Gill; collection date: 2 June 1967. - Etymology: The name *francoismoutoui* is a patronym in honour of Dr. François Moutou of the Unité d'Epidémiologie, Agence Française de Sécurité Sanitaire des Aliments, Maison Alfort, France. Dr. Moutou has made important contributions to the vertebrate fauna of the Mascarene Islands, particularly La Réunion (Goodman *et al.*, 2008c: 1319). (Current Combination)

TAXONOMY:
Formerly identified as *M. acetabulosus* see Goodman *et al.* (2008c: 1316).

COMMON NAMES:
Czech: morous réunionský. English: Reunion Free-tailed bat. French: Petit molosse, Tadaride de La Réunion. German: Reunion Mastino-Fledermaus.

CONSERVATION STATUS:
Global - Goodman *et al.* (2008c: 1325) state it is under no serious threat of population decline in the near future. Augros *et al.* (2016: 372) refer to IUCN (2010) and mention "LC" as status.

CONSERVATION ACTIONS:
On the basis of territorial legislation, all bats on La Réunion are protected by law (Arrêté of 17 April 1981 and of 17 February 1989) (Goodman *et al.*, 2008c: 1325).

GENERAL DISTRIBUTION:
Mormopterus francoismoutoui has been recorded from a variety of localities on La Réunion from sea level to about 2,000 m (Moutou, 1982; Goodman *et al.*, 2008c).

Native: Réunion (Goodman *et al.*, 2008c: 1316).

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Mormopterus francoismoutoui is a relatively large member of the genus *Mormopterus*. Its dorsal body fur is short and dense with a rich dark brown color and its ventrum is slightly paler. Wing membrane and uropatagium are brownish black and show no noticeble change in pigmentation across their surface area. In adult males, there is a large glandular sac on the ventral portion of the lower neck; this gland is absent in females (Goodman *et al.* (2008c).

An albino specimen was reported by Ramasindrazana *et al.* (2014: 103) and Lucati and López-Baucells (2016: Suppl.).

DENTAL FORMULA:
I $^{1}/_{3}$, C $^{1}/_{1}$, P $^{1}/_{2}$, M $^{3}/_{3}$ = 30

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:
See Goodman *et al.* (2008c): The skull of *M. francoismoutoui*, as with most other members of this genus, is not noticebly flattened and has a long rostrum and well-developed lachrymal tubercles. The postorbital processes are well developed and distinctly shaped. The palatal emargination is well developed, similar to character state 4 for variable C65 of Freeman (1981b). Basisphenoid pits are present, but are not prominent, and there is a pronounced extension of the palatal spine descending onto the palatine bone.

ECHOLOCATION:
Barataud and Giosa (2013: 150) analyzed 63 sequences from *M. francoismoutoui* specimens on Réunion and found QFC = 77 kHz and FM = 176 kHz

HABITS:
The holotype and associated specimens roosting in the expansion joint of a bridge were observed to roost in a vertical position (head down) in very narrow crevices (Goodman *et al.*, 2008c: 1319).

ROOST:
Found in a variety of different roost sites, ranging from natural caves to synanthropic situations (Goodman *et al.*, 2008c). The holotype and associated specimens were extracted by hand from the expansion fissures in the lower portion of a concrete bridge (Goodman *et al.*, 2008c). Moutou (1982) found the species to roost in the crevices found in the rock faces around the island. It is also associated with a variety of human structures, including open roofs, roof slats, and window shutters (Goodman *et al.*, 2008c).

Augros *et al.* (2016: 374) provide an overview of 112 roosts, of which 74 (66 %) were artificial.

MIGRATION:
The bats abandon Trois Bassins (with estimates of 10,000 to 25,000 individuals) during the austral winter, and it is not known where these bats spend the winter (Probst, 2003; Issartel, 2004; Devaux, 2006; Goodman *et al.*, 2008c).

POPULATION:
Structure and Density - The largest known day roost colony on La Réunion (at Trois Bassins), with estimates from 10,000 to 25,000 individuals, is abandoned in austral winter, and it is not known where these bats spend the winter (Devaux, 2006; Issartel, 2004; Probst, 2003; Goodman *et al.*, 2008c: 1325) [as *M. acetabulosus*].

Trend - 2008 - Unknown (Hutson and Bergmans, 2008; IUCN, 2009).

PARASITES:
Laudisoit *et al.* (2012: 739) indicate that *M. francoismoutoui* is actually the type host for *Araeopsylla martialis* (Rothschild, 1903) (Syphonaptera; Ischnopsyllidae) and not "*Nyctinomus acetabulosus*".

Dietrich *et al.* (2015b: 4280) found similar infection dynamics for *Leptospira* bacteria and paramyxoviruses, which showed peak infections during late pregnancy and two months after the initial birth period. Both pathogens, however, did not seem to interact with one another.

Guernier *et al.* (2016: 1) found *M. francoismoutoui* on Réunion to be infected by *Leptospira borgpetersenii* bacteria, which also infect humans. However, these bacteria had different haplotypes, indicating that the bats do not have any role in human infections. Dietrich *et al.* (2018a: 2) mention the bacterium to be closely related to *L. borgpetersenii*.

VIRUSES:
Rhabdoviridae
A large amount of bats from La Réunion were tested for lyssaviruses by Mélade *et al.* (2016a: 6), which resulted in the following numbers: *Lagos bat lyssavirus*: 3 seroreactions for 121 bats; *Duvenhage lyssavirus*: 14/117, and *European bat lyssavirus 1*: 9/82.

Réunion.

Mormopterus jugularis (Peters, 1865)

*1865. *Nyctinomus (Mormopterus) jugularis* Peters, in: Sclater, Proc. zool. Soc. Lond., 1865, II: 468. Publication date: October 1865. Type locality: Madagascar: Antananarivo (formerly Tananarive) [18 55 S 47 31 E]. Holotype: ZMB 2977: ad ♂, skull and alcoholic. Collected by: H.R. Caldwell. Presented/Donated by: William Lutley Sclater. See Turni and Kock (2008: 70).

1877. *Nyctinomus [(Mormopterus)] albiventer* Dobson, Proc. zool. Soc. Lond., 1876, IV: 733. Publication date: April 1877. Type locality: Madagascar: "Madagascar" [Goto Description]. Holotype: BMNH 1863.12.26.1: ♀. Presented/Donated by: ?: Collector Unknown. - Comments: Type: BMNH ???, ad ♀, alcoholic, purchased.

? *Mormopterus albiventer:*

? *Mormopterus jugularis:* (Name Combination, Current Combination)

TAXONOMY:
See Simmons (2005: 445).

COMMON NAMES:
Czech: morous Petersův. English: Peters's Goblin bat, Peters's Wrinkle-lipped Bat, Peters' Wrinkle-lipped Bat. French: Sauromys à jugulaire, Sauromys de Peters, Tadaride de Madagascar. German: Madagaskar Mastino-Fledermaus. Japanese: Pita-ohiki-koumori.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Muldoon *et al.* (2009: 1114) report on subfossil remains from the Ankilitelo fauna (late Holocene, appr. 500 years ago).
Gunnell *et al.* (2014: 3) refer to fossil material from Tsimanampetsotsa (one tooth and a few pieces of a forelimb according to Sabatier and Legendre (1985: 23)), Ankilitelo, and Andrahomana on Madagascar.

CONSERVATION STATUS:
Global - This species is listed as Least Concern (LC ver 3.1 (2001)) in view of its widespread distribution across Madagascar and because it is not thought to be facing any major threats across its range (Andriafidison *et al.*, 2008g; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Andriafidison *et al.*, 2008g; IUCN, 2009). 1996 - VU A2c ver 2.3 (1994) (Baillie and Groombridge, 1996).

MAJOR THREATS:
This species is not threatened by loss of native forests because it forages in open areas associated with agriculture. It is locally persecuted when roosting in buildings although this is not yet a major threat. Some colonies are subject to hunting and although this is though to have resulted in abandonment in at least two cases (Goodman *et al.*, 2008d), harvest levels do not appear a major threat (Andriafidison *et al.*, 2008g; IUCN, 2009).

Fernández-Llamazares *et al.* (2018: 273) indicate that *M. jugularis* is often hunted in sacred caves in and around the Tsimanampetsotsa National Park,

although in the park, it is generally restricted to periods of famine, e.g. in 2007, when the bats fed 200 people for two months.

CONSERVATION ACTIONS:
Andriafidison *et al.* (2008g) [in IUCN (2009)] report that as this species is more commonly found roosting in buildings than natural settings it is not found in many of the protected areas in Madagascar (Goodman *et al.*, 2005a). However, there is no need for any conservation measures at present as this species appears to be widely distributed and is locally abundant.

GENERAL DISTRIBUTION:
Mormopterus jugularis is endemic to Madagascar (Peterson *et al.*, 1995) and very widespread across the island with a known distribution extending from the coast up to the high plateau at 1,400 m in Anjozorobe (J. Ranivo *pers. comm.,* in Andriafidison *et al.*, 2008g) in IUCN, 2009).

Native: Madagascar (Peterson *et al.*, 1995; Simmons, 2005: 445)

DETAILED MORPHOLOGY:
Baculum:
Rakotondramanana and Goodman (2017: 62) describe the baculum of this species as proportionately broad at the proximal, rounded base and tapering to a rounded distal tip. In lateral view, the structure has a slight curve to the main shaft; length: 0.69 ± 0.015 (0.68 - 0.71) mm, width: 0.24 ± 0.016 (0.22 - 0.26) mm.

MOLECULAR BIOLOGY:
DNA - Unknown
Karyotype - Richards *et al.* (2010) reported one male with a 2*n*=48 and a Fna=54. They found one large metacentric, three medium-sized metacentric and 19 acrocentric autosomal pairs. The X chromosome is submetacentric and the Y chromosome is metacentric. FISH using *Myotis* probes was also applied.

HABITAT:
Dammhahn and Goodman (2013: 108) indicate that this species' foraging habitat consists of open areas and the area above the forest canopy.

ROOST:
Synantropic structures are the typical roosting sites for this species on Madagascar (see Wilkinson *et al.*, 2012: 160).

MIGRATION:
Reher *et al.* (2019: 121) found that *M. jugularis* was only present in a southwestern Madagascan cave during the rainy season, whereas other species such as *Triaenops menamena* and *Miniopterus mahafaliensis* were present in both the dry and wet season.

DIET:
Kemp *et al.* (2018: Suppl.) used DNA metacarcoding to detect insect pest species in the diet of these bats and found the following prey orders (in descending order): Coleoptera (*Xyleborus ferrugineus* (Fabricius, 1801)), Ephemeroptera, Diptera (*Simulium lineatum* (Meigen, 1804), *Culex annulioris* Theobald, 1901, *Culex* MBI-27, *Anopheles squamosus* Theobald, 1901), Lepidoptera (*Meyrickiella homosema* (Meyrick, 1887), *Herpetogramma licarsisalis* (Walker, 1859)), Blattodea, Dermaptera, Hemiptera, Neuroptera, Orthoptera, Sarcoptiformes, Astigmata, Hymenoptera

PREDATORS:
Goodman *et al.* (2015c: 78) found the remains of three individuals in pellets of Bat Hawk *Macheiramphus alcinus* Bonaparte, 1850 in western central Madagascar.

POPULATION:
Structure and Density - There are no quantitative data available on populations of this species; however, it is assumed to have a high population size because it is widespread and roosts in large colonies in buildings (Andriafidison *et al.*, 2008g; IUCN, 2009).
Trend - 2008 - Unknown (Andriafidison *et al.*, 2008g; IUCN, 2009).

PARASITES:
Lagadec *et al.* (2012: 1696) and Gomard *et al.* (2016: 5) report the presence of *Leptospira* sp bacteria in this species, which, according to Dietrich *et al.* (2018a: 3), were having sequences closely related to *L. borgpetersernii*

Laudisoit *et al.* (2012: 739) refer to Lumaret (1962), who reported the present of *Araeopsylla martialis* (Rothschild, 1903) (Siphonaptera; Ischnopsyllidae) on "*Tadarida albiventer*" [= *M. jugularis*]. This flea was also reported by Hastriter (2016: 15).

Durette-Desset and Chabaud (1975: 10) described the Nematode *Molinostrongylus richardae* from a "*Mormopterus albiventer*" from Anjiro, Madagascar.

VIRUSES:
Flaviviridae
Flavivirus
Reynes *et al.* (2011: 3) reported the isolation of Dakar bat virus from *M. jugularis*.

Paramyxoviridae

Wilkinson *et al.* (2012: 160) tested 13 individuals from the Mauritius using RT-PCR specific for Respirovirus/Morbillivirus/Henipahvirus (RMH) and Paramyxovirinae (PMV) and found 0 positive results for viral nucleic acids. Wilkinson *et al.* (2014) tested 19 individuals in Madagascar with an RT-PCR specific for the Respiro-, Morbilli- and Henipavirus genera, two of the 19 individuals tested positive for paramyxovirus RNA.
12 out of 152 Madagascan specimens tested by Mélade *et al.* (2016b: 4) were positive for paramyxoviruses.

Rhabdoviridae
58 specimens were tested by Mélade *et al.* (2016a: 6), which laid to three seroreactive results for *Lagos bat lyssavirus* and 17 for *Duvenhage lyssavirus*.

UTILISATION:
See Goodman *et al.* (2008d).

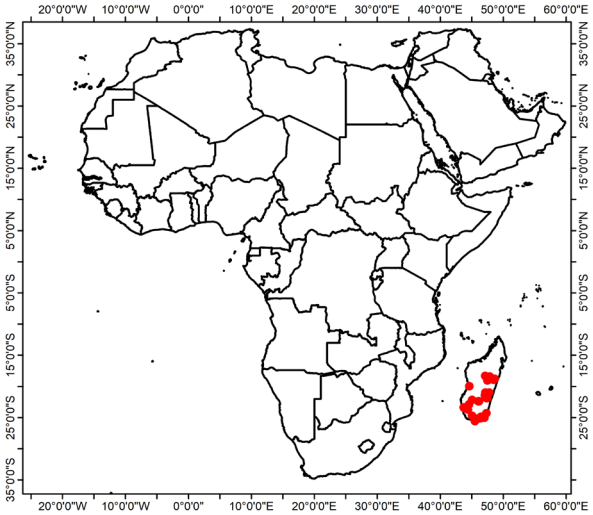

Figure 189. Distribution of *Mormopterus jugularis*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Madagascar.

Genus ***Myopterus*** E. Geoffroy St.-Hilaire, 1818

*1818. *Myopterus* E. Geoffroy Saint-Hilaire, Description des Mammifères qui se trouve en Egypte, 2: 113. Publication date: 1818 [Goto Description]. - Comments: Type species: *Myopterus senegalensis* Oken, 1816 (not available) (=*Myopteris daubentonii* Desmarest, 1820). - Etymology: From the Greek "*μύξ*" or é*μυόξ*", meaning mouse and "*πτέρυξ*", meaning wing (see Palmer, 1904: 440). (Current Combination)
1820. *Myopteris* Desmarest, Encyclopédie Méthodique, (Zoologie, Mammalogie), 1: 131. Publication date: 1820. - Comments: Type: *Myopteris daubentonii* Desmarest, 1820.
1837. *Myoptera* de Blainville, C. R. séances Acad. Sci., Paris, 5: 815. Publication date: 1837.
1905. *Eomops* Thomas, Ann. Mag. nat. Hist., ser. 7, 16 (95): 572. Publication date: 1 November 1905 [Goto Description]. - Comments: Type species: *Mormopterus whitleyi* Scharff, 1900.

TAXONOMY:
Includes *Eomops*; see Hayman and Hill (1971: 56). Grubb *et al.* (1998: 97) indicate that *Myopterus* Oken, 1816, Lehrbuch Naturgesch. Pt 3, Zool. Sect. 2: 952, type species *Myopterus senegalensis* Oken (=*Myopteris daubentonii* Desmarest, 1820), is not available according to Opinion 417 of the ICZN.

Grubb *et al.* (1998: 97) indicate that Mahoney and Walton (1988a: 116) considered the date of Geoffroy's publication to be 1813. Gardner and Hayssen (2004: 12) mention that the correct date should be 1818, not 1813 as mentioned on the publication itself.

Known species within the genus *Myopterus*: ***daubentonii*** Desmarest, 1820; ***whitleyi*** (Scharff, 1900).

COMMON NAMES:
Czech: krysoví morousi, spaky. English: Winged-mouse Bats, African Free-tailed Bats, Winged-rat Free-tailed Bats. French: Myoptères. German: Pergamentflügel-Fledermäuse.

Myopterus daubentonii Desmarest, 1820

1816. *Myopterus senegalensis* Oken, Lehrbuch Naturgeschichte, Jena, 3 (2): 952. Type locality: Senegal. - Comments: Not available (Opinion 417 of the ICZN) see Grubb *et al.* (1998: 97).
*1820. *Myopterus daubentonii* Desmarest, Encyclopédie Méthodique, (Zoologie, Mammalogie), 1: 132. Publication date: 1820. Type locality: Senegal: "Senegal". Holotype: [Unknown] lost:. See Koopman (1993a: 238). - Comments: Type specimen lost (see Koopman, 1993a: 238). - Etymology: In honour of the French naturalist Louis-Jean-Marie d'Aubenton

[=Daubenton] (1716 - 1799/1800) (see Bogdanowicz, 1994: 5; Kozhurina, 2002: 15). (Current Combination)

1915. *Myopterus albatus* Thomas, Ann. Mag. nat. Hist., ser. 8, 16 (96): 469. Publication date: 1 December 1915. Type locality: Congo (Democratic Republic of the): Uele River [04 09 N 22 26 E] [Goto Description]. Holotype: BMNH 1919.5.9.1: Collected by: M. Hutereau; original number: 17. Congo Museum o. 2911.

? *Myopterus daubentonii albatus:* (Name Combination)

TAXONOMY:
Koopman (1989a) and Simmons (2005) recognise *albatus* Thomas, 1915 as a subspecies. Allen (1939a: 110) used *Myopterus senegalensis* Oken, 1816 for this species.

COMMON NAMES:
Czech: morous krysový, spaka krysová. English: Daubenton's Winged-mouse Bat, Daubenton's Free-tailed Bat, Senegal Mastiff Bat. French: Myoptère de Daubenton, Myoptère du Sénégal. German: Daubentons Pergamentflügel-Fledermaus.

CONSERVATION STATUS:
Global - Listed as Data Deficient (DD ver 3.1 (2001)) since, although it has been recorded over a very wide area, there are only very few records, and very little is known with certainty about its distribution, threats and habitat requirements (Mickleburgh *et al.*, 2008bc; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) (Mickleburgh *et al.*, 2008bc; IUCN, 2009). 2004 - NT ver 3.1 (2001) (Mickleburgh *et al.*, 2004ca; IUCN, 2004). 1996 - DD (Baillie and Groombridge, 1996).

MAJOR THREATS:
The species is generally threatened by habitat loss, especially the removal of potential roost trees (Mickleburgh *et al.*, 2008bc; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008bc) [in IUCN (2009)] report that there appear to be no direct conservation measures in place, and it is not known if the species is present within any protected areas. Further studies are needed into the distribution, natural history and threats to this bat.

GENERAL DISTRIBUTION:
Myopterus daubentonii is patchily recorded from eight localities in West and Central Africa. It has been reported from Côte d'Ivoire, Central African Republic and northern Democratic Republic of the Congo. It is generally a lowland species, but has been found up to 1,250 m asl.

Native: Central African Republic; Congo (The Democratic Republic of the); Côte d'Ivoire; Senegal.

ROOST:
Brosset and Vuattoux (1968: 85) reported five specimens from Côte d'Ivoire (as *M. senegalensis*), that were captured in a hollow trunk of a Borassus palm (*Borassus aethiopum*). The tree was standing in a savanna area, but only a few hundred meters from a galery forest. The bats were roosting at an altitude of about 12 meters.

POPULATION:
Structure and Density - This appears to be a rare species, known from very few specimens (Mickleburgh *et al.*, 2008bc; IUCN, 2009).
Trend - 2008 - Unknown (Mickleburgh *et al.*, 2008bc; IUCN, 2009).

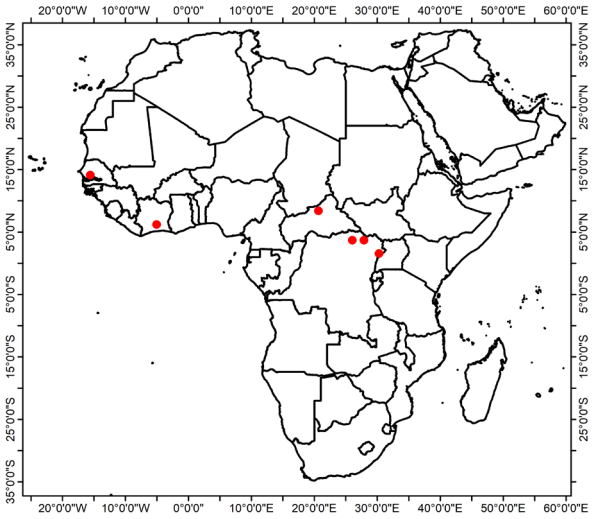

Figure 190. Distribution of *Myopterus daubentonii*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Central African Republic, Congo (Democratic Republic of the), Côte d'Ivoire, Senegal.

Myopterus whitleyi (Scharff, 1900)

*1900. *Mormopterus Whitleyi* Scharff, Ann. Mag. nat. Hist., ser. 7, 6 (36): 569. Publication date: 1 December 1900. Type locality: Nigeria: Mid-Western Region, Nikrowa Forest Reserve,

Sapoba: Benin City [06 19 N 05 41 E] [Goto Description]. Holotype: BMNH 1900.10.26.1: ad ♂, skull and alcoholic. Presented/Donated by: ?: Collector Unknown.

? *Myopterus whitleyi:* (Name Combination, Current Combination)

TAXONOMY:
See Simmons (2005).

COMMON NAMES:
Czech: morous západoafrický. English: Bini Winged-mouse Bat, Whitley's Winged-mouse Bat, Bini Free-tailed Bat. French: Myoptère de Whitley, Myoptère de Bini. German: Whitleys Pergamentflügel-Fledermaus, Bini Pergamentflügel-Fledermaus.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008bd; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2008bd; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2004cf; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
This species is presumably threatened by general conversion of forest to agricultural land and logging activities (Mickleburgh *et al.*, 2008bd; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008bd) [in IUCN (2009)] report that there appear to be no direct conservation measures in place. It is not known if the species is present in any protected areas. Further research is needed into the species distribution, natural history, and adaptability to habitat degradation.

GENERAL DISTRIBUTION:
Myopterus whitleyi is distributed in West and Central Africa. It has been recorded from Ghana in the west, through parts of Nigeria, Cameroon, Gabon, and the Democratic Republic of the Congo to western Uganda in the east.

Native: Cameroon; Central African Republic (Barrière *et al.*, 2002: 234); Congo (The Democratic Republic of the) (Hayman *et al.*, 1966; Van Cakenberghe *et al.*, 1999; Monadjem *et al.*, 2010d: 545); Gabon; Ghana; Nigeria; Uganda.

POPULATION:
Structure and Density - It is generally considered to be a rare species. It is found roosting singly or in small numbers (Mickleburgh *et al.*, 2008bd; IUCN, 2009).
Trend - 2008 - Decreasing (Mickleburgh *et al.*, 2008bd; IUCN, 2009).

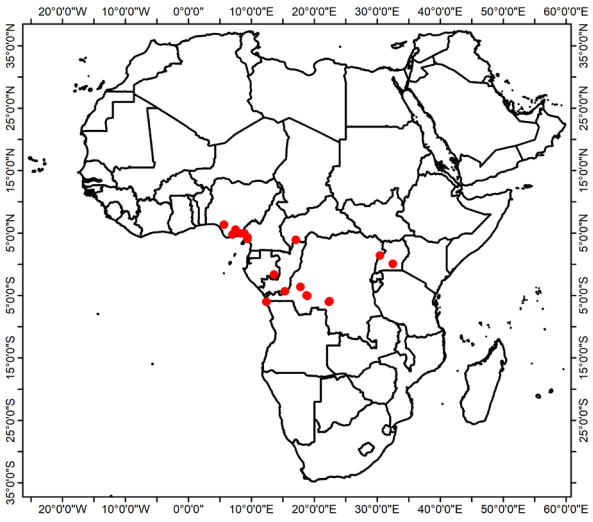

Figure 191. Distribution of *Myopterus whitleyi*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Cameroon, Central African Republic, Congo (Democratic Republic of the), Gabon, Ghana, Nigeria, Uganda.

Genus ***Otomops*** Thomas, 1913

*1913. *Otomops* Thomas, J. Bomb. nat. Hist. Soc., 22: 91. Publication date: April 1913. - Comments: Type species: *Nyctinomus wroughtoni* Thomas, 1913. - Etymology: From the Greek substantive "*oὖς*" (genitive "*ὠτός*", "*ûs*", "*ōtós*"), meaning "ear" and the masculine German substantive *Mops*, as the genus has outstandingly large ears (see Lanza *et al.*, 2015: 309). (Current Combination)

TAXONOMY:
Richards *et al.* (2012: 910) suggest that three distinct taxa might be recognized in Africa: *Otomops madagascariensis* from Madagascar; *O. martiensseni* s.s. from southern, eastern, central, and western Africa; and an "undescribed taxon"

(now identified as *O. harrisoni*) from north-east Africa and the Arabian Peninsula.

Known species within the genus *Otomops*: *formosus* Chasen, 1939 – Java (Simmons, 2005: 447); ***harrisoni*** Ralph et al., 2015; *johnstonei* Kitchener, How and Maryanto, 1992 – Alor Isl (Indonesia) (Simmons, 2005: 447); ***madagascariensis*** Dorst, 1953; ***martiensseni*** (Matschie, 1897); *papuensis* Lawrence, 1948 – southeastern New Guinea (Simmons, 2005: 448); *secundus* Hayman, 1952 – northeastern New Guinea (Simmons, 2005: 448); *wroughtoni* (Thomas, 1913) – southern and northeastern India, Cambodia (Simmons, 2005: 448).

COMMON NAMES:
Czech: velkouší morousi. English: Big-eared Bulldog Bats, Big-eared Free-tailed Bats, Mastiff Bats. French: Molosses à grandes oreilles. German: Riesen-Bulldoggfledermäuse. Italian: Otocarlìno.

ETYMOLOGY OF COMMON NAME:
So named because they have outstanding large round-pointed ears that are attached along the nose and lie in the plane of the face (see Taylor, 2005).

BIOGEOGRAPHY:
Lamb *et al.* (2008) suggests that African and Oriental *Otomops* lineages diverged around 4.2 Myr, while Malagasy and African lineages split around 1.5 Mya.

MOLECULAR BIOLOGY:
Patterson *et al.* (2018: 7) found the average interspecific genetic distance (uncorrected cyt-*b* p-distance) between *O. harrisoni* and *O. martiensseni* to be 2.5 %.

Otomops harrisoni Ralph, Richards, Taylor, Napier and Lamb, 2015

*2015. *Otomops harrisoni* Ralph, Richards, Taylor, Napier and Lamb, Zootaxa, 4057 (1): 1, 18, figs 8 - 10. Publication date: 9 December 2015. Type locality: Ethiopia: Bale district: Sof Omar Cave [06 54 N 40 48E, 1340 m] [Goto Description]. Holotype: HZM 60.36217: ad ♂, skull and alcoholic. Collected by: Paul J.J. Bates, Malcolm J. Pearch and O. Nurhussein; collection date: 19 July 1998; original number: A51. Presented/Donated by: ?: Collector Unknown. Paratype: HZM 40.31315: ad ♂. Collected by: ?: Collector Unknown; collection date: 19 July 1998. Presented/Donated by: ?: Collector Unknown. Paratype: HZM 62.36219: ad ♀. Collected by: ?: Collector Unknown; collection date: 19 July 1998. Presented/Donated by: ?: Collector Unknown. Ralph *et al.* (2015: 19) mention "(also DM 14750)". Paratype: HZM 63.36220: ad ♀. Collected by: ?: Collector Unknown; collection date: 19 July 1998. Presented/Donated by: ?: Collector Unknown. Paratype: HZM 64.36221: ad ♂. Collected by: ?: Collector Unknown; collection date: 19 July 1998. Presented/Donated by: ?: Collector Unknown. - Etymology: In honour of Dr. David L. Harrison (1926 - 2015), who's numerous publications on Afro-Arabian Chiroptera, in particular the Molossidae, have significantly improved our knowledge of this poorly known family (Ralph *et al.* (2015: 20).

COMMON NAMES:
Chinese: 哈氏巨犬吻蝠. English: Harrison's large-eared giant mastiff bat. German: Harrison-Riesen-Bulldoggfledermaus

SIMILAR SPECIES:
Ralph *et al.* (2015: 25) report that *O. harrisoni* is in general larger than other *Otomops* species.

CONSERVATION STATUS:
Patterson *et al.* (2018: 11) report the status of *O. harrisoni* as Vulnerable.

GENERAL DISTRIBUTION:
Native: Djibouti; Eritrea (Kock and Zinner, 2004: 3 as *O. martiensseni*); Ethiopia (in a disused railway tunnel 8 km east of Asmara) for the first time (Kock and Zinner, 2004: 3 as *O. martiensseni*); Kenya (Patterson *et al.*, 2018: 1), Rwanda (Patterson *et al.*, 2018: 1) and Yemen (Hud Sawa cave, Ar-Rayadi Al-Gharbi Mountains) on the Arabian Peninsula (Al-Jumaily, 1999; Hutson *et al.*, 2001 as *O. martiensseni*).

Ralph *et al.* (2015: 27) suggest that the range might include additional localities in Uganda, northern areas of Tanzania and southern areas of Somalia.

Patterson *et al.* (2018: 1) found both O. martiensseni and *O. harrisoni* in a cave in the Musanze district, Rwanda. As they found both species in Kenya, they also caution the identifications of *Otomops* specimens from that country, especially those from Kwale, Lake Baringo, Nairobi, Naivasha, and
Wei-Wei River (p. 11).

DENTAL FORMULA:
The dental formula of *O. harrisoni* is I 1/2, C 1/1, P 2/2, M 3/3, characteristic of molossid bats (see Ralph *et al.*, 2015: 26).

ECHOLOCATION:
Ralph *et al.* (2015: 26) indicate that Taylor *et al.* (2005) reported the following values for *O. martiensseni* specimens from Bungule, Kenya: F_{peak}: 12.00 kHz, F_{min}: 10.50 kHz, F_{max}: 50 kHz, and duration of 9.00 msec. However, since this locality is equidistant from localities were either *O. martiensseni* or *O. harrisoni* was found, the taxonomic assignment of the specimens involved remains uncertain.

Patterson *et al.* (2018: Suppl.) recorded the following parameters for 10 Kenyan specimens identified as "*O.* cf. *harrisoni*: F_{max}: 13.99 ± 2.93 (9.52 - 17.95) kHz, F_{start}: 19.35 ± 3.50 (10.72 - 21.90) kHz, F_{end}: 11.58 ± 1.17 (9.63 - 13.13) kHz, duration: 10.13 ± 2.46 (7.04 - 15.16) msec. However, they also found (p. 7) differences between *O. harrisoni* populations from two localities in Kenya: Chyulu Hills: F_{peak}: 17.18 ± 0.42 (16.40 - 17.95) kHz, F_{max}: 21.67 ± 0.10 (21.48 - 21.90) kHz, F_{min}: 12.53 ± 0.29 (11.80 - 13.13) kHz and call duration: 10.72 ± 1.10 (7.57 - 12.67) msec; and Mount Suswa: F_{peak}: 11.86 ± 0.72 (9.52 - 13.80) kHz, F_{max}: 17.81 ± 1.70 (10.72 - 21.62) kHz, F_{min}: 110.94 ± 0.47 (9.63 - 12.80) kHz and call duration: 9.74 ± 1.21 (7.04 - 15.16) msec.

MOLECULAR BIOLOGY:
Karyotype:
Warner *et al.* (1974) reported 2*n* = 48, FN = 58, BA = 12, a submetacentric X chromosome and a submetacentric Y chromosome for one male *O. martiensseni* specimen from Kenya, which differed from previously reported karyotypes. It is therefore possible that this male might have been a representative of *O. harrisoni*.

HABITAT:
Ralph *et al.* (2015: 27) mention that these bats are found at high altitudes (above 1,000 m) characterised by relatively drier climates (< 500 mm annual precipitation), including warm semi-arid, tropical savanna, warm desert and temperate oceanic climates (e.g. the Ethiopian highlands).

ROOST:
Ralph *et al.* (2015: 27) indicate that individuals roost predominantly in mountain-associated cave systems and lava caves.

DIET:
Feacal data from Ethiopia indicate that medium (size range: 1 - 5 cm) to large (wing span size range: 2.5 - 30 cm) Lepidoptera (Noctuidae, Geometridae and Saturniidae) form 97 % by volume of this bat's diet (see Ralph *et al.*, 2015: 26).

PARASITES:
At Mount Suswa (Kenya), Patterson *et al.* (2018: 10, Suppl.) found the following ectoparasites: *Brachytarsina alluaudi* (Falcoz, 1923) [Diptera, Hippoboscidae], *Hypoctenes clarus* (Jordan, 1922) [Hemiptera, Polyctenidae], *Lagaropsylla* sp. [Siphonaptera, Ischnopsyllidae], and some unidentified Argasidae and Macronyssidae.

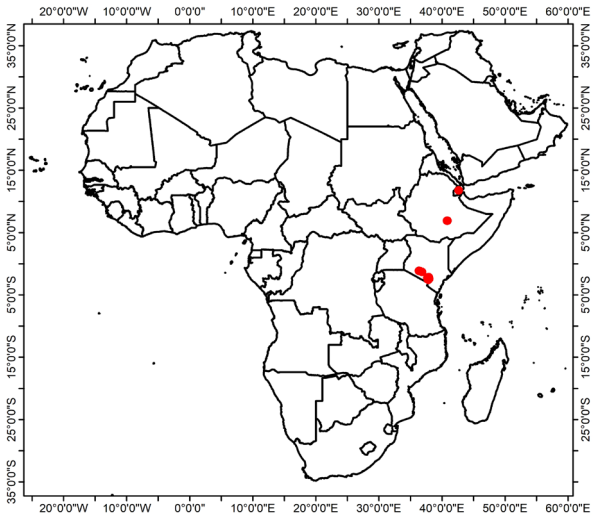

Figure 192. Distribution of *Otomops harrisoni*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Djibouti, Ethiopia, Kenya.

Otomops madagascariensis Dorst, 1953

*1953. *Otomops madagascariensis* Dorst, Mém. Inst. Scient. Madagascar, (A) 8: 236. Type locality: Madagascar: S of Soalala: Namoroka, Réserve Naturelle: Cave P. Saboureau, No. 8 [16 23 S 45 28 E]. Holotype: MNHN ZM-MO-1953-1590: ad ♀, skull and alcoholic. Collected by: Renaud Paulian; collection date: September 1952. See Peterson *et al.* (1995: 181), Richards *et al.* (2012: 912). - Etymology: Referring to the island where this taxon occurs. (Current Combination)

2000. *Otomops martiensseni madagascarensis:* Horácek, Hanák and Gaisler, Bats of the Palearctic region. (Lapsus)

? *Otomops madagascariensis madagascariensis:* (Name Combination)

? *Otomops martiensseni madagascariensis:* (Name Combination)

TAXONOMY:
Previously recognised as a subspecies or synonym of *Otomops martiensseni* (Koopman, 1993a: 239). Valdivieso *et al.* (1979) listed it as a distinct species, as did Peterson *et al.* (1995: 183) and Russ *et al.* (2001). We are (yet) unable to confirm whether the original spelling is *madagascariensis* (see Koopman, 1993a: 239, Peterson *et al.*, 1995, Russ *et al.*, 2001, Simmons, 2005: 447) or *madagascarensis* (see Horácek *et al.*, 2000: 137; Fenton *et al.*, 2002: 1584).

COMMON NAMES:
Czech: morous madagaskarský. English: Madagascar Free-tailed Bat, Madagascar Mastiff Bat. French: Molosse à grandes oreilles de Madagascar. German: Madagassische Riesen-Bulldoggfledermaus.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Muldoon *et al.* (2009: 1114) report on subfossil remains from the Ankilitelo fauna (late Holocene, appr. 500 years ago).

CONSERVATION STATUS:
Global - This species is listed as Least Concern (LC ver 3.1 (2001)) in view of its widespread but patchy distribution in Madagascar. It is not well known in Madagascar, but it is likely distributed more widely than current records suggest and it is unlikely that it is declining at a rate that would warrant listing in a higher category of threat (Andriafidison *et al.*, 2008l; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Andriafidison *et al.*, 2008l; IUCN, 2009).

MAJOR THREATS:
The threats to this species are unclear, but more research is needed into possible disturbance at its roost sites (Andriafidison *et al.*, 2008l; IUCN, 2009).

CONSERVATION ACTIONS:
Andriafidison *et al.* (2008l) [in IUCN (2009)] report that this species roosts in one cave that is locally protected by 'fady' or taboo (Andriafidison *et al.*, 2007). It has been recorded from five protected areas: Parc National du Tsingy de Bemaraha, Parc National de Namoroka, Parc National d'Isalo, Réserve Spéciale d'Ankarana and Réserve Spéciale d'Analamerana (Goodman *et al.*, 2005a). A total of nine roosting colonies are currently known: six in Réserve Spéciale d'Ankarana (Cardiff, 2006), two in Parc National du Tsingy de

Bemaraha (Andriafidison *et al.*, 2007) and one in Sarodrano (Goodman *et al.*, 2005a; Andriafidison *et al.*, 2007), and all receive some form of protection. More research is needed on its roosting ecology and surveys are required in areas where this species is expected to occur.

GENERAL DISTRIBUTION:
Otomops madagascariensis is endemic to the island of Madagascar where it has a disjunct distribution from the north to the south-west of the island. It has an elevation range of 5 m to 800 m above sea level (Goodman *et al.*, 2005a).

O'Brien (2011: 289) reports it from the Tanzanian island of Mafia.

Native: Madagascar (Valdivieso *et al.*, 1979; Peterson *et al.*, 1995: 183; Russ *et al.*, 2001; Simmons, 2005: 447).

DETAILED MORPHOLOGY:
Baculum:
The baculum of *O. madagascariensis* is an elongated rod with a notable twist to the mid-shaft. In lateral view, its proximal portion is distinctly wider than the proximal end (Rakotondramanana and Goodman, 2017: 62); length: 0.74 ± 0.057 (0.65 - 0.80) mm, width: 0.13 ± 0.028 (0.09 - 0.18) mm.

MOLECULAR BIOLOGY:
DNA - See Lamb *et al.* (2008).
Karyotype - Unknown.
Protein / allozyme - Unknown.

HABITAT:
Dammhahn and Goodman (2013: 108) report that this species' foraging habitat includes open areas and the area above the forest canopy.

ROOST:
Cave roosts in limestone or sandstone (Goodman *et al.*, 2005a; Andriafidison *et al.*, 2007).

POPULATION:
Structure and Density - The colony of *O. madagascariensis* in a cave in the south of Parc National du Tsingy de Bemaraha consisted of between 90 and 100 individuals in 2003 (Andriafidison *et al.*, 2007). The Sarodrano roost in the south of Madagascar contained at least 67 animals in November 2003 (Andriafidison *et al.*, 2007). The maximum colony size at Réserve Spéciale d'Ankarana was 97 individuals (S. G. Cardiff *pers. comm.* [in Andriafidison *et al.* (2008l) in IUCN (2009)]).
Trend - 2008 - Unknown (Andriafidison *et al.*, 2008l; IUCN, 2009).

PARASITES:
Lagadec *et al.* (2012: 1696), Lei and Olival (2014: Suppl.) and Gomard *et al.* (2016: 5) report the presence of *Leptospira* sp. bacteria in this species, which were identified as having sequences closely related to *L. borgpetersenii* by Dietrich *et al.* (2018a: 3).

Laudisoit *et al.* (2012) describe a new species *Lagaropsylla makay* (Siphonaptera; Ischnopsyllidae), and they also mention a new parasite-host association between *Araeopsylla martialis* (Rothschild, 1903) (Siphonaptera; Ischnopsyllidae) and *O. madagascariensis*.

Ramasindrazana *et al.* (2016: 6) report the presence of an unnamed filariod in this bat species.

VIRUSES:
Paramyxoviridae
Wilkinson *et al.* (2012: 160) tested 8 individuals from the Madagascar using RT-PCR specific for Respirovirus/Morbillivirus/Henipahvirus (RMH) and Paramyxovirinae (PMV) and found 0 positive results for viral nucleic acids. Wilkinson *et al.* (2014) tested 18 individuals from Anjohikinakina in Madagascar with an RT-PCR specific for the *Respiro-*, *Morbilli-* and *Henipavirus* genera, five of the 18 individuals tested positive for paramyxovirus RNA.
Seven out of 39 Madagascan specimens tested by Mélade *et al.* (2016b: 4) were positive for paramyxoviruses.

Rhabdoviridae
Mélade *et al.* (2016a: 6) examined 20 specimens for *Lagos bat lyssavirus* and got three positive results. Four out of 18 animals had a positive outcome for *Duvenhage lyssavirus*.

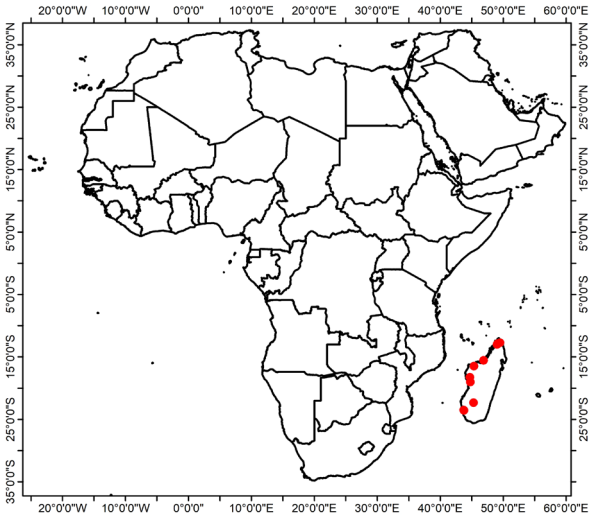

Figure 193. Distribution of *Otomops madagascariensis*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Madagascar.

Otomops martiensseni (Matschie, 1897)

*1897. *Nyctinomus martiensseni* Matschie, Arch. Naturgesch. Berlin, 63 (1): 84. Publication date: October 1897. Type locality: Tanzania: 25 mi W of Tanga, SE portion of W Usambara Mts: Magrotto Plantation [05 07 S 38 45 E] [Goto Description]. Holotype: ZMB 97523: ♂, skin and skeleton and skull. Collected by: Martienssen; collection date: August 1897. See Turni and Kock (2008: 71). - Comments: Horácek *et al.* (2000: 137) mention the type locality as "Usanbara Mts., W of Tanga, NE Tanzania". Grubb *et al.* (1998: 98) indicate that the locality has been defined by Swynnerton, 1945, Proc. Zool. Soc. Lond., 115: 63). - Etymology: In honour of "Herr Martienssen of the Königlich Museum für Naturkunde" who found the type specimen (see Long, 1995: 4).
1966. *Otomops maertiensseni:* Hayman, Misonne and Verheyen, Ann. Kon. Mus. Mid. Afr., Zool. Wetensch., (8) 154: pl. XX. Publication date: December 1966. (Lapsus)
2017. *O[tomops] martiensenni:* Waruhiu, Ommeh, Obanda, Agwanda, Gakuya, Ge, Yang, Wu, Zohaib, Hu and Shi, Virol. Sin., 32 (2): 10. Publication date: 6 April 2017. (Lapsus)
2017. *Otomops martiensenii:* Waruhiu, Ommeh, Obanda, Agwanda, Gakuya, Ge, Yang, Wu, Zohaib, Hu and Shi, Virol. Sin., 32 (2): 7. Publication date: 6 April 2017. (Lapsus)
2017. *Otomops martienssi:* Tao, Shi, Chommanard, Queen, Zhang, Markotter, Kuzmin, Holmes and Tong, J. Virol., 91 (5) e01953-16: Suppl. Publication date: 11 January 2017. (Lapsus)
? *Otomops martiensseni:* (Name Combination, Current Combination)

TAXONOMY:
Koopman (1993a: 239) included *madagascariensis*, but see Peterson *et al.* (1995: 183), Long (1995) and Simmons (2005: 447). Lamb *et al.* (2008: 30) indicate that there are two clades in *martiensseni*, of which "clade 1" (north-east Africa + Yemen) would constitute an undescribed taxon. Additionally, Lamb *et al.* (2008: 31) indicate that the population from Côte d'Ivoire may represent a distinct lineage.

Ralph *et al.* (2015) proved that the specimens from Ethiopia, Eritrea, Somalia, Djibouti and Yemen represent a different species: *O. harrisoni*, which is larger and more robust than any other *Otomops*.

Ammerman *et al.* (2012: 23) indicate that the separation between *martiensseni* and *madagascariensis* took place less than 2 million years ago.

Simmons (2005: 447) recognises one subspecies *icarus* Chubb, 1917.

COMMON NAMES:
Afrikaans: Bakoor-losstertvlermuis. Chinese: 大耳犬吻蝠. Czech: morous Martienssenův. English: Martienssen's Big-eared Bulldog Bat, Large-eared Free-tailed Bat, Giant Mastiff Bat, Martiensen's Free-tailed Bat, Martienssen bat, Large-eared Giant Mastiff Bat. French: Grand molosse à grandes oreilles, Chauve-souris bouledogue géante. German: Großohrige Riesen-Bulldoggfledermaus. Italian: Otocarlìno di Martienssèn. Kinande (DRC): Mulima.

CONSERVATION STATUS:
Global - Listed as Near Threatened (NT ver 3.1 (2001)) because this species is probably still in significant decline globally (but probably at a rate of less than 30 % over ten years), owing to the probable continued loss of the known major East African populations. Smaller populations from southern Africa may be increasing. The status of populations in Central and West Africa, where the species is still known from very few specimens, remains unclear. Almost qualifies as threatened under criterion A2c (Mickleburgh *et al.*, 2008dd; IUCN, 2009).
Ralph *et al.* (2015: 27) indicate that the assignment of this species must be re-evaluated due to the split off of *O. harrisoni* in the northern part of the original distribution area.

Assessment History -
2008 - NT ver 3.1 (2001) (Mickleburgh *et al.*, 2008dd; IUCN, 2009). 2004 - NT ver 3.1 (2001) (Mickleburgh *et al.*, 2004cq; IUCN, 2004). 1996 - VU (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - LC ver 3.1 (2001) (Richards *et al.*, 2016e). 2004- VU D2 ver 3.1 (2001) (Friedmann and Daly, 2004). 1986 - Indeterminate (Smithers, 1986).

MAJOR THREATS:
The leading threat to this species appears to be roost disturbance. Major colonies in East Africa, such as the population at Mount Suswa (Kenya),

seem to have disappeared through disturbance of their cave habitats (Hutson *et al.*, 2001) [see Kock *et al.*, 2005: 3, who refutes this]. Threats to these caves include guano mining (with associated changes to the cave microclimate), blocking of entrances, recreational caving and general tourism activities (Anonymus, 2004f: 57). It is possible that the collection of 4,954 bats by Mutere (1973a) as part of a reproductive study may have contributed to a decline of the Kenyan populations [see Kock *et al.*, 2005 who refute this too]. Populations in Durban (South Africa) have been found to use old buildings with attics as roosts, and it appears that the main threat to these populations is indirect poisoning through the application of toxic timber treatments (Fenton *et al.*, 2002).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008dd) [in IUCN (2009)] report that there is a need to reassess the status of all known roosts (and to locate additional localities) to ascertain numbers and status of colonies, so that key sites can be identified. There is a need to collect better information on the current status of populations in both Central and West Africa. Disturbance of key localities should be restricted or managed to reduce the impact on colonies. The species has been recorded from Comoe National Park, Côte d'Ivoire, it has been recorded from within a national park in Rwanda, and the former large colony at Mount Suswa, Kenya, is believed to be protected (Hutson *et al.*, 2001). *O. martiensseni* is protected by provincial ordinance in KwaZulu Natal, South Africa. An IUCN Species Action Plan has been developed for this species (Hutson *et al.*, 2001).

GENERAL DISTRIBUTION:
Otomops martiensseni has been widely, but patchily, recorded from much of sub-Saharan Africa. In Africa, it has been reported from Côte d'Ivoire and Ghana in West Africa, through Central Africa (recorded from Central African Republic, the Democratic Republic of the Congo, Rwanda and western Uganda) to East Africa (Kenya and Tanzania) to southern Africa (Malawi, central Angola [Chitau], Zimbabwe, Zambia and eastern South Africa). It is found at elevations from sea level to 2,900 m asl, although the highest elevations might need to be referred to *O. harrisoni*.

Records from Madagascar are now refered to *O. madagascariensis* (see Taxonomy section above). Lamb *et al.* (2008: 30, 39) mention it from Côte d'Ivoire, Ghana, and Burundi, but also see Taxonomy paragraph. Records from Djobuti, Eritrea, Ethiopia, Somalia, Yemen are now referred to *O. harrisoni*, as might be the case for some of the records from Kenya, Tanzania and Uganda (see Taxonomy section above).

Patterson *et al.* (2018: 1) found both *O. martiensseni* and *O. harrisoni* in a cave in the Musanze district of Rwanda.

Native: Angola (Crawford-Cabral, 1989; Monadjem *et al.*, 2010d: 545; Taylor *et al.*, 2018b: 63); Botswana (Adams *et al.*, 2015: 711); Central African Republic; Congo (The Democratic Republic of the) (Ansell, 1974; Hayman *et al.*, 1966; Monadjem *et al.*, 2010d: 545); Côte d'Ivoire; Ghana; Kenya (Patterson *et al.*, 2018: 5); Malawi (Monadjem *et al.*, 2010d:454); Rwanda (Patterson *et al.*, 2018: 1); South Africa (Monadjem *et al.*, 2010d:545;Adams *et al.*, 2015: 710-711); Tanzania; Uganda; Zambia Monadjem *et al.*, 2010d: 545); Zimbabwe (Lamb *et al.*, 2008; Monadjem *et al.*, 2010d: 545).

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Large species, with narrowest wings of any bat for fast flying in open areas (Anonymus, 2004f: 57).

FUNCTIONAL MORPHOLOGY:
Based on the analysis of wing dimensions, Thollesson and Norberg (1991: 34) suggest that the longer hand wings and more pointed wing tips of *O. martiensseni* indicate that this is a species primarily flying in open areas at a high altitude.

ECHOLOCATION:
From Bungule in Kenya Taylor *et al.* (2005) reported a maximum frequency of 16.5 kHz. However, due to the split off of *O. harrisoni*, the taxonomic status of the specimens involved is uncertain (see Ralph *et al.*, 2015: 26).

At Sengwa in Zimbabwe, Jacobs (1996) and Fenton and Bell (1981) recorded a highest frequency of 17 kHz. Taylor (1999b) recorded maximum frequencies of 29.5 (2.4) kHz (open flight) and 14.7 (1.5) (emergence) from two localities in the Durban area in South Africa. Whereas, Fenton *et al.* (2004) reported a highest frequency of 14.7 (1.68) kHz from the Durban area in South Africa. From the same area, Schoeman and Waddington (2011: 291) mention a peak frequency of 10.7 ± 0.4 kHz and a duration of 27 ± 1.5 msec.
Fenton (2004b: 4) states that there is evidence that, in this species, calls originally associated with echolocation may actually serve more for communication.

Adams *et al.* (2015: 709) report the following values from South Africa: F_{char}: 11.70 ± 3.61 (10.51 - 13.54) kHz; F_{high}: 13.19 ± 1.08 (11.01 - 15.67) kHz; F_{low}: 10.82 ± 0.65 (9.11 - 12.23) kHz; Band

width: 2.40 ± 0.90 (0.65 - 5.64) kHz; F_{max}: 12.41 ± 0.90 (10.76 - 14.55) kHz; Duration: 21.18 ± 3.61 (11.79 - 27.81) msec. Also from the RSA (Mapungubwe National Park), Parker and Bernard (2018: 57) reported on 20 calls: F_{char}: 10.74 ± 0.63 kHz, F_{max}: 11.52 ± 0.60 kHz, F_{min}: 10.28 ± 0.50 kHz, F_{knee}: 10.81 ± 0.64 kHz, duration: 22.68 ± 13.89 msec, with 3.98 ± 2.40 calls/sec.

For seven calls from the Aberdares Range in Kenya, Eisenring *et al.* (2016: SI 2) reported: PF: 14.8 ± 2.8 (9.9 - 17.4), HF: 22.0 ± 4.2 (14.5 - 26.4), LF: 9.9 ± 2.5 (5.2 - 13.2), DT: 0.1 ± 0.0 (0.1 - 0.2), DF: 12.1 ± 2.4 (9.3 - 16.0), IPI: 3.3 ± 2.0 (1.5 - 5.5).

MOLECULAR BIOLOGY:
DNA - See Hoofer and Van Den Bussche (2003), Lamb *et al.* (2006) and Lamb *et al.* (2008).
Karyotype - Đulic and Mutere (1973a) reported 2*n* = 48, FN = 56, BA = 10, a submetacentric X chromosome, and an acrocentric Y chromosome. However, Warner *et al.* (1974) reported 2*n* = 48, FN = 58, BA = 12, a submetacentric X chromosome and a submetacentric Y chromosome for one male specimen from Kenya. In view of the split off of *O. harrisoni* the Kenyan karyotype might represent the latter species rather than *O. martiensseni*.

Protein / allozyme - Unknown.

HABITS:
O. martiensseni is probably a long-range forager, which hunts over a wide diversity of habitats, e.g. semi-arid areas and montane forests up to 2,000 m (Anonymus, 2004f: 57). Adams *et al.* (2015), referring to Fenton and Griffin (1997), indicate that foraging occurs at altitudes exceeding 600 m above ground. Actually, Fenton and Griffin (1997: 248) reported one call in the 10 - 13 kHz range (used by *O. martiensseni*) at an altitude between 500 and 550 m.

Foord *et al.* (2018: 5) indicate that open-air feeders (e.g. *O. martiensseni*) may commute over 10 km between roosts and feeding areas, but do prefer smaller feeding areas.

ROOST:
In the Durban area, Taylor *et al.* (1999: 67) found roosts on the brick surface of the inner gable apex wall within the roof space, with entrances height between 3 and 12 m. The colony size varied between one and 30.

Anonymus (2004f: 57) indicates that *O. martiensseni* is generally colonial with larger colonies in underground sites (e.g. caves and lava tubes), whereas in South Africa small colonies occur in houses.

POPULATION:
Structure and Density - Although *O. martiensseni* was once considered to be rare, with gaps in distribution, additional collecting has demonstrated local abundance in several areas (Long, 1995; Taylor, 1998; Fenton *et al.*, 2002; Skinner and Chimimba, 2005). For example, it is common around Durban in KwaZulu Natal Province of South Africa (Fenton *et al.*, 2002), and is fairly common in Comoe National Park, Côte d'Ivoire. Hutson *et al.* (2001) reported that major colonies of this species (consisting of hundreds of bats) from caves in East Africa have declined severely and now have few or no bats (no date of observation given). However, Kock *et al.* (2005: 3) refute this as a visit to Mt. Suswa 15 February 2004 where they reported a collony of 10-15 thousand individuals to be present.
Trend - 2008 - Decreasing (Mickleburgh *et al.*, 2008dd; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
Martin and Bernard (2000: 32) indicate that the corpus luteum undergoes luteolysis in late pregnancy. Krutzsch (2000: 126) further mentions that the species exhibits classical mammalian male-female synchrony of reproductive cycles.

Monadjem *et al.* (2010d) [in Weier *et al.* (2018: Suppl.)] indicated that juveniles have been recorded from October through May.

MATING:
Ober *et al.* (2016: 375) mention that *O. martiensseni* forms single male/mulitple female groups.

PARASITES:
SIPHONAPTERA
Ischnopsyllidae: Beaucournu and Kock (1996) reported *Araeopsylla scitula* Rothschild, 1909 from a bat from Kenya. However, in view of the split off of *O. harrisoni*, this latter species might have been the host for this ectoparasite.

ACARI
Trombiculidae: Stekolnikov (2018a: 189) mentioned *Willmannium suswaensis* (Vercammen-Grandjean & Langston, 1976) from a bat collected at Mount Suswa (Kenya).

VIRUSES:
In their country-wide survey of Kenyan bats, Waruhiu *et al.* (2017) found the following viruses in *Otomops martiensseni*: Adenoviruses and Polyomaviruses.

Adenoviridae:

Adenovirus - Two of the 19 specimens from the Suswa Cave (Kenya) by Conrardy *et al.* (2014: 259) tested positive for this virus.

Coronaviridae - Coronaviruses
SARS-CoV - Tong *et al.* (2009) tested two bats collected in Kenya during 2006 positive for the presence of coronavirus RNA in fecal samples.
28.6 % (10 out of 35) of the Kenyan *O. martiensseni* specimens were positive for CoV (Tao *et al.*, 2017: 3).

Flaviviridae
Hepacivirus (BHV) - Quan *et al.* (2013: Table S5) report that 3 of 15 Kenyan specimens were infected with clade C *Hepacivirus* (20.0 %).
Pegivirus (BPgV) - 2 of the 15 specimens examined by Quan *et al.* (2013: Table S5) were also infected with clade K *Pegivirus* (13.3 %).

Paramyxoviridae:
Paramyxovirus - Five of the 19 specimens from the Suswa Cave by Conrardy *et al.* (2014: 259) tested positive for this virus, and this was also the case for nine out of 40 specimens from Kenya, which were tested by Mortlock *et al.* (2015: 1481).

Polyomaviridae:
Orthopolyomavirus - Initially, three novel orthopolyomaviruses were detected in 2006 from Kenya by Tao *et al.* (2012). Additional surveillance detected 6 of the 19 specimens from the Suswa Cave to be positive tested by Conrardy *et al.* (2014: 259).

Rhabdoviridae
Lyssavirus - Rabies related viruses
Horton *et al.* (2014: Table S1) tested 16 Kenyan *O. martiensseni* specimens but failed to find neutralising antibodies to IKOV (Ikoma lyssavirus).

Remark: as most of these viruses were found on "*O. martiensseni*" specimens from Kenya, the actual host species might be *O. harrisoni*.

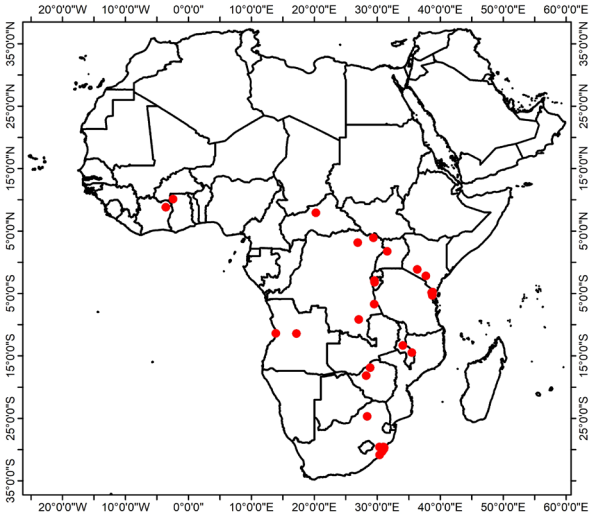

Figure 194. Distribution of *Otomops martiensseni*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Angola, Burundi, Central African Republic, Congo (Democratic Republic of the), Côte d'Ivoire, Ethiopia, Ghana, Kenya, Malawi, Rwanda, South Africa, Tanzania, Zimbabwe.

Otomops martiensseni icarus Chubb, 1917

*1917. *Otomops icarus* Chubb, Ann. Durban Mus., 1: 433, pl. 21. Publication date: 21 May 1917. Type locality: South Africa: KwaZulu-Natal: Durban [29 52 S 31 00 E] [Goto Description]. Holotype: BMNH 1916.10.9.1: ♂. Collected by: ?: Collector Unknown. Presented/Donated by: ?: Collector Unknown. - Etymology: Named after Icarus, son of Daidalos, who fled from their prison with wings made of wax and feathers.
? *Otomops martiensseni icarus:* (Name Combination, Current Combination)

GENERAL DISTRIBUTION:
From Angola to KwaZulu-Natal, Malawi (Horácek *et al.*, 2000: 137).

Otomops martiensseni martiensseni (Matschie, 1897)

*1897. *Nyctinomus martiensseni* Matschie, Arch. Naturgesch. Berlin, 63 (1): 84. Publication date: October 1897. Type locality: Tanzania: 25 mi W of Tanga, SE portion of W Usambara Mts: Magrotto Plantation [05 07 S 38 45 E] [Goto Description]. Holotype: ZMB 97523: ♂, skin and skeleton and skull. Collected by: Martienssen; collection date: August 1897. See Turni and Kock (2008: 71). - Comments: Horácek *et al.* (2000: 137) mention the type locality as "Usanbara Mts., W of Tanga, NE Tanzania". Grubb *et al.* (1998: 98) indicate that the locality has been defined by Swynnerton, 1945, Proc. Zool. Soc. Lond., 115: 63).

- Etymology: In honour of "Herr Martienssen of the Königlich Museum für Naturkunde" who found the type specimen (see Long, 1995: 4).

.

? *Otomops martiensseni martiensseni:* (Name Combination, Current Combination)

GENERAL DISTRIBUTION:
Central African Republic to Yemen and south to Zimbabwe (Horácek *et al.*, 2000: 137).

Genus ***Platymops*** Thomas, 1906

*1906. *Platymops* Thomas, Ann. Mag. nat. Hist., ser. 7, 17 (101): 499. Publication date: 1 May 1906 [Goto Description]. - Comments: Type species: *Platymops Macmillani* Thomas, 1906 (=*Mormopterus setiger* Peters, 1878). - Etymology: From the Greek adjective "*πλατύς*" (platýs), meaning "flat" and the masculine German substantive *Mops*, referring to the extremely flattened skull of the genus (see Lanza *et al.*, 2015: 315). (Current Combination)

? *Mormopterus (Platymops):* (Name Combination)

TAXONOMY:
Considered a subgenus of *Mormopterus* by Koopman (1993a: 238), Czaplewski *et al.* (2003: 68), but a valid genus by Kock (1969a: 155), Simmons (2005).
Included in *Mormopterus* by Jacobs and Fenton (2002: 1).

Known species within the genus *Platymops*: ***setiger*** (Peters, 1878).

COMMON NAMES:
Czech: ploší morousi. English: East African Flat-headed Bats, Peters's flat-headed Bats. French: Tadarides à tête plate. German: Flachkopf-Bulldoggfledermäuse. Italian: Platicarlìni.

Platymops setiger (Peters, 1878)

*1878. *Mormopterus setiger* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, 196, pl. 1, fig. 2. Type locality: Kenya: Taita district: Ndi [03 14 S 38 30 E, 2 000 m] [Goto Description]. Syntype: ZMB 5265a: ♀, skull and alcoholic. Collected by: Dr. Johann Maria Hildebrandt; collection date: July 1877. See Turni and Kock (2008). Syntype: ZMB 5265b: ♀, skull and alcoholic. Collected by: Dr. Johann Maria Hildebrandt; collection date: July 1877. See Turni and Kock (2008). - Comments: Allen (1939a: 109) mentioned 1881; Monatsb. K. Preuss. Akad. Wiss., Berlin, p. 483, pl., fig. 3. - Etymology: From the masculine Latin adjective *sètiger*, meaning "covered with coarse hair, bristly", referring to the coarse fur of the species Lanza *et al.*, 2015: 316).

1960. *Platymops setiger:* Harrison and Fleetwood, Durban Mus. Novit., 5 (20): 269. (Name Combination, Current Combination)

TAXONOMY:
See Freeman (1981b: 133, 161). Included in *Platymops* by Harrison and Fleetwood (1960: 277 - 278).

COMMON NAMES:
Chinese: 彼德犬吻蝠. Czech: morous plochý. English: East African Flat-headed Bat, Peters's Flat-headed Bat, Flat-headed free-tailed bat. French: Sauromys à tête plate, Tadaride à tête plate de Peters. German: Peters' Flachkopf-Bulldoggfledermaus. Italian: Carlìno setolóso.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008al; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2008al; IUCN, 2009). 2004 - DD ver 3.1 (2001) (Mickleburgh *et al.*, 2004ay; IUCN, 2004). 1996 - LR/lc [assessed as *Mormopterus setiger*] (Baillie and Groombridge, 1996).

MAJOR THREATS:
There are presumably no major threats to this species (Mickleburgh *et al.*, 2008al; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008al) [in IUCN (2009)] report that there appear to be no direct conservation measures in place. In view of the species' East African range, it seems likely that it is present within some protected areas, although this needs to be confirmed. Further studies are needed into the distribution, natural history and potential threats to this species.

GENERAL DISTRIBUTION:
Platymops setiger is an East African species present in Kenya, southwestern Ethiopia (Glass, 1965: 179), southeastern Sudan and is possibly present in adjacent Uganda, although this needs to be confirmed. It has been recorded at elevations of up to 2,000 m asl.

Native: Ethiopia; Kenya; Sudan.
Presence uncertain: Uganda.

MOLECULAR BIOLOGY:
DNA - Unknown.
Karyotype - Warner *et al.*, 1974) reported 2*n* = 48, FN = 54, BA = 8 and submetacentric X and acrocentric Y chromosomes.
Protein / allozyme - Unknown.

POPULATION:
Structure and Density - Little information is available on the population abundance or size of this species (Mickleburgh *et al.*, 2008al; IUCN, 2009).
Trend - 2008 - Unknown (Mickleburgh *et al.*, 2008al; IUCN, 2009).

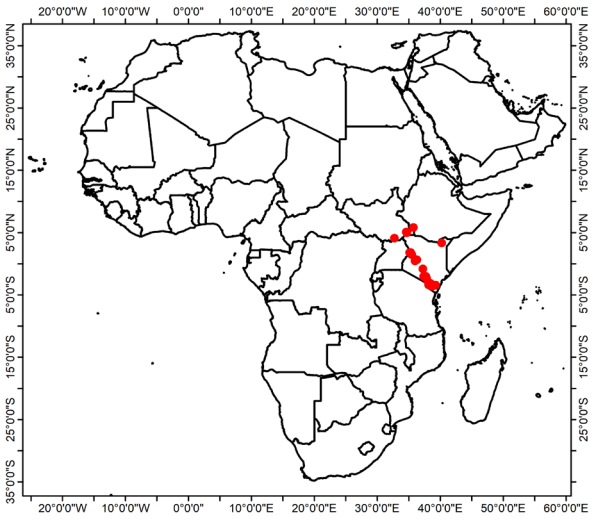

Figure 195. Distribution of *Platymops setiger*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Kenya.

Platymops setiger macmillani Thomas, 1906

*1906. *Platymops Macmillani* Thomas, Ann. Mag. nat. Hist., ser. 7, 17 (101): 500. Publication date: 1 May 1906. Type locality: Ethiopia: Between Addis Ababa and Lake Rudolf [Goto Description]. Holotype: BMNH 1906.11.1.10: ad ♂, skull and alcoholic. Collected by: Ph.C. Zaphiro. Presented/Donated by: W.N. McMillan Esq. 7 specimens. - Etymology: In honour of Mr. W.N. McMillan, to whose liberality science is indebted for the exploration of which it is part of the outcome (see Thomas, 1906b: 501).

1956. *Platymops barbatogularis* Harrison, Ann. Mag. nat. Hist., ser. 12, 9 (104): 549. Publication date: 18 December 1956. Type locality: Sudan: SE Sudan, Ilemi triangle: Lokomarinyang Marsh [05 02 N 35 33 E] [Goto Description]. Holotype: BMNH 1967.1232: ad ♂, skin and skull. Collected by: John George Williams; collection date: 10 June 1953. Formerly HZM 2.1897 (see Harrison (1956e: 549). Paratype: BMNH 1957.258:. - Comments: Evenhuis (2003: 54) indicates that ser. 12, 9 (104) is the "August 1956" issue which was published on "18 December 1956".

1960. *Platymops barbatogularis parkeri* Harrison and Fleetwood, Durban Mus. Novit., 5 (20): 270, figs 1 - 6. Publication date: 30 April 1960. Type locality: Kenya: Lualeni borehole: Maktau [03 24 S 38 08 E] [Goto Description]. Holotype: BMNH 1959.524: ad ♀, skin and skull. Collected by: Ian Parker; collection date: 12 February 1958; original number: 2.

? *Mormopterus setiger macmillani:* (Name Combination)

? *Platymops setiger macmillani:* (Name Combination, Current Combination)

TAXONOMY:
Kock (1969a: 155) considers *barbatogularis* to be a synonym of *macmillani*.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Ethiopia, Kenya, South Sudan.

Genus ***Sauromys*** Roberts, 1917

1917. *Platymops* Roberts, Ann. Transv. Mus., 6(1): 5. Publication date: 28 June 1917. - Comments: Type species: *Platymops (Sauromys) petrophylus* Roberts, 1917. Not of Thomas, 1906.
*1917. *Platymops (Sauromys)* Roberts, Ann. Transv. Mus., 6(1): 5. Publication date: 28 June 1917. - Comments: Type species: *Platymops (Sauromys) haagneri* Roberts, 1917 (=*Platymops petrophilus* Roberts, 1917). As a subgenus of *Platymops* Thomas, 1906. - Etymology: From Greek "*sauros*" meaning lizard and "mys" meaning mouse (see Jacobs and Fenton, 2002: 1).
? *Mormopterus (Sauromys):* (Name Combination)
? *Sauromys:* (Current Combination)
? *Tadarida (Sauromys):* (Name Combination)

TAXONOMY:
Bronner *et al.* (2003) state that the status of *Sauromys*, described as a monotypic subgenus of the extralimital *Platymops* for the South African flat-headed free-tailed bat, remains unclear. Peterson (1965) raised it to generic rank, a treatment endorsed by many subsequent authors, and corroborated by a limited multivariate analysis of wing bone and cranial characteristics (Peterson, 1985). However, morphometric studies by Freeman (1981b) and Legendre (1984) concluded that it is a subgenus of *Mormopterus*, a position followed by Koopman (1993a, 1994), and Jacobs and Fenton (2002: 1). Simmons (2005) retains *Sauromys* as a valid genus in the 3rd Edition of Mammal Species of the World, a treatment we favour because of the unique ecology and morphology of *S. petrophilus*. Analysis of the Rag2 data confirmed the split between *Mormopterus* and *Sauromys* (see Ammerman *et al.*, 2013: 309).

Meester *et al.* (1986) also state that originally described as a subgenus, this genus was regarded as a synonym of *Platymops* by Shortridge (1942), Roberts (1951) and Ellerman *et al.* (1953). Harrison (1962) retains it as a subgenus, while Peterson (1965) raises it to generic rank, in which he is followed by Hayman and Hill (1971), Smithers (1971), Corbet and Hill (1980) and Rautenbach (1982). However, Freeman (1981b), followed by Koopman (1982) and Legendre (1984), conclude that both *Sauromys* and *Platymops* are subgenera of *Mormopterus*. We take the view that both *Platymops* and *Sauromys* are valid genera.

Generic and species classification of African flat-headed molossids is unclear. Roberts (1917c) originally described *Sauromys* as a subgenus of *Platymops*. Later Roberts (1951, 1954) dropped *Sauromys* as a subgenus, as Shortridge (1942) reported that a minute upper premolar was found on the type *Platymops macmillani* Thomas, 1906. Peterson (1965) indicates that the minute premolar on the type *P. macmillani* is probably a milk premolar and that normal adult dental formula should be considered as having only one upper premolar. For this reason and others (e.g. glands not on wings) Peterson (1965) raises *Sauromys* to generic status. Koopman (1975) indicates that *Sauromys* is a subgenus within *Tadarida*, however Freeman (1981b) found that all the so-called flat-headed bats; *Sauromys*, *Platymops*, and *Neoplatymops*, are phenotypically related to *Mormopterus*. While the phenogram in Freeman

(1981b) also indicates that *Tadarida aegyptiaca* (E. Geoffroy 1818) and *T. brasiliensis* (I. Geoffroy St.-Hilaire 1824) are phenetically similar to *Mormopterus*, this grouping is explained due to convergence of shape due to similar life styles (Freeman, 1981b). Meester *et al.* (1986) did not follow Freeman (1981b) and rather followed Peterson (1965) recognizing *Sauromys*, *Mormopterus* and *Platymops* as valid genera. While Koopman (1993a) followed Freeman (1981b) in classifying *Sauromys* and *Platymops* as subgenera in the genus *Mormopterus*, Simmons (2005) recognizes *Sauromys* as a distinct genus.

Peterson (1965) suggests that a detailed comparison between *Sauromys* and *Tadarida* needs to be performed, including an investigation into the specific status and geographic variation. Ammerman *et al.* (2012: 21) suggest that *Sauromys* is more appropriately recognized as a member of the genus *Tadarida*, which split off from *T. aegyptiaca* some 6.5 million years ago. However, based on their morphological data, Gregorin and Cirranello (2015: 10) still find it premature to transfer *Sauromys* into *Tadarida*.

Known species within the genus *Sauromys*: ***petrophilus*** (Roberts, 1917).

COMMON NAMES:
Czech: ještěří morousi. French: Sauromys. German: Flachkopf-Bulldoggfledermäuse.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Avery (2007: 619) reported on the presence of *Sauromys* sp. in Pleistocene deposits at Wonderwerk Cave, South Africa.

Sauromys petrophilus (Roberts, 1917)

*1917. *Platymops (Sauromys) petrophilus:* Roberts, Ann. Transv. Mus., 6(1): 5. Publication date: 28 June 1917.
1917. *Platymops petrophilus* Roberts, Ann. Transv. Mus., 6(1): 5. Publication date: 28 June 1917. Type locality: South Africa: Western Transvaal: near Rustenburg: Bleskop [Goto Description]. Holotype: TM X835: ♂. Collected by: G.P. Van Dam; collection date: 2 February 1917; original number: 16. Presented/Donated by: ?: Collector Unknown. - Etymology: From the Greek "*petros*" meaning rock and "*philos*" meaning loving. (Name Combination)
? *Mormopterus petrophilus petrophilus:* (Name Combination)
? *Mormopterus petrophilus:* (Name Combination)
? *Platymops haagneri haagneri:*
? *Sauromys petrophilus:* (Name Combination, Current Combination)

TAXONOMY:

Figure 196. *Sauromys petrophilus umbratus* from Kliphuis, Cederberg, Western Cape South Africa.

Roberts (1951, 1954) recognised two species and five subspecies of flat-headed bats in southern Africa: *Platymops haagneri* Roberts, 1917 (*haagneri*, *umbratus* Shortridge and Carter, 1938) and *Platymops petrophilus* Roberts, 1917 (*petrophilus*, *erongensis* Roberts, 1946, *fitsimonsi* Roberts, 1946). Ellerman *et al.* (1953) suggested that the two species are conspecific, and rather recognized five subspecies of *Platymops petrophilus* (*petrophilus*, *haagneri*, *umbratus*, *erongensis* and *fitzsimonsi*). Meester *et al.* (1986) also recognized the five subspecies suggested by Ellerman *et al.* (1953) for *petrophilus* but within the genus *Sauromys*, following Peterson (1965: 12). Freeman (1981b) indicates that *erongensis* (Roberts, 1946) may be a synonmy of *haagneri* (Roberts, 1917) and *fitzsimonsi* (Roberts, 1946) is possibly a synonym of *umbratus* (Shortridge and Carter, 1938). Included in *Mormopterus* by Jacobs and Fenton (2002: 1). Jacobs and Fenton (2002: 1) considered *M. petrophilus* to be monotypic.

COMMON NAMES:
Afrikaans: Platkop-losstertvlermuis. Czech: morous ještěří. English: Rock-loving Flat-headed Bat, Rock-dwelling Flat-headed Bat, Roberts' Flat-headed Bat, Roberts's Flat-headed Bat, Flat-headed Free-tailed Bat. French: Sauromys de Roberts. German: Roberts' Flachkopf-

Bulldoggfledermaus. Portuguese: Morcego de cabeca curta.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
No fossils are known (Jacobs and Fenton, 2002: 1).

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008an; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2008an; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2004bc; IUCN, 2004). 1996 - LR/lc [assessed as *Mormopterus petrophilus*] (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - LC ver 3.1 (2001) (Jacobs *et al.*, 2016e). 2004 - LC ver 3.1 (2001) (Friedmann and Daly, 2004).

MAJOR THREATS:
There appear to be no major threats to this species. In parts of its range it is believed to be threatened by considerable habitat change resulting from deforestation (Mickleburgh *et al.*, 2008an; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008an) [in IUCN (2009)] report that this species is present in several protected areas in Namibia and Angola. In South Africa it has been reported from the protected Algeria forestry station. No direct conservation measures are currently needed for this species as a whole.

GENERAL DISTRIBUTION:
Sauromys petrophilus is found in southern Africa, ranging along the west coast from the Angola and Namibia border area, south into southern South Africa, and from here into northeastern South Africa, Zimbabwe, and western Mozambique. It is found between 100 m and 2,000 m asl. In the RSA, its distribution is best predicted by geology (Babiker Salata, 2012: 50).

Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 915,652 km^2.

The Ghanaian specimen which should be in the USNM (see Meester *et al.*, 1986), could not be located in the collection (see Jacobs and Fenton, 2002: 2).

Native: Angola; Botswana (Monadjem *et al.*, 2010d: 545); Mozambique (Monadjem *et al.*, 2010d: 545; Monadjem *et al.*, 2010c: 382); Namibia (Monadjem *et al.*, 2010d: 545); South Africa (Seamark and Kearney, 2007; Monadjem *et al.*, 2010d: 545)); Zimbabwe (Monadjem *et al.*, 2010d: 545).
Presence uncertain: Ghana.

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
See Jacobs and Fenton (2002).

Schoeman and Jacobs (2002: 157) mention the following wing parameters for 51 specimens from the Algeria Forestry Station (RSA): Fa: 39.0 ± 1.0 mm, Wing area: 93.1 ± 11 cm^2, Wing span: 26.3 ± 1.9 cm, Wing loading: 11.2 ± 1.1 N/m^2, and aspect ratio: 7.4 ± 0.6.

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:
As indicated by Rautenbach and Nel (1980: 112), the extremely flattened skull is an adaptation to roosting in the narrowest of rock crevices.
For further details, see Jacobs and Fenton (2002).

DETAILED MORPHOLOGY:
Baculum - Unknown
For a description of the crania, ears and tragus, and wingshape and aspect ratio, see Jacobs and Fenton (2002).

Curtis and Simmons (2018: 1390) found a relatively large, anteroposteriorly elongated, single, mineralized midline element positioned anterior to the dorsal margin of the nasal aperture in the cupular cartilages. Their CT-microscans showed a variation in the grayscale, suggesting porosity or trabeculae, which in turn might suggest a bony structure.

FUNCTIONAL MORPHOLOGY:
Toussaint and McKechnie (2012: 1138) found that the rapid increases in Evaporate Water Loss at high ambient temperatures in *S. petrophilus* may imply that, notwithstanding having a comparatively heat tolerance, this species may also be most vulnerable to lethal dehydration during future heat waves.

ECHOLOCATION:
See Jacobs and Fenton (2002).

From Algeria Forest Station (RSA), Schoeman and Jacobs (2002: 157) reported the type of calls to be low duty echolocation dominated by frequency modulated calls, with a F_{peak}: 29.2 ± 1.8 kHz.

