotypic. No substantial geographic differences were found in support to subspecific status of the forms named within the species (i.e. *jin, ustus, cinereus* etc.). Close relationship between *Otonycteris* and MN 12 *Samonycteris majori* has been confirmed. A resemblance among both the taxa and the fossil forms referred to *Scotophilus* (Steinheim, Anwil, Djebel Zelten) and/or to *Eptesicus serotinus* group (Sansan, Suchamasty 3) indicates a possible relationship.

Appearance of *Samonycteris*, undoubtedly an ancestor of *Otonycteris*, in the W-Palearctic is synchronous with extensive spread of eremial biome associated with the Messinian (cf. also the author's unpublished record of Rhinopomatidae in MN11 locality Elaiochoria 2, N-Greece).

Otonycteris is an inhabitant of the temperate zone rocky deserts. Its ecology exhibits a number of respective adaptations including those responding food supply in such habitats. Feeding on vertebrate prey (suggested e.g. by Norberg & Fenton 19SS) has not been observed, but it cannot be excluded. Field observations as well as dental adaptations of *Otonycteris* indicate a carnivorous-like foraging pattern (cf. slow narrow flight, close to ground, low frequency echolocation with a low repetition rate, well pronounced sensitivity to external acoustic stimuli, etc.,). Not only in these respects but in number of morphological characters, *Otonycteris* closely resembles *Antrozous*. The similarity is considered to be a product of the parallel adaptation strategies in different but related clades. Affinities of *Antrozous* seems to be with *Nycticeius* (not with Nyctophilini as often suggested), while *Otonycteris* seems to be related to Scotophilus and/or *Hypsuqo*. Both the clades are considered to be sister groups of *Eptesicus*.

Horácek, I. and V. Hanák (1986). Generic status of *Pipistrellus savii* and comments on classification of the genus *Pipistrellus* (Chiroptera, Vespertilionidae).

Pipistrellus savii and several other species are placed into a separate genus *Hypsugo*. New diagnoses are proposed for *Pipistrellus, Hypsugo* and *Eptesicus*.

Hosken, D. J. (1998). Testes mass in megachiropteran bats varies in accordance with sperm competition theory.

Sperm competition is a widespread phenomenon influencing a range of characters, including investment in gonadal tissue. Conspecific proximity is one factor which can influence the risk of sperm competition and hence testicular investment, and decreased confidence of paternity may be one cost of group living. Aspects of female biology may also influence spermatogenic investment and sperm morphology. This study examines the associations between relative testes mass and roost-group size across 17 species of Megachiroptera. Associations between breeding season duration and investment in spermatogenesis are also examined, as are associations between female reproductive tract dimensions and testes mass and dimensions of spermatozoa across all bats. Relative testes mass was significantly positively associated with roost-group size at a species level and after appropriate phylogenetic control (pairwise comparisons and comparison of independent contrasts). There were no significant relationships between breeding season duration and relative testes mass. Across all bats, neither testes mass nor sperm length were significantly related to dimensions of the female tract. The results are discussed in the context of sperm competition.

Howard, C. W. (1908). A list of the ticks of South Africa, with descriptions and keys to all the forms known.

There are probably none of the external parasites of domestic animals of more importance to the stock raiser in South Africa than the ticks, owing to the large number of diseases which they transmit from animal to animal. The ticks of South Africa have, however, only been studied with regard to their connection with the transmission of diseases, and very few people are aware of the distinction between the various species and the various forms of the same species.

With a view to throwing a little more light on these creatures, and mainly of assisting the work of those interested in the study of the diseases referred to, a study of the ticks of South Africa was taken up by me about three years ago while in the Transvaal. Since then a large number of the life histories of these ticks have been worked out, and their immature stages carefully studied and compared. There are still many species which I have not been able to see owing to the rareness with which they occur, but in such cases I have compiled1 the literature from other authors and placed it in such shape as I consider will prove useful to the South African workers. There is still an immense amount of work to be done on this subject, and my only plea for placing this paper before the public is in the hopes that it will arouse more interest in such studies, and consequently advance the work.

Hubert, B. and W. Böhme (1978). Karyotype of *Gerbillus pyramidum* I. Geoffroy (Rodentia, Gerbillidae).

Gerbillus pyramidum is reported from Senegal for the first time. The external and cranial measurements and karyotype of the female specimen are presented.

Hutcheon, J. M., J. A. W. Kirsch and J. D. Pettigrew (1998). Base-compositional biases and the bat problem. III. The queston of microchiropteran monophyly.

Using single-copy DNA hybridization, we carried out a whole genome study of 16 bats (from ten families) and five outgroups (two primates and one each dermopteran, scandentian, and marsupial). Three of the bat species represented as many families of Rhinolophoidea, and these always associated with the two representatives of Pteropodidae. All other microchiropterans, however, formed a monophyletic unit displaying interrelationships largely in accord with current opinion. Thus noctilionoids comprised one clade, while vespertilionids, emballonurids, and molossids comprised three others, successively more closely related in that sequence. The unexpected position of rhinolophoids may be due either to the high AT bias they share with pteropodids, or it may be phylogenetically authentic. Reanalysis of the data with varying combinations of the five outgroups does not indicate a rooting problem, and the inclusion of many bat lineages divided at varying levels similarly discounts long branch attraction as an explanation for the pteropodid-rhinolophoid association. If rhinolophoids are indeed specially related to pteropodids, many synapomorphies of Microchiroptera are called into question, not least the unitary evolution of echolocation (although this feature may simply have been lost in pteropodids). Further, a rhinolophoid-pteropodid relationship - if true - has serious implications for the classification of bats. Finally, among the outgroups, an apparent sister-group relation of Dermoptera and Primates suggests that flying lemurs do not represent the ancestors of some or all bats; yet, insofar as gliding of the type implemented in dermopterans is an appropriate model for the evolution of powered mammalian flying, the position of *Cynocephalus* in our tree indirectly strengthens the argument that true flight could have evolved more than once among bats.

Hutterer, R. (1984). I. Säugetiere.

A short review is given of the history and the development of the mammal section of the Museum Alexander Koenig and its collections. A. Koenig collected mammals since 1875 for his private collection which later became part of the museum collections. The department of mammalogy was

founded in 1935. Since then activities in Europe, Asia and Africa have resulted in a considerable enlargement of the mammal collections which hold more than 30 000 specimens. In 1978 most of the historical collections of the Göttingen Museum were transferred to Bonn. The type specimens of this old collection are included in the present catalogue. The type catalogue lists syn-, holo-, lecto- and paratypes of eighty mammalian names. A lectotype is designated for *Mus sylvaticus maximus* Burg, 1925.

Hutterer, R., F. Dieterlen and G. Nikolaus (1992). Small mammals from forest islands of eastern Nigeria and adjacent Cameroon, with systematical and biogeographical notes.

26 species of insectivores, bats and rodents are recorded from the Gotel Mts and the Mambilla Plateau in eastern Nigeria and adjacent Cameroon. These mountain ranges carry relict forests representing distribution islands for many vertebrate species. 8 species of mammals are recorded for the first time from Nigeria, one bat from Cameroon, and a new subspecies of *Praomys hartwigi* is described. The taxonomic status of several forms is discussed and full species rank is proposed for *Sylvisorex camerunensis, Hylomyscus grandis* and *Lophuromys eisentrauti*. The insectivore and rodent faunas of nine mountain areas within the Cameroon Mountains system are analyzed and the result is presented in the form of an area cladogram.

Hutterer, R. and U. Joger (1982). Kleinsäuger aus dem Hochland von Adamaoua, Kamerun.

35 Kleinsäugearten werden aus dem Hochland von Adamaoua (Kamerun) gemeldet. Erstnachweise für Kamerun sind *Suncus infinitesimus, Crocidura boydi, C. roosevelti, Eptesicus guineensis, Aethomys hindei* und *Uranomys niddi*. Artstatus wird *Crocidura attila* und *Aethomys stannarius* gegeben, und die Merkmale von *Aethomys stannarius* und *Aethomys hindei* werden beschrieben. - Die Säugetierfauna des Westkameruner Montanblocks besteht zu einem großen Teil aus ostafrikanischen Arten und aus Endemiten.

35 species of small mammals are recorded from the Adamaoua hignlands of Cameroun. Six represent first records from Cameroun: *Suncus infinitesimus, Crocidura boydi, C. roosevelti, Eptesicus guineensis, Aethomys hindei* and *Uranomys ruddi*. *Crocidura Attila* and *Aethomys stannarius* are raised to specific rank, and the characters of *Aethomys stannarius* and *Aethomys hindei* are described. - A considerable amount of mammals of the Cameroun mountains are East African species and endemics.

35 espèces de petits mammifères sont signalés du plateau de l'Adamaoua (Cameroun). *Suncus infinitesimus, Crocidura boydi, C. roosevelti, Eptesicus guineensis, Aethomys hindei* et *Uranomys ruddi* sont cités du Cameroun pour la première fois. Le rang d'espèce est donné à *Crocidura attila* ainsi qu'à *Aethomys stannarius*. Les charactères spécifiques d'*Aethomys stannarius* et d'*Aethomys hindei* sont décrits. - Une grande partie des mammifères de la faune montagnarde camerounaise se constitue de formes est-africaines ou bien endémiques.

Hutterer, R. and J. C. Ray (1997). Bat predation by small carnivores in a central African rainforest.

Fragments of four species of bats (*Mops* cf. *spurrelli, Nycteris arge, Hipposideros cyclops, H. ruber* were identified in scats of small carnivores collected in a tropical rainforest of Central African Republic. For all four species the Dzanga forest constitutes the second locality record in this country. Genets (*Genetta servalina*) and long-nosed mongoose (*Herpestes nasa*) were identified as the predator species. Bats occurred in only 0.4 % of the scats analyzed. The few examples refer to bat species which roost solitarily or in small groups. Their presence in the scats can be attributed to chance encounters. Large bat colonies seem to be rare or inaccessible in the study area.

Hutton, J. M. (1986). The status and distribution of bats in Zimbabwe.

Faunal diversity in the southern African subregion increases both northwards and eastwards. Zimbabwe lies in the northeast of the subregion in the highly productive Southern Savanna Woodland biotic zone. Bat specimens have been collected from 44% of the quarter degree grid squares in Zimbabwe. Fifty-eight species are recorded, of which 14 reach the southern periphery of their range. A broad analysis of distribution relative to dominant geographical and climatic features is made. Several species are confined to the eastern half of the country but few show a similar restriction to the drier west. Seven species are widespread, but only *Nycteris thebaica* and *Eptesicus capensis* are truly ubiquitous. The distribution of many species is markedly correlated with altitude and the central watershed disrupts the distribution of several. Fourteen species are represented by too few specimens for their distribution to be assessed. Six species fail to show a distributional pattern. Distribution maps are given for species with a marked increase in collecting localities over Smithers & Wilson (1979).

Ibáñez, C. (1988). Notes on bats from Morocco.

In the last few years, a series of papers on the bats from Morocco have modified and increased the information available on the composition of this fauna (Palmeirin 1982; Aulagnier and Destre 1985; Aulagnier and Mein 1985; Kock 1987).

These notes offer the most relevant of the information obtained from fieldwork conducted in the north of Morocco during the spring and summer of 1986 and the spring of 1987. This information refers to the occurrence of a species reported for the first time in this country as well as to other species which are not well known. Linear measurements are given in millimeters and weight in grams. Except when otherwise indicated, the specimens are adults with fused phalangeal epiphyses. All of the specimens cited are deposited in the collection of the Estacion Biologica de Donana.

Ibáñez, C. and R. Fernández (1985a). Murciélagos (Mammalia, Chiroptera) de las Islas Canarias.

En esta contribution ampliamos y actualizamos la informatión existente sobre aspectos distribucion y taxonomía de las seis especies de murciélagos conocidas en el archipielago canario (*Pipistrellus kuhli, P. maderensis, P. savii, Plecotus teneriffae, Barbastella barbastellus* y *Tadarida teniotis*).

This paper adds to and brings up to date the existing information on some aspects of distribution and taxonomy of the six species of bats known in the Canary Islands (*Pipistrellus kuhli, P. maderensis, P. savii, Plecotus teneriffae, Barbastella barbastellus* and *Tadarida teniotis*).

Ibáñez, C. and R. Fernández (1989). Catalogo de murcielagos de las colecciones del museo nacional de ciencias naturales.

This paper shows the results of a revision of the bats collection held in the Museo Nacional de Ciencias Naturales de Madrid, which consists of over 1300 specimens shared by at least 144 species belonging to 11 families.

The more interesting specimens are emphasized, those being without doubt the types of the 17 species and subspecies described by Angel CABRERA using the material from this Museum. Of them, they are actually considered as valid names *Dobsonia remota, Rhinolophus anderseni, Hipposideros caffer tephrus* and *Cabreramops aequatorianus* although the first species offers some doubts. Their holotypes and paratypes are preserved, at least parcially. A careful study of the different grupus could make possible the validity of some other names like *Rhinolopnus carpetanus, R. f. obscurus,*

Pipistrellus p. mediterraneus and *P. savii ochromixtus*. The rest of them are included under synonymy in a rather definitive way.

En este trabajo revisamos la colección de quirópteros del Museo Nacional de Ciencias Naturales de Madrid, que consta de más de 1.400 ejemplares repartidos al menos en 144 especies de 11 familias.

Hacemos mayor hincapié en los ejemplares de más interés que son, sin duda, los tipos de las 17 especies y sub especies descritas por Angel CABRERA con material de este Museo. De todas estas descripciones actualmente son considerados como nombres válidos *Dobsonia remota, Rhinolophus anderseni, Hipposideros caffer tephrus* y *Cabreramops aequatorianus*, la primera especie con ciertas dudas. De todos ellos se conservan los holotipos y paratipos al menos parcialmente. Es posible que con una revisión profunda de los distintos grupos algunos otros nombres puedan tener validez, tal es el caso de *Rhinolophus carpetanus, R. t. obscurus, Pipistrellus p. mediterraneus* y *P. savii ochromixtus*. El resto está incluido en sinonimia de forma bastante definitiva.

Ifuta, N. B. (1985). Observations sur quelques groupements interspécifiques de Microchiroptères des forêts ombrophiles de Kisangani (Zaïre).

Cet article relate les résultats de deux années de recherches intensives sur les rassemblements entre Microchiroptères d'espèces différentes, récoltés à Kisangani et ses environs.

A l'issue de cette étude, nous avons mis en évidence sept groupements incluant: d'une part les familles des Nycteridae et Hipposideridae, les Nycteridae et Rhinolophidae; et d'autre part les familles des Nycteridae et Vespertilionidae entre elles.

The present paper gives an account of the results of intensive investigation into assemblages of different species of Microchiroptera collected in Kisangani and its vicinity over a period of two years.

At the close of this study, seven groupings of bats, including Nycteridae and Hipposideridae as well as Nycteridae and Rhinolophidae families on the other hand, and Nycteridae and Vespertilionidae by themselves on the other, were placed in a prominent position.

Six out of seven of the assemblages are mentioned for the first time.

Ifuta, N. B. and H. Gevaerts (1986). Données préliminaires sur la reproduction d' *Epomops franqueti* (Chiroptera: Pteropodidae) recoltées à Kisangani et environs.

Epomops franqueti est une chauve-souris dont le régime alimentaire est essentiellement frugivore à Kisangani. C'est même de loin le plus abondant des Mégachiroptères de nos récoltes, représentatns à lui seul 63.7 % de nos captures.

Les données relatives à sa reproduction ne sont pas nombreuses et sont souvent les résultats de sondages pris au hasard parmi les individus capturés. Elles sont consignée dans la monographie de Verschuren (1957), les publications de Brosset (1988a et b) et celle de Jones (1972). Toutes ces investigations font état de l'absence de périodicité de la reproduction chez *Epomops franqueti*. Sous cette étude, qui d'ailleurs est en cours et qui prendra fin en novembre 1986, nous présentons les prémices de nos résultats sur le cycle annuel de reproduction de cette espèce animale au voisinage de l'équateur afin de les comparer aux recherches antérieures. Le présent travail s'étandra sur une durée totale de deux ans.

Ifuta, N. B., H. Gevaerts and E. R. Kuhn (1988). Thyroid hormones, testosterone, and estradiol-17ß in plasma of *Epomops frangueti* (Tomes, 1860) (Chiroptera) in the Rain Forest of the Equator.

Using Japanese catching nets a total of 77 males and 37 females of the fruit eating bat *Epomops franqueti* (Megachyroptera) were captured during a period of 1 year around Kisangani (Zaire). Adult males with white epaulets weighing 143 ± 3.6 g (18) had their testes present in the scrotum and higher plasma concentrations of thyroxine (T_4) and testosterone than adult males without epaulets and with abdominal testes (weight 107.5 ± 2.0 g (39)) or juveniles (72.7 ± 2.8 g (20)). Mean embryo weight of pregnant bats was 4.26 ± 1.09 g (12) ranging from 1.8 to 14.8 g whereas body weight of mothers (+ embryos) was 117.0 ± 3.6 g (12). Body weight of nonpregnant bats was 107.3 ± 2.1 (10) and of female juveniles 74.6 ± 4.3 (15). Plasma concentrations of triiodothyronine (T_3) were lowest in nonpregnant adults and comparable in juveniles and pregnant bats. No difference in plasma T_4 concentrations was found between all groups. Estradiol-17ß concentrations were three times higher in pregnant bats compared to nonpregnant ones or juveniles. A possible relationship between these high figures and elevated T_3 values has been discussed.

Ifuta, N. B., G. B. Katuala and M. L. Bola (1987). Etude du régime alimentaire de quelques espèces des Mégachiroptères de la région de Kisangani (Zaïre).

Des recherches menées sur le régime alimentaire de huit espèces de chauves-souris de Kisangani - Megachiroptera - nous ont conduit à recenser 34 espèces végétales dont les fruits sont consommées.

Les fruits les plus affectionnés appartiennent aux familles des Moraceae, Anacardiaceae, Mytaceae, Rubiaceae, Apocynaceae et Museceae.

Dans cette étude, une esquisse des préférences alimentaires de chaque espèce des Mégachiroptères est tentée.

The study made on the diet of eight bat species - Megachiroptera - at Kisangani revealed 34 plant species whose fruits are eaten.

The most consumed fruits belong to Moraceae, Anacardiaceae, Myrtaceae, Rubiaceae, Musaceae and Apocynaceae families. In this paper, the alimentary preferences of each species of Megachiroptera is outlined.

Iliopoulou-Georgudaki, J. and E. B. Giagia (1986). The chromosomes of Kuhl's pipistrelle bat *Pipistrellus kuhli* (Kuhl, 1819) from Greece.

Standard karyotype and G-bands observed in the chromosomes of *Pipistrellus kuhli* from Greece are described. The karyorypes have confirmed the high conservatism of the Vespertilionidae bats, as the studied species possess 2n = 44 with three large biarmed pairs. The G-band patterns found in the karyotypes of the examined species are identical with those previously described of that species from Ajerbaijan (USSR) and Libya.

Ingoldby, C. M. (1929). On the mammals of the Gold Coast.

A collection of mammals - mainly small mammals - from the Gold Coast Colony, including Ashanti and the Northern Territories, recently got together by the author, proves to contain a considerable number of species not previously recorded from the Colony; and, as available literature on this area is scanty and scattered, it seems worth while to attempt a list of its mammalian fauna as now known.

Two considerable collections have been received by the British Museum from Ashanti - by Dr. Spurrell (1910-1912), and by Captain Giffard, from the Northern Territories. A few specimens have been sent by others from time to time. For the Ungulates I have drawn fully on the B.M. "Catalogue of Ungulate Mammals," 1914-1916, Lydekker. I have to acknowledge the assistance I have received from the authorities of the British Museum, who have allowed me ready access to the collection and to literature, and especially to Mr. M. A. C. Hinton and Mr. Oldfield Thomas, who have given me the friendliest encouragement and help throughout. To Mr. Pocock, who has also helped me with a valued gift of "separates," to Dr. E. Schwarz, for help in some points of nomenclature of the Primates and one or two of the Carnivores, and to Mr. Oldfield I owe thanks.

The most interesting facts brought to light by this new collection are, perhaps, the large number of species inhabiting this small area, the occurrence of *Hylochcerus meinertzhageni* so far to the west, and the discovery of an important new species of the rare genus *Uranomys*.

Iredale, T. and E. Le G. Troughton (1934a). A check-list of the mammals recorded from Australia.

More than three centuries have passed away since Pelsart in 1629 provided the first known description of an Australian pouched animal, and, although over 400 species and subspecies of mammals, marsupial and otherwise, have since been described, the present work is the first to assemble in a. comprehensive taxonomic list the mammalian orders indigenous to Australia and the adjacent seas.

Much care has been devoted to supplying the original references to species, thus avoiding the reiteration of extensive synonymic lists, while the essential generic references are quoted in a manner adequately stabilising the name to be accepted. A feature especially helpful to fellow-workers is the listing of authentic type localities, as those of many of the earlier species have hitherto been either overlooked or misquoted, and wrong conclusions have resulted therefrom.

A very natural result of the early recognition of the extraordinary interest of the Australian fauna was that collections made by explorer-naturalists, officials, and settlers went overseas to be described and stored away for all time. Until recently, therefore, much of the mammalian research has been carried out abroad, and Australian, workers have been troubled by the fact that many species are known only by meagre descriptions of material which is rarely illustrated and mostly unrepresented in their collections.

Further confusion arose from the fact that for many years no attempt was made accurately to localise individual discoveries, so that a vast amount of field-work must be carried out in order to check not only the identity but the actual survival and present range of many species.

No student of Australian mammalogy, however, can fail to be impressed by the magnitude of the work accomplished by John Gould, and the wide knowledge he gained in the early days of various parts of the continent and the habits of its quaint denizens, which led to the preparation of the three wonderful volumes of "The Mammals of Australia."

The authors also pay tribute to those past and present workers who have devoted much ability and energy to furthering a knowledge of the fascinating mammalian fauna. Amongst the earlier workers were Gerard Krefft and Dr. B. Pierson Ramsay, past Curators of the Australian Museum. In the nineties J. Douglas Ogilby was engaged by the Museum Trustees to prepare a "Catalogue of Australian Mammals," published in 1892, a compilation which, though providing a useful basis, suffered from the author's lack of experience of the subject, and his failure to consult the important collections already available in the Museum. While a member of the Museum staff, Edgar R. Waite contributed some important work upon the mammals, notably in association with Professor Baldwin Spencer, who also named some important discoveries, on the collections of the Horn Expedition to Central Australia.

The "Catalogue of Marsupialia and Monotremata" by Oldfield Thomas, of the British Museum, will, of course, provide a basis of study for all time. Since its publication in 1888, however, its author has described not only a great number of marsupials, but rodents and bats as well, so that his acitivities alone provided urgent need for the compilation of a check-list.

Of the more recent comprehensive works, the "List of Australasian and Austro-Pacific Muridæ," published by Heber A. Longman in 1916, is invaluable when studying the indigenous rodent fauna, but many forms have since been described, while the nomenclature has been subjected to considerable revision. Finally, there is the splendid handbook to "The Mammals of South Australia," 1923-1925, prepared and illustrated with so much care and originality by Professor F. Wood Jones while occupying the Chair of Anatomy at the University of Adelaide. Workers in mammalogy owe a debt of gratitude to the author of this handbook, which, though restricted as to the range of actual forms, really provides a complete introduction to the study of the mammalian fauna of Australia.

Concerning the major classification of Marsupialia, it has seemed advisable to follow the older and more familiar one used in the "Catalogue" by Thomas rather than that adopted by Wood Jones in his Handbook, though close analysis of the latter classification must prove very instructive to students of mammalogy.

All references to scientific names have been checked by consultation of Palmer's "Index Generum Mammalium" and Sherborn's "Index Animalium." The accuracy of both of these compilers is, of course, beyond comparison, and the satisfactory compilation of this List has been greatly facilitated by the assistance of these standard works.

Throughout this work, the provision of vernacular names for all forms, many of which were met with in the wild state only by the collector, has often proved a more difficult task than that of establishing the priority of scientific names. The aboriginal names, which may vary with local tribes, or those used by settlers in various districts or States, for instance, are hardly applicable to single species which may occur in several mainland States and on islands as well.

The law of priority has invariably been followed in the acceptance of scientific names and, although the inevitable and sometimes drastic changes may be regretted, adoption of the earliest valid name provides the sole means of reaching finality, and also avoids the lasting confusion which results from conserving here and rejecting there.

At the present time there is definite evidence of a revival of interest in mammalian research within the Commonwealth, and it is the authors' hope that this List will not only enable workers to designate genera and species with certainty, but also assist ia creating a universal understanding of our faunal problems and the urgent need for the conservation of existing species.

Izhaki, I., C. Korine and Z. Arad (1995). The effect of bat (*Rousettus aegyptiacus*) dispersal on seed germination in eastern Mediterranean habitats.

The fruit-bat *Rousettus aegyptiacus* (Pteropodidae) in Israel consumes a variety of cultivated and wild fruits. The aim of this study was to explore some of its qualities as a dispersal agent for six fruit-bearing plant species. The feeding roosts of the fruit-bat are located an average of 30 m from its feeding trees and thus the bats disperse the seeds away from the shade of the parent canopy. The bat spits out large seeds but may pass some (2 %) of the small seeds (< 4 mg) through its digestive tract. However, neither the deposited seeds nor the ejected seeds (except in one case) had a significantly higher percentage germinating than intact seeds. Although the fruit-bat did not increase the percentage germinating, seeds of three plant species subject to different feeding behaviors (deposited in feces or spat out as ejecta) had a different temporal pattern of germination from the intact seeds. The combined seed germination distribution generated by these different treatments is more even over time than for each treatment alone. It is suggested that this increases asynchronous germination and therefore enhances plant fitness by spreading the risks encountered during germination, especially in eastern Mediterranean habitats where the pattern of rainfall is unpredictable.

Jackson, H. D. (1973). Faunal notes from the Chimanimani mountains, based on a collection of birds and mammals from the Mucrera river, Mozambique.

The paper reports on a collection of 125 specimens taken in August - September, 1972, in the vicinity of the Mucrera River, Mozambique; this is in the Chimanimani Mountains close to the Rhodesian border. The collection includes the first specimen of Cape Eagle Owl *Bubo capensis* from Mozambique (see Jackson, 1973a) and useful series of Whitethroated Swallow *Hirundo albigularis* (ten specimens), Wailing Cisticola *Cisticola lais* (25 specimens), Bokmakiri *Telophorus zeylonus* (eight specimens; see Jackson, 1972) and Egyptian Freetailed Bat *Tadarida aegyptiaca* (27 specimens). The specimens represent 24 bird and four mammal species; also recorded are another 27 bird and five mammal species seen but not collected, including the first record of the Rednecked Francolin *Francolinus afer* from the Chimanimanis.

Habitat notes are provided for most of the species. The Dabchick *Tachybaptus ruficollis* was found breeding in the Chimanimanis for the first time and ovarian activity was noted in Rameron Pigeon *Columba arquatrix* (apparently no breeding records from Mozambique or Rhodesia), Freckled Nightjar *Caprimulgus tristigma* and Stonechat *Saxicola torquata*; for most species the breeding season was only just beginning. Notes on courtship and other behaviour are included for several species.

The Mucrera deme of the Wailing Cisticola is shorter-winged than *C.l. mashona*, the taxon to which the Chimanimani populations are usually referred.

The Whitethroated Swallow is not resident in the Chimanimanis as claimed by Hodgson (1971); it arrives in August, the males apparently preceding the females by a few weeks.

The weights of all specimens are given and for several bird species the colours of soft parts given in McLachlan & Liversidge (1970) are shown to be unreliable.

Jacobs, D. S. (1996). Morphological divergence in an insular bat, *Lasiurus cinereus semotus*.

1 Bats are the only terrestrial mammals to have reached isolated oceanic islands without human assistance. Despite the fact that the greatest evolutionary divergence would be expected on such islands, very few studies on the divergence of oceanic island fauna from their mainland counterparts have focused on bats. This study investigated divergence of the insular Hawaiian Hoary Bat, *Lasiurus cinereus semotus*, from its North American subspecies, *L. c. cinereus*.

2. Divergence in the Hawaiian Hoary Bat involved characters related to flight and feeding.

3. The Hawaiian bat has undergone a 45 % reduction in body size with allometric responses in the size of its wings. These changes resultedin a combination of low wing loading (ratio of weight to wing area) with relatively long, narrow wings. The low wing loading permits slower and more manoeuvrable flight near vegetation, whild the relatively long, narrow wings enable enduring flight in open areas. This increased flexibility in fligh behavior has allowed the Hawaiian bat to expand its foraging habitat to include open habitats similar to those of *L. c. cinereus*, and closed habitats that are not used by *L. c. cinereus*.

4. Divergence in characters related to feeding involved relative increases in size of the gape, size of the masseter muscle and the height of the coronoid process. These changes give the jaw more crushing power for more efficient processing of large and hard-bodied prey. This has enabled the Hawaiian bat to include large, and hard-bodied insects (not taken by *L. c. cinereus*) in its diet despite a marked reduction in body size.

Jacobsen, N. H. G., P. C. Viljoen and W. Ferguson (1986). Radio tracking of problem Fruit bats (*Rousettus aegyptiacus*) in the Transvaal with notes on flight and emergetics.

Radio tracking was used to locate a cave in which Egyptian fruit bats roosted after nightly feeding visits to litchi orchards in the Trichardtsdal/Ofcolaco area of the northeastern Transvaal. This paper reports on results of this technique and discusses its shortfalls.

Radio-Ortung von schadenanrichtenden Flughunden (*Rousettus aegyptiacus*) in Transvaal mit Anmerkungen über Flug und Energiehaushalt.
Radio-Ortung wurde zur Auffindung einer von Nilflughunden benutzten Höhle gebraucht, in die sie nach nächtlichem Fressen in Litschi Obstgärten in der Trichardtsdai/Ofcolaco-Region des nordöstlichen Transvaal zurückflogen. Die Arbeit berichtet über die Ergebnisse dieses Verfahrens und diskutiert seine Schwächen.

Jadin, J. B., P. H. Vercammen-Grandjean and A. Fain (1955). *Trombicula nycteris* n.sp. Un Trombiculidae (Acarina) parasite de chiroptères.

En juin 1953, l'un d'entre nous récolta sur une Chauve-souris: *Nycteris macrotis*, un certain nombre de larves de Trombiculidés d'espèce nouvelle et apparentée à *Trombicula* PHIL. & TRAUB 1950.

Cette espèce nouvelle fut appelée: *Trombicula nycteris*. Elle appartient à un groupe important des *Trombicula*, africains, parmi lesquels sont déjà connus les suivants: *T. panieri* JAD. & VERC. 1952, *T. jadini* VERC. 1952 et *T. rodhaini* JAD. & VERC. 1952.