Two calls by bats from the Kalahari Desert had the following characteristics: F_{char}: 24.0 ± 0.2 kHz, F_{max}: 30.3 ± 3.2 kHz, F_{min}: 23.7 ± 0.1 kHz, duration: 4.3 ± 0.7 msec (Adams and Kwiecinski, 2018: 4).

MOLECULAR BIOLOGY:
DNA - See Hoofer and Van Den Bussche (2003).
Karyotype - Rautenbach *et al.* (1993) reported 2*n* = 48, FN = 62, BA = 16, a submetacentric X chromosome, and an acrocentric Y chromosome for specimens from Namibia and South Africa. However, this did not include specimens from the Western Cape that Rautenbach *et al.* (1993) included with *Chaerephon pumilus*, but have subsequently been reidentified as *S. petrophilus* (Jacobs and Fenton, 2001).
Protein / allozyme - Unknown.

HABITAT:
Sirami *et al.* (2013: 34) recorded in the Western Cape Province, South Africa that *S. petrophilus* activity was significantly and positively influenced by size of wetland, while habitats 100 m surrounding wetlands were also significantly and positively influenced by the water body. *S. petrophilus* favoured open habitats surrounding wetlands (Sirami *et al.*, 2013: 35) .

HABITS:
See Jacobs and Fenton, 2002).

ROOST:
See Jacobs and Fenton (2002).

DIET:
See Jacobs and Fenton (2002).

From the Algeria Forestry Station (RSA) Schoeman and Jacobs (2002: 157) reported the following prey groups based on 464 faecal pellets from 51 bats (in volume percent): Diptera (37.8 ± 31.2), Hemiptera (32.9 ± 23.7), Coleoptera (19.5 ± 23.1), Hymenoptera (7.9 ± 16.2), Neuroptera (0.6 ± 3.0), Trichoptera (0.4 ± 2.9), Lepidoptera (0.3 ± 2.2), and unknown (1.0 ± 3.3).

PREDATORS:
Mikula *et al.* (2016: Supplemental data) mention *S. petrophilus* as possible prey of Lanner falcon (*Falco biarmicus* Temminck, 1825) and Peregrine falcon (*Falco peregrinus* Tunstall, 1771),

POPULATION:
Structure and Density - This is a locally common species. It is generally found in small numbers, with colonies thought to be tens of animals rather than hundreds (Jacobs and Fenton, 2002).
Trend - 2008 - Stable (Mickleburgh *et al.*, 2008an; IUCN, 2009).

ACTIVITY AND BEHAVIOUR:
See Jacobs and Fenton, 2002).

REPRODUCTION AND ONTOGENY:
See Jacobs and Fenton (2002).

VIRUSES:
Rhabdoviridae
Lyssavirus - Rabies related viruses
Rabies - Oelofsen and Smith (1993) tested 12 individuals from Riemvasmaak, Northern Cape, South Africa using "Trousse Platelia Rage" ELISA kit (Diagnostic Pasteur), none tested positive for antibodies to rabies virus glycoprotein G. Oelofsen and Smith (1993) tested 12 individuals from Riemvasmaak, Northern Cape, South Africa by means of the "Rapid rabies enzyme immunodiagnosis" (RREID) test (Diagnostic Pasteur), none were tested positive.

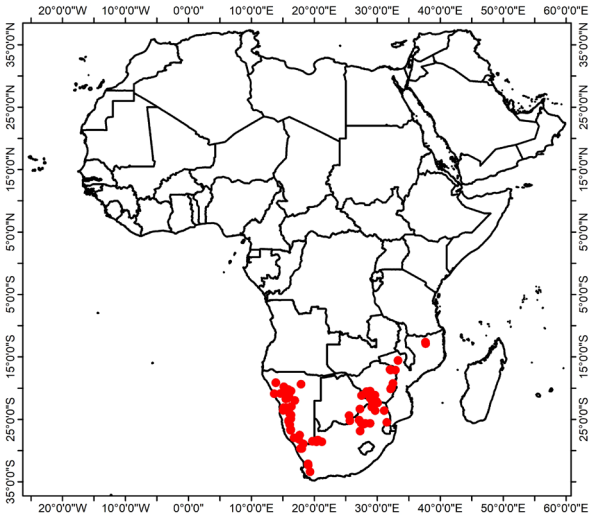

Figure 197. Distribution of *Sauromys petrophilus*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Botswana, Mozambique, Namibia, South Africa, Zimbabwe.

Sauromys petrophilus erongensis (Roberts, 1946)

*1946. *Platymops petrophilus erongensis* Roberts, Ann. Transv. Mus., 20 (4): 308. Type locality: Namibia: Damaraland: Omaruru district: Eronga Mountains: Ombu Farm [21 35 S 15 43 E] [Goto Description]. Holotype: TM 9494: ♂. Collected by: The Barlow TM-Expedition and Austin Roberts; collection date: 19 September 1941; original number: 112 (14). Presented/Donated by: ?: Collector Unknown. Holotype: TM 9570: ♂. Collected by: Austin Roberts; collection date: 22 September 1941; original number: 128. Presented/Donated

by: ?: Collector Unknown. Paratype: TM 9495: ♀. Collected by: The Barlow TM-Expedition and Austin Roberts; collection date: 14 September 1941; original number: 77. Genus ***Tadarida*** Rafinesque, 1814

*1814. *Tadarida* Rafinesque, Précis des découvertes et travaux somiologiques, 55. Publication date: 3 June 1814. - Comments: Type species: *Cephalotes teniotis* Rafinesque, 1814. - Etymology: Meaning unknown (Flannery, 1990: 366). Possibly from the Greek "data" or Latin "taeda" and "nukterida" (see Kozhurina, 2002: 18). Braun and Mares (1995: 182) refer to Gotsch (1979), who states this is a word created by C.S. Rafinesque. Lanza *et al.* (2015: 317 - 318) gives the following explanation: "From the feminine Greek substantive "*νυκτερίς*" (nykterís) [genitive "*νυκτερίδος*" (nikterídos)], meaning "bat"; by aphaeresis] and dialectal deformation, the above genitive turned into "tadarida" in southern Italy. Some examples of similar dialect deformations are according to Forsyth Major (1893): tagddariti (Naples); taddarita, taddarida and taddarito (Calabria), tardaritòla and tardarira (Sicily)". (Current Combination)
1818. *Nyctinomus* E. Geoffroy Saint-Hilaire, Description des Mammifères qui se trouve en Egypte, 2: 114, pl. 2. Publication date: 1818 [Goto Description]. - Comments: Type species: *Nyctinomus aegyptiacus* E. Geoffroy St. Hillaire, 1818. - Etymology: From the Greek "*νύξ*" or "*νυκτός*", meaning night and "*νομός*", meaning habitation (see Palmer, 1904: 466).
1821. *Nyctimones* Gray, London Med. Repos., 15: 299. Publication date: 1 April 1821. - Comments: Generally, the name is reported as *Nyctinomes*, but Gray (1821: 299) actually mentioned *Nyctimones*, with one species *Vesp. acetabulosus*.
1821. *Nyctinoma* Bowdich, Analysis of the Natural Classification of Mammalia, p. 28.
1822. *Nyctinomia* Fleming, The Philosophy of Zoology, 2: 178 [Goto Description].
1825. *Dinops* Savi, Nuov. Giorn. Letter. Pisa, Sci., 10: 229. - Comments: Type species: *Dinops cestoni* Savi, 1824 (=*Cephalotes teniotis* Rafinesque, 1814). - Etymology: From the Greek "*δεινός*", meaning terrible and "*ώψ*", meaning face or aspect, probably referring to the deeply grooved or wrinkled face (see Palmer, 1904: 234).
1830-1831. *Dysopes* Cretzschmar, in: Rüppell, Atlas Reise Nördlichen Afrika, Zoologie Säugethiere, 1: 69. Publication date: 1830-1831. - Comments: Not of Illiger, 1811. The publication date of Cretzschmar's work is sometimes indicated as "1826" (as mentioned on the title page), but also as "1827", "1828", "1830-1831".
1934. *Austronomus* Iredale and Troughton, Mem. Aust. Mus., p. 100. - Comments: Type species: *Nyctinomus australis atratus* Thomas, 1924 (=*Molossus australis* Gray, 1839). (*Nomen Nudum*).

1941. *Austronomus* Troughton, Animals of Australia, 1st ed, 360. - Comments: Type species: *Nyctinomus australis atratus* Thomas, 1924 (=*Molossus australis* Gray, 1839). Validation of *Austronomus* Iredale and Troughton, 1934 (see Meester *et al.*, 1986: 68; Simmons (2005).
1973. *Tatarida:* Eisentraut, Bonn. zool. Monogr., 3: 113. (Lapsus)
1984. *Rhizomops* Legendre, Rev. suisse Zool., 91 (2): 427. Publication date: June 1984. - Comments: Type species: *Rhizomops brasiliensis* (I. Geoffroy Saint-Hilaire, 1824). - Etymology: From the Greek "*riza*" meaning root (see Legendre, 1984: 427).
1995. *Dynops:* Pavlinov, Borissenko, Kruskop and Jahonton, Arch. Zool. Mus., Moscow State Univ., 133: ???. (Lapsus)
? *Tadarida sp.:*

TAXONOMY:
Formerly included *Chaerephon*, *Mops*, *Mormopterus*, and *Nyctinomops*; see Freeman (1981b: 133). Includes *Rhizomops*, but see Legendre (1984); see also Owen *et al.* (1990). Mahoney and Walton (1988c) regarded *Nyctinomus* as the prior name for this genus.

Based on their analysis of molecular data, Lamb *et al.* (2011: 9) suggest that the genus *Tadarida* - as currently recognized - is not a natural group. *Tadarida teniotis* - the type species of the genus - forms a separate clade from *T. aegyptiaca* - the type species of *Nyctinomus* - and "*C. jobimena*". They suggest that the two latter species - together with other species - might be placed in a separate genus: *Nyctinomus*, but they await further taxonomic sampling and resolution of the phylogeny of other African taxa before making this formal.

Known species within the genus *Tadarida*: ***aegyptiaca*** (E. Geoffroy, 1818); *australis* (Gray, 1839) – south and central Australia (Simmons, 2005: 449); *brasiliensis* (I. Geoffroy, 1824) – southern Brazil, Bolivia, Argentina and Chile to Oregon, south Nebraska and Ohio (USA), Greater and Lesser Antilles (Simmons, 2005: 450); ***fulminans*** (Thomas, 1903); *insignis* Blyth, 1862 – Japan, Taiwan, Korea, southern China (Simmons, 2005: 450); *kuboriensis* McKean and Calaby, 1968 – New Guinea (Simmons, 2005: 450); *latouchei* Thomas, 1920 – northern China, Thailand, Laos, Japan (Simmons, 2005: 450); ***lobata*** (Thomas, 1891); ***teniotis*** (Rafinesque, 1814); ***ventralis*** (Heuglin, 1861).

COMMON NAMES:
Czech: širokouší morousi (hroznohledové, netopýři morousovití. English: Guano Bats, Free-tailed Bats, Tadarine Bats. French: Tadarides. German: Gewöhnliche Bulldoggfledermäuse. Italian: Tadarìde.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Avery (2007: 619) reported on the presence of *Tadarida* sp. in Pleistocene deposits at Wonderwerk Cave, South Africa.

PARASITES:
Barbosa *et al.* (2016: 215) reported *Trypanosoma erneyi* from a *Tadarida* sp. from Mozambique.

ACARI
Myobiidae: Fain (1994: 1280) reports one species of *Schizomyobia*, living on Old World *Tadarida*.

†*Tadarida engesseri* Rachl, 1983

*1983. *Tadarida engesseri* Rachl, Die Chiroptera (Mammalia) aus den mittelmiozänen Kalken des Nordlinger Rieses (Suddeutschland). Thesis Doct, Ludwig-Maximilians. Universität München.. Type locality: Germany: Steinberg (Ries).

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Middle Miocene (Astaracanian).

GENERAL DISTRIBUTION:
Europe; Morocco Hugueney *et al.* (2015: 472).

Tadarida aegyptiaca (E. Geoffroy St.-Hilaire, 1818)

*1818. *Nyctinomus ægyptiacus* E. Geoffroy Saint-Hilaire, Description des Mammifères qui se trouve en Egypte, 2: 128, pl. 2, No 2. Publication date: 1818. Type locality: Egypt: Giza province: Giza [30 01 N 31 13 E]. Lectotype: MNHN ZM-MO-1986-1084 (A.467): ad ♂, skin and skull. Collected by: ?: Collector Unknown. Presented/Donated by: ?: Collector

Unknown. Number 228 in Rode (1941: 251). - Comments: Type locality restricted from "Egypt" to Giza by Koopman (1975: 422): see Qumsiyeh (1985: 73), Meester *et al.* (1986: 70). - Etymology: From the scientific Latin feminine adjective *aegyptiacus*, meaning "Egyptian", as the species was decribed from an Egyptian specimen (see Lanza *et al.*, 2015: 319).

1855. *D[ysopes] aegyptiacus:* Giebel, Die Säugethiere., 957. (Name Combination)

2012. *Nyctinomus aegyptiacus:* Benda, Faizolâhi, Andreas, Obuch, Reiter, Ševcík, Uhrin, Vallo, and Ashraf, Acta Soc. Zool. Bohem., 76: 163, 516. Publication date: 27 December 2012. (Alternate Spelling)

2018. *Tadarida aegyptica:* Lazzeroni, Burbrink and Simmons, Ecol. Evol., 8 (24): 12584. Publication date: 28 November 2018. (Lapsus)

? *Tadarida (Tadarida) aegyptiaca:* (Name Combination)

? *Tadarida aegyptiaca:* (Name Combination, Current Combination)

TAXONOMY:
Includes *tragata*; see Corbet (1978: 63) and Freeman (1981b: 165). However, see Benda *et al.* (2012a: 523) and Bendjeddou *et al.* (2016b:23) who consider *tragata* to be a separate species, extralimital to Africa.

Benda *et al.* (2012a: 516) place this taxon in the genus *Nyctinomus*, a view followed by a.o. Bendjeddou *et al.* (2016b: 23).

COMMON NAMES:
Afrikaans: Egiptiese losstertvlermuis. Bengali: Lomba-leji Chamchika. Chinese: 北非犬吻蝠. Czech: morous egyptský, přišerec egipecký, tadarida jižní, morous jižní. Dutch: Egyptischte bulvleermuis. English: Egyptian Free-tailed Bat, Egyptian Guano Bat, Egyptian Nyctinome. French: Tadaride d'Egypte, Molosse d'Egypte. German: Ägyptische Bulldoggfledermaus. Italian: Tadarìda egiziàna. Portuguese: Morcego de cauda livre do egipto. Tamil: எகிப்தி ய வாலற்ற வௌவால், Ekiptiya Vālarra Veḷavāl.

ETYMOLOGY OF COMMON NAME:
The original specimens were collected in Egypt during the Napoleonic wars by E. Geoffroy Saint-Hilaire, who at that time served under Napoleon (see Taylor, 2005).

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Avery and Avery (2011: 18) report on Holocene and Pleistocene remains from Wonderwerk (Northern Cape province, South Africa).

CONSERVATION STATUS:
Global - Broadly distributed and locally common, hence is listed as Least Concern (LC ver 3.1 (2001)) (Mickleburgh *et al.*, 2008ar; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2008ar; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2004bb; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - LC ver 3.1 (2001) (MacEwan *et al.*, 2016a). 2004 - LC ver 3.1 (2001) (Friedmann and Daly, 2004).

MAJOR THREATS:
No serious threats other than roost disturbance from human interference is noted for this species (Molur *et al.*, 2002). Pesticides used against locusts are a threat as for all bat species found in the Saharan belt (Mickleburgh *et al.*, 2008ar; IUCN, 2009). Furthermore, Doty and Martin (2012: 75) report on fatalities due to wind turbines in the Eastern Cape, South Africa.

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008ar) [in IUCN (2009)] report that the species is protected by national legislation in some of the Mediterranean range states as well as in South Africa. It is likely to be found in protected areas. A survey using bat detectors should be undertaken to help clarify the distribution limits and population size of this species as it is probably more widespread than current records indicate. A study on the impacts of pesticides is required, especially ways in which the impact might be minimised.

GENERAL DISTRIBUTION:
Tadarida aegyptiaca is found throughout Africa, and in the Arabian Peninsula through to India, Sri Lanka and Bangladesh. In the Mediterranean region there are isolated records from southern Morocco and western Algeria, but it is more widely distributed in Egypt along the Nile River valley eastwards to the Red Sea coast and south to the Sudanese border. The species is thought to be more widely distributed than is currently known and may well occur elsewhere in the region. In South Asia, this widely distributed species is presently known from Afghanistan (Kabul Province) (Habibi, 2003), Bangladesh (no exact location) (Khan, 2001; Srinivasulu and Srinivasulu, 2005), India (Andhra Pradesh, Gujarat, Karnataka,

Kerala, Madhya Pradesh, Maharashtra, Rajasthan, Tamil Nadu and West Bengal), Pakistan (Punjab and Sind) and Sri Lanka (Central and Uva Provinces) (Molur *et al.*, 2002). Elevation: sea level up to 2,100 m asl.

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 1,214,127 km^2. In the RSA, the species' distribution is linked with land use/land cover (Babiker Salata, 2012: 50).

Native: Afghanistan; Algeria; Angola (Crawford-Cabral, 1989; Hayman, 1963; Monadjem *et al.*, 2010d: 545; Taylor *et al.*, 2018b: 63); Bangladesh; Botswana (Monadjem *et al.*, 2010d: 545); Congo (The Democratic Republic of the); Egypt; Ethiopia; Eritrea (Lavrenchenko *et al.*, 2004b: 132); India; Iran, Islamic Republic of; Kenya; Lesotho (Lynch, 1994: 197; Monadjem *et al.*, 2010d: 545); Mauritania; Morocco (Benda *et al.*, 2004d; El Ibrahimi and Rguibi Idrissi, 2015: 365); Mozambique (Monadjem *et al.*, 2010d: 545; Monadjem *et al.*, 2010c: 382); Namibia (Monadjem *et al.*, 2010d: 545); Nigeria; Oman; Pakistan; Saudi Arabia; South Africa (Seamark and Kearney, 2007; Monadjem *et al.*, 2010d: 546); Swaziland (Monadjem *et al.*, 2010d: 546); Sri Lanka; Sudan; Tanzania; Tunisia (Bendjeddou *et al.*, 2016b: 23); Uganda; Yemen (Benda *et al.*, 2011b: 45); Zambia (Cotterill, 2004a: 260; Monadjem *et al.*, 2010d: 546); Zimbabwe (Monadjem *et al.*, 2010d: 546).

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Schoeman and Jacobs (2002: 157) reported the following parameters for 43 specimens from the Algeria Forestry Station (RSA): Fa: 45.1 ± 1.2 mm, Wing area: 115.2 ± 8.4 cm^2, Wing span: 30.8 ± 1.0 cm, Wing loading: 13.1 ± 1.6 N/m^2, and aspect ratio: 8.3 ± 0.6.

ECHOLOCATION:
See Taylor (1999b).

From Algeria Forest Station (RSA), Schoeman and Jacobs (2002: 157) reported the type of calls to be low duty echolocation dominated by frequency modulated calls, with a F_{peak}: 22.8 ± 1.9 kHz.

Schoeman and Waddington (2011: 291) mention a peak frequency of 21.8 ± 1.7 kHz and a duration of 12.8 ± 0.7 msec for specimens from Durban, South Africa.

From Waterberg, South Africa, Taylor *et al.* (2013b: 18) recorded the following parameters for 8 calls: F_{max}: 28.3 ± 3.36 (24.8 - 34.1) kHz, F_{min}: 21.6 ± 2.73 (17.2 - 24.0) kHz, F_{knee}: 24.2 ± 1.47 (21.9 - 26.1) kHz, F_{char}: 22.8 ± 1.39 (20.5 - 24.5) kHz, duration: 7.2 ± 3.10 (3.3 - 10.9) msec.

At Farm Welgevonden, South Africa, Taylor *et al.* (2013a: 556) report a F_{knee} value of 24 (22 - 26) kHz.
Linden *et al.* (2014: 40) reported the following parameters from the Soutpansberg range (RSA): F_{min}:17 - 24 kHz, F_{char}: 20 - 24 kHz, F_{knee}: 22 - 26 kHz, Slope: 65 - 221 OPS, duration: 3 - 11 msec. In the Mapungubwe National Park (RSA), Parker and Bernard (2018: 57) recorded 20 calls with the following characteristics: F_{char}: 23.68 ± 1.51 kHz, F_{max}: 29.23 ± 5.77 kHz, F_{min}: 22.47 ± 1.74 kHz, F_{knee}: 25.72 ± 2.92 kHz, duration: 9.87 ± 3.93 msec, with 4.10 ± 2.72 calls/sec.

Moores and Brown (2017: 612) recorded the following parameters for 25 calls from southern Morocco: F_{start}: 26.0 ± 2.6 (22.2 - 30.4) kHz, F_{max}: 19.6 ± 1.6 (17.4 - 22.3) kHz, F_{end}: 18.4 ± 0.8 (17.2 - 19.5) kHz, duration: 9.4 ± 1.4 (8.1 - 12.2) msec, interpulse interval: 373 ± 153 (220 - 780) msec.

Adams and Kwiecinski (2018: 4) reported the following values for 5 calls from the Kalahari Desert: F_{char}: 21.6 ± 1.2 kHz, F_{max}: 25.2 ± 1.1 kHz, F_{min}: 21.2 ± 1.1 kHz, duration: 4.9 ± 0.6 msec.

MOLECULAR BIOLOGY:
DNA - Unknown.
Karyotype - Both Nagorsen *et al.* (1976) and Rautenbach *et al.* (1993) reported 2*n* = 48 and an actrocentric Y chromosome. However, while Nagorsen *et al.* (1976) reported FN = 54, BA = 8, and a submetacentric X chromosome, Rautenbach *et al.* (1993) reported FN = 68, BA = 22, and a metacentric X chromosome, for specimens from Namibia and South Africa.
Protein / allozyme - Unknown.

HABITAT:
Sirami *et al.* (2013: 34) recorded in the Western Cape Province, South Africa that *T. aegyptiaca* activity was significantly and positively influenced by wetland size, while habitats 100 m surrounding wetlands were also significantly and positively influenced by the water body. *T. aegyptiaca* favoured open habitats surrounding wetlands (Sirami *et al.*, 2013: 35).

HABITS:
Rautenbach and Nel (1980: 112) indicate that this is fast flying bat which follows a relatively straight flight path.

Thomas and Jacobs (2013: 129) report that, at De Hoop Nature Reserve, South Africa, bats feeding on Diptera (such as *T. aegyptiaca*) emerged later than bats feeding on Lepidoptera (e.g. *Rhinolophus capensis* and *Nycteris thebaica*).

ROOST:
In the Durban area (RSA), Taylor *et al.* (1999: 68) found these bats roosting in high-rise buildings of the Central Business District, and the colony sizes varied between 30 and an estimated 300.

Toussaint *et al.* (2010) examined roost temperature in Pretoria, South Africa.

DIET:
In Zimbabwe, Fenton and Thomas (1980: 86) report that the diet of *T. aegyptiaca* consists of Lepidoptera and Coleoptera.

From the Algeria Forestry Station (RSA) Schoeman and Jacobs (2002: 157) reported the following prey groups based on 314 faecal pellets from 43 bats (in volume percent): Diptera (34.6 ± 33.4), Coleoptera (25.5 ± 30.7), Hemiptera (19.2 ± 24.6), Hymenoptera (8.4 ± 22.2), Lepidoptera (5.4 ± 13.4), Ephemeroptera (2.7 ± 7.7), Neuroptera (1.5 ± 6.5), Orthoptera (0.6 ± 3.4), and unknown (1.4 ± 7.1).

For Saudi-Arabia, Benda *et al.* (2012a: 524) indicate that some diet samples were dominated by Lepidoptera, whereas others were dominated by Coleoptera and Hymenoptera or by Heteroptera and Brachycera. In Iran, three digestive tracts were analysed: One tract was empty, one contained Lepidoptera (30 % of volume), Coleoptera (Scarabaeidae) (30 %), Neuroptera (Myrmeleontidae) (10 %), and Orthoptera (Ensifera) (30 %), and the third tract contained Coleoptera (Elateridae, Carabidae) (60 %) and Orthoptera (Ensifera) (40 %).

PREDATORS:
Avery *et al.* (2005: 1054) found this species to be present in pellets from *Tyto alba* in South Africa.

Mikula *et al.* (2016: Supplemental data) mention the Bat hawk (*Macheiramphus alcinus* Bonaparte, 1850) as diurnal avian predator.

POPULATION:
Structure and Density - This species is widespread and common in its South Asian range, where its population seems to be stable (Molur *et al.*, 2002). Trend - 2008 - Unknown (Mickleburgh *et al.*, 2008ar; IUCN, 2009).

ACTIVITY AND BEHAVIOUR:
Toussaint *et al.* (2010) examined heterothermy in *T. aegyptiaca* in Pretoria, South Africa.

REPRODUCTION AND ONTOGENY:
In Pretoria (South Africa), Tsita (1993), Bernard and Tsita (1995: 18) and le Grange *et al.* (2011: 170 - 171) found spermatogenesis occurring in January, and spermatozoa were first found in the epididymis in May, where they were stored until the end of September. In females, follicular development was already taking place in January. Copulation, ovulation and fertilization took place in August to early September; and births took place in December. Their conclusion was that *T. aegyptiaca* is a monoestrous, monotocous seasonal breeder. le Grange *et al.* (2011: 173) also indicate that, at 33° S, spermatogenesis only started in February, and that follicular development only started in April, but copulation, ovulation, and fertilization also occurred at the end of August.

Monadjem *et al.* (2010d) [in Weier *et al.* (2018: Suppl.)] mentioned births in November or December.

PARASITES:
Copeland *et al.* (2011: 363) reported the rediscovery of the "terrible hairy fly" (*Mormotomyia hirsuta* (after 62 years) in guano produced by *C.* cf. *bivittatus* and *T. aegyptiaca* at Ukasi Hill, Kenya.

From Algeria, the following ectoparasites were reported by Bendjeddou *et al.* (2017: 15): Nycteribiidae: *Nycteribia (Nycteribia) pedicularia* Latreille, 1805 and *Phthiridium biarticulatum* Hermann, 1804; Streblidae: *Brachytarsina (Brachytarsina) flavipennis* Macquart, 1851: and Arachnida: *Spinturnix myoti* (Kolenati, 1856) and *Eyndhovenia euryalis* (G. Canestrini, 1885).

VIRUSES:
Bunyaviridae
Phlebovirus
Rift Valley Fever Virus (RVFV) - Oelofsen and Van der Ryst (1999) tested 24 individuals from two localities in the Free State Province, South Africa for RVFV antigen using an enzyme linked immunosorbet assay (ELISA), none tested positive.

Rhabdoviridae
Lyssavirus - Rabies related viruses
Rabies - Oelofsen and Smith (1993) tested 55 individuals from four localities using "Trousse Platelia Rage" ELISA kit (Diagnostic Pasteur), none tested positive for antibodies to rabies virus glycoprotein G. Oelofsen and Smith (1993) tested 89 individual brains, from 9 localities by means of the "Rapid rabies enzyme immunodiagnosis" (RREID) test (Diagnostic Pasteur), none were tested positive.

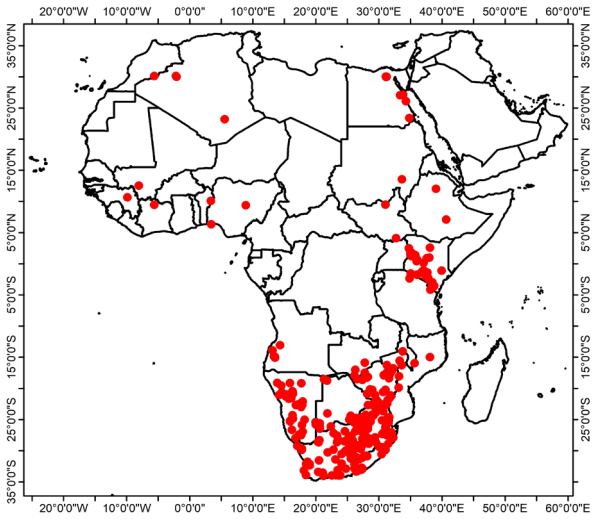

Figure 198. Distribution of *Tadarida aegyptiaca*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Algeria, Angola, Botswana, Côte d'Ivoire, Egypt, Ethiopia, Guinea, Kenya, Lesotho, Malawi, Mali, Mauritius, Morocco, Mozambique, Namibia, Niger, Nigeria, South Africa, South Sudan, Sudan, Swaziland, Tanzania, Uganda, Zambia, Zimbabwe.

Tadarida aegyptiaca aegyptiaca (E. Geoffroy St.-Hilaire, 1818)

*1818. *Nyctinomus ægyptiacus* E. Geoffroy Saint-Hilaire, Description des Mammifères qui se trouve en Egypte, 2: 128, pl. 2, No 2. Publication date: 1818. Type locality: Egypt: Giza province: Giza [30 01 N 31 13 E]. - Comments: Type locality restricted from "Egypt" to Giza by Koopman (1975: 422): see Qumsiyeh (1985: 73), Meester *et al.* (1986: 70). - Etymology: From the scientific Latin feminine adjective *aegyptiacus*, meaning "Egyptian", as the species was decribed from an Egyptian specimen (see Lanza *et al.*, 2015: 319).

1827. *Dysopes geoffroyi* Temminck, Monogr. Mamm, 1: 226, pls 19, 23. Publication date: 1827. - Comments: Allen (1939a: 110), Qumsiyeh (1985: 73) mentioned 1827 as year of publication. Kock (1969a: 137), Meester *et al.* (1986: 70) mention 1826. Substitute for *aegyptiacus* E. Geoffroy St. Hilaire (see Ellerman and Morrison-Scott, 1951: 135; Harrison, 1964a: 109; Kock, 1969a: 137; Qumsiyeh, 1985: 73; Meester *et al.*, 1986: 70).

1877. *Dysopes talpinus* Heuglin, Reise in Nordost Afrika, 2: 28. Publication date: 1877. Type locality: Sudan: Bahr-el-Ghazal province: Kidj district: Bahr el Jebel, West bank: "Kidj district" [ca. 07 06 N 30 46 E].

1916. *Nyctinomus (Nyctinomus) tongaënsis* Wettstein, Anz. kais. Akad. Wiss., Wien, 53: 192. Publication date: 1916. Type locality: Sudan: Upper White Nile: Tonga [09 30 N 31 03 E] [Goto Description]. Syntype: NMW 8406: ♂, alcoholic (skull not removed). Collected by: Prof. Dr. Franz Werner; collection date: 16 April 1916. Presented/Donated by: Otto Ritter von Westersheim Wettstein. See Benda *et al.* (2012a: 582). Syntype: NMW 8407: ♂, skull and alcoholic. Collected by: Prof. Dr. Franz Werner; collection date: 16 April 1916. Presented/Donated by: Otto Ritter von Westersheim Wettstein. See Benda *et al.* (2012a: 582). - Comments: Wettstein (1916: 189, 192) mentions two male type specimens, collected by Prof. Dr. Franz Werner on 16 April 1914.

1938. *[Nyctinomus] tongaënsis:* Frechkop, Exploration du Parc National Albert, 54. (Name Combination)

? *Tadarida aegyptiaca aegyptiaca:* (Name Combination, Current Combination)

? *tongaensis:* (Current Spelling)

GENERAL DISTRIBUTION:
Arabia, N Africa (Horácek *et al.*, 2000: 136).

PARASITES:
SIPHONAPTERA

Ischnopsyllidae: *Araeopsylla scitula* (Rothschild 1909) found in southern Africa from Cape, Natal, Transvaal Provinces of South Africa, Lesotho and Botswana (Haeselbarth *et al.*, 1966: 189).

Tadarida aegyptiaca bocagei (Seabra, 1900)

1900. *Nyctinomus Anchietæ* Seabra, J. Sci. mat. phys. nat., ser. 2, 6: 82. Publication date: August 1900. Type locality: Angola: W Angola: Quibula [Goto Description].

*1900. *Nyctinomus Bocagei* Seabra, J. Sci. mat. phys. nat., ser. 2, 6: 84. Publication date: August 1900. Type locality: Angola: Benguela district: East of Hanha: Galanga [12 04 S 15 09 E] [Goto Description].
1900. *Nyctinomus brunneus* Seabra, J. Sci. mat. phys. nat., ser. 2, 6: 83. Publication date: August 1900. Type locality: Angola: NE of Benguela: Quissange [12 30 S 14 05 E] [Goto Description].
1941. *Tadarida bocagei:* Hill and Carter, Bull. Am. Mus. Nat. Hist., 78 (1): 55. Publication date: 25 July 1941. (Name Combination)
? *Tadarida (Tadarida) aegyptiaca bocagei:* (Name Combination)
? *Tadarida aegyptiaca bocagei:* (Name Combination, Current Combination)

TAXONOMY:
If page precedence is to be taken into account, *anchietae* might be the senior synonym for this form.

COMMON NAMES:
Afrikaans: Bocagese Losstertvlermuis. English: Bocage's Free-tailed Bat.

GENERAL DISTRIBUTION:
Angola and Zambia to South Africa (Horácek *et al.*, 2000: 136).

PREDATORS:
Dean (1975: 218) reports on remains being found in barn owl (*Tyto alba*) pellets in South Africa.

PARASITES:
HEMIPTERA
Cimicidae: *Stricticimex transverses* Ferris and Usinger, 1957 from Kanye, Botswana (Haeselbarth *et al.*, 1966: 15).

SIPHONAPTERA
Ischnopsyllidae: *Araeopsylla scitula* (Rothschild, 1909) found in southern Africa from Cape, Natal, Transvaal Provinces of South Africa, Lesotho and Botswana (Haeselbarth *et al.*, 1966: 189).

ACARI
Trombiculidae: *Microtrombicula kanyei* Vercammen-Grandjean, 1965 was reported by Stekolnikov (2018a: 155) from bats from Kanye, Botswana.

Tadarida fulminans (Thomas, 1903)

*1903. *Nyctinomus fulminans* Thomas, Ann. Mag. nat. Hist., ser. 7, 12 (71): 501. Publication date: 1 November 1903. Type locality: Madagascar: Eastern Betsileo: Fianarantsoa [21 36 S 47 05 E, 1 130 m] [Goto Description]. Holotype: BMNH 1882.3.1.34: ♂, skull and alcoholic. Collected by: Rev. W. Deans Cowan; original number: 4. - Etymology: From the Latin "*fulminate*" meaning strike with lightning.
1946. *Nyctinomus mastersoni* Roberts, Ann. Transv. Mus., 20 (4): 306. Type locality: Zimbabwe: Bindura district: Masembura Nature Reserve: Chikupu caves [17 24 S 31 20 E] [Goto Description]. Holotype: TM 9976: ad ♂, skin and skull. Collected by: H.B. Masterson; collection date: 10 July 1945. Topotype: ROM 64580: ad ♂, skin and skull. Collected by: Randolph L. Peterson and G.E. Turner; collection date: 11 May 1972. Presented/Donated by: ?: Collector Unknown.
2004. *Tadarida fulmilans:* Goodman and Cardiff, Acta Chiropt., 6 (2): 227. (Lapsus)
? *Tadarida fulminans mastersoni:* (Name Combination)
? *Tadarida fulminans:* (Name Combination, Current Combination)

TAXONOMY:
See Simmons (2005).

COMMON NAMES:
Afrikaans: Madagaskarse grootlosstertvlermuis. Chinese: 岛犬吻蝠. Czech: morous východoafrický. English: Large Free-tailed Bat, Lightning Guano Bat, Large Guano Bat, Madagascan Large Guano Bat, Madagascan Large Free-tailed Bat, Madagascan Free-tailed Bat, Madagascar Large Free-tailed Bat, Malagasy Free-tailed Bat. French: Tadaride de Thomas, Grande Tadaride de Madagascar, Molosse de Madagascar. German: Madagassische Bulldoggfledermaus.

ETYMOLOGY OF COMMON NAME:
The colloquial name refers to the island where the species occurs.

CONSERVATION STATUS:
Global - This species is listed as Least Concern (LC ver 3.1 (2001)) in view of its wide range across east and southern Africa. Although it is not a common species and can be patchily distributed, it is not thought to be facing any major threats (Cotterill *et al.*, 2008; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Cotterill *et al.*, 2008; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Cotterill, 2004b; IUCN, 2004). 1996 - LR/nt (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - LC ver 3.1 (2001) (Monadjem *et al.*, 2016z). 2004 - Considered a vagrant. Not assessed, due to known form a single locality (Friedmann and Daly, 2004). 1986 - Indeterminate (Smithers, 1986).

MAJOR THREATS:
There appear to be no major threats to this species (Cotterill *et al.*, 2008; IUCN, 2009).

CONSERVATION ACTIONS:
Cotterill *et al.* (2008) [in IUCN (2009)] report that it has been recorded from one protected area in Madagascar and is presumed to exist in many protected areas within its range in eastern and southern Africa, however, there appear to be no active conservation measures in place. Further studies are needed into the distribution and taxonomic status of bats allocated to *Tadarida fulminans*.

GENERAL DISTRIBUTION:
Tadarida fulminans ranges through East Africa, southern Africa and a few localities on the island of Madagascar. Populations have been recorded through eastern and southeastern Africa, from around the border of Kenya and Uganda as far south as the border between Zimbabwe and South Africa. The most westerly record is from eastern Democratic Republic of the Congo. In Madagascar, it is only known from a few records, mostly from the central-south region near to Fianarantsoa and Isalo National Park, and from records at Tolagnaro near the southeast coast (Jenkins *et al.*, 2007a). Further surveys are needed within Madagascar (Goodman and Cardiff, 2004). It ranges from about sea level (at Fort Dauphin in Madagascar) to close to 2,000 m asl (Albertine Rift).

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 541,523 km^2.

Native: Congo (The Democratic Republic of the); Kenya; Madagascar; Malawi (Happold *et al.*, 1988; Monadjem *et al.*, 2010d: 546); Mozambique (Monadjem *et al.*, 2010d: 546; Monadjem *et al.*, 2010c: 382); Rwanda; South Africa (Monadjem *et al.*, 2010d: 546); Tanzania; Zambia (Ansell, 1957; Ansell, 1967; Monadjem *et al.*, 2010d: 547); Zimbabwe (Monadjem *et al.*, 2010d: 547).

ECHOLOCATION:
See Taylor (1999b).

MOLECULAR BIOLOGY:
DNA - Unknown.
Karyotype - Peterson and Nagorsen (1975) reported 2*n* = 48, FN = 54, BA = 8, a submetacentric X chromosome, and an acrocentric Y chromosome, for specimens from Zimbabwe. However, Rautenbach *et al.* (1993) reported 2*n* =48, FN =66, BA =20, a metacentric X chromosome and an acrocentric Y chromosome for specimens from South Africa.
Protein / allozyme - Unknown.

POPULATION:
Structure and Density - Locally common, but patchily distributed in Africa. On Madagascar this bat is an uncommon, patchily distributed species. Colonies of this species may consist of dozens of individuals (although always fewer than 100 animals) (Cotterill *et al.*, 2008; IUCN, 2009).
Trend - 2008 - Stable (Cotterill *et al.*, 2008; IUCN, 2009).

PARASITES:
Polyctenidae: *Hypoctenes fani* Benoit 1958, a single female collected from Rwanda (Haeselbarth *et al.*, 1966: 18).

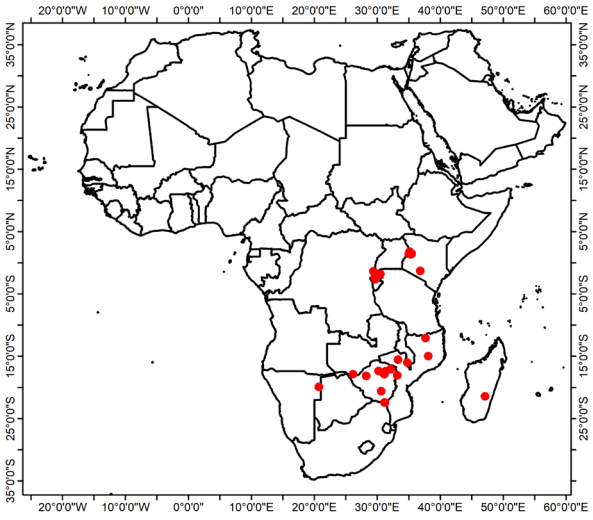

Figure 199. Distribution of *Tadarida fulminans*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Congo (Democratic Republic of the), Kenya, Madagascar, Malawi, Mozambique, Namibia, Rwanda, South Africa, Tanzania, Zimbabwe.

Tadarida lobata (Thomas, 1891)

*1891. *Nyctinomus lobatus* Thomas, Ann. Mag. nat. Hist., ser. 6, 7 (39): 303. Publication date: 1 March 1891. Type locality: Kenya: West Pokot: upper reaches of Turkwell: Turkwell Gorge, at or near [ca. 01 52 N 35 22 E] [Goto Description]. Holotype: BMNH 1893.2.3.7: ♂, skull and alcoholic. Collected by: Sir Frederic John Jackson. Peterson and Harrison (1970: 1) indicate that this specimen is probably a male, although they could not find any trace of scrotal development. - Etymology: From "*lobata*" meaning lobed.
? *Tadarida (Chaerephon) pumila limbata:*
? *Tadarida lobata:* (Name Combination, Current Combination, Current Spelling)
? *Tadarida pumila limbata:*

TAXONOMY:
See Simmons (2005).

COMMON NAMES:
Afrikaans: Grootoor-losstervlermuis. Chinese: 大耳犬吻蝠. Czech: morous širokouchý. English: Big-eared Guano Bat, Big-eared Kenyan Guano Bat, Kenyan Big-eared Free-tailed Bat, Big-eared Free-tailed Bat, Big-eared Kenya Free-tailed Bat, Eastern Africa Free-tailed Bat. French: Tadaride du Kenya, Tadaride de l'Afrique orientale, Molosse à grandes oreilles. German: Großohr-Bulldoggfledermaus.

ETYMOLOGY OF COMMON NAME:
The colloquial name perhaps refers to the country from which the species was originally described (see Taylor, 2005).

CONSERVATION STATUS:
Global - Although this species is known mainly from isolated records from a large area, it is listed as Least Concern (LC ver 3.1 (2001)) because it is associated with rocky areas in dry savanna habitat, and is unlikely to be declining fast enough to qualify for listing in a more threatened category (Cotterill, 2008e; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Cotterill, 2008e; IUCN, 2009). 2004 - DD ver 3.1 (2001) (Cotterill, 2004e; IUCN, 2004). 1996 - VU (Baillie and Groombridge, 1996).

MAJOR THREATS:
There appear to be no identifiable threats to this species (Cotterill, 2008e; IUCN, 2009).

CONSERVATION ACTIONS:
Cotterill (2008e) [in IUCN (2009)] report that there appear to be no direct conservation measures in place. It is not known if the species is present in any protected areas. Further surveys are needed to better determine the range of this species, and to understand whether it is restricted to rocky areas or can persist in modified habitats.

GENERAL DISTRIBUTION:
Tadarida lobata has only been recorded from four localities in Kenya and four localities in Zimbabwe (Skinner and Chimimba, 2005). It is found between 600 and 2,000 m asl.

Native: Kenya; Zimbabwe (Monadjem *et al.*, 2010d: 547).

POPULATION:
Structure and Density - It appears to be a rare species found in small colonies (Cotterill, 2008e; IUCN, 2009). The apparent rarity might be attributed to their high-flying habits and inaccessible daylight roosts (Cotterill, 1996b).
Trend - 2008 - Unknown (Cotterill, 2008e; IUCN, 2009).

PARASITES:
Duszynski (2002: 20) indicates that *T. lobata* might be a host for *Eimeria dukei* Lavier, 1927, but as Pellérdy (1974) mentioned the bat as "*Tadarida limbata*" this might not be correct.

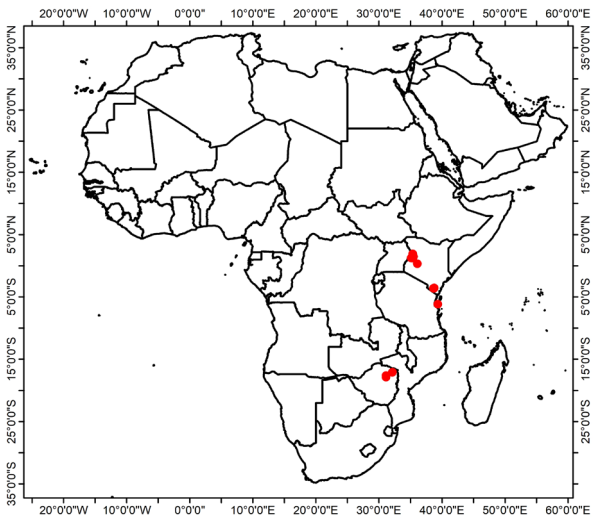

Figure 200. Distribution of *Tadarida lobata*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Kenya, Tanzania, Zimbabwe.

Tadarida teniotis (Rafinesque, 1814)

*1814. *Cephalotes teniotis* Rafinesque, Précis des découvertes et travaux somiologiques, 12, 55. Publication date: 3 June 1814. Type locality: Italy: Sicily [Goto Description]. - Etymology: From the Greek "*teniotis*" meaning striped, banded.

1825. *Dinops Cestonii* Savi, Nuov. Giorn. Letter. Pisa, Sci., 10: 230. Type locality: Italy: Tuscany: Pisa [43 43 N 10 24 E]. Syntype: ZFMK 1983.0173: ♂, alcoholic (skull not removed). Collected by: Prof. Paulo Savi; collection date: 1846. On label: "*Nyctinomus cestonii* (Savi) Dobson (In der Sammlg. Von Berthold als *Dysops Savii* angegeben) Toscana"; ex Göttingen Museun 1978: see Hutterer (1984: 32).

1827. *Dysopes rüpelii* Temminck, Monogr. Mamm, 1: 224, pl. 18. Publication date: 1827. Type locality: Egypt: Cairo [30 03 N 31 15 E]. Lectotype: SMF 12380: skin and skull. Collected by: Wilhem Peter Edward Simon Rüppell. Presented/Donated by: ?: Collector Unknown. Locality: Egypt original number: II.K.1.b. Paralectotype: SMF 12379: skin and skull. Collected by: Wilhem Peter Edward Simon Rüppell. Presented/Donated by: ?: Collector Unknown. Locality: Egypt old catalog number: II.K.1.a. - Comments: Type locality restricted from "Egypt" to Cairo by Qumsiyeh (1985: 71). Incorrect original spelling (*rüpelii*) corrected by Qumsiyeh (1985: 71) as *rueppellii*.

1840. *Dysopes Savii* Schinz, Europäische Fauna oder Verzeichniss der Wirbelthiere Europa's, 1: 138. - Comments: Substitute for *cestoni* (see Ellerman and Morrison-Scott, 1951: 134; Harrison, 1964a: 106). - Etymology: In honour of Gaetano Savi (1769 - 1844) (see Kozhurina, 2002: 17).

TAXONOMY:
Revised by Aellen (1966a) and Kock and Nader (1984).

Populations in Japan, Taiwan and Korea are now treated as a separate species, *T. insignis* (Simmons, 2005).

COMMON NAMES:
Albanian: Lakuriq nate bishtlirë, Lakuriq nate bisht-lire. Arabian: Khaffash. Armenian: Լայնականջ ծալքաշուրթ չղջիկ. Azerbaijani: Bükükdodaq enliqulaq. Basque: Saguzar buztanluze europar, Saguzar buztanluzea. Belarusian: Тадарыда еўрапейская. Bosnian: Golorepi šišmiš. Breton: Molos Cestoni. Bulgarian: Булдогов прилеп. Castilian: Murciélago rabudo. Catalan: Ratpenat cuallarg, Rat penat cuallarg. Croatian: Sredozemni slobodnorepac. Czech: Tadarida evropská, Morous evropský, Hroznohled pyskatý, Psohubec myšowý, Netopýr vrásopyskatý. Danish: Europæisk bulldogflagermus. Dutch: Zuideuropese bulvleermuis, Bulveermuis, Europese bulvleermuis. English: European Free-tailed Bat, European Guano Bat, Striped or Banded Guano Bat, Wrinkle-lipped Bat, Eurasian Free-tailed Bat. Estonian: Euroopa kurdmokk. Finnish: Doggilepakko. French: Molosse de Cestoni, Tadaride d'Europe, Molosse d'Europe, Tadaride de Cestoni. Frisian: Muskusbulflearmûs. Galician: Morcego rabudo. Georgian: ევროპული ჭადარიდა. German: Bulldoggfledermaus, Europäische Bulldoggfledermaus. Greek: Νυχτονόμος. Hebrew: Pashaf Matsui. Hungarian: Európai szabadfarkú-denevér, Nycteris i urophoros. Irish Gaelic: Ialtóg earrshaor Eorpach. Italian: Molosso del Cestoni. Latvian: Brivastes sikspā rnis. Lithuanian: Europinis raukš lė talŪ pis. Luxembourgish: Europäesch Bulldogfliedermaus. Macedonian: Опашест лилјак [= Opashest Liljak]. Maltese: Tadarida. Montenegrin: Dugorepi slijepi miš. Norwegian: Middelhavsfrihale. Polish: Molos europejski. Portuguese: Morcego-rabudo. Rhaeto-Romance: Moloss buldoc. Romanian: Lilacul cu coadă liberă europeană. Russian: Складчатогуб широкоухий. Serbian: Средоземни репаш [= Sredozemni repaš], Широкоухий складчатогуб Scottish Gaelic: Ialtag eàrr-shaor Eòrpach. Slovak: Tadarida buldogovitá. Slovenian: Dolgorepi netopir. Swedish: Veckläppad fladdermus. Turkish: Avrupa Serbest Kuyruklu Yarasası. Ukrainian: Тадарида європейська. Welsh: Ystlum cynffonog.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Amorim *et al.* (2013: 7) indicate that palaeodistribution models predict that during the Last Glacial Maximum (LGM: 23,000 - 18,000 YBP) the climatic conditions for *T. teniotis* were favorable in southern Europe and northern Africa.

CONSERVATION STATUS:
Global - The species is widely distributed over a large extent of occurrence. It occurs in urban areas and forages in other modified habitats. Population trends are not known but are not believed to approach the threshold for the population decline criterion of the IUCN Red List. Consequently, it is assessed as Least Concern (LC ver 3.1 (2001)) (Aulagnier *et al.*, 2008e; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Aulagnier *et al.*, 2008e; IUCN, 2009). 1996 - LR: lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
It is negatively affected by disturbance and loss of roosts in buildings, and by use of pesticides. It is also potentially threatened by wind farms (GMA Europe Workshop, 2006), and deforestation affects the species in some parts of its range (Z. Amr *pers. comm.,* 2005 [in Aulagnier *et al.* (2008e in IUCN, 2009]). However, none of these are considered to be major threats at present (Aulagnier *et al.*, 2008e; IUCN, 2009).

Sherwin *et al.* (2012: 174) report aerial hawking and long-distance dispersal to be risk factors related with climatic change.

CONSERVATION ACTIONS:
Aulagnier *et al.* (2008e) [in IUCN (2009)] report that it is protected by national legislation in a number of range states and receives international legal protection through the Bonn Convention (Appendix II and Eurobats Agreement) and Bern Convention in parts of its range where these apply. It occurs in several protected areas across its range.

GENERAL DISTRIBUTION:
Tadarida teniotis is mainly a Palaearctic species, although the south-eastern edge of its range extends into the Indomalayan region. It is well known in the Mediterranean basin, occuring from Portugal, Spain eastwards through southern Europe to the Balkans, Turkey, Israel, Palestine and Jordan. In North Africa it has been recorded from Morocco, Algeria, Tunisa, Libya and Egypt. It is possibly present on Madeira (to Portugal) as there was a supposed old record, but it has not been recorded from there again. It occurs on all the Canary Islands (to Spain) except for

Fuerteventura and Lanzarote. It is also recorded from a number of Mediterranean islands (Hutson, 1999; Simmons, 2005). It occurs from sea level to 3,100 m.

Populations in Japan, Taiwan and Korea are now considered to be a separate species, *T. insignis* (Simmons, 2005).

Native: Afghanistan; Albania; Algeria (Horácek *et al.*, 2000: 136); Andorra; Armenia; Azerbaijan; Bangladesh; Bhutan; Bosnia and Herzegovina; Bulgaria; Croatia; Cyprus; Egypt; France [Corse]; Georgia; Gibraltar; Greece [Kriti]; Holy See (Vatican City State); India; Iran, Islamic Republic of; Iraq; Israel; Italy [Sardegna, Sicilia]; Jordan; Kazakhstan; Kyrgyzstan; Lebanon; Libyan Arab Jamahiriya (Horácek *et al.*, 2000: 136); Macedonia, the former Yugoslav Republic of; Malta; Monaco; Montenegro; Morocco (Benda *et al.*, 2010a: 161; El Ibrahimi and Rguibi Idrissi, 2015: 364); Myanmar; Nepal; Portugal; Russian Federation; San Marino; Saudi Arabia; Serbia; Spain [Baleares, Canary Is.]; Switzerland; Syrian Arab Republic; Tajikistan; Tunisia (Horácek *et al.*, 2000: 136; Dalhoumi *et al.*, 2014: 53; 2016b: 867); Turkey; Turkmenistan; Uzbekistan.
Presence uncertain: China.

FUNCTIONAL MORPHOLOGY:
Maniakas and Youlatos (2012: 574) studied the external and muscular forelimb features that could be associated with high-speed flight in open air. They found (p. 576) that the mass of the muscles responible for the downstroke represented 59.3 % of the total forelimb musculature, and that more than half of these muscles are formed by the M. pectoralis. The muscles responsible for the upstroke are comparatively small, which might indicate that the upstroke in this bat is less important than for other bat groups (p.580). All these features result in a fast, steady enduring flight with relatively limited maneuverability.

ECHOLOCATION:
For 10 Greek specimens, Papadatou *et al.* (2008b: 133) report a start frequency of 15.4 ± 3.28 kHz, a terminating frequency of 11.1 ± 1.34 kHz, a peak frequency of 13.2 ± 1.18 kHz, and a bandwidth of 5.3 ± 1.49 kHz. The duration of the call is 18.4 ± 4.74 msec, and the interpulse interval is 764.6 ± 259.37 msec. Walters *et al.* (2012: suppl.) report the following figures for 35 calls from bats from France, Greece, Italy and Switzerland: duration: 15.03 ± 3.47 msec, F_{max}: 14.61 ± 4.95 kHz, F_{min}: 10.64 ± 1.51 kHz, bandwidth: 3.97 ± 3.76 kHz, F_{peak}: 11.76 ± 2.28 kHz.

In Jordan, Benda *et al.* (2010b: 204) recorded the following parameters for seven calls: F_{start}: 15.7 ± 3.8 (12.4 - 22.6) kHz, F_{end}: 9.8 ± 0.4 (9.4 - 10.5) kHz, F_{peak}: 11.7 ± 0.4 (11.1 - 12.6) kHz, duration: 16.3 ± 2.2 (13.1 - 19.3) msec, and interpulse duration: 571.8 ± 254.6 (163.0 - 800.0) msec.

14 calls from Iranian specimens were reported by Benda *et al.* (2012a: 183): F_{start}:19.0 ± 2.6 (14.1 - 22.2) kHz, F_{end}: 11.8 ± 2.2 (8.9 - 14.2) kHz, F_{peak}: 14.5 ± 1.3 (10.6 - 15.9) kHz, duration: 10.6 ± 0.8 (9.5 - 11.8) msec, and interpulse interval: 368.7 ± 89.8 (266.0 - 484.0) msec.

Hackett *et al.* (2016: 223) recorded 44 calls in Israel with the following values: Pulse duration: 12.17 ± 3.34 msec, F_{start}: 22.73 ± 5.02 (17.5 - 29.2) kHz, F_{end}: 15.90 ± 1.44 (13.1 - 17.5) kHz, F_{peak}: 18.49 ± 1.57 (15.1 - 21.4) kHz.

Disca *et al.* (2014: 226) indicate that in Morocco the type of call is FM-QFC, with the following parameters: F_{start}: 22.3 ± 4.2 kHz, F_{end}: 13.3 ± 0.7 kHz, F_{peak}: 14.4 ± 0.8 kHz, bandwidth: 9.0 ± 3.9 kHz, duration: 18.7 ± 2.7 msec.

MOLECULAR BIOLOGY:
DNA - Unknown.

Karyotype - Đulic and Mrakovcic (1980) reported $2n$ = 48, FN = 76, BA = 30, a submetacentric X chromosome and a subtelocentric Y chromosome for one male from Kroatia. Arroyo Nombela *et al.* (1986), however, reported $2n$ = 48, FN = 78, BA = 32 , a submetacentric X and an acrocentric Y for specimens from Spain. Volleth and Eick (2012: 167) mention $2n$ = 48 and a segment number of 25. The autosomal complement consists of five meta- and submetacentrics, and 19 subtelocentric and acrocentric pairs, of which the smallest is dot-like (Arslan and Zima, 2014: 14). These authors also indicate that the X chromosome was found to be subtelocentric in some studies.

Combining mtDNA fragments, 14 microsatellites and ecological modelling tools, Amorim *et al.* (2017: 38) found three main haplogroups in Mediterranean *T. teniotis*: one restricted to the eastern Mediterranean and two that are widespread across the Iberian Peninsula and Morocco. The nuclear data indicated that the bats from the Canary Islands showed the lowest signs of gene flow with the continental populations. Furthermore, they found that gene flow between Morocco and the central Mediterranean area is higher than that between the Iberian Peninsula and the central Mediterranean.

Mata *et al.* (2017: 152) reported the mitogenome to be 16,869 bp long, containing 13 protein-coding genes, 2 ribosomal RNA genes, 22 transfer RNA genes, and 1 control region (d-loop). All protein-

coding genes start with the ATG start codon, except for ND2, ND3, and ND5 which begin with ATA or ATT. Eleven protein-coding genes terminated in a canonical stop codon, TAA or TAG, two contain incomplete stop codons, T or TA. Cytochrome b terminates in the mitochondria-specific stop codon AGA.

Protein / allozyme - Unknown.

HABITAT:
In her study on the summer foraging habitats of bats in the Mediterranean region of the Iberian Peninsula, Rainho (2007: 176) found that *T. teniotis* showed low activity over fresh-water habitats, and primarily seemed to use pine-tree woodlands and Mediterranean shrublands. For southern Portugal, Marques *et al.* (2004: 99) reported that *T. teniotis* foraged preferentially over forested areas, particularly pine and cork oak woodlands. They used both alluvial plains and the valleys of a mountainous area, but not its ridges.

HABITS:
In southern Portugal, Marques *et al.* (2004: 99) found that *T. teniotis* is a late emerger, leaving its roost about one hour after sunset. They also found that these bats have only one foraging bout, which lasted on average 6 hours and 39 minutes. Its flight speed can reach over 50 km/h, and flying can be maintained for over 10 hours.

Ancillotto and Russo (2014: 221) found that that *T. teniotis* is able to discriminate between familiar and stranger individuals. They also found that the animals show higher rates of aggressive behaviours towards the strangers. Females show less aggressiveness than males, especially towards other females, and both sexes behave less aggressive towards juveniles.

ROOST:
In Libya, Benda *et al.* (2014c: 119) found a roosting colony in a fissure in the ceiling in the portal of a large, but shallow cave

DIET:
Rydell and Arlettaz (1994: 175) suggest that the intense narrowband echolocation calls with low frequency (11 - 12 kHz) without strong harmonics emitted by *T. teniotis* seems to be a specialization for long-range detection of large, tympanate insects such as Lepidoptera and Neuroptera, which are less well represented in the diet of most other aerial-hawking bats. Based on faecal analyses, they found the following volume percents: southeastern France: Lepidoptera (68.3 %), Neuroptera (24.3 %), others (4.3 %), Acari (0.5 %), and unidentified (2.6 %); Kirghizstan: Lepidoptera (86.8 %), others (12.8 %), unidentified (0.4 %).

Benda *et al.* (2014c: 124) examined four sets of faecal pellets from Libya. Ten pellets from Wadi an Nazrat contained only large moths (Lepidoptera) as did one pellet from the quarry at Wadi al Kuf. Twenty pellets from another location at Wadi al Kuf contained 97 % by volume medium-sized moths and 3 % beetles (Coleoptera). Eight pellets from one animal from Wadi Darnah contained 56 % by volume medium-sized moths and 44 % lacewings (Neuroptera: Chrysopidae).

Benda *et al.* (2012a: 515) indicate that Orthoptera formed the largest contributing group in the diet of *T. teniotis* in Turkey and Jordan. On Rhodes, Coleoptera (especially Curculionidae) formed the most important group. In Iran, Lepidoptera were the most important diet item and Coleoptera, Orthoptera (Ensifera) and Heteroptera also contributed substantially to the diet. Neuroptera (Chrysopidae) and Auchenorrhyncha were almost negligible.

In northeastern Portugal, Mata *et al.* (2016: 1, 2) found significant dietary differences between males and females, where females ate more larger moths and more moths with migratory behaviour (* in below listing). In guano pellets of 69 females and 74 males, Lepidoptera were present in 98.6 % of the females pellets and in 100 % of the males pellets. Split over the various familes and species (which all occur in northern African too), they found (wingspan; % in females, % in males): Crambidae: *Nomophila noctuella** (Denis and Schiffermüller, 1775) (rush veneer) (26 - 32 mm; 7.2, 14.9), other Crambidae 6 5.8 9.5; Gelechiidae: *Mirificarma mulinella* (Zeller, 1839) (5.5 - 7.5 mm; 7.2, 14.9), other Gelechiidae (0.0, 2.7); Geometridae: *Aspitates ochrearia* (Rossi, 1794) (yellow belle) (25 - 34 mm; 4.3, 10.8), *Rhodometra sacraria** (Linnaeus, 1767) (vestal) (22 - 28 mm; 14.5, 36.5), other Geometridae (20.3, 13.5); Noctuidae: *Agrotis ipsilon** (Hufnagel, 1766) (dark sword-grass) (40 - 45 mm; 21.7, 4.1), *Agrotis puta* (Hübner, 1803) (shuttle-shaped dart) (30 - 32 mm; 13.0, 18.9), *Agrotis segetum* (Denis & Schiffermüller, 1775) / *Agrotis trux* (Hübner, [1824]) (turnip/crescent dart) (32 - 42 mm; 37.7, 36.5), *Autographa gamma** (Linnaeus, 1758) (silver y) (30 - 45 mm; 43.5, 23.0), *Hoplodrina ambigua* (Denis & Schiffermüller, 1775) (vine's rustic) (32 - 34 mm; 18.8, 35.1), *Mythimna albipuncta* (Denis & Schiffermüller, 1775) (white-point) (30 - 35 mm; 5.8, 9.5), *Mythimna vitellina* (Hübner, 1808) (delicate) (36 - 43 mm; 24.6, 28.4), *Noctua pronuba* (Linnaeus, 1758) / *Noctua janthe* Borkhausen, 1792 (large/lesser broad-bordered yellow underwing) (50 - 60 mm / 30 - 40 mm; 14.5,

13.5), *Peridroma saucia** (Hübner, 1808) (pearly underwing) (43 - 50 mm; 24.6, 12.2), *Phlogophora meticulosa** (Linnaeus, 1758) (angle shades) (45 - 52 mm; 18.8, 8.1), other Noctuidae (31.9, 36.5); Tortricidae: *Tortrix viridana* Linnaeus, 1758 (European oak leafroller) (18 - 23 mm; 5.8, 13.5), other Tortricidae (2.9 5.4); other Lepidoptera (17.4, 21.6); unidentifiedLepidoptera (13.0, 23.0). Other orders present in the pellets were: Coleoptera (1.4, 1.4); Diptera (10.1, 12.2), Hemiptera (2.9, 8.1), Neuroptera (7.2, 12.2), unidentified Insecta (1.4, 1.4), and also some unidentified Arthropoda (7.2, 5.4).

PREDATORS:
In Isreal, Reuven (1991: 79) observed *T. teniotis* being preyed upon by a Lanner Falcon (*Falco biarmicus* Temminck, 1825). Balmori (2012: 9) furthermore reports bats being taken by Peregrine Falcon (*Falco peregrinus* Tunstall, 1771) and Common Kestrel (*Falco tinnunculus* Linnaeus, 1758) as well as by Barn Owl (*Tyto alba* (Scopoli, 1769)) and Tawny Owl (*Strix aluco* Linnaeus, 1758), but also by a Garden Dormouse (*Eliomys quercinus* (Linnaeus, 1766)).
Mikula *et al.* (2016: Supplemental data) mention the following diurnal avian predators: Lanner falcon (*Falco biarmicus* Temminck, 1825), Peregrine falcon (*Falco peregrinus* Tunstall, 1771) and Eurasian hobby (*Falco subbuteo* Linnaeus, 1758),

POPULATION:
Structure and Density - It is a common species in suitable habitats. Summer and winter colonies typically number 5 - 100 individuals, although colonies of up to 300 - 400 animals have been recorded. It is probably sedentary, although seasonal in some areas (e.g., Malta). It is not abundant in the Caucasus, nor is it highly gregarious - large colonies are not known in this region (K. Tsytsulina *pers. comm.,* 2005 in Aulagnier *et al.*, 2008e [in IUCN, 2009)]). There are only six records for Iran, however, there have not been extensive survey efforts there (M. Sharifi *pers. comm.,* in Aulagnier *et al.*, 2008e [in IUCN, 2009]).
Trend - 2008 - Unknown (Aulagnier *et al.*, 2008e; IUCN, 2009).

LIFESPAN:
Szekely *et al.* (2015: Suppl.) report a maximum longevity of 13 years.

REPRODUCTION AND ONTOGENY:
In Spain, Balmori (2003: 37) reported births taking place from the end of June to the beginning of July.

In Portugal, Amorim *et al.* (2015: 228) found that drought had a severe negative influence on the reproduction of *T. teniotis*. This drought probably resulted in reduced food resources early in the pre-breeding season, which limited the ability to restore the bat's body condition after the winter and before the breeding season.

MATING:
In a colony in Valladolid, Spain, Balmori (2003: 37; 2017: 460) found that *T. teniotis* bats were organized in 'harems' made up by a dominant male together with a variable number of females, in which the male defends the refuge ("resource defence polygyny"). The males were emitting mating calls to attract passing-by females. These harems were formed between August and October. When competitors were present, the males reacted by noisy and fast chasing-flights and the releasing of a strong scent, probably used to mark their territory.

Balmori (2017: 465) found two peaks of sexual activity: one in spring (Apri - –June) and another in summer/autumn (August - October), but also indicated that each female might only enter heat once a year.

PARASITES:
In Italy, Voyron *et al.* (2011: 193) reported the following fungal entities from live *T. teniois* specimens: *Aspergillus fumigatus var. fumigatus* and *Trichosporon chiropterorum*.

Benda *et al.* (2010b: 315) only found the mite *Parasteatonyssus hoogstraali* Keegan, 1956 parasiting on *Tadarida teniotis* in Jordan. They do report on other ectoparasites found previously: the bat fly *Nycteribia pedicularia* Latreille, 1805 found in Palestine, bat fleas *Araeopsylla wassifi* Traub, 1954 in Turkey and Egypt, *A. gestroi* (Rotschild, 1906) in Lebanon, and a tick *Argas vespertilionis* (Latreille, 1802) in Egypt. Balmori (2012: 9) also mentioned *Steatonyssus periblepharus* Kolenati, 1858, *Ewingana baekelandae* Estrada-Peña, 1992, and unidentified Trombiculidae, as well als the bat bug *Cimex pipistrelli* Jenyns, 1839 and the flea *Araeopsylla gestroi* (Rothschild, 1906).

Parasteatonyssus hoogstraali Keegan, 1956 was already reported by Estrada-Peña and Sanchez (1988: 310) from *T. teniotis* on Frontera, Canary Islands.

The following enteroparasites were reported by Balmori (2012: 9): Trematodes *Plagiorchis vespertilionis* (Müller, 1784), *Prosthodendrium ascidia* (Van Beneden, 1873) and *Lecithodendrium linstowi* Dollfus, 1931; Nematodes: *Molinostrongylus alatus* (Ortlepp, 1932), *Pseudophysaloptera formosana* (Yokogawa, 1922), *Rictularia bovieri* Blanchard,

1886, *Litomosa aelleni* Tibayrenc, Bain & Ramachandran 1979, and further unidentified *Litomosa* sp.

Benda *et al.* (2014c: 124) reported the following ectoparasites from Libya:
Ischnopsyllidae: *Araeopsylla gestroi* (Rothschild, 1906),
Macronyssidae: *Parasteatonyssus hoogstraali* (Keegan, 1956) [1st record from Libya],
Spinturnicidae: *Spinturnix myoti* (Kolenati, 1856).

From Algeria, Bendjeddou *et al.* (2017: 15) reported one ectoparasite: Arachnida: *Ixodes ricinus* (Linnaeus, 1758).

VIRUSES:
Reoviridae
Orthoreovirus
This virus was reported by Kohl and Kurth (2014: 3113) from Italian bats.

Rhabdoviridae
Lyssavirus - Rabies related viruses
European bat lyssavirus 1 was reported by Luis *et al.* (2013: Suppl.), Willoughby *et al.* (2017: Suppl.).

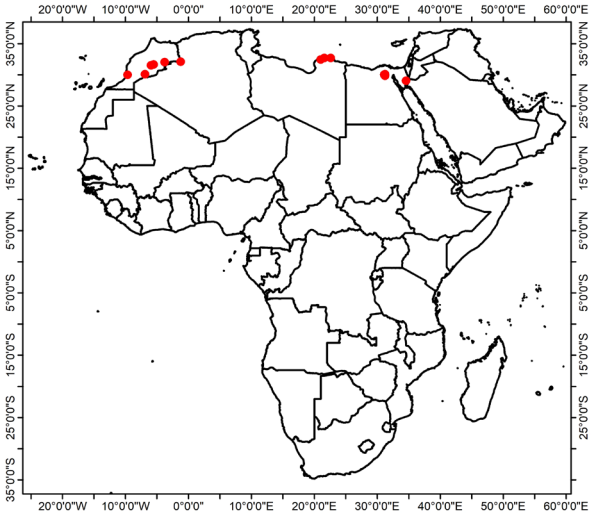

Figure 201. Distribution of *Tadarida teniotis*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Algeria, Egypt, Libya, Morocco, Sudan.

Tadarida ventralis (Heuglin, 1861)

*1861. *Nyctinomus (Dysopes) ventralis* Heuglin, Nov. Act. Acad. Cæs. Leop.-Carol., 29 (8): 4, 11. Publication date: 1861. Type locality: Eritrea: Kérén [ca. 15 45 N 38 20 E] [Goto Description]. Lectotype: SMNS 982: ad ♀, skull and alcoholic. Collected by: Martin Theodor von Heuglin; collection date: 1861. Presented/Donated by: ?: Collector Unknown. See Dieterlen *et al.* (2013: 294), who confirm that the Lectotype status of this specimen was designated by Kock (1975: 6). - Etymology: From the scientific Latin feminine adjective *ventràlis*, meaning "ventral", referring to the presence of a wide, median, prominent orange ventral stripe (see Lanza *et al.*, 2015: 324).
1862. *Nyctinomus ventralis:* Heuglin, Peterm. Geographische Mittheilungen, 8: 26. (Name Combination)
1876. *Nyctinomus africanus* Dobson, Ann. Mag. nat. Hist., ser. 4, 17 (101): 348. Publication date: 1 May 1876. Type locality: South Africa: Transvaal [Goto Description]. Holotype: BMNH 1875.11.19.1: ad ♂, skull and alcoholic. Presented/Donated by: Richard Browdler Sharp[e].
1877. *Dysopes ventralis:* Heuglin, Reise in Nordost Afrika, 2: 26. (Name Combination)
1877. *Nyctinomus [(Nyctinomus)] cestoni* Dobson, Proc. zool. Soc. Lond., 1876, IV: 719. Publication date: April 1877. - Comments: Not of Savi, 1825. In part (see Kock, 1975: 6).
1891. *N(yctinomus) taeniotis* Thomas, Proc. zool. Soc. Lond., 1891, II: 183. Publication date: August 1891. - Comments: Not of Rafinesque, 1814. See Kock (1975: 7).

? *Tadarida ventralis africana:* (Name Combination)

? *Tadarida ventralis:* (Name Combination, Current Combination)

TAXONOMY:
For use of this name in place of *africana*, see Kock (1975).

COMMON NAMES:
Afrikaans: Transvaalse losstertvlermuis, Reuse losstertvlermuis. Chinese: 非洲大犬吻蝠. Czech: morous africký, tadarida africká. English: Giant Guano Bat, Giant African Guano Bat, African Giant Free-tailed Bat, Giant African Free-tailed Bat, Transvaal Free-tailed Bat, Giant Free-tailed Bat. French: Tadaride géante d'Afrique, Grande tadaride africaine, Molosse géant. German: Große Bulldoggfledermaus, rothbraune Doggengrämler. Italian: Tadarìda ventràle. Portuguese: Morcego gigante de cauda livre.

CONSERVATION STATUS:
Global - Listed as Data Deficient (DD ver 3.1 (2001)) in view of the absence of sufficient information on its extent of occurrence, natural history, threats and conservation status (Mickleburgh *et al.*, 2008aj; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) (Mickleburgh *et al.*, 2008aj; IUCN, 2009). 2004 - NT ver 3.1 (2001) (Mickleburgh *et al.*, 2004ao; IUCN, 2004). 1996 - LR/nt (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - VU D2 ver 3.1 (2001) (Taylor *et al.*, 2016d). 2004 - Considered a vagrant. Not assessed, known from a single locality (Friedmann and Daly, 2004). 1986 - Indeterminate (Smithers, 1986).

MAJOR THREATS:
The threats to this species are poorly known. It may be threatened through the conversion of suitable habitat to agricultural land and the use of pesticides in these modified areas (Mickleburgh *et al.*, 2008aj; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008aj) [in IUCN (2009)] report that there appear to be no direct conservation measures in place. It is not known if the species is present in any protected areas. Further research is needed into the distribution, natural history, and threats to this little-known species.

GENERAL DISTRIBUTION:
Tadarida ventralis is widely distributed in East and Southern Africa. It ranges from Eritrea in the north to Zimbabwe, and northern South Africa, in the south. The westernmost record is from the eastern Democratic Republic of the Congo, close to the border area with Uganda. Most records are from high altitude (1,500 m upwards to 2,500 m asl).

Native: Congo (The Democratic Republic of the); Eritrea; Ethiopia; Kenya; Malawi (Ansell and Dowsett, 1988: 46; Monadjem *et al.*, 2010d: 547); Mozambique (Smithers and Lobão Tello, 1976; Monadjem *et al.*, 2010d: 547); South Africa (Taylor *et al.*, 2015: 50); Sudan; Tanzania; Zambia (Ansell, 1986; Monadjem *et al.*, 2010d: 547); Zimbabwe (Cotterill, 2004a: 260; Monadjem *et al.*, 2010d: 547).

ECHOLOCATION:
See Taylor *et al.* (2005).

POPULATION:
Structure and Density - It has been rarely recorded and is largely known from single dead individuals (Mickleburgh *et al.*, 2008aj; IUCN, 2009).
Trend - 2008 - Unknown (Mickleburgh *et al.*, 2008aj; IUCN, 2009).

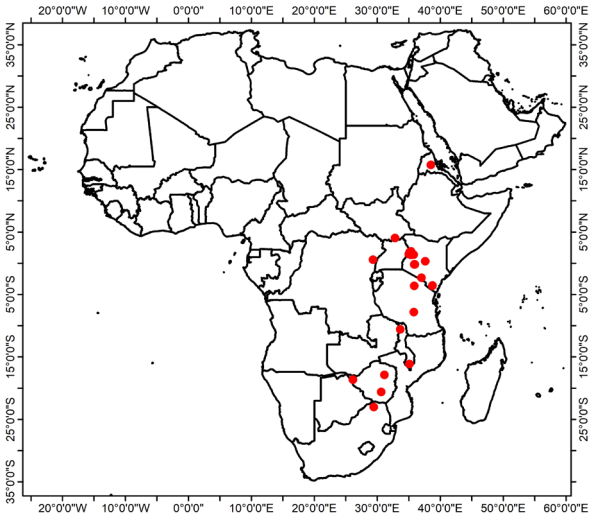

Figure 202. Distribution of *Tadarida ventralis*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Congo (Democratic Republic of the), Eritrea, Kenya, Malawi, South Africa, South Sudan, Tanzania, Zambia, Zimbabwe.

Superfamily VESPERTILIONOIDEA Gray, 1821

*1821. *Vespertilionoidea* Gray, London Med. Repos., 15: 299. Publication date: 1 April 1821. (Current Combination)

1928. *Vespertilionoidea:* Weber, Die Säugetiere, 24. - Comments: Type genus: *Vespertilio* Linnaeus, 1758. Introduced as tribe (but actually similar to superfamily) and originally included the families Vespertilionidae J. Gray, 1821, Natalidae J. Gray, 1866, Myzopodidae Thomas, 1904 and Molossidae Gervais, 1855 (see Jackson and Groves, 2015: 265).

TAXONOMY:
Currently recognized families within the Superfamily VESPERTILIONOIDEA within Africa: **CISTUGONIDAE** Van Cakenberghe and Seamark, 2011; **MINIOPTERIDAE** Dobson, 1875; **VESPERTILIONIDAE** Gray, 1821.

COMMON NAMES:
Czech: netopýrov ci.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Ravel *et al.* (2011: 402) suggest that affinities such as the closure of the protofossa, the slender lophes, and a tiny metaconule on the upper molars (in the fossil genus *Dizzya* and an unnamed "Eochiropteran" from the El Kohol Formation in Algeria) could support an African endemic radiation of modern Vespertilionoidea.

Family CISTUGONIDAE Lack, Roehrs, Stanley, Ruedi and Van den Bussche, 2010

2008. *Cistugoinae:* Van Cakenberghe and Seamark, African Chiroptera Report, 213. Publication date: 1 July 2008. - Comments: Spelling used for subfamily. (Name Combination, Alternate Spelling)
2010. *Cistugidae:* Lack, Roehrs, Stanley, Ruedi and Van den Bussche, J. Mamm., 91(4): 980. (Alternate Spelling)
2010. *Cistugonidae:* Benda, Vespertilio, 18-19: 271. - Comments: Type genus: Cistugo Thomas, 1912. (Current Combination, Current Spelling)

TAXONOMY:
Stadelmann *et al.* (2004b) showed that the genus *Cistugo* was not placed with the genus *Myotis*, but was basal to the vespertilioid radiation, which is also supported by Horácek *et al.* (2006). For this reason, the ACR (2008, 2009, 2010) recognized representatives of the genus *Cistugo* as a separate distinct subfamily within the Vespertilionidae.
Lack *et al.* (2010: 980) recognized that taxa within this group should be recognized at a family level and suggested the name “Cistugidae”. Benda (2010: 271) and ACR (2011) used a corrected form of the family (or subfamily) name: Cistugonidae (-goninae) - according to the code (genitive from *Cistugo* is Cistugonis, thus Cistugonidae).

Known genera within the family CISTUGONIDAE: ***Cistugo*** Thomas, 1912.

COMMON NAMES:
Czech: žlázokřídlecovití.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
The study by Amador *et al.* (2016: 26) supports the long-time separation from the Vespertilionidae, which probably occurred in the early middle Eocene (crown age 43 MYA).

Genus ***Cistugo*** Thomas, 1912

*1912. *Cistugo* Thomas, Ann. Mag. nat. Hist., ser. 8, 10 (56): 205. Publication date: 1 August 1912 [Goto Description]. - Comments: Type species: *Cistugo seabræ* Thomas, 1912. (Current Combination)

TAXONOMY:
Meester *et al.* (1986) included *Cistugo* as a subgenus of *Myotis*. Baker *et al.* (1974) recorded the karyotype of *Myotis* as 2*n* = 44, AA = 50, but Dippenaar *et al.* (1983) gave it as 2*n* = 50, AA= 48 in both *seabrai* and *lesueuri*.
Hayman and Hill (1971) doubt the validity of *lesueuri* and Corbet and Hill (1980) include it in *seabrai*, while Koopman (1982) retain it as a separate species. It is possible, particularly in view

of their allopatric distribution, that *lesueuri* may best be treated as a subspecies of *seabrai*.

Included as subgenus in *Myotis* by Koopman (1993a: 207), but considered a valid genus by Thomas (1915), Roberts (1919), Rautenbach *et al.* (1993), Bickham *et al.* (2004: 333), Stadelmann *et al.* (2004b: 185), and Simmons (2005). Stadelmann *et al.* (2004b: 185) state that it might be possible that the two genera share closer phylogenetic relationships with other families of bats than with the Vespertilionidae.

Lack *et al.* (2010: 980) erected a new family: Cistugoidae (see family account above for information about corrected spelling of family name), containing only the genus *Cistugo* Thomas, 1912, which they separate from the Vespertilionidae by the presence of 2 to 4 glands in the wing membrane immediately behind the forearm (see also Seamark and Kearney, 2006), which are lacking in all other vespertilionoid bats.

Currently recognized species of the genus *Cistugo*: ***lesueuri*** Thomas, 1912; ***seabrae*** Thomas 1912.

COMMON NAMES:
Czech: žlázokřídlecové. English: Wing-gland Bats. German: Mausohren.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Avery (2007: 619) reported on the presence of *Cistugo* sp. in Pleistocene deposits at Wonderwerk Cave, South Africa.

GENERAL DISTRIBUTION:
Seamark *et al.* (2012: 116-117) indicate that the ranges of the two species (*C. seabrae* and *C. lesueuri*) might not be allopatric as previously assumed, but might be overlapping.

Cistugo lesueuri Roberts, 1919

*1919. *Cistugo lesueuri* Roberts, Ann. Transv. Mus., 6(3): 112-113. Type locality: South Africa: SW Cape province: Paarl district: near Paarl, Franschhoek [=Frenchhoek] valley: L'Ormarins [=Lormarins] [33 44 S 18 58 E] [Goto Description]. Holotype: TM 2286: ad ♂, skin and skull. Collected by: J.S. Le Sueur Esq. Collection date: 15 September 1917; original number: 154. - Comments: For details on the type locality, see Meester *et al.*, 1986: 49). - Etymology: Named after J.S. le Sueur of L'Ormarins in the Paarl district, Western Cape, who recovered the original specimen from his cat (see Smithers, 1983: 92; Taylor, 2005). (Current Combination)
? *Myotis (Cistugo) lesueuri:* (Name Combination)
? *Myotis lesueuri:* (Name Combination)

TAXONOMY:

Figure 203. A female *Cistugo lesueuri* (TM 48190) caught at the Farm Schaapplaats, Free State, South Africa.

Hayman and Hill (1971) doubt the validity of *lesueuri* and Corbet and Hill (1980) include it in *seabrae*, while Koopman (1982) retain it as a separate species. It is possible, particularly in view of their allopatric distribution, that *lesueuri* may best be treated as a subspecies of *seabrae*.

COMMON NAMES:
Afrikaans: Lesueur se langhaarvlermuis, Lesueur-langhaarvlermuis, Lesueurse Vlerkkliervlermuis. Czech: žlázokřídlec Lesueurův. English: Lesueur's Wing-gland Bat, Lesueur's Hairy Bat, Lesueur's Myotis, Wing-gland bat. French: Murin de Lesueur. German: Leseuers Mausohr.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Jacobs, 2008b; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Jacobs, 2008b; IUCN, 2009). 2004 - VU D2 ver 3.1 (2001) (Jacobs, 2004b; IUCN, 2004). 1996 - VU (Baillie and Groombridge, 1996).

Regional -

South Africa: 2016 - LC ver 3.1 (2001) (Avenant *et al.*, 2016b). 2004 - NT ver 3.1 (2001) (Friedmann and Daly, 2004). 1986 - Indeterminate, assessed as *Myotis lesueuri* (Smithers, 1986).

MAJOR THREATS:
It is locally threatened in parts of its range by conversion of land to agricultural use (Jacobs, 2008b; IUCN, 2009).

CONSERVATION ACTIONS:
Jacobs (2008b) [in IUCN (2009)] reports that *C. lesueuri* is probably present in a number of protected areas and further studies are needed into the distribution and natural history of this bat.

GENERAL DISTRIBUTION:
This species is restricted to South Africa and Lesotho, where its distribution is best predicted by geology (Babiker Salata, 2012: 50). Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 673,792 km^2.

Native: Lesotho (Lynch and Watson, 1990; Lynch, 1994: 192; Monadjem *et al.*, 2010d: 562); South Africa (Free State - Watson, 1998; Monadjem *et al.*, 2010d: 562; KwaZulu Natal - Monadjem *et al.*, 2010d: 562; Western Cape - Herselman and Norton, 1985; Rautenbach *et al.*, 1993; Seamark and Brand, 2005; Monadjem *et al.*, 2010d: 562).

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
For 4 specimens from the Algeria Forestry Station (RSA) Schoeman and Jacobs (2002: 157) mention the following parameters: Fa: 36.0 ± 0.4 mm, Wing area: 93.3 ± 1.6 cm^2, Wing span: 23.8 ± 1.1 cm, Wing loading: 7.5 ± 1.4 N/m^2, and aspect ratio: 6.1 ± 0.7.

ECHOLOCATION:
From Algeria Forest Station (RSA), Schoeman and Jacobs (2002: 157) reported the type of calls to be low duty echolocation dominated by frequency modulated calls, with a F_{peak}: 36.8 ± 0.9 kHz.

MOLECULAR BIOLOGY:
DNA - Unknown.
Karyotype - Rautenbach *et al.* (1993) reported 2*n* = 50, FN = 48, BA = 0, a submetacentric X chromosome, and an acrocentric Y chromosome, these results were the same as those obtained for *C. seabrae* from Namibia (Rautenbach *et al.*, 1993) .
Protein / allozyme - Unknown.

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:

Figure 204. Clockwise from top lateral, ventral and dorsal skull images of TM 2286, holotype of *Cistugo lesueuri* Roberts, 1919.

HABITAT:
In the Free State Province of South Africa collected from broken country (e.g. koppies and cliffs), invariably away from human habitation and constructions, but close to open water (dams and streams). While in the Western Cape it inhabits fynbos and possibly the succulent karoo (Jacobs, 2008b; IUCN, 2009).

Cooper-Bohannon *et al.* (2016: Table S2) mention its occurrence in the following habitat types: Afromontane (43 %), High veld (29 %), SW Cape (13 %) and SW arid (11 %).

HABITS:
In the Free State Province of South Africa specimens were netted in the early evening, between 18:30 and 20:00, with only two specimens being caught after 21:15 (Watson, 1998: 128). When distrubed in their day roost they flew to another roost 50 meters away (Watson, 1998: 128).

ROOST:
Found in a crevice roughly four meters from the ground, on a west-facing dolorite rock face next to a river in the Free State Province of South Africa (Watson, 1998: 127).

DIET:
From the Algeria Forestry Station (RSA) Schoeman and Jacobs (2002: 157) reported the following prey groups based on 39 faecal pellets from 4 bats (in volume percent): Diptera (47.3 ± 37.3), Hemiptera (32.5 ± 22.8), Hymenoptera (6.8 ± 13.5), Coleoptera (6.3 ± 4.9), Trichoptera (2.5 ± 5.0), Ephemenoptera (1.5 ± 3.0), and unknown (3.3 ± 6.5).

POPULATION:
Structure and Density - Common, but not abundant, in the Free State Province of South Africa a group of approximately 40 individuals was located in a day roost (Watson, 1998: 127). Seamark and Brand (2005) showed that this species made up only 4.6% of the over all catch in the Cederberg, Western Cape. This species is very rarely recorded (Jacobs, 2008b; IUCN, 2009). Trend - 2008 - Decreasing (Jacobs, 2008b; IUCN, 2009). 2004 - Decreasing (Jacobs, 2004b; IIUCN, 2004).

VIRUSES:
Bunyaviridae
Phlebovirus
Rift Valley Fever Virus (RVFV) - Oelofsen and Van der Ryst (1999) tested a single individual from one locality in Lesotho for RVFV antigen using an enzyme linked immunosorbet assay (ELISA), none tested positive.

Rhabdoviridae
Lyssavirus - Rabies related viruses
Rabies - Oelofsen and Smith (1993) tested 15 individual brains, from four localities by means of the "Rapid rabies enzyme immunodiagnosis" (RREID) test (Diagnostic Pasteur), none were tested positive.

? *Cistugo seabrai:* (Name Combination, Alternate Spelling)
? *Myotis (Cistugo) seabrai:* (Name Combination)
? *Myotis seabrae:*
? *Myotis seabrai:* (Name Combination)

TAXONOMY:

Figure 206. A male *Cistugo seabrae* (TM 47582) caught at Khamkirri, Northern Cape, South Africa. Note the gland on the wing.

See Simmons (2005).

COMMON NAMES:
Afrikaans: Angola-langhaarvlermuis, Angolase Vlerkkliervlermuis. Czech: žlázokřídlec Seabrův. English: Seabra's Wing-gland Bat, Angolan Wing-gland Bat, Angolan Hairy Bat. French: Murin d'Angola. German: Angola-Mausohr.

ETYMOLOGY OF COMMON NAME:
The colloquial name is derived from the fact that the original specimen originated from Moçâmedes on the south-western coast of Angola (Taylor, 2005).

CONSERVATION STATUS:
Global - Although this species is known mainly from isolated records from a large area, it is listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because there are no threats, making it unlikely to be declining fast enough to qualify for listing in a more threatened category (Griffin and Jacobs, 2008; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Griffin and Jacobs, 2008; IUCN, 2009). 2004 - NT ver 3.1 (2001), assessed as *Cistugo seabrai* (Jacobs, 2004a; IUCN, 2004). 1996 - VU (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - NT D1+D2 ver 3.1 (2001) (Jacobs *et al.*, 2016f). 2004 - VU D2 ver 3.1 (2001) (Friedmann and Daly, 2004). 1986 - Indeterminate, assessed as *Myotis seabrai* (Smithers, 1986);

MAJOR THREATS:
There are no major threats to this species. It may be locally threatened by mining operations in a small part of its range (Griffin and Jacobs, 2008; IUCN, 2009).

CONSERVATION ACTIONS:
Griffin and Jacobs (2008) [in IUCN (2009)] report that it is not known if there are any direct conservation measures in place for this species, and it is unclear if it occurs within any protected areas. Further studies are needed into the distribution and natural history of this little-known species.

GENERAL DISTRIBUTION:
This southern African species ranges from the type locality of Moçâmedes in southwestern Angola, southwards through western Namibia to the Northern Cape of South Africa.

Native: Angola (Crawford-Cabral, 1989; Thomas, 1912c; Monadjem *et al.*, 2010d: 562); Namibia (Thomas and Hinton, 1925; Shortridge, 1934; Rautenbach *et al.*, 1993; Kearney and Van Schalkwyk, 2009; Monadjem *et al.*, 2010d: 562); South Africa (Herselman and Norton, 1985; Stadelmann *et al.*, 2004b; Seamark and Kearney, 2006; Kearney and Van Schalkwyk, 2009; Monadjem *et al.*, 2010d: 562).

MOLECULAR BIOLOGY:
DNA - Stadelmann *et al.* (2004b).
Karyotype - Rautenbach *et al.* (1993) reported 2*n* = 50, FN = 48, BA = 0, a submetacentric X chromosome, and an acrocentric Y chromosome, these results were the same as those obtained for *C. lesueuri* from South Africa (Rautenbach *et al.*, 1993).
Protein / allozyme - Unknown.

HABITAT:
Little is known about the natural history of this species. All of the localities from which they have been collected are arid with a mean annual rainfall of less than 100 mm (Skinner and Chimimba, 2005).

HABITS:
Specimens have usually been caught close to open water and have been observed gleaning insects from orange trees (Roberts, 1951; Taylor, 2000; Skinner and Chimimba, 2005).

POPULATION:
Structure and Density - It appears to be a rarely recorded species (Griffin and Jacobs, 2008; IUCN, 2009).
Trend - 2008 - Unknown (Griffin and Jacobs, 2008; IUCN, 2009). 2004- Decreasing (as *Cistugo seabrai*) (Jacobs, 2004a; IUCN, 2004).

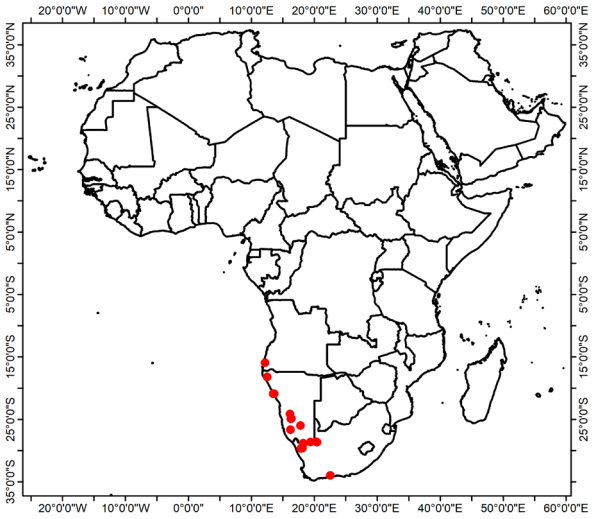

Figure 207. Distribution of *Cistugo seabrae*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:

*1875. *Miniopteridae* Dobson, Ann. Mag. nat. Hist., ser. 4, 16 (95): 348. Publication date: 1 November 1875. - Comments: Type genus: *Miniopterus* Bonaparte, 1837. Originally included the genera *Natalus* J. Gray, 1838; *Thyroptera* Spix, 1823 and *Miniopterus* Bonaparte, 1837. (Current Combination)
1898. *Miniopterae* Trouessart, Cat. Mamm, p. 134. - Comments: See Taylor (1934).
1907. *Miniopterinae:* Miller, Bull. U.S. natl. Mus., 57: xi, 227. Publication date: 29 June 1907. - Comments: Type genus: *Miniopterus* Bonapart, 1837.

1977. *Miniopteridae:* Mein and Tupinier, Mammalia, 41 (2): 207, 209. - Comments: Type genus: *Miniopterus* Bonaparte, 1837.

TAXONOMY:
Bannikova *et al.* (2002: 722) indicate that the Miniopterinae do not deserve the rank of independent family (as did Koopman, 1984b, 1993a, 1994; Yoshiyuki, 1989; Corbet and Hill (1992; McKenna and Bell, 1997), but see Hoofer and Van Den Bussche (2003: 13) who make a strong case for attributing family rank. They follow Mein and Tupinier (1977), Groombridge (1994), Gopalakrishna and Chari (1983), Tiunov (1989), Pierson (1986). See also Hawkins *et al.* (2019: 11355).

In their study on rolling-circle transposons (*Helitrons*), Thomas *et al.* (2010: 55) found none of these in the Miniopteridae. They also indicated that these *Helitrons* colonized the Vespertilionidae some 30 - 36 mya, which is much later than the split between Vespertilionidae and Miniopteridae, which occurred some 43 million years ago. Patterson and Webala (2012: 32) indicate that the split between Vespertilionidae and *Miniopterus* occurred between 38 and 47 million years ago.

Herkt *et al.* (2017: Appendix 4S), investigating the IUCN distribution maps and species distribution models, left out the Miniopteridae because of their exceptionally high cryptic diversity and level of phenetic similarity, which leads to unreliably identification of large amounts of published records.

Known genera of the family MINIOPTERIDAE: ***Miniopterus*** Bonaparte, 1837.

COMMON NAMES:
Czech: létavcovití, netopýři dlouhorucí. Dutch: Langvleugelvleermuizen. English: Long-fingered Bats. French: Minioptéridés. German: Langflügelfledermäuse. Italian: Miniottèridi, Minioptèridi. Russian: Длиннокрыловые. Vietnamese: Họ dơi cánh.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Amador *et al.* (2016: 26) estimated the split from the Vespertilionidae at c. 48 MYA, and a stem age at 13 MYA.

MOLECULAR BIOLOGY:
Capanna *et al.* (1968: 240) already pointed out that there was a cytotaxonomic difference between the Vespertilioninae and the Miniopterinae, especially in the average length of the aploid female set.

Platt *et al.* (2016: 9) analyzed the genome data for *M. natalensis* and compared it with that of several other vesper bats and they concluded that *Helitrons* and hATs were introduced into the genome of the Vespertilionidae after their divergence from *Miniopterus*.

Genus ***Miniopterus*** Bonaparte, 1837

*1837. *Miniopterus* Bonaparte, Iconografia Fauna italiana, 1, fasc. 20 [Goto Description]. - Comments: Type species: *Vespertilio ursinii* Bonapate, 1837 (=*Vespertilio schreibersii* Kuhl, 1817). - Etymology: From the Greek "*μινύς*" or "*μινός*", meaning small and "*πτέρυξ*", meaning wing, referring to the very short first phalanx of the third and longest finger (see Palmer, 1904: 426; Flannery, 1995a: 374; Kozhurina, 2002: 16). Lanza *et al.* (2015: 328) mention the following: "According to Bonaparte (1837-41) who described the genus and Lanza (2012), *Miniopterus* is a scientific masculine Latin substantive made up of the proper feminine Latin noun *Minyèias* 'Minyad', i. e. a daughter of Minyas, king of Orchomenus, turned into a bat, and of the Greek neuter substantive *πτερόν*" (pteròn) 'wing', meaning 'flying Minyad'. The etymology proposed by Kozhurina (2002), meaning 'with small (narrow) wings', is incorrect, even if formally logical. Also partially erroneous is the etymology given by some Italian dictionaries, such as Battaglia (1978) and Devoto & Oli (1997), who interpret 'minio' as 'minimum, red-lead', the red colouring agent, which obviously has nothing to do with the greyish brown colour of Miniopterus' wings". (Current Combination)

1846. *Minyopterus:* Agassiz, Nomenclator. Zool., Mamm., 235. - Comments: Variant spelling (Meester *et al.*, 1986: 45) or unjustified emendation (Jackson and Groves, 2015: 263). (Lapsus, Emendation)

1858. *Miniopteris:* Tomes, Proc. zool. Soc. Lond., 1858, XXVI (cccliv): 115. Publication date: 13 May 1858. - Comments: Variant spelling (Meester *et al.*, 1986: 45) or unjustified emendation (Jackson and Groves, 2015: 262). Not *Miniopteris* J. Gray, 1849 (Mammalia,

Chiroptera, Vespertilionidae) (used as genus name for *Myotis macrotarsus* (Waterhouse, 1845) (see Jackson and Groves, 2015: 263). (Alternate Spelling)

1900. *Minneopterus:* Lampe, Jb. nass. Ver. Naturkde, 53: Cat. Säugeth.-Sammlung, p. 12. Publication date: 1900. - Comments: Cat. Säugeth.-Sammlung, p. 12. Lapsus (see Allen, 1939a: 102; Meester *et al.*, 1986: 45). Jackson and Groves (2015: 263) indicate it appeart to be a *nomen nudum* or an unjustified emendation. (Lapsus, Emendation)

1920. *Mineopterus:* Haagner, South African Mammals, 22. (Lapsus)

1980. *Minioterus:* Bernard, Ann. Transv. Mus., 32 (3): 55. Publication date: January 1980. (Lapsus)

2014. *Mineropterus:* Kohl and Kurth, Viruses, 6 (8): 3112. Publication date: 13 August 2014. (Lapsus)

2015. *Minioptera:* Golden and Comaroff, Ecol. Soc., 20 (2): 42: 5. (Lapsus)

? *Miniopterus sp.*

TAXONOMY:

Reviewed (in part) by Peterson (1981). See Goodwin (1979: 119), Maeda (1982), and Hill (1983). All have come to very different conclusions. Molecular systematics and biogeography is discussed by Appleton *et al.* (2004); their DNA data (p. 437) suggest that the number of species currently recognized (11 or 13) is a gross underestimate. Phylogentic analyses performed by Christidis *et al.* (2014: 1) indicate that 18 clades are present within Malagasy *Miniopterus* of which only 11 have Latin binominals.

Šrámek *et al.* (2012: 165) investigated the taxonomic status of the bent-winged bats in the western Palaearctic and distinguished four species: *M. schreibersii* (s.str.) from Europe, coastal Anatolia, Levant, Cyprus, western Transcaucasia, and North Africa; *M. pallidus* from inland Anatolia, Jordan, eastern Transcaucasia, Turkmenistan, Iran and southern Afghanistan (Kandahar); a *Miniopterus* sp., recorded from Nangarhar province in eastern Afghanistan, which was tentatively assigned to *M.* cf. *fuliginosus*; and another *Miniopterus* sp. With Afro-tropic affinities confirmed from south-western Arabia and Ethiopia, which tentatively named *M.* cf. *arenarius*. They also indicate that a possible new taxon (subspecies) within *M. schreibersii* exists in the Atlas Mountains of Morocco. Bilgin *et al.* (2013: 21) indicate that this Maghrebian form possibly even represents a new species, which they tentatively call: *M. maghrebensis*.

See Taylor *et al.* (2019: 318) for a discussion on the recent increase in Afro-Madagascan species.

Known species to the genus *Miniopterus*: ***†horaceki*** Gunnell, Eiting, and Geraads, 1837; ***aelleni*** Goodman, Maminirina, Weyeneth, Bradman, Christidis, Ruedi and Appleton, 2009; ***africanus*** Sanborn, 1936; *australis* Tomes, 1858 – Philippines, Borneo, Java, Timor, Moluccas, southeast to Vanuatu and eastern Australia (Simmons, 2005: 519); ***brachytragos*** Goodman, Maminirina, Bradman, Christidis and Appleton, 2011; ***egeri*** Goodman, Ramasindrazana, Maminirina, Schoeman and Appleton, 2011; ***fraterculus*** Thomas and Schwann, 1906; *fuscus* Bonhote, 1902 – Ryuku Isls (Japan) (Simmons, 2005: 519); ***gleni*** Peterson, Eger and Mitchell, 1995; ***griffithsii*** Goodman, Maminirina, Bradman, Christidis and Appleton, 2009; ***griveaudi*** Harrison, 1959; ***inflatus*** Thomas, 1903; *macrocneme* Revilliod, 1914 – New Guinea to Vanuatu and New Caledonia (Simmons, 2005: 520); *magnater* Sanborn, 1931 – northeastern India, southeastern China, Burma, Thailand, Laos and Vietnam to Malaysia, Sumatra, Java, Timor (Indonesia), Borneo, Moluccas and New Guinea including the Bismarck Arch. (Simmons, 2005: 520); ***mahafaliensis*** Goodman, Bradman, Christides and Appleton, 2009; ***majori*** Thomas, 1906; ***manavi*** Thomas, 1906; *medius* Thomas and Wroughton,1909 – southeastern China, Thailand, western Malaysia, Borneo, Java, Sulawesi, Philippines, New Guinea (Simmons, 2005: 520); ***minor*** Peters, 1867; ***natalensis*** (A. Smith, 1834); *paululus* Hollister, 1913 – Majuyod, Negros and Guimarás Isl (Philippines), Berneo, Selaru (Simmons, 2005: 521); ***petersoni*** Goodman, Bradman, Maminirina, Ryan, Christidis and Appleton, 2008; *pusillus* Dobson, 1876 – India, Nepal and Burma to Sumatra and Timor (Indonesia), Philippines and Moluccas (Simmons, 2005: 520); *robustior* Revilliod, 1914 – Loyalty Isls (east of New Caledonia) (Simmons, 2005: 521); ***schreibersii*** (Kuhl, 1817); *shortridgei* Laurie and Hill, 1957 – Java, Madura, Lombok, Sumbawa, Moyo, Alor, Wetar, Seralu, Timor, Semau, Roti and Savu Isls (Indonesia) (Simmons, 2005: 522); ***sororculus*** Goodman, Ryan, Maminirina, Fhar, Christidis and Appleton, 2007; *tristis* (Waterhouse, 1845) – Philippines, Sulawesi, Sanan Isl, New Guinea, Bismarck Arch., Solomon Isls, New Hebrides (Simmons, 2005: 522).

The 18 Malagasy clades recovery by Christidis *et al.* (2014) in their phylogenetic analysis were

divided in into five primary lineages (representing sister species): (1) *M. griveaudi*; (2) *M. mahafaliensis, M. sororculus* and X3; (3) *M. majori, M. gleni* and *M. griffithsi*; (4) *M. brachytragos; M. aelleni* A, and *M. aelleni* B, and (5) *M. manavi* and *M. petersoni*. These are in turn linked to a group comprising *M. egeri* and five genetically distinct populations referred to as P3, P4, P5, P6 and P7.

COMMON NAMES:
Czech: létavci, netopýři dlouhorucí. English: Long-fingered Bats, Bent-winged Bats. French: Minioptères. German: Langflügelfledermäuse, Sackfledermaus.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
The oldest fossil remains for *Miniopterus* date from some 13.65 million years ago (see Shi and Rabosky, 2015: 1532).

Butler (1978) refers to African material of this genus, found from the early Pleistocene at Olduvai, and Avery (2007: 619) reported on the presence of *Miniopterus* sp. in Pleistocene deposits at Wonderwerk Cave, South Africa. Geraads *et al.* (2010: 279) reported *Miniopterus* in Late Cenozoic (ca. 2.5 MYA) deposits in Ahl al Oughlam, Morocco.

Weyeneth (2010) suggested that Malagasy *Miniopterus* colonized the Comoros during the Pleistocene, favored by prevailing winds.

BIOGEOGRAPHY:
Weyeneth *et al.* (2008) suggest that the Comoros were colonized independently at least two or three times by ancestors from Madagascar.

DETAILED MORPHOLOGY:
Brain - Maseko and Manger (2007) describe the nuclear parcellation and neuronal morphology of the cholinergic, catecholaminergic and serotonergic systems within the brain of six adult female *Miniopterus schreibersii* [possibly *M. natalensis* or *M. fraterculus*, not *Miniopterus schreibersii*], captured from caves in northwest region of Gauteng Province, South Africa.

SEXUAL DIMORPHISM:
Goodman and Maminirina (2007) found no notable evidence for sexual dimorphism in Malagasy *Miniopterus* spp.

ECHOLOCATION:
Bioacoustic data of 11 Malagasy (Madagascar and the Comoros) has been collected and investigated by Ramasindrazana *et al.* (2011).

PARASITES:
BACTERIA
Bartonellae
Bartonella - Kosoy *et al.* (2010: 1877) reported a prelevence of *Bartonella* spp. in *Miniopterus* sp. from Kenya of 22/105 (21.0 %) cultured from blood samples. Fifty-one *Bartonella* spp. *gltA* sequences were obtained from 3 identified species of *Miniopterus* (*africanus, minor, natalensis*), were 24 unique *gltA* genotypes representing at least 3 genogroups (Kosoy *et al.*, 2010: 1878). See also Kosoy (2010: 719) for further information.

ACARI
Myobiidae: Fain (1994: 1280) reported the genus *Calcarmyobia* to occur only on bats of the genus *Miniopterus* with 18 species and 8 subspecies.
Trombiculidae: *Trombigastia (Trombigastia) cadei* (Vercammen-Grandjean and Brennan, 1957) was reported by Vercammen-Grandjean and Fain (1958: 26) and Stekolnikov (2018a: 118) on *Miniopterus* sp. specimens from N'Gong, S Kenya.

Uchikawa (1985c: 110) reported the presence of *Pteracarus miniopteri* Uchikawa, 1978 from *Miniopterus* sp. specimens from Madagascar, Central Africa, Cameroon, Kenya (Mombasa), South Africa (Transvaal).

DIPTERA
Streblidae: *Raymondiodes leleupi* Jobling, 1954 described form a poorly identified bat (*Hipposideros caffer* or *Miniopterus* sp.) from Thysville, Congo (Haeselbarth *et al.*, 1966: 104). *Nycteribosca kollari* Frauenfeld, 1855 was reported by Vermeil (1960) from Tunisia.

Nycteribiidae: *Nycteribia tecta* Theodor, 1957 (Haeselbarth *et al.*, 1966: 110). Duron *et al.* (2014: 2108) mention the presence of *Nycteribia stylidiopsis* (Speiser, 1908) on *Miniopterus* sp. from the Comoros, and of *Penicillidia leptothrinax* (Speiser, 1908) from Madagascar. The latter were carrying Enterobacteriales and *Bartonella* and *Wolbachia* bacteria (Szentiványi *et al.*, 2019: Suppl.). Enterobacteriales were also found in *Penicillidia* cf. *fulvida* (Szentiványi *et al.*, 2019: Suppl.).

SIPHONAPTERA
Ischnopsyllidae: Members of the genus *Rhinolophopsylla* Oudemans, 1909 are known to be parasites of *Miniopterus* and *Rhinolophus* (Haeselbarth *et al.*, 1966: 191).

VIRUSES:
Adenoviridae
These viruses were found by Waruhiu *et al.* (2017) in bats from Kenay.

Coronaviridae

18 out of 300 Kenyan *Miniopterus* bats tested by Tao *et al.* (2017: Suppl.) was positive for CoV (6 %).

Paramyxoviridae
Mortlock *et al.* (2015: 1841) reported that 13 out of 77 examined Kenyan *Miniopterus* sp. specimens tested positive for *Paramyxovirus* sequences. This was also the case for two out of 41 specimens from the DRC.

Retroviridae
Farkašová *et al.* (2017: 3145) described an endogenous Deltaretrovirus, which only occurs in this family of bats and not in the closely related Vespertilionidae and Cistugonidae. This suggests that the endogenization occurred between 20 and 45 million years ago.

Rhabdoviridae
Lyssavirus - Rabies related viruses
West Caucasian Bat virus (WCBV) - Kuzmin *et al.* (2008b) detected WCBV in four of five localities sampled in Kenya with a seroprevalence of 17-26%.
Horton *et al.* (2014: Table S1) tested 229 Kenyan *Miniopterus* sp. specimens, but failed to find neutralising antibodies to IKOV (Ikoma lyssavirus).
Duvenhage lyssavirus (DUVV) - Banyard A. C. and Fooks A. R. (2017: 18) reported this virus from *Miniopterus* sp. specimens from South Africa and Kenya.

†***Miniopterus horaceki*** Gunnell, Eiting, and Geraads, 2011

*2011. *Miniopterus horaceki* Gunnell, Eiting, and Geraads, N. Jb. Geol. Paläont. Abh., 260 (1): 63, figs. 3B, 7C, 8D-F. Publication date: January 2011. Type locality: Morocco: Ahl al Oughlam [ca. 33 35 N 07 30 W] [Goto Description]. Holotype: INSAP AaO 4605: Collected by: ?: Collector Unknown. Presented/Donated by: ?: Collector Unknown. Right dentary with p2-p4, m1 trigonid. - Etymology: In honour of Ivan Horácek, in recognition of his many contributions to the understanding of the evolutionary history of bats, and especially of vespertilionids (see Gunnell *et al.*, 2011: 63). (Current Combination)

TAXONOMY:
Gunnell *et al.* (2011: 63) describe it as larger than nearly all extant African and European *Miniopterus* species (including *M. gleni, M. inflatus, M. newtoni, M. fraterculus, M. natalensis, M. manavi, M. noreenae, M. minor, M. williamsi*, and *M. schreibersi*). Generally similar in size to *M. africanus* but differs in having p3-4 relatively broader and more exodaenodont, p3 larger than p2, and in having relatively taller lower premolars. Larger than *M. schreibersi* with p2 smaller compared to p3, but *M. schreibersi* does possess relatively broad premolars similar to the Moroccan species.

Miniopterus aelleni Goodman, Maminirina, Weyeneth, Bradman, Christidis, Ruedi and Appleton, 2009

*2009. *Miniopterus aelleni* Goodman, Maminirina, Weyeneth, Bradman, Christidis, Ruedi and Appleton, Zool. Scr., 38 (4): 339, 353, figs. 3d, 3e, 4, 7 - 10. Publication date: 22 June 2009. Type locality: Madagascar: Antsiranana province: Ankarana special reserve, Canyon d'Antsiroandoa Centre,: 6.2 km NW Mahamasina [12 55.1 S 49 07.6 E, 120 m] [Goto Description]. Holotype: FMNH 173067: ad ♂, skull and alcoholic. Collected by: Vola Razakarivony and Scott G. Cardiff; collection date: 8 April 2002; original number: SMG 12809. See Goodman and Cardiff (2004: 230). Paratype: FMNH 173069: ad ♀, skull and alcoholic. Collected by: Vola Razakarivony and Scott G. Cardiff; collection date: 8 April 2002; original number: SMG. See Goodman and Cardiff (2004: 230). Paratype: FMNH 173070: ad ♀, skull and alcoholic. Collected by: Vola Razakarivony and Scott G. Cardiff; collection date: 8 April 2002; original number: SMG. See Goodman and Cardiff (2004: 230). Paratype: FMNH 173072: ad ♂, skull and alcoholic. Collected by: Vola Razakarivony and Scott G. Cardiff; collection date: 8 April 2002; original number: SMG. See Goodman and Cardiff (2004: 230). Paratype: FMNH 173075: ad ♂, skull and alcoholic. Collected by: Vola Razakarivony and Scott G. Cardiff; collection date: 8 April 2002; original number: SMG. See Goodman and Cardiff (2004: 230). Paratype: FMNH 173076: ad ♂, skull and alcoholic. Collected by: Vola Razakarivony and Scott G. Cardiff; collection date: 8 April 2002; original number: SMG. See Goodman and Cardiff (2004:

230). - Etymology: The name *aelleni* is a patronym for Villy Aellen (1926 - 2000) who was a mammalogist at the Muséum d'histoire naturelle de Genève from 1954 to his retirement in 1989, where he also served as curator, assistant director, and director (Mahnert, 2000; Goodman *et al.*, 2009a: 353). (Current Combination)

TAXONOMY:
See Goodman *et al.* (2009a).

Schoeman *et al.* (2014: 19) refer to Christidis *et al.* (2014) indicating that - from a phylogenetic species perspective - there is evidence that two sister species are present, which are tentatively named: *M. aelleni* A and *M. aelleni* B.

COMMON NAMES:
Czech: létavec Aellenův. English: Aellen's Long-fingered Bat. German: Aellens Langflügelfledermaus.

ETYMOLOGY OF COMMON NAME:
In honour of Villy Aellen (1926 - 2000), who was a mammalogist at the Muséum d'histoire naturelle de Genève from 1954 to his retirement in 1989, where he also served as curator, assistant director, and director. He devoted much of his professional interests to the study of bats, particularly those of Africa (see Goodman *et al.*, 2009a: 353).

GENERAL DISTRIBUTION:
Lowland portions of northern and western Madagascar (Goodman *et al.*, 2009a; Schoeman *et al.*, 2014: 28). Schoeman *et al.* (2014: 31) assigned *M. aelleni* A to the western or dry deciduous region bioclimatic zone, whereas *M. aelleni* B was classified to the humid forest region.

O'Brien (2011: 289) reports it also from the Comoros.

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
See Goodman *et al.* (2009a).

DENTAL FORMULA:
$^{2123}/_{3133}$ = 36.

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:
See Goodman *et al.* (2009a).

ECHOLOCATION:
Kofoky *et al.* (2009: 382) reported the calls as *M. manavi sen lat.*, these calls were broadband FM/QCF sweeps produced at low duty cycle with most energy at about 58.1 kHz in the fundamental, with pulses having a short duration of about 4 ms. Ramasindrazana *et al.* (2011: 294) recorded 19 calls from 7 *Miniopterus aelleni* specimens, and found the following echolocation call values: Frequency of maximum energy: 51.9 ± 1.57 (49.5 - 54.8) kHz, Maximum frequency: 99.8 ± 8.48 (75.0 - 119.0) kHz, Minimum frequency: 48.0 ± 1.43 (46.0 - 50.0) kHz, Call duration: 4.1 ± 0.65 (3.0 - 5.0) ms, Inter pulse interval: 87.3 ± 16.75 (61.0 - 118.5) ms.

MOLECULAR BIOLOGY:
DNA - See Goodman *et al.* (2009a).
Karyotype - Unknown.
Protein / allozyme - Unknown.

HABITAT:
Dammhahn and Goodman (2013: 108) mention the lower portion of forest structure and partially open areas as the foraging habitat for this species.

Also see Goodman *et al.*, 2009a).

ROOST:
See Goodman *et al.* (2009a).

POPULATION:
Structure and Density - See Goodman *et al.*, 2009a).

PARASITES:
Tortosa *et al.* (2013: 4) report the presence of the Nycteribiid bat fly *Nycteribia stylidiopsis* Speiser, 1908 and Wilkinson *et al.* (2016) report *Penicillidia leptothrinax* Speiser, 1908, which in turn carried *Bartonella* bacteria and the blood parasite *Polychromophilus melanipherus* (Szentiványi *et al.*, 2019: Suppl.). Ramasindrazana *et al.* (2017: Suppl.) report both flies.

Ramasindrazana *et al.* (2016: 6) reported the presence of *Litosoma* Clade 3 (Nematoda: Onchocercidae) on this bat species. They also mention *Litosoma goodmani* Martin, Bain, Jouvenet, Raharimanga, Robert & Rousset, 2006 from a *M. aelleni* specimen, that was previously identified as "*M. manavi*".

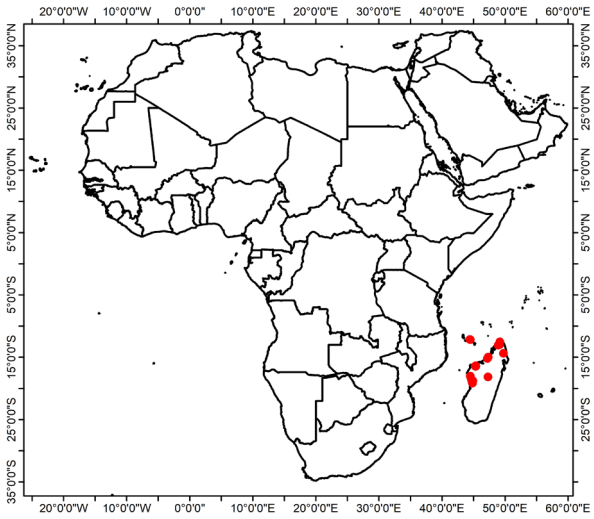

Figure 208. Distribution of *Miniopterus aelleni*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Comoros, Madagascar.

Miniopterus africanus Sanborn, 1936

*1936. *Miniopterus africanus* Sanborn, Field Mus. Nat. Hist., Zool. Ser., (362) 20 (14): 111. Publication date: 15 August 1936. Type locality: Ethiopia: Shoa province: Mulo, Sanford's Ranch [ca. 09 00 N 39 00 E, 8000 ft] [Goto Description]. Holotype: FMNH 28769: ad ♀, skin and skull. Collected by: Alfred Marshall Bailey; collection date: 25 October 1926; original number: 73. (Current Combination)
? *Miniopterus inflatus africanus:* (Name Combination)

TAXONOMY:
Included in *inflatus* by Koopman (1993a: 230), but considered a valid species by Peterson *et al.* (1995: 120), Lavrenchenko *et al.* (2004b: 144), Simmons (2005).

COMMON NAMES:
Chinese: 非洲长翼蝠. Czech: létavec východoafrický. English: African Long-fingered Bat. French: Minioptère d'Afrique orientale. German: Afrikanische Langflügelfledermaus.

CONSERVATION STATUS:
Global - LC ver 3.1 (2001) (IUCN, 2004; Schlitter, 2004h).

GENERAL DISTRIBUTION:
Native: Botswana; Eritrea; Ethiopia; Kenya; Namibia; Tanzania.

PARASITES:
Lutz *et al.* (2016: 9) examined 20 *M. africanus* specimens from East Africa and found four of them infected with the haemosporidan parasite *Polychromophilus melanipherus* Dionisi, 1899.

Uchikawa (1985a: 19) reported that the type specimen of *Miniopterus africanus* harboured the "atypical" form of *Calcarmyobia congoensis* Uchikawa, 1982 (Acari: Myobiidae). This species is also a host of *Calcarmyobia kenyaensis* Uchikawa, 1982 in Kenya (see Uchikawa (1985a: 22) as *M. inflatus africanus*). Possibly some other records mentioned by Uchikawa (1985a: 22) as collected from *M. inflatus* from Cameroon, Liberia, and The Democratic Republic of Congo should be included here.
Uchikawa (1985c: 110) also reported on the presence of the mite *Pteracarus miniopteri* Uchikawa, 1978 on some specimens from Kenya, that were identified as *M. inflatus africanus*.
Tortosa *et al.* (2013: 5) and Ramasindrazana *et al.* (2017: Suppl.) mention this species as host for the Nycteribiid bat flies *Nycteribia schmidlii* Schiner, 1853 and *Pencillidia fulvida* Bigot, 1885.

DIPTERA:
Streblidae: *Raymondia intermedia* Jobling, 1936 (Shapiro *et al.*, 2016: 255). *Raymondia seminuda* Jobling, 1954 (Shapiro *et al.*, 2016: 255).

VIRUSES:
Coronaviridae - Coronaviruses
SARS-CoV - Tong *et al.* (2009) tested 1 bat collected in Kenya during 2006 positive for the presence of coronavirus RNA in a fecal sample. One Kenyan bat tested by Tao *et al.* (2017: Suppl.) was negative for CoV.

Polyomaviridae:
Polyomavirus - Of the nine specimens tested from the Chyulu National Park (Kenya), one tested positive (Conrardy *et al.*, 2014: 259).

Rhabdoviridae:
Rhabdovirus - One of the nine specimens tested from the Chyulu National Park (Kenya) tested positive (Conrardy *et al.*, 2014: 259).

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Eritrea, Ethiopia, Kenya, Mozambique, Somalia.

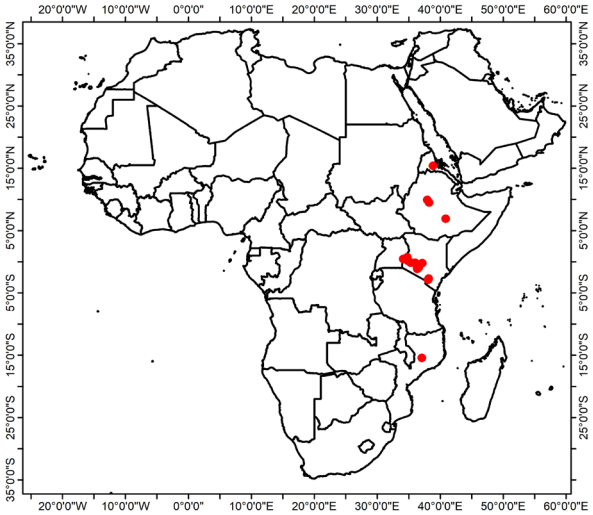

Figure 209. Distribution of *Miniopterus africanus*

Miniopterus ambohitrensis Goodman, Ramasindrazana, Naughton and Appleton, 2015

*2015. *Miniopterus ambohitrensis* Goodman, Ramasindrazana, Naughton and Appleton, Zootaxa, 3936 (4): 538, 543, figs 2 - 5. Publication date: 23 March 2015. Type locality: Madagascar: Province d'Antsiranana: Parc National de la Montagne d'Ambre: Joffreville (Ambohitra), 5.5 km SW: Station Forestière des Roussettes [12 31 37.3 S 49 10 19.1 E, 1000 m] [Goto Description]. Holotype: FMNH 202450: ad ♂, skull and alcoholic. Collected by: Steven M. Goodman; collection date: 9 May 2009; original number: SMG 16169. Presented/Donated by: ?: Collector Unknown. - Etymology: The name *ambohitrensis* is derived from the geographical name of the type locality, which in Malagasy is Ambohitra and in French is Montagne d'Ambre. The nearby village of Joffreville is also referred to as Ambohitra. In the Malagasy language, the root word of Ambohitra is *vohitra* meaning mountain or highlands, giving an ecological context to the specific epithet of this bat, which occurs at higher elevations.

COMMON NAMES:
English: Montagne d'Ambre Long-fingered Bat. French: Minioptère de Montagne d'Ambre. German: Ambre-Langflügelfledermaus.

PARASITES:
Wilkinson *et al.* (2016) report the presence of *Penicillidia leptothrinax* on "*Miniopterus* cf. *ambohitrensis*", which was carrying Enterobacteriales bacteria (Szentiványi *et al.*, 2019: Suppl.).

VIRUSES:
Paramyxoviridae
Mélade *et al.* (2016b: 4) found one out of 19 *M.* cf. *ambohitrensis* specimens they tested to be infected with paramyxoviruses.

Rhabdoviridae
Four out of 15 *M.* cf. *ambohitrensis* specimens tested by Mélade *et al.* (2016a: 6) showed a reaction against *Duvenhage Lyssavirus*.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Madagascar.

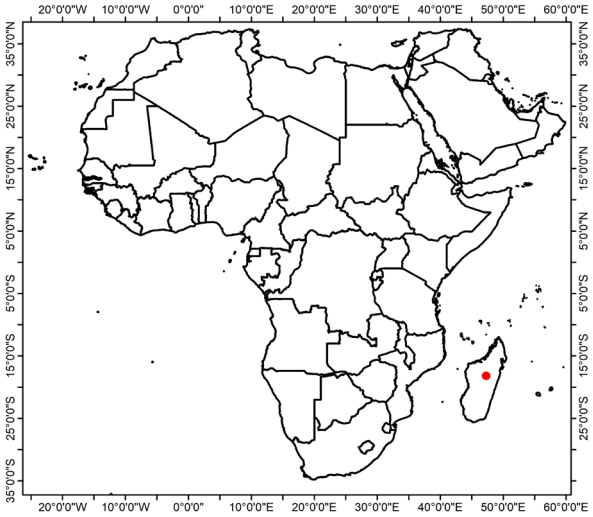

Figure 210. Distribution of *Miniopterus ambohitrensis*

Miniopterus brachytragos Goodman, Maminirina, Bradman, Christidis and Appleton, 2009

*2009. *Miniopterus brachytragos* Goodman, Maminirina, Bradman, Christidis and Appleton, Am. Mus. Novit., 3669: 1, 9, figs 3, 4A–C, 5. Publication date: 30 November 2009. Type locality: Madagascar: Province de Mahajanga: Réserve Naturelle Intégrale de Namoroka [status subsequently changed to Parc National]: Forêt d'Ambovonomby: 26 km NW Andranomavo [16 28.2 S 45 20.9 E, 200 m] [Goto Description]. Holotype: FMNH 175840: ad ♀, skull and alcoholic. Collected by: Steven M. Goodman; collection date: 9 October 2002; original number: SMG 13040. Presented/Donated by: ?: Collector Unknown. Paratype: FMNH 172685: Collected by: ?: Collector Unknown; collection date: 5 November 2001. Presented/Donated by: ?: Collector Unknown. Collected at the Réserve Naturelle Intégrale de Namoroka [status subsequently changed to Parc National], near source of Mandevy River, 32 km NW Andranomavo, 16°22.8'S, 45°20.7'E, 100 m. Paratype: FMNH 188651: Collected by: ?: Collector Unknown; collection date: 14 February 2006. Presented/Donated by: ?: Collector Unknown. Collected in Antsiranana Province, Nosy Komba, 0.9 km SW Ampangorinana, on trail to Station Forestière d'Antanampoera, 13°26.835'S, 48°20.466'E, 100 m. Paratype: FMNH 202523: Collected by: ?: Collector Unknown; collection date: 26 November 2007. Presented/Donated by: ?: Collector Unknown. Collected in Toamasina Province, Masoala Peninsula, 1.8 km S Ambanizana (village), 15°38.291'S, 49°57.944'E, 5 m. - Etymology: From the Greek *brachys* ("short") and *tragos*, meaning "goat," a word ultimately borrowed into New Latin to mean "tragus," and has been chosen as this taxon is easily distinguished from its congeners by its diminutive tragus (see Goodman *et al.*, 2009c: 17).. (Current Combination)

COMMON NAMES:
German: Namoroka-Langflügelfledermaus.

GENERAL DISTRIBUTION:
Occur on Madagascar, from the Masoala Peninsula in the northeast, the Daraina region in the central northeast, and in the karstic zones of

the Namoroka and Bemaraha massifs, as well as on the island of Nosy Komba (see Goodman *et al.*, 2009c: 11).

Schoeman *et al.* (2014: 28, 31) found the most suitable area for this species to be located in the northwestern part of the island (western or dry deciduous region).

ECHOLOCATION:
Ramasindrazana *et al.* (2011: 294) recorded 30 calls from 8 *Miniopterus brachytragos* specimens, and found the following echolocation call values: Frequency of maximum energy: 59.0 ± 1.06 (57.3 - 61.7) kHz, Maximum frequency: 105.8 ± 11.20 (85.0 - 128.0) kHz, Minimum frequency: 55.7 ± 0.84 (54.0 - 57.0) kHz, Call duration: 3.4 ± 0.49 (2.6 - 4.3) ms, Inter pulse interval: 84.6 ± 18.99 (56.1 - 122.5) ms.

PARASITES:
Rasoanoro *et al.* (2019: 67) refer to Raharimanga *et al.* (2003), who reported *Trypanosoma* sp. from "*Miniopterus manavi*", but one of these bats belonged to the current species.

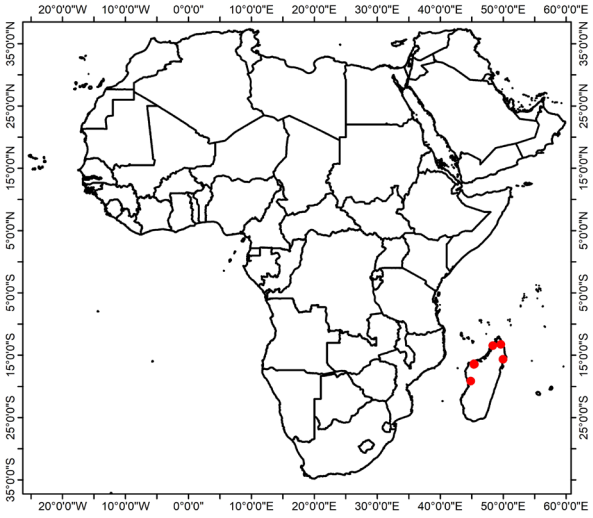

Figure 211. Distribution of *Miniopterus brachytragos*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Madagascar.

Miniopterus egeri Goodman, Ramasindrazana, Maminirina, Schoeman, and Appleton, 2011

*2011. *Miniopterus egeri* Goodman, Ramasindrazana, Maminirina, Schoeman, and Appleton, Zootaxa, 2880: 1, 9, figs 3, 4, 5A, 6, 7. Publication date: 17 May 2011. Type locality: Madagascar: Toamasina Province: Sahafina forest: Brickaville, 9.5 km W [18 48 37 S 48 58 48 E, 50 m] [Goto Description]. Holotype: FMNH 209160: ad ♀, skull and alcoholic. Collected by: Steven M. Goodman and Beza Ramasindrazana; collection date: 5 December 2009; original number: SMG 16602. Presented/Donated by: ?: Collector Unknown. - Etymology: in honor of Dr. Judith Eger, Senior Curator, Department of Mammalogy, Royal Ontario Museum, Toronto, for her contribution to taxonomic studies of Old World bats, including Madagascar (see Goodman *et al.*, 2011: 13). (Current Combination)

COMMON NAMES:
English: Eger's long-fingered bat. French: Minioptère d'Eger. German: Eger-Langflügelfledermaus.

GENERAL DISTRIBUTION:
Based on current knowledge it is known from scattered sites occuring across two-thirds of Madagascar's lowland area from near sea level to 550 m (Goodman *et al.*, 2011: 15).

Schoeman *et al.* (2014: 28, 31) found the most suitable area for this species to be located in the eastern coastal part of the island (eastern humid forest or lowland forest region - humid).

Native: Madagascar (Goodman *et al.*, 2011: 15).

DETAILED MORPHOLOGY:
Baculum:
Rakotondramanana and Goodman (2017: 63) could not find a baculum in the one specimen they examined.

ECHOLOCATION:
Low-duty cycle, frequency modulated/quasi constant (FM/QCF) echolocation call, with a peak frequency of 54.7 kHz (53.2 - 56.3 kHz) and a duration of 2.9 ms (2.5 - 3.4 ms) (Goodman *et al.*, 2011: 8).
Ramasindrazana *et al.* (2011: 294) recorded 16 calls from 2 *Miniopterus egeri* specimens, and found the following echolocation call values: Frequency of maximum energy: 54.7 ± 1.02 (53.2 - 56.3) kHz, Maximum frequency: 113.8 ± 3.62 (107.0 - 123.0) kHz, Minimum frequency: 49.0 ± 0.52 (48.0 - 50.0) kHz, Call duration: 2.9 ± 0.26 (2.5 - 3.4) ms, Inter pulse interval: 62.6 ± 12.57 (43.2 - 81.1) ms.

HABITAT:
Often associated with disturbed forests with mixed native and introduced trees or at the ecotone between degraded anthropogenic habitats and native forest (Goodman *et al.*, 2011: 15).

ROOST:
A day roost site of this species was found in a natural rock shelter in the Poste Forestier de Farankaraina surrounded by slightly disturbed natural lowland humid forest (Goodman *et al.*, 2011: 15).

DIET:
Rasoanoro *et al.* (2015: 63, 64) found that the diet of *M. egeri* mainly consisted of Coleoptera (51.5 vol %), Hymentoptera (28 %), Lepidoptera (10.8 %), and Isoptera (9.7 %).

POPULATION:
Structure and Density - Further information is needed (Goodman *et al.*, 2011: 15).
Trend - In the short term this species does not appear to face a risk of dramatic population decline (Goodman *et al.*, 2011: 15).

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Madagascar.

Miniopterus fraterculus Thomas and Schwann, 1906

*1906. *Miniopterus fraterculus* Thomas and Schwann, Proc. zool. Soc. Lond., 1906, I: 162. Publication date: 7 June 1906. Type locality: South Africa: Southern Cape Province: Knysna [33 53 S 22 59 E] [Goto Description]. Holotype: BMNH 1905.5.7.18: ad ♂, skin and skull. Collected by: Captain Claude Henry Baxter Grant; collection date: 3 October 1905; original number: 1073. See Thomas and Schwann (1906a: 162). - Comments: Coordinates mentioned as 35 56 S 23 06 E by Thorn *et al.* (2009: 49). - Etymology: From the Latin meaning "little brother" (see Goodman *et al.*, 2007b: 1222). (Current Combination)

1917. *Miniopterus breyeri vicinior* J.A. Allen, Bull. Am. Mus. Nat. Hist., 37 (18): 450. Publication date: 29 September 1917. Type locality: Congo (Democratic Republic of the): Oriental province: Uele district: Aba [03 53 N 30 17 E] [Goto Description]. Holotype: AMNH 49019: ad ♂, skin and skull. Collected by: Herbert Lang, James Paul Chapin and The American Museum Congo Expedition; collection date: 16 December 1911; original number: 1770. See Allen (1917: 450). - Comments: Considered a subspecies of *fraterculus* by Thorn *et al.* (2009: 49).

1978. *M[iniopterus] fraterreulus:* Herzit-Straschil and Robinson, Koedoe, 21: 104. (Lapsus)

? *Miniopterus cf. fraterculus:*

? *Miniopterus fraterculus fraterculus:* (Name Combination)

TAXONOMY:
Meester *et al.* (1986) state that Harrison and Clancey (1952) and Harrison (1953) have demonstrated that Ellerman *et al.* (1953) are mistaken in regarding *fraterculus* as a synonym of *M. schreibersii natalensis*. Koopman (1966) regards *fraterculus* instead as a subspecies of the extralimital (to southern Africa) *M. minor* Peters, 1867, but Hayman and Hill (1971) disagree. Corbet and Hill (1980) retain *fraterculus* as species, as do Swanepoel *et al.* (1980) and Koopman (1982).

Specimens from Madagascar assigned to *M. fraterculus* by Peterson *et al.* (1995) and Simmons (2005: 519) are now considered to be a distinct species: *Miniopterus sororculus* (Goodman *et al.*, 2007b).

COMMON NAMES:
Afrikaans: Klein grotvlermuis. Chinese: 小长翼蝠. Czech: létavec jihoafrický. English: Lesser Long-fingered Bat, Black Clinging Bat, Lesser bent-winged bat. French: Minioptère d'Afrique australe,

Petit minioptère. German: Kleine Langflügelfledermaus. Portuguese: Morcego pequeno de dedos compridos. SiSwati: Lilulwane.

CONSERVATION STATUS:
Global - Known from a number of discrete ranges. This species is listed as Least Concern (LC ver 3.1 (2001)) in view of its widespread distribution on the African mainland and its ability to live in a wide variety of habitat types (Schlitter *et al.*, 2008; IUCN, 2009). On Madagascar, it is quite rare and further surveys are required.

Assessment History -
2008 - LC ver 3.1 (2001) (Schlitter *et al.*, 2008; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Schlitter, 2004g; IUCN, 2004). 1996 - EN (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - LC ver 3.1 (2001) (MacEwan *et al.*, 2016c). 2004 - NT ver 3.1 (2001) (Friedmann and Daly, 2004).
Swaziland: 2003 - NT B2ab(iv); D2 ver 3.1 (2001) (Monadjem *et al.*, 2003).

MAJOR THREATS:
There are no major threats to this species on the African mainland (Schlitter *et al.*, 2008; IUCN, 2009).

CONSERVATION ACTIONS:
Schlitter *et al.* (2008) [in IUCN (2009)] report that this species is presumably present in a number of protected areas. In Tanzania it is present in the Manga Forest Reserve of Tanzania (Doggart *et al.*, 1999b). Further studies are needed to better define the range of this species.

GENERAL DISTRIBUTION:
Miniopterus fraterculus is present in Central Africa, East Africa and southern Africa. It is known from a number of discrete ranges, the largest of which stretches down south-eastern Africa, from Malawi, Mozambique and Zimbabwe, down to South Africa (where is extends along the south coast and its distribution is mostly affected by the annual temperature range (Babiker Salata, 2012: 50)). It is also known from eastern Democratic Republic of Congo near the borders with Uganda and Rwanda (although this population needs to be confirmed as *Miniopterus fraterculus*), and recorded from localities in Tanzania, Zambia, and Kenya. A small recorded range in Kenya near the border with Tanzania probably does not represent *Miniopterus fraterculus*.

Taylor *et al.* (2018b: 62) mention *Miniopterus* cf. *fraterculus* from Angola, however based on acoustic evidence only. Beja *et al.* (2019: 388) believe the Angolan records to be mis-identifications.

ROM has 28 specimens from two localities in Cameroon, which need verification as they are well outside the presently known distribution of the species.
Specimens from Madagascar assigned to *M. fraterculus* (Peterson *et al.* (1995; Russ *et al.*, 2001; Simmons, 2005: 519) are now considered to be a distinct species: *Miniopterus sororculus* (Goodman *et al.*, 2007b).

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 297,363 km^2. In the RSA, its distribution is most affected by the annual temperature range (Babiker Salata, 2012: 50).

Native: Kenya; Malawi (Happold *et al.*, 1988; Monadjem *et al.*, 2010d: 539); Mozambique (Monadjem *et al.*, 2010d: 539; Monadjem *et al.*, 2010c: 385 as *M.* cf. *fraterculus*); South Africa (Monadjem *et al.*, 2010d: 539); Swaziland (Monadjem *et al.*, 2010d: 539); Tanzania; Zambia; Zimbabwe.
Presence uncertain: Camaroon; Congo; The Democratic Republic of the; Rwanda; Uganda.

DENTAL FORMULA:
van der Merwe (1985b: 251) examined 44 skulls and found 95 % of them vestigial teeth between the upper canine and the first premolar. In 44 % of the skulls, the teeth were present on both sides.

ECHOLOCATION:
Schoeman and Waddington (2011: 291) mention a peak frequency of 62.1 ± 1.7 kHz and a duration of 3.7 ± 0.6 msec for specimens from Durban, South Africa.

The 135 calls analysed by Eisenring *et al.* (2016: SI 2) from bats in the Aberdares Range in Kenya had the following values: PF: 56.2 ± 1.4 (53.3 - 60.0), HF: 87.1 ± 15.9 (63.8 - 127.6), LF: 52.2 ± 1.6 (47.4 - 56.2), DT: 0.1 ± 0.0 (0.0 - 0.1), DF: 34.9 ± 15.9 (11.5 - 80.1), IPI: 0.8 ± 0.6 (0.3 - 4.8).

For calls from specimens from Swaziland, Monadjem *et al.* (2017c: 179) recorded: F_{min}: 58.5 ± 0.50 (58.1 - 58.8) kHz, F_{knee}: 63.6 ± 1.27 (62.7 - 64.4) kHz, F_c: 59.2 ± 0.40 (58.9 - 59.5) kHz and duration: 2.9 ± 0.32 (2.7 - 3.1) msec.

MOLECULAR BIOLOGY:
DNA - See Hoofer and Van Den Bussche (2003).
Karyotype - Rautenbach *et al.* (1993) described the karyotype as having a diploid number 2*n* = 46, aFN = 50, BA = 6, X = SM, Y = A.

Protein / allozyme - Unknown.

POPULATION:
Structure and Density - It is common and widespread (Schlitter *et al.*, 2008; IUCN, 2009).
Trend - 2008 - Unknown (Schlitter *et al.*, 2008; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
Delayed implantation (lasting two-and-a-half months), insemination, ovulation and fertilization occur in the autumn. Embryogenesis proceeds to the blastocyst stage and development is then retarded until arousal in spring, when the blastocyst implants and embryogenisis resumes. The active fetal growth period takes about four months (Bernard, 1980a: 55; Bernard, 1980c).

Bernard (1980b: 111) found that the ovarian and uterine function is asymmetrical as ovulations occurred primarily in the left ovary (94 %), whereas all implantations occurred in the right uterine horn.

PARASITES:
HAEMOSPORIDA
Lutz *et al.* (2016: 9) examined 6 *M.* cf. *fraterculus* specimens from East Africa and found two of them infected with the haemosporidan parasite *Polychromophilus melanipherus* Dionisi, 1899.

ACARI
Myobiidae: Uchikawa (1985a: 16) reported mites belonging to *Calcarmyobia rhinolophia* (Radford, 1940) on bats identified as *M. fuscus fraterculus* from Natal, South Africa.
Trombiculidae: *Leptotrombidium lawrencei* Vercammen-Grandjean and Langston, 1976 (see Stekolnikov, 2018a: 143).

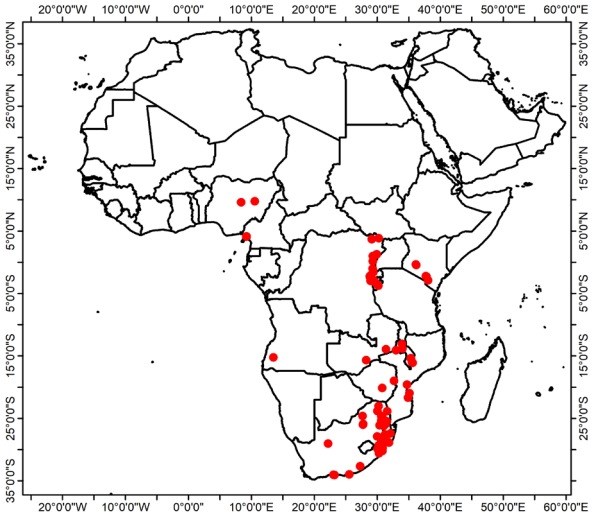

Figure 213. Distribution of *Miniopterus fraterculus*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Angola, Burundi, Cameroon, Congo (Democratic Republic of the), Kenya, Madagascar, Malawi, Mozambique, Nigeria, Rwanda, South Africa, Swaziland, Tanzania, Zambia, Zimbabwe.

Miniopterus gleni Peterson, Eger and Mitchell, 1995

*1995. *Miniopterus gleni* Peterson, Eger and Mitchell, Faune de Madagascar, Chiroptères, 84: 128, figs 60, 61. Type locality: Madagascar: 20 km S Tuléar: Sarodrano and Saint-Augustin, in a marine cave [23 33 S 43 45 E] [Goto Description]. Holotype: ROM 42567: ad ♂, skin and skull. Collection date: 9 May 1967. (Current Combination)

TAXONOMY:
See Simmons (2005).

COMMON NAMES:
Czech: létavec Glenův. English: Glen's Long-fingered Bat. French: Minioptère malgache. German: Glens Langflügelfledermaus.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Muldoon *et al.* (2009: 1114) report on subfossil remains from the Ankilitelo fauna (late Holocene, appr. 500 years ago).
Gunnell *et al.* (2014: 3) refer to Goodman and Junker (2013) who also report fossils from the Andrahomana cave.

CONSERVATION STATUS:
Global - This species is listed as Least Concern (LC ver 3.1 (2001)) in view of its widespread distribution in Madagascar. It may be locally threatened in parts of its range by hunting and roost disturbance, but is not thought to be declining fast enough to place it in a higher category of threat (Andriafidison *et al.*, 2008e; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Andriafidison *et al.*, 2008e; IUCN, 2009). 2000 - LR/nt (IUCN, 2000). 1994 - LR/nt ver 2.3 (1994) (Groombridge, 1994).

MAJOR THREATS:
It is threatened by roost site disturbance. This species is locally hunted in the south-west and north-west of Antananarivo (Goodman, 2006; Goodman *et al.*, 2008d) and as a relatively large species may be subject to similar exploitation elsewhere. There is no evidence that hunting presents a major threat. It is unclear if this species

is forest dependent (Andriafidison *et al.*, 2008e; IUCN, 2009).

CONSERVATION ACTIONS:
Andriafidison *et al.* (2008e) [in IUCN (2009)] report that this species is known to exist in a number of protected areas in the north-east (Eger and Mitchell, 2003) and many along the west coast (Goodman *et al.*, 2005a).

GENERAL DISTRIBUTION:
Miniopterus gleni is endemic to the island of Madagascar where it appears to be widely distributed (Eger and Mitchell, 2003; Goodman *et al.*, 2005a). The areas from where it has yet to be recorded may reflect low sampling effort rather than a genuine absence. North of Onilahy river (incl. Ile Sainte-Marie; Rakotonandrasana and Goodman, 2007: 6).

Schoeman *et al.* (2014: 28, 31) found the most suitable area for this species to be located in the coastal areas of northeast, north, west, and the south of the island (western or dry deciduous region).

Native: Madagascar (Eger and Mitchell, 2003; Goodman *et al.*, 2005a; Rakotonandrasana and Goodman, 2007: 6)

DETAILED MORPHOLOGY:
Baculum:
Rakotondramanana and Goodman (2017: 63) could not find a baculum in the three males they examined.

ECHOLOCATION:
Kofoky *et al.* (2009: 382) reported the calls of eight individuals, which were characterized by broadband FM/QCF pulses produced at low duty cycle with a frequency of maximum energy at about 44.8 kHz, while the fundamental was always the most intense call and pulses are short duration. Ramasindrazana *et al.* (2011: 294) recorded 16 calls from 6 *Miniopterus gleni* specimens, and found the following echolocation call values: Frequency of maximum energy: 42.3 ± 1.29 (40.1 - 44.6) kHz, Maximum frequency: 82.6 ± 8.22 (70.0 - 93.2) kHz, Minimum frequency: 37.4 ± 0.94 (36.0 - 38.9) kHz, Call duration: 3.7 ± 0.49 (3.0 - 4.4) ms, Inter pulse interval: 88.9 ± 17.75 (66.7 - 124.1) ms.

HABITAT:
Dammhahn and Goodman (2013: 108) mention the lower portion of forest structure and partially open areas as the foraging habitat for this species.

ROOST:
On Madagascar, Wilkinson *et al.* (2012: 160) reported the typical roosting site to be caves.

POPULATION:
Structure and Density - There was a maximum of 90 individuals recorded at a roost in Ankarana (S. G. Cardiff *pers. comm.*), but otherwise this species always appears to roost in rather small colonies (Robinson *et al.*, 2006). Its relative abundance, as determined by mist netting, varies from rare (Kofoky *et al.*, 2007) to locally common (Robinson *et al.*, 2006).
Trend - Unknown (Andriafidison *et al.*, 2008e; IUCN, 2009).

PARASITES:
Lagadec *et al.* (2012: 1696) and Dietrich *et al.* (2014: Suppl.) report the presence of spirochaetes bacteria of the genus *Leptospira*, and which were identified as *L. borgpetersenii* by Dietrich *et al.* (2018a: 3).

Ramasindrazana *et al.* (2016: 2) indicate that *Litomosa goodmani* Martin, Bain, Jouvenet, Raharimanga, Robert & Rousset, 2006 (Onchocercidae, Nematoda) was described from a *M. gleni* from northern Madagascar. They also recovered *Litomosa* Clade 1 from this bat species.

Perkins and Schaer (2016: Suppl.) report the presence of the haemosporidan *Polychromophilus* sp. Ramasindrazana *et al.* (2018: Suppl.) identified this parasite as *Polychromophilus melanipherus* Dionisi, 1899.

Tortosa *et al.* (2013: 4) and Ramasindrazana *et al.* (2017: Suppl.) reported the following Nycteribiid bat flies: *Nycteribia stylidiopsis*, *Penicillidia leptothrinax*, and *Penicillidia* sp. The first one was also mentioned by Wilkinson *et al.* (2016), which was found to carry Enterobacteriales and *Bartonella* bacteria, as well as the blood parasite *Polychromophilus melanipherus* (Szentiványi *et al.*, 2019: Suppl.).

VIRUSES:
Astroviridae
One of two *M. gleni* specimens tested by Lebarbenchon *et al.* (2017: Suppl.) was positive for Astroviridae.

Paramyxoviridae
Wilkinson *et al.* (2012: 160) tested 7 individuals from the Mauritius using RT-PCR specific for Respirovirus/Morbillivirus/Henipahvirus (RMH) and Paramyxovirinae (PMV) and found 0 positive results for viral nucleic acids.

Mélade *et al.* (2016b: 4) found four out of 22 *M. gleni* specimens they tested to be infected with paramyxoviruses.

UTILISATION:
Goodman (2006) describes the hunting method used by local inhabitants. See also Goodman *et al.* (2008d) and Jenkins and Racey (2008).

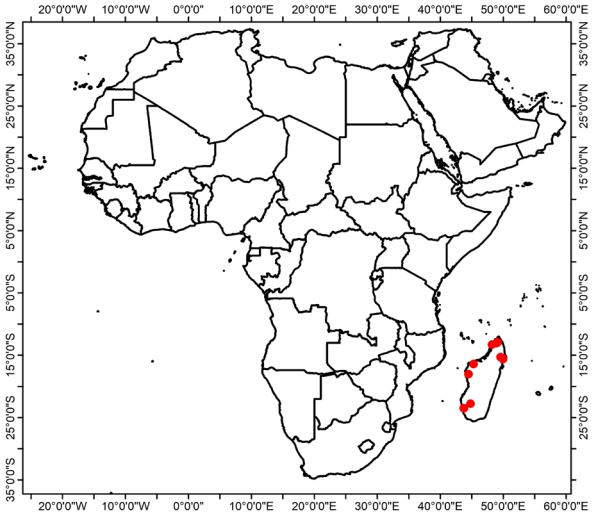

Figure 214. Distribution of *Miniopterus gleni*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Madagascar.

Miniopterus griffithsi Goodman, Maminirina, Bradman, Christidis and Appleton, 2009

*2009. *Miniopterus griffithsi* Goodman, Maminirina, Bradman, Christidis and Appleton, J. Zool. Syst. Evol. Res., 38: 75, 81, figs 4, 6. Publication date: prior to 25 October 2009. Type locality: Madagascar: Province de Toliara: Grotte d'Androimpano: 4.2 km NE Itampolo (village), on old road to Ejeda [24 39.012 S 43 57.797 E, 110m] [Goto Description]. Holotype: FMNH 184214: ad ♂, skull and alcoholic. Collected by: Steven M. Goodman; collection date: 23 February 2005; original number: SMG 14593. Paratype: FMNH 184153: ad ♂. Grotte de Vitane (Vitany), 4.1 km SE Itampolo, 244208.5S 435749.4E, 25m. Paratype: FMNH 184154: ad ♂. Grotte de Vitane (Vitany), 4.1 km SE Itampolo, 244208.5S 435749.4E, 25m. Paratype: FMNH 184167: ad ♂. Grotte de Vitane (Vitany), 4.1 km SE Itampolo, 244208.5S 435749.4E, 25m. Paratype: FMNH 184215: ad ♂. same locatlity as the holotype. Paratype: FMNH 184216: ad ♂. Same locatlity as the holotype. Paratype: FMNH 184236: ad ♀. Same locatlity as the holotype. Paratype: USNM 577076:. Fivondronana de Tolagnaro, 20 km WNW Ranopiso, 12 km ENE Amboasary, near Itaranta River, 2501S 4630E, 40m. Paratype: USNM 577077:. Fivondronana de Tolagnaro, 20 km WNW Ranopiso, 12 km ENE Amboasary, near Itaranta River, 2501S 4630E, 40m. (Current Combination)

TAXONOMY:
Goodman *et al.* (2009b) examining the phylogeography of the *M. gleni* complex, found that the Onilahy River is a major barrier to gene flow. Subsequently, morphological characters (tragus shape, pelage coloration and skull proportions) were identified, that supported the separation of the populations found on either side of the Onilahy River (Goodman *et al.*, 2009b).

COMMON NAMES:
German: Griffiths Langflügelfledermaus.

ETYMOLOGY OF COMMON NAME:
In honour of Owen Griffiths, founder of Biodiversity Conservation Madagascar, who is a specialist on the terrestrial mollusc fauna of the western Indian Ocean and has been instrumental in preserving key important areas of habitat on Mauritius and Madagascar. He has generously supported many initiatives for documenting the rich Malagasy fauna (including genetic studies on *Miniopterus*) (see Goodman *et al.*, 2009a: 346).

CONSERVATION STATUS:
IUCN - EN (Goodman *et al.*, 2009b).

GENERAL DISTRIBUTION:
Miniopterus griffithsii is endemic to Madagascar, where it seems to be restricted to the region between the southern banks of the Onilahy River and the Mandrare River (Itampolo east to near Ranopiso).

Schoeman *et al.* (2014: 28,31) found the most suitable area for this species to be located in the

south/southwestern coastal part of the island (south-west sub-arid or spiny bush).

Native: Madagascar.

ECHOLOCATION:
Ramasindrazana *et al.* (2011: 294) recorded 8 calls from 2 *Miniopterus griffithsi* specimens, and found the following echolocation call values: Frequency of maximum energy: 44.1 ± 0.67 (43.5 - 45.3) kHz, Maximum frequency: 80.4 ± 15.66 (61.0 - 99.0) kHz, Minimum frequency: 40.0 ± 0.0 (40.0 - 40.0) kHz, Call duration: 3.2 ± 0.29 (2.9 - 3.6) ms, Inter pulse interval: 89.2 ± 27.42 (56.4 - 128.5) ms.

ROOST:
Wilkinson *et al.* (2012: 160) indicate that caves are the typical roosting sites for these bats on Madagascar.

MIGRATION:
Reher *et al.* (2019: 121) found that *M. griffithsi* was only present in the Vintany Cave (southwestern Madagascar) during the wet season, whereas other species such as *Triaenops menamena* and *Miniopterus mahafaliensis* were present in both the dry and wet season.

PARASITES:
Lagadec *et al.* (2012: 1696), Dietrich *et al.* (2014: Suppl.) and Gomard *et al.* (2016: 5) report the presence of spirochaetes bacteria of the genus *Leptospira*, and which were further identified as *L. borgpetersenii* by Dietrich *et al.* (2018a: 3).

The haemosporidian *Polychromophilus melanipherus* Dionisi, 1899 was reported from this species by Ramasindrazana *et al.* (2018: Suppl.).

Ramasindrazana *et al.* (2016: 6) recovered *Litomosa* Clade 2 (Nematoda: Onchocercidae) from this bat species.

VIRUSES:
Paramyxoviridae
Wilkinson *et al.* (2012: 160) tested 2 individuals from the Mauritius using RT-PCR specific for Respirovirus/Morbillivirus/Henipahvirus (RMH) and Paramyxovirinae (PMV) and found 0 positive results for viral nucleic acids.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Madagascar.

Miniopterus griveaudi Harrison, 1959

*1959. *Miniopterus minor griveaudi* Harrison, Durban Mus. Novit., 5 (15): 192. Publication date: 30 April 1959. Type locality: Comoros: Grand Comoro [11 35 S 43 20 E] [Goto Description]. Holotype: BMNH 1967.1231: ad ♀, alcoholic (skull not removed). Collected by: Paul Griveaud; collection date: 10 August 1958. Formerly HZM 3.2803, see Harrison (1959a: 192). - Comments: The museum labels of the two other specimens, on which Harrison (1959a) based his description (HZM 4.2804 and 5.2805), have the following note by P. Griveaud: "couloir souterrain et grotte sous coulée de lave Niombadjée". Niombadjée is a toponym for Niombadjou (also spelled as Niumbadju), located on the western lower flank of Mt. Karthala at 11° 47' 57" S, 43° 17' 50" E (approximately 600 m) and where members of the expedition were based from 8 August 1958 to 23 August 1958: see Goodman *et al.* (2009a: 342). - Etymology: In honour of Mr. Paul Griveaud, the collector of the type specimen.
? *Miniopterus griveaudi (Clade 3):* Goodman, Maminirina, Weyeneth, Bradman, Christidis, Ruedi and Appleton, Zool. Scr., 38: 351 - 353, 362 - 363.
? *Miniopterus griveaudi:* (Current Combination)

TAXONOMY:
Originally synonomised with *Miniopterus minor*. Then moved as a synonym of *Miniopterus manavi* (Peterson *et al.*, 1995: 135; Simmons, 2005: 520). Peterson *et al.* (1995: 119) suggest that it may be a vaild species, which Simmons (2005: 520)

recognises as a valid subspecies. Juste [B.] *et al.* (2007: 32) consider *griveaudi* a valid species based on mtDNA data, a view supported by Weyeneth *et al.* (2008).

COMMON NAMES:
Czech: létavec komorský. English: Griveaud`s Long-fingered bat. French: Minioptère des Comores. German: Komoren-Langflügelfledermaus.

ETYMOLOGY OF COMMON NAME:
In honour of Mr. Paul Griveaud, the collector of the type specimen.

CONSERVATION STATUS:
Global - Listed as Data Deficient (DD ver 3.1 (2001)) in view of the absence of sufficient information on its extent of occurrence, natural history, threats and conservation status (Juste, 2008a; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) (Juste, 2008a; IUCN, 2009).

MAJOR THREATS:
The threats to this species are not known (Juste, 2008a; IUCN, 2009).