Javrujan, E. G. (1989). On some bat species from northern Africa (Algeria). Abstract.

From October, 1980 to July, 1984 incl., the author investigated the bat fauna of Algeria and its borderland with Tunisia and Morocco. The study area is heterogeneous as to geography and climate. Most bat species are concentrated on the Mediterranean coast, fewer species occur in the oases of the Sahara Desert, and still fewer in the mountain regions separating the wide coastal zone from the Sahara.

The author has ascertained 20 out of the 23 species recorded in the territory of Algeria; they belong to the families Rhinolophidae and Vespertilionidae. He inspected around 220 shelters and banded 660 individuals. Eighteen species, which mostly occur also in Armenia, were studied systematically. Mr Ahmed Amiri, vice-principal of the University, and students of the Department of Zoology of the University, in Annaba participated in the investigations.

Particular attention was paid to the Annaba region and the Algerian coastal zone where most morphological and biological investigations were made. Each year, five to seven expeditions were made to the Sahara. Investigations into ruins, tombs, mosques and houses were connected with diffeculties. Nevertheless, the author succeeded in compiling maps of localities and in obtaining an idea of the species composition and ecology of the bats of Algeria. The material obtained has also enabled him to compare the morphometric characters of certain northern African and Armenia species.

Editorial Note. In the same years (1980 - 1984), other authors also studied the distribution and ecology of bats in Algeria. According to published data (Gaisler 1983, 1984; Vesmanis 1985; Gaisler et Kowalski 1986; Kowalski et al. 1986), 26 species of six families of Chiroptera have been recorded in Algeria.

Jeffrey, S. M. (1975). Notes on mammals from the high forest of Western Ghana (excluding Insectivora).

Des renseignements sont fournis sur 73 espèces de Mammifères, collectionnés pendant trois ans dans une région forestière du Ghana occidental (près de Sefwi Wiawso) comprenant environ 3 845 km^2. Des détails de localité, d'habitat, de poids et de taille, de mœurs et de reproduction sont indiqués quand ils sont connus. *Tadarida congica* est rapporté pour la première fois en Afrique de l'Ouest.

Jentink, F. A. (1881). Description of a new African bat, *Leiponyx büttikoferi*.

In the family of the Pteropodidae there are three genera in which the claw, to the index finger is wanting, viz. *Cephalotes, Notopteris* and *Eonycteris*. The first of these genera is represented by two, the others each by a single species. They are distributed in the following manner: *Cephalotes peronii* inhabits the islands of the Austro-Malayan subregion, while *Cephalotes minor* is to be found in New Guinea; *Notopteris macdonaldii* is limited to the Fiji-group and Aneiteum-island and *Eonycteris spelaea* is to be found in caves on the Indian continent (Burma). The Pteropodidae met with by the numerous travellers in the African continent belong without exception to the genera *Epomophorus* and *Cynonycteris*. Taking these facts into consideration I was greatly surprised to find in a small collection of bats, made in Liberia by our travellers Büttikofer and Sala a *Pteropus*-like bat, which did not possess a claw to the index finger and so could not belong to a species of *Epomophorus* or *Cynonycteris*. This species differing in many points from the other species without a claw to the index finger, I am obliged to regard our specimen as the type-species of a new genus, which I propose to call *Leiponyx*.

Jentink, F. A. (1888a). Zoological researches in Liberia. A list of mammals, collected by J. Büttikofer, C.F. Sala and F.X. Stampfli, with biological observations.

This paper is a continuation of Büttikofer's papers on the zoological researches in Liberia in the Notes from the Leyden Museum, 1885, Vol. VII, p. 129 and 1886, Vol. VIII, p. 243. As well as Büttikofer's list of the birds gives a good impression of the richness of the Avifauna in that part of Africa, so my paper will give an idea of the luxuriousuess of the Mammalian forms in that country. Our travelers have been happy enough to procure several new species besides specimens of species hitherto only known by mutilated skins or by a single skull, by a single specimen or of which the locality was unknown or uncertain. The collections are the results of four voyages, made by Büttikofer and Sala (January 1880 - April 1882), by Stampfli (July 1884 - April 1886), by Büttikofer and Stampfli (November 1886 - May 1887) and the continuation of the latter by Mr. Stampfli who is still hunting in Eastern Liberia, but intends to return within a few months. In the above mentioned paper ....

Jentink, F. A. (1890). On a collection of mammals from Billiton.

Up to this day I knew only a single Mammal, *Sciurus prevostii*, from Billiton, a small island, situated between Borneo and Banka. As the islands between Sumatra and Borneo bear a peculiar scientific interest with regard to the distribution of the animals and to the hypothesis concerning the relation in prehistorical times between these two large islands, I was in sanguine expectations in receiving a letter from Dr. A. Vorderman (Batavia), containing the kind information that he had made a journey to Billiton in June 1888 and now presented the then collected animals to our Museum. And how great was my astonishment in finding in that collection no less than 10 species of Mammals from Billiton. So that we know at present eleven well-defined species from that interesting point in the Malay Archipelago.

Two species, *Pteropus edulis* and *Sciurus prevostii*, in the collection are from Mendanao, a small island close to the west coast of Billiton.

The following 10 species are contained in Vorderman's collection from Billiton.

Jobling, B. (1939). On the African Streblidae (Diptera, Acalypterae) including the morphology of the genus *Ascodipteron* Adens and a description of a new species.

Dr. F.W. EDWARDS has kindly submitted to me the specimens of Streblidae collected by him in March 1935, during his entomological expedition to East Africa, in the caves near Kapretwa, at 6500 ft., on Mt. Elgon, Kenya. To this material he added the specimens collected by Dr. G.H.E. Hopkins, in the same locality, and asked me to write a short report.

After an examination of these two collections, I came to the conclusion that a short report on these specimens will have very little value. Therefore, I have decided to write this paper, which includes all

the records of the African Streblidae known to me at present, and an illustrated key for their identification.

Amongst the material of Dr. Hopkins there were thirteen spirit specimens of bats infested with the endoparasitic females of the genus *Ascodipteron*. With this material I was able to study the external structure of this endoparasite, and the description of it is given in this paper. I think that this description will serve as a basis for the further study of the characters of the species of this highly specialized genus.

As I could not refer to the specimens of *Ascodipteron* to either *A. lophotes* Monticelli (1898), or to *A. tabulatum* Speiser (1908a), they are described here as a new species. However, I must mention that the descriptions of these authors are incomplete, and a comparison of my type specimen with theirs may demonstrate its identity with either *A. lophotes* or *A. tabulatum*.

The African species of this family of Diptera belong to the following three genera: *Raymondia, Nycteribosca* and *Ascodipteron*. The first two genera are included in the subfamily Nycteriboscinae and the last in the Ascodipterinae. The species of these genera are widely distributed in the Oriental region, where those of the genus *Nycteribosca* are more numerous than in Africa. But non of the Oriental species of these genera occur in Africa and vice versa. Three Ethiopian species, *Nycteribosca Africana* Walker, *N. alluaudi* Falcoz and *Raymondia huberi* Frauenfeld, are common on certain bats in the Palaearctic region of Africa. Of these species *Nycteribosca Africana* has the widest distribution, and is the only streblid which occurs in the Mediterranean parts of Europe and Asia (Portugal, south of France, Sardinia, Cyprus and Palestine).

Table 1 shows that the African Streblidae parasitize bats belonging to eight families of Chiroptera. The more common and widely distributed species, such as *N. africana* and *Raymondia huberi*, have been found on the species of the three families of bats, whereas the less common species, with the more localized distribution, have been recorded only from one, or from two species of bats of the same genus.

It seems that the evolution of the Streblidae has been going on side by side with that of their hosts. The most generalized species of this family occur on the species of the most generalized family of Chiroptera. Thus *Nycteribosca bequarti* and the Oriental species, *N. gigantean*, which are the most generalized species of the Streblidae, have been found only on bats of the most primitive form of Pteropidae of the suborder Megachiroptera.

The distribution of the African Streblidae is known very incompletely, for instance, there is only one record of these Diptera from the whole of West Africa (Old Calabar, South Nigeria), none from French Equatorial Africa and only two from the Belgian Congo.

Jobling, B. (1952). Description of two new species of *Ascodipteron* from Africa and one species of *Nycteribosca* from Madagascar (Diptera, Streblidae).

The description of one new species of *Ascodipteron* and another one of *Nycteribosca* is based on the material collected in Africa and Madagascar respectively by Mr H. Hoogstraal, of the United States Naval Medical Research Unit No. 3. These specimens represent a part of the collection which was sent to me for identification by Mr R. L. Wenzel of the Chicago Natural History Museum. In this paper I have also included the description of another new species of *Ascodipteron* of which two specimens were collected by Mr T. S. Jones in West Africa. As the specific characters of the species of the genus *Ascodipteron* have not been properly understood, they are described here in the comparative form, together with the morphology of the head, thorax and the abdomen.

Jobling, B. (1954). Streblidae from the Belgian Congo, with a description of a new genus and three new species (Diptera).

Mr. P. BASILEWSKY, Chief of the Entomological Department of the Musée Royal du Congo Belge at Tervuren, and Mr. P. L. G. BENOIT, Assistant, have very kindly submitted to me a very large collection of *Streblidae* made by N. LELEUP in the Belgian Congo, during his work at the *Institut pour la Recherche Scientifique en Afrique Centrale* (I.R.S.A.C.). In this collection were one new genus and three new species; the descriptions of these are given below, together with the record of the known species which have been found in this collection. The types are deposited in the Musée Royal du Congo Belge.

Except *Raymondia setiloba* sp. n . and *Raymondioides leleupi* gen. n. and sp, n. the rest of the *Streblidae* of the Belgian Congo occur in many other parts of Africa, and therefore, in order to give the complete records of their distribution, I have also included their previous records.

During the last ten years the *Streblidae* have been very extensively collected in the North-eastern parts of Africa, and for this we are indebted to Mr. H. HOOGSTRAAL, Head of the Department of Medical Zoology, U. S. Naval Medical Unit N° 3, in Cairo. His specimens have been identified by me, and they are now preserved jn the Chicago Natural History Museum. They helped me greatly to clarify several obscure points during the preparation of this paper, and the record of some of them are also mentioned here.

As my key to the African *Streblidae* was published in 1939, and during the intervening years several new species have been added to the African list, I have decided to include in the present paper a new key to the genera *Nycteribosca* and *Raymondia*. The species of the genus *Ascodipteron* are not treated here because they have not been sufficiently studied, and as yet, have not been recorded from the Belgian Congo.

Jobling, B. (1956). Streblidae from the French Ivory Coast, with a description of new species (Diptera).

Dr. V. AELLEN of the "Muséum d'Histoire Naturelle", Geneva, very kindly sent me a small but interesting collection of Streblidae, made by him during his scientific expedition to the French Ivory Coast. Among the specimens of this collection were two new species which are described below. A specimen from French Guinea is also recorded. The types of new species are deposited in the "Muséum d'Histoire Naturelle" of Geneva.

Johansson, S. G., P. Cunneyworth, N. Doggart and R. Botterweg (1998). Biodiversity surveys in the East Usambara Mountains: Preliminary findings and management implications.

Geographically referenced biodiversity information is important for conservation management and zoning. Biodiversity surveys were initiated in the East Usambara Mountains in 1995 to provide baseline information on the biological values of the forests for management planning and monitoring, and to train field staff in the use of biological inventory techniques. They were conducted in ten-week field phases. Vegetation plots were laid along a grid of 450 m x 450/900 m. Forest disturbance was assessed using the grid transects. Selected groups of fauna were surveyed using standard methods. Inventories have been completed in ten forests covering 11,076 ha. New species have been discovered, and several range extensions have been documented. Data on local distribution of endemics and threatened species has been incorporated in management plans for Forest Reserves. About 35 foresters have been trained. During 1997 a database was developed for data entry, retrieval and mapping.

Jones, C. (1971). The bats of Rio Muni, West Africa.

Based on reference specimens obtained from known localities, a modern list is presented of the bats of Rio Muni, West Africa. Information is presented and summarized on some aspects of the biology, especially reproduction and ecologic distribution, of these mammals. Data are recorded with regard to some of the morphological variations found in the species of bats listed.

Jones, C. (1972). Comparative ecology of three pteropid bats in Rio Muni, West Africa.

Data on morphologic features, habits ,stratification, flight, and thermal response are presented for *Eidolon helvum, Epomops franqueti*, and *Micropteropus pusillus* from Rio Muni, West Africa. Relative abundance and reproduction activities of these pteropodids are concordant with seasonal rainfall and availabitlity of foods in Rio Muni. There are major differences between these sympatric species with regard to roosting sites, foods and feeding behaviour, levels of flight, and aerodynamic properties. Thermal responses vary between the species and are correlated with differences in behavioural thermoregulation.

Jones, G., T. Gordon and J. Nightingale (1992). Sex and age differences in the echolocation calls of the lesser horseshoe bat, *Rhinolophus hipposideros*.

The CF portion of calls emitted by hand-held Lesser Horseshoe Bats *Rhinolophus hipposideros* depends on the age and sex of the bat. Bats older than one year have calls higher in frequency than those produced by first-years, and females emit higher frequency calls than males. Within sexes, frequency is not correlated with forearm length. The implications of intraspecific variation in pulse design for communication and resource partitioning are discussed.

La portion CF des cris émis par des Petits rhinolophes fer à cheval, (*Rhinolophus hipposideros*), tenus à la main, dépend de l'âge et du sexe de la chauve-souris. Celles qui sont agées de plus d'un an émettent des cris a plus haute fréquence que celles qui ont moins d'un an, et les femelles émettent à plus haute fréquence que les mâles. Entre membres du meme sexe, lé frequence à laqueile est émis le cri n'a aucun rapport avec la longueur de l'avant-bras. Une discussion est engagée sur les consequences possibles des variations intra-spécifiques dans la production des cris, pour la communication et le partage des resources.

Jones, G., M. Morton, P. M. Hughes and R. M. Budden (1993). Echolocation, flight morphology and foraging strategies of some West African hipposiderid bats.

We studied echolocation call structure, flight morphology and feeding behaviour of three hipposiderid bats (*Asellia tridens, Hipposideros caffer* and *H. ruber*: Chiroptera: Hipposideridae) in The Gambia during the wet season (July - August). All three species emitted brief CF/FM echolocation calls. In *A. tridens* CF (constant frequency) frequencies between 108 and 122 kHz were recorded. This variation was caused mainly by sex and age difference in call frequencies: juveniles used lower frequencies than did adults, and males were lower in frequency than females. Among adults, CF frequency was related to forearm length in a polygonal manner. *Asellia tridens* is unusual for a microchiropteran in that males are larger than females: nevertheless this species follows the typical trend for bats using CF components in their calls in that males call at lower frequencies than do females. The spread in frequencies notes for *A. tridens* in group flight was not caused primarily by individuals shifting their frequencies when flying in a group compared with when flying alone. Three bats were flown separately and then together in a small room. The hypothesis that bats shift emitted frequencies in group flight to minimize confugin their own echoes with those from conspecifics was not supported. Rather, we suggest each bat has a personal CF frequency determined by sex, age and size, and that the variation created by these factors reduces confusion with other bats' echoes during group flight. Bats of the genus *Hipposideros* were separated into two groups by discriminant analysis on flight morphology. The two groups showed little overlap of CF frequencies used in echolocation. Bats identified as *H. ruber* called with CF resting frequencies between 121 and 136 kHz, while *H. caffer* used 128 - 153 kHz. Our results support the classification of these bats into two sibling species. We compared the flight performance of *A. tridens* and *H. ruber* by flying bats through obstacle courses: *H. ruber* had a lower wing loading and was able to negociate more complex arrays of obstacles than could *A. tridens*. In the wild, *H. ruber* fed in more cluttered situations than did *A. tridens*. Both species were feeding mainly on

Coleoptera during the study period, and in *H. ruber* individuals with higher aspect ratios and long wingspans tended to eat more moths than did bats with broader and shorter wings.

Jones, G. and R. D. Ransome (1993). Echolocation calls of bats are influenced by maternal effects and change over a lifetime.

The greater horseshoe bat, *Rhinolophus ferrumequinum*, is a model species in echolocation studies, and emits calls containing long constant-frequency (CF) components. The bats have auditory systems tuned sharply to frequencies close to the resting CF (RF) values. Call frequency and neural processing are both flexible within individual bats which use this mode of echolocation. The simple structure of the calls makes them ideal for sonagraphic analysis. Here, in a large-scale and long-term analysis of changes in the vocalizations of bats we show that: (i) the calls of *R. ferrumequinum* aged 1-28 years vary seasonally and over a lifetime in a predictable manner; and (ii) an infant's RF is at least partly determined by the RF of its mother. We consider the relative importance of genetic and learning factors upon the correlation between RFS of mothers and offspring.

Jones, G. and J. M. V. Rayner (1989). Foraging behavior and echolocation of wild horseshoe bats *Rhinolophus ferrumequinum* and *R. hipposideros* (Chiroptera Rhinolophidae).

1. Echolocation and foraging behavior of the horseshoe bats *Rhinolophus ferrumequinum* and *R. hipposideros* feeding under natural conditions are described. 2. The calls of both species consisted predominantly of a long CF segment, often initiated and terminated by brief FM sweeps of substantial bandwidth. 3. *R. hipposideros* typically flew close to vegetation, and fed by aerial hawking, gleaning and by pouncing on prey close to the ground. *R. hipposideros* called with a CF segment close to 112 kHz which is the second harmonic of the vocalization; its calls included low intensity primary harmonics, and had prominent initial and terminal FM sweeps of considerable bandwidth. When searching for prey on the wing it had longer interpulse intervals than *R. ferrumequinum*, but emitted shorter pulses at a higher repetition rate; overall it had a similar duty cycle to *R. ferrumequinum*. 4. *R. ferrumequinum*, calling with a CF segment close to 83 kHz, also used harmonics other than the dominant secondary in its calls, and modified its echolocation according to ecological conditions. This species showed certain parallels with *R. rouxi* of Asia. It was observed feeding by aerial hawking and by flycatching. When scanning for prey from a perch (perch hunting), calls were of shorter duration, and interpulse intervals were on average longer, than when bats were flying. Mean duty cycle was longer in flight, and the bandwidths and frequency sweep rates of the FM segments in the calls increased in comparison with perched bats. 5. FM information may facilitate determination of target range and the location and nature of obstacles; it may also be involved in the interpretation of echoes and the detection of moving targets among clutter. The rising FM sweep initiating the call in both species when flying (and to a lesser extent perch hunting) in the wild must have a significant adaptive role, and should be considered an essential component of the call; rhinolophids should be termed FM/CF/FM bats.

Jones, G. and S. M. van Parijs (1993). Bimodal echolocation in pipistrelle bats: are cryptic species present?.

The pipistrelle bat *Pipistrellus pipistrellus* is the most widespread in Europe, and is often the most abundant bat species in northern and central Europe. *P. pipistrellus* has traditionally been considered as one species throughout Europe. Here we show that: (i) the echolocation calls of pipistrelles fall into two distinct frequency bands in Britain, with frequencies containing most energy averaging 46 khz and 55 khz; (ii) roosts consist of bats which use only one form of echolocation; (iii) small but significant differences in average gross morphology exist between the phonic types; and (iv) the two phonic types occur in sympatry over much of Britain. Recordings made from European populations show that bimodal echolocation is also typical of continentatl pipistrelles, with only one phonic type found in some areas, two types in sympatry in others. The sympatric occurrence of two phonic types, the lack of mixing of types between colonies, and the morphological divergence between phonic types suggests that *P. pipistrellus* may actually consist of at least two cryptic sibling species. The evolution of bimodal

echolocation in bats is discussed, and a model involving disruptive selection is presented to show how sympatric speciation may occur.

Jordan, K. (1936). Dr. Karl Jordan's expedition to South-West Africa and Angola: Siphonaptera.

The mammals obtained on the Expedition were mainly collected for the sake of their Ectoparasites, particularly fleas. As I found little time for trapping, especially in Angola, we did not get large numbers of fleas, there being hardly ever anything on the mammals brought in dead or alive by the natives. Since my return to Europe, Herr. W. Hoesch, one of my companions in South-West, has send me from that country two consignments of fleas which add materially to the collection. Some of the species we obtained are new, the most interesting new flea being a subspecies combining characters of *Ctenocephalides felis felis* and *Ct. connatus*.

In order to make the report on the fleas more useful, I have included in it all the species known to me from South-West and Angola.

Jüdes, U. (1994). Methods for monitoring of bats using ultrasonic detectors. Abstract.

At the 2nd European Bat Detector Workshop in Spain (1993) participants agreed on a cooperation to improve their work and established a working group

- to exchange information about monitoring methods for bats used in different European countries,
- to stimulate methodological discussion, and
-.to optimize and - as far as possible - standardize methods.

The procedure for this cooperation will follow the so-called Delphi-method:

1. Each participant describes his/her specific method(s) and experience in a short paper, fills in a questionnaire and sends both to the coordinator.

2. Coordinator builds subgroups (e.g. on specific aims of field studies) and distributes papers of participants among all subgroup members.

3. Subgroup members discuss papers, give additional hints and critical notes to authors of papers and to organizer.

4. Results of subgroup discussions are circulated again by organizer to all members for final criticism.

The cooperation will result in many international contacts, spreading of ideas among participants, testing of single methods in different countries, and - if possible - in a written many-author-guide on well experienced methods for bat detector field work.

All interested scientists and bat workers in Europe are invited to cooperate in this group and should contact me

---

Juste, J. and C. Ibáñez (1992). Taxonomic review of *Miniopterus minor* Peters, 1867 (Mammalia: Chiroptera) from western central Africa.

Western populations of *M. minor* from São Tomé Island, Zaire and the Republic of Congo are compared to one another and with the known eastern subspecies, using either quantitative and qualitative parameters. The analyses confirm the subspecific character of both the São Tomé population (described as *M. newtoni* Bocage, 1893) and the western continental population, distinguished by cranial relationships and qualitative characters from the other known populations and hereby described as a new subspecies.

In addition, a neotype for *newtoni* is designated.

Juste, J. and C. Ibáñez (1993a). An asymmetric dental formula in a mammal, the São Tomé Island fruit bat *Myonycteris brachycephala* (Mammalia: Megachiroptera).

The dental formula in heterodont mammals characteristically shows bilateral symmetry. Its expression is likely to be subject to very strong selective pressures, since it is associated with such basic functions as the acquisition and preparation of food. Here we report the exceptional finding of the first asymmetric dental formula in a heterodont mammal observed in the São Tomé Island (West Africa) frugivorous bat *Myonycteris brachycephala*. The asymmetry results from the absence of a lower internal incisor, occurring variably in the right or left mandible. This morphological innovation is possibly related to a developmental instability associated with the colonization by the island species.

La formule dentaire des mammifères hétérodontes est normalement caractérisée par la symétrie bilatérale. Son expression est en général le reflet de pressions de sélection très fortes parce qu'elle est associée à des fonctions aussi fondamentales que l'acquisition et la préparation de la nourriture. La formule dentaire asymétrique que nous décrivons ici, la première jamais rencontrée chez un mammifère hétérodonte, le chauve-souris frugivore *Myonycteris brachycephala* de l'île São Tomé (Afrique de l'ouest), reflète donc un phénomène tout à fait exceptionnel. Cette asymétrie résulte de l'absence d'une incisive inférieure interne, soit à gauche, soit à droite. Cette nouveauté morphologique est peut-être reliée à l'instabilité évolutive associée au processus de colonisation de cette espèce dans l'île.

Juste, J. and C. Ibáñez (1993b). A new *Tadarida* of the subgenus *Chaerephon* (Chiroptera: Molossidae) from Sao Tomé Island, Gulf of Guinea (West Africa).

We describe a population of the genus *Tadarida* (Molossidae) from São Tomé Island (Gulf of Guinea, West Africa), as a new species based on cranial and interaural-membrane morphology shown in three specimens. These features are shared only with *T. (Chaerephon) gallagheri* from Zaire and, in part, with *T. (C.) johorensis* from the Malayan Peninsula, two species that appear to be the closest allies. The families Molossidae (the new species and *T. (C.)pumila*) and Emballonuridae (*Taphozous mauritianus*) are recorded for the first time for the island of São Tomé.

Juste B. , J. and C. Ibáñez (1994a). Contribution to the knowledge of the bat fauna of Bioko island, Equatorial Guinea (Central Africa).

Although having been long studied, the bat fauna of Bioko island (formerly Fernando Poo, Equatorial Guinea, Central Africa), is still little known. The species *Hipposideros commersoni, Glauconycteris beatrix, Pipistrellus (P.) kuhlii, P. (N.) tenuipinnis*, and *P. (N.)* cf. *capensis* are reported for the first time. Furthermore, the species *Myonycteris torquata, Taphozous mauritianus, Nycteris arge, Hipposideros cyclops, Glauconycteris poensis, Mops (X.) spurrelli* and *M. (X.) thersites*, previously reported as doubtful, are confirmed on Bioko. These results increase the bat checklist for Bioko island by 25 %, and it now includes 26 species.

Juste B. , J. and C. Ibáñez (1994b). Bats of the Gulf of Guinea islands: faunal composition and origins.

The present study compares the bat faunas of the islands of the Gulf of Guinea. Species composition, endemism and hypothetical origins are discussed. All families present in the mainland region are found in Bioko, a typical landbridge island. Foliage gleaning guild species (Nycteridae) show limited colonization abilities. This is also true of the family Rhinolophidae, but not for the closely related family

Hipposideridae. The majority of the oceanic island species are African bats which show a widespread distribution and, therefore, have a high ecological plasticity. The continental relatives of the two endemic species *Myonycteris brachycephala* and *Chaerephon tomensis* are restricted to relatively small forested areas. Bioko's bat fauna is the result of the recent isolation from a formerly land-connected community. The oceanic bat faunas originated from the establishment of incomers from other areas. Nevertheless, extinction appears in both vicariant and dispersal processes, as an important factor in modelling the current bat communities of the Gulf of Guinea islands.

Juste B. , J., C. Ibáñez and A. Machordom (1997). Evolutionary relationships among the African Fruit Bats: *Rousettus egyptiacus*, *R. angolensis*, and *Myonycteris*.

Genetic relationships among *Rousettus egyptiacus, R. angolensis, Myonycteris torquata*, and *M. brachycephala* were studied based on a starch-gel electrophoretic analysis of 31 presumptive loci encoding 22 enzymatic systems. Data were analyzed by both phenetic and phylogenetic procedures, considering both allele and loci as characters. All of the analyses (both quantitative and qualitative) showed a high level of concordance in establishing *R. (Lissonycteris) angolensis, M. torquata*, and *M. brachycephala* as a monophyletic group. Nevertheless, none of the analyses was clearly able to identify sister groups among these taxa. Based on the evidence generated here and from previous independent datasets, the maintenance of *Lissonycteris* within the genus *Rousettus* is not sustainable.

Juste B. , J., A. Machordom and C. Ibáñez (1996). Allozyme variation of the Egyptian Rousette (*Rousettus egyptiacus*; Chiroptera, Pteropodidae) in the Gulf of Guinea (West-Central Africa).

Genetic variation among the populations of *Rousettus egyptiacus* from the islands of the Gulf of Guinea (Bioko, Principe and São Tomé) and two other continental populations of *R. egyptiacus*, (Rio Muni and Guinea Conakry) was studied in order to evaluate their systematic and evolutionary relationships. Insular and mainland populations had similar levels of genetic variation. The data support the subspecific assignment of the São Tomé and Principe populations of *R. egyptiacus*.

Justine, J.-L. (1989a). Une nouvelle espèce de *Capillaria* (Nematoda, Capillariinae) parasite de chauve-souris (Mammalia, Chiroptera) du Gabon.

Résumé. - Description de *Capillaria chabaudi* n. sp., parasite de l'estomac de *Rhinolophus silvestris* au Gabon. Le mâle possède deux ailes latéro-caudales de petites dimensions et épaisses, une bourse caudale membraneuse et un cirre inerme. La bourse caudale est soutenue par deux expansions pulpeuses bifurquées. Le spicule (long de 665 - 840 µm) est bien visible, peu sclérifié, sans stries transversales et à extrémité postérieure effilée. La femelle porte un appendice vulvaire. La face interne de la paroi du vagin utérin est striée transversalement. Les quatre espèces les plus proches morphologiquement de *C. chabaudi* n. sp. sont *C. speciosa* sensu Zdzitowiecki, 1970, parasite de chauves-souris d'Europe, *C. pipistrelli* sensu Wang, 1982, *C. kashmirensis* et *C. rhinolophi*, trois espèces parasites de chauves-souris d'Asie. *C. chabaudi* est la première espèce de *Capillaria* trouvée en Afrique centrale chez un Chiroptère.

Abstract. - Description of *Capillaria chabaudi* n. sp., a stomach parasite of *Rhinolophus silvestris* from Gabon (Africa). The male has two small and thick latero-caudal alae, a membranous caudal bursa and a non-spiny cirrus. The caudal bursa is supported by two forked expansions. The spicule (665 - 840 µm in length) is well visible, little sclerified, without transverse striations, and with a pointed posterior extremity. The female bears a vulvar appendage. The inner face of the wall of the vagina uterina shows transverse striations. The four species morphologically most closely related to *C. chabaudi* n. sp. are *C. speciose* sensu Zdzitowiecki, 1970, a parasite of european bats, *C. pipistrelli* sensu Wang, 1982, *C. kashmirensis* and *C. rhinolophi*, three species parasitic in asian bats. *C. chabaudi* is the first species of *Capillaria* found in central Africa in a Chiroptera.

Justine, J.-L. (1989b). Quatre nouvelles espèces de *Capillaria* (Nematoda, Capillariinae) parasites de Chiroptères du Gabon.

Résumé. - Description de quatre espèces de *Capillaria* parasites de microchiroptères du Gabon. Les trois premières espèces ont en commun: chez le mâle, deux ailes latéro-caudales, une bourse caudale membraneuse, un cirre inerme; chez la femelle, la présence d'un appendice vulvaire et des œufs à surface lisse. *Capillaria landauae* n. sp., de l'intestin et estomac de *Rhinolophus silvestris*, a un spicule fin strié transversalement, long de 650 µm, une bourse caudale de petite dimension soutenue par deux expansions pulpeuses bifurquées, et la femelle possède un prolongement fibreux à l'extrémité postérieure de l'ovaire et une petite bande bacillaire médiane en plus des bandes latérales. *C. brosseti* n. sp., de l'intestin de *Rhinolophus landeri* a un spicule non sclérifié, presque invisible, long de 300 µm, un cloaque à cuticule interne puissante, une bourse caudale de grande dimension soutenue par deux expansions massives portant chacune trois papilles. *C. gabonensis* n. sp., de l'intestin de *R. landeri*, est proche de *C. brosseti* mais est différencié par la forme des stichocytes et les dimensions des œufs. Une quatrième espèce, *C. magnova* n. sp., de l'estomac de *Miniopterus inflatus*, est décrite à partir de femelles seulement. Cette espèce a aussi un appendice vulvaire; elle se différencie des trois autres par ses œufs de dimensions importantes et pourvus de stries au niveau des pôles. L'existence de spicules non sclérifiés, visibles seulement avec un microscope équipé du contraste interférentiel de Nomarski (chez *C. brosseti, C. gabonensis* et probablement d'autres espèces), est considérée comme un argument contre la validité du genre *Skrjabinocapillaria* Skarbilovitsch, 1946.