CONSERVATION ACTIONS:
Juste (2008a) [in IUCN (2009)] reports that it is not known if the species is present in any protected areas. Further studies are needed into the distribution, abundance, natural history, and threats to this species.

GENERAL DISTRIBUTION:
Miniopterus griveaudi is endemic to Grand Comore Island in the Comoros.

O'Brien (2011: 289) also reports it from Madagascar. Schoeman *et al.* (2014: 28, 31) found the most suitable area for this species to be located in the northwestern part of the island (western or dry deciduous region).

Native: Comoros (Koopman, 1993a: 231 [as *minor*], Simmons, 2005: 521 [as *minor*], Juste [B.] *et al.*, 2007: 32).

ECHOLOCATION:
Kofoky *et al.* (2009: 382) reported the calls as *M. manavi s.l.*, these calls were broadband FM/QCF sweeps produced at low duty cycle with most energy at about 58.1 kHz in the fundamental, with pulses having a short duration of about 4 ms.
Ramasindrazana *et al.* (2011: 294) recorded 49 calls from 17 *Miniopterus griveaudi* specimens from Madagascar, and found the following echolocation call values: Frequency of maximum energy: 59.9 ± 1.73 (56.4 - 62.4) kHz, Maximum frequency: 105.6 ± 12.05 (82.0 - 130.0) kHz, Minimum frequency: 55.9 ± 1.36 (53.0 - 58.0) kHz, Call duration: 3.5 ± 0.54 (2.7 - 4.4) ms, Inter pulse interval: 85.7 ± 19.80 (40.0 - 123.6) ms.
For 27 calls of 8 specimens from the same species from Anjoun, Ramasindrazana *et al.* (2011: 294) reported the following echolocation call values: Frequency of maximum energy: 59.2 ± 0.73 (58.2 - 60.8) kHz, Maximum frequency: 104.3 ± 8.86 (86.0 - 123.0) kHz, Minimum frequency: 54.5 ± 1.22 (53.0 - 57.0) kHz, Call duration: 3.2 ± 0.53 (2.7 - 4.6) ms, Inter pulse interval: 83.8 ± 15.60 (57.6 - 128.1) ms.
And 22 calls of 6 specimens from Grande Comore gave the following echolocation call values: Frequency of maximum energy: 59.4 ± 0.78 (58.2 - 60.9) kHz, Maximum frequency: 110.0 ± 11.10 (74.0 - 124.0) kHz, Minimum frequency: 55.0 ± 0.76 (53.0 - 56.0) kHz, Call duration: 3.1 ± 0.34 (2.6 - 3.6) ms, Inter pulse interval: 83.5 ± 13.18 (66.1 - 123.9) ms.

MOLECULAR BIOLOGY:
DNA - Unknown
Karyotype - Richards *et al.* (2010) reported one female with a $2n$=46 and a FNa=50. The karyotype consists of two large metacentric, one medium metacentric and 19 acrocentric chromosomal pairs. As FISH with the complete set of *Myotis* probes was applied, the X chromosome could be identified as a submetacentric element. Volleth and Eick (2012: 167) also mention a segment number of 23.

HABITAT:
Dammhahn and Goodman (2013: 108) mention the lower portion of forest structure and partially open areas as the foraging habitat for this species.

ROOST:
Wilkinson *et al.* (2012: 160) indicated that caves are the typical roosting site for this species on the Comoros.

POPULATION:
Structure and Density - The abundance and population size of this species are not known (Juste, 2008a; IUCN, 2009).
Trend - 2008 - Unknown (Juste, 2008a; IUCN, 2009).

PARASITES:
Lagadec *et al.* (2012: 1696), Lei and Olival (2014: Suppl.) and Gomard *et al.* (2016: 5) found this species to be infected by *Leptospira* bacteria on the Comoro Islands. These were further identified as *L. borgpetersenii* by Dietrich *et al.* (2018a: 3).

The haemosporidian *Polychromophilus melanipherus* Dionisi, 1899 was reported from this species by Ramasindrazana *et al.* (2018: Suppl.), as wel as an unidentified *Haemosporida* sp.

Tortosa *et al.* (2013: 4) reported these bats to be parasitized by *Nycteribia stylidiopsis* on both the Comoro Islands and on Madagascar. On the latter island, two additional Nycteribiid bat flies were found: *Penicillidia leptothrinax* and *Penicillidia* sp. *N. stylidiopsis* and *P. leptothrinax* were also reported by Wilkinson *et al.* (2016) and Ramasindrazana *et al.* (2017: Suppl.). Wilkinson *et al.* (2016) furthermore reported the presence of "*Penicillidia* sp. (cf. *fulvida*)". The *N. stylidiopsis* flies were found to carry Enterobacteriales, and the *P.* cf. *fulvida* the blood parasite *Polychromophilus murinus* as well as Enterobacteriales and *Bartonella* bacteria, whereas *P. leptothrinax* was carrying Enterobacteriales and *Bartonella* and *Wolbachia* bacteria (Szentiványi *et al.*, 2019: Suppl.).

Ramasindrazana *et al.* (2016: 6) recovered *Litomosa* Clades 1, 2 and 3 (Nematoda: Onchocercidae) from this bat species, as well as an unnamed filariod.

VIRUSES:

Astroviridae

26 bats were tested by Lebarbenchon *et al.* (2017: Suppl.) of which 15 were positive for Astroviridae.

Paramyxoviridae

Wilkinson *et al.* (2012: 160) tested 20 individuals from the Comoros using RT-PCR specific for Respirovirus/Morbillivirus/Henipahvirus (RMH) and Paramyxovirinae (PMV) and found 3 positive results for viral nucleic acids. Wilkinson *et al.* (2014) tested 17 individuals from Amabhibe in Madagascar with an RT-PCR specific for the *Respiro-*, *Morbilli-* and *Henipavirus* genera, four of the 17 individuals tested positive for paramyxovirus RNA.

18 out of 116 Madagascan specimens tested by Mélade *et al.* (2016b: 4) were positive for paramyxoviruses.

Rhabdoviridae

Mélade *et al.* (2016a: 6) tested 33 specimens for *Lagos bat lyssavirus* and two of them showed seroreactivity. This was also the case for 10 out of 29 specimens they tested for *Duvenhage lyssavirus*.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Comoros, Madagascar.

Miniopterus inflatus Thomas, 1903

*1903. *Miniopterus inflatus* Thomas, Ann. Mag. nat. Hist., ser. 7, 12 (72): 634. Publication date: 1 December 1903. Type locality: Cameroon: Efulen [02 46 N 10 42 E] [Goto Description]. Holotype: BMNH 1903.2.4.8: ad ♂, skin only. Collected by: George Latimer Bates Esq. Collection date: 24 July 1901. - Etymology: From the masculine Latin adjective *inflatus*, meaning "inflated, swollen", referring to its inflated skull (see Lanza *et al.*, 2015: 329). (Current Combination)

? *Miniopterus infatus:* (Lapsus)

TAXONOMY:

Koopman (1975: 230) included *africanus*, but see Peterson *et al.* (1995: 120), Simmons (2005: 520) and Juste [B.] *et al.* (2007: 28).

Simmons (2005: 520) recognises *rufus* Sanborn, 1936 as a valid subspecies.

COMMON NAMES:

Afrikaans: Groot grotvlermuis. Chinese: 大长翼蝠. Czech: létavec větší. English: Greater Long-fingered Bat, High-crowned bat. French: Grand minioptère africain, Grand minioptère, Minioptère à couronne. German: Aufgeblasene Langflügelfledermaus. Italian: Miniòttero maggióre di Thòmas, Miniòptero maggióre di Thòmas. Portuguese: Morcego grande de dedos

compridos. Spanish (Castillian): Murciélago de Ala Larga.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Schlitter, 2008h; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) [includes *africanus* Sanborn, 1936] (Schlitter, 2008h; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Schlitter, 2004j; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

Regional-
South Africa: 2016 - NT D1 ver 3.1 (2001) (Richards *et al.*, 2016c).

MAJOR THREATS:
There do not appear to be any major threats to this species. Some roosting caves are disturbed by tourism activities (Schlitter, 2008h; IUCN, 2009).

CONSERVATION ACTIONS:
Schlitter (2008h) [in IUCN (2009)] report that this species has been recorded from a number of protected areas. There is a need to limit disturbance of important roosting caves. Further studies are needed into the distribution of this species in West Africa.

GENERAL DISTRIBUTION:
Patchily recorded over much of sub-Saharan Africa. It has been reported from Liberia and Guinea in West Africa; from Cameroon, Equatorial Guinea, Gabon, Central African Republic and the Democratic Republic of the Congo in Central Africa; from Ethiopia, Uganda, Kenya and Tanzania in East Africa; and from Namibia, Zimbabwe and Mozambique in southern Africa.

The distribution of this species is somewhat unclear in West Africa due to confusion with records of *Miniopterus schreibersii* (Simmons, 2005:520).

Native: Burundi (Simmons, 2005: 520); Cameroon (Simmons, 2005: 520); Central African Republic; Congo (Bates *et al.*, 2013: 329 - 1st authenticated records); Congo (The Democratic Republic of the) (Schouteden, 1944; Hayman *et al.*, 1966; Simmons, 2005: 520; Monadjem *et al.*, 2010d: 539); Equatorial Guinea; Ethiopia; Gabon (Simmons, 2005: 520); Guinea; Kenya (Simmons, 2005: 520); Liberia (Simmons, 2005: 520); Malawi (Monadjem *et al.*, 2010d: 539); Mozambique (Smithers and Lobão Tello, 1976; Simmons, 2005: 520; Monadjem *et al.*, 2010d: 539; Monadjem *et al.*, 2010c: 385); Namibia (Monadjem *et al.*, 2010d: 539); South Africa (Monadjem *et al.*, 2010d: 539); Tanzania; Uganda (Kityo and Kerbis, 1996: 62; Simmons, 2005: 520); Zambia (Ansell, 1974; Monadjem *et al.*, 2010d: 539); Zimbabwe (Monadjem *et al.*, 2010d: 539).
Presence uncertain: Nigeria (Simmons, 2005: 520).

DENTAL FORMULA:
van der Merwe (1985b: 251) examined three skulls and found vestigial teeth between the upper canine and the first premolar in all of them.

MOLECULAR BIOLOGY:
DNA - See Hoofer and Van Den Bussche (2003).
Karyotype - Ruedas *et al.* (1990) described the karyotype as having a diploid number of 2*n* = 46, aFN = 50, BA = 6, X = M, Y = A.
Protein / allozyme - Unknown.

HABITAT:
In the Mount Nimba area, Monadjem *et al.* (2016y: 371) recorded this species from a variety of forested and disturbed habitats between 500 and 1,000 m.

ROOST:
Monadjem *et al.* (2016y: 371) found a roost of this species in an old mine adit.

POPULATION:
Structure and Density - This is generally considered to be a locally rare species, although it can be common in some areas (Schlitter, 2008h; IUCN, 2009).
Trend - 2008 - Unknown (Schlitter, 2008h; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
Brosset and Saint Girons (1980: 227) indicate that in Gabon all females were pregnant between August and September, and births were taking place in October. Between January and July, none of the females were either having any fetuses or young or were lactating. The males were non-reproductive between 9 October and 10 February.

PARASITES:
Fain (1959a: 342) described *Nycteridocoptes miniopteri* (Acari: Sarcoptidae) from a *M. inflatus* specimen collected in Mulungu, Kivu, DRC.

Uchikawa (1985a: 22) reported *Calcarmyobia kenyaensis* Uchikawa, 1982 (Acari: Myobiidae) from *Miniopterus inflatus* specimens from Cameroon, Liberia, The Democratic Republic of Congo, Uganda and Kenya. Some Kenyan bats

were identified as belonging to *Miniopterus inflatus africanus*, which might indicate that the host should actually be *M. africanus*.
Uchikawa (1985b: 52) further collected two paratypes of *Calcarmyobia producta* from a *M. inflatus* specimen from N Chyulu Hills, Kenya.
Uchikawa (1985c: 110) furthermore reported on several specimens from Kenya and The Democratic Republic of Congo, infected with four female *Pteracarus miniopteri* Uchikawa mites.

Justine (1989b: 555) described a new stomach parasite: *Capillaria magnova* from a *M. inflatus* from Belinga (Gabon).

Duval *et al.* (2012: 1559) indicate that the haemosporidan *Polychromophilus (Polychromophilus) corradetti* Landau et al., 1980 was described from *M. inflatus* specimens from Gabon (see Landau *et al.*, 1980b: 22). They also report (p. 1561) on five haplotypes belonging to the *Polychromophilus melanipherus* group and isolated during their study in Gabon.

ACARI
Laelapidae: *Neospinolaelaps Illiniopteri* Zumpt and Patterson, 1952 was reported by Taufflieb (1962: 112).
Sarcoptidae: Fain (1959d: 157) described *Notoedres (Metanotoedres) miniopteri* from *M. inflatus* from Thysville (=Mbanza-Ngungu), DRC.
Spinturnicidae: Taufflieb (1962: 112) reported *Spinturnix selllilunaris* de Meillon and Lavolplerre, 1944.

DIPTERA:
Streblidae: *Brachytarsina allaudi* (Falcoz, 1923) in Gabon (Obame-Nkoghe *et al.*, 2016: 5). *Raymondia huberi* Frauenfeld 1856 in Guinea-Bissau (Haeselbarth *et al.*, 1966: 102). *Raymondia seminuda* Jobling, 1954 (Shapiro *et al.*, 2016: 255). *Raymondia tauffliebi* Theodor, 1968 in Congo (Shapiro *et al.*, 2016: 256).

Nycteribiidae: *Nycteribia exacuta* Theodor, 1957 from Dalaba, Guinea (Haeselbarth *et al.*, 1966: 108). *Nycteribia schmidlii* Schiner, 1853 (Haeselbarth *et al.*, 1966: 108; Tortosa *et al.*, 2013: 5; Duron *et al.*, 2014: 2108; Obame-Nkoghe *et al.*, 2016: 5; Ramasindrazana *et al.*, 2017: Suppl.), which was in Gabon carrying the blood parasite *Polychromophilus melanipherus* (Szentiványi *et al.*, 2019: Suppl.). *Penicillidia fulvida* (Bigot, 1885) (Haeselbarth *et al.*, 1966: 114; Duron *et al.*, 2014: 2109; Obame-Nkoghe *et al.*, 2016: 5), which in Gabon was also carrying the same blood parasite as above (Szentiványi *et al.*, 2019: Suppl.). *Eucampsipoda africana* Theodor, 1955 (Obame-Nkoghe *et al.*, 2016: 5).

VIRUSES:
Coronaviridae - Coronaviruses
SARS-CoV - Müller *et al.* (2007b) tested between 1986 and 1999, for antibody to SARS-CoV in sera in 34 individuals from Oriental Province, DRC, one tested positive (1/34, 2.9 %). Tong *et al.* (2009) tested 7/12 bats collected in Kenya during 2006 positive for the presence of coronavirus RNA in a fecal sample.
Anthony *et al.* (2017b: Suppl.) mention the alpha-coronaviruses: Kenya_Cov_KY33 and Predict_CoV_28. One out of two Kenyan specimens tested by Tao *et al.* (2017: Suppl.) was positive for CoV.

Filoviridae - Filoviruses
Marburgvirus
This virus is reported by Becquart *et al.* (2010: 1), Kuzmin *et al.* (2010b: 353), Luis *et al.* (2013: Suppl), Changula *et al.* (2014: 486), Simons *et al.* (2014: 2090), and Willoughby *et al.* (2017: Suppl.).

Ebolavirus
On 24 January 2019, a series of newspaper articles was published, where several scientists from EcoHealth Alliance were quoted (Simon J. Anthony, Jonathan Epstein) stating that in a mouth swab one Liberian *Miniopterus inflatus* (out of 150 tested) RNA material of the Zaire Ebolavirus was found. Epstein, however, pointed out that if the bat was a natural host for the virus, it would have been found in more than one bat. He also pointed out that the bat could have become infected by another bat species living in the same habitat. Fabian Leendertz (veterinary epidemiologist at the Robert Koch Institute - not involved in the study) indicated that the virus itself wasn't isolated but only about one-fifth of its genome (Grady, 2019; Kupferschmidt, 2019; Su, 2019; Brainard, 2019).

Nairoviridae
Orthonairovirus
9 out of 51 *M. inflatus* specimens from Gabon tested by Müller *et al.* (2016: 3) were positive for Crimean Congo hemorrhagic fever virus (CCHFV).

Paramyxoviridae
Drexler *et al.* (2012a: Suppl. Table S1) indicated that two of the 125 specimens they examined from Gabon tested positive for *Rubulavirus*.

In their overview table, Maganga *et al.* (2014a: 8) reported the following viruses were already found on *M. inflatus*: Marburg virus (MBGV), Coronavirus, Rubulavirus.

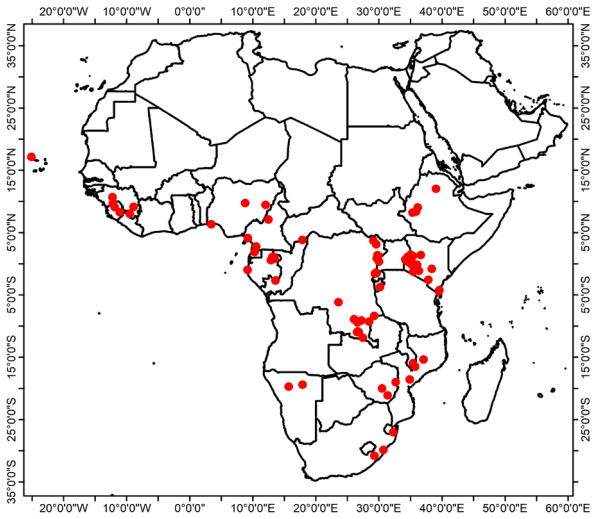

Figure 217. Distribution of *Miniopterus inflatus*

DISTRIBUTION BASED ON VOUCHER SPECIMENS: Cameroon, Cape Verde, Central African Republic, Congo (Democratic Republic of the), Ethiopia, Gabon, Guinea, Kenya, Liberia, Madagascar, Malawi, Mozambique, Namibia, Nigeria, Rwanda, Sierra Leone, South Africa, Uganda, Zambia, Zimbabwe.

Miniopterus inflatus inflatus Thomas, 1903

*1903. *Miniopterus inflatus* Thomas, Ann. Mag. nat. Hist., ser. 7, 12 (72): 634. Publication date: 1 December 1903. Type locality: Cameroon: Efulen [02 46 N 10 42 E] [Goto Description]. - Etymology: From the masculine Latin adjective *inflatus*, meaning "inflated, swollen", referring to its inflated skull (see Lanza *et al.*, 2015: 329). (Current Combination)

? *Miniopterus inflatus inflatus:* (Name Combination, Current Combination)

Miniopterus inflatus rufus Sanborn, 1936

*1936. *Miniopterus rufus* Sanborn, Field Mus. Nat. Hist., Zool. Ser., (362) 20 (14): 112. Publication date: 15 August 1936. Type locality: Congo (Democratic Republic of the): Tanganyika-Moero: Lualaba River, 40 mi (64 km) below Bukama: Katobwe [08 51 S 26 05 E] [Goto Description]. Holotype: FMNH 29416: ad ♂, skin and skull. Collected by: John Todd Zimmer; collection date: 28 November 1926; original number: 566.

? *Miniopterus inflatus rufus:* (Name Combination, Current Combination)

PARASITES: Lutz *et al.* (2016: 9) examined 31 "*M. rufus*" specimens from East Africa and found 22 of them infected with the haemosporidan parasite *Polychromophilus melanipherus* Dionisi, 1899.

Miniopterus maghrebensis Puechmaille, Allegrini, Benda, Bilgin, Ibañez and Juste, 2014

*2014. *Miniopterus maghrebensis* Puechmaille, Allegrini, Benda, Bilgin, Ibañez and Juste, in: Puechmaille, Allegrini, Benda, Gürün, Šrámek, Ibáñez, Juste and Bilgin, Zootaxa, 3794 (1): 108, 112, figs 2, 3a-b, 4a-b, 5a-b. Publication date: 5 May 2014. Type locality: Morocco: Er Rachidiyah Province: 5.7 km S of Ksar Tazougart, 19 km W-NW of Boudenib: Kef Azigza Cave (or Tazzouguert Cave) [32 01 46.6 N 03 47 16.7 W, 1060 m] [Goto Description]. Paratype: NMP 94513: skull and alcoholic. Collected by: Petr Benda, Jaroslav Cervený, Adam Konecný and Peter Vallo; collection date: 26 April 2008. Presented/Donated by: ?: Collector Unknown. Kef Azigza Cave. Paratype: NMP 94514: skull and alcoholic. Collected by: Petr Benda, Jaroslav Cervený, Adam Konecný and Peter Vallo; collection date: 26 April 2008. Presented/Donated by: ?: Collector Unknown. Kef Azigza Cave. Paratype: NMP 94515: skull and alcoholic. Collected by: Petr Benda, Jaroslav Cervený, Adam Konecný and Peter Vallo; collection date: 26 April 2008. Presented/Donated by: ?: Collector Unknown. Kef Azigza Cave. - Etymology: The name maghrebensis refers to the region (the Maghreb; the region of northern Africa located between the Atlantic Ocean, the Mediterranean Sea, and the Sahara) where the new species was discovered (see Puechmaille *et al.*, 2014a: 118). (Current Combination)

TAXONOMY:
Bilgin *et al.* (2016: 330) calculated that the split between *M. maghrebensis* and *M. schreibersii* took place some 72,041 years ago (95 % HDP Interval = 5,637 - 139,570 years).

COMMON NAMES:
Czech: létavec maghrebský. Dutch: Maghrebijns langvleugelvleermuis. English: Maghrebian bent-wing bat. French: Minioptere du Maghreb. German: Maghreb-Langflügelfledermaus. Spanish (Castillian): Murrcielago de cueva magrebí.

GENERAL DISTRIBUTION:
Northern Morocco to south of the High Atlas Mountains and northern Tunisia.

SEXUAL DIMORPHISM:
Šrámek and Benda (2014: 222) found that most of the cranio-dental measurements in males were larger than in females, except for the dimensions associated with skull and rostral width. In dental characters, on the other hand, females were larger in 38 of 57 variables and the sexes highly diverged ($P < 0.001$) in the length of the lower canine; slightly diverged in widths of the second lower incisor, second upper molar (in central part) and third lower molar.

ECHOLOCATION:
Puechmaille *et al.* (2014a: 113) provide the following data [(avg ± sd (min - max)]: Peak frequency: 52.89 ± 0.74 (51.00 - 54.78) kHz; Start frequency: 74.69 ± 7.66 (63.57 - 101.07) kHz; End frequency: 50.36 ± 0.81 (48.92 - 51.85) kHz; Duration: 4.48 ± 0.67 (3.20 - 5.60) msec; Interval between pulses: 107.14 ± 27.35 (67.20 - 239.20) msec.

MOLECULAR BIOLOGY:
The GenBank sequence (partial Cytochrome *b*, tRNA-Threonine, tRNA-Proline, HV1) of the holotype corresponds to the accession numbers KJ535784 & KJ535824 (see Puechmaille *et al.*, 2014a: 117).

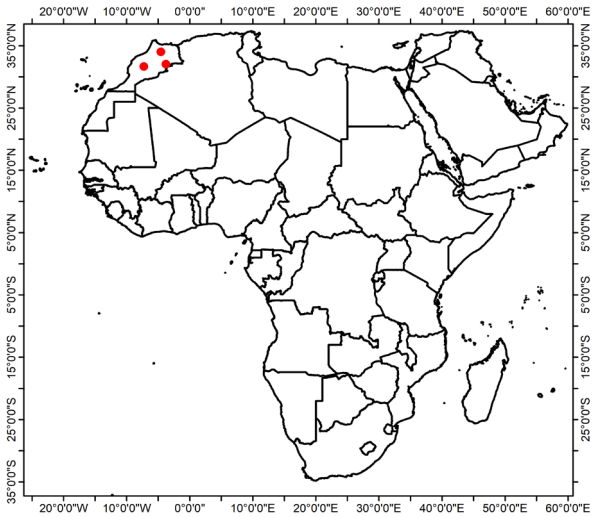

Figure 218. Distribution of *Miniopterus maghrebensis*

Grotte de Bisihiko, 0.75 km E St. Augustin, 23°32.933' S, 43°46.044' E, 10 m. Paratype: FMNH 75774:; collection date: 18 June 1953. Betroka, 23°15'50" S, 46°05'30" E, 800 m. - Etymology: The name *mahafaliensis* is derived from the Malagasy word mahafaly, meaning ‘‘to make taboos,’’ but here specifically referring to one of the local cultural groups in southwestern Madagascar, the Mahafaly, and the Mahafaly Plateau, a limestone karst area, from whence many of the specimens of this taxon were collected. In the region of the Forêt des Mikea (see Goodman *et al.*, 2009c: 28). (Current Combination)

COMMON NAMES:
German: Mahafaly-Langflügelfledermaus.
Malagasy: kitrotroke.

GENERAL DISTRIBUTION:
Madagascar (known from numerous sites on or in close proximity to the limestone Mahafaly Plateau in the southwestern portion of the island, including the zone from Itampolo north across the Onilahy River to Sarodrano spanning the elevational range from sea level to 120 m. Its distribution then continues further north to the Forêt des Mikea (70 - 80 m) and based on current data ends in the Kirindy-Mite region (30 - 35 m). Further, it is known from the more inland and upland sites of Ihosy and near Betroka from 800 - 950 m and within the Isalo formation at 550 m.).

Schoeman *et al.* (2014: 28, 31) found the most suitable area for this species to be located in the southwestern quarter of the island (south-west sub-arid or spiny bush).

DETAILED MORPHOLOGY:
Baculum:
Rakotondramanana and Goodman (2017: 63) could not find a baculum in the one specimen they examined.

ECHOLOCATION:
Ramasindrazana *et al.* (2011: 294) recorded 24 calls from 9 *Miniopterus mahafaliensis* specimens, and found the following echolocation call values: Frequency of maximum energy: 59.6 ± 1.46 (57.3 - 62.2) kHz, Maximum frequency: 113.7 ± 8.08 (95.0 - 123.0) kHz, Minimum frequency: 55.1 ± 1.47 (53.0 - 57.0) kHz, Call duration: 3.3 ± 0.25

(2.9 - 3.8) ms, Inter pulse interval: 68.7 ± 14.04 (43.5 - 95.3) ms.

ROOST:
Wilkinson *et al.* (2012: 160) reported caves to be the typical roosting site for these bats on Madagascar.

DIET:
Ramasindrazana *et al.* (2012: 120-121) examined feacal pellets from bats in the Tsimanampetsotsa NP, and found them to contain 47.5 ± 5.5 volume percent Lepidoptera, 39.9 ± 5.5 Coleoptera, 6.9 ± 2.9 Hymenoptera, 3.4 ± 0.6 Psocoptera, 1.1 ± 0.4 Diptera, 1.0 ± 0.2 Aranea, and 0.1 ± 0.0 Homoptera/Hemiptera. During the dry season, 52.9 ± 6.1 volume percent Coleoptera were found and 35.2 ± 5.7 Lepidoptera. The latter order was represented by 82.3 ± 7.7 percent in the wet season, whereas the Coleoptera dropped to 3.2 ± 0.8 percent.

PARASITES:
Lagadec *et al.* (2012: 4696), Dietrich *et al.* (2014: Suppl.), Lei and Olival (2014: Suppl.) and Gomard *et al.* (2016: 5) report the presence of spirochaetes bacteria of the genus *Leptospira*, which were identified as *L. borgpetersenii* by Dietrich *et al.* (2018a: 3).

The haemosporidian *Polychromophilus melanipherus* Dionisi, 1899 was reported from this species by Ramasindrazana *et al.* (2018: Suppl.), as wel as an unidentified *Haemosporida* sp. Rasoanoro *et al.* (2019: 67) refer to Raharimanga *et al.* (2003) who reported *Trypanomsoma* sp. from a "*Miniopterus manavi*".

Ramasindrazana *et al.* (2016: 6) recovered *Litomosa* Clade 2 (Nematoda: Onchocercidae) from *M. mahafaliensis*.

On Madagascar, Tortosa *et al.* (2013: 4) found Nycteribiid bat flies belonging to *Penicillidia leptothrinax*.

VIRUSES:
Paramyxoviridae
Wilkinson *et al.* (2012: 160) tested 11 individuals from the Mauritius using RT-PCR specific for Respirovirus/Morbillivirus/Henipahvirus (RMH) and Paramyxovirinae (PMV) and found 0 positive results for viral nucleic acids.

In their extensive study, Mélade *et al.* (2016b: 3) found that *M. mahafaliensis* was the least infected species of Madagascan bat, with only 4 out of 89 specimens (4.5 %) infected.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Madagascar.

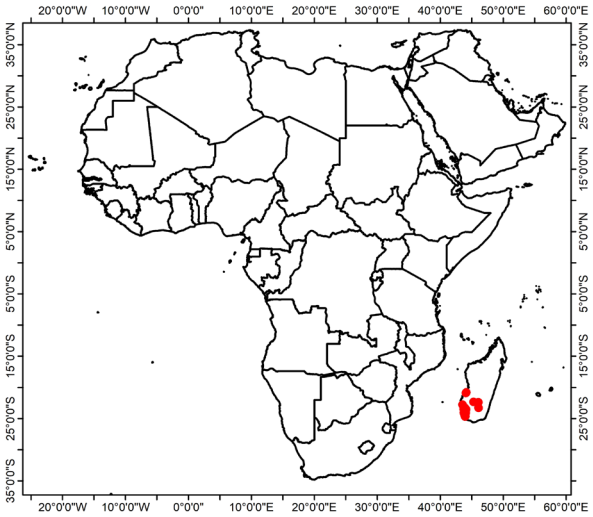

Figure 219. Distribution of *Miniopterus mahafaliensis*

Miniopterus majori Thomas, 1906

*1906. *Miniopterus Majori* Thomas, Ann. Mag. nat. Hist., ser. 7, 17 (98): 175. Publication date: 1 February 1906. Type locality: Madagascar: SE Betsileo: Imasindrary [=Sahamananina] [20 17 S 47 31 E, 1 600 m] [Goto Description]. Holotype: BMNH 1897.9.1.38: ad ♀, skin and skull. Collected by: Dr. Charles Immanuel Forsyth Major; collection date: 3 July 1895; original number: 457. - Etymology: In honour of Dr. C.I. Forsyth Major, collector of the type specimen (see Thomas, 1906a: 176). (Current Combination)
? *Miniopterus majori majori:* (Name Combination)
? *Miniopterus majori:* (Current Spelling)

TAXONOMY:
Included in *schreibersi* by Koopman (1993a: 231), but considered a valid species by Peterson *et al.* (1995: 131), Hutson *et al.* (2001: 32), Russ *et al.* (2001), Simmons (2005: 520).

COMMON NAMES:
Czech: létavec východomadagaskarský. English: Major Long-fingered Bat, Major's Long-fingered Bat. French: Grand minioptère malgache. German: Majors Langflügelfledermaus.

CONSERVATION STATUS:
Global - This species is listed as Least Concern (LC ver 3.1 (2001)) in view of its relatively wide range, ability to live in a wide variety of habitats from intact forests to heavily degraded areas, and because there is no evidence of a decline that would warrant listing in a higher category of threat (Jenkins and Rakotoarivelo, 2008a; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Jenkins and Rakotoarivelo, 2008a; IUCN, 2009). 2003 - DD (IUCN, 2003). 2001 - DD (IUCN/SSC Action Plan, 2001).

MAJOR THREATS:
The major threats to this species are not known. It could be susceptible to cave disturbance in some sites and it could perhaps be hunted in some areas (Jenkins and Rakotoarivelo, 2008a; IUCN, 2009).

CONSERVATION ACTIONS:
Jenkins and Rakotoarivelo (2008a) [in IUCN (2009)] report that this species is reported from a few protected areas, such as Parc National de Masoala and Parc National de Mantadia (Russ and Bennet, 1999; Randrianandriananina *et al.*, 2006). Some of these records may need to be reassessed in view of the ongoing taxonomy of this genus in Madagascar (Goodman and Maminirina, 2007).

GENERAL DISTRIBUTION:
Miniopterus majori is endemic to Madagascar and has a sympatric distribution with *Miniopterus sororculus* in the highlands of Madagascar (Goodman *et al.*, 2007b) and is widely, but patchily, distributed across the island (Peterson *et al.*, 1995; Eger and Mitchell, 2003).

Schoeman *et al.* (2014: 28, 31) found the most suitable area for this species to be located in the eastern part of the island (higher elevations of the Central Highlands - sub-humid region).

Goodman and Maminirina (2007) suggest that the only specimens known form the Comoro Islands were collected by M. Humbolt and may have been incorrectly provenanced. Until new material is available from the island to confirm that *M. majori* exists, it is removed from the known distribution of the species, and is restricted at this time to Madagascar.

Native: Madagascar (Peterson *et al.*, 1995; Eger and Mitchell, 2003; Simmons, 2005: 520; Goodman and Maminirina, 2007).
Presence incorrectly assigned: Comoro Islands (Simmons, 2005: 520).

ECHOLOCATION:
Kofoky *et al.* (2009: 382) reported the calls as *Miniopterus majori/sororculus*, which produced broadband FM/QCF echolocation calls at low duty cycle, but with a lower maximum energy, at about 48.5 kHz. The fundamental being most intense with short duration pulses of about 4.5 ms.
Ramasindrazana *et al.* (2011: 294) recorded 39 calls from 12 *Miniopterus majori* specimens, and found the following echolocation call values: Frequency of maximum energy: 48.5 ± 1.15 (46.1 - 52.0) kHz, Maximum frequency: 82.5 ± 11.78 (64.0 - 102.0) kHz, Minimum frequency: 44.4 ± 0.97 (43.0 - 46.0) kHz, Call duration: 3.6 ± 0.42 (2.8 - 4.5) ms, Inter pulse interval: 85.0 ± 16.34 (59.5 - 134.8) ms.

DIET:
Kemp *et al.* (2018: Suppl.) used DNA metacarcoding to detect insect pest species in the diet of these bats and found the following prey orders (in descending order): Lepidoptera (*Ericeia inangulata* (Guenée, 1852), *Pandemis* sp., *Celsumaria elongata* Brown, 2017, *Meyrickiella homosema* (Meyrick, 1887), *Emmalocera* sp., *Palpita* sp., *Pandemis retroflua* Diakonoff, 1960, *Achaea euryplaga* (Hampson, 1913), *Eublemma viettei* (Berio, 1954), *Herpetogramma licarsisalis* (Walker, 1859), *Chloroclystis androgyna* Herbulot, 1957, *Idiodes oberthuri* Dognin 1911, *Scopula* AH01Md, *Ectropis* AH27Md), Hemiptera, Blattodea, Trombidiformes, Diptera (*Simulium lineatum* (Meigen, 1804)), Coleoptera, Hymenoptera, Ephemeroptera, Trichoptera, Sarcoptiformes, Astigmata

POPULATION:
Structure and Density - There is no information on its population status (Jenkins and Rakotoarivelo, 2008a; IUCN, 2009).
Trend - 2008 - Unknown (Jenkins and Rakotoarivelo, 2008a; IUCN, 2009).

PARASITES:
Dietrich *et al.* (2014: Suppl.) and Gomard *et al.* (2016: 5) report the presence of spirochaetes of the genus *Leptospira* in bats from Fianarantsoa, Madagascar. These were identified as *L. borgpetersenii* by Dietrich *et al.* (2018a: 3).

Uchikawa (1985b: 45) reports *Calcarmyobia comoresensis* mites of bat specimens from Vobima and Bersroha, Madagascar. Uchikawa (1985c: 111) mentions the presence of *Pteracarus miniopteri* Uchikawa, 1978 mites on *M. schreibersi majori* specimens from Madagascar. Tortosa *et al.* (2013: 4), furthermore, reported the presence of Nycteribiid bat flies: *Nycteribia stylidiopsis* and *Penicillidia leptothrinax*. The *Nycteribia* is also reported by Ramasindrazana *et al.* (2017: Suppl.).

Ramasindrazana *et al.* (2016: 6) recovered *Litomosa* Clade 1 (Nematoda: Onchocercidae) from this bat species.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Madagascar.

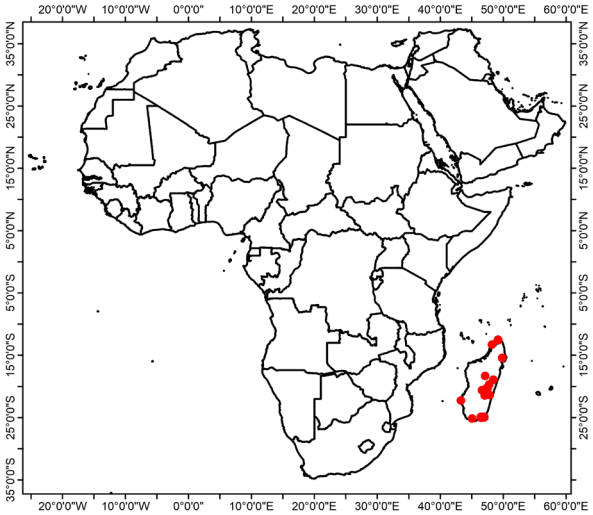

Figure 220. Distribution of *Miniopterus majori*

Miniopterus manavi Thomas, 1906

*1906. *Miniopterus manavi* Thomas, Ann. Mag. nat. Hist., ser. 7, 17 (98): 176. Publication date: 1 February 1906. Type locality: Madagascar: Eastern/Northeastern Betsileo: Fandriana region [20 17 S 47 31 E] [Goto Description]. Holotype: BMNH 1897.9.1.37: ad ♂, skin and skull. Collected by: Dr. Charles Immanuel Forsyth Major; collection date: 3 July 1895; original number: 453. See Peterson *et al.* (1995: 135). Topotype: MCZ 45101: ♀, complete skeleton. Collected by: The Grandidier Collection; collection date: 3 July 1895. Presented/Donated by: ?: Collector Unknown. - Comments: [Imansindrary = ? Masindrary, 15 km ESE Fandriana, see Jenkins and Carleton, 2005 (in Goodman *et al.*, 2009a: 340)]. (Current Combination)

1993. *Miniopterus minor grivaudi:* Koopman, in: Wilson and Reeder, Mammal species of the World (2nd Edition): Chiroptera, 231. (Lapsus)

2007. *Miniopterus (griveaudi) manavi:* Goodman and Maminirina, Mammalia, 71 (4): 151. (Name Combination)

2009. *Miniopterus manavi (Clade 1):* Goodman, Maminirina, Weyeneth, Bradman, Christidis, Ruedi and Appleton, Zool. Scr., 38: 346-351, 362.

? *Miniopterus manavi manavi:* (Name Combination)

TAXONOMY:
Included in *minor* by Koopman (1993a: 231), but considered a valid species by Peterson *et al.* (1995: 135), Hutson *et al.* (2001: 32), Russ *et al.* (2001), and Simmons (2005: 520).

Simmons (2005: 520) recognised *griveaudi* Harrison, 1959 as a vaild subspecies of *M. manavi*, Juste [B.] *et al.* (2007: 33) elevated *griveaudi* as a separate species, which is followed in this account.

Weyeneth *et al.* (2008) used mitochondrial DNA markers to demonstrate that the specimens from the Comoro islands are not closely related to *M. minor* from the African mainland, and that these islands were probably populated as a result of two or three invasions originating from Madagascar.

COMMON NAMES:
Czech: létavec manavijský. English: Manavi Long-fingered Bat, Manavil Long-fingered Bat. French: Petit minioptère malgache. German: Manavi-Langflügelfledermaus.

CONSERVATION STATUS:
Global - This species is listed as Least Concern (LC ver 3.1 (2001)) in view of its widespread distribution (near suitable caves) across Madagascar. While it is locally threatened by hunting, this is not thought to be a major threat of this species across its range (Andriafidison *et al.*, 2008f; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Andriafidison *et al.*, 2008f; IUCN, 2009). 2003 - DD [as *M. menavi*] (IUCN, 2003). 2001 - DD [as *M. menavi*] (IUCN/SSC Action Plan, 2001). 2000 - DD.

MAJOR THREATS:
There are no major threats to the species. In Makira, this species is eaten by people (Golden,

2005), but it is not known if this species is hunted in other parts of its range. It is probably not forest dependent, but is rarely netted in areas without vegetation stands (Andriafidison *et al.*, 2008f; IUCN, 2009).

CONSERVATION ACTIONS:
Andriafidison *et al.* (2008f) [in IUCN (2009)] report that this species occurs in many of the forest protected areas in western and eastern Madagascar and as such does not require specific conservation measures. Additional information on its ecology would be helpful to better understand how it responds to deforestation and roost disturbance. There is some uncertainty about the taxonomy of *M. manavi* and that this taxon is actually a complex of new species (F. Ratromomanarivo *pers. Comm.*). Further studies on morphology, acoustics and genetics are therefore needed.

GENERAL DISTRIBUTION:
Miniopterus manavi is found on Madagascar including the islands of Nosy Be and Nosy Komba (Rakotonandrasana and Goodman, 2007: 6), where it is widely distributed (Eger and Mitchell, 2003; Goodman *et al.*, 2005a). It has a wide elevational range, from 20 to 1,500 m above sea-level.

Schoeman *et al.* (2014: 28, 31) found the most suitable area for this species to be located in the eastern part of the island, but not along the coast (higher elevations of the Central Highlands - sub-humid region).

Grand Comoro (Peterson *et al.*, 1995; Simmons, 2005: 520). Removed by Juste [B.] *et al.* (2007: 33), due to the removal of *griveaudi* as a separate species.

Native: Madagascar (Peterson *et al.*, 1995; Eger and Mitchell, 2003; Goodman *et al.*, 2005a; Simmons, 2005: 520; Rakotonandrasana and Goodman, 2007: 6).

ECHOLOCATION:
Russ *et al.* (2003) describe the echolocation as a freqency-modulated sweep that terminates in a constant-frequency portion with maximum energy around 57 kHz. Kofoky *et al.* (2009: 382) reported the calls as *M. manavi s.l.*, these calls were broadband FM/QCF sweeps produced at low duty cycle with most energy at about 58.1 kHz in the fundamental, with pulses having a short duration of about 4 ms. Low-duty cycle, frequency modulated/quasi constant (FM/QCF) echolocation call, with a peak frequency of 57.2 kHz (55.5 - 58.2 kHz) and a duration of 2.5 ms (2.1 - 3.0 ms) (Goodman *et al.*, 2011: 9).

Ramasindrazana *et al.* (2011: 294) recorded 9 calls from 2 specimens tentatively assigned to *Miniopterus 'manavi'*, and found the following echolocation call values: Frequency of maximum energy: 57.2 ± 0.77 (55.5 - 58.2) kHz, Maximum frequency: 98.4 ± 7.60 (89.0 - 110.0) kHz, Minimum frequency: 53.0 ± 0.0 (53.0 - 53.0) kHz, Call duration: 2.5 ± 0.32 (2.1 - 3.0) ms, Inter pulse interval: 66.0 ± 8.70 (54.1 - 84.7) ms.

DIET:
Razakarivony *et al.* (2005) found Araneae in 2 % of stomachs examined. Rakotoarivelo *et al.* (2007), in Madagascar, found *M. manavi* to mainly consume Hemiptera.

Kemp *et al.* (2018: Suppl.) used DNA metacarcoding to detect insect pest species in the diet of these bats and found the following prey orders (in descending order): Lepidoptera (*Pandemis retroflua* Diakonoff, 1960), Hymenoptera, Coleoptera, Hemiptera, Blattodea, Diptera (*Simulium lineatum* (Meigen, 1804), *Anopheles squamosus* Theobald, 1901, *Coquillettidia* sp.), Ephemeroptera, Mesostigmata, Sarcoptiformes, Trombidiformes, Astigmata, Neuroptera.

POPULATION:
Structure and Density - It is locally abundant in cavities or rocky overhangs that provide suitable roosting features. A colony of approximately 4,000 was found in Makira (Bayliss and Hayes, 1999).
Trend - 2008 - Unknown (Andriafidison *et al.*, 2008f; IUCN, 2009).

PARASITES:
Gomard *et al.* (2016: 5) reported the presence of *Leptospira* bacteria in 5 out of 7 tested bats (73.7 %).

Megali *et al.* (2010: 1042) and Duval *et al.* (2012: 1563) reported Genbank data for *Polychromophilus* sp. (*Haemosporida*) from *M. manavi*. Ramasindrazana *et al.* (2018: Suppl.) identified the parasite as *Polychromophilus melanipherus* Dionisi, 1899, and the bat as "*M. manavi* s.l.".
Raharimanga *et al.* (2003: 72) reported *Trypanosoma* sp. from *M. manavi*, but these bats were later re-identified as *M. mahafaliensis* and *M. brachytragos* (see Rasoanoro *et al.*, 2019: 67).

Uchikawa (1985b: 45) reported a mite belonging to *Calcarmyobia comoresensis* from the type specimen of *M. manavi*. From the same specimen, Uchikawa (1985c: 110) also reported mites belonging to *Pteracarus miniopteri* Uchikawa, 1978. Furtermore, he also described

two mite subspecies: *Calcarmyobia steatosetae steatosetae* and *Calcarmyobia steatosetae rectipenis* from several other bat specimens.

The presence of the Nycteribiid bat fly *Penicillidia leptothrinax* was reported by Tortosa *et al.* (2013: 4) and Ramasindrazana *et al.* (2017: Suppl.). Additionally, Ramasindrazana *et al.* (2017: Suppl.) reported both "*Penicillidia* sp. and *P. leptothrinax* from one and the same bat identified as "*Miniopterus* cf. *manavi*".

Ramasindrazana *et al.* (2016: 6) reported the presence of *Litosoma* Clade 1 (Nematoda: Onchocercidae) on this bat species.

UTILISATION:
In Makira, this species is eaten by people (Golden, 2005), also see Goodman *et al.* (2008d).

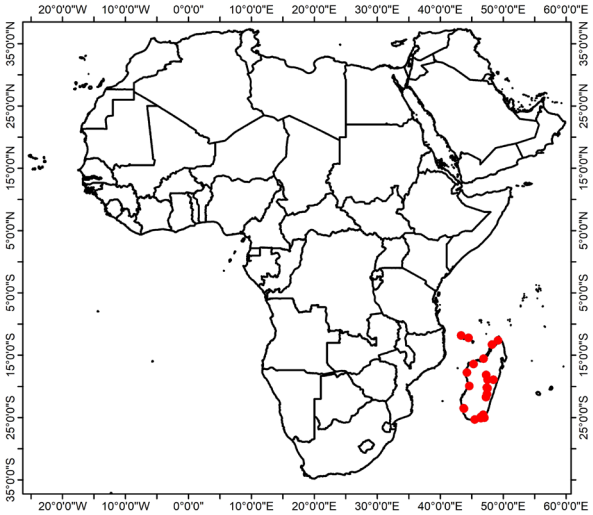

Figure 221. Distribution of *Miniopterus manavi*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Comoros, Madagascar.

Miniopterus minor Peters, 1867

*1867. *Miniopterus minor* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, 870 (for 1866). Publication date: 1867. Type locality: Tanzania: Coast opposite Zanzibar Island [Goto Description]. Holotype: ZMB 3268: ♂, skin and skull. Collected by: Baron Karl Klaus von der Decken. See Turni and Kock (2008: 52). - Comments: Peters (1867a: 885) mentions "Ein einziges ausgewachsenes Männchen von der Küste von Zanzibar". - Etymology: From the masculine Latin adjective *minor*, meaning "smaller", used as comparative of *parvus*, meaning "small", referring to the relatively small size of the species (see Lanza *et al.*, 2015: 334). (Current Combination)

1992. *Miniopterus minor occidentalis* Juste and Ibáñez, Bonn. zool. Beitr., 43 (3): 358, 362. Publication date: 21 October 1992. Type locality: Congo: Koilou, Meya-Nzouari Cave [03 53 S 14 31 E]. Holotype: MHNG 1074.013: ad ♀, skull and alcoholic. Collected by: M. Taufflieb; collection date: 1 July 1961. - Comments: (see Simmons, 2005). - Etymology: From the Latin for western. (Name Combination)

? *Miniopterus minor minor:* (Name Combination)

TAXONOMY:
Koopman (1993a: 231) included *griveaudi* Harrison, 1959 and *manavi* Thomas, 1906, but Peterson *et al.* (1995: 119, 135) and Simmons (2005: 520) recognised *manavi* as a distinct species, with *griveaudi* as a subspecies. Juste [B.] *et al.* (2007: 33) elevated *griveaudi* as a separate species.
Simmons (2005: 521) recognised *newtoni* Bocage, 1889 and *occidentalis* Juste and Ibáñez, 1992 as vaild subspecies of *M. minor*. Juste [B.] *et al.* (2007: 33) elevated *newtoni* as a separate species.
Reviewed by Juste and Ibáñez (1992).

COMMON NAMES:
Chinese: 侏长翼蝠. Czech: létavec nejmenší. English: Least Long-fingered Bat. French: Petit minioptère africain, Minioptère minuscule. German: Zwerg-Langflügelfledermaus. Italian: Miniòttero minóre, Miniòptere minóre.

CONSERVATION STATUS:
Global - Listed as Data Deficient (DD ver 3.1 (2001)) in view of continuing problems with its taxonomy as well as absence of recent information on its extent of occurrence, ecological requirements and threats (Jacobs *et al.*, 2008n; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) [includes *occidentalis* Juste and Ibáñez, 1992] (Jacobs *et al.*, 2008n; IUCN, 2009). 2004 - NT ver 3.1 (2001) (Jacobs *et al.*, 2004o; IUCN, 2004). 2003 - LR/nt (IUCN, 2003). 2001 - LR/nt (IUCN/SSC Action Plan, 2001). 1996 - LR/nt (Baillie and Groombridge, 1996).

MAJOR THREATS:
This species is presumably threatened in parts of its range by habitat loss resulting from logging operations and the conversion of land to agricultural use.

CONSERVATION ACTIONS:
Jacobs *et al.* (2008n) [in IUCN (2009)] report that there appear to be no direct conservation measures in place. It has been recorded from the Kambai Forest Reserve in Tanzania by Cunneyworth (1996b). Further studies are needed into the taxonomy, distribution, natural history and threats to this poorly known species.

GENERAL DISTRIBUTION:
Miniopterus minor recorded from very few locations over a wide area. It has been reported from a small area on the border between Congo and the Democratic Republic of the Congo, a single locality in southwestern Democratic Republic of the Congo, and from a small area of coastal Kenya and Tanzania (including the island of Unguja [see O'Brien, 2011: 289]).

São Tomé (Koopman, 1993a: 231; Simmons, 2005: 521) removed by Juste [B.] *et al.* (2007: 33) due to the removal of *newtoni* as a separate species.

Native: Angola; Congo (Juste and Ibáñez, 1992: 363; Simmons, 2005: 521; Bates *et al.*, 2013: 337); Congo (The Democratic Republic of the) (Hayman *et al.*, 1966; Juste and Ibáñez, 1992: 363; Van Cakenberghe *et al.*, 1999; Simmons, 2005: 521; Monadjem *et al.*, 2010d: 539); Kenya (Simmons, 2005: 521); Tanzania (Simmons, 2005: 521).

ROOST:
McWilliam (1982: 176) found this bat to be roosting in caves.

MIGRATION:
In Kenya, McWilliam (1982: 175) found that most long distance movements were made by females, whereas males showed a larger site specificity.

POPULATION:
Structure and Density - There are very few records of this species (Jacobs *et al.*, 2008n; IUCN, 2009). Trend - 2008 - Unknown (Jacobs *et al.*, 2008n; IUCN, 2009).

ACTIVITY AND BEHAVIOUR:
In Kenya, *M. minor* exhibits seasonal torpor between April and September, when the temperatures are lower (McWilliam, 1982: 184).

MATING:
McWilliam (1982: 176, 177) described a small "mating dome" within the Homa Lime cave in Kenya, which was almost exclusively occupied by mature males, which returned the following years. Immature males were excluded from the dome.
During the mating period (May to July), the males produced a pungent odour (resembling rotting cocoa) in their urine (McWilliam, 1982: 181).

PARASITES:
Uchikawa (1985b: 50) described the mite *Calcarmyobia minoris* from *Miniopterus minor minor* from Similani Cave, 16 km S. of Mombasa, Coast Province, Kenya. Uchikawa (1985c: 110) also reported three female mites belonging to *Pteracarus miniopteri* Uchikawa, 1978 from bats from Kenya.

Adam and Landau (1973a: 5) and Landau and Adam (1973: 6) report on the presence of a protozoan parasite of the genus *Polychromophilus* (Haemoproteidae) in *M. minor minor* from the Republic of Congo. About 50 % of the specimens they examined, were found to be infected. Gametocytes were found year-round. The bats were also infested by the nycteribiids *Penicillidia fulvida* Bigot, 1885 and *Nycteribia schmidlii scotti* Falcoz, 1923, of which the prior was a major carrier of *Polychromophilus* sporozoites. Garnham (1973: 237) reports the parasite as *Polychromophilus melanipherus*.
Polychromophilus sp. was also reported by Rosskopf *et al.* (2018: 31) from Gabonese *M. minor occidentalis*, where both of the examined specimens were infected.
Landau and Adam (1973: 6) also report on another prozotoan parasite: *Hepatocystis*, of which schizonts were found in the liver and lungs.

Duval *et al.* (2012: 1559) and Landau *et al.* (2012: 142) indicate that the haemosporidan *Polychromophilus (Polychromophilus) adami* Landau *et al.*, 1980 was described from *M. minor minor* specimens in the Republic of Congo (see Landau *et al.*, 1980b: 27). Landau *et al.* (2012: 142) also mention this bat as the type host for *Bioccala murinus* (Dionisi, 1899).

Lutz *et al.* (2016: 9) examined 13 *M. minor* specimens from East Africa and found five of them infected with *Polychromophilus melanipherus* Dionisi, 1899.

Nycteribiidae: *Nycteribia schmidlii* Schiner, 1853 (Haeselbarth *et al.*, 1966: 108).

VIRUSES:
In their country-wide survey of Kenyan bats, Waruhiu *et al.* (2017) found the following viruses in

Miniopterus minor: Astroviruses, Coronaviruses, Paramyxoviruses and Polyomaviruses.

Coronaviridae - Coronaviruses
SARS-CoV - Tong *et al.* (2009) tested 1 bat collected in Kenya during 2006 positive for the presence of coronavirus RNA in a fecal sample. 22.6 % (66 out of 292) of the Kenyan bats tested by Tao *et al.* (2017: 3) were positive for CoV.

Paramyxoviridae:
Paramyxovirus - Conrardy *et al.* (2014: 259) tested 16 bats from the Three Caves (Kenya) and found one of them to be positive. Mortlock *et al.* (2015: 1841) tested 151 Kenyan bats and found 14 to be positive.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Central African Republic, Comoros, Congo, Congo (Democratic Republic of the), Kenya, Madagascar, São Tomé and Principé, Tanzania.

Malawi, Mozambique, Zambia, Zimbabwe.

Miniopterus natalensis (A. Smith, 1833)

*1833. *Vespertilio Natalensis* A. Smith, S. Afr. Quart. J., ser. 2, 1 (2): 59. Publication date: November 1833. Type locality: South Africa: KwaZulu-Natal: Durban [29 52 S 31 00 E] [Goto Description]. Cotype: BMNH 1846.6.2.19:. Shared cotype for *Vespertilio natalensis* and *Vespertilio scotinus* - this needs further investigation as it is unlikely that Sundeval examined material described by Andrew Smith. It is possible that this co-type should only be assigned to one of these species. Cotype: BMNH 1848.6.12.19:. - Comments: Concerning the type locality, Meester *et al.* (1986: 46) remark: "Durban nominated by Roberts (1951: 73)").

1840. *Vespertilio d'asythrix* Temminck, Monographies de mammalogie ou description de quelques genres de mammifères, dont les espèces ont été observées dans les différens musées de l'Europe. Tome Seconde, 2: 268. Publication date: 1840. Type locality: South Africa: "Interior of Caffraria" [Goto Description]. Syntype: BMNH 1849.8.16.25:. Syntype: RMNH MAM.25093:. - Comments: .

1846. *Vespertilio scotinus* Sundevall, Öfvers. kongl. Sv. Vet.-Akad. Förhandl., 3 (4): 119. Publication date: 1846. Type locality: South Africa: KwaZulu-Natal: Durban [29 52 S 31 00 E]. Cotype: BMNH 1846.6.2.19:. Shared cotype for *Vespertilio natalensis* and *Vespertilio scotinus* - this needs further investigation as it is unlikely that Sundeval examined material described by Andrew Smith. It is possible that this co-type should only be assigned to one of these species. - Comments: Type locality originally mentioned as "variis Caffrariæ locis allata"; Meester *et al.* (1986: 46) state: "Durban nominated by Roberts (1951: 74)".

1909. *Miniopterus breyeri* Jameson, Ann. Mag. nat. Hist., ser. 8, 4 (23): 471. Publication date: 1 November 1909. Type locality: South Africa: N Transvaal province: Waterberg district: Gat(s)koppies [Goto Description]. Holotype: BMNH 1909.7.2.6: imm ♀. Collected by: Henry Paul William Lyster Jameson; original number: 398.

1912. *Miniopterus natalensis arenarius* Heller, Smiths. Misc. Coll., 60 (12): 2. Publication date: 4 November 1912. Type locality: Kenya: Central province: Nanyuki district: Northern Guaso Nyiro: Nyuki (=Nanyuki) river [00 01 N 37 04 E] [Goto Description]. Holotype: USNM 181811: ad ♀. Collected by: Edmund Heller; collection date: 4 October 1911; original number: 4413. - Comments: Coordinates mentioned as 00 21 N 36 55 E by Thorn *et al.* (2009: 49). (Name Combination)

1927. *Miniopterus smitianus* Thomas, Proc. zool. Soc. Lond., 373. Publication date: 12 July 1927. Type locality: Namibia: E Damaraland, 40 mi (64 km) W of Gobabis: Witvlei. Holotype: BMNH 1926.12.7.15:.

2018. *Miniopteris schriebersii:* Adams and Kwiecinski, Diversity, 10 (3) 103: 7. Publication date: 18 September 2018. (Lapsus)

? *Miniopterus schreibersii natalensis:* (Name Combination)

? *Miniopterus schreibersii:*

? *Vesperugo scotinus:*

TAXONOMY:
Considered a synonym of *schreibersi* by Koopman (1993a: 231). O'Shea and Vaughan (1980), Koopman (1994), Peterson *et al.* (1995) and Horácek *et al.* (2006: 105) suggested that *natalensis* may be distinct from *schreibersi*. Considered a valid species by Simmons (2005: 521).

Simmons (2005: 521) recognised *arenarius* Heller, 1912 as valid subspecies.

COMMON NAMES:
Chinese: 纳塔尔长翼蝠. Czech: létavec natalský. English: Natal Long-fingered Bat, Natal Clinging Bat. French: Minioptère du Natal. German: Natal-Langflügelfledermaus, Südafrikanischen Sackfledermaus, Kaffern-Sackfledermaus. SiSwati: Lilulwane.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
This species is present in the later half of the upper Pleistocene sequence and in the late Holocene at Border Cave, and probably at Nkupe during the middle and late Holocene (Avery, 1991: 6). Further Holocene material is reported by Avery and Avery (2011: 20) from Blinkklipkop, Limerock, and Zoovoorbij (Northern Cape province, South Africa), who also reported Pleistocene remains from Wonderwerk.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Jacobs *et al.*, 2008aj; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Jacobs *et al.*, 2008aj; IUCN, 2009). 2004 - NT ver 3.1 (2001) (Jacobs *et al.*, 2004ai; IUCN, 2004).

Regional -
South Africa: 2016 - LC ver 3.1 (2001) (MacEwan *et al.*, 2016b). 2004 - NT ver 3.1 (2001) [assessed as *M. schreibersii*] (Friedmann and Daly, 2004:263).
Swaziland: 2003 - NT B2ab(iv); D2 ver 3.1 (2001) [assessed as *M. schreibersii*] (Monadjem *et al.*, 2003: 184).

MAJOR THREATS:
In view of its wide range, there appear to be no major threats to this species. In parts of the species distribution it is locally threatened by habitat loss resulting from conversion of land to agricultural use, incidental poisoning with insecticides, and the disturbance of roosting and maternity caves by tourist activities (Jacobs *et al.*, 2008aj; IUCN, 2009).

CONSERVATION ACTIONS:
Jacobs *et al.* (2008aj) [in IUCN (2009)] report that there appear to be no conservation measures in place for this species. There is a need to identify and protect important roost sites (especially maternity caves). In view of the species wide range, it is presumably present in some protected areas. There is a need to better determine the range of this species when compared to that of *Miniopterus schreibersii*.

GENERAL DISTRIBUTION:
Miniopterus natalensis is a widely distributed species, recorded from southern and East Africa, with some records from Central African and from the Arabian Peninsula. In Africa it ranges south from Angola and southern Democratic Republic of the Congo, into Namibia, Botswana, South Africa, Lesotho, Mozambique, Malawi, Zimbabwe and Zambia, and from here north into Tanzania, Kenya, possibly Uganda, possibly southern Sudan and possibly Ethiopia. On the Arabian Peninsula it has been reported from Saudi Arabia and Yemen (Harrison and Bates, 1991, Benda *et al.*, 2011b: 45). Because of frequent misidentification between this species and *Miniopterus schreibersii*, there is a need to carefully review the distribution of *Miniopterus natalensis*.

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 1,227,870 km^2. In the RSA, its distribution is best predicted by geology (Babiker Salata, 2012: 50).

Native: Angola (Crawford-Cabral, 1989; Monadjem *et al.*, 2010d: 539; Taylor *et al.*, 2018b: 62); Botswana (Smithers, 1971; Monadjem *et al.*, 2010d: 539); Congo (The Democratic Republic of the) (Hayman *et al.*, 1966; Monadjem *et al.*, 2010d: 539); Ethiopia (Lavrenchenko *et al.*, 2004b: 132); Kenya; Lesotho (Lynch, 1994: 191 [as "*M. schreibersii*"]; Monadjem *et al.*, 2010d: 539); Malawi (Happold *et al.*, 1988; Ansell and Dowsett, 1988: 35; Monadjem *et al.*, 2010d: 539); Mozambique (Smithers and Lobão Tello, 1976; Monadjem *et al.*, 2010d: 539; Monadjem *et al.*, 2010c: 385); Namibia (Monadjem *et al.*, 2010d: 340); Saudi Arabia; South Africa (Simmons, 2005: 521, Seamark and Kearney, 2007: 4; Monadjem *et al.*, 2010d: 540); Swaziland (Monadjem *et al.*, 2010d: 540); Tanzania (Stanley and Goodman, 2011: 47 as *M. schreibersii*); Yemen (Benda *et al.*, 2011b: 45); Zambia (Ansell, 1974; Ansell, 1978; Monadjem *et al.*, 2010d: 540); Zimbabwe (Monadjem *et al.*, 2010d: 540).

Presence uncertain: Sudan (Simmons, 2005: 521); Uganda.

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Schoeman and Jacobs (2002: 157) reported the following wing parameters for one "*M. schreibersii*" specimen from the Algeria Forestry Station (RSA): Fa: 46.6 mm, Wing area: 137.7 cm^2, Wing span: 30.9 cm, Wing loading: 7.8 N/m^2, and aspect ratio: 6.9.

DENTAL FORMULA:
I $^2/_3$ C $^1/_1$ P $^2/_3$ M $^3/_3$ = 36 (van der Merwe, 1985a: 73).

van der Merwe (1985a: 73) also indicates that the deciduous tooth replacement starts in the lower jaw and is completed prior to that of the upper jaw. The replacement starts at an age of one and a half weeks. In general the replacement sequence is: i_3, i_1, c_1, i_2, p_4, p_3, and all teeth are replaced at week 5. In the upper jaw, the replacement starts two and a half weeks (p^4, p^3, i^2, i^3, c^1) and is generally completed in week 6

FUNCTIONAL MORPHOLOGY:
Moussy *et al.* (2012: 189), referring to Miller-Butterworth *et al.* (2003), indicate that isolation of different populations in South Africa has led to local adaptation in *Miniopterus schreibersii natalensis*, which is strongly associated with four biomes and results in differences in wing morphology and migratory behaviour. The animals from the northeastern population have a higher wing aspect ratio, which forms an advantage for long-distance flight, allowing for migrations over longer distances.

Brown (1999: 170) found that "*M. schreibersii*" is able to thermoregulate in temperatures between 5 and 40°C.

ECHOLOCATION:
See Jacobs (1999) and Taylor (1999b).

Schoeman and Waddington (2011: 291) mention a peak frequency of 51.1 ± 0.9 kHz and a duration of 6.8 ± 0.4 msec for specimens from Durban, South Africa.

For *Miniopterus natalensis* specimens from Swaziland and Namibia, Taylor *et al.* (2013b: 17) recorded the following parameters for 21 calls: F_{max}: 65.9 ± 5.76 (59.0 - 80.9) kHz, F_{min}: 53.7 ± 0.58 (52.5 - 54.9) kHz, F_{knee}: 56.5 ± 0.31 (55.7 - 57.0) kHz, F_{char}: 54.1 ± 0.78 (52.7 - 55.5) kHz, duration: 2.6 ± 0.48 (1.9 - 3.8) msec. Values for a further 11 specimens from Swaziland were reported by Monadjem *et al.* (2017c: 179): F_{min}: 53.2 ± 0.87 (51.3 - 54.8) khz, F_{knee}: 57.0 ± 0.96 (55.5 - 58.5) kHz, F_c: 53.6 ± 0.83 (51.6, 55.0) kHz and duration: 2.8 ± 0.37(2.2 - 3.7) msec. They also indicated that the maximum detection distance for this species is 5 m.

At Farm Welgevonden, South Africa, Taylor *et al.* (2013a: 556) report a F_{knee} value of 56 (56 - 57) kHz.
Schoeman and Jacobs (2002: 157) reported a F_{peak} of 53.6 kHz for one "*M. schreibersii*" from the Algeria Forestry Station (RSA). Linden *et al.* (2014: 40) reported the following parameters from the Soutpansberg area (RSA): F_{min}: 52 - 55 kHz, F_{char}: 45 - 62 kHz, F_{knee}: 56 - 57 kHz, Slope: 235 - 622 OPS, duration: 2 - 4 msec.
In the Mapungubwe National Park (RSA), Parker and Bernard (2018: 57) recorded 15 calls with F_{char}: 49.91 ± 0.95 kHz, F_{max}: 67.84 ± 4.75 kHz, F_{min}: 49.39 ± 0.88 kHz, F_{knee}: 53.61 ± 2.27 kHz, duration: 4.96 ± 1.31 msec and 7.30 ± 2.65 calls/sec.

Eisenring *et al.* (2016: SI 2) reported for 17 calls of bats from the Aberdares Range in Kenya the follow values: PF: 44.1 ± 3.5 (41.5 - 54.8), HF: 66.6 ± 17.7 (51.3 - 104.4), LF: 40.4 ± 1.5 (38.5 - 44.0), DT: 0.1 ± 0.0 (0.1 - 0.1), DF: 26.1 ± 17.5 (12.5 - 63.9), IPI: 1.0 ± 0.5 (0.5 - 2.5).

MOLECULAR BIOLOGY:
DNA - Teeling *et al.* (2017: 32) mention the assembly size for *M. natalensis* to be 1.80 Gb.

Karyotype - *M. schreibersii* from Namibia and South Africa now assigned to *M. natalensis*, were karyotyped by Rautenbach *et al.* (1993) who described the karyotype as having a diploid number of 2*n* = 46, aFN = 50, BA = 6, X = SM, Y = A.

Banerjee *et al.* (2017: 10) detected potential c-Rel binding sites in *M. natalensis*. This protein has a potential role in the DNA repair pathway as a regulator of inflammatory gene expression.

HABITAT:
Sirami *et al.* (2013: 34) recorded in the Western Cape Province, South Africa that *M. natalensis* activity was not significantly, nor positively influenced by size of wetland, while habitats 100 m surrounding wetlands were also significantly and positively influenced by the water body. *M. natalensis* prefered trees and orchards surrounding wetlands (Sirami *et al.*, 2013: 35).

Voigt *et al.* (2013: 751) investigated stable isotope ratios of carbon, nitrogen and hydrogen in the fur keratin of *M. natalensis* on the slopes of Mount Kilimandjaro and found that this species migrates seasonally between low and high elevations. They

found that *M. natalensis* captured before and after the cold period at around 1,800 m above sea level originated from around 1,400 m a.s.l. or lower, which they suggest might be the result of a search for colder hibernacula at higher elevations.

HABITS:
van der Merwe (1973b: 380) indicates that in the Transvaal *M. natalensis* forms hibernating (winter) and maternity (summer) colonies, and he reports on maternity caves housing 50,000 to 100,000 animals. The bats usually form closely packed clusters, hanging from the roofs of caves, although some might be hanging against the walls. Hibernation started at the beginning of May and lasted until the end of July.

At De Hoop Nature Reserve (Western Cape Province, South Africa), Thomas and Jacobs (2013: 124) found that *M. natalensis* emerged significantly later during early summer than in late summer.

ROOST:
van der Merwe (1973b: 380) reports "*M. schreibersi natalensis*" to occur in colonies of hundreds or thousands of animals occupying a wide range of caves. At Peppercorn's cave and at Sandspruit Cave No. 1 clusters of 50,000 and 100,000 individuals were reported.

van der Merwe (1973a: 133) found that the bats preferred caves with lower temperature for hibernation.

Brown (1999: 171) reported the mean temperature in tunnel roosts is on average 19.5°C in summer (max: 22°C) and 14°C in winter.

DIET:
At the Umbilo River (KwaZulu Natal, RSA), Naidoo *et al.* (2011: 26) found the following percentage volume diet composition: Lepidoptera (35.7 ± 10.3), Coleoptera (11 ± 9.1), Hemiptera (28.3 ± 12.9), and Trichoptera (25.0 ± 13.9). No data were provided for the winter.

Schoeman and Jacobs (2002: 157) reported the following volume percentages found in 20 faecal pellets from one "*M. schreibersii*" from the Algeria Forestry Station (RSA): Diptera (49), Hemiptera (33), Lepidoptera (6), Coleoptera (6), and Trichoptera (6).

For 21 "*M. schreibersii*" specimens from Sudwala (RSA), Jacobs (2000: 201) reported the following prey proportions: Lepidoptera (23.1 ± 31.2), Coleoptera (4.5 ± 16.7), Isoptera (70.8 ± 32.2), Diptera (0.6 ± 2.3), Hemiptera (0.6 ± 2.3), and Mantodea (0.4 ± 0.3).

PREDATORS:
Avery *et al.* (2005: 1054) found this species (reported as *M. schreibersii*) to be present in pellets from *Tyto alba* in South Africa. van der Merwe (1980a: 15) already reported the barn owl as a predator, but indicated that these bats do not rank high on its diet, although there was an increase when other terrestrial and subterrestrial preys are descreasing in availability.

POPULATION:
Structure and Density - This species can be found in colonies of more than 2,500 animals (Jacobs *et al.*, 2008aj; IUCN, 2009). Mason *et al.* (2010: 165) observed that the number of bats in the De Hoop maternity chamber increased from a few hundred to several thousand from 18th August to the 25 September 2006.
Trend - 2008 - Unknown (Jacobs *et al.*, 2008aj; IUCN, 2009).

LIFESPAN:
Based on mark-recapture techniques, van der Merwe (1989b: 87) determined the maximum life expectancy for this species in the wild to be 13 years.

REPRODUCTION AND ONTOGENY:
Delayed implantation, insemination, ovulation and fertilization occur in the autumn (April to May in South Africa, see Bernard *et al.* (1991: 31), as *M. schreibersii*). Embryogenesis proceeds to the blastocyst stage and development is then retarded until arousal in spring, when the blastocyst implants and embryogenisis resumes (van der Merwe, 1980b). van der Merwe (1982b: 319) also mentions that implantation is centric and superficial in the right uterine horn, as was already noticed by Ginther (1967: 580) and van der Merwe (1996: 154), who also indicated [referring to Matthews (1941)], that the implantation occurs in the uterine horn opposite to the ovary containing the corpus luteum. van der Merwe (1979a: 17) and Bernard (1980a: 55) indicated that the delayed implantation period for "*M. schreibersi natalensis*" lasted for four months (120 days), which is as long as the active fetal growth period, giving a gestation period of 240 days. van der Merwe (1981: 172) presented the following formula to calculate the embryo's age in days (t) based on its body mass (W): $t = W^{1/3}/0.0145 + 144$.

Bernard and Davison (1996: 218) investigated the relation between calcium availability (from the poor source that insects are) and the reproduction of "*M. schreibersii*" and found that seasonal changes in insect abundance could not explain the delayed implantation, but that lactating females nevertheless had the lowest bone calcium

concentrations. This is probably the reason why parturition occurs in seasons with maximum insect availabitiy.

Mason *et al.* (2010: 165) found at De Hoop that in mid August 2006 the bats sampled were either not pregnant or at a very early stage of pregnancy and no embryos were present. However, on the 8th September the first bat sampled was pregnant and carried an embryo at the limb bud stage (CS13), this is found approximately the same time of year as those of the KwaZulu Natal and Eastern Cape populations. No twins were observed and pregnant bats collected on the same day never had embryos from only one stage of development (Mason *et al.*, 2010). Mason *et al.* (2010: 168) found that the period of early to mid-embryonic development (CS11 to CS21) occurred over a period of about two weeks in both years sampled, however this period appeared to occur about two weeks later in 2008 than in 2006, this delay in pregnancy may be due to environmental factors. Also the embryonic stages were not the same among individuals sampled on the same day, indicating that although reproductive events may be synchronous (within the period of a month) in this species, exact developmental events were not highly synchronized between individuals.

At the Gatkop cave (RSA), Dietrich *et al.* (2018b: 4) were only able to trap non-scrotal males in September 2015. In November 2015, 90 % of the females they trapped had given birth very recently, and in January 2016, large amounts of juveniles were present, together with post-lactating females.

The mass of pregant females varied greatly and was not correlated to the developmental stage of the embryos that they carried (Mason *et al.*, 2010: 165). Pretorius *et al.* (2019: 319), however, found that lactating females with sclerotized nipples were 6 % heavier than non-reproductive females and pregnant females were 25 % heavier than non-reproductive females, a difference - which at least in part - was attributed to foetus mass. Over three successive years (2015 - 2017), the proportion of active breeding females was found to be 31 %, 33 % and 70 %.

Mason *et al.* (2015) studied the embryological development of the fore- and hindlimbs, and found that that the transcription factor *Meis2* has a significantly higher expression in bat forelimb autopods compared to hindlimbs. Eckalbar *et al.* (2016: 528) found over 7,000 genes and noncoding RNAs (incl. Tbx5-as1 and Hottip), that were differentially expressed between forelimb and hindlimb, and across different stages of development.

MATING:
van der Merwe (1973b: 384) reported that the period of mating was still uncertain, although he assumed that it occurred at the wintering caves prior to hibernation.

PARASITES:
BACTERIA:
Dietrich *et al.* (2016b: 3) tested 17 bats from Irene (RSA) and found two testing positive for *Bartonella* and one for *Rickettsia*. Five out of 8 bats from Vanderkloof Dam (RSA) also tested positive for *Bartonella*.
Dietrich *et al.* (2015a: 3) reported the presence of the Enterobacteria *Hafnia* and *Nitrococcus*. They also found *Leptospira* in the urine sample, and *Bartonella* in urine and saliva samples. Dietrich *et al.* (2018a: 4;2018b: 4) reported the presence of bacteria related to *Leptospira borgpetersenii* and a second group closely related to *L. interrogans* and *L. kirschneri*.

HAEMOSPORIDA
Lutz *et al.* (2016: 9) examined 42 *M. natalensis* specimens from East Africa and found 20 of them infected with *Polychromophilus melanipherus* Dionisi, 1899.
Kassahun *et al.* (2015: 168) examined two *M. arenarius* specimens from Masha (Ethiopia), and found one of them to be infected by *Leishmania* parasites.

Gastro-intestinal
Helminthes - See Ortlepp (1932) and Junker *et al.* (2008a).

NEMATODA:
Genov *et al.* (1992) reported *Molinostrongylus omatus* (Mönnig, 1927) from *M. natalensis* from South Africa. Ramasindrazana *et al.* (2016: 2) indicate that *Litomosa chiropterorum* Ortlepp, 1932 (Onchocercidae) was redescribed from a *M. natalensis* population from South Africa. This Nematode was already reported from a bat from Katanga (DRC) by Durette-Desset and Chabaud (1975: 304).

ACARI:
Myobiidae: Uchikawa (1985a: 15) corrected the type host for *Calcarmyobia rhinolophi* from *Rhinolophus lobatus* to *Miniopterus natalensis arenarius*. Uchikawa (1985a: 19) also reported that the type specimens of *Miniopterus breyeri*, *M. dasythrix*, and *M. scotinus* harboured the "atypical" form of *Calcarmyobia congoensis* Uchikawa, 1982, and he also (Uchikawa, 1985a: 22) mentioned *Calcarmyobia kenyaensis* Uchikawa, 1982 on "*Miniopterus schreibersi*" from Belgian Congo and on "*Miniopterus schreibersi arenarius*" (and *M. natalensis arenarius*) from Kenya.

Uchikawa (1985c: 110) furthermore reported on the presence of *Pteracarus miniopteri* Uchikawa, 1978 on bats from South Africa, Kenya, Zambia, Uganda, Cameroon, Namibia (as either *M. natalensis arenarius*, *M. schreibersi arenarius*, *M. schreibersi natalensis*, *M. schreibersi villiersi* or *M. smitianus*).
Trombiculidae: Stekolnikov (2018a: 147) mentioned *Microtrombicula armata* Vercammen-Grandjean, 1965 from a South African "*M. schreibersii*".

DIPTERA
Streblidae: *Ascodipteron africanum* Jobling, 1939 from Kapretwa and Mt. Kenya, Kenya, other records referred to this species are misidentification (Haeselbarth *et al.*, 1966: 106). *Ascodipteron theodori* Maa 1965 from Rooiberg, South Africa (Haeselbarth *et al.*, 1966: 106). *Raymondi waterstoni* Jobling 1931 which may be accidental (Haeselbarth *et al.*, 1966: 104) (see also Shapiro *et al.*, 2016: 256).
Nycteribiidae: *Nycteribia capensis* Karaman, 1939 from the Cape and Pietermaritzburg, South Africa (Haeselbarth *et al.*, 1966: 108). *Nycteribia latiterga* Theodor, 1957 from Mt. Menengai, Kenya (Haeselbarth *et al.*, 1966: 108). *Nycteribia schmidlii* Schiner, 1853 (Zumpt, 1950: 97; Haeselbarth *et al.*, 1966: 108; Blackwell, 1980: 146 - infected by the fungus *Arthrorhynchus eucampsipodae* Thaxter, 1901 [see also Haelewaters *et al.*, 2018: 794; Szentiványi *et al.*, 2019: Suppl.]). *Penicillidia fulvida* (Bigot, 1885) (Haeselbarth *et al.*, 1966: 114; Blackwell (1980: 144 - infected by the fungus *Arthrorhynchus nycteribiae* (Peyritsch) Thaxter [see also Haelewaters *et al.*, 2018: 794; Szentiványi *et al.*, 2019: Suppl.]).

SIPHONAPTERA:
Ischnopsyllidae: *Oxyparius isomalus* (Waterston, 1915) known from several localities in southern Africa (Transvaal, Natal of South Africa, Botswana and Namibia) and from the foothills of Mt. Elgon, Kenya (Haeselbarth *et al.*, 1966: 188). *Rhinolophopsylla ectopa* (Jordan, 1937) found in a cave in the foothills of Mt. Elgon, Kenya (Haeselbarth *et al.*, 1966: 191).

ACARI:
Argasidae: *Argas vespertilionis* (Latreille, 1802) from a "*M. schreibersi*" from Pretoria (see Howard, 1908: 168).
Dermanyssidae: Zumpt and Till (1954: 49) report *Steatonyssus natalensis* Zumpt and Patterson, 1951 from bats from Natal. Zumpt (1950 92) found a new mite of the genus *Bdellonyssus*.
Macronyssidae: Zumpt (1950: 89) described *Hirstesia transvaalensis* from bats from the Sterkfontein cave (RSA).
Myobiidae: *Myobia miniopterus* Womersley, 1941 (see Zumpt, 1950: 92).
Spinturnicidae: *Spinturnix semilunaris* De Meillon and Lavoipierre, 1944 (see Zumpt, 1950: 92).

VIRUSES:
Bunyaviridae
Phlebovirus
Rift Valley Fever Virus (RVFV) - Oelofsen and Van der Ryst (1999) tested [as *M. schreibersi*] 49 individuals from one locality in the Free State Province, South Africa for RVFV antigen using an enzyme linked immunosorbet assay (ELISA), none tested positive.

Coronaviridae - Coronaviruses
SARS-CoV - Müller *et al.* (2007b) tested [as *M. schreibersi*] between 1986 and 1999, for antibody to SARS-CoV in sera in one individual from Limpopo Province, South Africa, none were tested positive (0/1). Tong *et al.* (2009) tested 1 bat collected in Kenya during 2006 positive for the presence of coronavirus RNA in a fecal sample. Nine out of 53 (17 %) Kenyan bats tested by Tao *et al.* (2017: Suppl.) was positive for CoV.
One out of 14 specimens tested by Geldenhuys *et al.* (2013: 517) from Irene Caves, Gauteng, RSA tested positive for CoV.

Paramyxoviridae
Conrardy *et al.* (2014) detected a paramyxovirus sequence in one of eight bats sampled in Kenya. This virus does not group with the known paramyxoviruses and remains an unclassified paramyxovirus.

Rhabdoviridae
Lyssavirus - Rabies related viruses
Duvenhage - van der Merwe (1982a) implicated *Miniopterus schreibersii*, as an isolate of the virus but the bat was never positively identified. This record was also referred to by Hayman *et al.* (2011a: 88), who indicated that the bas was possibly a *M. natalensis*.
Rabies - Oelofsen and Smith (1993) tested [as *M. schreibersi*] 137 individual brains, from 5 localities by means of the "Rapid rabies enzyme immunodiagnosis" (RREID) test (Diagnostic Pasteur), none were tested positive.

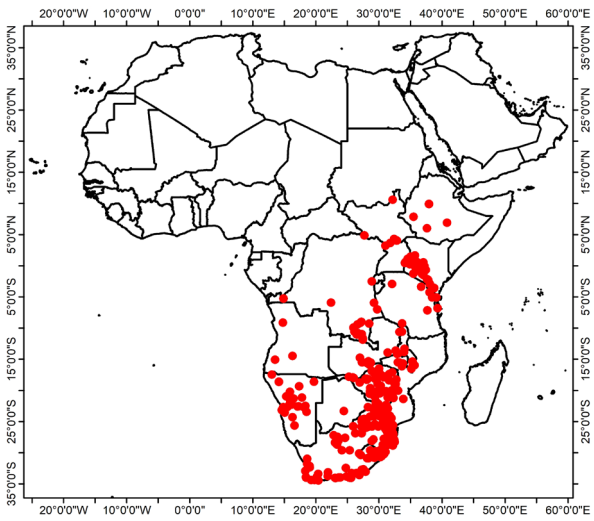

Figure 224. Distribution of *Miniopterus natalensis*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Angola, Botswana, Congo (Democratic Republic of the), Ethiopia, Kenya, Lesotho, Malawi, Mozambique, Namibia, South Africa, South Sudan, Sudan, Swaziland, Tanzania, Uganda, Zambia, Zimbabwe.

Miniopterus newtoni Bocage, 1889

*1889. *Miniopterus Newtoni* Bocage, J. Sci. mat. phys. nat., ser. 2, 1 (3): 198. Publication date: December 1889. Type locality: São Tomé and Principé: São Tomé Island [Goto Description]. Neotype: EBD MAM 17350: ad ♂, skull and alcoholic. Collected by: Javier Juste and Carlos J. Ibáñez Uargui; collection date: 4 April 1988. São Tomé Island, Santa Catarina, in a cave near the seashore (00 16 N 06 29 E), designated as neotype by Juste and Ibáñez (1992: 361). (Current Combination)

? *Miniopterus newtoni:* (Current Spelling)

TAXONOMY:
Recognised as a synonym (Koopman, 1993a: 231) or a subspecies (Simmons, 2005: 521) of *M. minor* Peters, 1867. Removed from *minor* by Juste [B.] *et al.* (2007: 33), based on mtDNA analyses. Juste and Ibáñez (1992: 361) designated a neotype for *newtoni* Bocage, 1889.

COMMON NAMES:
Czech: létavec tomášský. English: Sao Thome Long-fingered bat. French: Minioptère de São Tomé. German: Sao Thome Langflügelfledermaus.

CONSERVATION STATUS:
Global - Listed as Data Deficient (DD ver 3.1 (2001)) in view of the absence of sufficient information on its extent of occurrence, natural history, threats and conservation status (Juste, 2008b; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) (Juste, 2008b; IUCN, 2009).

MAJOR THREATS:
The threats to this species are not well known (Juste, 2008b; IUCN, 2009).

CONSERVATION ACTIONS:
Juste (2008b) [in IUCN (2009)] reports that it is not known if the species is present in any protected areas. Further studies are needed into the natural history and threats to this species.

GENERAL DISTRIBUTION:
Miniopterus newtoni is endemic to the island of São Tomé (São Tomé and Príncipe) where it is widespread (Juste [B.] *et al.*, 2007).

Native: São Tomé and Principe (Koopman, 1993a: 231 [as *minor*]; Simmons, 2005: 521 [as *minor*]; Juste [B.] *et al.*, 2007; Rainho *et al.*, 2010a: 33).

ECHOLOCATION:
Rainho *et al.* (2010a: 21) reports the calls of 14 individuals from São Tomé.

POPULATION:
Structure and Density - It is a common species (Juste B. and Ibáñez, 1994b).
Trend - 2008 - Unknown (Juste, 2008b; IUCN, 2009).

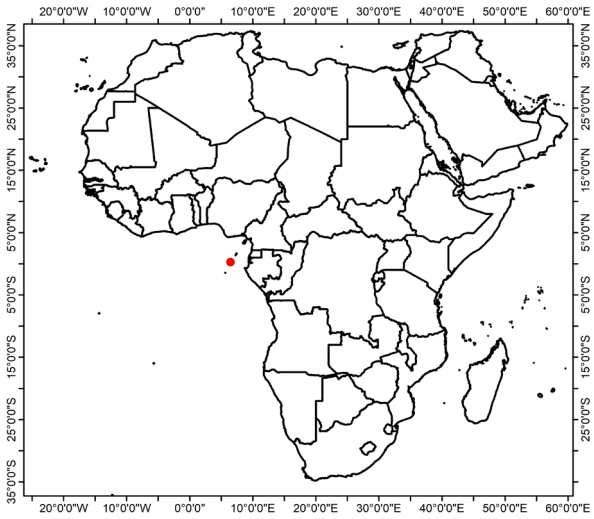

Figure 225. Distribution of *Miniopterus newtoni*

São Tomé and Principé.

Miniopterus petersoni Goodman, Bradman, Maminirina, Ryan, Christidis & Appleton, 2008

2007. *Miniopterus cf. sororculus:* Goodman, Ryan, Maminirina, Fahr, Christidis and Appleton, J. Mamm., 88 (5): 1229.

2008. *Miniopterus cf. petersoni:* Goodman, Bradman, Maminirina, Ryan, Christidis, and Appleton, Mamm. biol., 73: 202.

*2008. *Miniopterus petersoni* Goodman, Bradman, Maminirina, Ryan, Christidis and Appleton, Mamm. biol., 73: 199, 200, 201, figs 2 - 5. Type locality: Madagascar: Province de Toliara: Cascade de Manantantely: Tolagnaro, 5.2km NW [2459.343S 4655.370E, 65m]. Holotype: FMNH 194136: ad ♂. Collected by: Steven M. Goodman; collection date: 20 February 2007; original number: SMG 15833. Paratype: USNM 577096:. Paratype: USNM 577097:. Paratype: USNM 577098: Collected by: G. Kenneth Creighton and E. Raholimavo; collection date: 19-30 October 1990. Presented/Donated by: ?: Collector Unknown. Paratype: USNM 577099:. Paratype: USNM 577100:. Paratype: USNM 577101:. - Etymology: The name *petersoni* is a patronym in honour of Randolph L. Peterson of the Royal Ontario Museum, Toronto, Canada, who made pioneering contributions to the study of Malagasy bats, based on a 1967 collecting trip to the island, as well as other fields in mammalogy (Eger and Mitchell, 1990; Goodman *et al.*, 2008a). (Current Combination)

TAXONOMY:
See Goodman *et al.* (2008a).

COMMON NAMES:
Czech: létavec Petersonův. English: Peterson's Long-fingered Bat. French: Minioptère de Peterson. German: Petersons Langflügelfledermaus.

SIMILAR SPECIES:
See Goodman *et al.* (2008a).

CONSERVATION STATUS:
Global - This species is listed as Data Deficient (DD ver 3.1 (2001)) because although it appears to have a restricted range in the southeast of Madagascar and is associated with forest, there is taxonomic uncertainty about specimens from the north of Madagascar (which if proved valid would greatly extend the known range). There is also limited information on the population status and threats to this species (Jenkins and Rakotoarivelo, 2008b; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) (Jenkins and Rakotoarivelo, 2008b; IUCN, 2009).

MAJOR THREATS:
Although robust data are lacking and there are still some taxonomic uncertainties of specimens from the north of Madagascar, the information on *M. petersoni* from the southeast suggests that this species is closely associated with natural forest formations and is therefore threatened by the loss or degradation of these habitats (Goodman *et al.*, 2008a). Threats to roosting colonies have not yet been documented (Jenkins and Rakotoarivelo, 2008b; IUCN, 2009).

CONSERVATION ACTIONS:
Jenkins and Rakotoarivelo (2008b) [in IUCN (2009)] report that none of the known collecting localities for verified specimens of this species are from within protected areas (Goodman *et al.*, 2008a). The taxonomic status of specimens from north Madagascar requires further study.

GENERAL DISTRIBUTION:
Miniopterus petersoni is endemic to the island of Madagascar and appears to be restricted to lowland (< 550 m elevation) habitats in the south-east (Goodman *et al.*, 2008a).

Schoeman *et al.* (2014: 28, 31) found the most suitable area for this species to be located in the southeastern part of the island, but reaching along the coast to the northeast, where the suitability seems to increase again (eastern humid forest or lowland forest region - humid).

The taxonomic status of specimens from the north of Madagascar remain unresolved (Goodman *et al.*, 2008a).

Native: Madagascar (Goodman *et al.*, 2008a).

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
See Goodman *et al.* (2008a).

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:
See Goodman *et al.* (2008a).

ECHOLOCATION:
Low-duty cycle, frequency modulated/quasi constant (FM/QCF) echolocation call, with a peak frequency of 53.2 kHz (52.0 - 53.9 kHz) and a duration of 2.9 ms (2.5 - 3.3 ms) (Goodman *et al.*, 2011: 9).
Ramasindrazana *et al.* (2011: 294) recorded 6 calls from 1 *Miniopterus petersoni* specimen, and found the following echolocation call values: Frequency of maximum energy: 53.2 ± 0.75 (52.0 - 53.9) kHz, Maximum frequency: 106.5 ± 6.66 (95.0 - 115.0) kHz, Minimum frequency: 49.0 ± 0.63 (48.0 - 50.0) kHz, Call duration: 2.9 ± 0.32 (2.5 - 3.3) ms, Inter pulse interval: 71.0 ± 4.63 (63.8 - 76.7) ms.

MOLECULAR BIOLOGY:
DNA - See Goodman *et al.* (2008a).
Karyotype - Unknown.
Protein / allozyme - Unknown.

HABITAT:
See Goodman *et al.*, 2008a).

HABITS:
See Goodman *et al.* (2008a).

ROOST:
See Goodman *et al.* (2008a).

MIGRATION:
May be involved in seasonal migrations between cave roost sites (Goodman *et al.*, 2008a).

POPULATION:
Structure and Density - This species was only formally described in 2008 and there is no information on its population (Goodman *et al.*, 2008a).
Trend - 2008 - Unknown (Jenkins and Rakotoarivelo, 2008b; IUCN, 2009).

PARASITES:
Tortosa *et al.* (2013: 4) and Ramasindrazana *et al.* (2017: Suppl.) reported the presence of the Nycteribiid bat flies *Nycteribia stylidiopsis* and *Penicillidia leptothrinax*. The latter is also reported by Wilkinson *et al.* (2016), and was found to be carrying *Rickettsia* bacteria Szentiványi *et al.*, 2019: Suppl.).

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Madagascar.

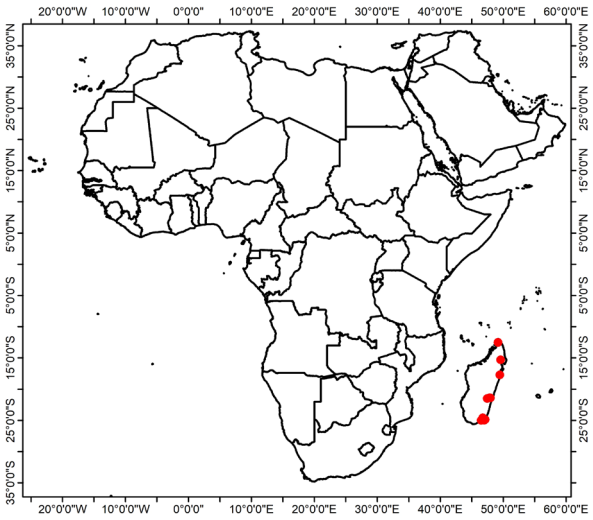

Figure 226. Distribution of Miniopterus petersoni

Miniopterus schreibersii (Kuhl, 1817)

*1817. *Vespertilio schreibersii* Kuhl, Die Deutschen Fledermäuse, Hanau, 14. Type locality: Romania: S Ban(n)at Mnts, near Coronini, left bank Danube: Kolumbács Cave [=Kulmbazer cave] [ca. 44 37 N 21 40 E]. - Comments: Turni and Kock (2008) mention

that the type and three "doublets" should have been present in the NMW, but are no longer found. - Etymology: In honour of Karl Franz Anton, Ritter von Schreibers (1775 - 1852), then director of the Vienna Museum (Flannery, 1995a: 378; 1995b: 452; Kozhurina, 2002: 17).

1827. *Vespertilio Screbersii:* Lesson, Manuel de Mammalogie, 89. (Lapsus)
1855. *V[espertilio] Schreibersi:* Giebel, Die Säugethiere, 950. (Name Combination)
1953. *Miniopterus schrebersii:* Harrison, Durban Mus. Novit., 4 (5): 65. Publication date: 30 June 1953. (Lapsus)
1995. *M[iniopterus] screibersi:* Pavlinov, Borissenko, Kruskop and Jahonton, Arch. Zool. Mus., Moscow State Univ., 133: 119. (Lapsus)
2013. *Miniopterus schreibersiias:* Shi, Sci. China Life Sci., 56 (8): 679. (Lapsus)

? *Miniopterus schreibersii:* (Name Combination, Current Combination)

TAXONOMY:
Molecular systematics and biogeography are discussed by Appleton *et al.* (2004: 436 - 437), who indicate that based on their data *M. schreibersii* would be restricted to Europe and North Africa; the Ethiopian representatives would belong to a second species and the Oriental-Australian a third (see also Stadelmann *et al.*, 2004b: 188). Tian *et al.* (2004: 303) confirm the views presented by Appleton *et al.* (2004), and suggest *M. schreibersii* for the European specimens, *M. fuliginosus* for the Asian representatives and *M. oceanensis* for the Australian ones (which was already suggested by Maeda (1982), although he separated the specimens from Hainan from the other Asian representatives, which is no longer supported by Appleton *et al.* (2004).

Reviewed by Crucitti (1976) and Hill (1983).

If *Miniopterus schreibersii* is restricted to northern Africa, then *Miniopterus inflatus villiersi* Aellen, 1956 should possibly be assigned to *Miniopterus natalensis*, but as already indicated by Fahr *et al.* (2006a: 74) and Monadjem *et al.* (2016y: 371), *villiersi* represents a distinct species, restricted to the Upper Guinea forest zone.

COMMON NAMES:

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Gunnell *et al.* (2015a: 22) report skeletal remains from a Pleistocene deposit at Olduvai Gorge (Tanzania), which they assigned to *Miniopterus* cf. *M. schreibersi*.

CONSERVATION STATUS:
Global - Listed as Near Threatened NT ver 3.1 (2001). Significant population declines and range contractions have been recorded in a number of range states and although it is stable in the Balkans and Turkey, overall the rate of population decline may approach 30 % (almost qualifies as VU under A2a) (Hutson *et al.*, 2008c; IUCN, 2009).

Assessment History -
2008 - NT ver 3.1 (2001) (Hutson *et al.*, 2008c; IUCN, 2009). 2004 - LC ver 3.1 (2001) [included *natalensis*] (Schlitter, 2004i; IUCN, 2004). 1996 - LR/nt [included *M. natalensis*] (Baillie and Groombridge, 1996).

Regional -
Mediterranean: 2008 - NT ver 3.1 (2001) (IUCN, 2009).

MAJOR THREATS:
The main threat in Africa is disturbance in roosts. In Europe, the disturbance and loss of underground habitats and pesticide use may threaten this species. In the Caucasus, disturbance caused by tourism in caves is a problem (K. Tsytsulina *pers. comm.,* 2005).

The cause of recent mass mortality events is unknown. In 2002 mass mortalities of this species were reported for populations in France, Spain and Portugal. There are also historical records for such mortalities in Italy, Australia and a possible incidence in Iran. A meeting was held at the 9th European Bat Research Symposium to discuss these incidents. Veterinary investigations in Spain did not identify any disease as the cause of the die offs, and there is increasing belief that the die offs are caused by bad weather in late winter/early spring (Hutson *et al.*, 2008c; IUCN, 2009).

The species's small range, cave/tree roosting and aerial hawking feeding style are believed to be the most important risk factors in view of climatic change (Sherwin *et al.*, 2012: 174).

CONSERVATION ACTIONS:
Hutson *et al.* (2008c) [in IUCN (2009)] report that in Europe, it is protected by national legislation in most range states. There are also international legal obligations for its protection through the Bonn Convention (Eurobats) and Bern Convention in parts of the range where these apply. It is included in Annex II (and IV) of the EU Habitats and Species Directive, and hence requires special measures for conservation including designation of Special Areas for Conservation. There is some habitat protection through Natura 2000, and some roosts are already protected by national legislation. There have been a number of LIFEfunded projects for this species in Spain, Italy, Romania and Germany.

The species is found in many protected areas throughout its range.

Care is required when fencing caves to minimise mortality. Further research is required into the causes of the recent mass mortality events.

GENERAL DISTRIBUTION:
Miniopterus schreibersii occurs from south-western Europe and North and West Africa through Anatolia and the Middle East to the Caucasus. In Africa it is known from records in North Africa (Morocco, Algeria, Tunisia, Libya), and West Africa (Guinea, Sierra Leone, Liberia, Nigeria, Cameroon). It is patchily distributed over its range in some huge and vulnerable colonies. It typically occurs at altitudes of up to 1,400 m asl (commuting up to 2,600 m asl).

Native: Afghanistan; Albania; Algeria; Armenia; Azerbaijan; Bosnia and Herzegovina; Bulgaria; Cameroon; Croatia; Cyprus; France [Corse]; Georgia; Gibraltar; Greece [East Aegean Isands; Kriti]; Holy See [Vatican City State]; Hungary; Israel; Italy [Sardegna, Sicilia]; Jordan; Lebanon; Liberia; Macedonia, the former Yugoslav Republic of; Malta; Monaco; Montenegro; Morocco (Benda *et al.*, 2010a: 158; El Ibrahimi and Rguibi Idrissi, 2015: 364); Nigeria; Palestinian Territory, Occupied; Portugal; Romania; Russian Federation; San Marino; Serbia; Sierra Leone; Slovakia; Slovenia; Spain [Baleares]; Switzerland; Syrian Arab Republic; Tunisia (Dalhoumi *et al.*, 2014: 53; 2016b: 867); Turkey.
Possibly extinct: Austria.
Regionally extinct: Germany; Ukraine.
Presence uncertain: Libyan Arab Jamahiriya.

DETAILED MORPHOLOGY:
Bhide (1979: 1) described the anatomy, histology and histochemistry of this bat's stomach

In Korea, three types of lingual papillae were on the tongue by Park and Lee (2009: 267): filiform, fungiform, and circumvallate.

Cebesoy and Karakas (2013: 382) report on the muscle fiber types in primary flight muscles of specimens from Turkey, where they recognized three types: I, IIa, and IIb, which respectively make up 14 %, 70 % and 16 % of the *serratus ventralis*. In their study on take-off performance, Gardiner *et al.* (2014: 1059) determined a wing beat frequency of 11.95 ± 0.17 Hz.

ECHOLOCATION:
The data for 61 animals from Greece are the following: F_{start}: 93.0 ± 11.84 kHz, F_{end}: 50.8 ± 1.16 kHz, F_{peak}: 54.9 ± 5.32 kHz, bandwidth: 17.8 ± 14.30 kHz, duration 6.7 ± 1.29 msec and interpulse interval: 94.1 ± 35.73 msec (Papadatou *et al.*, 2008b: 133). Walters *et al.* (2012: suppl.) report the following figures for 31 calls from France, Greece, Italy and Switzerland: duration: 6.37 ± 2.89 msec, F_{max}: 73.24 ± 12.13 kHz, F_{min}: 49.75 ± 1.33 kHz, bandwidth: 23.49 ± 11.29, F_{peak}: 52.02 ± 1.68 kHz. Davies *et al.* (2013b: Table S8) report a peak frequency of 56.07 kHz and a range between 52.1 and 85.2 kHz.

From Morocco, Disca *et al.* (2014: 226) indicate that the type of call is FM-QFC, with the following parameters: F_{start}: 97.3 ± 11.3 kHz, F_{end}: 50.6 ± 1.4 kHz, F_{peak}: 53.4 ± 1.2 kHz, $F_{QFC\text{-}peak}$: 52.3 ± 1.1 kHz, bandwidth: 43.2 ± 11.4 kHz, duration: 6.2 ± 1.2 msec.

For 3 calls from the Kalahari Desert, the characteristics were: F_{char}: 47.6 ± 6.5 kHz, F_{max}: 76.7 ± 7.7 kHz, F_{min}: 53.2 ± 4.9 kHz, duration: 2.6 ± 0.4 msec(Adams and Kwiecinski, 2018: 4).

MOLECULAR BIOLOGY:
DNA - Barragán *et al.* (2002), Appleton *et al.* (2004), Tian *et al.* (2004), Bilgin *et al.* (2006, 2008).

Karyotype - Matthey and Bovey (1948) and Bovey (1949) described the karyotype from Switzerland as having a diploid number of 2*n* = 46, aFN = 48, X = submetacentric, Y = acrocentric. Rushton (1970: 463) reported 2*n* = 46, FN = 50, X = metacentric, Y = minute. Capanna and Civitelli (1965 - Italy), Baker *et al.* (1974 - Tunisia), Bickham and Hafner, 1978 - Yugoslavia), Zima (1978 - Czechoslovakia), Pérez-Suárez *et al.* (1991 - Spain), Albayrak (2006 - Turkey) found the fundamental number to be aFN = 50, and X = metacentric for Zima (1978). The autosomal chromosomes contain two large metacentrics, one medium-sized metacentric, 17 acrocentric and two dot-like pairs (one of these pairs may be bi-armed) (Arslan and Zima, 2014: 14). In Turkey, Asan Baydemir (2015: 350) found Nucleolus Organising Regions (NORs) on the secondary constriction in 2 pairs of chromosomes (pairs 18 and 20). Capanna and Civitelli (1965: 546) mention 22 pairs of autosomes, of which 3 are metacentric, 17 acrocentric, and two very small; the X chromosome is a medium sized metacentric and the Y chromosome is a very small one. Capanna and Manfredi Romanini (1971: 474) mention 2*n* = 45, aFN = 50, 2 pairs of metacentrics, 1 pair of submetacentrics, 19 pairs of acrocentrics.

Gürün *et al.* (2014: 73) confirmed the pattern of local differentiation previously detected in mitochondrial DNA as they also found significant differences in the nuclear DNA between bats from North Africa, Lebanon, Cyprus, Anatolia, Russia, Thrace-Balkans, Slovakia, Italy, France, and Iberia.

HABITS:
In southern France, Vincent *et al.* (2011: 57) found that during pregnancy and lactation, females might switch roosts within a 30 km radius around the maternity colony. During the night, the females travelled between 4.1 and 29.2 km to their foraging areas. They also estimated the individual home-ranges for pregnant females to be 10,837 ha, and for lactating females 22,318 ha.

DIET:
Presetnik and Aulagnier (2013: 297) investigated the diet of *M. schreibersii* in Slovenia and found this to consist primarily of Lepidoptera (79 % by volume). Neuroptera (mostly Chrysopidae) accounted for 9.2 %), Diptera for 7.4 %, Trichoptera for 2.2 %, and Coleoptera for 1.4 %. This seems to indicate that *M. schreibersii* is an aerial hawker. Gardiner *et al.* (2014: 1058) assessed its foraging strategy as "high altitude fast aerial hawking".

PREDATORS:
Mikula *et al.* (2016: Supplemental data) mention the Bat hawk (*Macheiramphus alcinus* Bonaparte, 1850) as diurnal avian predator.

POPULATION:
Structure and Density - See Hutson *et al.* (2008c) [in IUCN (2009)] for information of populations outside Africa.
Trend - 2008 - Decreasing (Hutson *et al.*, 2008c; IUCN, 2009).

LIFESPAN:
Szekely *et al.* (2015: Supp.) reports a maximum longevity of 22 years.

REPRODUCTION AND ONTOGENY:
Tuttle and Stevenson (1982: 122) indicate that both sexes need about 16 months to attain sexual maturity.
Kurta and Kunz (1987: 82) report that, at birth, the young weights about 20.4 % of the mother's body mass (3.4 g versus 20.4 g), and that its forearm length is 35.5 % of its mother's (16.7 versus 47.0 mm).

Szekely *et al.* (2015: Suppl.) report that males become sexually mature after 730 days (24 months) and females after 577 days (19 months). The young is born after a gestation period of 100 days with a weight of 2.8 g (22 % of the adult). After weaning (66 days), its weight is increased to 12.8 g.

Chari and Gopalakrishna (1984: 464) describe the development of the foetal membranes and the changes in the structure of the placenta in the Indian *Miniopterus schreibersii fuliginosus*, and they indicate that this bat has some unique embryological features.

POSTNATAL DEVELOPMENT:
In Iran, Sharifi and Vaissi (2013: 1) found that newborns had a mass of 3.74 ± 0.09 g and forearm length of 24.3 ± 0.31 mm. Both of these increased linearly over the first two weeks (at about 0.54 g/day and 1.39 mm/day), after which they remained rather stable. The epiphyseal gap of the fourth metacarpal phalangeal joint increased until the thirteenth day, then decreased linearly until the 70th day and thereafter fused. The eyes opened during the first week and the ears bekame erect. The pups also began to move by that time. At 21 days, their ability to fly improved, and they started to fly freely in the cave. At that time their average body mass was 11.32 g (91.6 % of adult weight).

PARASITES:
Lei and Olival (2014: Suppl.) mention this species to be a host for *Bartonella* bacteria.

Landau *et al.* (2012: 142) mention the Heamosporidians *Polychromophilus melaniferus* (Dionisi, 1899) and *Polychromophilus corradetti* Landau *et al.*, 1980.

In Europe, Genov *et al.* (1992) reported the following Nematodes: *Molinostrongylus panousei* Dollfus, 1954, *M. skrjabini* Skarbilovitch, 1934, *M. alatus* (Ortlepp, 1932), and *M. ornatus* (Mönning, 1927).

Uchikawa (1985a: 22) proposed the new name *Calcarmyobia dusbabeki* (Acari: Myobiidae) for a mite found on *Miniopterus schreibersii* from amongst others Tunisia and Algeria. The Spinturnicid mites *Spinturnix psi* (Kolenati, 1856) and *Spinturnix myoti* (Kolenati, 1856) were reported by Postawa and Furman (2014: 390) from Central Anatolia and the Levant.

Calcarmyobia ? parenzani Lombardini, 1956 was found on a *M. schreibersii* from Ras el Qued cave, Morocco.

Rhipicephalus sanguineus (Latreille, 1806) (Arachnidae: Ixodida: Ixodidae) were reported from Algerian bats by Bendjeddou *et al.* (2013: 325). Bendjeddou *et al.* (2017: 15) reported the following ectoparasites from Algeria: Nycteribiidae: *Nycteribia (Nycteribia) pedicularia* Latreille, 1805, *Penicillidia (Penicillidia) dufourii* Westwood, 1835 and *Phthiridium biarticulatum* Hermann, 1804; Streblidae: *Brachytarsina (Brachytarsina) flavipennis* Macquart, 1851; and Siphonaptera: *Rhinolophopsylla unipectinata arabs* Jordan and Rothschild, 1921.

In Italy, Voyron *et al.* (2011: 193) reported the following fungal entities from *M. schreibersii* carcasses: *Aspergillus* sp., *Chrysosporium merdarium*, *Fusarium equiseti*, Ophiostomatacea, *Thielavia* sp., *Mucor hiemalis f. hiemalis*.

Ševcík *et al.* (2012: 35) report on the presence of the bat flies *Nycteribia schmidlii schmidlii* Schiner, 1853 and *Penicillidia conspicua* Speiser, 1901 on bats from Crete and Cyprus. These bat flies are vector hosts for the malaria parasite *Polychromophilus melanipherus* (see Witsenburg *et al.*, 2013: 169). Haelewaters *et al.* (2017: 1) furthermore reported *Nycteribia kolenati* Theodor & Moscona, 1954 from Hungary.

Additionally, Tortosa *et al.* (2013: 6) also reported the Nycteribiid bat fly *Penicillidia oceanica* (Bigot, 1885).
The bat flies *Nycteribia schmidlii* Schiner, 1853, *Penicillidia dufourii* (Westwood, 1834), and *Penicillidia conspicua* Speiser, 1901 were reported by Postawa and Furman (2014: 390) from Central Anatolia and the Levant. Haelewaters *et al.* (2018: 794) additionally reported the flies *Nycteribia parvula, Penicillidia indica, P. jenynsii*, and *P. oceanica* from non-specified areas.

In Europe, the tick *Ixodes simplex* Neumann, 1906 is highly specialized to *M. schreibersii* (see Hornok *et al.*, 2014: 1).

In Spain, Estrada-Peña and Serra-Cobo (1991: 346) found the following Acari: *Ixodes (Pomerantzevella) simplex* Neumann, 1906, *Ixodes (Eschatocephalus) vespertilionis* Koch, 1844, *Macronyssus longimanus* (Kolenati, 1856), *Macronyssus granulosus* (Kolenati, 1856),

Macronyssus cyclaspis (Oudemans, 1906), *Macronyssus rhinolophi* (Oudemans, 1902), *Macronyssus diversipilis* (Vitzthum, 1920), *Macronyssus ellipticus* (Kolenati, 1857), *Spinturnix psi* (Kolenati, 1856), *Eyndhovenia euryalis euryalis* (Canestrini, 1884); and the bat flies *Nycteribia schmidlii* Schiner, 1853 and *Penicillidia dufouri* (Westwood, 1835).

VIRUSES:

Astroviridae

Luis *et al.* (2013: suppl.) mention the presence of an unassigned bat astrovirus.

Coronaviridae - Coronaviruses

Luis *et al.* (2013: suppl.) report the occurrence of various Coronaviruses (e.g. BatCoV HKU7, Miniopterus bat coronavirus 1, Miniopterus bat coronavirus HKU8).

Alphacoronavirus

Kohl and Kurth (2014: 3112) report this virus from Spain and Germany.

Betacoronavirus

Kohl and Kurth (2014: 3112) report this virus from Bulgaria and Germany.

Filoviridae - Filoviruses

Cuevavirus - Reported from Spain by Kohl and Kurth (2014: 3113).

Negredo *et al.* (2011: 1) described a new virus (Lloviu virus [LLOV]) from *M. schreibersii* in Spain.

Flaviviridae

Flavivirus

de Jong *et al.* (2011: 10), Luis *et al.* (2013: suppl.) report Japanese encephalitis virus. Luis *et al.* (2013) also mentions Kyasanur Forest disease virus and Yokose virus.

Orthomyxoviridae

Despite sampling and testing of 2 individuals of this species, no evidence of influenza A-like viruses (*Orthomyxoviridae*) were obtained (Fereidouni *et al.*, 2015).

Papillomaviridae

Dyolambda

A new papillomavirus (*Miniopterus schreibersii* papillomavirus type 1 [MscPV1]) was described by Tse *et al.* (2012: 5) from Hong Kong as the first member of the novel Dyolambda-papillomavirus genus.

Phenuiviridae

Phlebovirus - Rift Valley fever virus:

de Jong *et al.* (2011: 11), Luis *et al.* (2013: suppl.) report the occurrence of Rift Valley fever virus.

Rhabdoviridae

Lyssavirus - Rabies related viruses

de Jong *et al.* (2011: 9) report the presence of West Caucasian bat virus.

van Eeden *et al.* (2011: 67) report an unconfirmed, but possible occurrence of Duvenhage virus in a specimen from the Limpopo province, South Africa.

In Algeria, Serra-Cobo *et al.* (2018: 2) found seven bats out of 63 testing seropositive for European bat lyssavirus 1.

"Various European bat lyssaviruses" were reported by Kohl and Kurth (2014: 3114) from a variety of European countries.

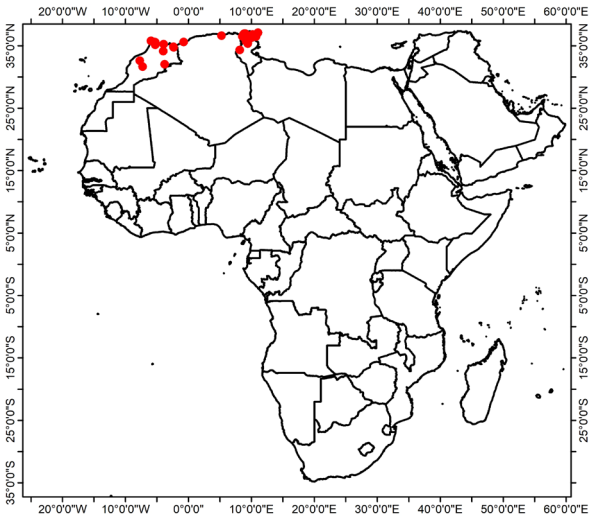

Figure 227. Distribution of *Miniopterus schreibersii*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Algeria, Morocco, Tunisia.

Miniopterus sororculus Goodman, Ryan, Maminirina, Fahr, Christidis and Appleton, 2007

*2007. *Miniopterus sororculus* Goodman, Ryan, Maminirina, Fahr, Christidis and Appleton, J. Mamm., 88 (5): 1219, figs 2 - 6. Type locality: Madagascar: Province de Fianarantsoa: unnamed cave: Ambatofinandrahana, 3 km S [2034.321S 4648.530E, 1450 m] [Goto Description]. Holotype: FMNH 177259: ad ♀, skull and alcoholic. Collected by: Steven M. Goodman; collection date: 23 March 2003; original number: SMG 13560. Paratype: FMNH 177255: Collected by: Steven M. Goodman; collection date: 23 March 2003. Paratype: FMNH 177256: Collected by: Steven M. Goodman; collection date: 23 March 2003. Paratype: FMNH 177257: Collected by: Steven M. Goodman; collection date: 23 March 2003. Paratype: FMNH 177258: Collected by: Steven M. Goodman; collection date: 23

March 2003. Paratype: FMNH 177260: Collected by: Steven M. Goodman; collection date: 23 March 2003. - Etymology: The name *sororculus* is derived from the Latin ("*sororcula*") and means "small sister" (Goodman *et al.*, 2007b: 1222). This epithet was chosen to contrast this taxon with its African counterpart *fraterculus*, which means "little brother", as well as this animal being slightly smaller than *M. majori* (Goodman *et al.*, 2007b: 1222). (Current Combination)

2018. *Miniopterus soroculus:* Kemp, López-Baucells, Rocha, Wangensteen, Andriatafika, Nair and Cabeza, Agric. Ecosyst. Environ., 369: 90 (for 2019). Publication date: 1 October 2018. (Lapsus)

? *Miniopterus sororculus fraterculus:* (Name Combination)

TAXONOMY:
Specimens from Madagascar assigned to *M. fraterculus* by Peterson *et al.* (1995) and Simmons (2005) are now considered to be a distinct species (Goodman *et al.*, 2007b).

COMMON NAMES:
Czech: létavec sesterský. English: Sororculus Longfingered Bat, Sororcula Long-fingered Bat. German: Madagaskar-Langflügelfledermaus.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) as the species appears to have a broad distribution in the central highlands with a relatively wide elevational range. There are no obvious major threats, and based on current records seems to be at least somewhat adaptable to disturbed habitats (Jenkins *et al.*, 2008f; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Jenkins *et al.*, 2008f; IUCN, 2009).

MAJOR THREATS:
There are no known threats to this species and it exists in areas some distance from native forest (Goodman *et al.*, 2007b; Jenkins *et al.*, 2008f; IUCN, 2009).

CONSERVATION ACTIONS:
Jenkins *et al.* (2008f) [in IUCN (2009)] report that at present, there are no known records from protected areas. This is a recently described taxon that does not appear to rely on large tracts of intact forest for its survival (Goodman *et al.*, 2007b). Further studies are needed to understand its adaptation to high elevations and extreme climate (Goodman *et al.*, 2007b).

GENERAL DISTRIBUTION:
Miniopterus sororculus is endemic to Madagascar where it has mainly been recorded from sites above 900 m elevation (Goodman *et al.*, 2007b) although there are a few records from sites at elevations < 50 m (Goodman *et al.*, 2008a). It is known from < 10 m confirmed localities ranging in elevation from 40 to 2,200 m above sea level. It is presumed to have a broad distribution spanning various portions of the central highlands (Goodman *et al.*, 2007b).

Schoeman *et al.* (2014: 28; 31) found the most suitable area for this species to be located in the central highland part of the island (higher elevations of the Central Highlands - sub-humid region).

Native: Madagascar (Goodman *et al.*, 2007b; Goodman *et al.*, 2008a).

ECHOLOCATION:
Kofoky *et al.* (2009: 382) reported the calls as *Miniopterus majori/sororculus*, which produced broadband FM/QCF echolocation calls at low duty cycle, but with a lower maximum energy, at about 48.5 kHz. The fundamenetal being most intense with short duration pulses of about 4.5 ms.
Ramasindrazana *et al.* (2011: 294) recorded 20 calls from 7 *Miniopterus sororculus* specimens, and found the following echolocation call values: Frequency of maximum energy: 55.3 ± 0.92 (53.9 - 56.6) kHz, Maximum frequency: 103.2 ± 9.04 (83.0 - 121.0) kHz, Minimum frequency: 51.7 ± 1.08 (50.0 - 53.0) kHz, Call duration: 3.3 ± 0.29 (2.7 - 3.9) ms, Inter pulse interval: 79.3 ± 13.06 (50.8 - 99.8) ms.

HABITAT:
The holotype of *M. sororculus* was collected in a small limestone cave surrounded by pseudosteppe at 1,450 m (Goodman *et al.*, 2007b). This species is known to use rock crevices and deeper caves as day roosts (Goodman *et al.*, 2007b). At Antsampandrano, this species was found occupying a day roost in the attic of a building occupied by people. Further, it has been obtained in open dry savanna in the central west of Madagascar (Goodman *et al.*, 2007b).

ROOST:
Wilkinson *et al.* (2012: 160) mention that caves are the typical roosting sites for this species on Madagascar.

POPULATION:
Structure and Density - There is no information available on the population status of this recently described endemic species (Jenkins *et al.*, 2008f; IUCN, 2009).
Trend - 2008 - Unknown (Jenkins *et al.*, 2008f; IUCN, 2009).

PARASITES:
Dietrich *et al.* (2014: Suppl.) and Gomard *et al.* (2016: 5) report the presence of spirochaetes of the genus *Leptospira*, which Dietrich *et al.* (2018a: 3) identified as *L. borgpetersenii*.

Ramasindrazana *et al.* (2016: 6) recovered *Litomosa* Clade 1 and 2 (Nematoda: Onchocercidae) from this species.

Tortosa *et al.* (2013: 4) reported the presence of *Penicillidia leptothrinax*, a Nycteribiid bat fly. Ramasindrazana *et al.* (2017: Suppl.) mentioned the bat fly *Nycteribia stylidiopsis* (but the specimen on which this was found - UADBA 43264 - is here considered to be a *M. majori*).

VIRUSES:
Paramyxoviridae
Wilkinson *et al.* (2012: 160) tested 1 individuals from the Mauritius using RT-PCR specific for Respirovirus/Morbillivirus/Henipahvirus (RMH) and Paramyxovirinae (PMV) and found 1 positive results for viral nucleic acids.

2 out of 22 Madagascan specimens tested by Mélade *et al.* (2016b: 4) were positive for paramyxoviruses.

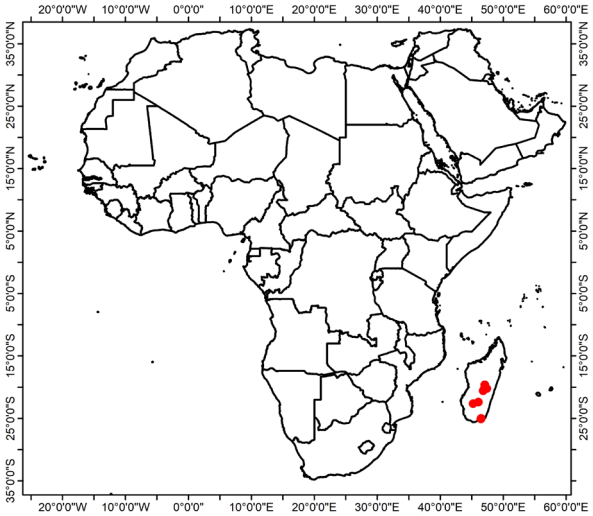

Figure 228. Distribution of *Miniopterus sororculus*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Madagascar.

Miniopterus villiersi Aellen, 1956

1956. *Miniopterus inflatus villiersi* Aellen, Bull. IFAN, (A) 18: 890. Type locality: Guinea: Dalaba: Grotte du Marché [10 42 N 12 15 W] [Goto Description]. Holotype: MHNG IFAN 54-1-1: ad ♂. Collected by: A. Villiers; collection date: 16 April 1954; original number: 2839. Former number IFAN: 54-1-1. - Comments: Considered a valid subspecies by Fahr and Ebigbo (2003: 128; 2004: 73), Fahr (2007a: 104). Aellen (1956a: 891) mentions 2 ♂♂ and 5 ♀♀ paratypes.
1965. *Miniopterus schreibersii villiersi:* Koopman, Am. Mus. Novit., 2219: 19. Publication date: 22 June 1965. (Name Combination)
2006. *Miniopterus (schreibersii) villiersi:* Fahr, Djossa and Vierhaus, Rapid assessment of bats (Chiroptera) in Déré, Diécké and Mt. Béro classified forests, southeastern Guinea; including a review of the distribution of bats in Guinée Forestière., 40: 74. (Name Combination)
2006. *Miniopterus villiersi:* Fahr, Djossa and Vierhaus, Rapid assessment of bats (Chiroptera) in Déré, Diécké and Mt. Béro classified forests, southeastern Guinea; including a review of the distribution of bats in Guinée Forestière: 74.. (Current Combination)
2017. *Miniopterus screibersii villiersi:* Reardon and Schoeman, Acta Chiropt., 19 (2): Suppl.. Publication date: December 2017. (Lapsus)
? *Miniopterus fraterculus villiersi:*

TAXONOMY:
For a long time, *villiersi* was considered to be a synonym or a subspecies of either *M. inflatus*, *M. schreibersii* or *M. natalensis*. Fahr *et al.* (2006a: 74), Weber and Fahr (2006: "4"), Jacobs *et al.* (2008x: 74) and Monadjem *et al.* (2016y: 371) indicated that *villiersi* represents a separate species (restricted to the Upper-Guinea forest zone), a view which is currently gaining support as detailed genetic analyses indicate the presence of multiple taxa in West Africa.

COMMON NAMES:
German: Lanflügelfledermaus.

GENERAL DISTRIBUTION:
Probably restricted to the Upper-Guinea forest zone, including Guinea (Decher *et al.*, 2016: 274).

HABITAT:
Monadjem *et al.* (2016y: 371) recorded *M. (schreibersii) villiersi* from altitudes between 460 and 900m in the Mount Nimba area.

ROOST:
Monadjem *et al.* (2016y: 371) found *Miniopterus (schreibersii) villiersi* roosting in old mine adits in the Mount Nimba area.

PARASITES:
HAEMOSPORIDA
Schaer *et al.* (2013a: 17416) report the presence of hemosporidian parasites of the genus *Polychromophilus* in three out of 12 investigated *M. villiersi* specimens from West Africa. Rosskopf *et al.* (2018: Suppl.) also found *Polychromophilus* sp. in bats from Guinea.

ACARI
Uchikawa (1985a: 19) indicates that *Miniopterus villiersi* is one of the true hosts of "typical" *Calcarmyobia congoensis* Uchikawa, 1982 (Acari: Myobiidae).

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Cameroon, Guinea, Nigeria.

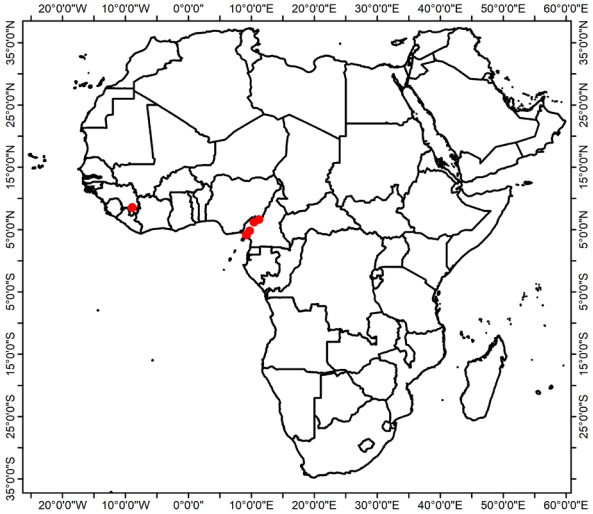

Figure 229. Distribution of *Miniopterus villiersi*

†Family PHILISIDAE Sigé, 1985

1985. *Philisidae* Sigé, Geol. Palaeontol., 19: 161-189. - Comments: Described as a distinct Family level.

TAXONOMY:
Ravel *et al.* (2014) confirmed the family status of the Philisidae within the superfamily Vespertilionoidae based on a cladistic assesment of the dental data, and that they represent the earliest offshoot of this superfamily (p. 698).

Sigé (1985) [in Ravel *et al.* (2014: 696)] concluded that the Philisidae could have originated in Late or Middle Eocene from a generalized Vespertilionidae after the divergence between the Molossidae and the Vespertilionidae sensu lato.

Ravel *et al.* (2012) suggested that *Philisis* and *Dizzya* were probably split of from the third genus of the family (*Witwatia*) in the Early Eocene. Ravel *et al.* (2012: 699), however, doubt the close relationship between the two former genera.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
According to Ravel *et al.* (2014: 691), Philisids were among the most common African bats in the Palaeogene (66 to 23.03 mya). They were found in the Late Eocene - Early Oligocene deposits of the Fayum Depression in Egypt, together with extant bat families, such as Rhinopomatidae, Megadermatidae, Emballonuridae and Myzopodidae (Sigé, 1985; Gunnell *et al.*, 2008, 2014).

†Genus ***Dizzya*** Sigé, 1991

*1991. *Dizzya* Sigé, N. Jb. Geol. Paläont. Abh., 182: ?. - Comments: Type species - *Dizzya exultans* Sigé, 1991. (Current Combination)

TAXONOMY:
Currently recognized species of *Dizzya*: ***†exsultans*** Sigé 1991.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Early. Eocene.

DENTAL FORMULA:
Ravel *et al.* (2011: 402) indicate that *Dizzya* differs from the other Philisidae in showing a nyctalodont molar structure.

†***Dizzya exsultans*** Sigé, 1991

*1991. *Dizzya exsultans* Sigé, N. Jb. Geol. Paläont. Abh., 182: ?. Type locality: Tunisia: Chambi. - Comments: Marandat (1994: 62) mentions the holotype to consist of a right M^1 or M^2.

. (Current Combination)

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Time frame - Early Eocene (Ypresian).

DETAILED MORPHOLOGY:
Ravel *et al.* (2014: 694) indicate that *Dizzya exsultans* is the smallest representative of the Philisidae. Together with *Witwatia sigei*, it is also the oldest. Based on data from Gunnell *et al.* (2009), Ravel *et al.* (2014: 702) estimated the body weight for this bat to be about 8.6 to 9.1 g.

†Genus ***Philisis*** Sigé, 1985

*1985. *Philisis* Sigé, Geol. Palaeontol., 19: ?. - Comments: Type species - *Philisis sphingis* Sigé, 1985. (Current Combination)

TAXONOMY:
May be a junior synonym of *Provampyrus*.

Ravel *et al.* (2014: 699) indicate that the genus might be paraphyletic.

Known species of *Philisis*: †*sevketi* Sigé, Thomas, Sen, Gheerbrant, Roger & Al-Sulaimani 1994 (Oman), †***sphingis*** Sigé 1985.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Ravel *et al.* (2014: 699) indicate that fossils of this genus were only found in deposits dating from the Early Oligocene.

†***Philisis sphingis*** Sigé, 1985

*1985. *Philisis sphingis* Sigé, Geologica et Palaeontologica, 19: ?. Holotype: YPM MAM 034488:. Right maxilla (P^4-M^3): see Gunnell *et al.* (2008: 2). (Current Combination)

DETAILED MORPHOLOGY:
Based on data from Gunnell *et al.* (2009), Ravel *et al.* (2014: 702) estimated the body weight for this bat to be between 36 to 74 g.

†Genus ***Witwatia*** Gunnell, Simons and Seiffert, 2008

*2008. *Witwatia* Gunnell, Simons and Seiffert, J. Vert. Paleont., 28 (1): 2. - Comments: Type species - *Witwatia schlosseri* Gunnell, Simons and Seiffert, 2008. - Etymology: *Wit Wat*, Egyptian Arabic for large, flapping wings (Gunnell *et al.*, 2008). (Current Combination)

TAXONOMY:
See Gunnell *et al.* (2008).

Ravel *et al.* (2014: 702) mention that the differences between *W. schlosseri* and *W. eremicus* (both found in the same locality: BQ2, Fayum, Egypt), might be attributed to the presence of a sexual dimorphism, where the former might represent the larger female and he latter the smaller male. But they also indicate that this is currently speculative.

Known species of the genus *Witwatia*: †***eremicus*** Gunnell, Simons and Seiffert, 2008; †***schlosseri*** Gunnell, Simons and Seiffert, 2008; †***sigei*** Ravel, Marivaux, Tabuce, Bel Haj Ali, Essid, and Vianey-Liaud, 2012.

SIMILAR SPECIES:
See Gunnell *et al.* (2008).

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
See Gunnell *et al.* (2008).

Timeframe - Ravel *et al.* (2014: 699) indicate that fossils were found dating back between the early and latest Eocene.

GENERAL DISTRIBUTION:
Egypt (Gunnell *et al.*, 2008).

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:
See Gunnell *et al.* (2008).

†***Witwatia eremicus*** Gunnell, Simons and Seiffert, 2008

*2008. *Witwatia eremicus* Gunnell, Simons and Seiffert, J. Vert. Paleont., 28 (1): 3, 4, 5. Type locality: Egypt: Fayum Depression: Quarry BQ-2: Umm Rigl Member of the Birket Qurun Formation. - Etymology: *Eremikos*, Greek for solitude, in reference to the vast solitude of the Egyptian Western Desert (Gunnell *et al.*, 2008). (Current Combination)

TAXONOMY:
See Gunnell *et al.* (2008).

SIMILAR SPECIES:
See Gunnell *et al.* (2008).

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
See Gunnell *et al.* (2008).

Time frame - Earliest Late Eocene (Priabonian), Umm Rigl Member of the Birket Qarum formation.

GENERAL DISTRIBUTION:
Egypt (Gunnell *et al.*, 2008).

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:
See Gunnell *et al.* (2008).

DETAILED MORPHOLOGY:
Based on data from Gunnell *et al.* (2009), Ravel *et al.* (2014: 702) estimated the body weight for this bat to be about 40 to 98 g.

†***Witwatia schlosseri*** Gunnell, Simons and Seiffert, 2008

*2008. *Witwatia schlosseri* Gunnell, Simons and Seiffert, J. Vert. Paleont., 28 (1): 2, 3, fig. 3D. Type locality: Egypt: Fayum Depression: Quarry BQ-2: Umm Rigl Member of the Birket Qarun Formation. Holotype: CGM 83668:. Left dentary (c1-m3): see Gunnell *et al.* (2008: 3). - Etymology: Specific name for Max Schlosser who described the first fossil bat from the Fayum (Gunnell *et al.*, 2008). (Current Combination)

TAXONOMY:
See Gunnell *et al.* (2008).

SIMILAR SPECIES:
See Gunnell *et al.* (2008).

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
See Gunnell *et al.* (2008).

Time frame - Earliest Late Eocene (Priabonian), Umm Rigl Member of the Birket Qarum formation.

GENERAL DISTRIBUTION:
Egypt (Gunnell *et al.*, 2008).

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:
See Gunnell *et al.* (2008).

DETAILED MORPHOLOGY:
Based on data from Gunnell *et al.* (2009), Ravel *et al.* (2014: 702) estimated the body weight for this bat to be between 57 and 116 g.

†***Witwatia sigei*** Ravel, Marivaux, Tabuce, Bel Haj Ali, Essid, and Vianey-Liaud, 2012

*2012. *Witwatia sigei* Ravel, Marivaux, Tabuce, Bel Haj Ali, Essid, and Vianey-Liaud, Palaeontology, 55 (5): 1035, 1036, fig. 2. Publication date: 18 September 2012. Type locality: Tunisia: Kasserine

area: Chambi [Goto Description]. Holotype: ONM CB1-230: unknown / no information. Collected by: ?: Collector Unknown. Presented/Donated by: ?: Collector Unknown. Left upper molar (M2), see Ravel *et al.* (2012: 1036). - Etymology: In honour of Bernard Sigé, who first extensively described Paleogene bats remains, including those from Chambi (see Ravel *et al.*, 2012: 1036). (Current Combination)

DETAILED MORPHOLOGY:
Based on data from Gunnell *et al.* (2009), Ravel *et al.* (2014: 702) estimated the body weight for this bat to be about 100 g.

Family VESPERTILIONIDAE Gray, 1821

1815. *Vespertilia* Rafinesque, Analyse de la Nature, 54. - Comments: Type genus: *Vespertilio* Linnaeus, 1758. Conserved by Direction 98 (IUCN , 1958), which also corrected the name to Vespertilionidae. Originally included the subfamilies Lophinia (Rafinesque, 1815) [including the genera *Rhinolophus* Lacépède, 1799; *Phyllostoma* G. Cuvier, 1800 [= *Phyllostomus* Lacépède, 1799]; *Vampyrum* Rafinesque, 1815; and *Megaderma* É. Geoffroy, 1810]; and Nycteria (Rafinesque, 1815) [including the genera *Pteropus* Brisson, 1762; *Eidolon* Rafinesque, 1815; *Pteronotus* Rafinesque, 1815; *Cephalotes* É. Geoffroy, 1810 [= *Nyctimene* Borkhausen, 1797]; *Tadaris* [sic = *Tadarida*] Rafinesque, 1814; *Vespertilio* Linnaeus, 1758; *Nycterus* [sic = *Nycteris*] É. Geoffroy and G. Cuvier, 1795; *Noctilio* Linnaeus,
1766; *Molossus* É. Geoffroy, 1805; and *Atalapha* Rafinesque, 1814 [= *Nyctalus* Bowdich, 1825: 36]] (see Jackson and Groves, 2015: 264).

*1821. *Vespertilionidæ* Gray, London Med. Repos., 15: 299. Publication date: 1 April 1821. - Comments: Type genus: *Vespertilio* Linnaeus, 1758. Dobson (1878: 167) refers to Dobson, 1875 (p. 347), indicating that Gray's (1866) definition includes genera beloning to very distinct families. Originally included the genera *Megadermes* [sic = *Megaderma*] É. Geoffroy, 1810; *Rhynolophus* [sic = *Rhinolophus*] Lacépède, 1799; *Nycterus* [sic = *Nycteris*] É. Geoffroy and G. Cuvier, 1795; *Rhynopoma* [sic = *Rhinopoma*] É. Geoffroy, 1818; *Thaphosores* [sic = *Taphozous*] É. Geoffroy, 1818; *Vespertilio* Linnaeus, 1758; *Pecotus* [sic = *Plecotus*] É. Geoffroy, 1818; and *Barbastella* J. Gray, 1821 (see Jackson and Groves, 2015: 264). The name was conserved by Direction 98 (ICZN, 1958: 131). (Current Combination)

1825. *Vespertilionina* Gray, Ann. Philos., 10 (5): 339. Publication date: November 1825. - Comments: Type genus: *Vespertilio* Linnaeus, 1758. Originally include the genera *Vespertilio* Linnaeus, 1758; *Plecotus* É. Geoffroy, 1818; *Barbastellus* J. Gray, 1825 [= *Barbastella* J. Gray, 1821]; *Proboscidea* Spix, 1823 [= *Rhynchonycteris* Peters, 1867; *Thyroptera* Spix, 1823; and *Caelano* [sic = *Celaeno*] Leach, 1821 [= *Noctilio* Linnaeus, 1766: 88] (see Jackson and Groves, 2015: 264).

1843. *Gymnorhina* Wagner.

1855. *Nycticeina* Gervais, in: F. Comte de Castelnau, Exped. Partes Cen. Am. Sud., Zool, ???. Publication date: 23 July 1856.

1866. *Nyctophilina* Gray, Ann. Mag. nat. Hist., ser. 3, 17 (98): 91. Publication date: 1 February 1866.

1866. *Plecotina* Gray, Ann. Mag. nat. Hist., ser. 3, 17 (98): 91. Publication date: 1 February 1866.

1866. *Romiciana* Gray, Ann. Mag. nat. Hist., ser. 3, 17 (98): 90. Publication date: 1 February 1866.

1866. *Vespertiliones* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, 1865: 524. - Comments: Type genus: *Vespertilio* Linnaeus, 1758. Originally included the genera *Synotus* Keyserling & Blasius, 1839 [= *Barbastella* J. Gray, 1821]; *Plecotus* É. Geoffroy, 1818; *Histiotus* Gervais, 1855; *Otonycteris* Peters, 1859; *Miniopterus* Bonaparte, 1837; *Vespertilio* Linnaeus, 1758; *Vesperugo* Keyserling and Blasius, 1839 [= *Vespertilio* Linnaeus, 1758]; *Vesperus* Keyserling and Blasius, 1839 [= *Vespertilio* Linnaeus, 1758]; *Murina* J. Gray, 1842; *Harpiocephalus* J. Gray, 1842; *Nycticejus* [sic = *Nycticeius*] Rafinesque, 1819]; *Atalapha* Rafinesque, 1814 [= *Nyctalus* Bowdich, 1825]; *Thyroptera* Spix, 1823; and *Antrozous* H. Allen, 1862 (see Jackson and Groves, 2015: 265). Jackson

and Groves (2015: 227) consider this (family) name a homonym of Vespertiliones Pallas, 1767, and indicated that it covers the Vespertionidae family, rather than the Vespertilioninae subfamily. Not Vespertiliones Dobson, 1878, a group name for the subfamily Vespertilioninae.

1869. *Gymnorhinida* Fatio, Faune des Vertébrés de la Suisse.

1872. *Vespertilionidae:* Gill, Smiths. Misc. Coll., 11 (1): 17. Publication date: November 1872. - Comments: Type genus: *Vespertilio* Linnaeus, 1758. Originally included the subfamilies Vespertilioninae J. Gray, 1821 and Nycticejinae Gill, 1872 (see Jackson and Groves, 2015: 265).

1893. *Nycteridae:* Schulze. - Comments: Not of Van der Hoeven, 1855. Not of Dobson, 1875 (see Pavlinov *et al.*, 1995: 93).

1893. *Vespertilionini* Winge, Samling af Afhandlinger. E Museo Lundii, 2 (1): 24. - Comments: Introduced as tribe (?). Jackson and Groves (2015: 265) (erroneously?) mention *Emballonura* Temminck, 1838 as type genus. Originally included the genera *Vespertilio* Linnaeus, 1758 [including the subgenera *Kerivoula* J. Gray, 1842; *Natalus* J. Gray, 1838; and *Nyctiellus* Gervais, 1855]; *Plecotus* É. Geoffroy, 1818; *Minyopterus* Agassiz, 1846 [= *Miniopterus* Bonaparte, 1837]; *Lasionycteris* Peters, 1865; *Vesperugo* Keyserling and Blasius, 1839 [= *Vespertilio* Linnaeus, 1758]; *Harpyiocephalus* J. Gray, 1866 [= *Harpiocephalus* J. Gray, 1842]; *Synotus* Keyserling & Blasius, 1839 [= *Barbastella* Gray, 1821]; *Chalinolobus* Peters, 1865; *Otonycteris* Peters, 1859; *Nyctophilus* Leach, 1821; *Atalapha* Rafinesque, 1814 [= *Nyctalus* Bowdich, 1825]; and *Antrozous* H. Allen, 1862 (see Jackson and Groves, 2015: 265).

1907. *Nyctophilinæ* Miller, Bull. U.S. natl. Mus., 57: xi, *234*. Publication date: 29 June 1907. - Comments: Type genus: *Nyctophilus* Leach, 1821. Originally included the genera *Antrozous* H. Allen, 1862 and *Nyctophilus* Leach (see Jackson and Groves, 2015: 270).

1942. *Myotini* Tate, Bull. Am. Mus. Nat. Hist., 80 (7): 221, 229. Publication date: 27 November 1942. - Comments: Type genus: *Myotis* Kaup, 1829. Introduced as tribe, and originally included the genera *Myotis* Kaup, 1829; *Lasionycteris* Peters, 1865; *Plecotus* É. Geoffroy, 1818; *Corynorhinus* H. Allen, 1865; *Idionycteris* Anthony, 1923; and *Euderma* H. Allen, 1891 (see Jackson and Groves, 2015: 280).

2008. *Vespertolionidae:* Selim, Nahla, and Shelfeh, Tishreen Univ. J. Res. Sci. Stud. - Biol. Sci. Ser., 30 (1): 247. (Lapsus)

2018. *Vespertilionnidae:* Malekani, Musaba, Gembu, Bugentho, Toengaho, Badjedjea, Ngabu, Mutombo, Laudisoit, Ewango, Van Cakenberghe, Verheyen, Asimonyo, Masudi, Bongo and Ngbolua, Nat. Conserv. Res., 3 (1): 67.. Publication date: January 2018. (Lapsus)

? *Vespertilioninae sp.:*

TAXONOMY:

Systematicians have long recognized that Vespertilionidae as so defined, is diagnosed by few if any apomorphies, and some data have been cited as evidence that the family is not monophyletic. For example, *Tomopeas ravus* (the only member of the subfamily Tomopeatinae) shares immunological affinities and several derived morphological and molecular traits with molossidis (Miller, 1907; Davis, 1970; Barkley, 1984; Pierson, 1986; Sudman *et al.* (1994). Miniopterines, which differ from other vespertilionids in several aspects of fetal development and adult morphology, show immunological affinity with molossids (Mein and Tupinier, 1977; Gopalakrishna and Chari, 1983; Pierson, 1986). Kerivoulines share derived morphological traits with Natalidae, Thyropteridae, Furipteridae, and Myzopodidae (Sigé, 1974; Van Valen, 1979). These patterns have lead various workers to suggest removal of one or more subfamilies from Vespertilionidae (Davis, 1970; Sigé, 1974; Mein and Tupinier, 1977; Van Valen, 1979; Gopalakrishna and Chari, 1983; Barkley, 1984; Sudman *et al.*, 1994). Each of the eight vespertilionid subfamilies just listed appears to be monophyletic, with the exception of Vespertilioninae, which may be paraphyletic. In morphology, Vespertilioninae is "perhaps best characterized by absence of the special modifications that distinguish the other groups" (Miller, 1907: 197). Volleth and Heller, 1994) describe several derived karyotype features that diagnose Vespertilioninae (including Nyctophilinae but exclude Myotinae), but their study did not include any members of Antrozoinae or Lasiurini.

Molecular phylogenetics reviewed by Hoofer and Van Den Bussche (2003).

Roehrs *et al.* (2011: 24) suggest the following subdivision in tribes/groups:
Vespertilionini (*Nyctalus, Pipistrellus, Scotoecus, Vespertilio*)

Hypsugine group (*Chalinolobus, Vespadelus, Hypsugo, Nycticeinops, Neoromicia, Laephotis, Tylonycteris*)
Eptesicini / Nycticeiini (*Arielulus, Lasionycteris, Glauconycteris, Nycticeius, Eptesicus, Scotomanes*)
Perimyotine group (*Parastrellus, Perimytois*)
Scotophilini (*Scotophilus*)
Antrozini (*Antrozous, Rhogeessa, Baeodon*)
Lasiurini (*Lasiurus*)
Plecotini (*Corynorhinus, Otonycteris, Barbastella, Plecotus, Idionycteris*).

Known genera in the subfamily Vespertilioninae:
Tribe Eptesicini Volleth and Heller, 1994 - *Arielulus* Hill and Harrison, 1987; ***Eptesicus*** Rafinesque, 1820; *Hesperoptenus* Peters, 1868.
Tribe Lasiurini Tate, 1942 - *Lasiurus* Gray, 1831.
Tribe Nycticeiini Gervais, 1855 - ***Nycticeinops*** Hill and Harrison, 1987; *Nycticeius* Rafinesque, 1819; *Rhogeessa* H. Allen, 1866; *Scoteanax* Troughton, 1943; ***Scotoecus*** Thomas, 1901; *Scotomanes* Dobson, 1875; ***Scotophilus*** Leach, 1821; *Scotorepens* Troughton,1943.
Tribe Nyctophilini Peters,1865 - *Nyctophilus* Leach, 1821; *Pharotis* Thomas, 1914.
Tribe Pipistrellini Tate, 1942 - *Glischropus* Dobson, 1875; *Nyctalus* Bowditch, 1825; ***Pipistrellus*** Kaup, 1829; *Scotozous* Dobson, 1875.
Tribe Plecotini Gray, 1866 - *Barbastella* Gray, 1821; *Corynorhinus* H. Allen, 1865; *Euderma* H. Allen, 1892; *Idionycteris* Anthony, 1923; ***Otonycteris*** Peters, 1859; ***Plecotus*** E. Geoffroy Saint-Hilaire, 1818.
Tribe Vespertilionini Gray, 1821 - *Chalinolobus* Peters, 1867; *Eudiscopus* Conisbee, 1953; *Falsistrellus* Troughton, 1943; ***Glauconycteris*** Dobson, 1875; *Histiotus* Gervais, 1856; ***Hypsugo*** Kolenati, 1856; *Ia* Thomas, 1902; ***Laephotis*** Thomas, 1901; ***Mimetillus*** Thomas, 1904; ***Neoromicia*** Roberts, 1926; *Philetor* Thomas, 1902; *Tylonycteris* Peters, 1872; *Vespadelus* Troughton, 1943; *Vespertilio* Linnaeus, 1758.

COMMON NAMES:
Czech: netopýrovití, netopýři holonosí. Dutch: Gladneusvleermuizen. English: Evening bats, Vespertilionid bats, Vesper Bats, Plain-faced Bats, Simple-nosed Bats. Finnish: Siipat. French: Vespertilionidés. German: Glattnasen, Glattnasen-Fledermäuse. Italian: Vespertiliònidi. Norwegian: Glattneser, Glattneseflaggermus. Polish: mroczkowate. Romanian: Lilieci cu tragus. Russian: Гладконосые. Spanish (Castillian): Murcielagos chicos, Murciélagos de cola envainada. Vietnamese: Họ dơi muỗi

ETYMOLOGY OF COMMON NAME:
Rosevear (1965) uses the colloquial name vesper bats, borrowing it from the name for the family, which is derived from the Latin for a bat, *vespertilio*. They are sometimes called 'evening bats' because of their time of activity (Taylor, 2005).

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Shi and Rabosky (2015: 1537) report the family-level stem ages/crown ages for the Vespertilionidae (including Miniopteridae and Cistugidae) to be 52.1 and 51.1 million years ago, respectively.

The oldest African fossil assigned to this family is *Khonsunycteris aegypticus* from the late Eocene (ca. 34 MYA) of the Fayum, Egypt (Hand *et al.*, 2016: 7).

GENERAL DISTRIBUTION:
Luo *et al.* (2019) investigated the geographic range of 126 vespertilionid bat species (including 20 African) in relation to their wing morphology and found that species with higher wing loading have larger distribution ranges than those with lower wing loading, and that the size of geographic ranges was associated with wing aspect ratio.

ROOST:
López-Baucells *et al.* (2018: 30) examined the roost selection by synanthropic bats in rural Madagascar and found that small colonies of vespertilionid bats had a preference for small, traditional houses made of mud and wood, especially if the roof was made from leaves.

PREDATORS:
Mikula *et al.* (2016: Supplemental data) mention a Vespertiliondae bat taken as prey by a Swamp boubou (*Laniarius bicolor* (Verreaux, 1857)) in Botswana.

PARASITES:
Fain (1994: 1280) reports that three genera of Myobiidae (Acari) are occurring on members of the Vespertilionidae: *Acanthophthirius*, with 4 subgenera (*Acanthophtirius, Myotimyobia, Chiromyobia, Mimetillobia*) and 47 species, *Pteracarus* with 21 species, and *Calcarmyobia* with 18 species and 8 subspecies. The latter genus is restricted to bats of the genus *Miniopterus*, and since this genus is currently included in a family of its own, this implies that only two genera of Myobiidae parasite on Vespertilionidae.

VIRUSES:
A paramyxovirus was detected in one out of nine Vespertilionidae bats sampled in Kirindy in Madagascar (Wilkinson *et al.*, 2014).

Subfamily Kerivoulinae Miller, 1907

*1907. *Kerivoulinae* Miller, Bull. U.S. natl. Mus., 57: 232. Publication date: 29 June 1907. - Comments: Type genus: *Kerivoula* Gray, 1842. Originally included the genera *Kerivoula* J. Gray, 1842 and *Phoniscus* Miller, 1905 (see Caron *et al.*, 2018: 265). (Current Combination)

TAXONOMY:
Known genera in the Kerivoulinae: †***Chamtwaria*** Butler, 1884; ***Kerivoula*** Gray, 1842; *Phoniscus* Miller, 1905.

COMMON NAMES:
Czech: vlnouškové, kerivuly. English: Forest Bats, Woolly bats.

†Genus ***Chamtwaria*** Butler, 1984

*1984. *Chamtwaria* Butler, Palaeovert., 14 (3): 117, 187. Publication date: 15 November 1984 [Goto Description]. (Current Combination)

TAXONOMY:
Was assigned to the Vespertilionidae by Beard *et al.* (1992).

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Timeframe- Early Miocene (Burdigalian).

Known species in the genus *Chamtwaria*: †***pickfordi*** Butler, 1984.

†***Chamtwaria pickfordi*** Butler, 1984

*1984. *Chamtwaria pickfordi* Butler, Palaeovert., 14 (3): 118, 187, figs 25 A, A'. Publication date: 15 November 1984. Type locality: Kenya: Tinderet (volcano) Region, Songhor, Kapurtay agglomeration: Chamtwara [Goto Description]. - Etymology: Named after Dr. Martin Pickford. (Current Combination)

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Angola.

Genus ***Kerivoula*** Gray, 1842

*1842. *Kerivoula* Gray, Ann. Mag. nat. Hist., [ser. 1], 10 (65): 258. Publication date: 1 December 1842. - Comments: Type species: *Vespertilio pictus* Pallas, 1767. Gray (1842: 258) mentions *Vesp. Hardwickii Horsfield, V. picta* Pallas, *V. tenuis*, G. Gärtneri [and *Kerivoula griseus, Kerivoula Poensis*]. Type species by subsequent designation (Peters, 1867c) (see Corbet and Hill, 1992: 153). Allen (1939a: 100) mentioned *Vespertilio hardwickii* Horsfield as genotype. - Etymology: Rosevear suggested that *Kerivoula* was derived from the Cingalese name for the Painted Bat, kehel vuhla. Flannery (1995a: 369) indicates that it was derived from the Ceylonese for plantain (banana) bat. (Current Combination)

1849. *Kirivoula* Gervais, Dictionnaire Universelle d'Histoire naturelle, 13: 213. Publication date: 1849. - Comments: Emendation (see Meester *et al.*, 1986: 63). (Emendation)

1861. *Nyctophylax* Fitzinger, Sber. k. Akad. Wiss. Wien, math. naturw. Kl., 42: 390 (for 1860). Publication date: 1861. - Comments: "Apparently based on *Vespertilio tralatitius*, Temminck, 1840 =*V. tralatitius* Horsfield, 1824, an indeterminable name according to Laurie and Hill (1954: 66). According to Palmer (1904), *Nyctophylax* was 'a new name for

the barbaric *Kerivoula* Gray, 1842'" (see Corbet and Hill, 1992: 153). Mentioned as a possible synonym (question mark) by Pavlinov *et al.* (1995: 93). - Etymology: From the Greek "*νύξ*" or "*νυκτός*", meaning night and "*φύλαξ*", meaning watcher (see Palmer, 1904: 467).

1870. *Nyctophilax:* Fitzinger, Sber. k. Akad. Wiss. Wien, math. naturw. Kl., 62 (1): 544. Publication date: November 1870. (Lapsus)

1891. *Cerivoula* Blanford, The fauna of British India, including Ceylon and Burma. Part II, 338. Publication date: 1891. - Comments: Emendation (see Meester *et al.*, 1986: 63). (Emendation)

1904. *Kehelvoulha* Jentink, Notes Leyden Mus., 24 (4): 175 (for 1902). Publication date: 15 Jul 1904. - Comments: *Nomen nudum*. Jentink (1904: 175) suggests that this should be the etymologically correct name, but adds immediately that this name has no taxonomical value whatsoever.

2005. *Keivoula:* Struebig, Rossiter, Bates, Kingston, Sai Sein Lin Oo, Aye Aye Nwe, Moe Moe Aung, Sein Sein Win and Khin Mya Mya, Acta Chiropt., 7 (1): 14. (Lapsus)

? *Kerivoula sp.:*

TAXONOMY:

Phoniscus Miller, 1906, has been included in *Kerivoula* as either a subgenus (Ellerman and Morrison-Scott, 1951; Ellerman *et al.*, 1953) or a synonym (Ryan, 1965). Hill (1965) argues for the generic separation of *Phoniscus* from *Kerivoula*, and this view appears to be widely accepted (Rosevear, 1965; Hayman and Hill, 1971; Corbet and Hill, 1992), but see Koopman (1982).

The species *aerosa* Tomes, 1858, was described from the east coast of South Africa, but Roberts (1951: 76) questions whether the description is not that of an immature *argentata*, although the colour is reminiscent of *lanosa*; Ellerman *et al.* (1953) point out that the type specimen resembles the Oriental species of *Kerivoula* (in which they include *Phoniscus*) rather than *argentata* or *lanosa*; Hill (1965: 553) has shown that *aerosa* should be transferred to the Asiatic *Phoniscus*. Hayman and Hill (1971) question the African origin of *aerosa*, and Corbet and Hill (1980) dubiously place it in Southeast Asia, while Koopman (1982) cite the provenance as 'possibly Africa'. In view of the considerable doubt about the status and origin of this species it is not treated as a member of the southern African fauna.

Known species of the genus *Kerivoula*: ***africana*** Dobson, 1878; *agnella* Thomas, 1908 – Louisiade Arch., Woodlark and D'Entrecasteaux Isls (Papua New Guinea) (Simmons, 2005: 526); ***argentata*** Tomes, 1861; ***cuprosa*** Thomas, 1912; ***eriophora*** (Heuglin, 1877); *flora* Thomas, 1914 – Borneo, Lesser Sunda Isls, Bali, Sumbawa and Sumba (Indonesia), Vietnam and Thailand (Simmons, 2005: 526); *hardwickii* (Horsfield, 1824) – India and Sri Lanka, Burma, Laos, Cambodia, Vietnam, Thailand, China, western Malaysia, Borneo, Java, Sumatra, Nusa Penida, Mentawai Isls, Sulawesi, Bali, Lesser Sundas, Kangean Isl and Talaud Isl (Indonesia), Philippines (Simmons, 2005: 526); *intermedia* Hill and Francis, 1984 – Borneo, western Malaysia (Simmons, 2005: 527); ***lanosa*** (A. Smith, 1847); *lenis* Thomas, 1916 – northeastern and southern India, western Malaysia, Sabah (Simmons, 2005: 527); *minuta* Miller, 1898 – western Malaysia, southern Thailand, Borneo (Simmons, 2005: 527); *muscina* Tate, 1941 – central New Guinea (Simmons, 2005: 527); *myrella* Thomas, 1914 – Bismarck Arch. (Simmons, 2005: 527); *papillosa* (Temminck, 1840) – Thailand, Cambodia, Vietnam, western Malaysia, Sumatra, Java, Sulawesi, Borneo (Simmons, 2005: 527); *pellucid* (Waterhouse, 1845) – Borneo, Philippines, Java and Sumatra, western Malaysia (Simmons, 2005: 528); ***phalaena*** Thomas, 1912; *picta* (Pallas, 1767) – Sri Lanka; India and Nepal to Vietnam, western Malaysia and southern China, Borneo, Sumatra, Java, Bali, Lombok and Molucca Isls (Simmons, 2005: 528); ***smithii*** Thomas, 1880; *whiteheadi* Thomas, 1894 – Philippines, Borneo, southern Thailand, western Malaysia (Simmons, 2005: 528).

COMMON NAMES:

Czech: praví vlnouškové. English: Woolly Bats, Trumpet-eared Bats. French: Chauves-souris peintes. German: Wollfledermäuse. Italian: Cherìvoule.