Abstract. - Four new species of *Capillaria* parasites of microchiropterans, are described from Gabon. Three species share: two latero-caudal alae, a membranous caudal bursa and a non-spiny cirrus in the male; presence of a vulvar appendage and eggs with smooth surfaces in the female. *Capillaria landauae* n. sp. is found in the intestines and stomach of *Rhinolophus silvestris*. The male has a thin, transversally striated spicule 650 µm in length, and a small membranous caudal bursa which surrounds two forked protrusions; the female has an ovary provided with a posterior fibrous expansion and a small median bacillary band in addition to the two usual lateral bands. *C. brosseti* n. sp. is found in the intestines of *Rhinolophus landeri*. The male has a non-sclerified, almost invisible spicule 300 µm in length, a cloaca with a powerful internal cuticle, and a large caudal membranous bursa which surrounds two massive protrusions each of which bears three papillae. *C. gabonensis* n. sp., found in the intestines of *R. landeri*, is similar to *C. brosseti* but is distinguished by the shape of stichocytes and the egg dimensions. A fourth species, *C. magnova* n. sp., is found in the stomach of *Miniopterus inflatus*, and is described only from females. This species also has a vulvar appendage and it is distinguished from the three above species by its eggs, which have greater dimensions and bear polar striations. The existence of non-sclerified spicules in *C. brosseti* and *C. gabonensis* (probably also found in other species) and which are only visible with a microscope equiped with Nomarski interference contrast is considered to be an argument against the validity of the genus *Skrjabinocapillaria* Skarbilovitsch, 1946.

Kalko, E. K. V. and H.-U. Schnitzler (1993). Plasticity in echolocation signals of European pipistrelle bats in search flight: implications for habitat use and prey detection.

We studied the echolocation and hunting behaviour of three aerial insectivorous species of bats (Vespertilionidae: *Pipistrellus*) in the field in order to characterize the signals used by the bats and to determine how call structure varies in relation to habitat structure ("uncluttered" versus "cluttered" space). We documented free-flying, naturally foraging wild pipistrelles in various habitats using multiflash stereophotography combined with simultaneous sound recordings. Then we reconstructed the bat's flight position in three-dimensional space and correlated it with the corresponding echolocation sequences. In all three species of pipistrelles, signal structure varied substantially. In echolocation sequences of the search phase we found a consistent association of signal types with habitat types. In uncluttered habitats (obstacles more than 5 m from the bat) pipistrelles emitted almost exclusively narrowband signals with bandwidths less than 15 kHz. In cluttered habitats (obstacles less than 5 m from the bat) they switched to signals with bandwidths of more than 15 kHz. Wideband signals were also used when the bats were turning in cluttered and uncluttered spaces and for an instant after turning away from obstacles. Prey detection occurred only when the outgoing signal did not overlap with the returning echo from potential prey. The bats also avoided overlap of echoes from

potential prey and obstacles. Based on the results of this study, we propose an overlap-free "window" within which pipistrelles may detect potential prey and which allows predictions of minimum distances to prey and clutter-producing objects.

Kearney, T. C. and P. J. Taylor (1997). New distribution records of bats in KwaZulu-Natal.

New distribution records are documented for four species of Microchiroptera, including two which are new to South Africa (*Scotoecus albofuscus* (Thomas 1890) and *Eptesicus rendalli* (Thomas 1889)), one which is new to KwaZulu-Natal (*Laephotis* cf. *wintoni* Thomas 1901), and one which represents a significant range extension within KwaZulu-Natal (*Pipistrellus anchietai* (Seabra 1900)).

Keller, A. (1986). Etude comparative de la structure fine des poils des Pipistrelles d'Europe (Mammalia: Chiroptera).

Comparative study on the different hair structures of the European Pipistrelles (Mammalia: Chiroptera).

The author describes and uses the different forms of the cuticular scales of the second guard hair to distinguish the four species: *Pipistrellus pipistrellus, P. nathusii, P. kuhli* and *P. savii*. The author proposes an artificial identification key, principally based on the shape of the scaly cuticula observed in the middle and on the distal hair part.

Kemp, G. E. (1975). Viruses other than arenaviruses from West African wild mammals. Factors affecting transmission to man and domestic animals.

At least thirty-seven different viruses have been isolated from wild mammals in West Africa since 1962. Some of these, including Lassa virus, are already known to cause serious human morbidity and mortality. Crimean haemorrhagic fever-Congo virus, Dugbe virus, Mokola virus, and smallpox-like agent from a gerbil in Dahomey are briefly discussed. An account of social and ecologic factors affecting man, domestic animals, and their interaction with wild mammals is given.

Kemp, G. E., O. R. Causey, H. W. Setzer and D. L. Moore (1974). Isolation of viruses from wild mammals in West Africa, 1966-1970.

During the 5-year period 1966 - 1970, a total of 7497 wild mammals of at least 101 different species were collected from 36 locations in Nigeria, Dahomey, and Togo and sampled for virus. The collections were made in five ecologically distinct vegetative zones: high forest, Guinea, Sudan, and Sahel woodland, and the Jos Plateau. Sixteen different virus types, represented by 83 isolates, were recovered, as follows: Arumowot (6 isolates), Bhanja (2), bluetongue type 7 (1), Chandipura (1), Congo (2), Dakar bat (3), Dugbe (1), IbAn 17143 (1), IbAn 33709 (1), Lebombo (1), Mokola (4), poxvirus IbAn 34325 (1), Semliki Forest (1), SudAn 754/6 1 (53), Uganda 5 (3), and West Nile (2). Viruses were isolated from Nigeria, the principal area of mammal collecting, and Dahomey, but not from Togo. The possible relationship of these viruses to diseases of man and domestic animals is discussed.

Kershaw, P. S. (1921). IV. - On the collection of South African mammals in the Durban Museum.

Mr. E. C. Chubb, the Curator of the Durban Museum, Natal, recently sent to the British Museum a large collection of small mammals for identification, a description of which, it is thought, may prove of interest to mammalogists.

Specimens have been contributed by a great many collectors principally from Natal and Zululand, but also from Cape Colony, Portuguese East Africa and Rhodesia. Among the chief contributors may be mentioned Mr. P. A. Sheppard at Vumba, Gorongoya district, on parallel 20 S in Portuguese East Africa; Mr. W . E. Jones at M'Fongosi, Zululand; Mr. H. H. Swinny in the Port St. John district, West Pondoland; Mr. L. Bevis in Zululand and Natal; the Rev. R. Godfrey at Pirie, Kingwilliamstown, Cape Colony; and Mr. E. C. Chubb in various localities.

Out of the collection, two new forms, a *Pachyura* and a *Sylvisorex*, have emerged which are described in this paper. These together with nine other specimens have been presented to the British Museum.

Kershaw, P. S. (1923a). Notes on mammals collected by Dr. H. Schouteden in the Belgian Congo.

This part of the collection, which was made by Dr. SCHOUTEDEN on behalf of the Congo Museum, Tervueren, on the Lower Congo and Kasai Rivers, was sent to the British Museum for comparison, with the types and series of specimens from the Congo in the possession of the latter. It has been found necessary to describe as new three forms, *Petrodromus tordayi tumbanus, Funisciurus mayumbicus* and *Protoxerus stangeri personatus*.

The paratypes of these, and certain other specimens Dr. SCHOUTEDEN has kindly presented to the British Museum.

As many of the localities given do not appear on ordinary maps, I have thought it well, on the first occurrence of such a name in this paper, to indicate its approximate position.

Keymer, I. F. (1971). Blood protozoa of insectivores, bats and primates in Central Africa.

A survey was made of blood protozoa of wild mammals in Central Africa and the parasites of Insectivora, Chiroptera and Primates are described.

Trypanosoma petrodromi was rediscovered in *Petrodromus treadactylus* and redescribed. A similar trypanosome found in *Elephantulus brachyrhynchus* is considered to be a new subspecies, *Trypanosoma petrodromi chitali*. This elephant-shrew was also infected with "*Plasmodium*" [gen. indet.] *brodeni* and probably represents a new host record. *Rhynchocyon cirneu* also appears to be a new host record for *Sarcocystis* sp. An unidentified trypanosome was found in a *Crocidura* sp. of shrew.

A *Hepatocystis* sp (probably *H. epomophori*) was found in *Epomophorus labiatus* and a *Nycteria* sp. (probably *N. medusiformis*) in *Nycteris thebaica*. So called "broad trypaonosomes" were found in four species of insectivorous bats and *Trypanosoma vespertilionis* in *Hipposideros caffer*.

Trypanosoma perodictici was found in *Galago crassicaudatus; Hepatocystis kochi* in *Cercopithecus aethiops* and a *Hepatocystis* in *Papio ? cynocephalus*.

No parasites were found in the insectivores, *Crocidura luna* and *C. flavescens* or in the bats, *Tadarida (Mops) condylura* and *T. (Chaerephon) pumila*.

There was no evidence that any of the parasites were pathogenic.

Khajuria, H. (1988). A new species of rat-tailed bats (Chiroptera: Rhinopomatidae) from Iraq.

A new species of rat-tailed bats, *Rhinopoma hadithaensis* is described from the Iraqi western desert. It is, easily distinguished from the other three species of the genus by the characters of the baculum, external male genetalia, size, colouration and to some extent by the form of nasal inflations.

Khalil, L. F. (1975). Two new species of the nematode genus *Spirura* Blanchard, 1849, from bats in Tanzania.

Spirura hipposiderosi n. sp. from the stomach of *Hipposideros ruber* resembles *S. diplocyphos* but differs in the head structure, the shape and size of the spicules, the position of the vulva and the presence of a tuft of spines in the male tail. *Spirura nycterisi* n.sp. from *Nycteris thebaica* and *Hipposideros ruber* resembles *S. spinicaudata* but differs in the presence of a membrane round the posterior half of the left spicule, the presence of a tuft of spines at the tipe of the male tail, the position of the vulva and the size of the eggs. A key to the African species of *Spirura* is given.

Killick-Kendrick, R. (1973). Parasitic protozoa of the blood of rodents. III. Two new malaria parasites of Anomalurine flying squirrels of the Ivory Coast.

Stained films of heart blood of 37 specimens of flying squirrels in the Ivory Coast were examined for malaria parasites. Two new species were found in blood films from *Anomalurus peli*. The name *Plasmodium landauae* sp. nov. is proposed for one, and *Plasmodium pulmophilum* sp. nov. for the other. Differences between the new parasites and *P. anomaluri* Pringle, 1960 of *A. derbianus* in Tanzania are discussed.

Protozoaires parasites du sang des Rongeurs: III. Deux nouveaux parasites malariques d'écureuils volants de la Côte d'ivoire.

Des frottis de sang de 37 Ecureuils volants ont été examinés en Côte-d'Ivoire, à la recherche de parasites du Paludisme. Deux espèces de *Plasmodium* ont été trouvées dans le sang d'*Anomalurus peli*. L'une d'entre elles est nommée *Plasmodium landauae* n. sp. et la seconde *Plasmodium pulmophilum* n. sp. Les caractères différentiels entre les nouvelles espèces et *P. anomaluri* Pringle, 1960, parasite d'*A. derbianus* en Tanzanie, sont discutés.

King, A., P. Davies, Lawrie and A. (1990). The rabies viruses of bats.

In the 1930s rabies was shown to affect blood-, insect- and fruit-eating bats. We have prepared antinucleocapsid monoclonal antibodies (MAbs) using Mokola and bat (Lagos, Duvenhage and Denmark) rabies viruses as immunogens. With these MAbs we have examined rabies viruses from vampire, insectivorous and frugivorous bats from the Americas, Africa, Europe and the Soviet Union and have compared them with isolates from terrestrial species including man. As well as confirming the findings of others with viruses of African and American bat origin, the results revealed the presence of a second biotype in European bats and demonstrated the presence of serotype 1 as well as serotype 4 viruses in bats of the Soviet Union.

Kirsch, J. A. W., T. F. Flannery, M. S. Springer and F. J. Lapointe (1995). Phylogeny of the Pteropodidae (Mammalia: Chiroptera) based on DNA hybridisation, with evidence for bat monophyly.

We constructed DNA-hybridisation matrices comparing 18 genera of Megachiroptera and an outgroup microchiropteran, and eight species of *Pteropus* and two related genera. Three species each of Megachiroptera and Microchiroptera, two of Primates, and an outgroup armadillo were compared in another matrix; additional representatives of other mammalian orders figured in a further set of experiments. Among the megachiropterans examined, *Nyctimene* and *Paranyctimene* comprise the sistergroup to other pteropodids. Of the "macroglossines", only *Macroglossus* and *Syconycteris* are associated apart from typical pteropodines, while the four remaining nectar-feeders (*Eonycteris, Megaloglossus, Melonycteris, Notopteris*) are independently linked with non-nectar-feeding clades.

Thus, *Megaloglossus* is the nearest relative of *Lissonycteris*; with *Epomophorus* and *Rousettus* successive sister-groups to both, while *Eonycteris* is the sister of all four; *Melonycteris* and *Pteralopex* form a trichotomy with the closely related *Acerodon* and *Pteropus*, and *Notopteris* is the sister-taxon to all four. It therefore appears that anatomical specialisations for nectar- and pollen-feeding evolved (or were lost) several times within Pteropodidae. *Cynopterus* and *Dobsonia* represent additional clades within the Pteropodinae, with which *Thoopterus* and *Aproteles* are respectively paired. Comparisons among species of *Pteropus* and related genera suggest that *Acerodon* may be congeneric with *Pteropus*, but that *Pteralopex* clearly is not. The ordinal-level matrices support bat monophyly: no order tested is closer to either of the chiropteran suborders than they are to each other, and bats are separated from Primates by at least two nodes. On the basis of previous rate determinations for mammals, we estimate that the African grouping (*Epomophorus, Megaloglossus, Lissonycterisi* is mid-Miocene in origin, that the two major pteropodid subfamilies (Nyctimeninae and Pteropodinae, including "Macroglossinae") separated in the Early Miocene, and that the divergence of chiropteran suborders dates from the latest Cretaceous or earliest Palaeocene. Arrangement of genera within Pteropodidae supports the family's Australo-Pacific or south-east Asian origin.

Kitchener, D. J. and N. Caputi (1985). Systematic revision of Australian *Scoteanax* and *Scotorepens* (Chiroptera: Vespertilionidae), with remarks on relationships to other Nycticeiini.

Classical and numerical taxonomic approaches based on morphology and utilising electrophoretic information have been applied to clarify the status of Australian species hitherto placed in the genus *Nycticeius*. Eight named forms have been reduced to five species; these are placed in existing genera: *Scoteanax (rueppellii)* and *Scotorepens* (*orion, balstoni, sanborni* and *greyii*).

Phylogenetic analysis of species representative of other Nycticeiini genera, and of geographic groupings of these Australian species, provides additional support for the above generic conclusions.

Indicators of gross morphology (skull, radius and lower tooth row lengths) in *Scotorepens* spp. vary in relation to their sex, and to latitude, longitude and several climatic variables, particularly average minimum temperatures in July.

Kitchener, D. J., N. Caputi and B. Jones (1986). Revision of Australo-Papuan *Pipistrellus* and *Falsistrellus* (Microchiroptera: Vespertilionidae).

A classical morphological taxonomic approach has been used to clarify the status of Australian and New Guinea species usually placed in the genus *Pipistrellus*. Multivariate phonetic and phylogenetic analyses of a suite of morphological characters were undertaken to determine the relationships between the taxa recognised in this study.

In tropical Australia, *Pipistrellus tenuis wenstralis* Koopman, 1984, from coastal and near coastal Kimberley, Northern Territory and western Queensland is elevated to species status. *Pipistrellus adamsi* sp. nov. is described from north Queensland and Northern Territory.

In New Guinea the following species of pipistrelles are recognised: *P. papuanus* (Peters and Doria, 1881); *P. angulatus* Peters, 1880; *P. collinus* Thomas, 1920 - as well as *P. wattsi* sp. nov. which is described from southeastern coastal New Guinea.

In more southern parts of Australia two species are recognised and placed in the genus *Falsistrellus* Troughton, 1943 [*F. tasmaniensis* (Gould, 1858) and *F. mackenziei* sp. nov.]. The former species is from Tasmania, Victoria, New South Wales and southeastern Queensland and the latter is described from southwestern Australia.

The phylogenetic and phonetic analyses support the generic distinction between *Falsistrellus* and *Pipistrellus* and suggest that the northern Australian pipistrelles have evolved independently from New Guinea species.

Kityo, R. M. and J. C. Kerbis (1996). Observations on the distribution and ecology of bats in Uganda.

Bat community patterns in Uganda are examined in relation to their occurrence in the different vegetation zones of the country. The data available so far cover only three of the country's floristic regions. These data suggest that the northern drier region U1 has more microchiropteran bats ancl that species diversity of megachiropteran bats tends to increase in the more forested western U2 and southern U4 regions. Species accounts in the appendix largely summarise the known information, they reveal that much more work is required to fully document the bats of Uganda.

Koch-Weser, S. (1984). Fledermäuse aus Obervolta, W-Afrika (Mammalia: Chiroptera).

The number of bat species known for Upper Volta is raised from 27 to 33 by further records of: *Rhinopoma hardwickei, Rh. Microphyllum, Taphozous nudiventris, Asellia tridens, Hipposideros jonesi, Pipistrellus rusticus*. For these and further 18 species locality records, measurements and biological data are given (i.e. for *Eidolon helvum, Epomophorus gambianus, Lissonycteris angolensis, Micropteropus pusillus, Taphozous perforatus, Nycteris hispida, N. macrotis, N. thebaica, N. gambiensis, Rhinolophus landeri, Rh. Fumigatus, Hipposideros ruber, H. abae, Eptesicus guineensis, Nycticeius schlieffeni, Scotophilus leucogaster, Tadarida pumila* and *T. majori*.

Vom 1.VII.1980-15.I.1981 wurden in Obervolta über 350 Mega- und Microchiropteren gefangen und vermesen. Insgesamt wurden 24 Arten gesammelt, darunder sechs Erstnachweise, die die Artenzahl in Obervolta von 27 auf 33 erhöhen: *Rhinopoma hardwickei, Rh. Microphyllum, Taphozous nudiventris, Asellia tridens, Hipposideros jonesi, Pipistrellus rusticus*. Alle 24 Arten warden beschrieben, gegebenenfalls die Taxonomie diskutiert. Verbreitungskarten, vor allem der Erstnachweise, Feldbeobachtungen und biologische Daten zur Lebenweise, Verhalten in Gefangenschaft, Fortpflantzung, Trink- und Nahrungsverhalten werden vergleichend diskutiert. Auf die Abwaderungen der im Sahel Obervoltas vorkommenden Arten während die Trockenzeit wird eingegangen.

Kock, D. (1967). Ein Neunachweis von *Myotis welwitschi* und der Status von *Myotis venustus* (Mammalia, Chiroptera).

Im Zusammenhang mit einem Neunachweis von *Myotis welwitschi* (Gray 1866) für Zambia wird eine kritische Revision der Nomenklatur, Systematik, Verbreitung und Variation der Färbung und Maße dieser Art vorgenommen. Die Form *venustus* Matschie 1899 hat keinen subspezifischen Wert.

In collection with the first record of *Myotis welwitschi* (Gray, 1866) from Zambia, a critical review of nomenclature, systematic, distribution and variation of colour and measurements of this species is given. The form described as *venustus* Matschie 1899 is not of subspecific value.

En relation avec la première trouvaille d'un *Myotis welwitschi* (Gray 1866) en Zambia, une revision critique du nomenclature, systématique, distribution et variation de couleur et des mensurations de cette espèce est faisée. La forme *venustus* Matschie 1899 n'est pas du valeur subspécifique.

Kock, D. (1969a). Die Fledermaus-Fauna des Sudan (Mammalia, Chiroptera).

Für den Sudan wird seit 1877 erstmals wieder eine Revision der Chiropteren-Fauna vorgenommen. Insgesamt sind 59 Fledermaus-Arten belegt, 5 weitere, darunter 2 nicht identifizierte werden diskutiert. Die sicher nachgewiesenen Arten verteilen sich wie folgt auf 9 Familien: 5 Pteropidae, 2 Rhinopomidae, 5 Emballonuridae, 5 Nycteridae, 1 Megadermidae, 7 Rhinolophidae, 5 Hipposideridae, 9 Molossidae, 20 Vespertilionidae. Die Systematik im Bereich der Arten und Unterarten wird kritisch

untersucht und nach in anderen Bereichen gewonnenen Erkenntnissen revidiert. Eigene Aufsammlungen werden ergänzt durch Vergleichsmaterial. Feldbeobachtungen an 26 vom Verf. im Sudan selbst gesammelten Arten erweitern die Kenntnisse über die Biologie afrikanischer Chiropteren. Die Zoogeographie der sudanesischen Chiropteren, ökogeographische Variationen und ökologische Adaptationen werden diskutiert.

Since 1877 the first revision of the chiropteran fauna of the Sudan is given. Altogether 59 species of bats are represented, further 5 are discussed, including 2 unidentified. Those undoubtedly recorded are belonging to 9 different families (vide supra). The systematics of the species and subspecies level is critically studied and revised according to results from other fields. Personal collections are completed extensively by comparative material. Field observations of 26 species collected by the author in the Sudan add to the knowledge of African chiropteran biology. Zoogeographical aspects of the Sudanese bat fauna, ecogeographical variations, and ecological adaptations are discussed.

Pour le Soudan, la première révision depuis 1877 de la faune des chiroptères est faite. Les espèces des chauves-souris représentées sont au nombre de 59 et en outre 5 sont discutées, parmis eux 2 non identifiées. Les espèces assurément recordées se distribuent aux 9 familles (voyez en haut). La systématique au rang des espèces et sous-espèces est étudiée critiquement et révisée d'après les résultats d'autres domaines. Collections personnelles sont complétées par matériel comparatif. Observations faites par l'auteur sur 26 espèces au cour de rassemblement au Soudan élargissent les connaissances de la biologie des chiroptères africains. La Zoogéographie des chiroptères soudanais, variations écogéographiques et adaptations écologiques sont discutées.

Kock, D. (1969b). Ueber ein weibliches Exemplar des afrikanischen Bulldogg-Fledermaus, *Xiphonycteris spurelli* von Fernando Poo.

Ein weiterer Beleg für *Xiphonycteris spurrelli* DOLLMAN 1911 von Fernando Poo ist das zweite bekannte ? von dieser Art. Es zeigt bemerkenswerte Variation im Besitz von Praemolaren, wie sie als typisch für ? angesehen wurden, sowie eines überzähligen unteren Incisiven und stärkerer unterer Canini.

A further specimen of *Xiphonycteris spurrelli* DOLLMAN 1911 from Ferando Poo is the second known ? of this species. It is remarkable in its dental variations by possessing praemolars of such a kind as were considered to be typical for males, in having a supernumerary lower incisor and larger lower canini.

Un nouveau spécimen de *Xiphonycteris spurrelli* DOLLMAN 1911 du l'ile Fernando Poo est le deuxième connu. II est remarquable pour ses variations dentales en y possédant des prémolaires dans une manière considérée typique pour des mâles, en y avoir un incisive inférieur supernumérair et des plus large canines inférieurs.

Kock, D. (1975). Ein Originalexemplar von *Nyctinomus ventralis* Heuglin 1861 (Mammalia: Chiroptera: Molossidae).

Die Untersuchung bisher unbekannter Strukturen und Dimensionen eines Original-Exemplares von *ventralis* HEUGLIN 1861 zeigt, daß diese Molossidae identisch ist mit und Priorität hat vor *africana* DOBSON 1876 und dieses Taxon als *Tadarida (Tadarida) ventralis* zu bezeichnen ist. Das HEUGLIN'sche Exemplar von Keren wird zum Lectotypus erwählt.

A study of the structures and dimensions, which were not yet known, of an original specimen of *ventralis* HEUGLIN 1861 proves this molossid bat to be identical with and having priority over *africana* DOBSON 1876; this taxon is to be named *Tadarida (Tadarida) ventralis*. HEUGLIN's specimen from Keren is chosen as lectotype.

L'étude des structures et des, dimensions inconnus d'un exemplair original du *ventralis* HEUGLIN 1861 établit le fait que cette molosse est identique avec et a priorité sur *africana* DOBSON 1876; il faut appeller cette taxon *Tadarida (Tadarida) ventralis*. L'exemplair d'HEUGLIN de Keren est choisi comme lectotype.

Kock, D. (1978a). Vergleichende Untersuchung einiger Säugetiere im südlichen Niger (Mammalia: Insectivora, Chiroptera, Lagomorpha, Rodentia).

Comparative study of some mammal species in southern Niger: *Crocidura flavescens, Erinaceus albiventris spinifex, Eidolon helvum, Epomophorus g. gambianus, Tadarida (Chaerephon) n. nigenae, Lepus capensis canopus, Gerbillus (G.) agag nigeriae*, of which a new large sized subspecies is described, *Tatera hopkinsoni, Mastomys erythroleucus* and *Acomys cahirinus johannis.- M. erythroleucus* is recorded from the Sudan, *G. agag* from Tchad. - The type localities of *E. a. spinifex* and *G. agag* are corrected. - Of the smaller gerbils, *asyutensis* SETZER 1960 is considered to be a subspecies of *gerbillus* OLIVIER 1801; *andersoni* DEWINTON 1902 is related with *eatoni* THOMAS 1902 and *inflatus* RANCK 1968 being different from *gerbillus; agag* THOMAS 1903 includes *nigeriae* THOMAS & HINTON 1920, *Rosalinda* ST. LEGER 1929 and *sudanensis* SETZER 1956, but not *dallonii* HEIM DE BALSAC 1936.

Neu für den Niger belegt wird *Tatera hopkinsoni*, zum zweiten Mal nachgewiesen werden *Crocidura ftavescens, Erinaceus albiventris spinifex, Eidolon helvum, Epomophorus g. gambianus* und *Tadarida (Ch.) n. nigeriae*; weitere Funde von *Lepus capensis canopus, Gerbillus (G.) agag nigeriae* mit *G. (G.) agag maradius* n. subsp., *Mastomys erytbroleucus* und *Acomys cahirinus johannis* werden vergleichend untersucht. - *M. erythroleucus* wird für den Sudan nachgewiesen, *G. agag* für den Tschad. - Der Typenfundort von *E. a. spinifex* und *G. agag* wird korrigiert. - Von den kleineren Gerbillen wird *asyutensis* SETZER 1960 als Unterart von *gerbillus* OLIVIER 1801 betrachtet; *andersoni* DEWINTON 1902 ist näher mit *eatoni* THOMAS 1902 und *inflatus* RANCK 1968 verwandt und von *gerbillus* zu trennen; *agag* THOMAS 1903 umfaßt als Art *nigeriae* THOMAS & HINTON 1920, *Rosalinda* ST. LEGER 1929 und *sudanensis* SETZER 1956, aber nicht *dallonii* HEIM DE BALSAC 1936.

Kock, D. (1981a). Zwei Fledermäuse neu für Kenya (Mammalia: Chiroptera).

For *Taphozous (Liponycteris) hamiltoni* and *Nycteris grandis* first records from Kenya are given together with measurements and distributional remarks. A supernumerary upper incisor is reported for *N. grandis*.

Taphozous (Liponycteris) hamiltoni und *Nycteris grandis* werden erstmals für Kenya nachgewiesen. Maße und Bemerkungen zur Verbreitung beider Arten werden angegeben. Ein überzähliger oberer Incisiv wurde bei *N. grandis* festgestellt

---

Kock, D. (1981b). Zur Chiropteren-Fauna von Burundi (Mammalia).

The bat species known for Burundi are briefly reviewed and further records are given; four additional species are reported: *Micropteropus pusillus, Taphozous mauritianus, Nycteris macrotis, Eptesicus flavescens*. A list of acceptable species records summarizes the bat fauna hitherto known.

Die Fledermaus-Arten von Burundi werden diskutiert, weitere Funde gemeldet und die Faunenliste durch vier Neunachweise (*Micropteropus pusillus, Taphozous mauritianus, Nycteris macrotis, Eptesicus flavescens*) ergänzt.

Kock, D. (1983). Fledermaus-Fliegen in Iran (Insecta: Diptera: Streblidae, Nycteribiidae).

Of four known (*Brachytarsina diversa, Nycteribia pedicularia, N. vexata, Penicillidia dufouri*) and four new records of Iranian bat-flies (*B. flavipennis, N. schmidli, Stylidia biarticulata, P. conspicua*), synonymies, distributional data and/or host specifities are discussed.

Kock, D. (1987b). *Micropteropus intermedius* Hayman 1963 und andere Fledermause vom unteren Zaire.

A fourth specimen is reported and additional measurements are given for a 5 *Micropteropus intermedius* from the mouth of Zaire River. The species is known only from moist savanna SW of the central African forest block. - A last century bat collection from lower Zaire River is reviewed (with fixation of a paralectotype for *Epomophorus zenkeri* MATSCHIE 1899) and an additional one listed in appendices. - Additional material examined of *M. pusillus* is from Cameroon, Equatorial Guinea, and Ethiopia.

Kock, D. and V. Aellen (1987). Cimicidae parasites de Chiroptera du Muséum de Genève (Insecta: Hemiptera).

Cimicidae parasites of Chiroptera in the Geneva Museum. - *Bucìmex chilensis* is recorded for the first time from Argentine as a parasite on *Myotis aelleni*, and *Propicimex tucmatiani* for the first time from Paraguay as a parasite on *Molossus m. crassicaudatus*. *Cimex dissimilis* is confirmed from Switzerland, parasitic on *Nyctalus noctula* and *Myotis myotis*. *Paracimex borneensis* is recorded for a known locality in Sarawak with a range extension to Sabah/North Borneo, and *Aphrania recta* from Zaire on an additional host, *Eptesicus tenuipinnis*. Transport of *Propicimex tucmatiani* and *Cimex dissimilis* by flying hosts are stated. Specimens identified by W. E. China and linked with previous publications are included. *Cimex lectularius* from W-France on *Myotis myotis*, *Cacodmus sumatrensis* from Sumatra on *Cynocephalus variegatus*, *C. villosus* from S-Zaire in colony of *Laephotis* sp. and *Afrocimex leleupi* from S-Zaire.