ECHOLOCATION:

Keeley *et al.* (2018: 13) indicate that some *Kerivoula* species have fundamental frequencies up to 295 kHz and bandwidths up to 155 kHz, which they link to the absence of grooves in the external ear.

Kerivoula africana Dobson, 1878

*1878. *Kerivoula africana* Dobson, Catalogue of the Chiroptera of the collection of the British Museum, p. xl, 331, ul 335. Publication date: June 1878. Type locality: Tanzania: Coast opposite Zanzibar Island [Goto Description]. - Comments: Type specimen: MNHN ???, ad ♂, alcoholic. (Current Combination)

TAXONOMY:
See Simmons (2005).

COMMON NAMES:
Czech: vlnoušek východoafrický, netopýr vlnatý, kerivula africká. English: African Woolly Bat, Tanzanian Woolly Bat. French: Kérivoule de Tanzanie, Chauve-souris peinte de Tanzanie. German: Tanzania-Wollfledermaus.

CONSERVATION STATUS:
Global - MacPhee and Flemming, 1999) considered this species to be extinct, followed by Simmons, 2005), but it was recently rediscovered, see (Burgess *et al.*, 2000). Listed as Endangered (EN B2ab(iii) ver 3.1 (2001)) because its area of occupancy is probably less than 500 km^2, with all individuals in fewer than five locations, and the extent of its forest habitat is continuing to decline (Fahr and Jacobs, 2008; IUCN, 2009).

Assessment History -
2008 - EN B2ab(iii) ver 3.1 (2001) (Fahr and Jacobs, 2008; IUCN, 2009). 2004 - EN B2ab(iii) ver 3.1 (2001) (Fahr and Jacobs, 2004; IUCN, 2004). 1996 - DD (Baillie and Groombridge, 1996). 1994 - Ex (Groombridge, 1994). 1993 - Ex (World Conservation Monitoring Centre, 1993). 1990 - Ex (IUCN 1990). 1988 - Ex (IUCN Conservation Monitoring Centre 1988).

MAJOR THREATS:
It is threatened by the loss of coastal forests, largely through conversion of land to subsistence agriculture and harvesting of timber and firewood for local use (Fahr and Jacobs, 2008; IUCN, 2009).

CONSERVATION ACTIONS:
Fahr and Jacobs (2008) [in IUCN (2009)] report that it has been recorded from Morogoro (presumably within the Morogoro State Forest Reserve) and Genda Genda (possibly in a Forest Reserve). There is a need to prevent further loss of coastal forest habitat. Further studies are needed into the distribution of this species to locate additional populations.

GENERAL DISTRIBUTION:
Endemic to eastern Tanzania, where it has only been recorded from Morogoro; the Genda Genda coastal forest; and the Tong'omba coastal forest.

Native: Tanzania (Matschie, 1895; Swynnerton and Hayman, 1951; Cockle *et al.*, 1998; Burgess *et al.*, 2000).

POPULATION:
Structure and Density - Very little is known about the population of this rarely recorded species (Fahr and Jacobs, 2008; IUCN, 2009).
Trend - 2008 - Decreasing (Fahr and Jacobs, 2008; IUCN, 2009).

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Tanzania.

Kerivoula argentata Tomes, 1861

*1861. *Kerivoula argentata* Tomes, Proc. zool. Soc. Lond., 1861, I: 31, 32. Publication date: May 1861. Type locality: Namibia: Ovamboland: Otjoro [=Otjihoro] [ca. 17 54 S 15 38 E] [Goto Description]. Holotype: [Unknown] ♀. Collection date: 1 December 1859. See Tomes (1861b: 33). Holotype: BMNH 1907.1.1.540: ♀. Collection date: 1 December 1859. Presented/Donated by: ?: Collector Unknown. - Comments: Ansell and Dowsett (1988: 44) indicate the type locality is probably Otjihoro, according to Shortridge (1934: 70). (Current Combination)

1865. *Nycticejus nidicola* Kirk, Proc. zool. Soc. Lond., 1864, III: 651. Publication date: May 1865. Type locality: Mozambique: Zambesi River: Shupanga [=Chupanga] [18 02 S 35 37 E] [Goto Description]. Syntype: BMNH 1864.1.9.37: ad. Collected by: Dr. Kirk. Syntype: BMNH 1864.1.9.38: ad. Collected by: Dr. Kirk. Syntype: BMNH 1864.1.9.39: ad. Collected by: Dr. Kirk. - Comments: (1 ad ♂ + 2 ad ♀♀). Considered a valid subspecies by Ansell and Dowsett (1988: 44.

1924. *Kerivoula nidicola zuluensis* Roberts, Ann. Transv. Mus., 10: 61. Publication date: 31 January 1924. Type locality: South Africa: KwaZulu-Natal: White Umfolosi River [28 19 S 31 50 E] [Goto Description]. Holotype: TM 3025: ad ♂, skin and skull. Collected by: Austin Roberts; collection date: 17 July 1922. Note: In weaver nest with two others. - Comments: Considered a valid subspecies by Taylor (1998: 57).

? *Kerivoula argentata argentata:* (Name Combination)

? *Kerivoula argentata zuluensis:* (Name Combination)

TAXONOMY:
See Simmons (2005).

COMMON NAMES:
Afrikaans: Damara-wolhaarvlermuis, Damaralandse Wolhaarvlermuis. Chinese: 银彩蝠. Czech: vlnoušek damarský. English: Silvery Woolly Bat, Silvered Woolly Bat, Silver Woolly Bat, Damara Woolly Bat. French: Chauve-souris peinte argentée, Chauve-souris laineuse du Damara. German: Bunte Wollfledermaus. Kiluba (DRC): Kasusu. Portuguese: Morcego lanoso da Damaralandia.

ETYMOLOGY OF COMMON NAME:
This species was originally described from a specimen from Damaraland, Namibia (Taylor, 2005).

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
K. argentata may be represented in the late Holocene at Nkupe, South Africa (Avery, 1991: 6).

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Jacobs *et al.*, 2008k; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Jacobs *et al.*, 2008k; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Jacobs *et al.*, 2004h; IUCN, 2004). 1996 - Lower Risk/least concern (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - NT C2a(i) ver 3.1 (2001) (Monadjem *et al.*, 2016f). 2004 - EN B1ab(iii)+2ab(iii) ver 3.1 (2001) (Friedmann and Daly, 2004). 1986 - Indeterminate (Smithers, 1986).

MAJOR THREATS:
There appear to be no major threats to this species as a whole (Jacobs *et al.*, 2008k; IUCN, 2009).

CONSERVATION ACTIONS:
Jacobs *et al.* (2008k) [in IUCN (2009)] report that there appear to be no direct conservation measures in place. It has been recorded from the Kambai Forest Reserve in Tanzania by Cunneyworth (1996b), and seems likely to be present in a number of protected areas within its range. Further studies are needed to determine if the species is truly present in Angola.

GENERAL DISTRIBUTION:
Kerivoula argentata is distributed in East Africa and southern Africa, with some records in southern parts of the Democratic Republic of the Congo and possibly northern Angola in Central Africa (records are uncertain from this country). In East Africa it has been recorded from Kenya and Tanzania in the north, through Zambia, Malawi and Mozambique. In southern Africa, it appears to be widespread in Zimbabwe, with additional scattered records from northeastern South Africa and central Namibia.

For southern Africa, Cooper-Bohannon *et al.* (2016: "5") calculated a potential distribution area of 752,853 km^2.

Native: Congo (The Democratic Republic of the) (Hayman *et al.*, 1966; Monadjem *et al.*, 2010d: 563); Kenya (Aggundey and Schlitter, 1984); Malawi (Happold and Happold, 1997b: 822; Monadjem *et al.*, 2010d: 563); Mozambique (Smithers and Lobão Tello, 1976; Monadjem *et al.*, 2010d: 563; Monadjem *et al.*, 2010c: 383); Namibia (Monadjem *et al.*, 2010d: 563); South Africa (Roberts, 1951; Smithers, 1983; Skinner and Smithers, 1990; Taylor, 2000; Skinner and Chimimba, 2005; Monadjem *et al.*, 2010d: 563); Tanzania, United Republic of (Cunneyworth, 1996b); Zambia (Ansell, 1974; Monadjem *et al.*,

2010d: 563); Zimbabwe (Smithers and Wilson, 1979; Monadjem *et al.*, 2010d: 563).

Presence uncertain: Angola (Hill and Carter, 1941), although Taylor *et al.* (2018b: 63) predict it might occur in that country.

ECHOLOCATION:
See Taylor (1999b).

Schoeman and Waddington (2011: 291) mention a peak frequency of 99 kHz and a duration of 1.7 msec for a specimen from the Mkuze Game Reserve, South Africa.

POPULATION:
Structure and Density - Although this species is rarely encountered, it is not thought to be especially uncommon (Jacobs *et al.*, 2008k; IUCN, 2009).
Trend - 2008 - Unknown (Jacobs *et al.*, 2008k; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
Trentin and Rovero (2011: 51) reported two lactating females, captured at Uzungwa Scarp Forest Reserve, Tanzania, at the end of November 2005.

VIRUSES:
Paramyxoviridae
Mortlock *et al.* (2015: 1841) reported that the one specimen they examined from South Africa tested positive for *Paramyxovirus* sequences.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Congo (Democratic Republic of the), Kenya, Malawi, Mozambique, Namibia, Senegal, South Africa, Tanzania, Zambia, Zimbabwe.

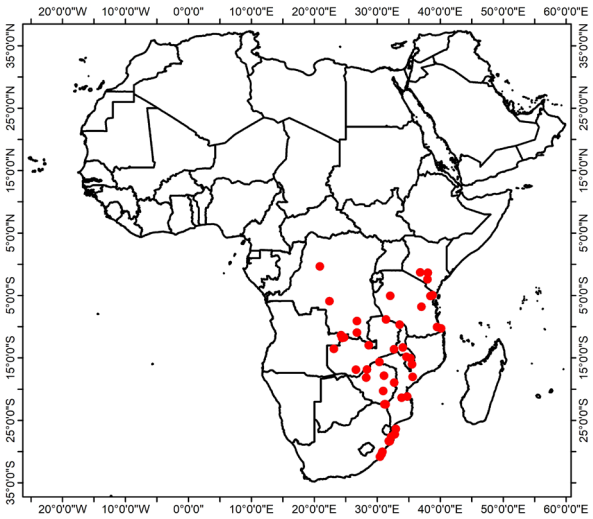

Figure 231. Distribution of *Kerivoula argentata*

Kerivoula cuprosa Thomas, 1912

*1912. *Kerivoula cuprosa* Thomas, Ann. Mag. nat. Hist., ser. 8, 10 (55): 41. Publication date: 1 July 1912. Type locality: Cameroon: Ja River: Bitye [03 13 N 12 22 E, 2 000 ft] [Goto Description]. Holotype: BMNH 1912.10.25.1: ad ♂. Collected by: George Latimer Bates Esq. Collection date: 17 October 1911; original number: 564. (Current Combination)

TAXONOMY:
See Simmons (2005).

COMMON NAMES:
Czech: vlnoušek bronzový. English: Copper Woolly Bat. French: Chauve-souris laineuse cuivrée, Chauve-souris peinte cuivrée. German: Kupferfarbene Wollfledermaus.

CONSERVATION STATUS:
Global - Listed as Data Deficient (DD ver 3.1 (2001)) in view of continuing problems with its taxonomy as well as absence of recent information on its extent of occurrence, ecological requirements and threats (Fahr, 2008b; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) (Fahr, 2008b; IUCN, 2009). 2004 - NT ver 3.1 (2001) (Fahr, 2004m; IUCN, 2004). 1996 - LR/nt (Baillie and Groombridge, 1996).

MAJOR THREATS:
The threats to this species are not well known. In parts of its range it is presumably threatened to some degree by habitat loss resulting from conversion of land to agricultural use, and harvesting of timber and firewood (Fahr, 2008b; IUCN, 2009).

CONSERVATION ACTIONS:
Fahr (2008b) [in IUCN (2009)] reports that jt is unclear if this species is present in any protected areas. Additional studies are needed into the taxonomy, distribution, natural history and threats to this little known bat.

GENERAL DISTRIBUTION:
Scattered records from West and Central Africa. It has apparently been reported from Guinea, Côte

d'Ivoire, Liberia, possibly Ghana (see Koopman *et al.*, 1995; Grubb *et al.*, 1998), Cameroon and the Democratic Republic of the Congo (see Hayman and Hill, 1971). It is found up to 600 m asl.

Grubb *et al.* (1998: 92) indicate that records west of Cameroon are erroneous and probably refer to a specimen from Oda, Ghana in the FMNH that was re-identified as *K. lanosa muscilla*. A record of this species from Kenya was based on a specimen subsequently reidentified as *Kerivoula smithii* (J. Fahr *pers. Comm.,* in Simmons, 2005: 526; and also in Fahr (2008b) [in IUCN (2009)]).

Native: Cameroon; Congo (The Democratic Republic of the); Côte d'Ivoire; Guinea (Fahr and Ebigbo, 2004: 69); Kenya (Harrison, 1957b); Liberia (Koopman, 1989b; Koopman *et al.*, 1995); Uganda (Kityo *et al.*, 2009: 135).
Presence uncertain: Ghana.

POPULATION:
Structure and Density - It appears to be a rare, or rarely recorded, species (Fahr, 2008b; IUCN, 2009).

Trend - 2008 - Unknown (Fahr, 2008b; IUCN, 2009).

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Cameroon, Congo (Democratic Republic of the), Côte d'Ivoire.

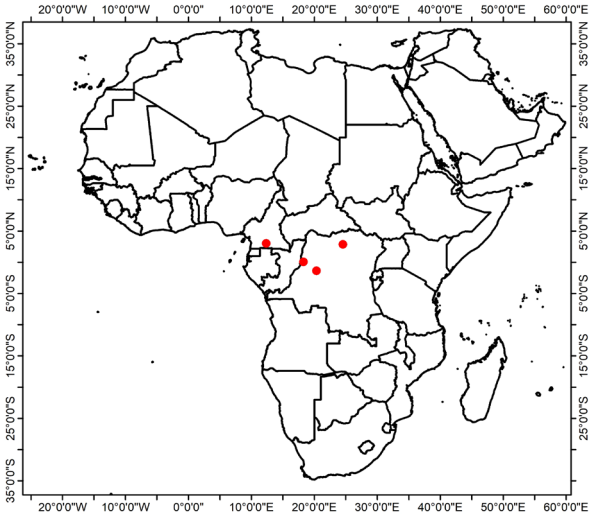

Figure 232. Distribution of *Kerivoula cuprosa*

Kerivoula eriophora (Heuglin, 1877)

*1877. *Nycticejus eriophorus* Heuglin, Reise in Nordost Afrika, 2: 34. Publication date: 1877. Type locality: Ethiopia: Begemdir province: Belegaz Valley: Semian and Wogara, between [ca. 12 50 N 38 20 E] [Goto Description]. - Etymology: From the Greek "*eriophora*" meaning wool-bearing.
? *Kerivoula eriophora:* (Name Combination, Current Combination)

TAXONOMY:
May be conspecific with *africana* which it antedates; see Hayman and Hill (1971: 53) and Simmons (2005: 526).

COMMON NAMES:
Czech: vlnoušek habešský. English: Ethiopian Woolly Bat. French: Chauve-souris laineuse d'Ethiopie, Chauve-souris peinte d'Ethiopie. German: Heuglins Wollfledermaus.

CONSERVATION STATUS:
Global - Listed as Data Deficient (DD ver 3.1 (2001)) in view of continuing problems with its taxonomy as well as absence of recent information on its extent of occurrence, ecological requirements and threats (Fahr, 2008c; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) (Fahr, 2008c; IUCN, 2009). 2004 - DD ver 3.1 (2001) (Fahr, 2004p; IUCN, 2004). 1996 - VU (Baillie and Groombridge, 1996).

MAJOR THREATS:
The threats to this species are not known (Fahr, 2008c; IUCN, 2009).

CONSERVATION ACTIONS:
Fahr (2008c) [in IUCN (2009)] reports that it is not known if the species is present in any protected areas. Further research is needed into the systematic status, distribution, natural history and possible threats to this species.

GENERAL DISTRIBUTION:
Kerivoula eriophora has only been recorded at the type locality of 'between Semian and Wogara, Belegaz Valley, Ethiopia'.

Native: Ethiopia (Heuglin, 1877: 34).

POPULATION:
Structure and Density - It is known only from the holotype (Fahr, 2008c; IUCN, 2009).
Trend - 2008 - Unknown (Fahr, 2008c; IUCN, 2009).

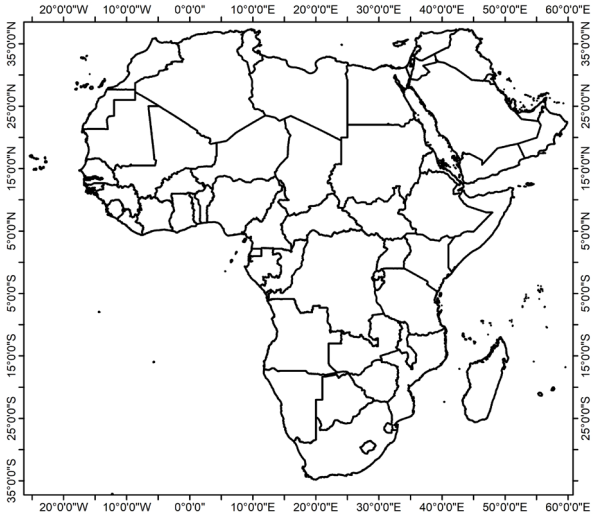

Figure 233. Distribution of *Kerivoula eriophora*

DISTRIBUTION BASED ON VOUCHER SPECIMENS: South Sudan.

Kerivoula lanosa (A. Smith, 1847)

*1847. *Vespertilio lanosus* A. Smith, Illustrated Zoology of South African Mammals, pl. 50 and text. Publication date: December 1847. Type locality: South Africa: Cape province: Cape Town, 200 mi (332 km) E. Syntype: BMNH 1907.1.1.538: ♂. Syntype: BMNH 1907.1.1.539:. - Comments: Thorn *et al.* (2009: 50) indicate that Roberts (1951: 75) designated Knysna as type locality. - Etymology: From the Greek "*lanosa*" meaning woolly.

1878. *Kerivoula brunnea* Dobson, Catalogue of the Chiroptera of the collection of the British Museum, xl, 331, 334. Publication date: June 1878. Type locality: South Africa: "South Africa or Madras" [Goto Description]. Holotype: BMNH 1852.8.12.9: sad ♂, alcoholic (skull not removed). Presented/Donated by: Sir Andrew Smith. - Comments: Roberts (1951: 75) mentioned "Madras or South Africa as type locality. Sir A. Smith (Obviously the type of Smith's *V. Lanosus*, cf. Roberts, 1913: Knysna)". Meester *et al.* (1986: 64) mention "South Africa or Madras").

1901. *Kerivoula harrisoni* Thomas, Proc. zool. Soc. Lond., 1900, IV: 802, footnote. Publication date: April 1901. Type locality: Ethiopia: between Lakes Zwai and Margherita [=Lake Abaya]: Walamo [c. 07 00 N 38 00 E,, 6 700 ft] [Goto Description]. Holotype: BMNH 1900.11.4.1: Collected by: J.J. Harrison; collection date: 21 February 1900. Presented/Donated by: J.J. Harrison.

1906. *Kerivoula muscilla* Thomas, Ann. Mag. nat. Hist., ser. 7, 18 (106): 294. Publication date: 1 October 1906. Type locality: Cameroon: Ja River [ca. 03 00 N 13 00 E] [Goto Description]. Holotype: BMNH 1908.6.23.10: ad ♂. Collected by: George Latimer Bates Esq. Collection date: 22 December 1905. Presented/Donated by: ?: Collector Unknown. - Comments: Considered a valid subspecies by Fahr and Ebigbo (2003: 128; 2004: 73).

1920. *Kerivoula lucia* Hinton, Ann. Mag. nat. Hist., ser. 9, 6 (32): 240. Publication date: 1 August 1920. Type locality: Zimbabwe: N'dola. [12 50 S 28 40 E] [Goto Description]. Holotype: BMNH 1920.11.3.27: ad ♂. Collected by: Captain Guy Chester Shortridge; collection date: 26 September 1919; original number: 472.

1922. *Kerivoula lueia* Kershaw, Ann. Mag. nat. Hist., ser. 9, 10 (55): 99. Publication date: 1 July 1922. - Comments: Erratum (see Meester *et al.*, 1986: 64).

1959. *Kerivoula harrisoni bellula* Aellen, Archs Sci. Genève, 12 (2): 221. Type locality: Côte d'Ivoire: NW of Abidjan: Adiopodoumé [05 19 N 04 08 W, 0 - 30 m] [Goto Description]. Holotype: MHNG 965.038: ad ♂, alcoholic (skull not removed). Collected by: Dr. Villy Aellen; collection date: 20 July 1953; original number: 622.

? *Kerivoula harrisoni lucia:* (Name Combination)

? *Kerivoula lanosa harrisoni:* (Name Combination)

? *Kerivoula lanosa lucia:* (Name Combination)

? *Kerivoula lanosa muscilla:* (Name Combination)

? *Kerivoula lanosa:* (Name Combination, Current Combination)

TAXONOMY:
Includes *harrisoni* and *muscilla*; see Hill (1977b), but see Fahr and Ebigbo (2003: 128; 2004: 73).

COMMON NAMES:
Afrikaans: Klein wolhaarvlermuis. Chinese: 小彩蝠. Czech: vlnoušek malý. English: Lesser Woolly Bat. French: Petite Chauve-souris laineuse, Chauve-souris laineuse. German: Kleine Wollfledermaus. Portuguese: Morcego lamoso Harrison.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Jacobs *et al.*, 2008l; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Jacobs *et al.*, 2008l; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Jacobs *et al.*, 2004a; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - LC ver 3.1 (2001) (Monadjem *et al.*, 2016g). 2004 - NT ver 3.1 (2001) (Friedmann and Daly, 2004). 1986 - Indeterminate (Smithers, 1986).

MAJOR THREATS:
There appear to be no major threats to this species (Jacobs *et al.*, 2008l; IUCN, 2009).

CONSERVATION ACTIONS:
Jacobs *et al.* (2008l) [in IUCN (2009)] report that it is not known if the species is present in any protected areas. Further studies are needed to better understand the taxonomic status of *Kerivoula lanosa*.

GENERAL DISTRIBUTION:
Kerivoula lanosa has been recorded across sub-Saharan Africa, from Liberia and Guinea in the west, to Ethiopia and Kenya in the east, and ranging as far south as southern South Africa. In the latter country, its distribution is mainly affected by temperature seasonality (Babiker Salata, 2012: 49).

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 636,522 km^2.

Native: Angola (Monadjem *et al.*, 2010d: 563; Taylor *et al.*, 2018b: 63); Botswana (Monadjem *et al.*, 2010d: 563); Central African Republic; Congo (The Democratic Republic of the) (Hayman *et al.*, 1966; Monadjem *et al.*, 2010d: 563); Côte d'Ivoire; Ethiopia (Kruskop and Lavrenchenko, 2009: 72 - first record in over a 100 years); Gabon; Ghana; Guinea (Fahr and Ebigbo, 2003: 128); Kenya; Liberia; Malawi (Ansell and Dowsett, 1988; Monadjem *et al.*, 2010d: 563); Mozambique (Smithers and Lobão Tello, 1976; Monadjem *et al.*, 2010d: 563; Monadjem *et al.*, 2010c: 383); Nigeria (Happold, 1987); South Africa (Roberts, 1951; Smithers, 1983; Skinner and Smithers, 1990; Taylor, 1998; Skinner and Chimimba, 2005; Monadjem *et al.*, 2010d: 563); Swaziland (Monadjem *et al.*, 2010d: 563); Tanzania; Zambia (Ansell, 1978; Monadjem *et al.*, 2010d: 563); Zimbabwe (Cotterill, 1996a; Monadjem *et al.*, 2010d: 563).
Presence uncertain: Namibia (Cotterill, 2004a: 262; Monadjem *et al.*, 2010d: 563).

MOLECULAR BIOLOGY:
DNA - Unknown.
Karyotype - Rautenbach *et al.* (1993) reported 2*n* = 28, FN = 50, BA = 24, a metacentric X chromosome, and an acrocentric Y chromosome, for specimens from South Africa.
Protein / allozyme - Unknown.

ROOST:
In the southern part of the Kruger Park, Pienaar (1964: 12) indicated that it is said that it often used disused nests of weaver birds, but he could not confirm this without doubt.

POPULATION:
Structure and Density - There appears to be little information available on the population abundance of this species (Jacobs *et al.*, 2008l; IUCN, 2009).
Trend - 2008 - Unknown (Jacobs *et al.*, 2008l; IUCN, 2009).

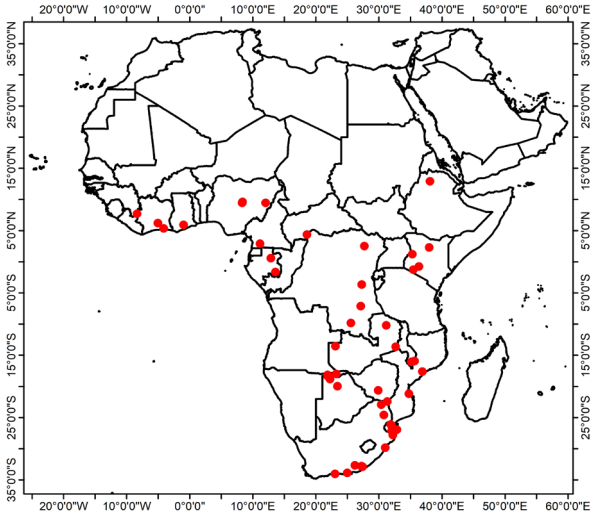

Figure 234. Distribution of *Kerivoula lanosa*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Botswana, Cameroon, Central African Republic, Congo (Democratic Republic of the), Côte d'Ivoire, Ethiopia, Gabon, Ghana, Guinea, Kenya, Liberia, Malawi, Mozambique, Namibia, Nigeria, South Africa, Swaziland, Tanzania, Zambia, Zimbabwe.

Kerivoula phalaena Thomas, 1912

*1912. *Kerivoula phalæna* Thomas, Ann. Mag. nat. Hist., ser. 8, 10 (57): 281. Publication date: 1 September 1912. Type locality: Ghana: Western province: Inland from Denkwa: Bibianaha [=Bibiani] [06 28 N 02 20 W, 720 ft] [Goto Description]. Holotype: BMNH 1912.6.20.3: ad ♀. Collected by: Dr. H.G.F. Spurrell; collection date: 24 April 1912; original number: 224. Presented/Donated by: Dr. H.G.F. Spurrell. - Etymology: From the Greek "*phalaena*" meaning whale. (Current Combination)
1973. *Kerivoula phalaema:* Eisentraut, Bonn. zool. Monogr., 3: 46. (Lapsus)
2010. *Kerivoula cf. phalaena:* Monadjem, Schoeman, Reside, Pio, Stoffberg, Bayliss, Cotterill, Curran, Kopp and Taylor, Acta Chiropt., 12(2): 383.
? *Kerivoula phalaena:* (Current Spelling)

TAXONOMY:
See Simmons (2005: 528).

COMMON NAMES:
Czech: vlnoušek západoafrický. English: Spurrell's Woolly Bat, Spurell trumpet-eared bat. French: Chauve-souris à oreilles en trompette de Spurell, Chauve-souris peinte phalène, Chauve-souris à oreilles en trompette de Spurell. German: Spurrells Wollfledermaus.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Fahr, 2008d; Fahr, 2008d).

Assessment History -
2008 - LC ver 3.1 (2001) (Fahr, 2008d; Fahr, 2008d). 2004 - NT ver 3.1 (2001) (Fahr, 2004l; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
The threats to this species are poorly known. Koopman *et al.* (1995) mention that this one of seven bat species from Liberia that have not been recorded from the lowland since 1965, and that it might have declined because of deforestation, although this may instead just indicate vagaries of collection within this country (Fahr, 2008d; IUCN, 2009).

CONSERVATION ACTIONS:
Fahr (2008d) [in IUCN (2009)] reports that it is not known if the species is present within any protected areas. Additional studies are needed into the distribution, abundance, natural history and threats to this little known species.

GENERAL DISTRIBUTION:
Recorded from Guinea, Liberia, Côte d'Ivoire and Ghana in West Africa; and from Cameroon, the Democratic Republic of the Congo to western Uganda in Central Africa.

Native: Cameroon; Congo (The Democratic Republic of the); Côte d'Ivoire; Ghana; Guinea

(Fahr and Ebigbo, 2004: 69); Liberia (Kuhn, 1965; Koopman *et al.*, 1995; Rwanda; Uganda.
Presence uncertain: Mozambique (Monadjem *et al.*, 2010c: 383, recorded as *K.* cf. *phalaena*).

HABITAT:
Monadjem *et al.* (2016y: 368) collected this bat in forested habitats in the Mount Nimba area, at altitudes between 450 and 700 m.

POPULATION:
Structure and Density - It appears to be a rare species that is known only from 14 localities (Fahr, 2008d; IUCN, 2009).
Trend - 2008 - Unknown (Fahr, 2008d; IUCN, 2009).

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Cameroon, Congo, Congo (Democratic Republic of the), Côte d'Ivoire, Gabon, Ghana, Liberia, Uganda.

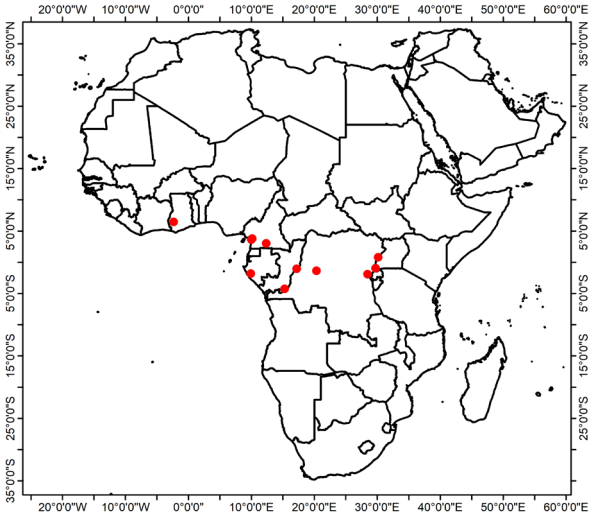

Figure 235. Distribution of *Kerivoula phalaena*

Kerivoula smithii Thomas, 1880

*1880. *Kerivoula Smithii* Thomas, Ann. Mag. nat. Hist., ser. 5, 6 (32): 166, text-fig. Publication date: 1 August 1880. Type locality: Nigeria: Eastern region: Old Calabar [04 56 N 08 22 E]. Holotype: BMNH 1880.7.21.9: Collected by: Dr. A. Robb. Presented/Donated by: Dr. J.A. Smith. - Etymology: In honour of Dr. J.A. Smith, who presented to the type specimen to the British Museum of Natural History. (Current Combination)
? *Kerivoula smithi:* (Alternate Spelling)
? *Kerivoula smithii:* (Current Spelling)

TAXONOMY:
See Simmons (2005: 528).

COMMON NAMES:
Chinese: 史密斯彩蝠. Czech: vlnoušek guinejský. English: Smith's Woolly Bat. French: Chauve-souris peinte de Smith. German: Smith's Wollfledermaus. Italian: Cherìvoula di Smith.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Fahr, 2008e; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Fahr, 2008e; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Fahr, 2004a; IUCN, 2004). 1996 - LR/nt (Baillie and Groombridge, 1996).

MAJOR THREATS:
There appear to be no major threats to this species (Fahr, 2008e; IUCN, 2009).

CONSERVATION ACTIONS:
Fahr (2008e) [in IUCN (2009)] reports that it is not known if the species is present within any protected areas. Further studies are needed into the distribution, abundance, and general ecology of this apparently rare species.

GENERAL DISTRIBUTION:
Kerivoula smithii is known from scattered records in a distribution band ranging from Nigeria and Cameroon in the west, through the Democratic Republic of the Congo, to Uganda and Kenya in the east. It has been recorded at elevations of 900 to 2,800 m asl.

Fahr (2007a: 105) indicates that the specimens from Liberia mentioned by Happold (1987: 349) and Koopman *et al.* (1995) are actually representatives of *K. phalaena*. J. Fahr *pers. comm.* [in Simmons (2005: 528)] also suggests that records from Côte d'Ivoire (Happold, 1987: 349) appear to be in error.

Native: Cameroon; Congo (The Democratic Republic of the) (Hayman *et al.*, 1966); Kenya (Harrison, 1963c; Aggundey and Schlitter, 1984) ; Nigeria (Happold, 1987: 77); Uganda.

Presence uncertain: Côte d'Ivoire (Happold, 1987: 349).

ECHOLOCATION:
Eisenring *et al.* (2016: SI 2) reported the following values for 14 calls from the Aberdares Range in Kenya: PF: 95.9 ± 6.2 (81.5 - 104.9), HF: 126.3 ± 7.2 (115.6 - 137.2), LF: 65.3 ± 13.2 (44.9 - 91.8), DT: 0.0 ± 0.0 (0.0 - 0.1), DF: 61.0 ± 16.5 (25.1 - 85.5), IPI: 0.2 ± 0.1 (0.1 - 0.6).

POPULATION:
Structure and Density - This species has been very rarely recorded (Happold, 1987: 77; Fahr, 2008e; IUCN, 2009).
Trend - 2008 - Unknown (Fahr, 2008e; IUCN, 2009).

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Cameroon, Central African Republic, Congo (Democratic Republic of the), Kenya, Nigeria, Tanzania, Uganda.

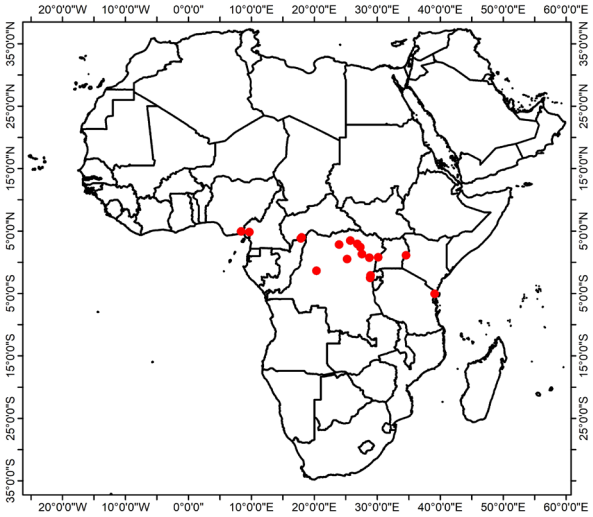

Figure 236. Distribution of *Kerivoula smithii*

Subfamily Myotinae Tate, 1942

*1942. *Myotinae* Tate, Bull. Am. Mus. Nat. Hist., 80 (7): 221, 229. Publication date: 27 November 1942. - Comments: Type genus: *Myotis* Kaup, 1829. (Current Combination)

1942. *Myotini* Tate, Bull. Am. Mus. Nat. Hist., 80 (7): 221, 229. Publication date: 27 November 1942. - Comments: Type genus: *Myotis* Kaup, 1829. Introduced as tribe, and originally included the genera *Myotis* Kaup, 1829; *Lasionycteris* Peters, 1865; *Plecotus* É. Geoffroy, 1818; *Corynorhinus* H. Allen, 1865; *Idionycteris* Anthony, 1923; and *Euderma* H. Allen, 1891 (see Jackson and Groves, 2015: 280).

1987. *Leuconoformes* Menu, Palaeovert., 17 (3): 77, 5992, 133. Publication date: 31 March 1987. - Comments: Type genus: *Leuconöe* Boie, 1830. Introduced with unclear rank, and originally included the genera *Leuconöe* Boie, 1830 [= *Myotis* Kaup, 1829]; *Pizonyx* Miller, 1906 [= *Myotis* Kaup, 1829]; and *Perimyotis* Menu, 1984 (see Jackson and Groves, 2015: 280).

1998. *Myotinae:* Simmons, in: Kunz, T. H.; Racey, P. A., A reappraisal of interfamilial relationships of bats., 12. - Comments: Type genus: *Myotis* Kaup, 1829.

2005. *Myotiinae:* Ramírez-Pulido, Arroyo-Cabrales, and Castro-Campillo, Acta Zool. Mex. (ns), 21 (1): 31. - Comments: Ramírez-Pulido *et al.* (2005) refer to Simmons (1998) for Myotiinae, but Simmons (1998: 5) uses the correct spelling (Myotinae). (Lapsus)

TAXONOMY:
Tate (1942: 229) originally named Myotini as a tribe within Vespertilioninae, in which he included the genera *Myotis*, *Lasionycteris*, *Plecotus*, *Corynorhinus*, *Idionycteris* and *Euderma*. Although Tate (1942: 230) noted that the latter four genera might alternatively be referred to their own tribe Plecotini. This suggestion was followed by subsequent authors, and Myotini has been restricted to *Myotis* and *Lasionycteris* in recent classifications (e.g. Hill and Harrison, 1987; Koopman, 1994). Volleth and Heller (1994) described karyological data which indicate that Myotini represents a lineage distinct from Vespertilioninae, and therefore they suggested that Myotini be raised to the rank of subfamily. Despite their suggestion, Volleth and Heller (1994) did not use the name Myotinae in their publication, so formal usage of the name at the subfamily rank dates from Simmons (1998: 3, 5), who raised it to the subfamily level, and followed in recent classifications (e.g., Bannikova *et al.*, 2002: 722; Hoofer and Van Den Bussche, 2003: 21).
May not be monophyletlic; see Hoofer and Van Den Bussche (2001), and Simmons (2005). Hoofer and Van Den Bussche (2003: 21) and Roehrs *et al.* (2010: 1081) only include the members of the genus *Myotis*, (not *Lasionycteris* nor *Cistugo*).

Known genera of the subfamily Myotinae: †***Khonsunycteris*** Gunnell, Simons and Seiffert, 2008; ***Myotis*** Kaup, 1829.

COMMON NAMES:
Czech: netopýrcové.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Ruedi *et al.* (2013: 446-447) doubt the African origin of the Myotinae as proposed by Gunnell *et al.* (2012), and their molecular phylogeny points to eastern Asia as the cradle of *Myotis* evolution.

Gunnell *et al.* (2017: 14) suggest that the basal myotines (e.g. *Khonsunycteris*) originated in northern Africa in the Late Eocene, followed by the appearance of *Myotis* in the early Oligocene of Europe. The fact that they found a plecotine bat (*Quinetia misonnei*) in the same Belgian location, furthermore suggests that the vespertilionid subfamilies Vespertilioninae and Myotinae had already diverged by 33.5 MYA.

The discovery of the southernmost and oldest record of *Myotis podlesicensis* Kowalski, 1956 in Europe (Spain; Late Miocene) by Crespo *et al.* (2017: 324) provides support for an African origin of this taxon.

†Genus ***Khonsunycteris*** Gunnell, Simons and Seiffert, 2008

*2008. *Khonsunycteris* Gunnell, Simons and Seiffert, J. Vert. Paleont., 28 (1): 3, 8. - Comments: Type species - *Khonsunycteris aegypticus* Gunnell, Simons and Seiffert, 2008. - Etymology: Khonsu, Egyptian God of the Moon, in reference to the nocturnal habits of vesper bats (Gunnell *et al.*, 2008). (Current Combination)

TAXONOMY:
See Gunnell *et al.* (2008).

SIMILAR SPECIES:
See Gunnell *et al.* (2008).

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
See Gunnell *et al.* (2008).

Gunnell *et al.* (2017: 9) indicate that *Khonsunycteris* might be the earliest known myotine bat.

GENERAL DISTRIBUTION:
Egypt (Gunnell *et al.*, 2008).

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:
See Gunnell *et al.* (2008).

†***Khonsunycteris aegypticus*** Gunnell, Simons and Seiffert, 2008

*2008. *Khonsunycteris aegypticus* Gunnell, Simons and Seiffert, J. Vert. Paleont., 28 (1): 3, 8, fig. 8. Type locality: Egypt: Fayum Depression: Quarry L-41: Lower Sequence, Jebel Qatrani Formation. Holotype: CGM 83673: Collected by: ?: Collector Unknown. Presented/Donated by: ?: Collector Unknown. Left dentary c1-m2. - Comments: latest Eocene, Priabonian. - Etymology: Name for Egypt (Gunnell *et al.*, 2008). (Current Combination)

TAXONOMY:
See Gunnell *et al.* (2008).

SIMILAR SPECIES:
See Gunnell *et al.* (2008).

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
See Gunnell *et al.* (2008).

GENERAL DISTRIBUTION:
Egypt (Gunnell *et al.*, 2008).

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:
See Gunnell *et al.* (2008).

Genus ***Myotis*** Kaup, 1829

*1829. *Myotis* Kaup, Skizzierte Entwicklungs-Geschichte Natürliche Systematik der Europäische Thierwelt, 1: 106. Publication date: 1829. - Comments: Type species: *Vespertilio myotis* Borkhausen, 1797, by subsequent designation by Miller (1912: 167). Kaup (1829: 106) mentioned *Vespertilio murinus*, but for a discussion on the type species, see Jackson and Groves (2015: 280). - Etymology: From the Greek "*μύς*" or "*μυός*", meaning mouse and

"*ούς*" or "*ώτός*" meaning ear (see Palmer, 1904: 442). Gardner (2005:184) considers the name to be masculine (My = mouse + ot = ear(ed) + is (Latin third declension ending)).

1829. *Nystactes* Kaup, Skizzirte Entwicklungs-Geschichte Natürliche Systematik der Europäische Thierwelt, 1: 108. Publication date: 1829. - Comments: Type species: *Vespertilio bechsteini* Kuhl, 1819. Jackson and Groves (2015: 281) indicate that this name is an objective synonym of *Paramyotis* Bianchi. Not *Nystactes* Gloger, 1827 (Aves, Piciformes, Bucconidae). - Etymology: From the Greek "*νυστακτής*", meaning the one who nods, a sleeper (see Palmer, 1904: 467).

1830. *Leuconoe* Boie, Isis oder Encyclopädische Zeitung von Oken, 256. Publication date: 1830. - Comments: Type species: *Vespertilio daubentonii* Kuhl, 1817. Considered a valid genus based on tooth morphology: see Menu (1985, 1987) in Menu *et al.* (2002: 320).

1841. *Capaccinius* Bonaparte, Iconografia Fauna italiana, 1: Indice Distributivo: 1. - Comments: Type species: *Vespertilio megapodius* Temminck, 1840 [=*Vespertilio capaccinii* Bonaparte, 1837], by tautonomy (see Jackson and Groves, 2015: 281). - Etymology: In honour of Francesco Capaccini, under secretary of state of Rome about 1833-34, and a patron of Bonaparte's "Iconografia della Fauna Italica," published in 1832-1841 (see Palmer, 1904: 49).

1841. *Selysius* Bonaparte, Iconografia Fauna italiana, 1: Mamm., Introd.: 3. Publication date: 1841 [Goto Description]. - Comments: Type species: *Vespertilio mystacinus* Kuhl, 1817, by monotypy (see Jackson and Groves, 2015: 281). - Etymology: In honour of Baron Edmond de Selys-Longchamps, 1813 - 1900, an eminent naturalist and statesman, some time president of the Belgian Senate; author of "Etudes de Micromammalogie," 1839, and "Faune Belge," 1844 (see Palmer, 1904: 51).

1842. *Trilatitus* Gray, Ann. Mag. nat. Hist., [ser. 1], 10 (65): 258. Publication date: 1 December 1842. - Comments: type species: *Vespertilio hasseltii* Temminck, 1840, by subsequent designation (see Jackson and Groves, 2015: 281). Included *Vespertilio hasselti* Temminck, *M. macellus* Temminck, and *V. blepotis* Temminck (a *Miniopterus*) (see Hall and Kelson, 1959: 159; Hall, 1981: 183; Corbet and Hill, 1992: 119).

1843. *Vespertilio* Gray, Cat. specs mamm., xix, 26. Publication date: 13 May 1843. - Comments: Type species: *Vespertilio mystacinus* Kuhl, 1817, by monotypy according to Jackson and Groves (2015: 281). Not Linnaeus, 1758, nor *Vespertilio* Mörch, 1852 (Mollusca, Neogastropoda, Volutidae) (see Jackson and Groves, 2015: 281).

1849. *Tralatitus:* Gervais, Dictionnaire Universelle d'Histoire naturelle, 13: 213. - Comments: A lapsus for *Trilatitus* (see Hall, 1981: 183). Modification of *Trilatitus* (see Ellerman and Morrison-Scott, 1951: 137; Meester *et al.*, 1986: 47). Incorrect subsequent spelling (see Jackson and Groves, 2015: 281). (Lapsus)

1856. *Brachyotus* Kolenati, Allg. deutsche naturh. Zeitung, N.F., 2 (2): 131. Publication date: 1856. - Comments: Type species: *Vespertilio mystacinus* Kuhl, 1817, by subsequent designation by Ellerman and Morrison-Scott (1951: 137) (see Jackson and Groves, 2015: 281). Preoccupied by *Brachyotus* Gould, 1837 (Aves, Strigiformes, Strigidae) (see Allen, 1939a: 89; Hall, 1981: 183; Corbet and Hill, 1992: 119; Pavlinov *et al.*, 1995: 95; Jackson and Groves, 2015: 281). Based on *V. mystacinus*, *daubentonii* and *dascyneme* (see Allen, 1939a: 89).

1856. *Isotus* Kolenati, Allg. deutsche naturh. Zeitung, N.F., 2 (2): 131. Publication date: 1856. - Comments: Type species: *Vespertilio nattereri* Kuhl, 1817. Considered a valid subgenus by Pavlinov *et al.* (1995: 95). - Etymology: From the Greek "*ίσος*", meaning equal and "*ούς*" or "*ώτός*", meaning ear (see Palmer, 1904: 354).

1856. *Myotus:* Kolenati, Allg. deutsche naturh. Zeitung, N.F., 2 (2): 131. Publication date: 1856. - Comments: Incorrect subsequent spelling (see Palmer, 1904: 442; Jackson and Groves, 2015: 282). (Lapsus)

1866. *Tralatitius:* Gray, Ann. Mag. nat. Hist., ser. 3, 17 (98): 90. Publication date: 1 February 1866. - Comments: Lapsus for *Trilatitus* Gray (seeHall, 1981: 183). Modification of *Trilatitus* (see Ellerman and Morrison-Scott, 1951: 137; Meester *et al.*, 1986: 47). (Lapsus)

1867. *Vespertilio (Pternopterus)* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, 706. Publication date: 1867. - Comments: Type species: *Vespertilio (Pternopterus) lobipes* Peters, 1867 (=*Vespertilio muricola* Gray, 1846).

1868. *Pternopterus* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, 1867: 706. - Comments: Type species: *Vespertilio (Pternopterus) lobipes* Peters, 1867 [= *Myotis muricola* (J. Gray, 1846)] by monotypy (see Jackson and Groves, 2015: 282).

1870. *Aëorestes* Fitzinger, Sber. k. Akad. Wiss. Wien, math. naturw. Kl., 62 (1): 427. Publication date: October 1870. - Comments: Based upon *Vespertilio villosissimus* E. Geoffroy, 1806, *albescens* E. Geoffroy, 1806, *laevis* I. Geoffroy, 1824 and *nigricans* Schinz, 1821 (see Allen, 1939a: 90; Hall, 1981: 183 [who excludes *laevis*]). Hill (in litt. In Meester *et al.*, 1986: 48) pointed out that *villosissimus* is a member of *Lasiurus* Gray, 1831, but all others are indeed *Myotis* representatives. If *villosissimus* can be regarded as the type species of *Aeorestes*, it should instead be included in *Lasiurus* (Meester *et al.*, 1986: 48). Hoofer and Van Den Bussche (2003: 25) consider *Aeorestes* a valid subgenus, including all of the New World species.

1870. *Comastes* Fitzinger, Sber. k. Akad. Wiss. Wien, math. naturw. Kl., 62 (1) 9: 565. Publication date: 1870. - Comments: Type species: *Vespertilio capaccinii* Bonaparte, 1837, by subsequent designation (see Jackson and Groves, 2015: 282). Based upon *Vespertilio capaccinii* Bonaparte, *megapodius*, *dasycneme* Boie, *limnophilus* (see Allen, 1939a: 90). Based upon *Vespertilio capaccinii* and *dasycneme* according to Hall and Kelson (1959: 159) and Hall (1981: 183). Not *Comastes* Jan, 1863 (Reptilia, Squamata, Colubridae) (see Jackson and Groves, 2015: 282). - Etymology: From the Greek "*κωμαστής*", meaning reveler, probably referring to the animal's nocturnal habits (see Palmer, 1904: 197).

1870. *Exochurus* Fitzinger, Sber. k. Akad. Wiss. Wien, math. naturw. Kl., 62 (1) 6: 75. Publication date: 1870. - Comments: Type species: *Vespertilio macrodactylus* Temminck, 1840, by subsequent designation (see Jackson and Groves, 2015: 282). Not of Kolenati (1858). Based upon *Vespertilio macrodactylus* Temminck, *V. horsfieldii* Temminck, and *V. macrotarsus* Waterhouse (see Hall, 1981: 183; Corbet and Hill, 1992: 119). Not of Kolenati, 1858: see Cabrera (1914: 91). - Etymology: From the Greek "*εξοχος*", meaning standing out and "*ούρά*", meaning tail (see Palmer, 1904: 284).

1899. *Euvespertilio* Acloque, Faune de France, Mammifères, 38. - Comments: Includes *Vespertilio emarginatus* Geoffroy, *murinus* Schreber =*myotis* Borkhausen, *mystacinus* Kuhl, *nattereri* Kuhl, and *bechsteinii* Kuhl. Hall and Kelson (1959: 159) and Hall (1981: 183) state that *Euvespertilio* includes *emarginatus* and *murinus* in a composite sense.

1906. *Pizonyx* Miller, Proc. Biol. Soc. Wash., 19: 85. Publication date: 4 June 1906. - Comments: Type species: *Myotis vivesi* Menegaux, 1901, by original designation (see Jackson and Groves, 2015: 282). Considered a valid genus by Hall and Kelson (1959), but only as a subgenus of *Myotis* by Hall (1981: 183).

*1910. *Chrysopteron* Jentink, Notes Leyden Mus., 32: 74. Publication date: January 1910 [Goto Description]. - Comments: Type species: *Chryopteron bartelsii* Jentink, 1910 [=*Vespertilio formosa* Hodgson, 1835]. Considered a valid subgenus by Hall and Kelson (1959: 159), Hall (1981: 183), Corbet and Hill (1992: 121) and Pavlinov *et al.* (1995: 95).

1917. *Dichromyotis* Bianchi, Ann. Mus. zool. Acad. Impér. Sci. St. Petersbourg, 21: lxxviii (for 2016). Publication date: 14 May - 13 Jun 1917. - Comments: Type species: *Vespertilio formosus* Hodgson, 1835, by original designation according to Csorba *et al.* (2014: 668), by monotypy according to Jackson and Groves (2015: 283).

1917. *Megapipistrellus* Bianchi, Ann. Mus. zool. Acad. Impér. Sci. St. Petersbourg, 21: lxxvii (for 2016). Publication date: 14 May - 13 June 1917. - Comments: Type species: *Pipistrellus annectans* Dobson, 1871, by monotypy (see Jackson and Groves, 2015: 282). Considered a valid subgenus by Pavlinov *et al.* (1995: 95).

1917. *Paramyotis* Bianchi, Ann. Mus. zool. Acad. Impér. Sci. St. Petersbourg, 21: lxxix (for 2016). Publication date: 14 May - 13 Jun 1917. - Comments: Type species: *Vespertilio bechsteinii* Kuhl, 1817. New name for *Nystactes* Kaup, 1829, preoccupied (see Hall and Kelson, 1959: 159; Hall, 1981: 183). Considered a valid subgenus by Pavlinov *et al.* (1995: 95).

1917. *Rickettia* Bianchi, Ann. Mus. zool. Acad. Impér. Sci. St. Petersbourg, 21: lxxvii (for 2016). Publication date: 14 May - 13 Jun 1917. - Comments: Type species: *Vespertilio (Leuconoe) ricketti* Thomas, 1894, by monotypy (see Jackson and Groves, 2015: 282). Valid as a subgenus (see Hall and Kelson, 1959: 159; Hall, 1981: 183).

1929. *Anamygdon* Troughton, Rec. Austr. Mus., 17 (2): 87. Publication date: 26 Jun 1929. - Comments: Type species: *Anamygdon solomonis* Troughton, by original designation (see Jackson and Groves, 2015: 283) [=*Vespertilio adversus* Horsfield, 1824 or *Leuconoe moluccarum* Thomas, 1915 ?].

1934. *Brachyotis:* Taylor, Monographs of the Bureau of Science, Manila, 30: 278. (Lapsus)

1958. *Hesperomyotis* Cabrera, Rev. Mus. Arg. Cienc. Nat., Zool., 4: 103. - Comments: Type species: *Myotis simus* Thomas, 1901, by original designation (see Jackson and Groves, 2015: 283).
1982. *Myottis:* Alberico and Orejuela, Cespedesia, 3 (suppl.): 103. (Lapsus)
1995. *Capaccinus:* Pavlinov, Borissenko, Kruskop and Jahonton, Arch. Zool. Mus., Moscow State Univ., 133: 95. (Lapsus)
1995. *Exochirus:* Pavlinov, Borissenko, Kruskop and Jahonton, Arch. Zool. Mus., Moscow State Univ., 133: 95. (Lapsus)
1995. *Selisius:* Pavlinov, Borissenko, Kruskop and Jahonton, Arch. Zool. Mus., Moscow State Univ., 133: 99. (Lapsus)
1996. *Myotiz:* Spiewak, Johansson and Wüthrich, Allergologie, 19 (11): 510 - 511. (Lapsus)
? *Loeconoe:* (Alternate Spelling)
? *Myotis sp.:*

TAXONOMY:
Woodman (1993) indicated that the genus name ending on -otis" is female, and therefore the species name should also be female. Benda and Tsytsulina (2000: 335) agree with Woodman (1993), but continue to understand *Myotis* as a masculine name, because it has been used for over 170 years, and hence was conserved in this way. Simmons (2005) follows Pritchard (1994) and retains the masculin names too. See also Gardner (2005: 184) where *Myotis* = My (mouse) + ot (ear[ed]) + is (Latin third declension ending) = masculine (Mammalia).

Bronner *et al.* (2003) state that the genus *Myotis* has been considered to include several subgenera, but the number thereof, and placement of species, varied considerably. Meester *et al.* (1986) listed three subgenera from the Southern African subregion, namely *Cistugo* Thomas, 1912 (for *seabrai* and *lesueuri*), *Chrysopteron* Jentink, 1910 (for *welwitschii*) and *Selysius* Bonaparte, 1841 (for *tricolor* and *bocagei*). Menu (1987) proposed synonymising *Selysius* under the subgenus *Leuconoe* Boie, 1830 on the basis of dental characters. This was endorsed by Koopman (1993a, 1994) who transferred *M. bocagei* to *Leuconoe* but included other *Selysius* and *Chrysopteron* in the subgenus *Myotis*, and also by Godawa-Stormark (1998)'s phenetic analysis of dental variation in the genus. Phylogenetic analysis of mitochondrial DNA sequences, however, do not support the monophyly of the three subgenera (*Selysius, Leuconoe* and *Myotis*) analysed (Ruedi and Mayer, 2001), but *Cistugo* warrants generic separation (N. Simmons in litt.) owing to the distinct wing glands and unique karyotypes (see Rautenbach *et al.*, 1993) found in *seabrai* and *lesueuri* from southern Africa.

Meester *et al.* (1986) state that their synonymy is slightly modified from Ellerman and Morrison-Scott (1951), who include also *Aeorestes* Fitzinger, 1870, a South American group, in the synonymy of *Myotis*, as does Hall (1981). However, J.E. Hill points out (in litt) that of the species included in this genus, the first, *Vespertilio villosissimus* E. Geoffroy, 1806, is a *Lasiurus* Gray, 1831, although the others, *albescens* E. Geoffroy, 1806, *nigricans* Schinz, 1821, and *levis* I. Geoffroy, 1824, belong in *Myotis*. If, as Hill suggests, *villosissimus* can be regarded as the type species of *Aeorestes*, it should instead be included in *Lasiurus*.

Phylogenetic analyses performed by Ruedi *et al.* (2013: 441) confirm that the Ethiopian clade within *Myotis* is highly supported with all methods of reconstruction (see also Stadelmann *et al.*, 2004b). This clade contains all of the sub-Saharan species, the species inhabiting the islands in the Western Indian Ocean, as well as *M. emarginatus* (which occurs circum-Mediterranean) and two Asian forms (*M.* cf. *formosus* and *M. formosus flavus*).

Patterson *et al.* (2019: "4') made an extensive phylogenetic analysis on the Afrotropical *Myotis* species and found that they were not monophyletic as *M. welwitschii* formed a sister clade with the east Asian *M. rufoniger*, which was separate from all other African species. All African species, together with *M. rufoniger, M. formosus* and *M. emarginatus* appeared to be grouping on a higher level.

Ghazali *et al.* (2016: 475) state that phylogenetic relationships within *Myotis* reflect biogeographic affinities rather than phenotypes. They also suggest that *Myotis* diverged from other bats in the early Miocene, with a subsequent split between Old and New World lineages about 19 MYA, and that ecomorphs ('Leuconoe' [near-water hunters], 'Myotis' [gleaners], 'Selysius' [aerial hawkers]) emerged independently in different lineages of *Myotis*. Their analyses indicate the ancestor of the African (Ethiopian) clade was most likely a *Myotis*, which diverged from the Eurasian clade about 17.0 MYA.

Bogdanowicz *et al.* (2015: Fig. 2, p. 640) mention Moroccan data for *Myotis nattereri*, but in the supplementary information, these are mentioned as *Myotis* cf. *nattereri*. They also include the Mediterranean coastal areas of Morocco and Algeria in the distribution area of *M. capaccinii*.

Known species of the genus *Myotis*: *abei* Yoshikura, 1944 – southern Sakhalin, Russia (Simmons, 2005: 500); *adversus* (Horsfield, 1824) – islands in Indonesia, New South Wales, Taiwan, possibly Vietnam and peninsular Malaysia (Simmons, 2005: 500); *aelleni* Baud, 1979 – southwestern Argentina (Simmons, 2005: 501); *albescens* (E. Geoffroy, 1806) – southern Veracruz (Mexico), Guatemala, Honduras, Nicaragua, Panama, Colombia, Venezuela, Guyana, Surinam, Equador, Peru, Brazil, Uruguay, northern Argentina, Paraguay and Bolivia (Simmons, 2005: 501); *alcathoe* von Helversen and Heller, 2001 – Greece, Hungary, France (Simmons, 2005: 501); *altarium* Thomas, 1911 – Szechwan, Kweichow (China), Thailand (Simmons, 2005: 501); ***anjouanensis*** Dorst, 1960; *annamiticus* Kruskop and Tsytsulina, 2001 – Vietnam (Simmons, 2005: 501); *annectans* (Dobson, 1871) – northeastern India to Burma, Thailand, Laos, Cambodia and Vietnam (Simmons, 2005: 502); *atacamensis* (Lataste, 1892) – southern Peru, northern Chile (Simmons, 2005: 502); *ater* (Peters, 1866) – Vietnam, western Sumatra, Peninsular Malaysia, Sulawesi, Togian Isl, northern Borneo, Moluccas, Papua New Guinea (Simmons, 2005: 502); *auriculus* Baker and Stains, 1955 – Arizona and New Mexico (USA) to Jalisco and Veracruz (Mexico); Guatemala (Simmons, 2005: 502); *australis* Dobson, 1878) – New South Wales (Simmons, 2005: 502); *austroriparius* (Rhoads, 1897) – southeastern USA including Florida, north to Indiana and North Carolina, west to Texas and southeastern Oklahoma (Simmons, 2005: 502); *bechsteinii* (Kuhl, 1817) – Europe to Caucasus and Iran; Bulgaria; England; southern Sweden (Simmons, 2005: 503); *blythii* (Tomes, 1857) – Turkey and Israel to Iraq and Iran; northwestern India and the Himalayas; northwestern Altai Mtns; Inner Mongolia and Shensi (China) (Simmons, 2005: 503); ***bocagii*** (Peters, 1870); *bombinus* Thomas, 1906 – Japan, Korea, southeastern Siberia, northeastern China (Simmons, 2005: 503); *brandtii* (Eversmann, 1845) – Britain south to Italy, Greece and Bulgaria, east to Kazakhstan and Mongolia, eastern Siberia, Kamchatka Peninsula and Kurile Isls; Ussuri region (Russia), Korea (Simmons, 2005: 503); *bucharensis* Kuzyakin, 1950 – Uzbekistan, Tajikistan and Afghanistan (Simmons, 2005: 504); *californicus* (Audubon and Bachman, 1842) – southern Alaska Panhandle (USA) to Baja California and higher elevations in the Sonoran and Chihuahuan deserts (Mexico); Guatemala (Simmons, 2005: 504); *capaccinii* (Bonaparte, 1837) – Mediterranean zone and islands of Europe; Bulgaria; Turkey; Israel; Iraq; Iran; Uzbekistan (Simmons, 2005: 504); *chiloensis* (Waterhouse, 1840) – central and southern Chile; Argentina (Simmons, 2005: 504); *chinensis* (Tomes, 1857) – Szechwan and Yunnan to Kiangsu (China); Hong Kong; northern Thailand; Burma; Vietnam (Simmons, 2005: 505); *ciliolabrum* Merriam, 1886 – southern Alberta and Saskatchewan (Canada) south through eastern Colorado and western Kansas (USA) (Simmons, 2005: 505); *cobanensis* Goodwin, 1955 – central Guatemala (Simmons, 2005: 505); *csorbai* Topál, 1997 – Nepal (Simmons, 2005: 505); *dasycneme* (Boie, 1825) – France and Sweden east to Yenisei River (Russia), south to Ukraine, northwestern Kazakhstan, China (Simmons, 2005: 505); *daubentonii* (Kuhl, 1817) – Europe (including Britain and Ireland; Scandinavia) east to Kamtschatka, Vladivostok, Sakhalin and Kurile Isls (Russia), Japan, Korea, Manchuria, northern and eastern China (including Tibet), Vietnam (Simmons, 2005: 505); *davidii* Peters, 1869 – northern China (Simmons, 2005: 506); ***dieteri*** M. Happold, 2005; *dominicensis* Miller, 1902 – Dominica, Guadeloupe (Simmons, 2005: 506); *elegans* Hall, 1962 – Mexico to Costa Rica (Simmons, 2005: 506); ***emarginatus*** (E. Geoffroy, 1806); *evotis* (H. Allen, 1864) – southern British Columbia, southern Alberta, southern Saskatchewan (Canada) to New Mexico (USA) and Baja California (Mexico) (Simmons, 2005: 506); *fimbriatus* (Peters, 1871) – southeastern China (Simmons, 2005: 507); *findleyi* Bogan, 1978 – Trés Marías Isls (Mexico) (Simmons, 2005: 507); *formosus* (Hodgson, 1835) – Afghanistan to northern India, Nepal, Tibet, Kweichow, Kwangsi, Kiangsu and Fukien (China), Taiwan, Korea, Tsushima Isl (Japan), Malaysia, Philippines, Sumatra, Java, Sulawesi and Bali (Simmons, 2005: 507); *fortidens* Miller and Allen, 1928 – Sonora and Veracruz (Mexico) to Guatemala (Simmons, 2005: 507); *frater* G. M. Allen, 1923 – eastern Siberia, Ussuri Region, Krasnoyarsk Region (Russia) to Korea, Heilungkiang (China), southeastern China; Japan (Simmons, 2005: 507); *gomantongensis* Francis and Hill, 1998 – Sabah (Borneo, Malaysia) (Simmons, 2005: 508); ***goudoti*** (A.Smith, 1834); *grisescens* A. H. Howell, 1909 – Florida Panhandle to Kentucky, Indiana, Illinois, eastern Kansas and northeastern Oklahoma (USA) (Simmons, 2005: 508); *hajastanicus* Argyropulo, 1939 – Sevan Lake basin in Armenia (Simmons, 2005: 508); *hasseltii* (Temminck, 1840) – eastern India, Sri Lanka, Burma, Thailand, Cambodia, Vietnam, western Malaysia, Sumatra, Mentawai Isls, Riau Arch., Java, Borneo (Simmons, 2005: 508); *hermani*

Thomas, 1923 – Sumatra (Indonesia) (Simmons, 2005: 508); *horsfieldii* (Temminck, 1840) – India, Andaman Isls, southeastern China, Thailand, Burma, Laos, Vietnam, western Malaysia, Java, Bali, Sulawesi, Borneo, Philippines (Simmons, 2005: 508); *hosonoi* Imaizumi, 1954 – Honshu (Japan) (Simmons, 2005: 509); *ikonnikovi* Ognev, 1912 – Ussuri region and North Korea to Lake Baikal (Russia), the Altai Mtns and Mongolia, northeastern China; Sakhalin Isl (Russia) and Honshû and Hokkaido Isls (Japan) (Simmons, 2005: 509); *insularum* (Dobson, 1878) – Samoa (Simmons, 2005: 509); *keaysi* J. A. Allen, 1914 – Tamaulipas (Mexico) to Bolivia, northern Argentina, Peru, Ecuador, Venezuela and Trinidad (Simmons, 2005: 509); *keenii* (Merriam, 1895) – Alaska Panhandle to western Washington (USA) (Simmons, 2005: 509); *laniger* Peters, 1871 – southern China including Tibet, Vietnam, eastern India (Simmons, 2005: 509); *leibii* (Audubon and Bachman, 1842) – eastern North America from southern Ontario, southern Quebec (Canada) and southern Maine (USA) to southwards to Georgia and western to eastern Oklahoma (USA) (Simmons, 2005: 509); *levis* (I. Geoffroy, 1824) – Bolivia, Argentina, southeastern Brazil, Uruguay (Simmons, 2005: 510); *longipes* (Dobson, 1873) – Afghanistan, northeastern India, Nepal (Simmons, 2005: 510); *lucifugus* (Le Conte, 1831) – Alaska (USA) to Labrador and Newfoundland (Canada), south to southern California, northern Arizona, northern New Mexico (USA) (Simmons, 2005: 510); *macrodactylus* (Temminck, 1840) – Japan, Kunashir Isl and Kurile Isls (Russia), southeastern Siberia, Korea (Simmons, 2005: 510); *macropus* (Gould, 1854) – southern Australia (Simmons, 2005: 511); *macrotarsus* (Waterhouse, 1845) – Philippines, northern Borneo (Simmons, 2005: 511); *martiniquensis* LaVal, 1973 – Martinique, Barbados (Lesser Antilles) (Simmons, 2005: 511); *melanorhinus* Merriam, 1890 – British Columbia (Canada) south to central Mexico and east to western Oklahoma (USA) (Simmons, 2005: 511); *moluccarum* (Thomas, 1915) – Ambon and Kai Isls (Moluccas), northern and western Australia, Seram, Waigeo Isl (West Palua, Indonesia), Papua New Guinea, Bismarck Arch., Solomon Isls (Simmons, 2005: 511); *montivagus* (Dobson, 1874) – Yunnan to Fukien and Chihil (China), northeastern India, Burma, Vietnam, Laos, northeastern Thailand, western Malaysia, Borneo (Simmons, 2005: 511); ***morrisi*** Hill, 1971. *muricola* (Gray, 1846) – Afghanistan through northern India and Nepal to Taiwan, Vietnam, Malaysia, Indonesia and New Guinea (Simmons, 2005: 512); *myotis* (Borkhausen, 1797) – central and southern Europe, east to Ukraine; southern England, most Mediterranean islands; Asia Minor; Lebanon, Syria and Israel (Simmons, 2005: 512); ***mystacinus*** (Kuhl, 1817); *nattereri* (Kuhl, 1817) – Ireland, Great Britain, Europe (except northern Scandinavia), Morocco, northern Algeria, Turkey, Israel, Jorden, Lebanon, Iraq, Iran, Bulgaria, Crimea and Caucasus to Turkmenistan (Simmons, 2005: 513); *nesopolus* Miller, 1900 – northeastern Venezuela; Curaçao and Bonaire (Netherlands Antilles) (Simmons, 2005: 513); *nigricans* (Schinz, 1821) – Nayarit and Tamaulipas (Mexico) to Peru, Bolivia, northern Argentina, Paraguay and southern Brazil; Trinidad and Tobago; St. Martin, Montserrat, Grenada (Lesser Antilles) (Simmons, 2005: 513); *nipalensis* Dobson, 1871 – Iran, Turkey and Uzbekistan to Nepal, Mongolia, Tibet and northwestern China, Siberia (Simmons, 2005: 513); *occultus* Hollister, 1909 – southern California to Arizona, New Mexico and Colorado (USA), south to Distrito Federal (Mexico) (Simmons, 2005: 514); *oreias* (Temminck, 1840) – Singapore (Simmons, 2005: 514); *oxygnathus* Monticelli, 1885 – Mediterranean region from Spain to Italy and Greece; Bulgaria to Turkmenistan, Kyrgyztan and Afghanistan (Simmons, 2005: 514); *oxyotus* (Peters, 1867) – Venezuela to Bolivia; Panama; Costa Rica (Simmons, 2005: 514); *ozensis* Imaizumi, 1954 – Honshu (Japan) (Simmons, 2005: 514); *peninsularis* Miller, 1898 – southern Baja California (Mexico) (Simmons, 2005: 514); *pequinius* Thomas, 1908 – Hong Kong, Hopeh, Shantung, Honan and Kiangsu (China) (Simmons, 2005: 514); *planiceps* Baker, 1955 – Coahuila, Nuevo León and Zacatecas (Mexico) (Simmons, 2005: 515); *pruinosus* Yoshiyuki, 1971 – Honshu and Shikoku (Japan) (Simmons, 2005: 515); ***punicus*** Felten, Spitzenberger and Storch, 1977; *ricketti* (Thomas, 1894) – Fukien, Anhwei, Kiangsu, Shantung, Yunnan (China); Hong Kong; Vietnam and Laos (Simmons, 2005: 515); *ridleyi* Thomas, 1898 – western Malaysia, Sumatra, Borneo (Simmons, 2005: 515); *riparius* Handley, 1960 – Honduras south to Uruguay, eastern Brazil, Argentina, Paraguay and Bolivia; Trinidad (Simmons, 2005: 515); *rosseti* (Oey, 1951) – Cambodia, Thailand (Simmons, 2005: 516); *ruber* (E. Geoffroy, 1806) – southeastern Brazil, southeastern Paraguay, northeastern Argentina (Simmons, 2005: 516); *schaubi* Komos, 1934 – Arminia and western Iran (Simmons, 2005: 516); ***scotti*** Thomas, 1927; *septentrionalis* (Trouessart, 1897) – eastern USA and Canada west to British Columbia, eastern Montana, eastern Wyoming; south to Alabama, Georgia, and Florida Panhandle (Simmons, 2005: 516); *sicarius* Thomas, 1915 – northeastern India and Nepal (Simmons, 2005: 516); *siligorensis* (Horsfield, 1855) – northern India to southern China, Burma, Vietnam and Laos; south to western Malaysia; Borneo (Simmons, 2005: 516); *simus* Thomas, 1901 – Colombia, Ecuador, Peru, northern Brazil, Bolivia, northeastern Argentina and Paraguay (Simmons, 2005: 517); *sodalis* Miller and Allen, 1928 – New

Hampshire to Florida Panhandle, west to Wisconsin and Oklahoma (USA) (Simmons, 2005: 517); *stalkeri* Thomas, 1910 – Kai and Gebe Isls (Molucca Isls), Waigeo Isl. (Prov. of Papua, Indonesia) (Simmons, 2005: 517); *thysanodes* Miller, 1897 – Chiapas (Mexico) to southwestern South Dekota (USA) and south-central British Columbia (Canada) (Simmons, 2005: 517); ***tricolor*** (Temminck, 1832); *velifer* (J. A. Allen, 1890) – Honduras to Kansas and southeastern California (USA) (Simmons, 2005: 517); *vivesi* Menegaux, 1901 – coast of Sonora and Baja California (Mexico), mainly on small islands (Simmons, 2005: 518); *volans* (H. Allen, 1866) – Jalisco to Veracruz (Mexico); Alaska Panhandle (USA) to Baja California (Mexico), east to northern Nuevo León (Mexico), South Dekota (USA) and central Alberta (Canada) (Simmons, 2005: 518); ***welwitschii*** (Gray, 1866); *yanbarensis* Maeda and Matsumura, 1998 – Northern Okinawa Isl (Japan) (Simmons, 2005: 518); *yesoensis* Yoshiyuki, 1984 – Hokkaido (Japan) (Simmons, 2005: 518); *yumanensis* (H. Allen, 1864) – Hidalgo, Morelos and Baja California (Mexico) north to British Columbia (Canada), east to Montana and western Texas (USA) (Simmons, 2005: 518).

COMMON NAMES:
Czech: netopýři myší, ouška myší, netopýrcové. English: Mouse-eared Bats, Little Brown Bats, Hairy Bats, Large-footed Bats. French: Murins. German: Mausohr, Mausohren. Polish: nocki.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
In Africa *Myotis* sp. have been found deposits of the Plio-Pleistocene, at Bolt's Farm, South Africa (Broom, 1948). Early Pleistocene, at Olduvai (Butler, 1978). Geraads *et al.* (2010: 279) reported the presence of *Myotis* in Late Cenozoic (ca. 2.5 MYA) deposits in Ahl al Oughlam, Morocco.

Molecular dating performed by Ruedi *et al.* (2013: 437-441) suggest an origin of all recent *Myotis* in the early Miocene (about 21 MYA with 95 % highest posterior density interval 23 - 20 MYA).

Shi and Rabosky (2015: 1532) report the approximate fossil date for crown Myotinae to be 27 MYA.

However, a recent study by Gunnell *et al.* (2017) reported on a fossil *Myotis* found in a Belgian Oligocene locality, dating 33 MYA.

The Ethiopian clade (see Taxonomy) would have been separated about 12.33 (15 - 10) MYA.

MOLECULAR BIOLOGY:
Baker *et al.* (1974) recorded the karyotype of *Myotis* as 2*n* = 44, AA = 50, but Dippenaar *et al.* (1983) give it as 2*n* = 50, AA = 48 in both *seabrai* and *lesueuri*.

PREDATORS:
In Algeria, Djilali *et al.* (2016: 159) found the Short-eared owl (*Asio flammeus*) to feed primarily on bats of the genus *Myotis*. They made up 37.8 % of all prey items (195 specimens on 516 prey items). The second one was *Gerbillus nanus* with only 5.4 % of all preys.

PARASITES:
From non-specified *Myotis* specimens, the following nycteribiids were reported by Vermeil (1960) from Tunisia: *Penicillidia conspicua* Speiser, 1900, *Nycteribia vexata vexata* Westwood, 1835, *Nycteribia biarticulata* Hermann, 1804, *Nycteribia latreillii* Leach, 1817, and *Nycteribia schmidlii* Schiner, 1853.

†***Myotis darelbeidensis*** Gunnell, Eiting, and Geraads, 2011

*2011. *Myotis darelbeidensis* Gunnell, Eiting, and Geraads, N. Jb. Geol. Paläont. Abh., 260 (1): 59, figs 3C, 5A-C, 8A-C. Publication date: January 2011. Type locality: Morocco: Ahl al Oughlam [ca. 33 35 N 07 30 W] [Goto Description]. Holotype: INSAP AaO 4571: Collected by: ?: Collector Unknown. Presented/Donated by: ?: Collector Unknown. Right dentary fragment with p2-m3. Paratype: INSAP AaO 4589: Collected by: ?: Collector Unknown. Presented/Donated by: ?: Collector Unknown. Left maxilla P4-M1. - Etymology: Name taken from Dar el Beida ("white house"), the Arabic name for Casablanca (see Gunnell *et al.*, 2011: 60). (Current Combination)

TAXONOMY:
Gunnell *et al.* (2011: 60) describe it as a large species of *Myotis*, similar in size to *M. blythii* and *M. myotis*, much larger than most other extant Mediterranean *Myotis* species (including *M. capaccinii, M. bechsteinii, M. emarginatus*).

Myotis anjouanensis (Dorst, 1960)

*1960. *? anjouanensis* Dorst, Bull. Mus. natn. Hist. nat., Paris, sér. 2, 31: 476 (for 1959). Type locality: Comoros: Anjouan Island. - Etymology: The specific name refers to the island where the type specimen was collected.
? *Myotis anjouanensis* (Name Combination, Current Combination)

TAXONOMY:
Considered a synonym of *goudoti* by Koopman (1993a: 211), and a subspecies of *goudoti* by Peterson *et al.* (1995: 89), but a valid species by Simmons (2005).

Csorba *et al.* (2014: 667) include *anjouanensis* in the subgenus *Chrysopteron*.

COMMON NAMES:
Czech: netopýr anžuánský. English: Anjouan Myotis, Anjouan Mouse-eared Bat. French: Murin d'Anjouan, Vespertilion de l'Ile d'Anjouan. German: Anjouan-Mausohr.

CONSERVATION STATUS:
Global - Listed as Data Deficient (DD ver 3.1 (2001)) since it has only recently been recognised as a distinct species, and there is still very little information on its extent of occurrence, status, threats and ecological requirements (Jacobs, 2008c; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) (Jacobs, 2008c; IUCN, 2009). 2004 - DD ver 3.1 (2001) (Jacobs, 2004k; IUCN, 2004).

MAJOR THREATS:
The threats to this species are not known (Jacobs, 2008c; IUCN, 2009).

CONSERVATION ACTIONS:
Jacobs (2008c) [in IUCN (2009)] reports that it is not known if the species is present in any protected areas. Further studies are needed into the natural history and possible threats to this little-known species.

GENERAL DISTRIBUTION:
Myotis anjouanensis is endemic to the island of Anjouan in the Comoros Islands.

Native: Comoros.

POPULATION:
Structure and Density - There is currently little information on the abundance of this species (Jacobs, 2008c; IUCN, 2009). Specimens were collected by Goodman, 2007) from Anjouan in 2007.

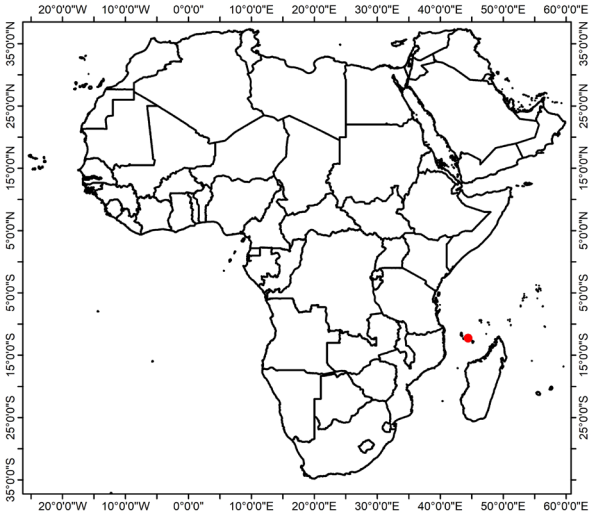

Figure 237. Distribution of *Myotis anjouanensis*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Comoros.