Kock, D. and H. R. Bhat (1994). *Hipposideros hypophyllus* n. sp. of the *H. bicolor*-group from peninsular India (Mammalia: Chiroptera: Hipposideridae).

Hipposideros hypophyllus n. sp. Is described from Karnataka in Peninsular India. Skull characters place it in the *galeritus*-subgroup of the *H. bicolor*-group sensu HILL (1963). It is unique among small sized Asian species of the *bicolor*-group in the structure of its horseshoe which has a single pair of supplementary leaflets. Its affinities are discussed and differences from *H. pomona* emphazised.

Hipposideros hypophyllus n. sp. Wird aus Karnataka, Zentral Indien, beschrieben. Den Schadelrnerkmalen nach muß die Art der *galeritus*- Untergruppe der *H. bicolor*-Gruppe sensu HILL (1963) zugeordnet werden. Sie ist einzigartig unter den kleineren asiatischen Arten der *bicolor*-Gruppe in der Struktur ihres Nasenblattes mit einem Paar supplernentarer Blattchen. Ihre Verwandtschaft wird diskutiert und die Unterschiede gegenüber der metrisch ahnlich großen *H. pomona* (species inquirenda, ? Nom. Dubium) herausgestellt.

Kock, D., D. C. D. Happold and M. Happold (1998b). Cimicidae and Polyctenidae from Malawian Chiroptera (Insecta: Hemiptera).

Cacodmus villosus, C. sparsilis, Aphrania cf. *barys* (Cimicidae) and *Adroctenes horuathi* (polyctenidae) are recorded from Malawi, Central Africa. All except *C. villosus* are first records for Malawi. The known distribution and host associations for the four species are listed and discussed. One host, *Pipistrellus*

rusticus was parasitised by both *C. villosus* and *C. sparsilis* simultaneously. *Pipistrellus rusticus, Scotoecus albigula* (hosts of *C. sparsilis*) and *Eptesicus melckorum* (host of *Aphrania* cf. *barys*) are new hosts for the Cimicidae, and *Rhinolophus fumigates* and *R. blasii* are new hosts for the Polyctenidae and for *Adroctenes horuathi*.

Kock, D. and K. M. Howell (1988). Three bats new for mainland Tanzania (Mammalia: Chiroptera).

Rhinolophus blasii empusa, Rh. swinnyi (Rhinolophidae) and *Laephotis wintoni* (Vespertilionidae) are added to the bat fauna of mainland Tanzania. Measurements are given and the ranges of the species are mapped. - The number of bat species presently known from Tanzania is 78.

Rhinolophus blasii empusa, Rh. swinnyi (Rhinolophidae) und *Laephotis wintoni* (Vespertilionidae) werden erstmals vom kontinentalen Tanzania gemeldet. Für diese Arten werden Maßen mitgeteilt und die Verbreitung dargestellt. Die Trennung der subsaharischen Unterarten von *Rh. blasii* und die mögliche Synonymie von *Rh. swinnyi* mit *Rh. denti* erfordert Untersuchungen umfangreichen Materials. - Bisher sind 78 Fledermaus-Arten für Tanzania nachgewiesen.

Kock, D. and I. A. Nader (1979). Two bat flies from the Kingdom of Saudi Arabia, their nomenclature, host specificity and zoogeography (Insecta: Diptera: Nycteribiidae).

Stylidia integra (THEODOR & MOSCONA 1954) and *Eucampsipoda aegyptia* (MACQUART 1851) are first records of Nycteribiidae for Saudi Arabia; the latter species is recorded for the first time from Jordan. Nomenclature, distribution and host associations are discussed.

Koneval, M. E. (1993). The systematic relationship of *Hipposideros commersoni matungensis* to other species of Rhinolophidae (Chiroptera).

The hyoid morphology of *Hipposideros commersoni matungensis* was dissected and compared to the morphology of other bats in the family Rhinolophidae. Several significant differences in morphology were found: a modified stylohyal, fused to the auditory bulla; loss of the stylohyoid; addition of a new muscle, possibly from the stylopharyngeus; a modified mylohyoid profundus; and insertion of the ceratohyoid onto only the stylohyal. Cladistic analysis suggests that of all bats examined, *H. commersoni* is most closely related to *H. armiger*, and *Triaenops persicus* is most closely related to *Rhinonycteris aurantius*. This result is unexpected because the ranges of the species are geographically distant: *H. commersoni* is an African bat, whereas *H. armiger* is from East Asia. *Triaenops* is also an African species, whereas *Rhinonycteris* is Australian.

Koopman, K. F. (1965). Status of forms described or recorded by J.A. Allen in "The American museum Congo expedition collections of bats".

In 1917, J. A. Allen, H. Lang, and J. P. Chapin published an important paper on the bats collected by the American Museum Congo Expedition. This collection of bats was apparently the first really important one made in the former Belgian Congo, even though most of it was limited to the northeastern part of the country. Part I of the paper, the "Systematic List," was written by J. A. Allen alone. In this account he listed 68 forms, three of which he described as new subspecies and 23 as new species. He also described two new subgenera. In the nearly 50 years which have elapsed since this publication, many additional specimens of bats have been collected in the Congo (see especially Schouteden, 1947), and considerable taxonomic work has been done on many of the genera involved. As a result of this work, some of the forms described by Allen have been recorded from other localities,

and a few have been synonymized. A number of forms named for the first time by Allen, however, have not been recorded by later writers.

Since I have studied all the types and most of the remaining material mentioned by Allen in connection with a forthcoming paper on the bats of the Sudan, it seemed desirable to make a reassessment of Allen's identifications and to relate this material to other specimens collected in the former Belgian Congo (not including Ruanda-Urundi). In this connection, I have looked at much hitherto unreported material at the American Museum of Natural History. I list additional species of Congo bats in the American Museum which are not represented in the Lang-Chapin collection. The specimens are discussed under the names by which they were identified by Allen.

This study was greatly facilitated by National Science Foundation Grant GB-l391 which enabled me to visit the British Museum (Natural History) in London, the Corynden Museum in Nairobi, and the National Museum in Bulawayo. I wish to thank the staffs of these institutions, particularly Mr. R. W. Hayman, Mr. J. E. Hill, and Miss Jean Ingles at the British Museum, Mr. John Williams of the Corynden Museum, and Mr. Graham Child of the National Museum. I wish to thank, also, Miss Barbara Lawrence of the Museum of Comparative Zoology at Harvard College for the loan of specimens. I had the benefit of stimulating conversations on many taxonomic problems from Dr. David Harrison in England and Mr. Frank Ansell in Rhodesia.

Koopman, K. F. (1966). Taxonomic and distributional notes on Southern African Bats.

Taxonomic and distributional notes are given for southern African Chiroptera of the genera *Rousettus, Epomophorus, Rhinolophus, Hipposideros, Cloeotis, Myotis, Pipistrellus, Miniopterus, Tadarida*, and *Platymops*. The known range of some species is extended, and the systematic position of several species is clarified. Some taxonomic questions, however, are left open pending availability of additional material.

Koopman, K. F. (1970). Zoogeography of bats.

The Order Chiroptera is the second largest order of mammals, with, according to my most recent revised figure, 846 species. Inasmuch as the group is world-wide, reaching many distant islands, and inasmuch as many species and higher groups are quite localized and some very distinctive, one might expect that a good deal of work on bat zoogeography would have been undertaken. However, such is not the case.

Darlington (1957, pp. 320-410) does discuss the general geographical patterns of bats, and Tate (1946) gives a useful analysis of the bats of the Malay archipelago. However, many writers on zoogeography have given them at best a very perfunctory treatment. This contrasts markedly with the attention given to bird zoogeography. From talking with various zoogeographers, I suspect the reason is that whereas birds are treated as a separate group in their own right, bats are treated as part of the Class Mammalia. Since all bats can fly, there seems to be a general assumption that they regularly cross various kinds of geographical barriers at will, with the result that they have been rather consistently downgraded with respect to flightless mammals in zoogeographical studies (see, e.g., Bigalke, 1968).

Actually, except for their ability at crossing narrow water gaps without too much difficulty, bats have several advantages in zoogeographical studies over various other groups of land vertebrates. With a very few exceptions, they are not likely to fly over the open ocean as part of their normal activities. They are almost entirely free of the problems of human introduction. I know of only one case where (unintentional) human introduction has played a role, and this has not resulted in an introduced population. This was a specimen of the North American *Myotis lucifugus*, collected in Iceland, that is believed to have been inadvertently transported by ship (see Koopman & Gudmundsson, 1966). Aside from the advantages mentioned above, the large number of species, at least in the tropics, means that there are enough individual cases to enable zoogeographical patterns to be worked out.

Koopman, K. F. (1971). Taxonomic notes on *Chalinolobus* and *Glauconycteris* (Chiroptera, Vespertilionidae).

The African genus *Glauconycteris* is shown to be a subgenus of the Australasian genus *Chalinolobus*. The two Pacific island taxa of *Chalinolobus* are here called *Chalinolobus tuberculatus* and *Chalinolobus gouldi neocaledonicus*. Three problematical species of the subgenus *Glauconycteris* are discussed and their suggested taxonomic status are represented by the names *Chalinolobus (Glauconycteris) variegatus machadoi, Chalinolobus (Glauconycteris) beatrix humeralis*, and *Chalinolobus (Glauconycteris) alboguttatus*.

Koopman, K. F. (1975). Bats of the Sudan.

A revision of the species of bats (Chiroptera) occurring in the Republic of the Sudan (the former Anglo-Egyptian Sudan) is presented. Sixty-six species are definitely recognized as occurring within the boundaries of the country, whereas some 38 others are known from nearby areas and may cross its borders. All eight of the widespread Old World families are represented. Most of the Sudan lies within the Ethiopian region but a relatively small area in the north is best allocated to the arid southwestern Palearctic. The bat fauna is grouped into nine ecogeographical categories (forest, forest-savanna, savanna, east African, desert, savanna-Palearctic, desert-Palearctic, Palearctic, and unclassified), and the Sudanese distribution of the species in each category is summarized. A number of interesting taxonomic problems are discussed, but the final resolution of most of them will involve analysis outside the Sudan.

Koopman, K. F. (1978). Zoogeography of Peruvian bats with special emphasis on the role of the Andes.

The known distribution of each of 122 species of bats from Peru is summarized. The Andean mountain chain affects these distributions both as a barrier and as a creator of habitat differentiation. Three main distributional areas are distinguished, the humid Amazonian lowlands (below 1000 m.), the highlands within the Amazonian drainage (above 1000 m.), and the chiefly arid Pacific slopes. Some complications occur in northwestern Peru, where the Pacific slopes (particularly the higher portions) are not arid, there are a few relatively low passes across the Andes, and the upper portions of certain Amazonian tributaries are arid. Instances of ecological (including altitudinal) replacement and specific or subspecific representation between the major ecological zones are discussed.

Koopman, K. F. (1981). A progress report on the systematics of African *Scotophilus* (Chiroptera, Vespertilionidae). Abstract.

The present state of our knowledge of taxonomy of African *Scotophilus* is reviewed emphasizing controversial points. Four species, *nigritellus, borbonicus, leucogaster (= "nigrita")*, and *gigas* are recognized, with synonymies given. Maps of the overall African distributions are given for these species (with the exception of *gigas*, over which there has been no biological controversy). Infraspecific variation is discussed only where it has been involved in specific discrimination.

Koopman, K. F. (1984a). Taxonomic and distributional notes on Tropical Australian Bats.

The bats of tropical Australia are reviewed with some 51 species recognized, though a few are very poorly known. A new subspecies, *Pipistrellus tenuis westralis* is described and *Rhinolophus megaphyllus ignifer* is synonymized with *R. m. megaphyllus*. The two previously recognized subspecies of *Macroderma gigas* are also synonymized. A majority of tropical Australian bats are

restricted to mesic areas, but a number are more or less arid tolerant. Only one species (*Taphozous hilli*) actually avoids mesic areas. The Cape York Peninsula has the greatest number of species with a falling off in numbers to the west and south. Of the three areas adjacent to tropical Australia, New Guinea shares a large number of species, whereas temperate Australia and the Lesser Sunda Islands share relatively few. New Guinea has probably been an important source area for tropical Australian bats, particularly those confined to the Cape York Peninsula. The low level of endemism among Australian bats strongly implies that there were no bats in Australia prior to the Miocene, when Australia drifted far enough to the north to be able to receive species occurring on the extended Malay archipelago. Since then some low level endemism and adaptive radiation has developed in Australia.

Koopman, K. F. (1986). Sudan bats revisited: An update of "Bats of the Sudan".

Rousettus lanosus, Myotis welwitschii, and *Scotophilus borbonicus* were recorded previously from Sudan and *Pipistrellus crassulus* is reported here. In the Sudan, *Pipistrellus crassulus* is a forest bat, *Scotophilus borbonicus* a savanna one, *Rousettus lanosus* and *Myotis welwitschii*. East African *Hipposideros ruber*, as distinct from *H. caffer*, is a forest bat, H. caffer now a savanna one.

Koopman, K. F. (1989a). Distributional patterns of Indo-Malayan bats (Mammalia: Chiroptera).

The bats of southeastern Asia and its islands (northeastern India, southern China, and the Riukiu islands to the Philippines, Sulawesi, and the Lesser Sundas) are enumerated with relevant taxonomic and distributional remarks. Some 254 species occur in this area. A majority of the species occur either in the Indochinese region (north of the Isthmus of Kra) or else in Malaya and the islands of the continental shelf. In each of the portions of this continental area, endemism is relatively low, even though some islands, such as Borneo, are very species-rich. Endemism is much higher in Sulawesi and the Philippines, which have a depauperate bat fauna but a much higher percentage of endemism. The indications from the bat fauna are very strong that the continental islands (separated by relatively shallow water) were recently connected to the mainland, whereas other islands were not.

Koopman, K. F. (1989b). Systematic notes on Liberian bats.

Based on previously unreported material, 32 species of bats are recorded from Liberia, bringing the total species known for that country to 52. The following species are recorded from Liberia for the first time: *Rhinolophus guineensis, Hipposideros fuliginosus, Myotis tricolor* (first record for western Africa), *Pipistrellus eisentrauti, "Eptesicus" brunneus, Glauconycteris poensis, Mops brachyptera*, and *M. spurrelli*. Other noteworthy findings are the confirmation of an unusually large form of *Rhinolophus clivosus* from tropical western Africa (here described as a new subspecies), the revelation of additional complexity in what is here called *Hipposideros ruber*, clarification of the distinction between *H. caffer* and *H. beatus*, and a discussion of the problems of distinguishing *Mops spurrelli* and *M. annulus*. It is clear that a large number of forest species, some basically East African, have been able to extend as far west as Liberia and probably to the western limits of the high forest.

Koopman, K. F. (1992). Taxonomic status of *Nycteris vinsoni* Dalquest (Chiroptera, Nycteridae).

The type of *Nycteris vinsoni* has been re-examined and the tragus partially reconstituted. It is now evident that the tragus is semilunate rather than pyriform in structure. This character causes *N. vinsoni* to be transferred from the *thebaica* group, where I had previously put it, to the *macrotis* group. I would therefore regard it as a subspecies of *Nycteris macrotis*.

Koopman, K. F. (1993b). Modern equivalents of genera in Dobson's 1878 "Catalogue of the Chiroptera of the British Museum".

In 1878, George Edward Dobson published his catalog including all the bat genera and species that were known to him. In 1880, he published a supplement to his catalog with additions and corrections. It should be pointed out that during much of the 19th and into the early 20th century the British Museum catalogs were major vehicles for publication of systematic research in zoology. Far more than mere lists of specimens, particularly the later ones were taxonomic revisions with diagnoses and keys of taxa whether represented by British Museum specimens or not. Dobson's 1878 catalog was such a work, giving, for each species, synonymy, diagnosis, distribution, and list of British Museum specimens, if so represented. This work was the standard source for almost 30 years until partially superseded by Miller's "Families and Genera of Bats." During this period, much was written on various aspects of bat biology, using the systematics of Dobson's catalog. Changes in systematics (particularly nomenclature) since Dobson, however, have made much of this literature difficult to use. At the original suggestion of Dr. William E. Rainey, I decided to compile a list of nomenclatural changes at the generic level since 1878, using my contribution to Wilson and Reeder's 1993 "Mammal Species of the World" as the present standard. I therefore list the genera as Dobson gave them with the present treatments of their contents. This, however, is based on Dobson's synonymies and does not guarantee that the British Museum specimens that he lists necessarily are referable to these species.

Koopman, K. F. (1997). The subspecies of *Emballonura semicaudata* (Chiroptera: Emballonuridae).

The four subspecies of the Pacific species *Emballonura semicaudata* are considered. Their taxonomic history, distribution, and characters are discussed. On the basis of size and morphology of skull, they form a linear series, *semicaudata-palauensis-rotensis-sulcata*.

Koopman, K. F. and J. K. Jones (1970). Classification of bats.

In the 10th edition of *Systema Naturae*, published in 1758 and the starting point of the binomial system of nomenclature currently employed in zoology, Linnaeus recognized seven species of bats, which he placed in a single genus (*Vespertilio*) and grouped with the primates and dermopterans. All of Linnaeus's seven species are recognized today, but as they now are classified each represents a distinctive genus, and the genera are arranged taxonomically in five different families of two suborders. In contrast to Linnaeus's scheme, the present classification of bats (long ago placed in a distinct order, Chiroptera) lists 847 Recent species, belonging to 169 Recent genera, 15 families (at least three other families are known only as fossils), and two suborders (see Table 1.)

Much work remains in elucidating the relationships of bats, even at the higher taxonomic levels. In the plethora of publications that have appeared in recent years on the distribution and systematics of bat genera and species, the trend has been to reduce the number of recognized taxa at these levels, even though some new species, and occasionally a new genus, are named annually. Several of the subsequent papers in this symposium touch on problems relating to classification.

Koopman, K. F., C. P. Kofron and A. Chapman (1995). The bats of Liberia: Systematics, Ecology, and Distribution.

Lists of bat species were (with critical taxonomic study when necessary) compiled for six countries of West Africa from Ghana to Guinea-Bissau (79 from Ghana, 62 from Ivory Coast, 57 from Liberia, 57 from Sierra Leone, 37 from Guinea, 24 from Guinea-Bissau) with a total (for all six countries) of 94 species. All but two species extend east of this region, 40 extend west of it, and two (*Rhinolophus guineensis, Hipposideros marisae*) appear to be confined to it. On the basis of overall distribution, 42 species are classified as basically forest, 18 as savanna, 29 ecologically widespread, and 5 (*Rhinolophus simulator, R. clivosus, R. maclaudi, Hipposideros marisae, Myotis tricolor*) as upland, at

least in West Africa. A more detailed analysis is attempted for those species occurring in Liberia. This has revealed a number of uncertainties and alternative interpretations. Some of these are probably related to the progressive deforestation that has accompanied human impact in Liberia as elsewhere.

Koopman, K. F., R. E. Mumford and J. F. Heisterberg (1978). Bat records from Upper Volta, West Africa.

The bats of Upper Volta are reviewed, based chiefly on previously unreported material. For the 27 species recognized, locality, habitat, and reproductive data are given. Taxonomic notes are added where necessary, and the distributional patterns in Upper Volta are considered in relation to the vegetation belts in West Africa. All but two species occur in the Sudan savanna, but nearly half of these also occur in the Guinea savanna, to which the two additional species appear to be confined. Several species reach the Sahel savanna. Whereas 12 species are recorded from Upper Volta for the first time, only two represent significant range extensions: *Pipistrellus deserti* south from Algeria and *Tadarida demonstrator* west from Sudan. A gazetteer of bat collecting localities in Upper Volta is included.

Korine, C. and Z. Arad (1993). Effect of water restriction on temperature regulation of the fruit-bat *Rousettus aegyptiacus*.

1. The thermoregulatory responses of the fruit-bat, *Rousettus aegyptiacus*, the only fruit-bat out of 32 bat species in Israel, were studied over a wide range of ambient temperature during normal hydration and during water restriction.

2. The thermoneutral zone of the normally-hydrated fruit-bat ranged between 31 - 36°C. Oxygen consumption in this range averaged 0.95 ± 0.15 ml g^{-1} h^{-1}.

3. Evaporative water loss and respiration frequency during normal hydration increased as power functions of ambient temperature and were significantly correlated ($P < 0.02$). The normally-hydrated, heat exposed fruit-bat effectively regulated its body temperature and dissipated the total metabolic heat production by evaporative cooling.

4. In bats fed on oven-dried apples (water restriction), body mass decreased by 20.72 ± 2.78 %. Oxygen consumption between 32 - 36°C increased significantly and body temperature was relatively high. Evaporative water loss decreased significantly, except at 36°C where evaporative water loss was not significantly different from that during normal hydration, suggesting the preference for body temperature regulation at the cost of increased water loss. At this ambient temperature, dry thermal conductance increased significantly compared to normal hydration, facilitating non-evaporative heat loss.

5. We conclude that the Israeli population of *Rousettus aegyptiacus* is adapted to the relatively warm climate and can cope with a decreased water content in its exclusive fruit diet and effectively regulate its body temperature and metabolic rate.

Korine, C., I. Izhaki and Z. Arad (1998). Comparison of fruit syndromes between the Egyptian fruit-bat (*Rousettus aegyptiacus*) and birds in East Mediterranean habitats.

This study analyses the fruit syndrome of the Egyptian fruit-bat, *Rousettus aegyptiacus*, the only fruit-bat found in East Mediterranean habitats. Two different sets of bat-fruit syndromes were revealed. One follows the general bat-fruit syndrome and one represents a special case of bat-dispersed fruit syndrome only found in East Mediterranean habitats. The latter syndrome is characterized by dry fruits with a relatively high protein content. Fruit species that belong to this syndrome are available mostly in winter (when the fruit-bat faces a severe shortage in fruit availability and inadequate fruit quality). The fruit syndromes and dietary overlap between frugivorous birds (based on the literature) and the

fruit-bat were also studied. Features associated with each set of fruit species generally follow the known bat and bird syndromes. Bird-dispersed fruits tend to be small, with a high seed mass to pulp mass, variable in fat content and characterized by a high ash content. However, when the shared fruit species were included in the analysis, no significant differences were found in fruit features between the bird-dispersed and bat-dispersed fruit syndromes. A limited and asymmetrical dietary overlap was observed between these two taxa, mainly between introduced and cultivated fruits.

Korine, C., I. Izhaki and D. Makin (1994). Population structure and emergence order in the fruit-bat (*Rousettus aegyptiacus*: Mammalia, Chiroptera).

Population size and emergence order of *R. aegyptiacus* were studied in the Abas cave. Haifa, Israel. Throughout the reproductive period adult females populated the cave and the adult population consisted mainly of adult females except during winter when higher numbers of adult males were recorded. The proportion of juveniles increased consistently from spring to winter. Thus, it is suggested that the Abas cave serves as a maternity roost. Adult females in the reproductive state emerged from the cave earlier that juveniles and adult males. Social factors and differences in nutritional demands which may correspond to this different emergence order are discussed.

Kowalski, K., J. Gaisler, H. Bessam, C. Issaad and H. Ksantini (1986). Annual life cycle of cave bats in northern Algeria.

The dynamics of bat populations in caves of northern Algeria were studied between 1978 and 1983. The 10 species represented were: *Rhinolophus ferrumequinum, R. mehelyi, R. blasii, R. euryale, R. hipposideros, Myotis blythi, M. emarginatus, M. nattereri, M. capaccinii* and *Miniopterus schreibersi*. Detailed reproductive data, including histological examination of reproductive organs, were obtained for *R. mehelyi* and *M. blythi* during a part of the annual cycle. All species examined except *Miniopterus schreibersi* reach their southern limits of distribution in Algeria. The duration of hibernation was shorter in Algeria than in Europe, but the reproductive cycle was similar in that insemination took place in autumn and fertilization in spring. Parturition occurred earlier than in European populations of the same species. Observations were made on the choice of roosts, formation of intra- and interspecific associations, as well as individual and geographic variation in dates of parturition. The tendency of *M. blythi* to form harems during the mating season was noted.

Krampitz, H. and F. Anciaux de Faveaux (1960). Ueber einige Haemosporidien aus Fledermäusen der Höhlen des Berglandes von Katanga.

Von einigen Haemoproteiden der Gattungen *Nycteria, Polychromophilus* und *Hepatocystis*, gesammelt aus Fledermäusen des Berglandes von Katanga, werden ergänzende strukturelle Eigentümlichkeiten mitgeteilt und miteinander verglichen. Diese vergleichende morphologische Betrachtung der im Blut verschiedener afrikanischer Chiropteren gesehenen Haemosporidien erbrachte die Bestätigung der Tatsache, daß sie sich strukturell um so mehr ähneln, je systematisch näher sich ihre Wirte stehen, so daß die Frage der genauen Arttrennung bei ähnlichen Parasiten aus nahe verwandten Wirten auf morphologischer Basis allein in den meisten Fällen kaum möglich ist. Deutlich charakterisiert ist *Nycteria medusiformis* aus *Nycteris macrotis* durch Filamentbildungen, die in Übereinstimmung mit GARNHAM u. HEISCH (1953) als eine der Wirtszelle eigene degenerative Bildung gedeutet werden. Die in den beiden Hufeisennasen *Hipposiderus caffer centralis* und *Rhinolophus h. hildebrandti* gesehenen *Polychromophilus*-Formen werden als eine neue Art aufgefaßt. Für sie ist nach dem Fundort der Name *Polychromophilus congolensis* spec. nov. vorgeschlagen. Bei den Angehörigen der intraerythrozytär eifrig pigmentbildenden Gattung *Polychromophilus* vermißten wir in den Makrophagen der Milz und Leber in allen darauf untersuchten Fällen Pigmentspeicherungen. Die Existenz der entfernt an Vorstadien zur intraerythrozytären Schizogonie erinnernden Konfiguration, die RODHAIN (1926) bei *Hepatocystis epomophori* erstmals beobachtet und 1953 neu gedeutet hat, wird bestätigt, wobei wir uns der letztliehen Auffassung RODHAINS über deren Natur anschließen.

Morphological peculiarities of three species of Haemosporidia belonging to the family Haemoproteidae (*Nycteria, Polychromophilus, Hepatocystis*), which had been collected from bats in the rnountains of Katanga, were studied and compared. Evidently their structural conformity is the greater the closer the systernatic relationship of their hosts. Hence, differentiation of species frorn closely related hosts, merely on the basis of their morphology, is almost rendered impossible. *Nycteria medusiformis* from *Nycteris macrotis*, however, can be clearly distinguished by characteristic filaments which protrude from the parasitized blood cell. In accordance with GARNHAM & HEISCH (1953), these filaments are considered to be degenerative formations of the erythrocyte and not cellular structures of the parasite itself.

Parasites of the genus *Polychromophilus* found in two species of horseshoe hats (*Hipposiderus caffer centralis* and *Rhinolophus h. hildebrandti*) are believed to belong to a hitherto unknown species for which the narne *Polychromophilus congolensis* spec. nov. is proposed.

The lack of pigment storage in the macrophages of spleen and liver in all cases of *Polychromophilus* infections examined was striking, since the parasites of this genus readily produce pigment within the erythrocyte. The existence of peculiar configurations occuring in infections with *Hepatocystis epomopheri* which had been reported by RODHAIN (1926) for the first time, could be confirmed, although they are rarely found. These configurations, which somewhat resemble a preliminary stage of intraerythrocytic schizogony, are believed - as previously alleged by RODHAIN (1953) - to represent a certain stage of development prior to sexual maturing in the microgametocytes.

Dans le sang des chiroptères hahitantes particulierement dans les grottes des Montagnes du Haut Katanga (région du Congo) des formes différentes des plasmodides ont été trouvées. Elles appartiennent aux genres: *Nycteria, Polychromophilus* et *Hepatocystis*. Les formes qui apparaissent dans le sang sont discutées et comparées au point de vue de leurs propriétés morphologiques.

Une nouvelle espèce très répandue dans le sang de deux chauves-souries: *Rhinolophus h. hildebrandti* et *Hipposiderus caffer centralis* est postulée: *Polychromophilus congolensis* spec. nov.

Krumbiegel, I. (1943). Zur Kenntnis der Säugetierfauna von Fernando Poo. (8. Beitrag zu den wissenschaftlichen Ergebnissen der Forschungsreise H. Eidmann nach Spanisch-Guinea 1939/40).

Die EIDMANNsche Bereisung der Insel Fernando Poo ist gerade auch vom Standpunkt der Säugetierkunde aus recht zu begrüßen. weil das (zoologische) Schrifttum über diese Insel fast ausschließlich in englischer und spanischer Sprache erschienen ist - eine Ausnahme macht nur die umfangreiche ethnologische Bearbeitung von TESSMANN. Zoologische Arbeiten in deutscher Sprache von größerem Umfang stehen bis zum Erscheinen der EIDMANNschen Veröffentlichungen (vgl. EIDMANN; 1941) noch aus, die Säugetierfauna ist nur nebenher bei Bearbeitungen westafrikanischer Tiere mit erwähnt. Dabei ist die Insel schon seit 1472 bekannt und liegt von dem früheren deutschen Schutzgebiet Kamerun nicht allzuweit entfernt .

Als erster ging WATERHOUSE (1838, 1841) auf die Säugetierfauna der Insel ein und stellte eine Reihe von Typen auf, die sich z. T. in abgeänderten Formen später auch auf dem gegenüberliegenden Festland vorfanden. THOMSON berichtete im 2. Band der "Narrative of the Niger Expedition" (1841), schließlich sind FRASERS "Zoologica tvpica" (1842) und seine Veröffentlichungen in den "Proc. Zool. Soc. London" (1852) zu nennen, sowie die Ornithologie *Hartlaub*s (1857). Moderne Arbeiten liefere CABRERA (1908, 1920, 1923, 1929).

Angesichts des relativen Mangels an zoologischen Arbeiten über die Insel an und für sich und an deutschem Anteil im besonderen ist das Material der EIDMANNschen Ausbeute doppelt wertvoll. Ich benutze die Gelegenheit, Herrn Prof. Dr. EIDMANN für die Überlassung der Säugetierausbeute zur Bearbeitung bestens zu danken, ebenso der Fachgliederung Forst- und Holzforschung des Reichsforschungsrates für die Überlassung von Mitteln.

Wissenschaftlich ist das Säugetiermaterial nicht bloß vom speziell systematischen Standpunkt aus interessant, sondern auch vom allgemein-zoologischen, da es einen Beitrag zum Problem der Inselfaunen überhaupt und der Isolierung bzw. Rassenbildung liefert. Hiervon ist im Anschluß an die systematische Durchsicht noch die Rede. Die vier Guinea-Inseln und ihre Entfernung vom Kontinent zeigt Abb. 1.