Myotis bocagii (Peters, 1870)

*1870. *Vespertilio Bocagii* Peters, J. Sci. mat. phys. nat., ser. 1, 3 (10): 125. Publication date: December 1870. Type locality: Angola: Duque de Bragança [08 55 S 16 10 E]. Lectotype: ZMB 3973: ad ♂, skull and alcoholic. Presented/Donated by: José Vicente Barboza du Bocage. Lectotype designated by Turni and Kock (2008: 57). - Comments: Turni and Kock (2008: 57) also indicate that Peters did not mention the number of specimens he examined, therefore it might be possible that additional syntypes might have existed in the Lisbon museum, but were destroyed by the fire in 1978. Thorn *et al.* (2009: 51) situate the type locality at 09 23 S 15 53 E. - Etymology: In honour of J.V. Barbosa du Bocage, an eminent Portuguese zoologist, who worked during the nineteenth century, and who named material from the Congo and Angola collected by his Portuguese colleague Snr. M. Jose d'Anchieta (Smithers, 1983: 93).
1976. *Myotis boccagei:* Brosset, Z. Tierpsychol., 42 (1): 50. (Lapsus)

1996. *Myotis bocagi:* Kityo and Kerbis, J. East Afr. Nat. Hist., 85: 63. (Lapsus)
? *Myotis (Selysius) bocagei:* (Name Combination, Alternate Spelling)
? *Myotis bocagei:* (Alternate Spelling)
? *Myotis bocagii:* (Name Combination, Current Combination)

TAXONOMY:

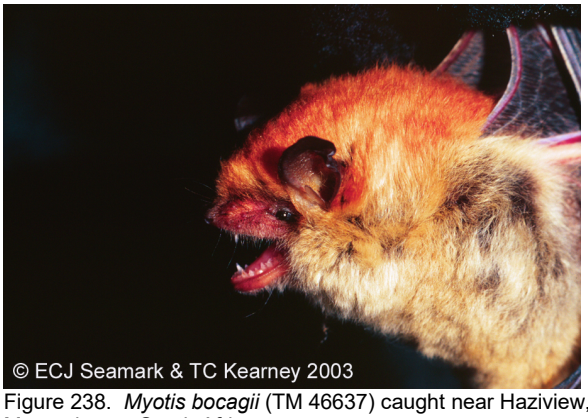

Figure 238. *Myotis bocagii* (TM 46637) caught near Haziview, Mpumalanga, South Africa.

Mentioned as *bocagei* by Corbet (1978: 49), Smithers (1983: 93), Meester *et al.* (1986: 49), Koopman (1993a: 209), Horácek *et al.* (2000: 121) Wilson and Cole (2000: 58), Hutson *et al.* (2001: 28), Fenton and Bogdanowicz (2002: 1008) but as *bocagii* by Ansell and Dowsett (1988: 37), Harrison and Bates (1991: 76), Grubb *et al.* (1998: 82), Stadelmann *et al.* (2004b: 178); and as *bocagi* by Kityo and Kerbis (1996: 63).

Csorba *et al.* (2014: 667) include *bocagii* in the subgenus *Chrysopteron*, but see Ruedi and Mayer (2001: 436), Ghazali *et al.* (2016: 476) and Patterson *et al.* (2019: "2") who reject the subgeneric division.

The phylogenetic analyses by Patterson *et al.* (2019: "5") revealed the presence of two groups within *M. bocagii*: one including a single Senegalese specimen and two all the remainder, including material from Ghana, DRC, Kenya, and Tanzania. These findings do not support the currently accepted division into two subspecies: *bocagii* and *cupreolus*, although the authors stress that no material from Angola (where the type of *bocagii* was collected) was included in the analyses (p. "9"). As such, it might be possible that two subspecies might still be present, with *bocagii* restricted to Angola. Until this has been resolved, we do retain the two traditionally recognized subspecies. Patterson *et al.* (2019) also indicated that *M. bocagii* forms a sister group with *M. goudoti* + *M. anjouanensis*, which in turn form a sister group to *M. tricolor* and *M. emarginatus* (based on nuclear genes).

COMMON NAMES:

Afrikaans: Rooi langhaarvlermuis. Chinese: 棕红鼠耳蝠. Czech: netopýr Bocageův. English: Rufous Mouse-eared bat, Bocage's Mouse-eared Bat, Rufous Mouse-eared Myotis, Rufous Hairy Bat, Bocage Banana Bat, Bocage's Hairy Bat. French: Murin roux, Murin de Du Bocage. German: Kupferfarbenes Mausohr, Bananen-Mausohr. Portuguese: Morcego lanudo de Bocage. Spanish (Castillian): Murciélago de Orejas de Ratón.

CONSERVATION STATUS:

Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Jacobs, 2008d; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Jacobs, 2008d; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Jacobs, 2004f; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - LC ver 3.1 (2001) (Monadjem *et al.*, 2016j). 2004 - DD ver 3.1 (2001) (Friedmann and Daly, 2004). 1986 - Indeterminate (Smithers, 1986).

MAJOR THREATS:

There appear to be no major threats to this species as a whole (Jacobs, 2008d; IUCN, 2009).

CONSERVATION ACTIONS:

Jacobs (2008d) [in IUCN (2009)] reports that it has been recorded from Kruger National Park, South Africa (Skinner and Chimimba, 2005), Dzanga-Sangha Special Dense Forest Reserve in the Central African Republic (Lunde *et al.*, 2001), and from the Manga Forest Reserve in Tanzania (Doggart *et al.*, 1999b), and in view of the species wide range it is presumed to be present in many more protected areas. There are no direct conservation measures currently needed for this species as a whole.

GENERAL DISTRIBUTION:

Myotis bocagii is widespread throughout much of sub-Saharan Africa. It occurs from Sierra Leone and Senegal in West Africa, eastwards through Cameroon and Central Africa, to Ethiopia and East

Africa, being recorded as far south as northeastern South Africa. Outside of Africa it has been recorded from southern Yemen.

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 594,469 km^2.

Native: Angola (Crawford-Cabral, 1989; Monadjem *et al.*, 2010d: 564); Benin; Burkina Faso (Kangoyé *et al.*, 2015a: 618); Burundi; Cameroon; Central African Republic; Congo (The Democratic Republic of the) (Allen, 1917; Hayman *et al.*, 1966; Van Cakenberghe *et al.*, 1999; Monadjem *et al.*, 2010d: 564); Côte d'Ivoire; Equatorial Guinea; Ethiopia; Gabon; Ghana; Guinea (Fahr *et al.*, 2006a: 73); Kenya; Liberia (Monadjem and Fahr, 2007: 50); Malawi (Happold *et al.*, 1988; Monadjem *et al.*, 2010d: 564); Mozambique (Smithers and Lobão Tello, 1976; Monadjem *et al.*, 2010d: 564; Monadjem *et al.*, 2010c: 383); Nigeria; Rwanda; Senegal; Sierra Leone (Weber *et al.*, 2019: 25); South Africa (Monadjem *et al.*, 2010d: 564); Swaziland (Monadjem *et al.*, 2010d: 564; Shapiro and Monadjem, 2015: 353); Sudan; Tanzania (Stanley and Goodman, 2011: 43); Togo; Uganda; Yemen; Zambia (Monadjem *et al.*, 2010d: 564); Zimbabwe (Monadjem *et al.*, 2010d: 564).

Bates *et al.* (2013: 339) reject the occurrence of *M. bocagii* in the Republic of Congo as Happold (2013dn: 693) only provided a map without any supporting data.

ECHOLOCATION:
Schoeman and Waddington (2011: 291) mention a peak frequency of 43.2 ± 0.2 kHz and a duration of 2.0 ± 0.1 msec for specimens from Durban, South Africa. Monadjem *et al.* (2017c: 179) reported for one specimen the following parameters from Swaziland: F_{min}: 30.1 kHz, F_{knee}: 41.2 kHz, F_c: 36.6 kHz, and duration: 2.8 msec. They were also to capture the call up to a distance of 5 m.

MOLECULAR BIOLOGY:
DNA - See Hoofer and Van Den Bussche (2003).
Karyotype - Rautenbach *et al.* (1993) reported 2*n* = 44, FN = 50, BA = 8, a submetacentric X chromosome, and an acrocentric Y chromosome, for specimens from South Africa. These results are the same as those obtained for *M. tricolor* specimens from South Africa and Zimbabwe (Rautenbach *et al.*, 1993).
Protein / allozyme - Unknown.

HABITAT:
In southern Africa, this species primarily (82 %) occurs in Savanna habitats (Cooper-Bohannon *et al.*, 2016: Table S2).

In the Mount Nimba area, Monadjem *et al.* (2016y: 369) collected one specimen in old growth forest at 420 m.

HABITS:
Brosset (1976) found that harem groups of female *M. bocagii*'s remained very stable over a period of several years. The males in these groups were replaced more often.

DIET:
From the Umbilo River in KwaZulu Natal (RSA), Naidoo *et al.* (2011: 26) reported the following prey volume percentages: during summer: Lepidoptera (1.3 ± 1.9), Coleoptera (0.8 ± 1.0), Hemiptera (8.5 ± 13.1), Diptera (37.8 ± 25.8), and Trichoptera (51.8 ± 29.9); during winter: Lepidoptera (7.5 ± 10.6), Coleoptera (32.5 ± 46.1), Hemiptera (20.0 ± 28.3), Diptera (33.4 ± 33.0), and Trichoptera (6.7 ± 4.7).

Weier *et al.* (2019b: 6) investigated droppings from this species in the Levubu region (Limpopo, RSA) and found DNA sequences of *Bathycoelia distincta* Distant, 1878 (Hemiptera).

POPULATION:
Structure and Density - Although this species is difficult to catch it is possibly not very rare (Jacobs, 2008d; IUCN, 2009).
Trend - 2008 - Unknown (Jacobs, 2008d; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
Stanley and Goodman (2011: 43) report on a male with scrotal testes collected in the East Usambara Mountains (Tanzania) on 30 July 1992.

One female captured on 4 June in Sierra Leone by Weber *et al.* (2019: 25) was pregnant.

VIRUSES:
Coronaviridae - Coronaviruses
SARS-CoV - Müller *et al.* (2007b) tested between 1986 and 1999, for antibodies to SARS-CoV in serum of one individual from Limpopo Province, South Africa, which tested negative (0/1).

? *Myotis capaccinii:* (Name Combination, Current Combination)

TAXONOMY:
Most recent authors consider *M. capaccinii* as a monotypic species (Spitzenberger and von Helversen, 2001; Simmons, 2005).

COMMON NAMES:
Albanian: Lakuriq nate gishtgjatë. Arabian: Khaffash. Armenian: Միջերկրածովայիհն գիշերաչղջիկ. Azerbaijani: Uzunbarmaq gecəşə bpə rə si. Basque: Saguzar hatz-luze, Saguzar hankahandia. Belarusian: Начніца даўгапалая. Bosnian: Dugoprsti š iš miš. Breton: Gousperell Capaccini. Bulgarian: Дългопръст нощник. Castilian: Murciélago patudo, Murciélago ratonero patudo. Catalan: Ratpenat de peus grans, Rat penat de peus grans. Croatian: Dugonogi š iš miš. Czech: Netopý r dlouhonohý. Danish: Capaccinis flagermus. Dutch: Capaccini's vleermuis. English: Capaccinii's Mouse-eared Bat, Long-fingered Bat, Long-fingered Myotis. Estonian: Pikkjalg-lendlane. Finnish: Pitkäsormisiippa. French: Murin de Capaccini, Vespertilion de Capaccini, Vespertilion des montagnes. Frisian: Grutfuottige flearmûs. Galician: Morcego de pés grandes. Georgian: კაპაჩინის მღამიობი. German: Langfußfledermaus, Freischeinige Stelzfussfledermaus. Greek: Ποδαρομυωτίδα. Hebrew: Nishpon Gadot. Hungarian: Hosszúlábú denevér, Nycteris i macropus. Irish Gaelic: Ialtóg fhadmhéarach. Italian: Vespertilio di Capaccini. Latvian: Garpirkstu naktssikspā rnis. Lithuanian: Ilgapirštis pelė ausis. Luxembourgish: Laangfoussfliedermaus. Macedonian: Долгопрст ноќник [= Dolgoprst Nokjnik]. Maltese: Farfett il-Lejl tas-Swaba Twal. Montenegrin: Dugoprsti već ernjak. Norwegian: Langfotflaggermus. Polish: Nocek dł ugopalcy. Portuguese: Morcego de Capaccini. Rhaeto-Romance: Vespertil da Capaccini. Romanian: Liliacul cu picioare lungi, Liliac-cu-picioare-lungi. Russian: Ночница средиземная (итальянская). Serbian: Дугопрсти вечерњак [= Dugoprsti večernjak]. Scottish Gaelic: Ialtag fhad-mheurach. Slovak: Netopier dlhonohý. Slovenian: Dolgonogi netopir. Swedish: Storfotsfladdermus. Turkish: Uzunayaklı Yarasa. Ukrainian: Нічниця довгопала. Welsh: Ystlum hirfys.

CONSERVATION STATUS:
Global - The species occupies specialised habitat (caves and associated water systems). In the eastern part of the range it congregates in winter in a few sites which are threatened by human disturbance. It has declined between 30 and 50 % in Spain in the last 10 years, and there are indications of declines in other parts of the range. It only hunts in watercourses and is therefore threatened by water pollution and the development of tourist infrastructure, which is expected to continue in the future. It is suspected that population declines are underway that will exceed 30 % over 18 years (3 generations), and for that reason the species is considered Vulnerable (VU A4bce ver 3.1 (2001)) (Hutson *et al.*, 2008k; IUCN, 2009).

Assessment History -
2008 - VU A4bce ver 3.1 (2001) (Hutson *et al.*, 2008k; IUCN, 2009). 1996 - VU (Baillie and Groombridge, 1996). 1994 - VU (IUCN, 1994). 1990 - VU (IUCN, 1990). 1988 - VU (IUCN, 1988).

MAJOR THREATS:
Threats include changes in water quality through pollution and dam building, and loss of water bodies and watercourses. Damage or disturbance to caves (tourism, fires and vandalism) used as roosts may also be a problem, as the species is very dependent on caves. The species is collected for medicinal purposes in North Africa (Hutson *et al.*, 2008k; IUCN, 2009).

The species's small distribution range, cave or tree roosting, and aerial hawking feeding style are considered to be the most important risk factors related to climatic change (Sherwin *et al.*, 2012: 174). Bilgin *et al.* (2012: 434) predict that the range retraction for *M. capaccinii* as a result of climatic change may pose severe threats to its survival as this species has the bulk of its range in the Mediterranean region.

CONSERVATION ACTIONS:
Hutson *et al.* (2008k) [in IUCN (2009)] report that it is protected by national legislation in most range states. There are also international legal obligations for its protection through the Bonn Convention (Eurobats) and Bern Convention in the range states where these apply. It is included in Annex II (and IV) of EU Habitats and Species Directive, and hence requires special measures for conservation including designation of Special Areas for Conservation. Some habitat protection through Natura 2000. In Spain, fences are in place to protect several known colonies. Measures needed include protection of colonies (these measures should avoid the blocking of any cave

entrances with gates and control of tourist access) and improvement of water quality.

GENERAL DISTRIBUTION:
Myotis capaccinii is sparsely distributed from eastern Iberia, Spain through the northern Mediterranean to coastal Asia Minor and Israel, Lebanon and Jordan, and also in Mesopotamia from Turkey to Iran and in north-west Africa (limited to the Mediterranean fringe of western Maghreb: north Morocco and northwest Algeria). It occurs from sea level to 900 m.
Bilgin *et al.* (2012) examined climate change scenarios within the Asia Minor and Levant region, they predict that *M. capaccinii* will have a range contraction, which may pose severe threats to their survival of this species.

Native: Albania; Algeria (Kowalski and Rzebik-Kowalska, 1991: 91); Andorra; Austria; Bosnia and Herzegovina; Bulgaria; Croatia; Cyprus (Benda *et al.*, 2007: 71); France [Corse]; Greece [Kriti]; Holy See [Vatican City State]; Iran, Islamic Republic of; Iraq; Israel; Italy [Sardegna, Sicilia]; Jordan; Lebanon; Macedonia, the former Yugoslav Republic of; Montenegro; Morocco (Aulagnier and Thevenot, 1986: 44); Romania; Russian Federation; Serbia; Slovenia; Spain [Baleares]; Syrian Arab Republic; Tunisia; Turkey; Uzbekistan.
Regionally extinct: Switzerland.

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Almenar *et al.* (2006: 158) indicate that the large hind feet and pointed wings of this species are well suited for capturing prey while trawling through the water surface.

DETAILED MORPHOLOGY:
In their study on take-off performance, Gardiner *et al.* (2014: 1059) determined a wing beat frequency of 12.96 ± 0.18 Hz.

FUNCTIONAL MORPHOLOGY:
Gardiner and Nudds (2011: 2187), in their study of flight-initiating jumps, found that *M. capaccinii* did not show a reduced jumping performance, which could have been expected due to the large feet, which leads to extra weight at the extremities.

ECHOLOCATION:
Highly variable depending on activity and habitat; these data refer to cruising calls in the main habitat. Search-phase call-shape (while hunting above water surface): hyperbolic FM. Start-frequency: 43 kHz; end-frequency: 22 kHz; frequencies with maximum energy: 28 - 35 kHz; call-duration: 6 - 9 msec, inter-call interval: 145 - 165 msec (Barataud, 2002, 2005).
The data for 56 animals from Greece were the following: F_{start}: 89.7 ± 7.35 kHz, F_{end}: 35.1 ± 2.18 kHz, F_{peak}: 48.9 ± 4.76 kHz, bandwidth: 14.2 ± 9.93 kHz, duration 4.6 ± 0.77 msec and interpulse interval: 75.4 ± 22.97 msec (Papadatou *et al.*, 2008b: 132).
Walters *et al.* (2012: suppl.) report the next figures for 30 calls of bats from France and Italy: duration: 3.62 ± 1.40 msec, F_{max}: 73.51 ± 9.28 kHz, F_{min}: 36.6 ± 3.18 kHz, bandwidth: 36.91 ± 10.73 kHz, F_{peak}: 52.2 ± 6.93 kHz.
The following data for 20 calls from Iran were reported by Benda *et al.* (2012a: 182): F_{start}: 66.0 ± 12.3 (53.1 - 87.1) kHz, F_{end}: 48.9 ± 2.0 (46.6 - 52.6) kHz, F_{peak}: 52.9 ± 1.9 (49.9 - 55.3) kHz, duration: 5.3 ± 0.7 (3.9 - 6.3) msec, and interpulse interval: 49.1 ± 20.4 (19.4 - 84.4) msec. Mehdizadeh *et al.* (2018: 1) reported that isolation calls of 1 to 4 day old Iranian *M. capaccinii* were FM shallow calls with longer duration (7.54 ± 1.83 ms) and lower F_{peak} (20.07 ± 0.89 kHz) as compared to adult female calls (2.35 ± 0.75 ms and 54.02 ± 4.34 kHz). Between days 12 and 16, the calls began to sounc more like these of the adults.

Aizpurua *et al.* (2013: 4) indicate that *M. capaccinii* is able to regulate the temporal component of the echolocation call so that they can modify their capturing technique depending on whether they are hunting for aquatic arthropods or fish.

MOLECULAR BIOLOGY:
DNA - See Hoofer and Van Den Bussche (2003).
Karyotype - Capanna *et al.* (1968) and Rushton (1970: 463) reported 2*n* = 44, aFN = 50, X = metacentric, Y = acrocentric for specimens from Italy, while Pérez-Suárez *et al.* (1991) reported 2*n* = 44, aFN = 52, X = submetacentric, Y = acrocentric for specimens from Spain.
From Italy, Capanna and Manfredi Romanini (1971: 474) mention 2*n* = 44, aFN =60, 3 metacentric pairs of chromosomes, 1 submetacentric and 17 acrocentric; with the X chromosome being metacentric and the Y chromosome acrocentric.

Karaman *et al.* (2017: 119) indicate that the ddRAD and mtDNA structure suggests that three lineages in the Mediterranean area could be considered different species, but this needs to be investigated further.

Protein / allozyme - Unknown.

HABITAT:
In the eastern Iberian peninsula, Almenar *et al.* (2006: 157) report that *M. capaccinii* only used aquatic habitats as foraging sites, and that most of their foraging activity was on rivers.

M. capaccinii preferentially used river stretches characterised by an open course and smooth water surfaces (Almenar *et al.*, 2012). They shifted foraging stretches seasonally, likely following the spatiotemporal dynamics of prey production over the watershed (Almenar *et al.*, 2012).

HABITS:
Aihartza *et al.* (2008: 287) describe the fishing behaviour of *M. capaccinii* as observed in a flight tent containing an artificial pool. They distinguished two patterns: "A) long series of circular flights, skimming along the water and dipping in softly twice or three times in each roundabout; B) long figure-eight loops with bats flying faster and higher, swooping down on the centre of the pond, where they snapped their hind feet hard into the water." They also suggest (p. 297) that the bats detect the presence of fish by touching them when they dip their feet into the water.

ROOST:
Within the Iberian Peninsula, within the lower basin of the Xúquer River, Almenar *et al.* (2012) reported a main roost within a limestone cave with a variable colony size through the season: 81 *M. capaccinii* during pre-breeding, 219 during lactation and 113 during weaning of 2004. More than 100 individuals inhabit the second roost during lactation, located 8.4 km from the first. Both roosts are shared with other bat species (*Rhinolophus euryale*, *Rhinolophus mehelyi*, *Myotis blythii*, *Myotis myotis*, *Myotis emarginatus*, *Myotis nattereri* and *Miniopterus schreibersii*) (Almenar *et al.*, 2012).

DIET:
Aihartza *et al.* (2008: 288) indicate that in the Mediterranean arean aquatic arthropods (e.g. Diptera: Culicidae and Chironomidae) form the main prey of this species, supplemented by Trichoptera, Neuroptera, Lepidoptera, Heteroptera and arachnids. But its diet also contains fish.
Although some *M. capaccinii* populations are known to eat fish in the wild Aihartza *et al.*, 2003; Levin *et al.*, 2006; Biscardi *et al.*, 2007), the diet of the surveyed individuals appeared to be exclusively arthropods (Almenar, 2008).
On the Iberian peninsula, Aizpurua *et al.* (2011: 48) examined 2600 guano samples and retrieved 97 otoliths, all from the mosquitofish (*Gambusia holbrooki*) which would have been between 1.5 and 3.6 cm in length (maximum size of fishes: 5 cm in males and 8 cm in females, see Aihartza *et al.*, 2003: 196). They also found that one of the bats was able to eat between 8 and 15 fishes in one or two nights.

POPULATION:
Structure and Density - See Hutson *et al.*, 2008k) [in IUCN (2009)].
Trend - 2008 - Decreasing (Hutson *et al.*, 2008k; IUCN, 2009). *Myotis capaccinii* populations within the Asia Minor and Levant region are predicted to have a declining population trend, under climate change scenarios (Bilgin *et al.*, 2012: 433).

REPRODUCTION AND ONTOGENY:
In Greece, most females were pregnant by the second half of April and had given birth before the end of May. The first flying young were found by the end of June or the beginning of July (Papadatou *et al.*, 2008a 509).

In Iran, Mehdizadeh *et al.* (2018: 1) found the forearm length of neonates to be 19.59 ± 1.23 mm, with a linear growth of 0.74 mm/day until day 28. The weight at day one was 3.59 ± 0.23 g, and this increased linearly with 0.15 g/day until day 28.

PARASITES:
In Italy, Voyron *et al.* (2011: 193) reported the following fungal entities from carcasses: *Alternaria* sp., *Candida palmioleophila*, *Chrysosporium/Gymnoascus*, *Cladosporium cladosporioides*, Gimnoascacea, *Verticillium lecanii*, *Trichosporon chiropterorum*, *Mucor hiemalis f. hiemalis*, *Mucor racemosus*.

Ševcík *et al.* (2012: 35) report on the presence of the bat flies *Nycteribia pedicularia* Latreille, 1805, *Nycteribia schmidlii schmidlii* Schiner, 1853, and *Penicillidia dufourii* Westwood, 1835 on bats from Crete and Cyprus. *Nycteribia kolenati* Theodor & Moscona, 1954 and *Phthiridium biarticulatum* Hermann, 1804 were reported for the first time by Haelewaters *et al.* (2017: 1) from bats from Hungary.
From a non-specified area, Haelewaters *et al.* (2018: 794) added *Penicillidia conspicua* Speiser, 1901.

In Algeria, Bendjeddou *et al.* (2013: 325) reported two ectoparasites: *Cimex lectularius* (Linnaeus, 1758) (Hemiptera: Cimicidae) and *Rhipicephalus sanguineus* (Latreille, 1806) (Arachnidae: Ixodida: Ixodidae). Bendjeddou *et al.* (2017: 15) added the following species: *Nycteribia (Nycteribia) latreillii* (Leach, 1817) and *Phthiridium biarticulatum* Hermann, 1804 (Nycteribiidae); *Brachytarsina (Brachytarsina) flavipennis* Macquart, 1851 (Streblidae) and *Spinturnix myoti* (Kolenati, 1856) and *Ixodes vespertilionis* Koch, 1844 (Arachnida).

VIRUSES:
Paramyxoviridae
Morbillivirus

This virus was reported from Bulgaria, Germany and Romania by Kohl and Kurth (2014: 3113).

UTILISATION:
The species is collected for medicinal purposes in North Africa (Hutson *et al.*, 2008k; IUCN, 2009).

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Morocco, Tunisia.

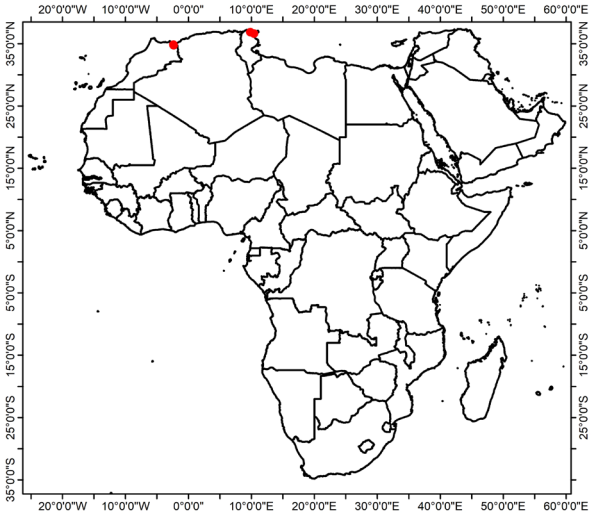

Figure 240. Distribution of *Myotis capaccinii*

Myotis dieteri M. Happold, 2005

*2005. *Myotis dieteri* M. Happold, Acta Chiropt., 7 (1): 11, figs 1 - 2. Type locality: Congo: Loudima: Grotte du Viaduc [04 15 S 13 00 E] [Goto Description]. Holotype: MNHN ZM-MO-1985-1925: ad ♀, alcoholic and cranium only (no mandibula). Collected by: Jean-Paul Adam; collection date: between 1961 and 1968. - Etymology: In honour of Dr. Dieter Kock of the Senkenberg Museum, Frankfurt, Germany, in recognition of the great contribution he made to the knowledge of African mammals, in recognition of the kindness and generosity with which he has helped so many others with their studies, and in gratitude for our long firendship (see Happold, 2005: 11). (Current Combination)

TAXONOMY:
Known only from the type specimen (Happold, 2005: 11).

Csorba *et al.* (2014: 668) indicate that *dieteri* is probably the only sub-Saharan *Myotis* that doesn't belong to the subgenus *Chrysopteron*, but molecular data are missing to confirm this.

COMMON NAMES:
Czech: netopýr Kockův. French: Murin de Kock. German: Kocks Mausohr.

CONSERVATION STATUS:
Global - Listed as Data Deficient (DD ver 3.1 (2001)) since it has only recently been described, and there is still very little information on its extent of occurrence, status, threats and ecological requirements (Happold, 2008; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) (Happold, 2008; IUCN, 2009).

MAJOR THREATS:
The threats to this species remain unknown (Happold, 2008; IUCN, 2009).

CONSERVATION ACTIONS:
Happold (2008) [in IUCN (2009)] reports that it is not known if the species is present within any protected areas. Additional studies are needed into the distribution, abundance, breeding biology and general ecology of this species. There is a need to determine if the species is still present at Grotte du Viaduc à Loudima, and to locate additional populations through directed surveys.

GENERAL DISTRIBUTION:
Myotis dieteri has only been recorded from type locality of 'Grotte du Viaduc à Loudima, Republic of Congo (04º15'S, 13º00'E) (Happold, 2005: 11). Despite extensive surveys of other seemingly suitable localities, it has not been recorded from additional caves in the Loudima-Kimongo region, or from caves in the Mayombe and lower Kouilou regions of Congo, the Haut-Ivindo region of Gabon, or Kikwit in the Democratic Republic of Congo (Happold, 2005).

Native: Congo (Happold, 2005: 11; Bates *et al.*, 2013: 337).

POPULATION:
Structure and Density - It is known only from the holotype collected by Jean-Paul Adam sometime

between 1961 and 1968, from a small number of this species present in the cave (Happold, 2005). Trend - 2008 - Unknown (Happold, 2008; IUCN, 2009).

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Congo.

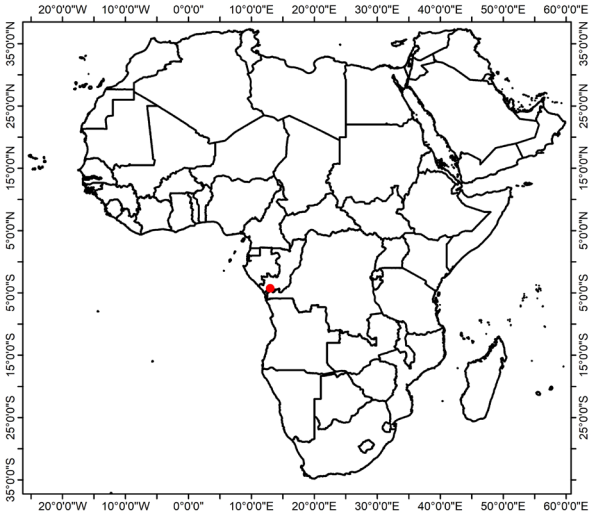

Figure 241. Distribution of *Myotis dieteri*

Myotis emarginatus (E. Geoffroy St.-Hilaire, 1806)

*1806. *Vespertilio emarginatus* E. Geoffroy Saint-Hilaire, Ann. Mus. Hist. nat. Paris, 8: 198. Type locality: France: Ardennes: Givet: Charlemont. Holotype: MNHN 819-202: ad, mounted skin (skull not removed). Additional skull A6953: see Rode (1941: 244), who mentions Abbeville as locality, and M. Baillon as collector.
? *Myotis emarginata:* - Comments: corrected gender for specifc name. (Alternate Spelling)
? *Myotis emarginatus emarginatus:* (Name Combination)
? *Myotis emarginatus:* (Name Combination, Current Combination)

TAXONOMY:
Assigned to the subgenus *Isotus* by Pavlinov *et al.* (1995: 97), but Csorba *et al.* (2014: 667) include it in the subgenus *Chrysopteron*.

Woodman (1993) notes that many mammalian generic names ending in *-otis* use the wrong gender for specific names therefore this name should be *M. emarginata*. However, see also Benda and Tsytsulina (2000: 335), and Simmons (2005).

COMMON NAMES:
Albanian: Lakuriq nate i Geoffroy-it. Arabian: Khaffash. Armenian: Եռագույն գիշերաչղջիկ. Azerbaijani: Üçrə ng gecəşə bpə rə si. Basque: Geoffroy saguzar. Belarusian: Начніца трохкаляровая. Bosnian: Trobojni šišmiš. Breton: Gousperell Geoffroy. Bulgarian: Трицветен нощник. Castilian: Murciélago orejirroto, Murciélago de Geoffroy, Murciélago ratonero pardo. Polish: Nocek orzę siony. Portuguese: Morcego-lanudo. Rhaeto-Romance: Vespertil cun tschegls, Vespertil cun tscheglias. Romanian: Liliacul cărămiziu, Liliac-cu-gene-lungi. Russian: Ночница трёхцветная, Трехцветная ни1086\чница [= Tryokhtsvetnaya nochnitsa]. Serbian: Риђи вечерњак [= Riđi večernjak]. Scottish Gaelic: Ialtag Geoffroy. Slovak: Netopier brvitý. Slovenian: Vejicati netopir. Swedish: Flikörad fladdermus. Turkish: Kirpikli Yarasa. Ukrainian: Нічниця триколірна. Welsh: Ystlum Geoffroy.

CONSERVATION STATUS:
Global - The species experienced a significant decline in at least parts of its range from the 1960s to the 1990s, but now it is expanding in central Europe and is stable or not significantly declining elsewhere. The range is still large and the species is not specialized to restricted habitat, although it has a very specialized diet. Assessed as Least Concern (LC ver 3.1 (2001)) (Hutson *et al.*, 2008m; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Hutson *et al.*, 2008m; IUCN, 2009). 1996 - VU A2c ver 2.3 (1994) (Baillie and Groombridge, 1996).

MAJOR THREATS:
In Europe the species is mainly associated with agricultural landscapes, therefore all agricultural activities can affect populations of this species. Loss of and disturbance to roost sites in buildings (including remedial timber treatment in attics) and underground sites are also threats. In the African part of the range, cave habitats, where the species roosts, are being destroyed by fires and vandalism. The species is also collected for traditional medicine practices in North Africa (Hutson *et al.*, 2008m; IUCN, 2009).

CONSERVATION ACTIONS:
Hutson *et al.* (2008m) [in IUCN (2009)] report that it is protected by national legislation in most range states. There are also international legal obligations for its protection through the Bonn Convention (Eurobats) and Bern Convention in the range states where these apply. It is included in Annex IV of EU Habitats and Species Directive, and there is some habitat protection through Natura 2000.
Protection of roosts and promotion of awareness about the lack of medicinal value of the species is required.

GENERAL DISTRIBUTION:
Myotis emarginatus occurs in southern Europe from Portugal in the west to the Balkans in the east and southern part of western and central Europe and non-arid parts of southwestern Asia from Asia Minor, Caucasus region and Palestine to Oman, Uzbekistan and Tajikistan; also in north-west Africa (recorded from northern Maghreb (Algeria, Morocco and Tunisia)). In the eastern part of the Mediterranean it occurs in various parts of Turkey, Syria, Lebanon and Israel. It occurs from sea level to 1,800 m, highest records in the Alps are 812 m (maternity colony) and 1,505 m (hibernaculum) (Spitzenberger, 2002).

Native: Afghanistan; Albania; Algeria; Andorra; Armenia; Austria; Azerbaijan; Belgium; Bosnia and Herzegovina; Bulgaria; Croatia; Cyprus; Czech Republic; France [Corse]; Georgia; Germany; Gibraltar; Greece [Kriti] (Benda *et al.*, 2007: 71); Hungary; Iran, Islamic Republic of; Israel; Italy [Sardegna]; Jordan; Kazakhstan; Kyrgyzstan; Lebanon; Luxembourg; Macedonia, the former Yugoslav Republic of; Monaco; Montenegro; Morocco (El Ibrahimi and Rguibi Idrissi, 2015: 360); Netherlands; Oman; Poland; Portugal; Romania; Russian Federation; San Marino; Saudi Arabia; Serbia; Slovakia; Slovenia; Spain [Baleares]; Switzerland; Syrian Arab Republic; Tajikistan; Tunisia (Dalhoumi *et al.*, 2014: 53); Turkey; Turkmenistan; Ukraine; Uzbekistan.

ECHOLOCATION:
Highly variable depending on activity and habitat; these data refer to cruising calls in the main habitat. Search-phase call-shape (close to foliage): steep linear FM. Start-frequency: 110 kHz; end-frequency: 39 kHz; frequency with maximum energy: 65 kHz; call-duration: 2.6 msec; inter-call interval: 26-32 msec (Barataud, 2005).

The data for 42 animals from Greece were the following: F_{start}: 110.5 ± 10.90 kHz, F_{end}: 42.6 ± 5.57 kHz, F_{peak}: 72.8 ± 7.28 kHz, bandwidth: 43.4 ± 8.29 kHz, duration 3.3 ± 0.73 msec and interpulse interval: 79.4 ± 23.83 msec (Papadatou *et al.*, 2008b: 132).
Walters *et al.* (2012: suppl.) report the following figures for 26 calls (24 sequences) from France and Germany: duration: 2.29 ± 0.70 msec, F_{max}: 93.23 ± 20.18 kHz, F_{min}: 42.00 ± 3.47 kHz, bandwidth: 51.23 ± 17.78 kHz, F_{peak}: 60.23 ± 15.14 kHz.

MOLECULAR BIOLOGY:
DNA - See García-Mudarra *et al.* (2009).

Karyotype - Bovey (1949) and Pérez-Suárez *et al.*, 1991) reported 2*n* = 44, aFN = 50, X = submetacentric, Y = acrocentric, while Radjhabli *et al.* (1970) reported aFN = 56 and Zima (1978) aFN = 52 with X = metacentric. The autosomal component consists of three large metacentric, one small metacentric, 15 acrocentric and two dot-like pairs (with one being bi-armed) (Arslan and Zima, 2014: 10). The latter authors also refer to the X chromosome as being a medium-sized metacentric.

HABITAT:
In Spain, Goiti *et al.* (2011: 19) found that *M. emarginatus* flew on average 5 km to its foraging areas, with a maximum distance of almost 10 km. The foraging area covered between 120 and 371 ha, and consisted mainly of scrubland (35 % of mean individual foraging time) and pine plantations (34 % of mean individual foraging

locations), followed by isolated trees (oak, pine, or eucalyptus - on average 11 %), riparian woods (7 %), oak dehesas (6 %), and eucalyptus plantations (5 %).

DIET:
Goiti *et al.* (2011: 20) found that, in Spain, spiders made up the major part of the diet by both volume (mean 79 %) and frequency (in feces of all examined bats, and in 95 % of the feces). The next most important group was formed by moths, with a mean consumption of 7 % of the diet by volume; dipterans (flies and midges - 6.3 %), and lacewings (especially the family Hemerobiidae - 4.4 %). Earwings, harvestmen, wasps, and beetles all made up less than 2 % of the diet.
Benda *et al.* (2012a: 325) summarizes the European food groups as: Araneae, Lepidoptera, brachyceran Diptera, and Lepidoptera larvae. In the Middle East Diptera, Lepidoptera, Coleoptera, and Homoptera are prevailing in Azerbaijan, Araneae and Brachycera in Syria, and Hemiptera, Araneae, and Brachycera in Turkey. In Iran, there was a high proportion of Tipulidae, and in Jordan of scarabaeid beetles. This lead Benda *et al.* (2012a: 325) to conclude that a certain level of flexibility of the trophic niche in *M. emarginatus*.

POPULATION:
Structure and Density - Locally it can be rare or common. The species experienced a significant decline from the 1960s to the 1990s, but in recent time the numbers in several regions have increased and the species has spread into new areas. It lives in large colonies (up to 1,200 individuals in Austria in one maternity colony) (Hutson *et al.*, 2008m; IUCN, 2009).
Trend - 2008 - Stable (Hutson *et al.*, 2008m; IUCN, 2009). *M. emarginatus* populations within the Asia Minor and Levant region are predicted to have a stable population trend, under climate change scenarios (Bilgin *et al.*, 2012: 433).

PARASITES:
Frank *et al.* (2015: 8) mention the following parasites for European *M. emarginatus*:
Arachnida: *Eyndhovenia euryalis* (G. Canestrini, 1885), *Macronyssus rhinolophi* (Oudemans, 1902), *Steatonyssus periblepharus* Kolenati, 1858, *Spinturnix emarginata* (Kolenati, 1856).

Insecta: *Basilia nana* Theodor & Moscona, 1954, *Basilia italica* Theodor, 1954, *Cimex pipistrelli* Jenyns, 1839, *Ischnopsyllus emarginatus*, *Ischnopsyllus simplex* Rothschild, 1906, *Penicillidia dufourii* (Westwood, 1835), *Phthiridium biarcticulatum*, *Rhinolophopsylla unipectinata* (Taschenberg, 1880).

Trematoda - Digenea: *Lecithodendrium linstowi* Dollfus, 1931, *Prosthodendrium aelleni* Dubois, 1956, *Prosthodendrium chilostomum* (Mehlis, 1831).

Cestoda: *Myotolepis grisea* (Beneden, 1873).

Bendjeddou *et al.* (2017: 15) mention the following parasites from bats from Algeria: Nycteribiidae: *Nycteribia (Nycteribia) latreillii* (Leach, 1817) and *Penicillidia (Penicillidia) dufourii* Westwood, 1835; Arachnida: *Spinturnix myoti* (Kolenati, 1856) and *Ixodes vespertilionis* Koch, 1844.

VIRUSES:
Orthomyxoviridae
Despite sampling and testing of 3 individuals of this species, no evidence of influenza A-like viruses (Orthomyxoviridae) were obtained (Fereidouni *et al.*, 2015).

UTILISATION:
The species is also collected for traditional medicine practices in North Africa (Hutson *et al.*, 2008m; IUCN, 2009).

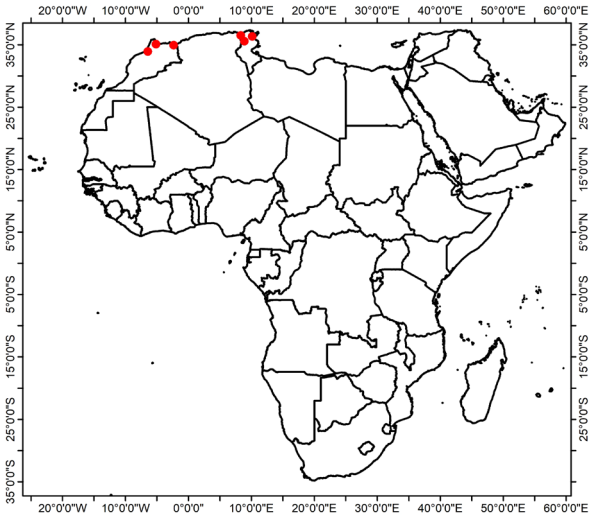

Figure 242. Distribution of *Myotis emarginatus*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Algeria, France, Macedonia, Morocco, Tunisia.

Myotis goudoti (A. Smith, 1834)

*1834. *Vespertilio goudoti* A. Smith, S. Afr. Quart. J., ser. 2, 2: 244. Publication date: June 1834. Type locality: Madagascar: "Madagascar" [Goto Description].

1858. *Vespertilio Madagascariensis* Tomes, Proc. zool. Soc. Lond., 1858, XXVI (ccclii): 89. Publication date: 27 April 1858. Type locality: Madagascar: "Madagascar". Holotype: BMNH 1907.1.1.503:.
1870. *Vespertilio sylvicola* A. Grandidier, Rev. Mag. Zool., ser. 2, 22: 49. Publication date: February 1870. Type locality: Madagascar: Ambaravantao forest [Goto Description]. - Comments: The type locality was mentioned as "Forests of Ambaravaranvatou" by Allen (1939a: 91). Dobson (1878: 301, footnote) indicates that the type has been lost and that the description is insufficient. He, therefore, included it with a question mark.
? *Myotis goudoti goudoti:* (Name Combination)
? *Myotis goudoti:* (Name Combination, Current Combination)

TAXONOMY:
Simmons (2005) states that it does not appear to include *anjouanensis*; see Peterson *et al.* (1995).

Csorba *et al.* (2014: 667) include *goudoti* in the subgenus *Chrysopteron*, but Ruedi and Mayer (2001: 436), Ghazali *et al.* (2016: 476) and Patterson *et al.* (2019: "2") reject the division in subgenera.

COMMON NAMES:
Czech: netopýr madagaskarský. English: Malagasy Mouse-eared Bat. French: Murin de Madagascar, Chauve-souris malgache à oreille de souris, Vespertilion de Madagascar. German: Madagaskar-Mausohr.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Samonds (2007: 60) found samples in deposit (SS2), which was collected from the surface near the main cave entrance, dating attemps revealed this sample was contaminated, therefore no date is known for this locality in Anjohibe cave, Madagascar.

Weyeneth (2010) indicated that, during the Pleistocene, populations of this speciesi diverged into a southern and a northern component, with subsequent expansion and adaptation to all biomes.

CONSERVATION STATUS:
Global - This species is listed as Least Concern (LC ver 3.1 (2001)) in view of its widespread distribution across Madagascar, and the absence of any major threats. Close monitoring of roosting colonies in areas where the forest is subject to disturbance is needed (Andriafidison *et al.*, 2008h; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Andriafidison *et al.*, 2008h; IUCN, 2009). 1996 - LR/nt ver 2.3 (1994) (Baillie and Groombridge, 1996).

MAJOR THREATS:
There are no known threats to this species although additional research is needed to determine the impact of forest degradation on its persistence in cave roosts (IUCN, 2009; IUCN, 2009).

CONSERVATION ACTIONS:
Andriafidison *et al.* (2008h) [in IUCN (2009)] report that this is a widespread species that is found in many of Madagascar's protected areas, including those in the east and west of the island (Goodman, 1999; Russ *et al.*, 2003; Goodman *et al.*, 2005a).

GENERAL DISTRIBUTION:
Myotis goudoti is endemic to the island of Madagascar (Simmons, 2005) where it is widely distributed across a range of different vegetation types (Peterson *et al.*, 1995; Goodman, 1999; Eger and Mitchell, 2003; Russ *et al.*, 2003; Goodman *et al.*, 2005a), including Nosy Be and Nosy Komba (Rakotonandrasana and Goodman, 2007: 6).

Native: Madagascar (Peterson *et al.*, 1995; Goodman, 1999; Eger and Mitchell, 2003; Russ *et al.*, 2003; Goodman *et al.*, 2005a; Rakotonandrasana and Goodman, 2007: 6).

DETAILED MORPHOLOGY:
Baculum:
Rakotondramanana and Goodman (2017: 64) reported the structure as being triangular, and in some cases, with a pronounced proximal indentation; length: 0.87 ± 0.111 (0.68 - 1.02) mm, width: 0.53 ± 0.081 (0.43 - 0.67) mm.

ECHOLOCATION:
Russ *et al.* (2003) describe the echolocation as a single frequency-modulated sweep from 75 kHz to 55 kHz. Kofoky *et al.* (2009: 382) reported the calls of 11 individuals, which were characterized by broadband FM sweeps produced at low duty cycle. The most energy always found in the fundamental at about 64.4 kHz, and the pulses were very short about 3 ms.

MOLECULAR BIOLOGY:
DNA.- Unknown.
Karyotype.- Richards *et al.* (2010) examined one female and one male having a 2*n*=44 and a FNa=

50, a submetacentric X and small acrocentric Y chromosome. In addition, Volleth and Eick (2012: 167) mention a segment number of 22.

HABITAT:
Dammhahn and Goodman (2013: 108) mention the lower portion of forest structure and partially open areas as the foraging habitat for this species.

ROOST:
Wilkinson *et al.* (2012: 160) indicate that caves are the typical roosting sites for these bats on Madagascar. Ravelomanantsoa *et al.* (2019: 110) added crevices and possibly tree holes.

DIET:
Razakarivony *et al.* (2005) found Araneae in 27 % of stomachs examined. Rakotoarivelo *et al.* (2007) in Madagascar found *M.goudoti* to mainly consumed Hymenoptera, Neuroptera, Araneae and fragments of spiders were present in 55 % of the fecal samples.

Rakotondramanana *et al.* (2015: 78) report the following diet items (volume percent, frequency percent): Coleoptera (34.0, 100.00); Hymenoptera (4.0, 60.0); Lepidoptera (62.0, 100.0). Rasoanoro *et al.* (2015: 64) found the following volume percentages for two specimens: Aranea (40.7), Coleoptera (43.7), Hymenoptera (8.4), Isoptera (4.6), Lepidoptera (2.5).

Kemp *et al.* (2018: Suppl.) used DNA metacarcoding to detect insect pest species in the diet of these bats and found the following prey orders (in descending order): Coleoptera, Hymenoptera, Lepidoptera (*Homona* sp., *Thaumatotibia batrachopa* (Meyrick, 1908)), Diptera (*Simulium lineatum* (Meigen, 1804), *Culex* sp., *Culex annulioris* Theobald, 1901, *Coquillettidia* sp., *Anopheles* sp.), Sarcoptiformes, Ephemeroptera, Hemiptera, Araneae, Blattodea, Trichoptera, Symphypleona, Mesostigmata, Trombidiformes.

PREDATORS:
Goodman *et al.* (2015c: 78) found the remains of one individual in pellets of Bat Hawk *Macheiramphus alcinus* Bonaparte, 1850 in western central Madagascar.

POPULATION:
Structure and Density - Although widespread, there is a paucity of information on the population status of *M. goudoti*. It is frequently trapped in mist nets during bat surveys and appears to be at least locally abundant in west (Kofoky *et al.*, 2007; Rakotoarivelo and Randrianandrianina, 2007), but is more difficult to net, or is less abundant in the east (Russ *et al.*, 2003; Randrianandriananina *et al.*, 2006). There are few data available on roosting colonies but aggregations of up to 1,000 individuals have been recorded.
Trend - 2008 - Unknown (Andriafidison *et al.*, 2008h; IUCN, 2009).

ACTIVITY AND BEHAVIOUR:
Rakotoarivelo *et al.* (2007) suggest that *M. goudoti* is better adapted to forage in cluttered areas and may have a closer association with forest vegetation. They also suggest that *M. goudoti* may be a gleaner.

PARASITES:
BACTERIA
Lagadec *et al.* (2012: 1696), Dietrich *et al.* (2014: Suppl.) and Gomard *et al.* (2016: 5) report the presence of spirochaetes bacteria of the genus *Leptospira*, which are assigned to *L. borghpetersenii* by Dietrich *et al.* (2018a: 3). Lei and Olival (2014: Suppl.) mention *M. goudoti* as host for *Bartonella* bacteria.

HAEMOSPORIDA
Megali *et al.* (2010: 1042) and Duval *et al.* (2012: 1563) reported Genbank data for *Polychromophilus* sp. from *M. goudoti*. Ramasindrazana *et al.* (2018: Suppl.) identified this parasite as *Polychromophilus murinus* Dionisi, 1899.

Ramasindrazana *et al.* (2016: 6) reported the presence of an unnamed filariod in this bat species.

DIPTERA
Nycteribiidae: Ramasindrazana *et al.* (2017: Suppl.) found the bat flies *Nycteribia stylidiopsis* and *Penicillidia* sp. on specimens from this bat species.

ACARI
Trombiculidae: Stekolnikov (2018a: 116) reported *Trisetica aethiopica* (Hirst, 1926) from this bat species.

VIRUSES:
Astroviridae
Lebarbenchon *et al.* (2017 Suppl.) tested 14 animals and three of them was positive for Astroviruses.

Paramyxoviridae
Wilkinson *et al.* (2012: 160) tested 2 individuals from the Madagascar using RT-PCR specific for Respirovirus/Morbillivirus/Henipahvirus (RMH) and Paramyxovirinae (PMV) and found 0 positive results for viral nucleic acids. Wilkinson *et al.* (2014) tested 8 individuals from Anjohikinakia and Bekoaky in Madagascar with an RT-PCR specific

for the *Respiro-*, *Morbilli-* and *Henipavirus* genera, two of the 8 individuals tested positive for paramyxovirus RNA.
48 Madagascan *M. goudoti* specimens were tested by Mélade *et al.* (2016b: 4) and five of them were positive for paramyxoviruses.

Rhabdoviridae
Of the 11 bats tested by Mélade *et al.* (2016a: 6), four showed a seroreaction.

UTILISATION:
See Goodman *et al.* (2008d).

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Madagascar.

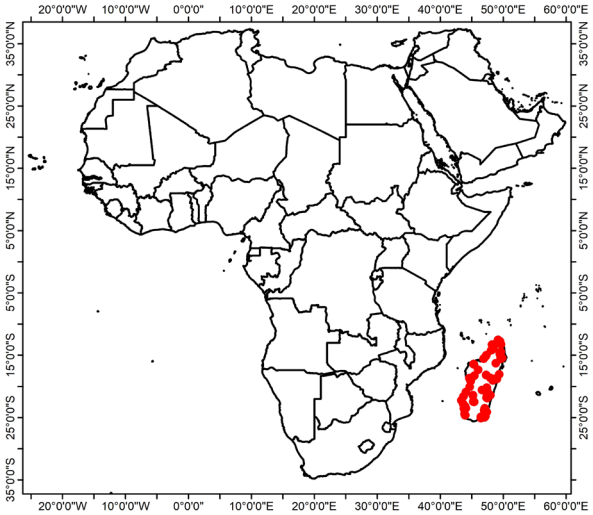

Figure 243. Distribution of *Myotis goudoti*

Myotis morrisi Hill, 1971

*1971. *Myotis morrisi* Hill, in: Hill and Morris, Bull. Br. Mus. (nat. Hist.) Zool., 21 (2): 43, pl. 1, 2 (a, b). Publication date: 28 April 1971. Type locality: Ethiopia: Walaga, Blue Nile Gorge: Didessa River mouth: "Forward Base Three" [10 05 N 35 38 E, ca. 1 000 m] [Goto Description]. Holotype: BMNH 1970.488: ad ♀, skin and skull. Collected by: The Great Abbai Expedition; collection date: 28 August 1968; original number: A107. (Largen, Yalden & King). Also see Hill and Morris (1971: 43). - Etymology: In honour of Dr. Pat Morris of Royal Holloway College, University of London, in recognition of his many services to the study of the Ethiopian fauna while with the Great Abbai Expedition (Hill in Hill and Morris, 1971: 44). (Current Combination)

TAXONOMY:
Known only from two specimens (see Stadelmann *et al.*, 2004b: 179).

COMMON NAMES:
Czech: netopýr Morrisův. English: Morris's Mouse-eared Bat, Morris's Bat, Morris's Myotis. French: Murin d'Ethiopie, Vespertilion de Morris. German: Morris' Mausohr.

CONSERVATION STATUS:
Global - Listed as Data Deficient (DD ver 3.1 (2001)) in view of the absence of sufficient information on its extent of occurrence, threats and conservation status (Jacobs *et al.*, 2008o; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) (Jacobs *et al.*, 2008o; IUCN, 2009). 2004 - VU D2 ver 3.1 (2001) (Jacobs *et al.*, 2004b; IUCN, 2004). 1996 - VU (Baillie and Groombridge, 1996).

MAJOR THREATS:
The threats to this species are unclear. It may be threatened by cave disturbance and subsistence harvesting for food (Jacobs *et al.*, 2008o; IUCN, 2009).

CONSERVATION ACTIONS:
Jacobs *et al.* (2008o) [in IUCN (2009)] report that it is not known if the species is present in any protected areas. Further studies are needed into the distribution, abundance, natural history, and threats to this poorly known species.

GENERAL DISTRIBUTION:
Myotis morrisi has only been recorded from two very disjunct sites, the type locality of 'Didessa River mouth, Walaga' in Ethiopia (Hill and Morris, 1971) and from Numan, Adamawa Province, in northeastern Nigeria (Hill *et al.*, 1988).

Native: Ethiopia (Hill and Morris, 1971); Nigeria (Hill *et al.*, 1988).

POPULATION:
Structure and Density - Little information is available on the population abundance or size of this species (Jacobs *et al.*, 2008o; IUCN, 2009).
Trend - 2008 - Unknown (Jacobs *et al.*, 2008o; IUCN, 2009).

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Ethiopia, Nigeria.

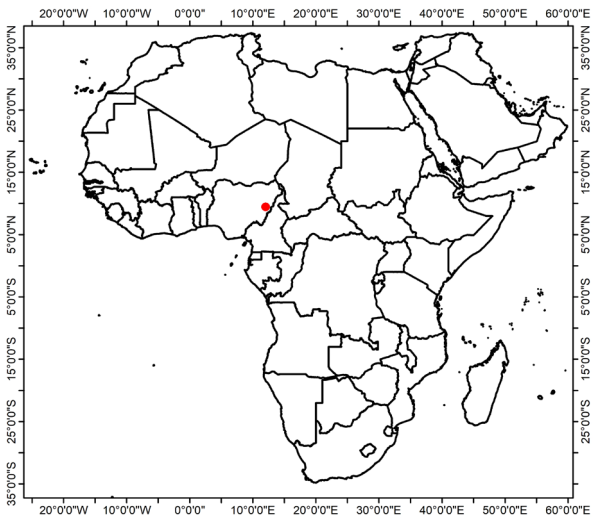

Figure 244. Distribution of *Myotis morrisi*

Myotis mystacinus (Kuhl, 1817)

*1817. *Vespertilio mystacinus* Kuhl, Die Deutsche Fledermäuse, 7, 58. Type locality: Germany. Syntype: ZMB 461: ♂, skin and skull. Unknown locality, presumably coll. Kuhl, purchased from Kuhl, 09.1818.: see Turni and Kock (2008: 60).
? *Myotis mystacinus:* (Name Combination, Current Combination)

TAXONOMY:
Despite the fact that numerous species have been recently recognized within this complex, the whiskered bats from Morocco are still included in the nominal form (von Helversen *et al.*, 2001; Mayer *et al.*, 2007; García-Mudarra *et al.*, 2009).

At present, this species includes three forms differing in morphological traits: *M. mystacinus mystacinus* (most of European range), *M. mystacinus occidentalis* (Iberia and Morocco) and *M. mystacinus caucasicus* (Caucasus region).

COMMON NAMES:
Albanian: Lakuriq nate me mustaqe. Armenian: Բեղավոր գիշերաչղջիկ. Azerbaijani: Bığ lı gecəşə bpə rə si. Basque: Saguzar biboteduna. Belarusian: Начніца вусатая. Bosnian: Mali brkati š iš miš. Frisian: Burdflearmûs. Galician: Morcego bigotudo, Morcego de bigotes. Georgian: ულვაშა მღამიობი. German: Bartfledermaus, Kleine Bartfledermaus, Schnauzbärtige Fledermaus. Greek: Μουστακονυχτερίδα. Hungarian: Bajuszos denevér, Nycteris i mystakophoros. Indonesian: Kelelewar myotis pucuk. Irish Gaelic: Ialtóg ghiobach. Italian: Vespertilio mustacchino. Latvian: Bārdainais naktssikspārnis. Lithuanian: suotasis pelėausis. Luxembourgish: Kleng Baartfliedermaus. Macedonian: Мустаќест ноќник [= Mustakjest Nokjnik]. Maltese: Farfett il-Lejl Daqni. Montenegrin: Brkati večernjak. Norwegian: Skjeggflaggermus. Polish: Nocek wasatek. Portuguese: Morcego-de-bigodes. Rhaeto-Romance: Vespertil dal barbis, Vespertil pitschen dal barbis. Romanian: Liliacul mustăcio, Liliac-cu-mustăþi. Russian: Ночница усатая, Усатая ночница [= Usataya nochnitsa]. Serbian: Тамнолики бркати вечерњак [= Tamnoliki brkati več ernjak]. Scottish Gaelic: Ialtag ghibeach. Slovak: Netopier fúzatý. Slovenian: Brkati netopir, Skupina brkatih netopirjev. Swedish: Mustaschfladdermus. Turkish: Bıyıklı Siyah Yarasa. Ukrainian: Нічниця вусата. Welsh: Ystlum barfog.

CONSERVATION STATUS:
Global - *Myotis mystacinus* has a large population size and a wide distribution. No declines in population size have been detected, and there are no known widespread major threats. Assessed as Least Concern (LC ver 3.1 (2001)) (Hutson *et al.*, 2008r; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Hutson *et al.*, 2008r; IUCN, 2009).

MAJOR THREATS:
There are no major threats to this species overall, but the species is affected by loss of woodland and other aspects of land management and development. It is also affected by loss of and damage to roost sites in trees, buildings and underground habitats. In the African part of the species' range, cave habitats where the species roosts are being destroyed by fires and vandalism. This species is also collected for medicine, but not at a level that constitutes a threat to the species (Hutson *et al.*, 2008r; IUCN, 2009).

CONSERVATION ACTIONS:
Hutson *et al.* (2008r) [in IUCN (2009)] report that it is protected by national legislation in most range states. There are also international legal obligations for its protection through the Bonn Convention (Eurobats) and Bern Convention. It is included in Annex IV of EU Habitats and Species Directive, and there is some habitat protection through Natura 2000. It occurs in protected areas throughout its range. Protection of cave roost sites is required.

GENERAL DISTRIBUTION:
Myotis mystacinus is a western Palaearctic species, occurring in western and central Europe, southern parts of Scandinavia, the British Isles, Morocco, northern parts of eastern Europe, western parts of the Caucasus and the Urals. The occurrence in southeast Europe is questionable but likely. It is marginal in Africa, restricted to Moroccan mountains from the Rif in the north to the southern slope of High Atlas in the south. It has been recorded from sea level up to 1,920 m asl (Gerell, 1999).

Native: Andorra; Armenia; Austria; Azerbaijan; Belgium; Bosnia and Herzegovina; Bulgaria; China; Croatia; Czech Republic; Denmark; Estonia; Finland; France [Corse]; Georgia; Germany; Greece [Kriti]; Hungary; Ireland; Italy; Latvia; Liechtenstein; Lithuania; Luxembourg; Macedonia, the former Yugoslav Republic of; Montenegro; Morocco (Benda *et al.*, 2004d; El Ibrahimi and Rguibi Idrissi, 2015: 360); Netherlands; Norway; Poland; Romania; Russian Federation; Serbia; Slovakia; Slovenia; Spain; Sweden; Switzerland; Turkey; Ukraine; United Kingdom.
Regionally extinct: Portugal.
Presence uncertain: Albania; Lebanon.

ECHOLOCATION:
Papadatou *et al.* (2008b: 132) report the following data for 1 Greek specimen belonging to *M. mustacinus bulgaricus*: F_{start}: 104.0 kHz, F_{end}: 33.6 kHz, F_{peak}: 47.7 kHz, bandwidth: 9.1 kHz, duration 3.8 msec and interpulse interval: 72.7 msec.
Data for 51 calls from France, Greece, Switzerland, and the UK, presented by Walters *et al.* (2012: suppl.) include: duration: 2.36 ± 0.59 msec, F_{max}: 84.76 ± 14.10 kHz, F_{min}: 37.04 ± 3.24 kHz, bandwidth: 47.72 ± 14.14 kHz, F_{peak}: 51.55 ± 7.70 kHz.

MOLECULAR BIOLOGY:
DNA - See von Helversen *et al.* (2001), Mayer *et al.* (2007), García-Mudarra *et al.* (2009).

Karyotype - Bovey (1949) reported a 2*n* = 44, aFN = 50, X = metacentric, Y = acrocentric, while Zima (1978) found aFN = 52. Arslan and Zima (2014: 9) added an FN of 54 and that the autosomal component consists of three large metacentric, one small metacentric, 15 acrocentric and two dot-like pairs.

POPULATION:
Structure and Trend - In Europe, it is one of the more common species within the regular distribution area. It is very rare in North Africa, with only 25 specimens in 4 locations (Hutson *et al.*, 2008r; IUCN, 2009).
Trend - 2008 - Unknown (Hutson *et al.*, 2008r; IUCN, 2009).

PARASITES:
In Europe, Genov *et al.* (1992) reported the presence of the following Nematodes: *Molinostrongylus alatus* (Ortlepp, 1932), *M. skrjabini* Skarbilovitch, 1934, *M. spasskii* Andrejko, Pinchuk and Skvorzov, 1968, and *M. vespertilionis* Morosov and Spassky, 1961.

Frank *et al.* (2015: 8) provide the following overview for parasites in European *M. mystacinus*: Arachnida: *Argas vespertilionis* (Latreille, 1796, *Ixodes* sp., *Ixodes vespertilionis* Koch, 1844, *Macronyssus ellipticus* (Kolenati, 1857), *Macronyssus flavus* (Kolenati, 1856), *Spinturnix kolenatii* Oudemans, 1910, *Spinturnix myoti* (Kolenati, 1856), *Spinturnix mystacinus* (Kolenati, 1857), *Steatonyssus periblepharus* Kolenati, 1858, *Steatonyssus spinosus* Wilmann, 1936.

Insecta: *Basilia nana* Theodor & Moscona, 1954, *Basilia nattereri* Kolenati, 1857, *Basilia italica* Theodor, 1954, *Cimex pipistrelli* (Jenyns, 1839), *Ischnopsyllus hexactenus* (Kolenati, 1856), *Ischnopsyllus mysticus* Jordan, 1942, *Ischnopsyllus octactenus* (Kolenati, 1856), *Ischnopsyllus simplex* Rotschild, 1906, *Ischnopsyllus variabilis* (Wagner, 1898), *Myodopsylla trisellis* Jorda, 1929, *Nycteribia kolenatii* Theodor and Moscona, 1954, *Nycteribia pedicularia* Latreille, 1805, *Nycteridopsylla*

longiceps Rotschild, 1908, *Nycteridopsylla pentactena* (Kolenati, 1856).

Trematoda - Digenea: *Lecithodendrium linstowi* Dollfus, 1931, *Plagiorchis vespertilionis* (Muller, 1784), *Prosthodendrium chilostomum* (Mehlis, 1831).

Nematoda: *Molinostrongylus alatus* (Ortlepp, 1932), *Molinostrongylus spasskii* Andrejko, Pintschuk and Skvorzov, 1968, *Molinostrongylus vespertilionis* Morosov and Spassky, 1961.

Cestoda: *Vampirolepis balsaci* (Joyeux and Baer, 1934).

VIRUSES:
Orthomyxoviridae
Despite sampling and testing of 44 individuals of this species, no evidence of influenza A-like viruses (*Orthomyxoviridae*) were obtained (Fereidouni *et al.*, 2015).

UTILISATION:
Species are also collected for medicine, but not at a level that constitutes a threat to the species (Hutson *et al.*, 2008r; IUCN, 2009).

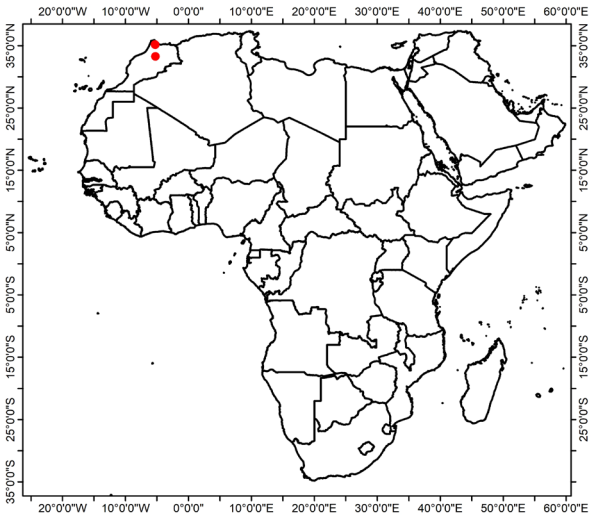

Figure 245. Distribution of *Myotis mystacinus*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Morocco.

Myotis punicus Felten, 1977

1875. *Vespertilio murinus africanus* Dobson, Ann. Mag. nat. Hist., ser. 4, 16 (94): 260. Publication date: 1 October 1875. Type locality: Gabon: "Gaboon". Holotype: BMNH 1873.4.16.5:. . - Comments: The type locality was originally mentioned as 'Gaboon', but the specimen is more probably from Kashmir, see Blanford (1888-91) and Hayman and Hill (1971: 35) (in Corbet and Hill, 1992: 120). However, see also Grubb (2004: 92); who indicates that Gabon might not be rejected.

*1977. *Myotis blythii punicus* Felten, in: Felten, Spitzenberger and Storch, Senckenb. biol., 58 (1/2): 39. Publication date: 22 August 1977. Type locality: Tunisia: Cap Bon: El Haouaria cave [37 03 N 11 01 E] [Goto Description]. Holotype: SMF 44104: ad ♂, skull and alcoholic. Collected by: Nagel, Schubert and Indulis Evalds Vesmanis; collection date: 25 March 1971. See Felten *et al.* (1977: 39). Paratype: SMF 18946: ♂, skull and alcoholic. Collected by: ?: Collector Unknown; collection date: 15 May 1960. Presented/Donated by: ?: Collector Unknown. Paratype: SMF 18947: ♂, skull and alcoholic. 2000. *Myotis cf. punicus* Castella, Ruedi, Excoffier, Ibanez, Arlettaz and Hausser, Mol. Ecol., 9: 1761.

? *Myotis blythii oxygnathus:*

? *Myotis blythii:*

? *Myotis myotis myotis:*

? *Myotis myotis:*

? *Myotis oxygnathus:*

? *Myotis punicus:* (Name Combination, Current Combination)

TAXONOMY:

Originally described as a subspecies of *M. blythii*, but recently shown to lie outside a clade including *blythii*, *myotis* and *oxygnathus* (Ruedi and Mayer, 2001). Considered a valid species by Castella *et al.* (2000), Dietz and von Helversen (2004: 71), Benda *et al.* (2004d) and Evin *et al.* (2008). Biollaz *et al.* (2010) suggest that the Corsican and Sardinian populations are currently isolated from the continental gene pool and therefore should be considered as different evolutionary significant units. Baron (2012: 5) found that the population on Malta is a single panmitic unit with an tendency towards becoming isolated mating systems.

COMMON NAMES:

Albanian: Lakuriq nate maghrebian. Armenian: Փյունիկյան գիշերաչղջիկ. Azerbaijani: Siçanqulaq gecəşəbpərəsi. Basque: Saguzar arratoi-belarri mairutar. Swedish: Medelhavsmusöra. Turkish: Mahrep Farekulaklı Yarasası. Ukrainian: Нічниця магрибська. Welsh: Ystlum clustlydan Maghreb.

CONSERVATION STATUS:

Global - The species is cave dwelling, only a small number of colonies are known, and these are in tourist areas subject to disturbance. There is evidence of decline in Corsica, and it is assumed that the population trend will be similar on Sardinia as the species faces the same threats there. On Malta, surveys have shown an estimated decline of 50 % or more in 3 generations, although this is a small part of the overall population and the trend has now stabilised. Given that it is a strict cave dweller, there are probably significant declines in North Africa due to exploitation and cave disturbance. Hence the species is listed as Near Threatened (NT ver 3.1 (2001)) almost meets VU under criteria A4cd (Aulagnier *et al.*, 2008c; IUCN, 2009).

Assessment History -
2008 - NT ver 3.1 (2001) (Aulagnier *et al.*, 2008c; IUCN, 2009). 2004 - DD ver 3.1 (2001) (Aulagnier and Juste, 2004; IUCN, 2004).

MAJOR THREATS:

Human disturbance is a major threat, as colonies are located in tourist areas, in caves that are well known and popular. Changes in land management and agricultural pollution are also threats. In North Africa, the species is collected for traditional medicinal use (Aulagnier *et al.*, 2008c; IUCN, 2009).

The species is a cave or tree rooster, its water stress and long-distance dispersal were found to be the major risk factors related to climatic change (Sherwin *et al.*, 2012: 174).

CONSERVATION ACTIONS:
Aulagnier *et al.* (2008c) [in IUCN (2009)] report that it is protected by national legislation in its European range states. There are also international legal obligations for its protection through the Bonn Convention (Eurobats) and Bern Convention, in parts of its range where these apply. It is included in Annex IV of the EU Habitats and Species Directive, and some habitat protection may be provided through Natura 2000. There is an ongoing project for the conservation of this species. Appropriate conservation measures include fencing cave entrances (but not gating) and obtaining legal protection for the species.
In North Africa further research into population trends, establishment and management of protected areas, education, and implementation of national-scale legislation are needed.
Biollaz *et al.* (2010) suggest that special care is needed for the Sardinian population as an important source of genetic diversity.

GENERAL DISTRIBUTION:
Myotis punicus occurs in North-west Africa (Morocco, Algeria, Tunisia, and to western Libya) and on the Mediterranean islands of Corsica (to France), Sardinia (to Italy), and Malta (including Gozo [Baron and Borg, 2013: 407]).

Native: Algeria; Libyan Arab Jamahiriya; Malta; Morocco (Benda *et al.*, 2004d; 2010a: 157; El Ibrahimi and Rguibi Idrissi, 2015: 361); Tunisia (Dalhoumi *et al.*, 2014: 53; 2016b: 867).

BIOGEOGRAPHY:
Biollaz *et al.* (2010: 8)'s study suggests that the islands (Corsica and Sardinia) were colonized by *M. punicus* in a stepping-stone manner and predates human colonization. Mitochondrial analysis revealed that the insular populations were well differentiated from the mainland, with mean haplotypes and nucleotide diversities decreading from Tunisia to Sardinia, and from Sardinia to Corsica. While a Baysian and ML trees showed that the Corsican haplotypes are nested within the Sardinan ones, suggesting that the Corsica might have been colonized from Sardinia (Biollaz *et al.*, 2010: 8). Compared with the North African populations, the two islands harbour significant lower allelic richness as well as observed and expected heterozygosities, which could reflect recent population crashes or a bottleneck during the colonization of the islands (Biollaz *et al.*, 2010). The Sardinian and Corsican populations were estimated to date back to the early and mid-Pleistocene, respectively (Biollaz *et al.*, 2010). During the glacial episodes that punctuated this period, low sea levels exposed land that was previously underwater. Geographical distances between the islands and the mainland were thus reduced with the emergence of land bridges between some of the islands, favouring island colonization, with the first the colonization of Sardinia from North Africa and then the colonization of Corsica from Sardinia. As the Ice Age ended, sea levels rose and islolated the two islands, explaining the strong reduction of gene flow currently observed (Biollaz *et al.*, 2010).
The large divergence between the Moroccan and Tunisian populations suggest that both populations had been isolated since the Pleistocene (Biollaz *et al.*, 2010), despite current nuclear gene flow, no female exchange seems to have occured since then. The confinement of Moroccan populations in the High Atlas Range and the philopatric behaviour of females could have enhanced the isolation of these populations, explaining the low haplotype diversity (Biollaz *et al.*, 2010). In North Africa, poor nuclear differentiation between colonies associated with a strong mitochondrial differentiation suggested current male-biased dispersal on the continental area.

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Dietz and von Helversen (2004) and Baron (2012: 1) mention the following external characters: large size (comparable to *M. myotis*), the wing membrane starting at the base of the toes, a lancet shaped tragus and distinct dorsal (light brown) and ventral (white) fur coloration.

ECHOLOCATION:
Walters *et al.* (2012: suppl.) report the following figures for 26 calls (6 sequences) from French bats: duration: 3.62 ± 0.96 msec, F_{max}: 60.42 ± 15.65 kHz, F_{min}: 27.07 ± 2.26 kHz, bandwidth: 33.35 ± 14.25 kHz, F_{peak}: 35.82 ± 4.21 kHz

For this species, Disca *et al.* (2014: 226) report two call types: A - FM APMF, with the following parameters: F_{start}: 79.2 ± 16.4 kHz, F_{end}: 25.0 ± 2.1 kHz, F_{peak}: 37 ± 7.9 kHz, bandwidth: 54.2 ± 15.5 kHz, duration: 5.5 ± 0.6 msec; B - FM APBF, with the following parameters: F_{start}: 77.3 ± 6.6 kHz, F_{end}: 20.2 ± 1.2 kHz, F_{peak}: 32.0 ± 5.2 kHz, bandwidth: 57.1 ± 7.1 kHz, duration: 8.6 ± 0.6 msec.

MOLECULAR BIOLOGY:
DNA - See Castella *et al.* (2000) and Biollaz *et al.* (2010).
Karyotype - Unknown.

ROOST:
Benda *et al.* (2014c: 38-39) reported that, in Libya, these bats are only found in ruins, which might serve as temporary roosts or perhaps as maternity roost.

DIET:
Ahmim and Moali (2011: 45, 48) found that the diet of *M. punicus* in Algeria consisted of 96.06 % of insects, 2.82 % of chilopods, and 1.12 % of spiders. Among the insects, Diptera (46.32 %), Lepidoptera (20.33 %), and Hemiptera (10.16 %) were found most frequently in the bat's guano.
On Malta, Baron and Borg (2013: 415) report that the major food sources are Orthoptera (65 %), Lepidoptera (20 %), and Coleoptera (15 %), whereas on Corsica, the Orthoptera only account for 36 %.
In Libya, Benda *et al.* (2014c: 44) analyses two groups of pellets. One set (from one individual) contained only large spiders (Aranea), while the other consisted primarily of Coleoptera (Scarabaeidae: Melolonthinae), which were supplemented by solifuges (Solpugida), cockroaches (Blattodea) and small scorpions (Scorpionida).

POPULATION:
Structure and Density - Over 10,000 individuals, found in large colonies (300 - 500 individuals). On Corsica, there are around 4,000 individuals in four colonies. The total population size on Corsica, Sardinia and Malta is estimated at between 7,000 and 9,000 individuals. This is a cave dwelling species, therefore there are few colonies. On Malta, over 50 % of the population was lost between the latter half of the 1980s and the early 1990s. Numbers appear to have stabilised at 400 - 450 individuals (Borg, 2002, J.J. Borg *unpubl. data* [in Aulagnier *et al.* (2008c) in IUCN (2009)]).
Trend - 2008 - Decreasing (Aulagnier *et al.*, 2008c; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
At Sabratha (Libya), Benda *et al.* (2014c: 40) collected a pregnant female on 2 April and a juvenile female on 14 April.

PARASITES:
Bruyndonckx *et al.* (2010) collected *Spinturnix myoti* (Kolenati, 1856) in 11 colonies in North Africa, Corsica and Sardinia.

From Libya, Benda *et al.* (2014c: 44) reported the following ectoparasites:
Nycteribiidae: *Nycteribia vexata* Westwood, 1835, *Nycteribia latreillii* (Leach, 1817),
Spinturnicidae: *Spinturnix myoti* (Kolenati, 1856),
Macronyssidae: *Steatonyssus occidentalis* (Ewing, 1933),
Ischnopsyllidae: *Rhinolophopsylla unipectinata* (Taschenberg, 1880).

From Algeria, Bendjeddou *et al.* (2013: 325) reported the following ectoparasites:
Nycteribiidae: *Penicillidia dufouri* (Westwood, 1825), *Phthiridium biarticulatum* Hermann, 1804,
Spinturnicidae: *Spinturnix myoti* (Kolenati, 1856),
Ixodidae: *Rhipicephalus sanguineus* (Latreille, 1806).
Bendjeddou *et al.* (2016a: 109) added *Ixodes vespertilionis* Koch, 1844.
Bendjeddou *et al.* (2017: 15) mentioned the following species from Algeria: Nycteribiidae: *Nycteribia (Nycteribia) latreillii* (Leach, 1817) and *Phthiridium biarticulatum* Hermann, 1804; Streblidae: *Brachytarsina (Brachytarsina) flavipennis* Macquart, 1851 and Arachnida: *Spinturnix myoti* (Kolenati, 1856) and *Ixodes vespertilionis* Koch, 1844.

Blackwell (1980: 145) and Haelewaters *et al.* (2017: Suppl.) mention the presence of the Nycteribiid bat-fly *Nycteribia vexata* Westwood, 1835 on "*M. oxygnathus*" in Tunisia, which in turn was infected by the fungus *Arthrorhynchus nycteribiae* (Peyritsch) Thaxter.

VIRUSES:
Coronaviridae - Coronaviruses
Alphacoronavirus
Ar Gouilh *et al.* (2018: 92) reported the EPI 9 virus from Tunisia (3 infected out of 8 bats).

Rhabdoviridae
Lyssavirus
Serra-Cobo *et al.* (2018: 2) tested 63 Algerian bats for European bat lyssavirus type 1 and found one being seropositive. This was also the case for 15 out of 262 Moroccan bats.

"Africa", Algeria, Libya, Morocco, Tunisia.