Kuhn, H. J. (1962a). *Scotonycteris zenkeri* Matschie, 1894 in Liberia.

Scotonycteris zenkeri aus der Zentral-Provinz von Liberia erweitern das bekannte Verbreitungsareal der Art nach Westen. Nach dem verfügbaren Material ist die Abtrennung einer Subspecies aus Oberguinea nicht aufrechtzuerhalten. Unterschiede im Gaumenfaltenmuster bei einem erwachsenen Weibchen und seinem halbwüchsigen Sohne werden beschrieben.

Kuhn, H. J. (1962b). Zur Kenntnis der Microchiroptera Liberias.

Zwischen Oktober 1960 und Februar 1961 konnte ich in der Central Province der Republik Liberia einige Microchiroptera sammeln. Ohne die Jungtiere sind es nur 43 Exemplare in 10 Arten. Es sei aber hier kurz über sie berichtet, weil die Arten *Nycteris intermedia, Nycteris aethiopica, Kerivoula phalaena* und *Tadarida thersites* früher in Liberia nicht gefunden worden sind, bei den beiden letzten ergibt sich durch die neuen Funde eine mitteilenswerte Erweiterung des bekannten Verbreitungsgebietes nach Westen.

Die Fundorte der Tiere sind erstens Harbel (50 km östlich von Monrovia) an der größtenteils entwaldeten Küste, zweitens die im Primärwald liegende Gbi-Stadt Freemanntown (schätzungsweise 30 km südlich von Tappita) und drittens das im sekundären Walde gelegene Deaple (Nyor-Clan, Saniquelli-District, etwa 40km südöstlich von Bahn).

Herzlich danke ich der American Foundation for Tropical Medicine, die mich in ihrem Institut in Harbel auf vielfache Weise unterstützte und dort besonders Herrn Dr. WALTER, der mir je ein Exemplar von *Nyteris hispida* und von *Nycteris intermedia* schenkte.

Kulzer, E. (1958). Untersuchungen über die Biologie von Flughunden der Gattung *Rousettus* Gray.

1. Flughunde der Gattung *Rousettus* GRAY wurden an verschiedenen orten in Ägypten und Britisch-Ostafrika in ihren natürlichen Lebensraumen beobachtet. Die Zusammensetzung der Tierkolonien, ihre Tagesquartiere und ihre nächtliche Nahrungssuche konnten beobachtet werden.

2. Genaueren Aufschluß über die Biologie der Tiere erhielt ich erst durch Laboratoriums-Untersuchungen. Die Tiere befinden sich zum Teil bereits über 4 Jahre in Gefangenschaft.

3. Ein Flughundschwarm aus 16 Tieren wurde längere Zeit in einem geeigneten Käfig mit anschließendem Flugraum gehalten und ständig beobachtet. Dabei zeigte sich, daß die Tiere einen ausgesprochenen Tag- und Nachtrhythmus besitzen. Die aktive Zeit beginnt mit Einbruch der Dunkelheit. Durch Wechsel der Beleuchtungsverhältnisse laß sich dieser Rhythmus umkehren.

4. Die Nahrungsaufnahme und die damit verbundenen Futter- und ..htzkämpfe konnten beobachtet werden. Durch Elektronenblitzaufnahmen wurden die Flugbewegungen analysiert. Die Flughunde putzen sich häufig, um Nahrungsreste und Parasiten aus dem Fell zu entfernen. Auf rasche Bewegungen und Geräusche reagieren die Tiere mit einer Schreckreaktion. Das Fortpflanzungsverhalten und die damit verbundenen Lautäußerungen wurden beobachtet und registriert.

5. Es ist gelungen, die Flughunde in Gefangenschaft zur Nachzucht zu bringen und dabei die postembryonale Entwicklung der Jungen zu studieren. Das Junge bleibt mindestens 4 Monate beim Muttertier. Durch Stimmfühlungslaute ist der Zusammenhalt zwischen Muttertier und Jungem gewährleistet. Die Tiere erkennen sich gegenseitig an ihrem Individualduft. Beim ersten Ausflug sendet der junge Flughund bereits Ultraschall-Orientiesrungslaute aus. Die komplizierten Ohrbewegungen erfolgen bereits in der zweiten Wochen nach der Geburt. Der Flug des Jungen ist gewandt und sicher. Die Jungen wachsen ..fangs sehr rasch, später langsam und erreichen erst im Laufe eines Jahres die Größe des erwachsenen Tieres.

6. Durch Versetzungsversuche der Heimatkäfige konnte das Heimfindevermögen geprüft werden. Die Tiere besitzen ein hervorragendes Ortsgedächtnis, ihren "Stammplatz" finden sie aber immer mit der Nase.

7. Die Jugendentwicklung und das Orientierungsverhalten von Mikrochiroptoren und Flughunden werden verglichen.

8. Die Megachiropteren stehen wegen ihrer noch vielfältigen Ausdrucksformen und Sinnesleistungen den Ursprungsformen der Chiropteren nahe.

Kulzer, E. (1959). Fledermäuse aus Ostafrika. Ueber eine Sammlung van Chiropteren aus Kenia und Tanganyika mit ethologischen und ökologischen Beobachtungen.

1. Die im Verlauf einer Forschungsreise in Ostafrika (Kenia und Tanganyika) gesammelten 19 verschiedenen Formen (18 Arten) von Chiropteren, ihre geographische Verbreitung in Ostafrika sowie Beobachtungen im Freiland und in Gefangenschaft werden beschrieben.

2. Die Schwerpunkte der Verbreitung einiger Chiropterenarten liegen entlang ostafrikanischen Küste. Dies trifft sowohl für die Artenzahl als auch für die Individuenzahl zu.

3. Die Flughunde der Arten *Epomophorus wahlbergi* und *Rousettus leachii* bevorzugen als Lebensräume die Waldgebiete der Küstenzone und die Waldränder Hochlandzone (am Rande des Kulturlandes) bis zu den Seenprovinzen.

4. Besondere Anpassungsfähigkeiten einzelner Chiropterenarten begünstigen ihre Verbreitung in den verschiedenen klimatischen und landschaftlichen Zonen Ostafrikas:

a) Als typischer Vertreter der offenen Graslandzone (Savanne-Steppe) kann *Lavia frons* angesehen werden. Diese Tiere leben tagsüber in Büschen und Bäumen der Nähe von Wasservorkommen. Sie sind damit den Verhältnissen des offenen Landes am weitesten angepaßt. Sie sind auch tagsüber voll aktiv. Ähnliches Verhalten am Tage zeigen die Tiere der Art *Megaderma cor*; sie haben ein ähnlich weites Verbreitungsgebiet in Ostafrika.

b) Eine Möglichkeit, den starken Klimagegensätzen, wie sie z. B. in der Hochlandzone herrschen, zu begegnen, zeigen Tiere der Art *Scotophilus nigrita*: Sie haben einen ausgeprägten Tag- und Nachtrhythmus in bezug auf Ruhezeit und Aktivität. hierfür erforderliche Zeitsinn ist ebenfalls stark ausgeprägt. Ähnliche Fähigkeiten besitzen auch Molossiden.

c) Fledermäuse, die in allen klimatischen und landschaftlichen Zonen verbreitet und keine entsprechende körperliche Anpassungsfähigkeit besitzen, zeigen eine Vorliebe für höhlenartige Tagesquartiere, die gegen die Außenwelt klimatisch isoliert sind. Diese Arten sind auch tagsüber in der Hochlandzone und in der Graslandzone in ihren Tagesquartieren aktiv (z. B. Tiere der Gattungen *Rhinolophus, Hipposideros* und *Nycteris*.

d) Alle an der Küste gefangenen Tiere (Vertreter der Gattungen *Taphozous, Coleura, Triaenops, Rhinolophus, Hipposideros* und *Megadarma*) waren auch tagsüber auffallend aktiv.

4. Eine scharfe landschaftliche Trennung der verschiedenen Fledermausarten ist nicht zu erkennen, wenn auch einige Vertreter eine Vorliebe für bestimmte

regionale Gegebenheiten zeigen. Zahlreiche Arten kommen in allen drei erwähnten Zonen vor. Entscheidend für ihre Verbreitung ist das Vorhandensein geschützter Tagesquartiere und ein reichliches Nahrungsangebot.

Kulzer, E. (1961). Ueber die Biologie der Nil-Flughunde (*Rousettus aegyptiacus*).

1. Die von TH. ANDERSEN in Tanganyika gesammelten 17 verschiedenen Formen von Chiropteren, ihre Verbreitung in Tanganyika und Freilandbeobachtungen werden beschrieben.

2. Ein Vergleich der Fundorte und der Tagesquartiere der von ANDERSEN und mir gesammelten Arten zeigt. daß nur in wenigen Fällen deutliche Beziehungen zwischen der systematischen Stellung der Tiere und ihrem Lebensraum bestehen. Die einzelnen Gattungen und Arten stellen oft ganz unterschiedliche Ansprüche an ihre Tagesquartiere. Unter den *Megachiroptera* sind die Flughunde der Gattung *Rousettus* Höhlenbewohner; Flughunde der Gattung *Epomophorus* verbringen den Tag dagegen auf Bäumen. V on den Mikrochiroptera sind die Gattungen *Rhinolopbus, Hipposideros, Triaenops* und *Coleura* zu den primären Höhlenfledermäusen zu rechnen. Nur selten findet man sie in anderen Lebensräumen. Die Tagesquartiere der Gattungen *Megaderma, Nycteris, Taphozous* und *Scotophilus* sind unterschiedlich. Erdhöhlen, Baumhöhlen und Dächer menschlicher Behausungen werden bevorzugt. Als Kulturfolger zeigen sich verschiedene Arten der Gattung *Tadanda*, ferner die Bananenfledermaus *Pipistrellus n. nanus*. Als Parallele zu den in Bäumen lebenden *Megachiroptera* treten unter den *Mikrochiroptera* die Arten *Lavia frons* und *Nycteris hispida* auf.

Kulzer, E. (1965). Temperaturregulation bei Fledermäusen (Chiroptera) aus verschiedenen Klimazonen.

1. Die Fähigkeit zur Regulation der Körpertemperatur wurde an 18 Arten (18 Gattungen) von Fledermäusen aus verschiedenen Klimazoinen der Erde untersucht.

2. Der tägliche Verlauf der Körpertemperatur steht im Zusammenhang mit dem Wechsel von Ruhe und Aktivität; er wird von der Jahreszeit, von der Umgebungstemperatur und von den Gefangenschaftsbedingungen beeinflußt.

3. Alle Fledermäuse der gemäßigten Zone können in der Ruhephase ihre Körpertemperatur der Umgebungstemperatur weitgehend angleichen. Flughunde (*Megachiroptera*) sind von der Umgebungstemperatur unabhängig; rein tropische und subtropische Fledermäuse senken ihre Körpertemperatur nur in einem mittleren Bereich der Umgebungstemperatur.

4. Bei niederen Umgebungstemperaturen verfallen die Fledermäuse der gemäßigten Zone (v. a. *Vespertilionidae* und *Rhinolophidae*) in tiefe Kältelethargie. Bis auf einige lebenswichtige Reflexhandlungcn sind dann alle Bewegungen blockiert. Aus der Lethargie erwachen die Tiere spontan oder nach einem Weckreiz auch *ohne* künstliche Wärmezufuhr. Der Lethargiezustand ist geregelt.

5. Rein tropische und subtropische Fledermäuse werden durch Kälte in Alarmstimmung versetzt. Sie verfallen nicht in Kältelethargie. Dauernde Kältebelastung führt zu ungeregelter Hypothermie.

6. Die Atmung wird den Erfordernissen im Wachzustand und in der Lethargie angepaßt. Lange Atempausen und schubweise aufeinanderfolgende Atemzüge kennzeichnen die Lethargie-Atmung. Bei den untersuchten Megachiropteren gibt es dagegen keine Apnoezustände. Besondere Atmungsmuster zeigen auch die tropischen Fledermäuse (*Microchiroptera*).

7. Stoffwechsel und Atmung stehen in engem Zusammenhang: Während der Kältelethargie wird ein Minimalstoffwechsel aufrechterhalten; der Wachstoffwechsel wird auf ein Minimum gedrosselt. Die rein tropischen und subtropischen Arten steigern bei Kälte ihren Stoffwechsel entsprechend der Kältealarmierung.

8. Dauernde Kältebelastung führt bei den tropisch-subtropischen Fledermäusen zum Zusammenbruch der Temperaturregulation und zum Kältetod. Erfolgt rechtzeitig eine künstliche Aufwärmung, so kann die Hypothermie wieder aufgehoben werden.

9. Die Ordnung *Chiroptera* kann nicht mehr den poikilothermen Tieren zugerechnet werden. Alle untersuchten Megachiropteren haben sich als *homoiotherm* erwiesen. Die Kleinfledermäuse (*Microchiroptera*) reagierten in verschiedenem Grade *heterotherm*: Während die rein tropischen Arten die Fähigkeit zur Kälteleth argie nicht besitzen, finden wir sie bei allen untersuchten Arten der Vespertilioniden und Rhinolophiden (auch in den Tropen). Diese Fähigkeit ist eine Voraussetzung zur Ausbreitung in der kühl temperierten Zone. Auf ihr bauen alle Anpassungen an die Lebensbedingungen auf. Es ist anzunehmen, daß die beiden Familien die Fähigkeit haben, ihre Körpertemperatur auf verschiedenen Ebenen zu regulieren.

The ability to regulate body temperature was studied in 28 species (18 genera) of bats from different climatic zones. All bats from the cool temperate zone show body temperatures which are close to the environmental temperatures during the daily resting phase. Fruitbats (*Megachiroptera*) are independent of the environmental temperature and are able to regulate their body temperatures above low ambient temperatures. Bats which live only in tropical and subtropical zones lower their body temperatures at medium environmental temperatures but not when it is very cold. While bats of the temperate zone enter deep torpidity during cold, tropical bats show an "alarm reaction". They elevate their body temperature and their metabolism äs long äs possible. The state of torpidity (Kälteleth argie) in vespertilionid and rhinolophid bats is subject of physiological regulation: Even in deep lethargy there is a small difference between body temperature and the environment. Respiration and metabolism are regulated to minimum levels. Torpid bats are able to regulate their body-temperatures to activity level either spontaneously or after a short stimulus without artificial rewarming. In tropical and subtropical bats, with exception of vespertilionid and rhinolophid bats, extended exposure to cold leads finally to uncontrolled hypothermia and to death. Hypothermic animals are never able to rewarm themselves, neither spontaneously nor after stimulation. The only way to Interrupt the hypothermia is artificial rewarming. The Chiroptera are not poikilothermic animals as is still postulated in recent literature. All species of *Megachiroptera* studied are homeothermic animals. The *Microchiroptera* on the other hand show different degrees of heterothermism. While the pure tropical and subtropical bats are not able to enter deep torpidity, many species of the families *Vespertilionidae* and *Rhinolophidae* are able to enter lethargy even in the tropics. This ability was necessary to enter the cool temperate zone, where many adaptations evolved. It seems likely that both families are able to regulate their body temperatures at any given environmental temperature within the ränge of viability.

Kulzer, E. (1982). Nektar-Lecken beim afrikanischen Langzungen-Flughund *Megaloglossus woermanni* Pagenstecher, 1885.

The dorsal surface of the tongue of *Megaloglossus woermanni*, the African long-tongued fruitbat, is highly adapted to nectar-drinking. The anterior tip of the tongue is covered by rows of hair-like papillae which project posteriorly. The filiform papillae are 0.7 mm in length and 0.2 mm in width (at their base). They become shorter at the lateral surface of the tongue. The many filiform papillae not only occupy a large area on the tip of the tongue, the very short distances between them (0.2 mm) cause a felt-like structure in which the nectar is caught. These anatomical structures are generally similar to the surface of the tongue of the New World nectar-feeding bats, especially in *Glossophaga soricina*. The quick movements of the tongue of *Megaloglossus woermanni* could be shown by motion pictures. Using honey-water as food, the fruitbats made 7 licking movements/sec.; the amount of fluid withdrawn from a glass tube was 0,18 ml/sec.

Kumerloeve, H. (1974). Über die Balgsammlung Ludwig Graf von Huyns und weiteres äthiopisches Vogelmaterial im Zoologischen Forschungsinstitut und Museum Alexander Koenig.

Between about 1930 and 1934 Count Ludwig von Huyn (b. 14th September 1896, d. 20th May 1946) collected in central Ethiopia (province Shoa) more than 760 birds, 100 mammals, a few reptiles and some insects for the Museum Alexander Koenig, an interesting, still unpublished scientific material. A short review of the bird species and subspecies in this collection is given, including the remaining Ethiopian specimens in the Museum Alexander Koenig, mainly collected by G. Schrader (between 1897 and 1909), by Dr. J. Havestadt (about 1927/28) and by G. Nikolaus (in 1972) and by a few others, among these Prof. O. Neumann. On the whole, about 1435 bird specimens are reviewed. In an appendix, a list of the mammals collected by Count Ludwig von Huyn is given by Prof. E. von Lehmann.

Kunz, T. H. (1996). 3. Obligate and opportunistic interactions of Old-World tropical bats and plants.

Over half of the approximately 920 species of living bats use plants exdusively or opportunistically as resources for food and/or shelter. The 166 or so species of the Old-World family Pteropodidae (suborder Megachiroptera) depend on plants as their principal source of food including flowers (nectar, pollen, and petals), fruit, and leaves. Nectarivorous bats pollinate flowers in exchange for nectar and pollen rewards, and both bats and plants benefit when bats ingest high-energy fruit and subsequently disperse seeds away from parent plants. Most fruit-eating bats are effective seed dispersers, but only the large pteropodids can disperse the largest seeds. Folivory by leaf-fractionation may be important for species with limited access to alternative sources of dietary protein or minera!s, and some species may exploit secondary compounds of plants as cues for reproduction. Plants also provide shelter for many Old-World bats. Roosting bats use tree cavities, crevices in tree boles and branches, spaces beneath exfoliated bark, unaltered foliage, and spaces beneath altered leaves, stems, and flower/fruit clusters. Plant-visiting bats contribute to the maintenance of tropical diversity by dispersing pollen and seeds, promoting a diversity of roost and food resources which benefit bats that feed at other trophic levels.

Kunz, T. H., A. Allgaier, J. Seyjagat and R. Caligiuri (1994). Alloparental care: helper-assisted birth in the Rodrigues fruit bat *Pteropus rodricensis* (Chiroptera: Pteropodidae).

We report observations of allomaternal care, or epimeletic (care-giving) behaviour, exhibited by one female toward another, before, during. And after giving birth in the Rodrigues fruit bat, *Pteropus rodricensis* (Chiroptera: Preropodidae). Interactions between the expectant mother and other roost mates, from the onset to completion of birth, were observed continuously over a period of approximately three hours. The attending female assisted the mother when she. (1) intermittently groomed her anovaginal region; (2) grasped her with partially outstretched wings; (3) 'tutored' her in a feet-down birthing posture; (4) groomed the emerging pup; and (5) physically assured the mother by manoeuvring the pup into a suckling position. This is the first report of extensive assistance given by a female bat to another during parturition. We suggest that epimeletic behaviour may be common In the highly social Chiroptera, especially among primiparous or inexperienced females and/or when an expectant mother experiences difficulty during labour and parturition. Our observations support the hypothesis that roosting associations in bats may be as important as relatedness in explaining the occurrence of apparently altruistic acts.

Kurta, A. and T. H. Kunz (1987). Size of bats at birth and maternal investment during pregnancy.

This paper summarizes data on neonatal and maternal body mass and forearm length for 74 species of bats (order Chiroptera], representing both suborders and 10 out of 17 families. Maternal body mass ranged from 3.9 to 575 g. Newborn bats averaged 22.3 % (range: 12 - 43 %) of maternal body mass; non-volant eutherians of similar maternal size averaged only 7.8 %. Total maternal investment in terms of litter mass was approximately the same in bats as in other placental mammals of similar size. Neonatal body mass in bats increased by a factor of 0.93 with increasing maternal mass; litter mass scaled to a factor of 0.84 across the order. Using allometric analysis to correct for the effects of maternal body size, we found that phyllostornids and rhinolophids had the largest individual neonates,

while vespertilionids with a litter size of two had the smallest. Vespertilionids that produce twins, however, invest the most in terms of litter mass (up to 50 % of maternal mass), while vespertilionids with a single young per litter, and the pteropodids, invest the least. Phyllosromids had the largest neonatal forearms, after the effects of maternal size were removed, and vespertilionids with two young per litter had the smallest. Despite a small litter size (generally only one or two offspring per litter), long gestation periods, and relatively large neonatal size, bats appear to be functionally altricial at birth. The energetic cost of pregnancy for a bat may be estimated using data from the literature and appropriate allometric relationships,

---

Lancaster, W. C., S. C. Thomson and J. R. Speakman (1997). Wing temperature in flying bats measured by infrared thermography.

1. We collected data on the wing temperature of flying bats using infrared thermal imaging to assess the thermoregulatory function of wing membranes.

2. Thermographic images of two Egyptian Fruit Bats, *Rousettus aegyptiacus* were captured as they flew along a 12 m length of corridor.

3. Body temperature was measured before the first flight and immediately after flight sequences using a rectal thermister probe.

4. Temperatures across the wing ranged from 34°C near the forearm muscle mass, to less than 24°C at the trailing edge (mean ambient temperature 23°C). The majority of the wing was 1-2°C above ambient temperature.

5. We found small, but significant changes in body temperature during flight. These changes did not correlate with changes in wing temperature.

Landau, I. and A.-G. Chabaud (1978). Description de *Plasmodium cyclopsi* n. sp. parasite du Microchiroptère *Hipposideros cyclops* à Makokou (Gabon).

Plasmodium cyclopsi n. sp. est caractérisé par la petite taille des formes asexuées et par des gamétocytes de type "*malariae*". Il est proche de *P. anomaluri*, dont l'hôte vertébré a le même habitat: troncs d'arbres creux de la forêt tropicale. En raison de l'ancienneté de son hôte (Rhinolophoidea) et de son appartenance au groupe "*malariae*", *P. cyclopsi* est interprété comme une espèce très primitive.

Description of *P. cyclopsi* n. sp. a parasite of the Microchiropteran Bat *Hipposideros cyclops* in Gabon.

P. cyclopsi sp. nov. is characterized by the small size of the asexual stages and by gametocytes belonging to the type "*malariae*". It is related to *P. anomaluri* and the hosts of both species share the same habitat: hollow trees of the tropical forest. By the ancientness of its vertebrate host and its relationship with the "*malariae*" group of Haemosporidia *P. cyclopsi* is interpreted as a primitive species.

Landau, I., G. Rosin, F. Miltgen, J.-P. Hugot, N. Leger, I. Beveridge and D. Baccam (1980). Sur le genre *Polychromophilus* (Haemoproteidae, parasite de Microchiroptères).

Le genre *Polychromophilus* est constitué par deux ensembles d'espèces très différents que les auteurs ont groupés dans 2 sous-genres : a) le sous-genre *Polychromophilus*, avec pour espèce type *P. (P.) melanipherus* Dionisi 1899, telle qu'elle a été redéfinie par Garnham (1973): la morphologie des gamétocytes est de type *malariae*; b) le sousgenre *Bloccala*, avec pour espèce type *P. (B.) murinus* Dionisi 1898; la morphologie des gamétocytes est proche de celle des Hemoproteidae d 'Oiseaux.

Des *Polychromophilus* de Minioptères d'Europe, d'Afrique et d'Australie ont été étudiés et décrits, en particulier 2 espèces nouvelles africaines: *P. (P.) corradettii* chez *Miniopterus inflatus* au Gabon et *P. (P.) adami* chez *Miniopterus m. minor* au Congo-Brazzaville. Des formes de multiplication tissulaire nombreuses et variées ont été trouvées, mais les infections étant généralement mixtes, il n'est pas possible de rattacher avec certitude les différents schizontes observés à un sous-genre déterminé. Cependant, les auteurs proposent une interprétation s'inspirant des affinités phylétiques des parasites. Ainsi sont classés: a) dans le sous-genre *Polychromophilus* (gamétocytes de type *malariae*), les schizontes tissulaires de grande taille, siégeant dans une cellule hôte très hypertrophiée entourée par une capsule et dont les noyaux sont, chez les stades âgés, complexes et granuleux; b) au sous-genre *Bioccala* (gamétocytes de type *oiseau*), les schizontes de petite taille (type Mer et Goldblum). De même, la sporogonie observée chez les Nyctéribies par divers auteurs serait celle du sous-genre *Bioccala*.

The genus *Polychromophilus* contains two different groups of species, which we classify in two sub-genera: a) subgenus *Polychromophilus* with, as type species, *P. (P.) melanipherus* Dionisi 1898 as redefined by Garnham (1973); the morphology of the gametocytes are of the type *malariae*; b) subgenus *Bloccala* with, as type species, *P. (B.) murinus* Dionisi 1898; the morphology of gametocytes resembles that of Haemoproteidae of birds.

Polychromophilus from Minoptera from Europe, Africa and Australia are studied and described i.e. two new species from Africa: *P. (P.) corradettii* a parasite of *Miniopterus inflatus* in Gabon and *P. (P.) adami* a parasite of *M. m. minor* in Congo-Brazzaville. Division stages in the tissues are abundant and varied but the infections are frequently mixed and it is not possible to relate the different types of schizonts to one or the other subgenus. Nevertheless the authors propose an interpretation based on the phyletic affinities of the parasites. Therefore schizonts found are classified as follows: a) in subgenus *Polychromophilus* (gametocytes of type *malariae*) the large tissue schizonts develop in a much hypertrophied host cell surrounded by a capsule and with complex, granular nuclei in the older stages; b) in subgenus *Bloccala* (gametocytes of the *avian* type) the schizonts are small (Mer and Goldblum's type). The stages of sporogony described by several authors in Nycteribid flies are assigned to parasites of the subgenus *Bioccala*.

Lane, H. C., N. Schönenberger and H. J. Huggel (1971). Quelques données sur l'innervation de l'artère et de la veine digitales alaires des Megachiroptères (*Rousettus aegyptiacus* et *Pteropus giganteus*).

The wall of vein and artery in the bat wing, on each side of the metacarpals receive both adrenergic and cholinergic fibres, as shown by specific histochemical methods. Adrenergic innervation takes the form of an adventitial plexus which gives rise to terminal varicosities ending at the medio-adventitial border.

Cholinergic fibres do not form a plexus, but give rise to varicosities ending also at the external border of the media.

At this level myelinated and non-myelinated nerve fibres are seen in association with the muscle cells of the media.

ZUSAMMENFASSUNG

Mit Hilfe spezifischer histochemischer Methoden wird gezeigt, dass in den Wänden der Blutgefässe (Venen und Arterien), die sich zu beiden Seiten des Metacarpus der Fledermäuse befindet, sowohl adrenergische als auch cholinergische Nervenfasern auftreten.

Die adrenergischen Fasern bilden in der Adventitia einen Plexus mit variköser Versätelung. Die Nervenendigungen befinden sich an der Grenze zwischen Adventitia und Media. In der gleichen Region treten auch variköse cholinergische Endigungen auf, die im Gegensatz zu den adrenergischen Fasern keinen Plexus bilden.

An der Adventitia-Media-Grenze treten myelinisierte und nicht myelinisierte Nervenfasern zusammen mit Fasern der glatten Muskulatur der Media auf.

Lanza, B. (1961). Alcune particolarita delle pliche palatine e dell'accrescimento postembrionale del cranio in *Epomophorus* (Mammalia: Megachiroptera).

L'A. describe alcune particolarità delle pliche palatine e dell'accresimento postembrionale del cranio di *Epomophorus walbergi* Sund. e di *E. labiatus* Temm.

L'A. décrit quelque particularités des plis palatins et de l'accroissement postembryonnaire du crân de *Epomophorus wahlbergi* Sund. et de *E. labiatus* Temm.

In the *Microchiroptera*, at least in the European ones, the skull attains its definitive size within almost two months from the birth; in *Megachiroptera* the skull may increase for a long time after birth, as proved by specimens of *Epomophorus wahlbergi* Sund., which, though immature and with cranial sutures not yet obliterated, have a skull length equal with that of fully adult animals. Therefore, the study of the postembryonal development of the skull is, in such animals, especially interesting from a systematic point of view. In *E. wahlbergi* and in *E. labiatus* Temm. The postembryonal growth of some parts of the skull obtains in allometric manner: the skull length increases with the age, while the brain-case height is already definitive in the very young specimens (fig. 2); rostrum (fig. 1) and postdental palate (fig. 3) increase in positive allometric manner in comparison with the total skull and palate length respectively. The positive allomeric lengthening of the rostrum, already observed by ZUCKERMAN in the baboon, *Papio porcarius*, probably occurs in all the long-faced species of *Megachiroptera* (and, in general, of Mammals). The rostrum of the *Megachiroptera*, moderately variable in shapes, varies considerably both in relative and absolute length. The extreme ratios between rostrum and total skull length obtain in the male *Hypsignathus monstrosus* (48 %) and in the genus *Nyctimene* (less than 19 %); the correspondent values in *E. wahlbergi* are 39.3 % (??) and 36.4 % (??); in *E. labiatus* 34.2 % (??) and 33.9 % (??). It is not worthy that in the adults of *E. labiatus* the values of the relative rostrum length nearly overlap thos of the youngs of *E. wahlbergi* having the same skull length (fig. 1); that means that in *E. labiatus* the dimensional development of the rostrum stops at a stage that for *E. wahlbergi* is a transitory, juvenile one. Moreover, in the males of *E. labiatus* the rostrum is scarcely more developed than in the females, while for such character there is a marked sexual dimorphism in *E. wahlbergi*, in which, contrary to *E. labiatus*, the size of the males is definitely larger than that of females. On the contrary, the relative values of the postdental palate length are the same both in the two sexes of *E. labiatus* and in the males of *E. wahlbergi* (figs. 3, 4à; but the females of the latter species have a relatively shorter postdental palate, showing also for this character a sexual dimorphism. A relatively short face is a juvenile character in *Epomophorus* and a definitive one in other genera of *Megachiroptera*; the same obtains for the basicranial angle, which in young specimens is less obtuse than in subadult and adult ones (in which the axis of the rostrum is almost parallel with the basicranial one); this obtains probably in all *Megachiroptera* and was described also in *Rousettus aegyptiacus* by EISENTRAUT. According ANDERSEN the deflection of the face is greatest, as a general rule, in genera or species with weak dentition. The greatest deflection is to be found in the *Macroglossinae* (especially in *Notopteris, Nesonycteris* and, above all, in *Melonycteris*), the smallest in nearly all genera of the *Pteropodidae* of the *Epomophorus* and *Cynopterus* sections. One may consequencty suppose that in the very young specimens of the heavy-toothed species (as those of *Epomophorus* and *Rousettus* are) the process which brings about the reduction or the disappearance of the deflection begins with the chewing function.

The palate ridges begin their development as dermal formations of the bony palate and till a certain stage of the embryonal life they remain hidden by the epithelium (figs. 5, 6); later on (perhaps before the birth) they become salient; in grown individuals the epithelium appears moderately confined and, in *E. labiatus*, produces denticulations.

As the number of the postdental palatine-ridges is of taxonomic significance, is important to emphasise that they, palallel with the backwards growth of the postdental palate, are less in very young animals than in more grown up individuals (fig. 4).

Der Verfasser beschreibt einige Besonderheiten der Gaumenfalten und der postembryonalen Vermehrung des Schädels von *Epomophorus wahlbergi* Sund. Und *E. labiatus* Temm.

Lanza, B. and M. L. Azzaroli (1971). I mammiferi delle Alpi Apuane.

I Mammiferi delle Alpi Apuane non sono perfettamente conosciuti; fino ad ora sono state trovate in questa regione solamente 38 - 39 specie, ma è probabile che in futuro ne verranno trovate altre, poichè nelle zone circostanti sono presenti circa 60 specie. Dal punto di vista biogeografico, le specie più interessanti sono *Microtus nivalis* e *Microtus arvalis*; il primo è un relitto glaciale già noto nell'Appennino Settentrionale e Centrale. il secondo è sconosciuto in Italia a sud delle Alpi Apuane.

The Mammals of the Apuanian Alps are not perfectly known; up till now only 38 - 39 species have been found in this district, but it seems likely that others will be discovered in the future, as about 60 species are present in the surrounding countries. From the biogeographical point or view, the most interesting species are *Microtus nivalis* and *Microtus arvalis*; the first is a glacial relict already known in the Northern and Central Apennines, the second is unknown South of the Apuanian Alps in Italy.

Lanza, B. and C. Calloni (1970). The buccal pad of *Scotophilus nigrita* (Schreber) and of *Nycticeius hirundo* (De Winton) (Mammalia, Chiroptera, Vespertilionidae).

Gli Autori sintetizzano i dati finora esistenti sui cuscinetto buccale dei Chirotteri e descrivono quello di due specie africane, nelle quali la presenza di questa formazione anatomica non era stata ancora osservata: *Scotophilus nigrita* (Schreber) e *Nycticeius hirundo* (De Winton).

Lanza, B. and D. L. Harrison (1963). A new description of the type specimen of *Nyctinomus aloysii-sabaudiae* Festa 1907.

Redescription of the type and only known specimen of *Nyctinomus Aloysii-Sabaudiae* Festa 1907 (Toro, Uganda). This bat is a distinct species, one of the little known larger African members of the Sub-Genus *Chaerephon*. It should be named *Tadarida (Chaerephon) aloysiisabaudiae* (Festa, 1907).

Neubeschreibung des typischen und einzigen bekannten Stückes von *Nyctinomus Aloysii-Sabaudiae* Festa 1907 (Toro, Uganda). Diese Fledermaus ist eine gute Art, zugehörig zur Gruppe der wenig bekannten größeren afrikanischen Arten der Untergattung *Chaerephon*. Sie sollte heißen: *Tadarida (Chaerephon) aloysiisabaudiae* (Festa 1907).

Nouvelle description de l'exemplaire typique (le seul qui est connu de l'espèce) du *Nyctinomus Aloysii-Sabaudiae* Festa 1907 (Toro, Uganda). Ce chauve-souris est une bonne espèce, laquelle appartient au group, peu conu, qui comprende les espèces africaines les plus grosses du sousgenre *Chaerephon*. Il doit être nommé *Tadarida (Chaerephon) aloysiisabaudiae* (Festa 1907).

Largen, M. J., D. Kock and D. W. Yalden (1974). Catalogue of the mammals of Ethiopia. 1. Chiroptera.

The present work summarises the known distribution of Chiroptera in Ethiopia. Seventy-two species are listed, of which 12 represent new records for the country: *Rousettus angolensis* (Bocage, 1898), *Taphozous mauritianus* E. Geoffroy, 1818, *Nycteris hispida hispida* (Schreber, 1775), *Hipposideros*

fuliginosus (Temminck, 1853), *Eptesicus guineensis* (Bocage, 1889), *Mimetillus moloneyi* (Thomas, 1891), *Nycticeius hindei* (Thomas, 1901), *Nycticeius hirundo* (De Winton, 1899), *Scotophilus leucogaster* (Cretzschmar, 1830), *Otomops martiensseni martiensseni* (Matschie, 1897), *Tadarida condylura* (A. Smith, 1833), *Tadarida nanula* (J. A. Alien, 1917).

As far as possible, all collecting localities in Ethiopia have been gazetted and this record is supplemented with distribution maps for every species.

Sixty-two of the species recorded from Ethiopia are essentially African in distribution, six of the remainder are Palaearctic forms and four are associated with the arid Saharo-Sindian belt.

Only five species appear to be represented by more than one race and only four are potentially endemic to Ethiopia: *Asellia patrizii* De Beaux, 1931, *Myotis scotti* Thomas, 1927, *Myotis morrisi* Hill, 1971, *Kerivoula eriophora* (Heuglin, 1877). These figures low compared with those for other groups of small mammals and are, presumably, correlated with the comparative mobility of these flying animals.

La chirotterofauna dell'Etiopia annovera attualmente 72 specie, 12 delle quali sono qui ricordate per la prima volta come presenti nella regione considerata: *Rousettus angolensis* (Bocage, 1898), *Taphozous mauritianus* E. Geoffroy, 1818, *Nycteris hispida hispida* (Schreber, 1775), *Hipposideros fuliginosus* (Temminck, 1853), *Eptesicus guineensis* (Bocage, 1889), *Mimetillus moloneyi* (Thomas, 1891), *Nycticeius hindei* (Thomas, 1901), *Nycticeius hirundo* (De Winton, 1899), *Scotophylus leucogaster* Cretzschmar, 1830), *Otomops martiensseni martiensseni* (Matschie, 1897), *Tadarida condylura* (A. Smith, 1833), *Tadarida nanula* (J. A. Alien, 1917).

Gli Autori forniscono un elenco il piu possibile completo delle localita, con loro posizione geografica, in cui sono stati sinora raccolti pipistrelli e forniscono una carta di distribuzione di tutte le specie note dell'Etiopia.

Di tali specie, 62 hanno una distribuzione essenzialmente africana e sono paleartiche; di quest'ultime 4 sono proprie della fascia saharosindica.

Solo 5 specie sono rappresentate nel territorio da piu di una razza e solo 4 sono potenzialmente endemiche dell'Etiopia: *Asellia patrizii* De Beaux, 1931, *Myotis scotti* Thomas, 1927, *Myotis morrisi* Hill, 1971, *Kerivoula eriophora* (Heuglin, 1877). II tasso d'endemismo e basso rispetto quello riscontrabile in altri ordini della stessa classe e presumibilmente e da mettere in relazione con la vagilita di questo ordine di mammiferi.

Lataste, F. (1880). Addition à la note précédente.

Mr. le docteur G. E. Dobson n'ayant eu sous les yeux. qu'une partie de ma récolte de Chiroptères algériens, je prends la liberté d'ajouter quelques renseignements à la très intéressante note qui précède.

Lataste, F. (1887a). Exploration scientifique de la Tunisie. Catalogue critique des mammifères apélagiques sauvages de la Tunisie.

Le présent Catalogue n'est pas un simple extrait, remanié, de mon *Catalogue des Mammifères de Barbarie*. Depuis la publication de ce travail, j'ai reçu de nouveaux matériaux, j'ai fait et j'ai appris de nouvelles observations qui ont modifié et accru ma connaissance de la faune barbaresque. J'ai corrigé des erreurs, tranché des questions encore pendantes et posé de nouveaux problèmes à résoudre. Ainsi, dans l'ordre des Insectivores, j'ai, me rangeant à l'opinion de M. le Dr G.-E. Dobson, réuni spécifiquement au *Crocidura Araneus* Schreber le *C. suaveolens* Pallas, que j'en avais d'abord distingué, et séparé de ce dernier le *C. Etrusca* Savi, que je lui avais réuni; et j'ai pu comparer à l'*Erinaceus Libycus* Hemprich et Ehrenberg, d'Egypte, les deux Hérissons de Barbarie que je n'avais précédemment comparés qu'entre eux et à l'espèce d'Europe. Dans l'ordre des Carnivores, je me suis

préoccupé du problème de la distinction des différentes espèces de Chacal, dont deux, d'après Gray, se trouveraient en Barbarie, et j'ai résolu celui de la valeur du Renard d'Algérie par rapport au Renard d'Europe; d'après des statistiques officielles, j'ai serré d'un peu plus près la distribution géographique du Lion et de la Panthère en Barbarie et dans les trois provinces de l'Algérie, et j'ai montré avec précision le progrès de leur décroissance numérique dans cette région, progrès tel que la destruction du Lion sera vraisemblablement accomplie dans quelques années et celle de la Panthère dans une ou deux générations; enfin j'ai réuni spécifiquement à la Loutre commune d'Europe celle d'Algérie, que j'en avais d'abord distinguée. Dans l'ordre des Rongeurs, j'ai étudié de plus près les rapports du *Gerbillus hirtipes* de Barbarie, d'une part, avec des sujets égyptiens de la même espèce, et, d'autre part, avec les deux espèces voisines *G. Gerbillus* Olivier et *G. pyramidum* Geoffroy.

Je dois les matériaux de cette dernière étude à M. Walter Innes, conservateur du Musée de l'école de médecine du Caire, dont les envois me fournissent de précieux objets de comparaison, tant pour la continuation de mes recherches sur la faune des Mammifères de Barbarie que pour la préparation de mes Catalogues des Reptiles de Barbarie et de Tunisie, qui paraîtront bientôt; je le prie d'agréer ici le témoignage de ma reconnaissance. Je tiens aussi à adresser mes remerciements à M. H. Vaucher, de Tanger, qui a entendu mes paroles de regret de n'avoir aucun correspondant au Maroc, un pays dont la faune, encore si peu connue, nous cache bien des surprises et où il serait bon de constater directement la présence des espèces même qu'on y pourrait indiquer *a priori*. Le seul et petit envoi que M. H. Vaucher ait encore eu le temps de m'adresser contenait quelques Reptiles et seulement cinq Mammifères; or quatre de ceux-ci, *Canis Niloticus, Eliomys quercinus , Erinaceus Algirus* et *Crocidura Araneus*, vont être, grâce à cet envoi, pour la première fois cités dans la faune du Maroc.

Dans le présent Catalogue j'ai jugé inutile de reproduire les *Tableaux dichotomiques* qui composent la première partie de celui des *Mammifères de Barbarie*. Je renvoie à ce dernier ouvrage le lecteur désireux de se servir de ces tableaux, soit pour faciliter ses déterminations, soit pour contrôler les miennes.

Les Mammifères de la Tunisie n'avaient été, jusqu'à ce jour,l'objet d'aucune publication spéciale; quelques espèces seulement avaient été indiquées, çà et là, dans divers ouvrages, voyages, traités généraux, publications relatives à la faune barbaresque ou à la faune algérienne, etc., ouvrages qui seront cités quand il y aura lieu.

Cette faune était donc tout à fait neuve quand, sur la proposition de M. le professeur A. Milne Edwards, membre de la Commission des missions au Ministère de l'Instruction publique, et avec l'aurément de M. le Dr E. Cosson, président de la Mission de l'exploration scientifique de la Tunisie, je fus officiellement nommé membre de cette Mission pour la zoologie. L'étude préalable de la faune des Mammifères algériens et deux voyages en Algérie, dont l'un poussé dans le Sahara jusqu'au Mzab et à Ouargla, m'avaient d'ailleurs convenablement préparé à cette tâche. Malheureusement, malgré le précieux concours prêté à la Mission par les autorités militaires, l'exploration qui devait servir de base à l'étude de l'histoire naturelle de la Tunisie ne put être faite dans d'aussi bonnes conditions qu'il eût été désirable. Les fonds insuffisants mis par le Ministère à la disposition du président de la Mission ne lui permirent de m'allouer que 3000 francs. Avec cette somme, je ne pus faire qu'un seul voyage, qui dura trois mois et pendant lequel je ne visitai qu'une faible partie du pays; encore, par raison d'économie, et sur les conseils du président de la Mission, avais-je dû me joindre à mon collègue, M. A. Letourneux, ce qui me procura l'avantage de voyager en compagnie d'un homme aimable et savant, mais aussi l'inconvénient de renoncer à toute initiative personnelle. Je ne pus m'arrêter où j'aurais dû et je fis parfois des séjours inutiles; en outre le concours des autorités locales, absolument indispensable quand il s'agit de recueillir en peu de temps un grand nombre de Vertébrés, fut en grande partie absorbé par mon collègue, qui s'occupait à la fois de botanique, de malacologie, d'entomologie, de linguistique, etc. Aussi mes récoltes furent-elles pauvres.

Ainsi que j'en avais pris l'engagement avant mon départ, un sujet au moins de chacune des espèces que j'ai rapportées de ce voyage a été remis par moi à M. le professeur A. Milne Edwards, pour le Muséum d'histoire naturelle de Paris; les espèces dont j'ai pu me procurer plus d'un échantillon sont représentées aussi dans ma collection.

Laurent, P. (1937c). Essai d'une clef dichotomique des chéiroptères de la Barbarie.

The dichotomic catalogue proposed by the author enables one to determine the presently known forms of Barbay bats. There are 11 genera, 18 species, and 19 subspecies. Dr. Laurent gives the description of three new species:
Rhinolophus hipposideros vespa - Asellia tridens pallida - Plecotus auritus saharae,
recently published elsewhere and mentions also three new subspecies which have not yet been described.

Diet dichotomische Tafel, die der Verfasser vorschlägt, erlaubt die Formen der Fledermäuse zu bestimmen, die gegenwärtig in der Berberie bekannt sind: 11 Gruppen, 18 Arten, und 19 Unter-Arten. Dr. Laurent gibt die hauptsächlichsten Merkmal dreier neuer Formen:
Rhinolophus hipposideros vespa - Asellia tridens pallida - Plecotus auritus saharae,
die übrigens kürzlich veröffentlich worden sind, und nennt auch 3 andere neue Formen, die noch nicht beschrieben worden sind.

LaVal, R. K. (1973). A revision of the neotropical bats of the genus *Myotis*.

More than 650 specimens of bats of the Neotropical genera *Rhogeessa* and *Baeodon* were examined to determine the number of genera and species that should be recognized, as well as to evaluate geographic variation within each species. In addition to the usual morphological characters, large numbers of bacula were measured and compared, and hairs were examined by scanning electron microscopy. The preliminary results of a study of karyotypic variation in *Rhogeessa* by R. J. Baker and associates were taken into account. Both multivariate and univariate statistical methods were utilized.

One species, *Rhogeessa alleni*, is assigned to the subgenus *Baeodon*, and is a large-skulled form restricted to western Mexico. The remaining five species are assigned to the subgenus *Rhogeessa*. *Rhogeessa parvula*, restricted to western Mexico, is characterized by a hairy uropatagium. *Rhogeessa gracilis*, also restricted to western Mexico, possesses much larger ears than do the other species. A new species, *R. mira*, is presently known only from two localities in Michoacan, and is substantially smaller than the other three species inhabiting western Mexico. *Rhogeessa tumida*, an extremely variable (and perhaps composite) species, ranges from Tamaulipas to Brazil and Bolivia. *Rhogeessa minutilla* a pale desert species, is restricted to Margarita Island, northwestern Venezuela, and the adjoining Guajira Peninsula of Colombia.

Con el fin de determinar el numero de generos y especies que deben ser reconocidos y tambien analizar la variacion dentro de cada especie, se examinaron mas de 650 especimenes de murcielagos neotropicales do los generos *Rhogeessa* y *Baeodon*. Ademas de los caracteres morfologicos usualmente empleados, se midieron y compararon los baculos, y se examinaron los pelos por medio de un microscopio electronico de "scanning." Fueron tomados ademas en consideracion, el estudio hecho por R. J. Baker y companeros, sobre la variacion en los kariotipos de *Rhogeessa*; y finalmente para el analisis estadistico se uso los metodos de univarianza y multivarianza.

Una de las especies, *Rhogeessa alleni*, una forma de craneo grande, restringida a el Occidente de Mexico, es asignada al subgenero *Baeodon*. Las otras cinco especies son asignadas a el subgenero *Rhogeessa*. *Rhogeessa parvida*, restringida a Mexico occidental, esta caracterizada por tener un uropatagio cubierto de pelo. *Rhogeessa gracilis*, tambien restringida a Mexico occidental, tiene orejas que son mas grandes que las de las otras especies. Una especie nueva, *R. mira*, conocida solamente de dos localidades de Michoacan, es la mas pequena de las quatro especies en Mexico occidental. *Rhogeessa tumida*, una especie extremadamente variable y posiblemente un "composite species" (compuesta de mas de una especie), se extiende desde Tamaulipas hasta Brasil y Bolivia. *Rhogeessa minutilla*, una especie de color palido, encon trada en areas deserticas, es restringida a la Isla Margarita, el Noroeste de Venezuela, y la peninsula de la Guajira de Colombia y Venezuela.

LaVal, R. K. and M. L. LaVal (1977). Reproduction and behavior of the African banana bat, *Pipistrellus nanus*.

Roosting behavior and the reproductive chronology of the banana hat *Pipistrellus nanus*, were studied in Natal, South Africa. These bats roost singly or in small groups in rolled leaves of bananas (*Musa* sp.) and *Strelitzia*. Sex ratios were 1:1 for adults but 2:1 (female:male) in juveniles. Group structure was facultative and ephemeral, and movements were for short distances. *P. nanus* is monestrous and seasonal, with births of single or twin infants in November and December. Males reached peak testis size in May, and had abdominal testes most of the remainder of the vear.

LaVal, R. K. and M. L. LaVal (1980). Prey selection by the Slit-faced bat *Nycteris thebaica* (Chiroptera: Nycteridae) in Natal, South Africa.

During much of the year, foraging slit-faced bats (*Nycteris thebaica*) in Natal, South Africa, preyed mainly on Orthoptera, especially katydids, crickets, and cockroaches. At times, substantial quantities of Lepidoptera, Isoptera, Homoptera and Coleoptera were also taken. Slit-faced bats seem to prefer those insects characterized by large body size, abundance and ease of location and capture. Many of these are captured, while stationary, or at least when at rest rather than it flight.

Lawrence, B. (1964). Notes on the horseshoe bats *Hipposideros caffer*, *ruber* and *beatus*.

Attempts to identify a small series of *Hipposideros*, collected in the Belgian Congo by Alvin Novick in 1956, have made necessary a re-examination of the distribution and specific characters of *caffer, ruber* and *beatus*. This has brought to light some new characters of the nasal swellings and of the nose leaves, and emphasizes the importance of the nasal region in general for showing specific differences.

Lawrence, B. and A. Novick (1963). Behavior as a taxonomic clue: relationships of *Lissonycteris* (Chiroptera).

Re-examination of the generic status and relationships of *Rousettus, sensu stricto*, and *Lissonycteris*, a supposed subgenus of *Rousettus*, has been prompted by the great differences observed between live specimens of the two genera. In 1955 and 1956, Novick was able to make extensive observations of living bats not only of these two genera but of six other pteropodids as well Novick, 1958). Of these, according to Andersen (1912), *Eidolon helvum* and *Pteropus g. giganteus* as well as *Rousettus* belong in the *Rousettus* section of the Pteropinae. *Cynopterus brachyotis luzoniensis, Cynopterus sphinx ceylonensis*, and *Ptenochirus jagorii* belong in the *Cynopterus* section of the Pteropinae, while *Eonycteris spelaea glandifera, Eonycteris robusta*, and *Macroglossus l. lagochilus* are in the subfamily Macroglossinae.

Lay, D. M. (1967). A study of the mammals of Iran resulting from the Street Expeditions of 1962-1963.

A narrative account cursorily describes the physiography and general ecology observed along the routes taken in Iran by the W. S. and J. K. Street Expedition. Separate from the narrative and arranged alphabetically by the name of the collecting locality, ecological description of each of the places where the expedition paused to study and collect tells what mammals were found in what sort of biotic communities. A gazetteer is provided with the coordinates of, or appropriate remarks on, every Iranian locality cited in the text.

The distribution data for Iran published before 1963, for each of the 99 species represented by the 1719 mammal specimens obtained by the expedition, and the 26 other species known from Iran is summarized for the first time since 1876.

The following advances in taxonomic knowledge of mammal species of southwest Asia beyond that presented by Ellerman and Morrison-Scott (1951) and Misonne (1959) result from this study of collections of the Street Expedition in relation to previously existing materials:

Crocidura leucodon lasia Thomas, 1906, is in fact *C. leucodon* Hermann, 1780, and not *C. lasiura* Dobson, 1890.

Crocidura russula caspica Thomas, 1907, is in fact *C. russula* Hermann, 1780, and not *C. lasiura* Dodson, 1890.

Rhinopoma hardwickei pusillum Thomas, 1920, is shown to be synonomous with *R. h. seianum* Thomas, 1913.

Pipistrellus Aladdin Thomas, 1905, is a synonym of *P. kuhli kuhli* Kuhl, 1819.

Miniopterus schreibersi pallidus Thomas, 1907, and *M. s. pulcher* Harrison, 1956, are shown to be junior synonyms of *M. s. schreibersi* Kuhl, 1819.

Microtus guentheri Danford and Alston, 1880, and *Microtus irani* Thomas, 1921, are synonymous with *Microtus socialis* Pallas, 1773.

Ellobius lutescens is a subspecies of *E. fuscocapillus*.

The subspecies *buxtoni* Thomas, 1919, and *insularis* Goodwin, 1939, are shown to be synonymous with *Nesokia indica indica* Gray and Hardwicke, 1832.

Glis glis persicus Erxleben, 1777, is shown to be the oldest available name for the south Caspian fat dormouse, and *G. g. caspicus* Satunin, 1905, is a junior synonym.

Collecting efforts of the expedition are shown to have resulted in discoveries in Iran of nine species not previously known to occur there:

Erinaceous europaeus
Neomys anomalus
Talpa streetorum
Rhinolophus Euryale
Rhinolopus blasii
Eptesicus nilssoni
Vespertilio murinus
Barbastella leucomelas
Microtus nivalis

One species entirely new to science, a mole of the family Talpidae, has been described from Hezar Darreh, Kurdistan, Iran and named *Talpa streetorum*.

Laycock, P.(A.) (1973). Distribution and abundance of bats in the Natal Midlands (Mammalia: Chiroptera).

The distribution and abundance of microchiropteran species in Town Bush cave, Pietermaritzburg, were studied throughout 1972. It was found that this cave serves as a wintering cave for *Rhinolophus simulator*, a permanent residence for a small group of *R. clivosus augur*, a maternity cave for *Myotis (SeIysius) tricolor*, and as a prematernity and pre-wintering cave for *Miniopterus schreibersi natalensis*. No young *Miniopterus* or *Rhinolophus* were seen during the study period, although pregnant females were observed in October and November.

Other caves in the Pietermarirzburg area were visited as they became known but were too tar from Pierermaritzburg to allow regular visiting, thus no definite conclusions could be reached on the part they play in the migratory cycle of the bats seen occupying them.

Leconte, J. (1855). Observations on the North American species of Bats.

Notwithstanding all that has been written by Rafinesque, F. Cuvier and Dr. Bachman on the bats of North America, a diligent study has shown me considerable errors in the accounts of all. Before proceeding to a description of these animals, it is necessary to remark, that every bat which I have seen, has an uncertain number of transverse wrinkles or plaits on the outer portion of the ear, and has the toes furnished with rather long and fine hairs, as it were fimbriated, wherefore these two marks are omitted as furnishing no good specific characters. All our bats except the *Molossus* belong to the same genus; the trifling difference in the number of the teeth does not afford a sufficient reason for considering them as different. M. F. Cuvier in the first volume of the Nouv. Annales du Museum, divides the genus into three sections, the Serotinoids, the Noctuloids and the Murinoids. The form of the cranium seems to be the chief mark in distinguishing them from each other. The Serotinoids may be described as having the cranium somewhat inflated and rounded, the jaws short, widened and elevated at the extremity, the facial angle 43°. The European species as far as I can collect, have four upper incisors. In this country we have but two belonging to this section, the *Noveboracensis* and the *cinereus*, both of which have but two upper fore teeth. The Noctuloids have the skull rather straight and flat on the top, and the jaws more extended, the facial angle is 30°. They all have four upper incisors except the crepuscularis which has like those of the first division but two. The Murinoids are known by having the cranium inflated and rounded, the jaws elongated a little raised in front with a considerable depression separating them from the cranium, the facial angle is 22*. The *V. pallidus* which has but two upper fore teeth appears to me to be a Murinoid ; all the rest have four upper fore teeth. As for what has been called a *Plecotus* (even by myself) it certainly belongs to this division: it differs considerably from the *Plecotus auritus* of Europe, in the form and position of the ears. I am not writing about the animals of a foreign country, and therefore I say no more on this head, than that the *P. auritus* as far as regards the skull appears to be a Serotinoid. My remarks on the Molossus will appear when I come to describe that species.

Legendre, S. (1982). Hipposideridae (Mammalia: Chiroptera) from the Mediterranean Middle and Late Neogene, and evolution of the genera *Hipposideros* and *Asellia*.

New fossils from the Burdigalian locality of Port-la-Nouvelle (southern France) add to our knowledge of the Hipposideridae. Four species of this family are represented, including a new species of the subgenus *Brachipposideros* Sigé (*Hipposideros aguilari* n.sp.). *H. vetus* (Lavocat) from Beni Mellal (Miocene of Morocco) and *H*. cf. *vetus* from Sète (late Pliocene of France), formerly attributed to *Asellia*, are placed in the subgenus *Syndesmotis* Peters, which includes the Recent East African species *H. (S.) megalotis*. The following genera and subgenera are recognized in this study: genus *Hipposideros* including the subgenera *Hipposideros, Brachipposideros, Syndesmotis* and *Pseudorhinolophus*, and the genus *Asellia*. Anatomy of teeth and jaws suggests new phyletic interpretations: *Pseudorhinolophus* could be ancestral to *Asellia*, and *Brachipposideros* to *Syndesmotis*; *Pseudorhinolophus* and *Brachipposideros* may both be represented in the Recent fauna by large and small *Hipposideros*, respectively; on the other hand, *Brachipposideros* is unlikely to have originated from *Pseudorhinolophus*, and neither of these genera can be derived from the Paleogene European genus *Palaeophyllophora* Revilliod.

Legendre, S. (1984). Étude odontologique des représentants actuels du groupe *Tadarida* (Chiroptera, Molossidae). Implications phylogéniques, systématiques et zoogéographiques.

The study of the dental morphology of the recent bats of the *Tadarida* group leads to distinguish four genera: *Rhizomops* nov. gen., *Nyctinomops*, *Tadarida* (including the sub-genera *Chaerephon* and *Mops*), and *Mormopterus* (including the sub-genera *Platymops, Sauromys*, and *Micronomus*,

revalidated in this work). These genera are gathered together with *Otomops* within the Tadaridinae nov. subfam. as opposed to the Molossinae nov. subfam. and the Cheiromelinae nov. subfam. The systematic clarification, provided by an odontological approach of paleontological tradition, leads to consider the phylogenetical relationships between these taxonomical types. It also allows to reconstitute the zoogeographical history of the Molossidae, which are scattered in the warm areas of both OId and New World.

L'étude de la morphologie dentaire des représentants actuels des chauves-souris du groupe *Tadarida* amène à le découper en quatre genres: *Rhizomops* nov. gen., *Nyctinomops*, *Tadarida* (incluant les sous-genres *Chaerephon* et *Mops*) et *Mormopterus* (incluant les sous-genres *Platymops, Sauromys* et *Micronomus* revalidé dans ce travail). Ces genres sont regroupés avec *Otomops* dans les Tadaridinae nov. subfam., par opposition aux Molossinae nov. subfam. et aux Cheiromelinae nov. subfam. La clarification systématique, apportée par une approche odontologique de tradition paléontologique, permet d'envisager les relations phylogéniques de ces types taxonomiques. Elle autorise également une reconstitution de l'histoire biogéographique de la famille des Molossidae, qui sont dispersés dans les régions chaudes de l'Ancien et du Nouveau Monde.

Loche, V. (1858). Catalogue des mammifères et des oiseaux observés en Algérie par le capitaine Loche.

Le goût des sciences naturelles est aujourd'hui universellement répandu; chaque localité pourvue de galeries zoologiques voit la foule s'y presser, et, non moins que les naturalistes et les savants, les simples curieux en sont les visiteurs assidus.

C'est que cette infinie diversité des êtres, auxquels la Providence a assigné un rôle dans les harmonies générales de l'univers, parle à l'âme de tous les hommes, l'élève vers le Créateur, et fait naître cette envie d'apprendre qui caractérise- nôtre époque et conduira peut-être à soulever le voile qui noiis-'cache encore tant d'impôrtantes vérités.

Malheureusement beaucoup de personnes sont arrêtées, dès les premiers pas qu'elles essayent de faire dans cette intéressante étude, par le défaut de moyens d'instruction et de termes de comparaison.

Le prix élevé des livres ayant des planches coloriées les rend peu accessibles, et les galeries zoologiques manquent à la plupart des localités.

Sans ces ressources, la détermination des sujets par les seuls procédés zoologiques exige un long apprentissage et n'est pas exempte de difficultés, même pour ceux qui ont à leur disposition de nombreux ouvrages spéciaux.

Nous avons fait, depuis noire enfance, de l'histoire naturelle notre science de prédilection, et, comme nous avons souvent été entravé par ces obstacles, nous comprenons toute la vocation et la persévérance dont il faut être doué pour ne pas s'en laisser rebuter.

Ces inconvénients sont plus frappants et plus vivement sentis en Algérie qu'ailleurs, par la difficulté d'y traîner avec soi les livres et les éléments de confrontation indispensables à quiconque veut étu dier la faune ou la flore de ce pays dépourvu détablissements scientifiques.

Et pourtant l'histoire naturelle a une importance énorme; elle conduit, par l'observation intelligente., à la connaissance de l'homme, des animaux, du monde entier, mieux qu'une dissertation théologique; elle démontre la puissance du Dieu qui a tout créé, et c'est par elle qu'on est le plus certain d'arriver à. la découverte des vérités qui sont du ressort de l'esprit humain. Ne doit-on donc pas avoir à coeur de l'encourager, de la diriger en lui offrant aide et hommage?

Parler aux yeux est toujours le moyen le plus .certain d'arriver à l'esprit; en rendant l'étude facile et attrayante on attire à elle, et c'est en lui donnant une bonne direction qu'on préserve la jeunesse de fâcheux écarts.

Cette multitude d'êtres différents que la nature a libéralement répartis sur la surface de notre globe, et dont les analogies, les aptitudes et jusqu'aux dissemblances frappent si vivement l'esprit qu'elles le poussent vers l'investigation des causes, serait à-coup sûr un sublime enseignement qui, en échauffant le coeur, imprimerait à l'imagination un noble essor et pourrait conduire à l'intelligence des lois suprêmes.

Persuadé, par ces considérations qu'un assez long séjour en Afrique nous avait rendues plus palpables, des incontestables services que la science, la jeunesse studieuse, les savants et les voyageurs retireraient de la création à Alger d'un jardin zoologique et d'un muséum d'histoire naturelle ayant pour annexe une bibliothèque spéciale, nous en proposâmes, il y a trois ans; la fondation à M. le gouverneur général.

Pour contribuer autant qu'il était en nous à la prompte édification de ces précieux monuments, nous n'offrîmes pas seulement nos services ; mais étant parvenu, par un travail opiniâtre pendant plus de trente années et au prix d'immenses sacrificesi à réunir des collections considérables, nous offrîmes de les donner à ces établissements, qui, au moyen de ces importants matériaux, auraient pu être presque immédiatement inaugurés.

Nous n'avons; point été informé des motifs qui ont pu, malgré la haute approbation de M. le gouverneur général et les éloges par lui publiquement exprimés sur ce qu'il appelait notre généreux désintéressement, et l'importance et la beauté de nos collections, empêcher nos offres d'être acceptées; mais, n'ayant été déterminé à cette libéralité que par un sincère désfr d'être utile, nous n'avons nullement été froissé qu'elle né fût .pas agréée, et nous avons attendu des circonstances plus favorables pour prouver à l'Algérie, à ce pays de nos prédilections, notre dévouement à ses intérêts. Il y a un peu plus d'un an, Son Excellence M. le maréchal gouverneur général de l'Algérie, qui a créé à Alger une exposition permanente des produits de ce pays, nous attacha à cet. établissement, qui, sous la direction aussi habile qu'éclairée de M. le colonel de Neveu, a réalisé des progrès non moins importants que rapides.

Les productions zoologiques seules continuaient, à lui faire défaut par des motifs faciles à comprendre: les unes exigent de patientes et minutieuses recherches, les autres des préparations manuelles délicates et que peu de personnes savent exécuter.

Heureux de pouvoir combler en partie cette lacune, nous nous sommes empressé de doter l'Exposition de toutes les espèces du règne animal que nous avions pu jusqu'ici colliger en Algérie, et de nous-mettre à la recherche des autres.

La tâche que nous accomplissons, moins étendue que celle que nous voulions entreprendre, n'en a pas moins une incontestable utilité: réunir, classer et déterminer toutes les productions qui constituent la richesse zoologique de l'Algérie, et mettre ainsi tous ceux qui s'intéressent aux sciences naturelles et à l'avenir de ce beau pays à même d'embrasser d'un regard synthétique l'ensemble et les détails de sa faune, nous a semblé une mission non moins patriotique que scientifiquement utile, et nous l'avons embrassée avec ardeur.

Nous ne nous sommes point dissimulé que, pour réunir toutes les productions naturelles d'un si vaste pays, le concours de tous ceux qui regardent la nature animée d'un oeil affectueux et intelligent pouvait nous être d'un grand secours ; mais, nous étant dit aussi que, pour l'invoquer avec chance de succès, il fallait qu'un commencement d'exécution vînt prouver plus éloquemment que notre faible voix ne le saurait faire le but que nous nous proposions d'atteindre, nous nous sommes mis à l'oeuvre avec courage, menant de front les travaux d'installation, les préparations taxidermiques, les explorations qui pouvaient nous faire espérer l'augmentation de nos collections, et la recherche des documents qui nous manquent encore pour pouvoir donner à la' publication d'un ouvrage sur la Mammalogie et l'Ornithologie de l'Algérie, dont la rédaction nous est confiée, l'étendue et l'exactitude que l'état actuel de la science exige. Chacun sera à même, en visitant l'exposition permanente, de juger si les résultats que nous avons réalisés dans un si court espace de temps sont satisfaisants et peuvent inspirer bon espoir pour l'avenir.

Une pénible exploration que nous avons récemment accomplie dans le Sahara nous y a fait découvrir des espèces nouvelles pour la science, d'autres non encore signalées comme algériennes; nous les avons adressées à M. le maréchal Vaillant, ministre de la guerre, qui s'est empressé de les

communiquer à l'Académie des Sciences, dont il est membre. Cette nouvelle preuve du bienveillant intérêt que cet illustre et savant ministre ne dédaigne pas de nous témoigner, et le flatteur accueil qu'il a bien voulu nous faire, nous imposent la douce obligation de redoubler de zélé et d'efforts pour justifier une confiance qui nous honore autant qu'elle nous touche.

C'est encouragé par ces premiers succès que nous venons aujourd'hui, avec plus d'assurance, faire un appel à tous ceux qui peuvent nous aider à accomplir la tâche qui nous est dévolue; nous craindrions que- nos efforts personnels ne fussent trop lents à la mener à bien, si l'active collaboration que nous osons solliciter nous était refusée.

Nos récentes explorations, en nous prouvant que la faune algérienne était encore bien imparfaitement connue, nous ont démontré que, pour en colliger tous les éléments, un long séjour dans chaque localité serait non moins indispensable que des perquisitions ardues et consciencieuses; et encore, que d'intéressantes espèces échapperaient aux regards, que d'individus vainement poursuivis par les zoologistes deviendraient la proie peu appréciée de personnes qui en ignoreraient la valeur relative, et les laisseraient se perdre sans soupçonner le dommage qu'elles occasionneraient ainsi à la science!

Nous espérons donc que les chasseurs, les pêcheurs, les agriculteurs, aussi bien que les naturalistes, les fonctionnaires civils ou militaires, les commandants des ports, des cercles, des bureaux arabes, les membres du corps médical, les ingénieurs, les employés des forêts, les officiers de l'armée d'Afrique, aussi bien que toutes les autres personnes dont nous venons indistinctement solliciter le concours, voudront- bien, en nous adressant les spécimens qu'ils pourront recueillir, hâter l'achèvement d'une œuvre qui, en faisant, mieux connaître les richesses de l'Algérie, contribuera infailliblement à la faire aimer davantage.

Tous les mammifères, oiseaux, oeufs, reptiles, poissons, mollusques, insectes et zoophytes, aussi bien que les végétaux, les minéraux et les objets ouvrés donnés à l'Exposition, seront pourvus d'étiquettes reproductives des inscriptions des catalogues; elles indiqueront donc scrupuleusement le nom du donateur, le nom et la provenance dé chaque sujet; l'honneur de la découverte sera par nous toujours attribué à son auteur, et c'est une règle dont nous ne nous départirons jamais.

Comme les classifications de Son Altesse le prince Charles-Lucien Bonaparte ont été appliquées au Muséum d'histoire naturelle de Paris, et que ses ouvrages sont actuellement dans les mains de toutes les personnes, qui s'occupent un peu sérieusement d'histoire naturelle, nous avons cru faire une chose bonne et utile en suivant la méthode d'un aussi célèbre zoologiste.

L'intérêt aussi bienveillant qu'affectueux dont cet illustre savant nous honorait, les lumières et les encouragements que nous puisions dans ses conseils, nous feront à tout jamais regretter qu'une mort prématurée soit venue enlever à la science et à ses'amis ce zélé et incomparable naturaliste.

Pour que les personnes non encore-familières avec les nouvelles appellations génériques ou spéciales puissent immédiatement se rendre compte de leur relation avec celles auxquelles elles sont habituées, nous faisons suivre, autant que possible, les noms français et latins des sujets d'une courte synonymie. Le but d'utilité pratique que nous nous sommes imposé ne nous permettant pas de négliger un seul moyen de faciliter les recherches, nous avons ajouté aux noms scientifiques et vulgaires des espèces les noms arabes, écrits en caractères français et en caractères arabes; de la sorte, les indigènes ou les personnes qui désireront s'en aider seront immédiatement renseignés. Nous ferons observer que les noms arabes sont en général plutôt génériques que spécifiques, et que la même dénomination est souvent appliquée par les indigènes à des espèces différences dont les caractères instinctifs leur ont échappé.

La conservation des collections exige qu'elles soient déposées dans des armoires; leur étude en est par cela même rendue par fois un peu difficile. C'est un désagrément inévitable; nous l'avions reconnu et déploré bien avant qu'il nous fût signalé, mais nous n'y connaissions point de remède.

De judicieux observateurs, auxquels nous serons toujours charmé de prouver notre déférence, nous ont conseillé, afin d'obvier autant que possible à cet inconvénient, de publier des catalogues reproductifs des indications dont les sujets sont porteurs;.de la sorte, ceux placés trop haut pour que leurs étiquettes soient lues aisément ne seraient pas des énigmes pour les visiteurs, que le catalogue, facile à consulter, renseignerait toujours. Ce moyen nous semblant, en effet, le seul capable de

remédier au mal, nous nous hâtons de l'employer, et nous publions pour commencer le catalogue des mammifères et celui des oiseaux.

Toutes les espèces que nous avons été à même d'observer en Algérie seront inscrites sur ces catalogues. Les noms des donateurs, l'indication de sexe et de provenance désigneront celles déjà installées à l'Exposition.

Nous ferons suivre chaque catalogue, mais seulement à titre de renseignement, d'une liste supplémentaire de quelques autres espèces qui nous ont été signalées comme se trouvant en Algérie, mais dont la présence en ce pays ne nous est pas assez prouvée pour que ,nous puissions l'affirmer. Nous nous sommes imposé la loi de ne pas indiquer une seule espèce sur la foi d'autrui ou sur des renseignements vagues ; tous les animaux mentionnés sur les catalogues que nous, publierons auront donc été vus et examinés par nous.

Nous ne terminerons pas ce trop long préambule sans offrir à Son Excellence M. le maréchal Vaillant, ministre de la guerre, à M. le maréchal Randon, gouverneur général de l'Algérie, à MM. Les généraux Renault, Yusuf, de Chabaud-Latour, de Liniërs de Tourville, et à M. le colonel de Neveu, un public témoignage de notre gratitude; la flatteuse approbation qu'ils ont bien voulu nous témoigner est la plus douce récompense de nos persévérants efforts.

Nous serions, ingrat, et, Dieu merci, nous ne le sommes pas, si nous ne venions pas ici prier M. le commandant Marguerite de vouloir bien agréer un sincère témoignage de notre vive reconnaissance. Ayant été autorisé par M. le gouverneur général à nous joindre à la colonne qui, sous les ordres de cet officier supérieur, a, pendant l'expédition de 1856-57, parcouru le Sahara, nous avons dû à sa généreuse obligeance, à son excellent et efficace concours, la majeure partie des résultats par nous obtenus; le souvenir de sa gracieuse bonté nous sera à jamais précieux, et nous espérons que les bons offices qu'il a bien voulu nous rendre auront leur utilité pour la science. Nous renouvelons aussi à M. le docteur Reboud et à M. le lieutenant Philibert, qui, pendant cette expédition du Sahara, nous ont si activement secondé, nos affectueux remefcîments, et nous les prions, ainsi que M. le docteur Guyon, monsieur Schousboë, MM. les capitaines Garnis et Guyon-Vernier, et tous ceux qui nous sont déjà venus en aide, de vouloir bien nous continuer leur amicale assistance.

Loche, V. (1867). Exploration scientifique de l'Algerie pendant les années 1840, 1841, 1842. Histoire naturelle des mammifères. Ordre des Chéiropteres Chiroptera (pp. 73 - 83).

La difficulté de parcourir l'Algérie pendant la domination des deys a laissé planer sur la Zoologie de ce pays une obscurité regrettable, que tous les efforts de quelques savants, parvenus à pénétrer dans cette contrée, n'ont pu entierenrent dissiper.

Le gouvernement français, toujours jaloux d'imprimer à la science une.énergique impulsion, constitua en 1839 une commission scientifique, qui, durant les années 1840, 1841 et 1842, explora l'Algérie et fut chargée, sous ses auspices, de publier le résultats de cette exploration.

Plusieurs des naturalistes qui faisaient partie de cette commission, ont accompli leur tâche, quelques-uns ne l'ont pas entièrement achevée, et l'un d'eux s'est abstenu; c'est par suite de cette abstention, dont nous n'avons pas à examiner les motifs, que la rédaction de la Mammalogie et de l'Ornithologie de cet ouvrage nous a été inopinément confiée.

Nous ne nous sommes pas dissimulé qu'il faudrait plus de talent et,de science que nous n'en possédons, pour mener à bien cette tâche ardue: la Mammalogie et l'Ornithologie de l'Algérie étant encore si incomplètement connues! Un désir, qui pour nous est un ordre, ne nous a cependant pas permis d'hésiter, alors surtout que les hommes les plus considérables de la science daignaient nous encourager, nous offrir le secour de leurs lumières et accorder à nos efforts la plus flatteuse; approbation.

Nous étions déjà redevable à M. Isidore Geoffroy-Saint-Hilaire du titre de correspondant du Muséum d'histoire naturelle de Paris cet illustre savant; dont les travaux ont eu un si grand retentissement, a

bien voulu encore faire, mettre à notre disposition les incomparables richesses de l'établissement dont il est une des gloires.

Son Altesse le prince Charles-Lucien Bonaparte, ce zoologiste éminent dont la science déplore si amèrement la perte, n'a pas dédaigné non plus d'encourager nos efforts; ses judicieuses observations nous ont fourni les moyens de rendre notre travail moins inparfait, et il nous est bien pénible de ne pouvoir plus consigner qu'ici le profond sentiment de reconnaissance dont son affectueuse bienveillance nous avait pénétré.

M. Z. Gerbe, naturaliste, dont la modestie égale la science, et à l'affection duquel nous devons tant, nous a prêté un concours que son profond savoir nous a rendu do.blement précieux.

M. Schousboë, interprète principal de l'armée, a bien voulu nous fournir, sur les appellations des animaux de l'Algérie, d'utiles renseignements.

M. Jules Verreaux, cet infatigable zoologiste-voyageur, qui cultive avec le même succès toutes les branches de l'Histoire naturelle, mais que l'Ornithologie surtout toujours passionné, et à laquelle il a consacré la meilleure part de sa vie, ses si heureuses aptitudes et une incroyable activité d'esprit, ce judicieux et si sagace observateur qui plus que personne a vu et comparé, et qui plus que personne aussi a su mettre à profit les exceptionnelles facilités d'examen qu'il a eues, Jules Verreaux, avec une bonne grâce et une obligeance parfaite, nous a favorisé de conseils et d'indications qui nous rendent à jamais son sincère obligé.

Combien aussi ne devons-nous pas au savant M. Lemercier, sous-bibliothécaire au Musée d'histoire naturelle de Paris? C'est à son inépuisable obligeance que nous avons dû les précieuses facilités de recherches qui nous étaient si nécessaires pour notre travail bibliographique.

Pourquoi faut-il qu'en Algérie, où nous avons dû accomplir la majeure partie de notre travail, nous ayons manqué de toutes les ressources'qui, à Paris, nous étaient libéralement offertes? Malheureusement il n'existait point ici de collections publiques ni privées, et les documents scientifiques n'y faisaient pas moins défaut. C'est donc très souvent, sans avoir à notre disposition les moyens d'arriver à une exacte et rigoureuse détermination des sujets, que nous avons dû procéder: aussi, de quelque minutieuses précautions que nous nous soyons entouré pour éviter lés causes d'erreur, n'osons-nous pas nous flatter d'y être toujours parvenu.

Nous avons souvent envoyé à Paris des sujets sur lesquels nous ne pensions pas pouvoir prononcer avec certitude, mais malgré cette précaution nous n'avons pas toujours obtenu des renseignements suffisants.

Diverses excursions accomplies dans le Sahara nous permirent de recueillir un certain nombre de Mammifères et d'Oiseaux, dont les uns nous semblèrent nouveaux pour la science, et les autres non encore signalés comme se trouvant en Algérie. Ils méritaient certainement un examen spécial; nous les adressâmes à M. le maréchal Vaillant, alors ministre de la guerre, qui s'empressa de les soumettre à l'Académie des sciences; dont ce savant ministre est un des membres les plus distingués: cette nouvelle preuve du bienveillant intérêt dont cet illustré savant daigne nous honorer, a mis le comble à la gratitude que nous lui avons vouée, mais nous avons eu le regret d'être forcé d'imposer nous-même des dénominations à ces espèces, dont on rencontrerai description dans le cours de cet ouvrage; car après avoir été soumis.à la docte assemblée, par des motifs qui nous sont restés inconnus, ces sujets nous sont revenus sans être détermines.

Comme la Botanique et l'Entomologie ont en Algérie de nombreux et savants adeptes, l'on s'étonnerait à bon droit que deux des plus importantes classes du Règne animal y en rencontrassent aussi peu, si l'on ne se rendait pas compte des difficultés spéciales dont l'étude de certains vertébrés y est entourée.

Quelque restreints que soient les loisirs dont on peut disposer, ils:permettent toujours de colliger les plantes ou les insectes de la localité qu'on habite, on sait où les rencontrer, et c'est presque toujours à coup sûr qu'on procède à leur recherche; une fois récoltés, leur aménagement est facile, il exige peu d'espace, la préparation des sujets se fait sans apprentissage, n'oblige qu'à des dépenses minimes, et les ouvrages sur la matière, depuis les plus élémentaires jusqu'aux plus savants, sont nombreux. Il en est tout autrement pour les Mammifères et pour les Oiseaux doués d'une grande perfection

d'organes et de puissants moyens de locomotion, les individus qui composent ces deux grandes classes due Règne animal sont difficiles à capturer; les observer vivant est malaisé, leurs dépouilles mêmes, pour être conservées, exigent les préparations immédiates, souvent pénibles et répugnates, toujours délicates et que très-peu de personnes savent exécuter; dès qu'il s'agit d'animaux de grande taille, qui vivent loin des centres habités, les moyens de transport manquent souvent dans un pays non encore pourvu de voies de communication: toutes ces causes apportent au zèle des explorateurs des obstacles trop souvent insurmontables. Néanmoins, une collection est-elle réunie, elle exige un vaste local, l'installation en est longue, coûteuse, elle réclame des travaux et des soins continuels; les ouvrages sur la matière sont assez rares, leur prix très-élevé et encore n'est-il pas toujours facile de se les procurer.

Tels sont en abrégé les obstacles qui tout d'abord entravent l'étude de la Mammalogie et de l'Ornithologie. Cette étude, cependant, recèle un attrait si vif, que si l'on en surmonte les premières difficultés, on s'en éprend ardemment et on souscrit à toutes ses exigences! Nous le savons par expérience, car après lui avoir consacré tous les loisirs de notre vie, lui avoir sacrifié tous nos intérêts et nos plus légitimes espérances d'avancement, nous ne regrettons qu'une chose, c'est de n'être pas parvenu à faire davantage pour elle, et nous ne nous en consolons qu'en cherchant constamment à la glorifier et à lui créer des prosélytes.

Nous nous sommes dit que parler aux yeux est toujours le chemin le plus sûr pour arriver au coeur et à l'esprit, et faire naître cette envie d'apprendre, qui ira toujours s'augmentant si elle trouve à sa portée des moyens de satisfaction.

Pénétré de cette conviction, nous avons saisi avec empressement l'occasion de mettre nos théories en pratique, et M. le maréchal comte Randon, gouverneur général de l'Algérie, ayant créé à Alger une Exposition permanente des produits de ce pays, et nous ayant attaché à cet établissement, nous nous sommes résolument mis à l'oeuvre, et là, sans négliger la tâche qui nous est confiée, tâche que nos recherches au contraire doivent (nous l'espérons du moins) mieux nous mettre à même de remplir, nous sommes enfin parvenu à fonder une galerie zoologique exclusivement algérienne, où sont déjà réunis et classés les principaux types de la faune de ce pays, ce qui n'est pas un des moindres attraits qu'offre à ses visiteurs l'Exposition permanente des produits de l'Algérie.

Aux soixante-dix espèces de Mammifères et aux trois cent cinquante-sept espèces d'Oiseaux, mentionnés dans le catalogue que nous avons précédemmènt publié, nous devons déjà ajouter quinze espèces de Mammifères et douze espèces d'Oiseaux; ce résultat de nos récentes explorations nous fait bien augurer de l'avenir.

Les dépouilles de presque toutes les espèces mentionnées dans cet ouvrage figurent dans les galeries de notre Exposition permanente, et seront certainement le meilleur et le plus utile commentaire de ce traité de Mammalogié et d'Ornithologie algériennes.

Les collections d'OEufs, de Reptiles, Crustacés, Insectes, Mollusques, etc., que nous achevons de réunir dans l'établissement dont la direction nous est confiée, et les riches herbiers qui y sont mis à la disposition du public, ont aussi déjà fourni de très-utiles renseignements à ses visiteurs toujours plus nombreux.

Espérant populariser promptement en Algérie le goût des sciences naturelles, nous avons donné à nos recherches toute l'étendue qu'il nous a été possible; nous n'avons pas reculé devant la nécessité d'aller même, pendant les ardeurs de l'été, explorer les localités les plus malsaines, et d'où la crainte des fièvres éloignait jusqu'aux indigènes en d'autres circonstances, nous avons suivi nos colonnes expéditionnaires jusqu'aux extrêmes limites de nos possessions, fournissant chaque jour notre étape comme le soldat: nous avons ainsi pu poursuivre dans les immenses solitudes du Sud, au risque de nous y égarer, les espèces qui s'y confinent; malheureusement nous n'avions aucun auxiliaire, et obligé, comme nous l'étions, de consacrer nos nuits à la préparation des sujets et à la rédaction de nos notes, nous craignons, malgré toute la peine que nous avons prise et les sacrifices que nous avons accomplis, de n'avoir qu'imparfaitement réussi.

II reste beaucoup à faire dans un pays aussi richement doté, et qui est encore bien imparfaitement connu; nous serions heureux que nos faibles travaux pussent attirer sur l'Algérie l'attention des savants et des naturalistes, qui peuvent seuls achever la tâche que nous n'avons fait qu'ébaucher: nous

pouvons promettre à nos successeurs des facilités qui nous ont manqué; les collections que nous avons réunies dans les galeries de l'Exposition leur fourniront des indications dont l'absence nous a fait perdre un temps énorme, forcé que nous étions d'effectuer nos courses au hasard ; nous avons pourvu, autant que possible, les sujets de leur synonymie, ainsi que de leurs noms vulgaires et arabes, et de celui des localités où ils ont été capturés; des voies de communication perfectionnées se créent chaque jour en Algérie, les moyens de circulation s'y améliorent, l'étendue de nos possessions, la sécurité que le zèle éclairé et l'active surveillance, de l'administration sont parvenus à faire régner jusqu'à leurs extrêmes' limites, permettront d'explorer ce pays avec autant d'agrément que de fruit. Par un heureux privilège, cette contrée devenue française, offre au naturaliste le plus rare et le plus curieux assemblage de productions. La configuration de l'Algérie; sa position, son immense littoral, son Sahel, ses admirables plaines, ses hautes montagnes, ses forêts séculaires et même ses déserts, la mettent dans des conditions de température telles que peu de contrées du globe peuvent lui être comparées et montrer, sur un espace relativement peu étendu, une aussi grande variété des êtres auxquels la Providence assigne un rôle dans les harmonies de la nature. Tout invite à venir visiter ce pays, la bienfaisance de son climat ajoute à tous ses charmes un précieux attrait: que de personnes déjà lui doivent le retour d'une santé que les rigueurs des hivers européens avaient délabrée? Aux portes de la France, à laquelle il est relié par un rapide et régulier service de bateaux à vapeur et par un câble électrique, les rapports sont faciles et presque instantanés! Aussi espérons-nous que l'appel que nous nous permettons d'adresser aux amis des sciences naturelles, sera entendu. S'il en était ainsi, avant peu nous en ayons la conviction, l'attention du monde savant serait fixée sur la faune et sur la flore de cette admirable contrée, et combien nous nous féliciterions si, pour si peu que ce soit, nous pouvions contribuera ce résultat!

Il résulte des observations consécutives que nous avons réalisées sur les Mammifères et les Oiseaux de l'Algérie, que les espèces qui se rencontrent dans les parties septentrionales de ce pays, offrent de très-grands rapports avec leurs congénères de l'Europe méridionale, que beaucoup sont communs aux deux contrées, mais qu'à mesure qu'on s'avance vers le sud, l'analogie s'amoindrit et s'efface, d'abord pour les Mammifères, pour les Oiseaux ensuite; puis on remarque alors entre nos espèces algériennes et celles qui se trouvent en Nubie, en Abyssinie, au Sennaar, des similitudes de plus en plus frappantes.

Contrairement à ce que la différence de climat pourrait, *a priori*, faire supposer, la reproduction des Mammifères et surtout celle des Oiseaux s'effectue plus tardivement en Algérie qu'en France; il en est de même.pour la mue qui, ici, n'a guère lieu qu'un mois plus tard qu'en France.

Cette apparente anomalie a sa raison d'être et sa réelle utilité. Cette tardive reproduction évite aux nichées les inconvénients que les pluies du printemps, torrentielles en Algérie, ne manqueraient pas de leur occasionner.

La taille des Mammifères et des Oiseaux est en Algérie généralement un peu inférieure à celle de leurs congénères d'Europe, ce qu'on peut attribuer à une nourriture trouvée en moins grande abondance, dans un pays où de très-vastes espaces sont incultes.

Pour élucider cette question de l'influence que peut avoir sur la taille des individus l'abondance ou la disette de nourriture, nous rappellerons un fait que tous les chasseurs ont observé en France, à savoir: que les Perdrix qui vivent sur les montagnes sont bien moins grosses, que celles qui vivent dans les plaines. Les Perdrix étant particulièrement granivores, trouvent en conséquence, dans nos plaines de France bien cultivées et très-fertiles, une nourriture plus considérable que celle à laquelle sont réduites les Perdrix des pays de montagnes, où les céréales sont rares; de là certainement leur différence de taille.

En Algérie, les Perdrix préfèrent aux céréales des graminées sauvages, que la culture fait disparaître des plaines, et qui, au contraire, sont très-abondantes sur les montagnes; de là la taille supérieure des Perdrix de montagne. Ajoutons, comme argument corroboratif, que, dans le Sahara algérien, la taille de la Perdrix est encore bien plus petite que dans toutes les autres localités de ce pays.

La livrée des Mammifères et des Oiseaux offre, en Algérie, des teintes plus pures, plus nettes et plus brillantes que celle de leurs congénères d'Europe, mais ces différences, dues à une température plus élevée surtout en hiver, ne suffisent pas, avec la différence de taille mentionnée plus haut, pour constituer, en l'absence d'autres diagnostics, des caractères spécifiques.

II nous a été indiqué, comme se trouvant en Algérie, quelques espèces de Mammifères et d'Oiseaux que nous n'y avons point rencontrées, et dont la présence en ce pays ne nous semble pas assez certaine pour que nous pensions devoir les admettre. Nous ne signalerons donc, comme espèces algériennes, que celles dont nous ayons constaté la capture en cette contrée.

Dans le but de venir en aide aux personnes qui voudront effectuer des recherches zoologiques en Algérie, nous ajoutons aux noms vulgaires et scientifiques des espèces ceux sous lesquels les Arabes les désignent, afin de faciliter ainsi aux explorateur, les moyens de s'entendre avec les indigènes. C'est principalement à M. Schousboë interprète principal, que nous devons ces utiles renseignements.

Nous ferons remarquer que les indigènes, loin de donner à chaque espèce un non spécial, désignent par la même appellation toutes celles qui leur semblent avoir quel que conformité d'orgànisation, de mœurs ou de physionomie. Le nom arabe correspond donc plus généralement à un nom de genre, et même parfois de famille, qu'celui d'une espèce.

Parmi les Mammifères, le Magot commun (la seule espèce de l'ordre des Primates que nous ayons rencontrée en Algérie) est connu des Arabes sous le nom de Chadi.

Le Chacal est appelé Dib.
Les différentes espèces de Renards sont confondues sous la dénomination de Tsaalb.
L'Hyène est connue sous le nom de Debaâ;
La Mangouste sous celui de Zerdi;
Les deux espèces de Genette sous la même appellation de Khot-el-Ghali.
Le Lion est désigné par les Arabes sous le nom de Sebaà. Les Marocains le nomment Axed.
La Panthère est appelée Nemeur, et probablement aussi le Serval?
Le Guépard a un nom spécial, celui de Fehed.
Le Caracal est nommé Anag-el-Ard.
Les divers Félis se nomment indistinctement Kot-el-Khla.
La Belette d'Algérie ou Putois Boccamele est appelée Far-el-Kheil.
La Loutre est désignée sous le nom de Kilb-el-Ma.
Le Sanglier est connu sous la dénomination de Hallouf-el-Ghaba.
Le Chameau est appelé Djemel, et le Chameau-coureur Mehari.
L'Antilope Addax est connue dans le Sud sous le nom de Meha.
Les .deux espèces de Gazelles portent le mênre nom, Ghzala ou Bezala.
Le Bubale est nommé Begra-el-Ouahch;
Le Moufflon à manchettes, El-Arouy.
Tous les Vespertilionidés sont connus des Arabes sous la dénomination générale de Their-Ellil, tandis que les Marocains les nomment Onthouith.
Les diverses Musaraignes, aussi bien que les petits Rongeurs, sont indiqués par le même nom de Far-el-Khla.
La Macroscélide, selon les contrées, est nommée Far-el-Kheil, comme la Belette, ou Erbib-el-Helalif.
Le Hérisson est nommé Ganfoud.
Les diverses espèces de Gerboises ont la même dénomination, Djerboa.
Le Cténodactyle, et probablement quelques espèces de Gerbilles, sont nommés Gird ou Djird.
Le Rat rayé ou de Barbarie est nommé Zordani.
Le Porc-Epic est appelé Darban.
Le Lièvre se nomme OErneb.
Le Lapin Gounïn.

Il nous a été impossible d'obtenir aucun renseignement sur les noms de quelques Mammifères, que les Arabes ne veulent pas considérer comme tels; le Dauphin et le Phoque sont pour eux des Poissons, voilà tout; mais quant à une autre désignation spécifique, ils n'ont pas pu nous l'indiquer.

Si, parmi les Oiseaux, quelques espèces sont connues des Arabes sous des noms spéciaux, il en est d'autres auxquels ils n'ont même pas appliqué une dénomination générique.

Tout Vulturien est nommé Ennesser ou Nesser.
Le Gypaëte, comme les Aigles en général, a reçu des Arabes le nom de El-Ogab.

Le Néophron, probablement en raison de sa petite taille et de sa coloration, possède un nom particulier, Rähhma ou Errakhma.
Les habitudes spéciales-du Balbusard et sa manière de vivre, le font désigner sous celui de Boukhatem.
Tous les Milans sont confondus sous le nom générique El-Essaf. Les Marocains les nomment Siouna.
Les Faucons, que cependant les chefs arabes utilisent pour la chasse, sont tous désignés sous la même appellation, Taïr-el-Hor.
Les Busards et les Buses, que nous avons parfois entendu nommer Taïr-el-Baz, sont le plus souvent nommés comme les Milans, Essaf.
Toutes les grandes espèces de nocturnes, et surtout la Chouette-Hulotte, que les Arabes connaissent bien, sont appelés par eux Bourourou, par onomatopée probablement.

Les petites espèces sont plus spécialement, désignées sous le nom de Youka ou Moukha, qu'ils appliquent, aussi aux Engoulevents.
Les Martinets et les Hirondelles sont tous nommés Khothaïfa.
L'aspect particulier de la Huppe lui a valu un nom spécial, Hadhoid.
Le Coucou, par analogie avec son chant, est appelé Tekouk.
Pour tous les Pics, il n'est qu'un nom, Nekkab-Essedjàr.
Le Martin-Pêcheur porté seul le nom de Mekkiet-el-Ma.
Les Guépiers sont nommés Elliamoun. Les Européens, les nomment Chasseurs .d'Afrique.
Le Rollier, que les Arabes nomment Cherrekhbrok, est le Geai bleu des Européens
Toutes les Mésanges sont nommées, par les Arabes, Bou-Reziza.
Les Bergeronnettes, Emsissi ou Messissi.
Le Merle, le Turdoïde, et peut-être quelques autres espèces encore, sont désignés sous le nom de Djahmouna.
Le Rossignol et la plupart des Becs-Fins chanteurs sont tous indistinctement nommés Belbel ou Oum-el-Hassem.
Toutes les Pies-Grièches n'ont qu'un seul nom, Bousseround.
Le Geai, qui, en Algérie, est appelé Djirire, se nomme Derraz au Maroc.
La Pie, que par imitation de son cri les paysans nomment si généralement Agasse en France, est probablement, par le même motif, appelée par les Arabes Agâag.
Les Corvidés sont connus sous le nom générique El-Ghorab.
Le Crase Coracias est désigné, par les Arabes, sous le nom d'Ogrieb-N'sara, ou, Corbeau des chrétiens.
L'Étourneau vulgaire et l'Unicolor n'ont qu'une même désignation, Zerzour.
Le Bruant Proyer, et nombre d'autres espèces que les Arabes n'en distinguent pas sont compris sous une même désignation, celle de Dorriz ou Derris.
Les Moineaux, que les Arabes nomment Zaouch, sont appelés Borthal par les Marocains.
Le Chardonneret est nommé Mokhnim.
Le Pigeon Ramier ou Palombe est spécialement appelé Zaotoul.
Le Biset et le Colombin sont nommés l'un et l'autre Hamman-el-Berri.
Les Gangas sont désignés sous le nom deKoudri.
Les Caâtas portent celui de El-Guetâa.
La Perdrix porte le nom harmonieux de Hadjel.
Le Craterope fauve ou numide, Errebib el Hadjela (fils adoptif de la Perdrix).
La Caille et aussi le Turnix sont indifféremment désignés sous les noms de Melloh, Melloha ou Semmana.
La Foulque macroule et la Foulque à crête ont la même dénomination de El-Ghor que partage peut-être encore la Poule-d'eau
Le Courre-Vite Isabelle est nommé Souaq-el-Ibe (piqueur de Chameaux).
La Grue, qui n'est cependant que de passage en Algérie,.est connue des Arabes sous le nom de Gharnouy, sous lequel est- aussi désignée probablement la Grue-Demoiselle.
L'Outarde cannepetière, si connue des Européens en Algérie sous le nom de Poule de Carthage, est nommée par les Arabes Râad, et par les Marocains Sefsaf.
Les Otis, Tarda, Arabs, Houbara, n'ont qu'une seule désignation, celle de Hobara.
L'Outarde par excellence des Européens en Algérie est l'Outarde Houbara, celle que les chefs arabes chassent au Faucon.
L'OEdicnème porte le nom de Kirouna.
Le Vanneau, celui de Bibetli.
Le Pluvier doré, et probablement aussi le Guignard, se nomment Dorrich ou Dorridj.

L'Ibis Falcinelle est plus connu des Marocains que des Arabes, sous le nom de Mâazet-el-Ma.
Les Hérons sont en général nommés en Algérie Bou-Ank, et au Maroc Aichauch.
Le Butor a un nom spécial, celui de Sebou-eî-Merdja.
La Cigogne, très-répandue en Algérie, et qui niche sur les gourbis des Arabes, est nommée par eux Belaredj et Boucherkchakh.
La Spatule est appelée Bouquerquaba.
Le Phénicoptère se nomme Nihof ou Nehof.
L'Oie est appelée Onza, et le Cygne n'a probablement pas d'autre désignation.
Le Canard sauvage partage, avec toutes les espèces de sa famille, la dénomination générique de Zergue-Erras.

Nous n'avons pu obtenir aucun renseignement sur les noms des petits Echassiers et des Pélagiens, assez nombreux cependant en Algérie.

Les Mammifères et les Oiseaux de l'Algérie qui sont les plus connus, sont ceux qui, communs à cette contrée et à quelque autre partie du globe, ont été décrits et figurés dans des ouvrages devenus claissiques.

Les espèces plus récemment découvertes ou d'aspect moins remarquable, ne possèdent pas les mêmes avantages; ce n'est que dans des ouvrages spéciaux ou des publications périodiques, peu faciles à consulter, qu'on peut en trouver les descriptions quelques-uns même sont encore inédits.

Ces différences nous imposeront l'obligation de décrire d'autant plus longuement une espèce, qu'elle-sera moins connue. Quand faire se pourra, nous citerons, *in-extenso*, la description, de l'auteur initial; mais s'il l'avait publiée dans une langue avec laquelle nous serions trop peu familiers pour en être un traducteur suffisant, nous nous bornerons à reproduire sa diagnose.

La synonymie, dont chaque espèce sera accompagnée, en donnant pour les individus que nos grands maîtres ont si bien fait connaître, les moyens de se reporter à leur ouvrages, pourra nous permettre d'abréger nos descriptions, et de n'y ajouter que les détails qui nous paraîtront susceptibles d'intéresser.

Le système de classification de Son Altesse le prince Charles-Lucien Bonaparte ayant été appliqué aux galeries ornithologiques du Muséum d'histoire naturelle de Paris, magnifique établissement que d'immenses richesses, des moyens d'étude et de comparaison hors ligne et sans cesse accrus par le zèle de ses administrateurs, font chaque jour consulter avec plus de fruit, et les ouvrages de cet illustre savant, étant d'ailleurs entre les mains de toute personne s'occupant un peu sérieusement de Zoologie, nous avons cru faire une chose bonne et utile en nous conformant, pour l'arrangement systématique de cet ouvrage, comme nous l'avions fait pour les catalogues qui l'ont précédé, à la méthode de classification de ce célèbre zoologiste.

Nous savons bien que, n'ayant à nous occuper que des espèces d'une seule contrée, de nombreuses lacunes existeront nécessairement; mais c'est un inconvénient qui eût toujours été inévitable, quel que fût le système auquel nous nous fussions arrêté; nous conviendrons au surplus que, tout en reconnaissant les services qui pourraient être rendus à la science par une méthode de classification dont la perfection ne serait pas contestée, nous craignons qu'une telle méthode ne soit vainement espérée, et nous avons préféré suivre celle du prince, déjà expérimentée, que de venir, nous aussi, essayer d'innover et compliquer ainsi des difficultés qui n'ont que trop éloigné des sciences naturelles les personnes qui ne peuvent y consacrer que de courts loisirs, et auxquelles l'impossibilité de se reconnaître au milieu de tant de divisions et d'appellations nouvelles a fait abandonner cette intéressante étude, qui est ainsi menacée de devenir l'apanage exclusif d'un petit nombre d'initiés.

Trop de .personnes aujourd'hui semblent croire que l'établissement d'un système de classification est le but, au lieu d'être le moyen; quant à nous, qui voudrions populariser la science, au lieu d'en faire le monopole de quelques privilégiés pouvant lui consacrer tous leurs instants, et qui n'estimons un système que pour les facilités d'étude qu'il procure, bien convaincu que celui avec lequel on est déjà familier rendra plus de .services qu'aucun autre, nous ne changerons rien à celui d'après lequel ont été rédigé nos catalogues.

Lönnberg, E. (1908c). Notes on some mammals collected in the Congo Free State.

The following small collection of mammals was delivered to the R. Natural History Museum in Stockholm some time ago by the Swedish Missionary, Mr K. E. LAMAN, who previously has shown his interests for the zoology by collecting birds and insects, and thus in a valuable manner has increased our knowledge about the fauna of Lower Congo. The mammals mentioned below, and partly described as new, have been collected at Mukirnbungu below Manvanga , about an hours way from Congo River in Lower Congo.

Lönnberg, E. (1917a). Mammals collected by H.R.H. Prince Vilhelm's Expedition to British East Africa, 1914.

When H. R. H. Prince VILHELM had returned from his shooting expedition to British East Africa it pleased H. R. H. to present to the R. Natural History. Museum a valuable collection of mammals in addition to the collection of birds which I have had the honour of describing before. This collection of mammals contains about 115 specimens of various small mammals and in addition to this several heads of antelopes and other game. Especially among the former there are several forms of special interest and even new ones. Among the latter I have the honour of dedicating a new *Dendrohyrax* to H. R. H. to whom the Museum is indebted for this valuable donation.

The specimens have been mostly collected at Donya Sabuk and are prepared by Mr. CH. A. TURNER,who has done his work very well.

Lönnberg, E. and N. Gyldenstolpe (1925). Zoological results of the Swedish expedition to Central Africa 1921. Vertebrata. 3. Preliminary diagnoses of four new mammals.

The following mammals were collected during the expedition mentioned by H. R. R. Prince WILHELM and Count GYLDENSTOLPE. The type-specimens are all kept in the R. Nat. Hist. Museum in Stockholm.

Lopes, F. J. and J. Crawford-Cabral (1992). Catálogo dos Chiroptera em colecçao no Centro de Zoologia.

São listados neste trabalho 433 exemplares de Chiroprera, em colecção no Centro de Zoologia do Instituto de Investigação Científica Tropical, pertencentes a 30 espécies. Três dessas espécies são registadas pela primeira vez para a fauna da Guiné (*Taphozous perforatus, Eptesicus somalicus* e *Pipistrellus nanus*) e duas para a de Macau (*Pipistrellus abramus* e *Miniopterus schreibersi*).

The authors report 433 specimens of Chiroptera housed in Centro de Zoologia of Instituto de Investigação Científica Tropical. As many as 30 species are listed. Three of these species are recorded for the first time from Guiné (*Taphozous perforatus, Eptesicus somalicus* and *Pipistrellus nanus*) and two from Macau (*Pipistrellus abramus* and *Miniopterus schreibersi*).

Loveridge, A. (1923). Notes on East African mammals, collected 1920 - 1923.

The present paper may be looked upon as supplementary to the 1915 - 1919 notes, as localities then recorded are not repeated (except in one or two instances) or similar observatins duplicated.

A new feature of the present paper is the inclusion of carefully ascertained native names from only those tribes in whose district the specimens were collected. I consider it of importance that these names should be collected as soon as possible for, with the increasing facilities for travel, many tribes - especially along the Central Railway - are rapidly forgetting their specific names for animals and

adopting the blanket-names of the town bred coast Swahili, who call every rat, excepting Cricetomys, "Panya." The rat-eating Wagogo and Wanyaturu, on the other hand, have specific names for almost every species.

I have avoided using names supplied by other tribes until that particular animal has been collected in their particular district, as when a native is asked for the name of an animal he is not familiar with he will invariably supply you with the name of the nearest creature in appearance to it that he knows, and at times these may not be even related (e.g., lemurs and squirrels, or mole-rats and blesmols). For these reasons a very large percentage of names collected by travellers and given by Matschie are quite wrong (e.g. on p. 65, "Uma mwitu" is given for the jackal instead of "Mbweha"). Umba ya mwitu is the hunting dog, and means "dog of the bush." Matschie gives for its Chigogo (not Kigogo) name "Mbua ya porini," which is mererly the concoction of a bright native, as Iminzi is the correct Chigogo equivalent. None but a naturalist can hope to obtain native names of animals with any degree of accuracy, and only then by a lengthy cross-questioning can he be certain there is no confusion.

In this connection I should like to express my thanks to the Rev. John Briggs, who very kindly and thoroughly revised my whole vocabulary of Chigogo names, to Messrs. Thomas and Kershaw, for identifying all the primates, bats, and rodens, and a good many in the other groups (most of the ungulates were not submitted owing to the expense of freighting them); to Dr. Baylis, Mr. Stanley Hirst, and the late Hon. N.C. Rothschild, for kindly determining the parasitic worms, ticks, and fleas; and lastly, but not least, to my chief, C.F.M. Synnerton, Esq., for the encouragement and interest he has shown in my work, and for permission to publish various notes jotted down whilst on official journeys.

The material mentioned in the following pages consists of 920 skins and skulls, comprised as follows:

Order - Families - Genera - Species - No. of specimens.
Primates: 2 - 4 - 10 - 40
Chiroptera: 8 - 14 - 22 - 200
Insectivora: 3 - 5 - 13 - 43
Rodentia: 9 - 25 - 46 - 417
Carnivora: 5 - 15 - 28 - 120
Ungulata: 5 - 20 - 24 - 100
Totals: 32 - 83 - 144 - 920

As for two years of the time the writer was stationed at Kilosa, in the office of the Game Department, he had to rely on native collectors to a great extent. The success of the collecting is largely due to the enthusiasm of two brothers, Salimu and Nikola, who collected over 600 skins and exhibited the greatest keenness in looking for novelties. It need not be supported that the skins are poor on this account; on the contrary, I think they will compare very favourably with any made by Europeans.

It is to be regretted that in the great majority of cases the taking of the measurements had to be left to Nikola, but after checking him on many occasions I have sufficient confidence to believe that they are of some value, though it should be borne in mind that a native does not usually see the necessity for such accuracy as does the mammalogist. Where measurements are given in this paper they are always in this order: - (i.) Length from nose to vent. (ii.) Length of tail withoug terminal hairs. (iii.) Length of hind foot without claws. (iv.) Length of ear from tip to notch. In the case of bats a fifth measurement is added: (v.) Lengto of wing, sometimes across outstretched wings as well. All figures are in millimetres.

Four new species and one new race have already been described from this material by Mr. P.S. Kershaw, viz., *Nycteris marica, Elephantulus renatus, Steatomys muansæ, Arvicanthis tenebrosus*, and *Rattus chrysophilus singidæ*.

Lundberg, K. and R. Gerell (1986). Territorial advertisement and mate attraction in the bat *Pipistrellus pipistrellus*..

A South Swedish population of the vespertilionid bat *Pipistrellus pipistrellus* was studied by means of bat boxes from April to the beginning of October in 1984. The mating system of the pipistrelle bat is a

"resource defence polygyny". Three territorial males were studied to determine the relative importance of two potential resources, food and roost sites, for male reproductive success. The day roost was found to be the crucial resource for the male's chances to get access to females. A territorial male advertises the location of his day roost to the females by a songflight display. The male who spent most time in songflight display was visited by the greatest number of females.

Lunde, D. P. and P. Beresford (1997). Noteworthy records of bats from the Central African Republic.

The bat fauna of the Central African Republic is among the most poorly known in Africa. Schlitter et al. (1982) provided a comprehensive survey of what little was known of that fauna, along with 20 new species records for the country. The following year Hill (1983) reported an additional four species, bringing the total species count to 49.

During November and December 1996, the American Museum of Natural History initiated a collecting expedition to the Dzanga Sangha Special Dense Forest Reserve, in southernmost Central African Republic. We netted at the confluence of the Sangha and Babongo Rivers, approximately 6 km north of Bayanga, Habitats sampled include dense, inundated forest, characterized by stilt-rooted trees (*Uapaca* sp.) and vast areas of herbaceous plants of the Marantaceae family, and secondary forest along logging roads (Carroll, 1988).

Eleven bat specimens were collected, representing eight species from four families; only towards the end of the collection effort was it discovered that the local residents were regularly taking bats form nets to supplement their diet. Yet despite the small sample size, three of the eight species collected were new records for the country. We report on these specimens and provide an amended list of all species known from the Central African Republic (Table 1). This addition to the chiropteran fauna of the southwestern Central African Republic augments the expectations of Schlitter et al. (1982) that several dozen species remain as of yet unreported from this poorly collected region of central Africa. The specimens are housed in the Department of Mammology of the American Museum of Natural History.

Lynch, C. D. (1975). The distribution of mammals in the Orange Free State, South Africa.

Distribution records of mammals in the Orange Free State are scantily mentioned in ROBERTS (1951), ELLERMAN, MORRISON-SCOTT &. HAYMAN (1953), MEESTER (ed.) (1966 to 1969), and MEESTER & SETZER (eds.) (1971). For many species only a generalized distribution pattern is given e.g. the distribution is given as eastern O.F.S. or semi-arid regions. The distribution in the O.F.S. of some mammal groups are discussed by VON RICHTER (1972), VON RICHTER, LYNCH, & WESSELS (1972), and DAVIS (1974), while that of certain genera are dealt with by MEESTER (1963), MEESTER & LAMBRECHTS (1971), and ROWE-ROWE (1972).

Lynch, C. D. (1994). Mammals of Lesotho.

This is the first scientific publication, based on comprehensive collecting, describing the occurrence of mammals in the Kingdom of Lesotho. The object of this study was to produce a checklist of mammals occurring in Lesotho which lies between latitudes 28° 33' and 30° 41'S and longitudes 27° 00' and 29° 28'E. Particular attention was paid in this checklist to distribution patterns and how these relate with those of mammals from adjacent areas such as the Orange Free State, north-eastern Cape Province and Natal. Thirteen localities were surveyed, while information for several additional localities was obtained through other sources. Fifty-two species of 43 genera of the orders Insectivora, Chiroptera, Primates, Carnivora, Hyracoidea, Artiodactyla, Rodentia, Lagomorpha and Macroscelidea were found to occur in Lesotho. These have been discussed under the subheadings of distribution, habitat, breeding, linear measurements and mass, and records of occurrence. Additionally, 13 species of another 11 genera possibly occur.

Lynch, C. D. and J. P. Watson (1990). The mammals of Sehlabathebe National Park, Lesotho.

An annotated checklist of mammals occurring in Sehlabathebe National Park, Lesotho which lies between latitudes 29° 51' 05" and 29° 58' 00"S and longitudes 29° 04' 00" and 29° 10' 24"E is given. The low mammal diversity found at Sehlabathebe is ascribed to the high altitude, harsh climate, and relatively uniform topographic relief as well as the paucity of woody vegetation in the Park. Nevertheless a total of 32 species are currently recorded in the Park, with a further predicted 11 species and a further five, now extinct, used to occur in the area. These 48 species represent the orders Insectivora, Chiroptera, Primates, Carnivora, Hyracoidea, Artiodactyla, Rodentia and Lagomorpha. Seven of these species are included in the South African Red Data Book under the categories vulnerable, rare and indeterminate while eight species are endemic to greater South Africa and two to southern Africa.

MacDonald, K., E. Matsui, R. Stevens and M. B. Fenton (1994). Echolocation calls and field identification of the Eastern Pipistrelle (*Pipistrellus subflavus*: Chiroptera: Vespertilionidae), using ultrasonic bat detectors.

In the field, *Pipistrellus subflavus* produces 5-ms-long, broadband, echolocation calls when flying in search of airborne prey. These calls typically have two strong harmonics, the first with energy between 35 and 19 kHz and the second with energy between 70 and 38 kHz. To an observer with two narrowband bat detectors, one tuned to 40 kHz and the other to 20 kHz echolocation calls of *P. subflavus* are distinct from those of other syrnpatric species in the northern part of its geographic range.

Madkour, G. A. (1977). A comparative study of certain features of the alimentary canal and disposition of the viscera in egyption bats.

The general structure of the alimentary canal has been studied in fourteen species of Egyptian bats belonging to the family Pteropidae of the Megachiroptera, and the families Rhinopomatidae, Emballonuridae, Nycteridae. Rhinolophidae, Hipposideridae, Vespertilionidae, and Molossidae of the Microchiroptera.

The tongue of the megachiropteran bat, *Rousettus aegyptiacus*, differs from that found in the Microchiropteran species studied in bearing: only two kinds of papillae - the circumvallate and the filiform. The fungiform papillae are absent, although they are found in all the Egyptian Microchiroptera investigated, where they are located usually on the margins of the tongues.

Three circumvallate papillae occur in *R. aegyptiacus* and they are similar in appearance. In *Rhinopoma*, however, the apical third papilla is slit-like, whereas in all the other Microchiroptera studied there are only two circumvallate papillae.

The filiform papillae occur on most of the area of the tongue, but they vary in distribution, size and form in the different species. In *Rousettus* two kinds of these papillae are predominant: the large papillae and the horny ones. The latter are tridentate. In the Egyptian Microchiroptera the filiform papillae are of three types: the small, the large, and the horny (mono- or trifid) ones.

The palatal rugae also differ in the different species. Nine such rugae are present in *R. aegyptiacus* and a central raphe extends between them from the sixth to the eighth. *Nycteris, Rhinolophus* and *Asellia* form a distinct group in which these rugae do not extend beyond the level of the anterior third portion of the second molar teeth. In the other bats the last rugae extend behind this level. Accessory rugae occur in most of the microchiropteran bats, but not in *Rousettus*.

The various parts of the alimentary tract showed marked differences in size, shape and length. The stomach in *Rousettus* is long and tubular, whereas in the microchiropteran bats it is much wider, almost

mallet-shaped. The longest intestinal canal was found in *Rousettus*. The species of *Nycteris, Rhinolophus* and *Asellia* form a difinite group as regards the length of this region; it is nearly of the same length in each of them. Simpson (1945) grouped these bats in the superfamily Rhinolophoidea and Wassif and Madkour (1969, 1972 a, 1973) found similarities in them in the presence of laryngeal pouches, the location of the palatal rugae, and the structure of the pelvis.

Madkour, G. A. (1978). Significance of the distal part of the humerus in the identification of Egyptian bats.

This investigation deals with a comparative study of the distal part of the humeri of fourteen bats which are *Rousettus aegyptiacus aegyptiacus* (Pteropidae - Megachiroptera - *Rhinopoma hardwickei sennaariense, R. microphyllum microphyllum* (Rhinopomatidae), *Taphozous perforatus perforatus, T. nudiventris nudiventris* (Emballonuridae), *Nycteris thebaica thebaica* (Nycteridae), *Rhinolophus clivosus brachygnathus* (Rhinolophidae), *Asellia tridens tridens* (Hipposideridae), *Pipistrellus kuhli marginatus, P. rüppelli rüppelli, Otonycteris hemprichi hemprichi, Plecotus austriacus christiei* (Vespertilionidae), *Tadarida aegyptiaca aegyptiaca, T. teniotis rüppelli* (Molossidae) - Microchiroptera. This distal part of the humerus shows no remarkable specialization in the Megachiroptera, while in the Microchiroptera the entocondyloid tuberosity is large. Other structures were also described in these bats.

Fourteen species of bats were collected from different localities of Egypt, and the distal parts of their humeri were used for comparison between them. The bats belong to the family Pteropidae of the Megachiroptera, and Rhinopomatidae, Emballonuridae, Nycteridae, Rhinolophidae, Hipposideridae, Vespertilionidae, and Molossidae of the Microchiroptera.

The most complicated end of the humeri in these bats, is that of *Nycteris thebaica*, and the least specialized, is that of *Rousettus aegyptiacus*. In this latter bat, the capitulum is smaller and the medial epicondyle is stout. Although members of a definite genus may look similar in many anatomical structures, yet, they differ in the shape of the distal part of their humeri. The medial epicondyle of the *Rhinopoma hardwickei* is blunt and bigger than that of *R. microphyllum*. In *Taphozous perforatus*, the epicondyle is long and terminates distally by a pointed projection. This structure in *T. nudiventris* differs, and is prismatic in shape.

Members of the genera *Nycteris, Rhinolophus*, and *Asellia* are usually grouped in one Superfamily Rhinolophoidae SIMPSON 1945. They are similar in may anatomical features concerning the presence of laryngeal pouches, the palatal rugae, the structure of the pelvis (WASSIF and MADKOUR 1969, 1972, and 1973) and the dimensions of the intestine (MADKOUR 1977). *Asellia tridens* differs in having a very long styloid process, whereas in *Nycteris thebaica* the medial epicondyle projects medially forming a very long and broad process. This epicondyle in *Rhinolophus clivosus* is least specialized, and is prismatic in shape.

Each member of the family Vespertilionidae differs from the others. In *Otonycteris hemprichi*, the distal end of the humerus is robust with a large capitulum. The medial epicondyle is the largest and projects cranially. A pointed lateral epicondyle is found in *Pipistrellus kuhli* and *P. rüppelii* which is projected laterally in the former, and cranially in the latter. The distal end of the humerus in *Plecotus austriacus* is simpler than those of the other bats.

Of the family Molossidae, the trochlea of *Tadarida aegyptiaca* is much larger than that of *T. teniotis*.

Madkour, G. A. (1988). Faces of Microchiroptera from Egypt.

The morphology of faces of Microchiroptera found in Egypt, is very important for the identification of these animals. The present study contains brief descriptions of the faces of thirteen microchiropterous bats collected from the various localities of Egypt. These bats are *Rhinopoma hardwickei, R. microphyllum* (Rhinopomatidae); *Taphozous perforatus, T. nudiventris* (Emballonuridae); *Nycteris thebaica* (Nycteridae); *Rhinolophus clivosus, Asellia tridens* (Rhinolophidae); *Pipistrellus kuhlii, P.*

rueppelli, Otonycteris hemprichi, Plecotus austriacus (Vespertilionidae); *Tadarida aegyptiaca* and *T. teniotis* (Molossidae.

Maeda, K. (1972). Growth and development of large noctule, *Nyctalus lasiopterus* Schreber.

Cette étude qui traite de quelques aspects de la croissance et du développement de la Grande noctule, *Nyctalus lasiopterus* Schreber, a été effectuée à Sapporo en 1966 et en 1967 à notre laboratoire, sur les terrains de l'Université de l'Hokkaido et au Jardin des plantes. Nous avons au préalable captué quelques femelles au filet sur les terrains de l'Université et au Jardin des plantes. Notre travail est principalement basé sur l'observation des petits qui sont nés en laboratoire de ces femelles. Nous avons aussi intégré a notre étude des observations sur le terrain.

Several aspects on the growth and development of the Large noctule, *Nyctalus lasiopterus* Schreber were described. This work is mainly based upon the observations of the young which were born in our laboratory from captive bats netted in the botanical garden and on the campus of Hokkaido University, Sapporo. In addition to the study of the captive animals, field observations were also carried out in these habitats.

The young are born between about the 20th of June and about the 10th of July in Sapporo.

At birth, the young had vibrissae and hairs on the lower base of their claws of their thumbs and of their hind feet. Some of them had no hairs on the body but others had sparsely scattered thin hairs on the back and belly of the body. The pinnae and tragi of the young were folded over or unfolded and held erect. The lids of the eyes were sealed at birth. The measurements of the new born young are shown in Table 2.

The opening of the eyes occurred at 4 to 11 days of age. All the ears and tragi unfolded and were held erect by 7 days of age. The body hairs began to grow from the dorsal side of rump to the head, and to the ventral sides a little later and finally spread all over the body. At about 40 days of age the body hairs of young reached about the same lenght as those of the adult. The colour of hairs of young was darker than the adult's. The growth curves of several dimensions were shown in Fig. 1 to 4. The young began to fly at about 40 days of age when they grew up to nearly the same size as the adult.

The common litter size was two, but some females had only one young. Sex ratio (♂/♀) of young was 0.77.

Different growth and development were observed between singleton and twin.

Generally, the young are left in the roost during the time when the mothers fly out to get food.

Mainoya, J. R. and K. M. Howell (1979). Histology of the neck 'glandular' skin patch in *Eidolon helvum, Rousettus aegyptiacus* and *R. angolensis* (Chiroptera: Pteropodidae).

The histology of the neck ‘glandular’ skin patch has been examined in three Pteropodid bat species, *Eidolon helvum, Rousettus aegyptiacus* and *R. angolensis*. In *E. helvum* the neck skin patch contains a large sebaceous gland complex, which is better developed and more active in males than in females.

A comparable area in *R. aegyptiacus* contains rather non-specialized sebaceous gland alveoli in association with hair follicles and which are more active in males than in females. In *R. angolensis* the brush-like hair of the neck skin patch is much longer and coarser in the male than in the female, but in neither sex was the skin patch glandular.

On the basis of histological observations, the neck skin patch in *E. helvum* would appear to be important for scent emission while in *R. aegyptiacus*, the same structure would be less so. In *R. angolensis*, the neck skin patch, though covered by longer brush-like hair than in other species, contained almost no glandular tissue and perhaps functions to provide visual rather than olfactory behavioural cues.

L'histologie des régions cervicales de peau 'glandulaire' a été examinée chez trois espèces de chauve-souris Ptéropodides (*Eidolon helvum, Rousettus aegyptiacus* et *R. angolensis*). Chez *E. helvum*, cette région contient une grande glande sébacée complexe mieux développée et plus active chez les mâles que chez les femelles. Chez *R. aegyptiacus*, cette même région contient des alvéoles d'une glande sébacée assez peu spécialisée, associées à des follicules pileux, qui est plus active chez les mâles que chez les femelles. Chez *R. angolensis*, la fourrure hérissée de la région cervicale est plus longue et plus raide chez le mâle que chez la femelle, mais la peau n'est glandulaire chez aucun des deux sexes.

Sur la base d'observations histologiques, la région cervicale de la peau chez *E. helvum* semble responsable de l'émission d'odeur alors que chez *R. aegyptiacus*, la même structure l'est à un degré moindre. Chez *R. angolensis*, bien que couverte par des poils plus longs et hérissés que chez les autres espèces, la région cervicale de peau ne contient presque pas de tissu glandulaire et fonctionne peut-être pour fournir des indications comportementales plus visuelles qu'olfactives.