Myotis scotti Thomas, 1927

*1927. *Myotis scotti* Thomas, Ann. Mag. nat. Hist., ser. 9, 19 (113): 554. Publication date: 1 May 1927. Type locality: Ethiopia: Shoa province: ca. 40 mi (64 km) W Addis Ababa: Djem-djem Forest [09 00 N 38 12 E, 8 000 ft]. Holotype: BMNH 1927.3.4.1:. Paratype: BMNH 1927.3.4.2:. Paratype: BMNH 1927.3.4.3:. Paratype: BMNH 1927.3.4.4:. Paratype: BMNH 1927.3.4.5:. (Current Combination)

TAXONOMY:
See Simmons (2005).

Csorba *et al.* (2014: 667) include *scotti* in the subgenus *Chrysopteron*.

COMMON NAMES:
Czech: netopýr habešský. English: Scott's Mouse-eared Bat, Scott's Mouse-eared Myotis. French: Murin de Scott, Vespertilion de Scott. German: Scotts Mausohr.

CONSERVATION STATUS:
Global - Listed as Vulnerable (VU B2ab(iii) ver 3.1 (2001)) because its area of occupancy is possibly less than 2,000 km^2, its distribution is likely to be severely fragmented, and there is continuing decline in the extent and quality of its forest habitat in Ethiopia (Benda and Lavrenchenko, 2008; IUCN, 2009).

Assessment History -
2008 - VU B2ab(iii) ver 3.1 (2001) (Benda and Lavrenchenko, 2008; IUCN, 2009). 2004 - VU B2ab(iii) ver 3.1 (2001) (Benda and Lavrenchenko, 2004; IUCN, 2004). 1996 - VU (Baillie and Groombridge, 1996).

MAJOR THREATS:
The forest habitat of this species is being impacted through conversion of land to agricultural use and logging (Benda and Lavrenchenko, 2008; IUCN, 2009).

CONSERVATION ACTIONS:
Benda and Lavrenchenko (2008) [in IUCN (2009)] report that there appear to be no conservation measures in place, and it is not known if the species is present in any protected areas. There is a need to conserve areas of suitable montane forest habitat for this species. Further studies are needed into the abundance, biology and ecology.

GENERAL DISTRIBUTION:
Myotis scotti is endemic to the highlands of Ethiopia, where it has been recorded from ten localities between 1,300 and 2,500 m asl.

Native: Ethiopia.

POPULATION:
Structure and Density - It appears to be a rare species that is known from only about 20 specimens (Benda and Lavrenchenko, 2008; IUCN, 2009).
Trend - 2008 - Decreasing (Benda and Lavrenchenko, 2008; IUCN, 2009).

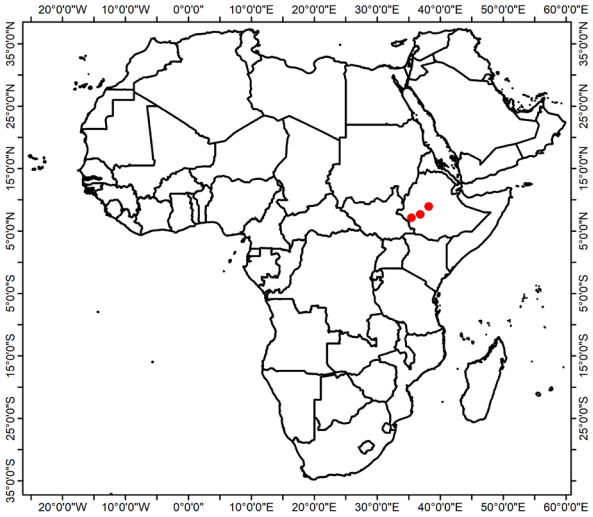

Figure 247. Distribution of *Myotis scotti*

Ethiopia.

Myotis tricolor (Temminck, 1832)

*1832. *V[espertilio] tricolor* Temminck, in: Smuts, Enumer. Mamm. Capensium, 106. Publication date: 1832. Type locality: South Africa: Cape province: Cape Town [33 56 S 18 28 E] [Goto Description]. - Comments: Type specimen: RMNH ???.
1924. *Eptesicus loveni* Granvik, Acta Univ. Lund, ser. 2, 21 (3): 12. Publication date: 1924. Type locality: Kenya: E slopes of Mount Elgon [01 07 N 34 35 E, 8 000 ft].

? *Myotis (Selysius) tricolor:* (Name Combination)
? *Myotis tricolor A:*
? *Myotis tricolor:* (Name Combination, Current Combination)

TAXONOMY:

Figure 248. *Myotis tricolor* (TM 48188) caught at the Farm Schaapplaats, Free State, South Africa.

Includes *Eptesicus loveni*, see Aggundey and Schlitter (1986).

Csorba *et al.* (2014: 667) include *tricolor* in the subgenus *Chrysopteron*, but see Ruedi and Mayer (2001: 436), Ghazali *et al.* (2016: 476) and Patterson *et al.* (2019: "2"), who reject the division into subgenera.

The phylogenetic analyses on mitochondrial DNA performed by Patterson *et al.* (2019: "5", "9"') identified three separate groups, two corresponding to South African samples and a third from Kenya (close to the type locality of *loveni*, which might possibly represent a separate (sub)species. The *Cytb* sequences of these groups differed by 3.7 - 3.8 %.

COMMON NAMES:
Afrikaans: Temminck se langhaarvlermuis, Temminck-langhaarvlermuis, Kaapse Langhaarvlermuis. Chinese: 南非鼠耳蝠. Czech: netopýr trojbarvý. English: Temminck's Mouse-eared Bat, Cape Myotis, Cape Hairy Bat, Tricoloured Mouse-eared Bat, Cape Hairy Myotis, Temminck's Hairy Bat, Three-coloured bat. French: Murin tricolore, Petit murin brun, Murin velu du Cap, Vespertilion d'Angola, Murin d'Angola. German: Dreifarb-Mausohr.

ETYMOLOGY OF COMMON NAME:
The colloquial name is after C.J. Temminck, who was the author of *Monographies de Mammalogie* (1827) (Taylor, 2005).

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
This species was represented in the very late Holocene at Border Cave, South Africa (Avery, 1991: 6).

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Jacobs, 2008e; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Jacobs, 2008e; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Jacobs, 2004e; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - LC ver 3.1 (2001) (Monadjem *et al.*, 2016k). 2004 - NT ver 3.1 (2001) (Friedmann and Daly, 2004).

MAJOR THREATS:
There appear to be no major threats to this species as a whole (Jacobs, 2008e; IUCN, 2009).

CONSERVATION ACTIONS:
Jacobs (2008e) [in IUCN (2009)] report that it has been recorded from the Virunga National Park in the Democratic Republic of the Congo (Baeten *et al.*, 1984) and in view of its East African range, it seems likely that it is present in additional protected areas. Further studies are needed into the range of this species in West and Central Africa.

GENERAL DISTRIBUTION:
Myotis tricolor has been patchily recorded in sub-Saharan Africa. In West Africa the species has currently only been reported from the northwestern uplands of Liberia (Koopman *et al.*, 1995), while in Central Africa it is known only from a few records in the Democratic Republic of the Congo and Rwanda (Hayman *et al.*, 1966; Baeten *et al.*, 1984). *Myotis tricolor* is much more widely recorded in East Africa, ranging from Ethiopia in the north, through Uganda, Kenya, Tanzania, Malawi, Zambia, Mozambique and Zimbabwe through to southern South Africa.

In the RSA, its distribution is best predicted by geology (Babiker Salata, 2012: 50).

Native: Congo (The Democratic Republic of the) (Hayman *et al.*, 1966; Monadjem *et al.*, 2010d: 564); Ethiopia; Kenya; Lesotho (Lynch, 1994: 193; Monadjem *et al.*, 2010d: 564); Liberia (Fahr, 2007a: 104); Malawi (Happold *et al.*, 1988; Monadjem *et al.*, 2010d: 564); Mozambique

(Smithers and Lobão Tello, 1976; Monadjem *et al.*, 2010d: 564; Monadjem *et al.*, 2010c: 384); Rwanda; Saõ Tomé (Rainho *et al.*, 2010a: 31); South Africa (Monadjem *et al.*, 2010d: 564); Swaziland (Monadjem *et al.*, 2010d: 565); Tanzania; Zambia (Ansell, 1978; Monadjem *et al.*, 2010d: 565); Zimbabwe (Monadjem *et al.*, 2010d: 565).

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Schoeman and Jacobs (2002: 157) mention the following parameters for 1 specimen from the Algeria Forestry Station (RSA): Fa: 46.9 mm, Wing area: 156.6 cm^2, Wing span: 30.6 cm, Wing loading: 6.9 N/m^2, and aspect ratio: 6.0.

DETAILED MORPHOLOGY:
Baculum - Kearney *et al.* (2002).

FUNCTIONAL MORPHOLOGY:
Jordaan and Jacobs (2009: 35) indicate that the wing morphology of *M. tricolor* is intermediate between that of a typical aerial forager, gleaner (takes insects off a substrate) and trawler (takes prey from the water surface).

ECHOLOCATION:
See Taylor (1999b). Rainho *et al.* (2010a: 21) reports the calls of 5 individuals from Saõ Tomé.

From Algeria Forest Station (RSA), Schoeman and Jacobs (2002: 157) reported the type of calls to be low duty echolocation dominated by frequency modulated calls, with a F_{peak}: 50.0 kHz.

Jordaan and Jacobs (2009: 35) found that its echolocation call structure is intermediate between that of typical aerial foragers, gleaners and trawlers.
Schoeman and Waddington (2011: 291) mention a peak frequency of 40.8 kHz and a duration of 4.4 msec for a specimen from Durban, South Africa.

In Waterberg, South Africa and Swaziland, Taylor *et al.* (2013b: 17) recorded 6 calls with the following parameters: F_{max}: 86.1 ± 5.92 (76.6 - 91.9) kHz, F_{min}: 42.7 ± 4.43 (37.1 - 50.0) kHz, F_{knee}: 57.6 ± 7.25 (48.5 - 67.5) kHz, F_{char}: 52.4 ± 6.13 (45.3 - 62.2) kHz, duration: 2.0 ± 0.40 (1.6 - 2.6) msec.
At Farm Welgevonden, South Africa, Taylor *et al.* (2013a: 556) report a F_{knee} value of 58 (48 - 68) kHz.
Four calls recorded at Mapungubwe National Park (RSA) by Parker and Bernard (2018: 57) had the following values: F_{char}: 42.68 ± 0.70 kHz, F_{max}: 70.40 ± 3.85 kHz, F_{min}: 40.88 ± 1.98 kHz, F_{knee}: 52.68 ± 3.43 kHz, duration: 3.03 ± 0.70 msec and 11.20 ± 7.85 calls/sec.

Release calls recorded at Telperion Nature Reserve by Kearney *et al.* (2019: 37) had a F_{char}: 37.04 kHz, slope at the start of the call: 372.62, time from start of call to F_{char}: 2.62 msec and duration 3.13 msec.

From Swaziland, Monadjem *et al.* (2017c: 179) reported F_{min}: 38.0 ± 3.78 (34.2 - 41.7) kHz, F_{knee}: 55.4 ± 10.8 (44.6 - 66.2) kHz, F_c: 49.4 ± 11.4 (38.0 - 60.8) kHz, duration: 2.4 ± 0.33 (2.07 - 2.72) msec. The maximum distance over which they were able to detect the calls was 10 m (mean: 4.6 ± 0.73 m).

Adams and Kwiecinski (2018: 4) reported F_{char}: 41.8 ± 4.3 kHz, F_{max}: 81.5 ± 6.2 kHz, F_{min}: 38.8 ± 2.2 kHz and duration: 2.9 ± 0.9 msec for six calls from the Kalahari Desert.

MOLECULAR BIOLOGY:
DNA - Unknown.
Karyotype - Rautenbach *et al.* (1993) reported 2*n* = 44, FN = 50, BA = 8, a submetacentric X chromosome, and an acrocentric Y chromosome, for specimens from South Africa and Zimbabwe. These results are the same as those obtained for *M. bocagii* specimens from South Africa (Rautenbach *et al.*, 1993).
Protein / allozyme - Unknown.

HABITAT:
Sirami *et al.* (2013: 34) recorded in the Western Cape Province, South Africa that *M. tricolor* activity was not significantly, nor positively influenced by size of wetland, while habitats 100 m surrounding wetlands were also significantly and positively influenced by the water body. *M. tricolor* was observed near trees and in orchards but also in open habitats surrounding wetlands (Sirami *et al.*, 2013: 35).

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 820,776 km^2.

ROOST:
In the Durban area, Taylor *et al.* (1999: 69) reported it roosting in the Shongweni Dam tunnel, with a colony size between 100 and 400. A colony consisting of females only, occupied this tunnel from September to the end of January.

DIET:
From the Algeria Forestry Station (RSA) Schoeman and Jacobs (2002: 157) reported the following prey groups based on 11 faecal pellets from 1 bat (in volume percent): Coleoptera (50), Hemiptera (25), Hymenoptera (25).

PREDATORS:
Avery *et al.* (2005: 1054) found this bat species in pellets from *Tyto alba* in South Africa.

POPULATION:
Structure and Density - This is a common species with colonies often consisting of thousands of animals (Jacobs, 2008e; IUCN, 2009).
Trend - 2008 - Unknown (Jacobs, 2008e; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
Bernard (1982b) [in Badwaik and Rasweiler (2000: 276) and Racey and Entwistle (2000: 374)] indicates that females exhibit partial regression of the corpus luteum during pregnancy, and that it has a restricted seasonal monoestry reproduction pattern. Bernard (1982b: 83) also indicated that in Natal copulation occurred in April, and that ovulation and fertilization probably occurred in mid-September, suggesting that sperm storage probably occurred during winter and ovulation was delayed until spring.

Jordaan and Jacobs (2009: 35) found that late pregnancy females forage for longer (307.0 ± 173.5 min) than early pregnant females (147.7 ± 154.5 min) to meet the high energy demands associated with the developping fetus.

PARASITES:
HAEMOSPORIDA:
Lutz *et al.* (2016: 9) examined 3 *M. tricolor* specimens from East Africa and found one of them infected with a haemosporidan parasite of the genus *Polychromophilus*.

DIPTERA:
Streblidae: *Raymondia hardyi* Fiedler, 1954 from South Africa (Shapiro *et al.*, 2016: 254).
Nycteribiidae: *Nycteribia capensis* Karaman, 1939 which may be the natural parasite for this species (Haeselbarth *et al.*, 1966: 108). *Nycteribia latiterga* Theodor, 1957 from Mt. Menengai, Kenya (Haeselbarth *et al.*, 1966: 108). *Penicillidia fulvida* (Bigot, 1885) (Haeselbarth *et al.*, 1966: 114).

SIPHONAPTERA
Ischnopsyllidae: *Oxyparius isomalus* (Waterston, 1915) locality not stated (Haeselbarth *et al.*, 1966: 188). *Rhinolophopsylla capensis* Jordan and Rothschild.

ACARI:
Trombiculidae: Stekolnikov (2018a: 189) reported *Willmannium natalense* (Lawrence, 1949) from bats in South Africa.

VIRUSES:
In their country-wide survey of Kenyan bats, Waruhiu *et al.* (2017) found the following viruses in *Myotis tricolor*: Astroviruses and Polyomaviruses.

Bunyaviridae
Phlebovirus
Rift Valley Fever Virus (RVFV) - Oelofsen and Van der Ryst (1999) tested two individuals from two localities in the Free State Province, South Africa and Lesotho for RVFV antigen using an enzyme linked immunosorbet assay (ELISA), none tested positive.

Rhabdoviridae
Lyssavirus - Rabies related viruses
Rabies - Oelofsen and Smith (1993) tested 10 individual brains, from four localities by means of the "Rapid rabies enzyme immunodiagnosis" (RREID) test (Diagnostic Pasteur), none were tested positive.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Congo (Democratic Republic of the), Ethiopia, Kenya, Lesotho, Liberia, Malawi, Mozambique, Nigeria, Rwanda, South Africa, Swaziland, Tanzania, Uganda, Zambia, Zimbabwe.

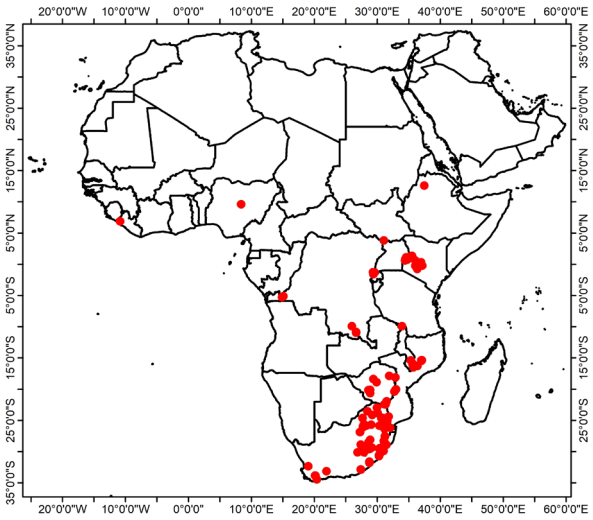

Figure 249. Distribution of *Myotis tricolor*

Myotis welwitschii (Gray, 1866)

*1866. *Scotophilus welwitschii*Gray, Proc. zool. Soc. Lond., 1866, II: 211, pl. 24. Publication date: September 1866. Type locality: Angola: NE Angola: (probably near Pungo Andongo: see Crawford-Cabral (1989: 17) in Thorn *et al.* (2009: 50)). [Goto Description]. Holotype:

BMNH 1866.4.12.2: ♂. Collected by: Dr. F.M. Welwitsch. - Etymology: Named after Welwitsch, an Austrian botanist who made extensive collections in Angola (Taylor, 2005).

1878. *Vespertilio welwitschii:* Dobson, Catalogue of the Chiroptera of the collection of the British Museum, 306. (Name Combination)

1899. *Vespertilio venustus* Matschie, Sber. Ges. naturf. Freunde Berlin, 74. Publication date: 1899. Type locality: Tanzania: Morogoro district: Ukami Mts., [north slope of Uluguru Mountains]: Kinole [06 50 S 37 42]. Holotype: ZMB 54653: ♂, skin and skull. Vendor: Schlüter; see Turni and Kock (2008: 63).

1922. *Myotis welwitschii:* Kershaw, Ann. Mag. nat. Hist., ser. 9, 10 (56): 181. Publication date: 1 August 1922. (Name Combination, Current Combination)

1951. *Scotophilus welwetschii:* Roberts, Mammals of South Africa, 80. (Lapsus)

1967. *Myotis venustus:* Kock, Senckenb. biol., 48 (5/6): 319. (Name Combination)

2014. *Myotis wilwitschii:* Ndara R., IJISR, 12 (1): 254. Publication date: November 2014. (Lapsus)

2016. *Myotis weltwitschii:* Simmons, Seiffert and Gunnell, Am. Mus. Novit., 3857: 43. Publication date: 9 May 2016. (Lapsus)

? *Myotis (Chrysopteron) welwitschii:* (Name Combination)

TAXONOMY:

Figure 250. *Myotis welwitschii* (TM 47968) caught at Lapalala Wilderness area, Limpopo Province, South Africa.

Csorba *et al.* (2014: 667) include *welwitschii* in the subgenus *Chrysopteron*, although Ruedi and Mayer (2001: 436), Ghazali *et al.* (2016: 476) and Patterson *et al.* (2019: "2") reject the division in subgenera.

Myotis welwitschii is monotypic (Kershaw, 1922b: 181; Hayman and Hill, 1971; Findley, 1972; Kock, 1967; Meester *et al.*, 1986; Simmons, 2005). However, the phylogenetic analyses by Patterson *et al.* (2019: "5", "9") indicate the existence of two groups within this species: one corresponding to an equatorial group occurring from Guinea to western Kenya and a second group existing in eastern and southern Africa, from Tanzania to South Africa (possibly representing *venustus*). These groups differ by 5 % in their *Cytb* sequence.

COMMON NAMES:

Afrikaans: Welwitsch se langhaarvlermuis, Welwitsch-langhaarvlermuis. Chinese: 魏氏鼠耳蝠. Czech: netopýr Welwitschův, netopýr Welwitschiův. English: Welwitsch's Mouse-eared Bat, Welwitsch's Hairy Bat, Welwitch's Bat, Welwitsch's Myotis. French: Murin de Welwitsch, Myotis de Welwitsch, Vespertilion de Welwitsch. German: Welwitschs Mausohr. Kiluba (DRC): Mulima. Portuguese: Morcego lanudo de weltsch.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:

No fossils are known (Ratcliffe, 2002).

CONSERVATION STATUS:

Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Jacobs *et al.*, 2008p; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Jacobs *et al.*, 2008p; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Jacobs *et al.*, 2004d; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - LC ver 3.1 (2001) (Monadjem *et al.*, 2016l). 2004 - NT ver 3.1 (2001) (Friedmann and Daly, 2004). 1986 - Indeterminate (Smithers, 1986).

MAJOR THREATS:

There appear to be no major threats to this species as a whole (Jacobs *et al.*, 2008p; IUCN, 2009).

CONSERVATION ACTIONS:

Jacobs *et al.* (2008p) [in IUCN (2009)] report that this species has been recorded from the Sengwa Wildlife Research Area and Kruger National Park in South Africa, and seem likely to be present in additional East or southern African protected areas. No direct conservation measures are currently needed for this species as a whole.

GENERAL DISTRIBUTION:

Myotis welwitschii has been widely, but patchily, recorded over much of East Africa and southern

Africa, parts of southern Central Africa, and with a single West African locality in southeastern Guinea. In East and southern Africa, it is distributed from Ethiopia and the Sudan in the north, through Kenya, Tanzania and Malawi, to Zambia, Mozambique, Zimbabwe and northeastern South Africa (where its distribution is linked with land use/land cover (Babiker Salata, 2012: 50)). In Central Africa, it is largely confined to southern Democratic Republic of the Congo, northern Angola, Rwanda and Burundi and western Uganda. It has not been recorded from Namibia or Botswana.

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 920,261 km^2.

Native: Angola (Hayman, 1963; Crawford-Cabral, 1989; Monadjem *et al.*, 2010d: 565; Taylor *et al.*, 2018b: 63); Burundi (Fahr and Ebigbo, 2003: 128); Congo (The Democratic Republic of the) (Fahr and Ebigbo, 2003; Monadjem *et al.*, 2010d: 565); Ethiopia; Guinea (Fahr and Ebigbo, 2003: 128); Kenya; Malawi (Happold *et al.*, 1988; Happold and Happold, 1997b: 819; Fahr and Ebigbo, 2003; Monadjem *et al.*, 2010d: 565); Mozambique (Smithers and Lobão Tello, 1976; Monadjem *et al.*, 2010d: 565); Rwanda; South Africa (Fahr and Ebigbo, 2003; Monadjem *et al.*, 2010d: 565); Sudan; Tanzania; Uganda (Kityo and Kerbis, 1996: 61); Zambia (Fahr and Ebigbo, 2003; Monadjem *et al.*, 2010d: 565); Zimbabwe (Fahr and Ebigbo, 2003; Monadjem *et al.*, 2010d: 565).

GEOGRAPHIC VARIATION:

Figure 251. *Myotis welwitschii* (TM 47968) - showing wing reticulations.

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
See Ratcliffe (2002).

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:
See Ratcliffe (2002).

DETAILED MORPHOLOGY:
Baculum - Unknown
For a description of the skull, teeth, ears and tragus, and wingshape and aspect ratio see Ratcliffe (2002).

ECHOLOCATION:
In Soutpansberg, South Africa, Taylor *et al.* (2013b: 17) recorded 1 call with the following parameters: F_{max}: 73.8 kHz, F_{min}: 33.8 kHz, F_{knee}: 52.9 kHz, F_{char}: 50.3 kHz, duration: 2.1 msec.
Linden *et al.* (2014: 40) reported the following parameters from the Southpansberg range (RSA): F_{min}: 34 kHz, F_{char}:50 kHz, F_{knee}: 53, Slope: 563 OPS, duration: 2.1 msec.

Thiagavel *et al.* (2017: Suppl.) mention a F_{peak} of 32.66 kHz.

MOLECULAR BIOLOGY:
DNA - See Hoofer and Van Den Bussche (2003).
Karyotype - Rautenbach *et al.* (1993) reported 2*n* = 44, FN = 50, BA = 8, and submetacentric X and Y chromosomes, for specimens from South Africa.
Protein / allozyme - Unknown.

HABITAT:
See Ratcliffe (2002).

In southern Africa, it occurs in Savanna (70 %) and Afromontane (20 %) habitats (Cooper-Bohannon *et al.*, 2016: Table S2).

HABITS:
See Ratcliffe (2002).

ROOST:
See Ratcliffe (2002).

POPULATION:
Structure - Considered solitary in its roosting habits (Smithers and Wilson, 1979; Ratcliffe, 2002). However in a single instance two animals were found roosting in the same bush (Smithers and Wilson, 1979).
Density - Unknown, although this species is widespread, it does not appear to be particularly common (Jacobs *et al.*, 2008p; IUCN, 2009).
Trend - 2008 - Unknown (Jacobs *et al.*, 2008p; IUCN, 2009).

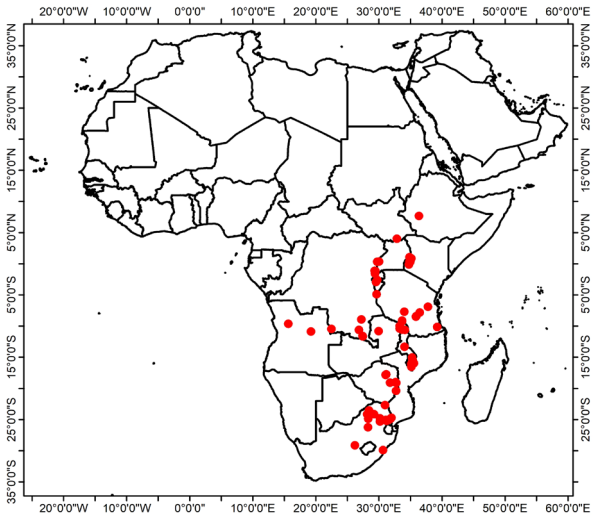

Figure 252. Distribution of *Myotis welwitschii*

DISTRIBUTION BASED ON VOUCHER SPECIMENS: Angola, Burundi, Congo (Democratic Republic of the), Ethiopia, Kenya, Malawi, Rwanda, South Africa, South Sudan, Tanzania, Uganda, Zambia, Zimbabwe.

Myotis zenatius Ibáñez, Juste, Salicini, Puechmaille and Ruedi, 2019

2019. *Myotis escalerai cabrerae* Çoraman, Mayer and Dietz, in: Çoraman et al., J. Biogeogr., 46 (2): 350. Publication date: 28 January 2019. Type locality: Morocco: Sous_Massa region: Wim Timdouine cave: near Agadir [30 40 49 N 09 20 42 W, 1340 M] [Goto Description]. Holotype: ZMB 107229: ♀, tissue. Collected by: ?: Collector Unknown. Presented/Donated by: ?: Collector Unknown. - Etymology: In honour of Angel Cabrera, who described *M. escalerai* from Spain.

*2019. *Myotis zenatius* Ibáñez, Juste, Salicini, Puechmaille and Ruedi, in: Juste et al., Acta Chiropt., 20 (2): 293, 295, figs 3C, 5D (for 2018). Publication date: 30 January 2019. Type locality: Morocco: Tanger-Tétouan-Al Hoceima region: Mizou Cave [c. 35 30 42 N 05 19 53 W, 330 m] [Goto Description]. Holotype: EBD MAM 29831: ad ♂, skull and alcoholic. Collected by: Irene Salicini, Carlos J. Ibáñez Uargui and Javier Juste; collection date: 18 July 2011; original number: 110718MspB12. Paratype: EBD MAM 26020: ♀, skull and alcoholic. Collection date: 10 June 2002; original number: MNA-56. Paratype: EBD MAM 26023: ♂, skull and alcoholic. Collection date: 11 July 2002; original number: MNA-15. Paratype: EBD MAM 29826: ad ♀, skin and skull. Collected by: Irene Salicini, Carlos J. Ibáñez Uargui and Javier Juste; collection date: 18 July 2011; original number: MspB6. Paratype: EBD MAM 29829: ad ♂, skull and alcoholic. Collected by: Irene Salicini, Carlos J. Ibáñez Uargui and Javier Juste; collection date: 18 July 2011; original number: Msp7. Paratype: EBD MAM 29830: ad ♀, skull and alcoholic. Collected by: Irene Salicini, Carlos J. Ibáñez Uargui and Javier Juste; collection date: 18 July 2011; original number: Msp11. - Etymology: "*zenatius*" refers to "Zanatah", a little known Berber tribe that lived in the Maghreb region in the Middle Ages (see Juste *et al.*, 2019: 297).

TAXONOMY:

The specimens forming this taxon were formerly included in *Myotis nattereri* (e.g. Brosset, 1963: 440; Gaisler, 1983: 362; Gaisler, 1984: 89; Kowalski *et al.*, 1986: 185; Aulagnier and Thevenot, 1986: 44; Benda *et al.*, 2004d: 19; Dieuleveut, 2010: 37). Various authors (e.g. García-Mudarra *et al.*, 2009: 442; Puechmaille *et al.*, 2011a: 225; Salicini *et al.*, 2011: 890; 2012: 1185), however, found differences between the European representatives of *M. nattereri* and the animals from northern Africa and assigned the latter tentatively to "*Myotis* sp. B".

Based on DNA, Çoraman *et al.* (2019: 350) indicated that "*Myotis* sp. B" is clearly distinct, both in mitochondrial and nuclear markers from *M. nattereri*, and suggests that this taxon should be considered as a subspecies of *Myotis escalerai*, for which they propose the name *Myotis escalerai cabrerae* Çoraman, Mayer and Dietz 2018. The paper only contains a short paragraph on the proposed name, where as the "description" itself is in the online supplement and is also restricted to a single sentence. The description is not supported by the designation of a physical museum specimen, but rather a DNA (tissue) sample, which according to the ICZN (http://iczn.org/content/can-dna-be-type-specimen) should nevertheless be acceptable.

Juste *et al.* (2019) compared physical specimens of "*Myotis* sp. B" with *M. escalerai* from the Iberian Peninsula and found a number of differences (including a much darker dorsal fur), which led them to describe a new species: *Myotis zenatius*.

As these two publications suggest a name for the populations previously assigned to "*Myotis* sp. B" (see Salicini *et al.*, 2011; 2012) the priority principle comes into play. Both papers were published in early 2019:

1) "*Myotis zenatius* Ibáñez, Juste, Salicini, Puechmaille and Ruedi, 2019" was published in "Acta Chiropterologica, 20 (2): 225 - 300, 2018", the front page of which indicates "December 2018", but the BioOne website (https://bioone.org/journals/Acta-Chiropterologica/volume-20/issue-2/15081109ACC2018.20.2.001/Two-New-Cryptic-Bat-Species-within-the-Myotis-nattereri-Species/10.3161/15081109ACC2018.20.2.001.full) mentions 14 February 2019 as date. Furthermore, the paper header mentions: "Version of Record, published online January 30, 2019 with fixed content and layout in compliance with Art.8.1.3.2.ICZN and registered in Zoobank with LSID urn:lsid:zoobank.org:pub:2348ACBD-2ECC-4A80-8EA4-E3DF05C878E3". This suggest that 30 January is to be considered as date of publication.

2) "*Myotis escalerai cabrerae* Çoraman, Mayer and Dietz, 2018" was published in "Journal of Biogeography, 46 (2): 343 - 354, 2019". Here the Wiley Online Library website (https://onlinelibrary.wiley.com/loi/13652699) mentions "February 2019" as publication date for the issue and for the paper itself (https://onlinelibrary.wiley.com/doi/10.1111/jbi.13509), it mentions "First published: 28 January 2019". The fact that the authors mention "2018" in the header of their description should be ignored.

ICZN article 21.9. mentions "Works issued on paper and electronically. A name or nomenclatural act published in a work issued in both print and electronic editions takes its date of publication from the edition that first fulfilled the criteria of publication of Article 8 and is not excluded by Article 9."

The members of our "Taxonomic Advisory Committee" [Petr Benda, Gábor Csorba, Peter Taylor, Stéphane Aulagnier] indicated that a description published in an online (part of the) paper without a ZooBank number (a requirement since 2012; IUCN, 2012: 1) is invalid for taxonomic purposes [="*nomen nudum*"]. ZooBank currently contains urn:lsid:zoobank.org:pub:A4A8BF4B-D592-485C-9E02-DC2A0B7C94F8 for the paper by Çoraman et al. and mentions publication date "February 2019". This agrees with the remark made in IUCN (2012: 3): "The following are examples of inadmissible errors: An author, in preparing a manuscript for publication, states that day's date for the registration date, intending to register it later that day but forgetting to do so. The author discovers the omission after the work is published and immediately registers it; because registration occurred after publication, the work is not available."

The problem was also signaled by Ruedi *et al.* (2019), who indicated that the new names proposed by Çoraman *et al.* (2019) (besides *M. escalerai cabrerae*, they also introduced *M. nattereri helverseni*) do not follow several mandatory rules imposed by the Code, they are declared unavailable and are not to be used for further taxonomy studies.

As such, we accept the name *Myotis zenatius* proposed in Juste *et al.* (2019) for this taxon.

COMMON NAMES:
English: Zenati myotis. French: Murin Zenati. German: Zenati Mausohr. Spanish: Murcielago ratonero
Zenate.

GENERAL DISTRIBUTION:
Probably endemic to the Mediterranean region of Morocco and Algeria, and possibly Tunisia (Juste *et al.*, 2019: 296).

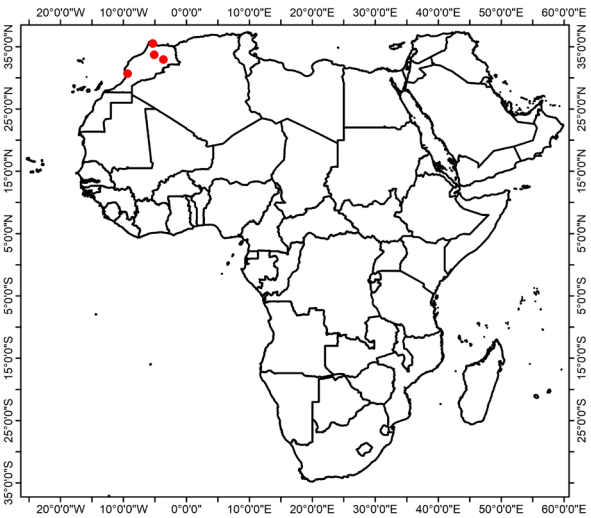

Figure 253. Distribution of *Myotis zenatius*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Morocco.

Subfamily Scotophilinae Van Cakenberghe and Seamark, 2008

1866. *Scotophili* A. Murray, The geographical distribution of mammals., 238. - Comments: Type genus: *Scotophilus* Leach, 1821. Introduced as "section". Synonymized with the Nycticeiini tribe by McKenna and Bell (1997: 320) (see Jackson and Groves, 2015: 276).
1866. *Scotophilina* Gray, Ann. Mag. nat. Hist., er. 3, 17 (98): 90.
1985. *Philisidae* Sigé, Geol. Palaeontol., 19: 161-189. - Comments: Described as a distinct Family level.
1987. *Scotophilini* Hill and Harrison, Bull. Br. Mus. (nat. Hist.) Zool., 52 (7): 278. Publication date: 30 July 1987. - Comments: Type genus: *Scotophilus* Leach, 1821. Introduced as tribe, and originally included the genera *Scotomanes* Dobson, 1875 [including *Scoteinus* Dobson, 1875] and *Scotophilus* Leach, 1821. The rank was recognized by Hoofer and Van Den Bussche (2003: 38), but synonimized with the Nycticeiini tribe by McKenna and Bell (1997: 320) (see Jackson and Groves, 2015: 276).
2006. *Philisinae* Horácek, Fejfar and Hulva, Lynx, 37: 145. - Comments: Type genus: *Philisis* Sigé, 1985.
*2008. *Scotophilinae* Van Cakenberghe and Seamark, African Chiroptera Report, 238. Publication date: 1 July 2008. - Comments: Type genus: *Scotophilus* Leach, 1821. Following the principle of typification. (Current Combination)

TAXONOMY:
Known genera of the subfamily Scotophilinae: †***Scotophilisis*** Horácek, Fejfar and Hulva 2006; †***Vampyravus*** Schlosser, 1910; ***Scotophilus*** Leach 1821.

COMMON NAMES:
Czech: mračníkové.

†Genus *Scotophilisis* Horácek, Fejfar and Hulva, 2006

*2006. *Scotophilisis* Horácek, Fejfar and Hulva, Lynx, n.s.37: 131, 140. - Comments: Type species - *Scotophilisis libycus* Horácek, Fejfar and Hulva, 2006.
The publication might date from 2007, since the paper was only received on 8 December 2006. - Etymology: Combination of the extant genus *Scotophilus* Leach, 1821 and a Palaeogene genus *Phylisis* Sigé, 1985, as this new genus is supposedly related to the stem line (Horácek *et al.*, 2006). (Current Combination)
2014. *Scotiphilisis:* Ravel, Adaci, Bensalah, Mahboubi, Mebrouk, Essid, Marzougui, Ammar, Charruault, Lebrun, Tabuce, Vianey-Liaud, and Marivaux, J. Syst. Palaeontol., 13 (8): 694. Publication date: 21 August 2014. (Lapsus)

TAXONOMY:
Known species of the genus *Scotophilisis*: †***libycus*** Horácek, Fejfar and Hulva, 2006.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Time frame - Early Miocene (Burdigalian).

†*Scotophilisis libycus* Horácek, Fejfar and Hulva, 2006

*2006. *Scotophilisis libycus* Horácek, Fejfar and Hulva, Lynx, n.s. 37: 131, 140, figs. 1 - 3. Type locality: Libya: MS2: Jebel Zelten [28 28 N 20 00 E]. Holotype: NMP NMPC/OF.J.Zel./Chil.:. Right mandible with M_1 and M_2 and alveoli of I_1 to P_4 and M_3. - Comments: Early Miocene, MN4-5. (Current Combination)

Genus *Scotophilus* Leach, 1821

*1821. *Scotophilus* Leach, Trans. Linn. Soc. Lond., 13 (1): 69, 71. Publication date: 23 May - 21 June 1821 [Goto Description]. - Comments: Type species: *Scotophilus kuhlii* Leach, 1821

(According to Meester *et al.*, 1986: 59 "=juvenile *Vespertilio temmincki* Horsfield"). Not *Scotophilus* Swainson, 1836 (Aves, Strigiformes, Strigidae). Not *Scotophilus* Meinert, 1870 (Arthropoda, Chilopoda, Geophilomorpha, Dignathodontidae). Not *Scotophilus* Hesse, 1881 (Crustacea, Maxillopoda, Cyclopodea, Family incertae sedis) (see Jackson and Groves, 2015: 272). - Etymology: From the Greek "*σκόοτος*", meaning "darkness" and "*φίλος*", meaning "loving" (see Palmer, 1904: 627). - ZooBank: EE74E9E4-260A-48A5-9CD7-C690F661AF90. (Current Combination)

1831. *Pachyotus* Gray, Zool. Misc., 1: 38. Publication date: 1831 [Goto Description]. - Comments: Type species: *Scotophilus kuhlii* Leach, 1821. - Etymology: From the Greek "*παχύς*" meaning thick and "*ούς*" or "*ώτός*", meaning ear (see Palmer, 1904: 495).
1842. *Nicticejus* Rüppell, Mus. Senckenberg., 3 (2): 157, 188. - Comments: Type species: *Nycticejus leucogaster* Cretzschmar, 1826.
1981. *Scotophilous:* Demeter, Vertebr. Hung., 20: 135. (Lapsus)
2018. *Schotophilus:* Leopardi, Holmes, Gastaldelli, Tassoni, Priori, Scaravelli, Zamperin and De Benedictis, Infec. Gen. Evol., 58: 284. Publication date: 30 January 2018. (Lapsus)
2018. *Scotophilis:* Adams and Kwiecinski, Diversity, 10 (3) 103: 4. Publication date: 18 September 2018. (Lapsus)

TAXONOMY:
Bronner *et al.* (2003) states that the taxonomy of African *Scotophilus* remains problematic. Three species, differing mainly in body size, probably occur in the [southern African] subregion, but species limits and phylogenetic inter-relationships are unclear (Meester *et al.*, 1986). Ellerman *et al.* (1953) referred to the largest species as *gigas*, but Robbins (1978a) showed that in describing *gigas*, Dobson (1875a) had in fact re-described *nigrita*, the name used by Ellerman *et al.* (1953) for the medium-sized species. Koopman (1982) accepted *nigrita* as a senior synonym of *gigas*, but argued that *nigrita* is a *nomen dubium* and should therefore not be used; a position later recanted (Koopman, 1993a, 1994). Since *nigrita* was no longer available for the medium-sized species, Robbins (1978a) used *dinganii* as the next valid name. Koopman (1975, 1978), however, regarded *leucogaster* as a senior synonym of *dinganii*, but later revised this opinion and recognised these as discrete species (Koopman, 1993a). Shortly thereafter he reverted to his earlier treatment and again listed *dinganii* under *leucogaster* (Koopman, 1994).

Ellerman *et al.* (1953) referred to the smallest of the three species in the [southern African] subregion as *viridis*, containing two subspecies (*S. v. viridis* and *S. v. damarensis*), which they recognised as distinct from *borbonicus* on Reunion Island. Hill (1980) regarded these taxa as conspecific and, therefore, used *borbonicus* as the prior name for this taxon. Corbet and Hill (1980) followed Koopman (1975) in confining *borbonicus* to Madagascar and Reunion, and thus once again recognised *viridis* as a mainland species, a treatment followed by Swanepoel *et al.* (1980) and Koopman (1982). Robbins *et al.* (1985) followed suit, but also listed *leucogaster* to accommodate *damarensis*, which they considered distinct from *viridis*, a treatment endorsed by Corbet and Hill (1992). Koopman (1993a) considered *damarensis* synonymous with *viridis*, but subsequently recognised both of these as only subspecies of *borbonicus* (Koopman, 1994).

Vallo *et al.* (2010: 303) indicate that several unrelated mitochondrial lineages occur within *S. dinganii*, but also that the African *Scotophilus* as a whole is in need of more detailed investigation and formal revision of systematics.

For a discussion on the names introduced by Brooks and Bickham, see Vallo and Van Cakenberghe (2017: 6).

Demos *et al.* (2018: 10) used multi-locus coalescent delimitation methods and concluded that 15 different species may occur in continental Africa, keeping in mind that large parts of the continent are seriously undersampled.

Prié *et al.* (2016) report on the echolocation characteristics of a "Chiroptera sp. 1" from Réunion, which they believe to be a *Scotophilus*. However, due to the terrible physical status and the taxonomic uncertainty of the *S. borbonicus* specimen(s) collected on the island, they feel it impossible to use the name *borbonicus* for these "Chiroptera sp. 1" specimens. Additional acoustic and distributional information on this species is provided by Augros (2017).

Known species of the genus *Scotophilus*: ***altilis*** G.M. Allen, 1914; ***andrewreborii*** Brooks and Bickham, 2014; ***borbonicus*** (E. Geoffroy, 1803); *celebensis* Sody, 1928 – Sulawesi (Indonesia) (Simmons, 2005: 465); *collinus* Sody, 1936 – Sabah, western Java, Bali, Lombok, Flores, Lembata, Timor, Semanu and Roti Isls (Indonesia) (Simmons, 2005: 466); ***dinganii*** (A. Smith, 1833);

Scotophilus ejetai Brooks and Bickham, 2014; *heathii* (Horsfield, 1831) – Afghanistan to southern China, including Hainan Isl, south to Sri Lanka, Vietnam, Cambodia, Thailand and Burma (Simmons, 2005: 466); *kuhlii* Leach, 1821 – Bangladesh, Pakistan to Taiwan, south to Sri Lanka, Burma, Cambodia, western Malaysia, Java, Bali, Nusa Tenggara (Indonesia), southeast to Philippines and Aru Isls (Indonesia) (Simmons, 2005: 466); ***leucogaster*** (Cretzschmar, 1830); ***livingstonii*** Brooks and Bickham, 2014; ***marovaza*** Goodman, Ratrimomanarivo and Randrianandrianina, 2006; ***nigrita*** (Schreber, 1774); ***nigritellus*** de Winton, 1899; ***nucella*** Robbins, 1973; ***nux*** Thomas, 1904; ***robustus*** Milne-Edwards, 1881; ***tandrefana*** Goodman, Jenkins and Ratrimomanarivo, 2005; ***trujilloi*** Brooks and Bickham, 2014; ***viridis*** (Peters, 1852).

COMMON NAMES:
Czech: mračníkové, mrakolibové. English: Yellow bats, House bats, Brown bats. French: Scotophiles. German: Hausfledermäuse. Italian: Scotòfili.

DETAILED MORPHOLOGY:
Baculum - Hill and Harrison (1987).

MOLECULAR BIOLOGY:
DNA - See Hoofer and Van Den Bussche (2003) for a *S. borbonicus* from Kenya.
Karyotype - Volleth *et al.* (2006) reported 2*n* = 36, FN = 50, BA = 18, a submetacentric X and a submetacentric Y chromosome for a male *S. leucogaster* from Burkina Faso. Recently, Eick *et al.* (2007) reported 2*n* = 36, FN = 50, BA = 16, a metacentric X chromosome and an acrocentric Y chromosome for South African specimens of *S. dinganii*.

HABITS:
Foord *et al.* (2018: 5) indicate that clutter-edge bats such as *Scotophilus* spp. may commute up to 3 km between roosts and feeding areas, but generally use a smaller core area.

DIET:
Jacobs (2000: 201) reported the following proportions of prey categories for 32 "*Scotophilus borbonicus*" specimens: Lepidoptera (13.8 ± 23.0), Coleoptera (37.4 ± 38.1), Isoptera (15.8 ± 28.7), Hymenoptera (11.5 ± 26.0), Diptera (7.5 ± 23.1), Hemiptera (13.4 ± 29.8), and unknown (0.6 ± 2.0).

REPRODUCTION AND ONTOGENY:
van der Merwe and Rautenbach (1988: 321) described the placenta of the lesser yellow house bat ("*S. borbonicus*") as antimesometrial discoidal, deciduate and hemodichorial. van der Merwe and Rautenbach (1990: 540) reported that this bat commonly gives birth to twins and occasionally even triplets. van der Merwe *et al.* (1988: 551) found that insemination,
ovulation and fertilization take place in autumn. The embryonic growth is soon retarded. but
not arrested and the embryo remains in the morula stage for 6 to 8 weeks, followed by a
blastocyst stage of about two months.
In the same species, van der Merwe and Rautenbach (1989: 83) found that spermatogenesis was prolonged and extended over 8 months, coinciding with spring, summer and autumn.

The above information might pertain to either *S. leucogaster* or *S. viridis*.

PARASITES:
PROTOZOA
Espinosa-Álvarez *et al.* (2018: 572, Suppl.) reported new trypanosomes (*Trypanosoma vespertilionis*-like G1 and *Trypanosoma* sp. HochG3) from *Scotophilus* bats collected in Guinea-Bissau.

DIPTERA
Nycteribiidae: *Basilia ansifera* Theodor, 1956 mainly a West African species, reaching Lake Victoria in the east and Lake Nyasa in the south, nearly all localities lie between 15° latitude north and south (Haeselbarth *et al.*, 1966: 110).

SIPHONAPTERA
Ischnopsyllidae: The genus *Scotophilus* was reported by Beaucournu and Kock (1996) as the first African host (in Eritrea) for *C. brockmani* Rothschild, 1915.

VIRUSES:
Togaviridae
Alphavirus
Chikungunyavirus- isolated from Senegal in 1962, from the salivary glands of *Scotophilus* sp. by Bres and Chambon (1963).

ZOOBANK:
EE74E9E4-260A-48A5-9CD7-C690F661AF90

Scotophilus altilis G.M. Allen, 1914

*1914. *Scotophilus altilis* G.M. Allen, Bull. Mus. comp. Zool., 58 (7): 350. Publication date: July 1914. Type locality: Sudan: Blue Nile province: north of [Er] Roseires: Aradeiba [12 25 N 34 20 E]. Holotype: MCZ 14463: ad ♂, skin and skull. Collected by: Glover Morrill Allen

and The Phillips Sudan Expedition; collection date: 22 January 1913; original number: 73. See Helgen and McFadden (2001: 147). Paratype: FMNH ad ♂, skin and skull. Exchanged; formerly MCZ (14462); see Helgen and McFadden (2001:147). Paratype: FMNH 34161: ad ♂, skin and skull. Collected by: Glover Morrill Allen; collection date: 6 January 1913; original number: 22. Presented/Donated by: ?: Collector Unknown. Formely MCZ 14462. Paratype: MCZ 14610: ad ♂, alcoholic (skull not removed). Paratype: MCZ 14611: ad ♂, alcoholic (skull not removed). See Helgen and McFadden (2001: 147).

TAXONOMY:
Traditionally considered a synonym of *Scotophilus leucogaster*, but see Vallo *et al.* (2019: 148) who found that there is a 10% genetic difference for *cytb* between *S. leucogaster* and specimens from southwestern Ethiopia and southern South Sudan. These latter specimens were also slightly smaller and had a slightly different ventral colour. Additionally, two nuclear markers (*zfy* and *fgb7* also showed similar differences.

GENERAL DISTRIBUTION:
Native: Democratic Republic of the Congo, Ethiopia, Kenya, South Sudan, Sudan (Vallo *et al.*, 2019: 151).

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Congo (Democratic Republic of the), Ethiopia, Kenya, South Sudan, Sudan.

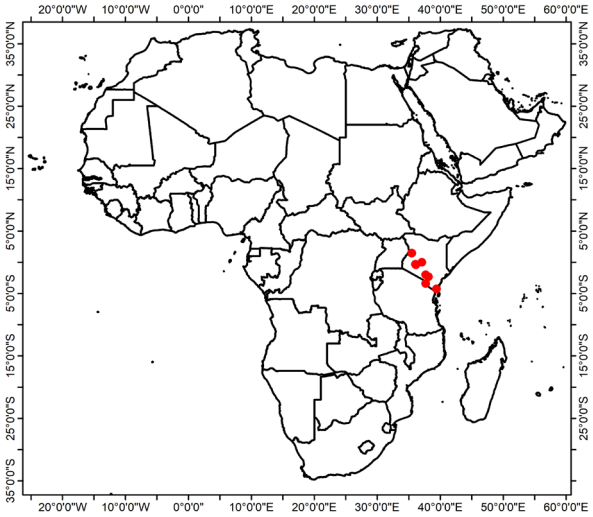

Figure 254. Distribution of *Scotophilus altilis*

Scotophilus andrewreborii Brooks and Bickham, 2014

*2014. *Scotophilus andrewreborii* Brooks and Bickham, Occ. Pap. Mus. Texas Tech Univ., 326: 1, 8, fig. 2. Publication date: 26 June 2014. Type locality: Kenya: Nakuru district, 12 km S, 4 km E Nakuru [00 24 S 36 07 E] [Goto Description]. Holotype: CM 98049: ad ♂, skin and skull. Collected by: Dr. Kimberlyn ("Kim") Nelson; collection date: 7 October 1985; original number: 217. Muscle tissue sample TK 33143. Paratype: CM 98048: ad ♀, skin and skull. Collected by: Dr. Kimberlyn ("Kim") Nelson; collection date: 7 October 1985; original number: 214. Muscle tissue sample TK 33140. Paratype: CM 98050: ad ♂, skin and skull. Collected by: Dr. Kimberlyn ("Kim") Nelson; collection date: 8 October 1985; original number: 219. Muscle tissue sample TK 33149. - Etymology: In honor of Andrew N. Rebori (1948 - 2011), who unknowingly touched the lives and inspired many individuals, including many museum professionals. He always maintained a keen interest in animals, especially bats, which exemplified his spirit and attitude toward life, 'Take flight every new day!' (see Brooks and Bickham, 2014: 8).

TAXONOMY:
Brooks and Bickham (2014) described four new species in the genus *Scotophilus*. However, they did not compare them with a number of already described taxa such as *colias* Thomas, 1904 or *flavigaster* Heuglin, 1861, which make the validity of (some of) these names doubtfull.

The analyses performed by Demos *et al.* (2018: 2) confirmed the validity of the taxon, but these authors also indicate that they cannot vouch for the validity of the name with respect to older taxa that would have nomenclatural priority.

COMMON NAMES:
Chinese: 安氏黄蝠. English: Andrew Rebori's House Bat. German: Andrews Hausfledermaus

GENERAL DISTRIBUTION:
Brooks and Bickham (2014: 8) indicate that the type series was collected in two localities in Kenya, and that there are at least five other Kenyan localities where this species occurs.

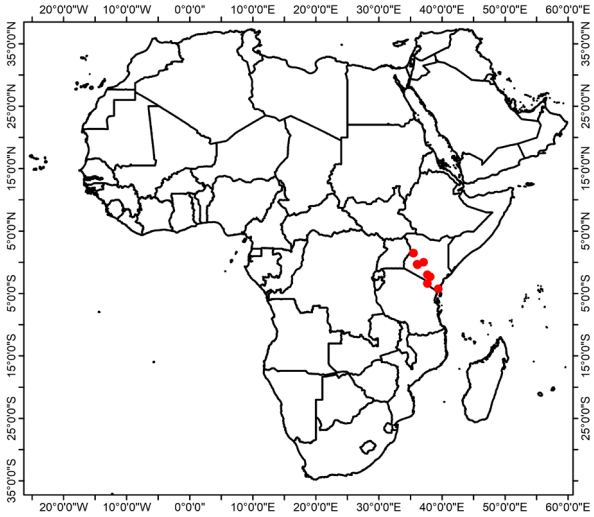

Figure 255. Distribution of *Scotophilus andrewreborii*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Kenya.

Scotophilus borbonicus (E. Geoffroy St.-Hilaire, 1803)

*1803. *Vespertilio borbonicus* E. Geoffroy Saint-Hilaire, Catalogue des Mammifères du Muséum national d'Histoire naturelle, Paris, 55. Type locality: Réunion: Ile Bourbon [=Réunion Island] [Goto Description]. Lectotype: RMNH MAM.28508: ad ♂, mounted skin (skull not removed). "Individu adulte monté, figuré dans la Mammalogie de Temminck, T.H. Pl. XLVII, fig. 6. Bourbon. Du voyage de M. Macé": see Goodman *et al.* (2005b: 871). - Etymology: Refering to "Ile Bourbon" where the type specimen was collected.
1855. *N[ycticejus] borbonicus:* Giebel, Die Säugethiere, 928. (Name Combination)
? *Scotophilus borbonicus:* (Name Combination, Current Combination)
? *Scotophilus cf. borbonicus:*

TAXONOMY:
Included equivocally in *leucogaster* by Hayman and Hill (1971: 50 - 51), but see Koopman (1975: 414 - 416). Hill (1980) considered African *viridis* and *damarensis*, and possibly *leucogaster* to be conspecific with *borbonicus*; but Robbins *et al.* (1985) rejected any affinity with African mainland species. Also see comment under *leucogaster* and genus. Koopman (1986) included *viridis*, *damarensis*, and *nigritellus* (but not *leucogaster*) in this species.

The authorship and date of this name was fixed to E. Geoffroy St.-Hilaire (1803) by Opinion 2005 (Case 3022) (see Anonymus, 2002b: 154).

COMMON NAMES:
Czech: mračník réunionský, netopýr zelený. English: Lesser Yellow Bat, Lesser Yellow House Bat, Madagascar Yellow House Bat, Bourbon Bat. French: Scotophile de Bourbon, Scotophile de Madagascar, Petite Chauve-souris jaune des maisons, chauve-souris des Hauts. German: Réunion-Hausfledermaus, Bourbonische Schwirrfledermaus. Portuguese: Morcego amarelo pequeno.

CONSERVATION STATUS:
Global - There have been exhaustive surveys of Réunion (e.g. Moutou, 1982) and this species has not been recorded for nearly 140 years. However, there is not enough information to determine its taxonomic status, as the holotype is badly damaged and other possible specimens cannot be reliably assigned to this species. If the taxonomic status of this species is confirmed, then the species may qualify for a higher threat category and may well be extinct (Andriafidison *et al.*, 2008j; IUCN, 2009).

Jones *et al.* (2009b: 507) assessed its status as Critically endangered - A1c. Conenna *et al.* (2017: Suppl.) assessed it as Data Deficient (DD).

Assessment History -
2008 - DD ver 3.1 (2001) (Andriafidison *et al.*, 2008j; IUCN, 2009). 2004 - CR A1c ver 2.3 (1994) (IUCN, 2004). 2002 - CR: A1c (Mickleburgh *et al.*, 2002a: 22);

MAJOR THREATS:
The threats to this species are not known (Andriafidison *et al.*, 2008j; IUCN, 2009).

CONSERVATION ACTIONS:
Andriafidison *et al.* (2008j) [in IUCN (2009)] report that there are no conservation measures in place.

GENERAL DISTRIBUTION:
This holotype was described from two specimens from La Réunion and one of these was designated as the lectotype but is now in very poor condition (Goodman *et al.*, 2005a). In Madagascar, it is known only from a single specimen collected in 1868, at Sarodrano, near Toliara in the south (Goodman *et al.*, 2005a). The identity of the Madagascar specimen cannot be confirmed due to absence of reliable material from La Réunion. The area near Sarodrano has been relatively well surveyed recently, but no new specimens were obtained (Goodman *et al.*, 2005a).

Records from Mauritius (Mascarene Islands) are erroneous, see Cheke and Dahl, 1981: 217, Moutou, 1982: 44).

Native: Madagascar (?); Réunion.

ECHOLOCATION:
During their field work on Réunion, Barataud and Giosa (2013) captured some echolocation calls of two unidentified bats, which were neither *Mormopterus francoismoutoui* nor *Taphozous mauritianus*. The signals for one of these ("Chiroptera sp1" - QFC = 60 kHz, FM = 61 kHz) were very similar to those of Madagascan and African continental *Scotophilus*, which lead them to hypothesize that "Chiroptera sp1" might possibly be *S. borbonicus*.

MOLECULAR BIOLOGY:
DNA - See Hoofer and Van Den Bussche (2003) for the results of a specimen from Kenya (which most probably represents a different species).

Karyotype, Protein / allozyme - Unknown.

HABITAT:
Maillard (1862: 158) indicated that this species usually lived in forests and also near the coast of Réunion.

POPULATION:
Structure and Density - This species was considered to be relatively common in the early 19th Century on La Réunion; however, it was not recorded in the 20th century or 21st century (Cheke and Dahl, 1981).
Trend - 2008 - Unknown (Andriafidison *et al.*, 2008j; IUCN, 2009).

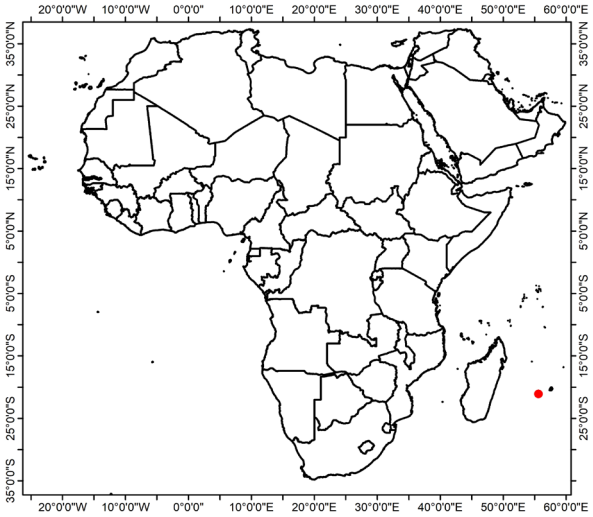

Figure 256. Distribution of *Scotophilus borbonicus*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Réunion.

Scotophilus dinganii (A. Smith, 1833)

1832. *Vespertilio epichrysus* Temminck, in: Smuts, Enumer. Mamm. Capensium, 106. Type locality: South Africa: Cape Town [33 56 S 18 28 E]. - Comments: Allen (1939a) and Ellerman *et al.* (1953) regard this taxon as unidentifiable, besides which it appears to fall outside the known range of the species as a whole (see Roberts, 1951: 90); Meester *et al.*, 1986: 60), who include it with a question mark). However, if valid, this is the senior name for the species. Dobson (1878: 303) mentions *Vespertilio epichrysus* (Temminck, Monogr. Mamm., 2: 208) with a question mark in the synonymy of *Vespertilio* [=*Myotis*] *emarginatus*.

*1833. *Vespertilio Dinganii* A. Smith, S. Afr. Quart. J., ser. 2, 1 (2): 59. Publication date: November 1833. Type locality: South Africa: Port Natal [=Durban] & Delagoa Bay [=Maputo], btwn [Goto Description]. - Etymology: In honour of Dingane (or Dingan / Dingaan), king of the Zulus (1795 - 1840) (see Lanza *et al.*, 2015: 487).

1852. *Nycticejus planirostris* Peters, Naturwissenschaftliche Reise nach Mossambique, Zoologie, Säugethiere, 65, pl; 17, fig. 1, a-e. Publication date: 1852. Type locality: Mozambique: Lower Zambesi River: Tete [16 10 S 33 35 E, 230 m] [Goto Description]. Holotype: ZMB 527: ad ♂, skin and skull. Collected by: Prof. Wilhelm Carl Hartwig Peters; collection date: March 1845. See Turni and Kock (2008) [=An 16363].

1855. *N[ycticejus] Dingani:* Giebel, Die Säugethiere, 927. (Name Combination)
1904. *Scotophilus nigrita colias* Thomas, Ann. Mag. nat. Hist., ser. 7, 13 (75): 207. Publication date: 1 March 1904. Type locality: Kenya: Fort Hall [=Muranga] [00 43 S 37 09 E] [Goto Description]. Holotype: BMNH 1902.7.6.11: ad ♂. Collected by: Mrs. Hildegarde Hinde; collection date: 25 January 1902; original number: 107. Presented/Donated by: Mrs. Hildegarde Hinde.
1906. *Scotophilus nigrita herero* Thomas, Ann. Mag. nat. Hist., ser. 7, 17 (98): 174. Publication date: 1 February 1906. Type locality: Namibia: Ovamboland: Olifants Vlei [18 00 S 17 30 E] [Goto Description]. Holotype: BMNH 1907.1.1.449: ad ♀, skin and skull. Collected by: Mr. C.J. Andersson; collection date: 8 August 1859; original number: 260. Formerly in Tomes collection. - Comments: Ellerman *et al.* (1953) point out that the type locality is not in Damaraland, as claimed by Thomas for both *herero* and *damarensis*: see Meester *et al.* (1986: 60).
1921. *Scotophilus nigrita dingani:* Kershaw, Durban Mus. Novit., 3 (1): 29. (Name Combination, Alternate Spelling)
1946. *Scotophilus nigrita pondoensis* Roberts, Ann. Transv. Mus., 20 (4): 304. Type locality: South Africa: Transkei, Western Pondoland: Port St.Johns [31 27 S 29 33 E] [Goto Description].
1951. *Vespertilio epichrysurus:* Roberts, Mammals of South Africa, 90. (Lapsus)
1953. *Scotophilus nigrita dingaanii:* Lawrence and Loveridge, Bull. Mus. comp. Zool., 110 (1): 6. (Lapsus)
1958. *Scotophilus nigrita coreas:* Eisentraut, Veröff. Überseemus. Bremen, (A) 3: 23. - Comments: Lapsus for colias (see Kock, 1969a: 193). (Lapsus)
2001. *scotophilus nigrata:* Lameed, Biodiversity, 8 (4): 8. - Comments: We can not exclude that this might be a synonym for *S. nigrita*. (Lapsus)

TAXONOMY:
Placed in *leucogaster* by Koopman (1975: 414 - 416, as *nigrita*; 2004ah: 11) and Koopman *et al.* (1978: 4 - 5); but see also Schlitter *et al.* (1980).

See also the discussion under the genus and under *nigrita* and *leucogaster*.

In their study on Arabian *Scotophilus*, Vallo *et al.* (2011c: 359) tentatively suggest to use the name *S. colias* for the East African yellow-bellied house bat as these bats clearly differ from the typical *S. dinganii* from southern Africa.

Trujillo *et al.* (2009: 554) found several divergent cytochrome *b* lineages in *S. dinganii*, suggesting that cryptic species might be present in different geographic areas southern Africa, eastern Africa, Ghana to Kakamega Forest (Kenya).

COMMON NAMES:
Afrikaans: Geel Dakvlermuis. English: Yellow House Bat, Dingan's Bat, Dingaan's House Bat, Yellow-bellied House Bat, Dingaan's Yellow Bat, African Yellow Bat, African Yellow House Bat. French: Scotophile africain, Chauve-souris jaune des maisons, Scotophile à ventre jaune. German: Gelbbäuchige Hausfledermaus, Natalischen Schwirrfledermaus, Flachschnauzigen Schwirrfledermaus. Italian: Scotòfilo di Dìngan. Portuguese: Morcego caseiro amarelo.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
This species has been recovered from the upper Pleistocene in South Africa, at Border Cave (Avery, 1991: 6), and Wonderwerk (Avery and Avery, 2011: 19).

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Griffin, 2008a; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Griffin, 2008a; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Griffin, 2004b;

IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - LC ver 3.1 (2001) (Monadjem *et al.*, 2016s). 2004 - LC ver 3.1 (2001) (Friedmann and Daly, 2004).

MAJOR THREATS:
There appear to be no major threats to this species as a whole (Griffin, 2008a; IUCN, 2009).

CONSERVATION ACTIONS:
Griffin (2008a) [in IUCN (2009)] report that in view of the species wide range it is believed to be present in many protected areas. No direct conservation measures are currently needed for this species as a whole.

GENERAL DISTRIBUTION:
Scotophilus dinganii is widely distributed in sub-Saharan Africa. It ranges from Senegal and the Gambia in the west, through West Africa and parts of Central Africa, to Sudan, Eritrea, Djibouti and Ethiopia in the east, from here it ranges south through much of East Africa and southern Africa, being recorded as far south as eastern South Africa, Lesotho and Swaziland. For South Africa, Babiker Salata (2012: 49) found that its distribution is stongly associated with the mean temperature of the coldest quarter.

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 1,251,825 km^2.

Native: Angola (Crawford-Cabral, 1989; Cotterill, 2004a: 262; Monadjem *et al.*, 2010d: 573; Taylor *et al.*, 2018b: 63); Benin (Capo-Chichi *et al.*, 2004: 163); Botswana (Archer, 1977; Monadjem *et al.*, 2010d: 573); Burkina Faso (Kangoyé *et al.*, 2012: 6026; 2015a: 626); Burundi; Cameroon; Central African Republic; Congo (Bates *et al.*, 2013: 337); Congo (The Democratic Republic of the) (Hayman *et al.*, 1966; Dowsett *et al.*, 1991: 259; Van Cakenberghe *et al.*, 1999; Monadjem *et al.*, 2010d: 573); Côte d'Ivoire; Djibouti (Pearch *et al.*, 2001: 398); Eritrea; Ethiopia (Lavrenchenko *et al.*, 2004b: 131); Gambia; Ghana; Guinea; Guinea-Bissau (Veiga-Ferreira, 1949; Lopes and Crawford-Cabral, 1992; Rainho and Ranco, 2001: 71); Kenya; Lesotho; Liberia; Malawi (Ansell and Dowsett, 1988: 38; Happold *et al.*, 1988; Monadjem *et al.*, 2010d: 573); Mali; Mozambique (Smithers and Lobão Tello, 1976; Monadjem *et al.*, 2010d: 573; Monadjem *et al.*, 2010c: 384); Namibia (Monadjem *et al.*, 2010d: 573); Nigeria; Rwanda; Senegal; Sierra Leone; Somalia; South Africa (De Graaf, 1960; Monadjem *et al.*, 2010d: 573); Sudan; Swaziland (Monadjem *et al.*, 2010d: 574); Tanzania (Stanley and Goodman, 2011: 45); Togo; Uganda; Yemen (Benda *et al.*, 2011b: 42); Zambia (Ansell, 1978; Monadjem *et al.*, 2010d: 574); Zimbabwe (Monadjem *et al.*, 2010d: 574).

DETAILED MORPHOLOGY:
Baculum - Hill and Harrison (1987) and Kearney *et al.* (2002).

ECHOLOCATION:
See Taylor (1999b) and Taylor *et al.* (2005).

Jacobs *et al.* (2007a) recorded the peak echolocation frequency (33.4 ± 1.4 kHz) for individuals from St. Lucia, KwaZulu Natal, South Africa. Schoeman and Waddington (2011: 291) mention a peak frequency of 33.9 ± 1.1 kHz and a duration of 4.1 ± 0.7 msec for specimens from Durban, South Africa.

Taylor *et al.* (2013b: 17) recorded the following parameters for 7 calls from Soutpansberg, South Africa: F_{max}: 51.6 ± 8.19 (42.1 - 65.2) kHz, F_{min}: 33.1 ± 0.79 (31.6 - 34.1) kHz, F_{knee}: 36.4 ± 1.10 (34.4 - 37.4) kHz, F_{char}: 33.8 ± 1.03 (31.9 - 35.3) kHz, duration: 3.4 ± 0.66 (2.7 - 4.6) msec.
Linden *et al.* (2014: 40) reported the following parameters from the Soutpansberg range (RSA): F_{min}: 32 - 34 kHz, F_{char}: 32 - 35 kHz, F_{knee}: 34 - 37 kHz, Slope: 287 - 588 OPS, duration: 3 - 5 msec.

At Farm Welgevonden, South Africa, Taylor *et al.* (2013a: 556) report a F_{knee} value of 36 (34 - 37) kHz.

From Maroua, Cameroon, Manga Mongombe (2012: 79) and Bakwo Fils *et al.* (2018: 4) reported for 19 calls a call type of FM/QCF and the following parameters: F_{max}: 58.5 ± 8.9 (49.4 - 84.8) kHz, F_{min}: 52.6 ± 6.2 (46.7 - 69.5) kHz, F_{mean}: 55.6 ± 7.5 (48.1 - 77.0) kHz, F_{knee}: 58.5 ± 8.9 (49.4 - 84.0) kHZ, F_{char}: 52.7 ± 6.2 (46.8 - 69.5) kHz, and duration: 0.88 ± 0.92 (0.73 - 1.02) msec.

Eisenring *et al.* (2016: SI 2) report on two calls from *S. nigrita* from the Aberdares Range in Kenya with the following characteristics: PF: 36.8 ± 3.3 (34.5 - 39.2), HF: 57.3 ± 12.4 (48.5 - 66.1), LF: 29.8 ± 0.4 (29.5 - 30.1), DT: 0.1 ± 0.0 (0.1 - 0.1) DF: 27.5 ± 12.9 (18.4 - 36.6), IPI: 1.1 ± 0.4 (0.9 - 1.4). As they compare their values with those presented by Fenton (1975), Fenton and Bell (1981) and O'Shea and Vaughan (1980), these values are probably also for *S. dinganii*.

From Swaziland, the following parameters were reported by Monadjem *et al.* (2017c: 179): F_{min}: 33.2 ± 1.26 (30.3 - 34.7) kHz, F_{knee}: 36.4 ± 1.61 (32.1 - 38.6) kHz, F_c: 33.7 ± 1.44 (30.3 - 35.6) kHz,

and duration: 3.8 ± 0.94 (2.6 - 6.1) msec. The calls were detectable up to a distance of 20 m.

Adams and Kwiecinski (2018: 4) recorded the following characteristics for four calls of bats from the Kalahari Desert: F_{char}: 33.9 ± 2.4 kHz, F_{max}: 40.9 ± 2.1 kHz, F_{min}: 33.4 ± 2.0 kHz, duration: 3.3 ± 0.9 msec.

MOLECULAR BIOLOGY:
DNA - See Hoofer and Van Den Bussche (2003) for the results of a specimen from Tanzania.
Karyotype - Peterson and Nagorsen (1975), Schlitter *et al.* (1980) and Ruedas *et al.* (1990) all reported 2*n* = 36. However, while Schlitter *et al.* (1980) reported FN = 52, BA = 18, an acrocentric X chromosome, and a metacentric Y chromosome, Ruedas *et al.* (1990) reported FN = 50, BA = 16, a submetacentric X chromosome, and a telocentric Y chromosome. Eick *et al.* (2007) reported the following autosomal pairs: seven meta- to submetacentric, nine acrocentric, and one subtelocentric. One homologue of the smallest acrocentric pairs showed a small heterochromatic short arm in one specimen, resulting in a subtelocentric state (Eick *et al.*, 2007). The diploid chromosome number (2*n*) is 36, the fundamental number of autosomal arms (Fna) is 50 (Eick *et al.*, 2007). The X chromosome is a medium-sized metacentric and the Y chromosome a small, probably acrocentric, partly heterochromatic chromosome (Eick *et al.*, 2007).
Protein / allozyme - Unknown.

HABITAT:
In southern Africa, this species is found in Savanna habitatas(80 %; Cooper-Bohannon *et al.*, 2016: Table S2).

HABITS:
Scotophilus dinganii is gregarious, roosting in small groups of up to 12 individuals (Skinner and Smithers, 1990).
Thermoregulation - See Jacobs *et al.*, 2007b).

ROOST:
Type - Buildings (Skinner and Smithers, 1990). In KwaZulu Natal, South Africa, Jacobs *et al.* (2007b), found *S. dinganii* roosted in the roofs of buildings in the crevices between the roof (either made of asbestos, clay tiles, or corrugated metal sheets) and the brickwork of the walls. Jacobs *et al.* (2007b) did not find any relationship between aspect and roost selection, or any relationship that the bats preferred roosts which received the direct rays of the afternoon sun. Monadjem *et al.* (2010b: 74) found that they roosted in *Combretum imberbe* trees.
Microclimate - Jacobs *et al.* (2007b) found that the temperature of building roosts appeared to track ambient temperature with a slight lag.

DIET:
On the Umbilo River (KwaZulu Natal, RSA), Naidoo *et al.* (2011: 26) found the diet to contain the following volume percentages during summer: Lepidoptera (17.5 ± 15.9), Coleoptera (81.9 ± 16.6), and Diptera (0.6 ± 1.3). And during winter: Lepidoptera (24.9 ± 12.9), Coleoptera (66.4 ± 21.7), and Diptera (8.9 ± 8.7).

Taylor *et al.* (2017b: 245, 252 - 254) reported the following 23 food items in the Limpopo province (RSA): five insect orders: Lepidoptera (*Toxocampinae tathorhynchus* + *Achrosis* sp. + *Isturgia roraria* + *Sena* sp. + *Sena prompta* + *Cortyta canescens* + *Pandesma robusta* + *Pericyma atrifusa* + *Argyrogrammatini*sp. + *Spodoptera exigua* + *Maurilia arcuata* + unmatched), Orthoptera (Tettigoninae + unmatched), Hemiptera (*Nezera viridula* + *Macrorhaphis acuta* + unmatched), Coleoptera (unmatched) and Blattodea (unmatched).

Weier *et al.* (2019b: 6) investigated droppings from this species in the Levubu region (Limpopo, RSA) and found DNA sequences of: Lepidoptera: *Cryptophlebia peltastica* (Meyrick, 1921) and *Thaumatotibia batrachopa* (Meyrick, 1908); Hemiptera: *Bathycoelia distincta* Distant, 1878 and *Nezara viridula* (Linnaeus, 1758).

PREDATORS:
Mikula *et al.* (2016: Supplemental data) mention the Bat hawk (*Macheiramphus alcinus* Bonaparte, 1850) and the African harrier-hawk (*Polyboroides typus* Smith, 1829) as diurnal avian predators.

POPULATION:
Strucuture and Density - Little information is available on the population abundance or size of this species (Griffin, 2008a; IUCN, 2009).
Trend - 2008 - Unknown (Griffin, 2008a; IUCN, 2009).

ACTIVITY AND BEHAVIOUR:
Jacobs *et al.* (2007b) found that bats roost exit times were variable, but most left their roost for the first time on a particular day between 17h15 and 18h00 and returned between 18h45 and 19h15 (remaining out of the roost on avarage for about 1hr).

REPRODUCTION AND ONTOGENY:
van der Merwe *et al.* (2006) reported, from examination of serially sectioned reproductive tracts of females, that *S. dinganii* is monoestrous species and that insemination, ovulation and

fertilization take place during mid to late autumn (April to May), Kruger-NP., South Africa. Early embryonic development of normally two embryos (one in each uterine horn) was retarded and implantation delayed until mid-winter (July), when the blastocysts implanted (van der Merwe *et al.*, 2006). van der Merwe (2006) found *S. dinganii* in the Kruger-N.P., South Africa to be seasonally monestrus, carrying a single foetus in each of the two uterine horns of the bicornute uterus. The amnion in *S. dinganii* was a schizamnion, and van der Merwe (2006) deduced that its formation was preceded by cavitation of the inner cell mass, with formation of the definitive amniotic cavity, where the floor of the cavity eventually formed the embryonic disc and its roof the ectodermal part of the true or definitive amnion.

van der Merwe and Rautenbach (1990: 540) reported that *S. dinganii* commonly gives birth to twins and occasionally even triplets.

Monadjem *et al.* (2010d) [in Weier *et al.* (2018: Suppl.)] mentioned births taking place between November and December.

Two pregnant females were reported from Sierra Leone on 7 April and 29 May by Weber *et al.* (2019: 27).

PARASITES:

BACTERIA

Dietrich *et al.* (2016b: 3) found one out of 12 bats from Rocktail Bay (RSA) to be positive for *Rickettsia*. Also from the RSA, Dietrich *et al.* (2018a: 4) reported the presence of *Leptospira borgpetersenii*.

Protozoa

Kassahun *et al.* (2015: 168) examined Ethiopian 12 *S. colias* specimens and found one (out of 11 from Metu) infected with *Leishmania* parasites.

HEMIPTERA

Cimicidae: *Cacodmus sparsilis* Rothschild, 1914 was described from one female specimen taken from a *S. dinganii* at Durban, South Africa (Haeselbarth *et al.*, 1966: 10, referred to as *Scotophilus nigrita*). *Stricticimex transverses* Ferris and Usinger, 1957 recorded from Windhoek, Namibia (Haeselbarth *et al.*, 1966: 14).

DIPTERA

Nycteribiidae: *Basilia bouvieri* (Falcoz, 1924) from Tanzania, Sudan, Senegal and Sierra Leone (Haeselbarth *et al.*, 1966: 111), referred to as *Scotophilus nigrita*).

Scotophilus ejetai Brooks and Bickham, 2014

SIPHONAPTERA

Ischnopsyllidae: (*Chiropteropsylla brockmani* Rothschild, 1915 was reported on *Scotophilus dinganii flavigaster* from Eritrea by Beaucournu and Kock (1996).

ACARI

Trombiculidae: Stekolnikov (2018a: 134) reported the presence of *Ericotrombidium scotophilum* (Vercammen-Grandjean and Langston, 1976) from "*Scotophilus nigrita*" from Pietermaritzburg, RSA.

VIRUSES:

Coronaviridae - Coronaviruses

SARS-CoV - Müller *et al.* (2007b) tested between 1986 to 1999, for antibody to SARS-CoV in sera in five individuals from Limpopo Province, South Africa, none were tested positive (0/5). One out of 14 (7.1 %) Kenyan bats tested by Tao *et al.* (2017: Suppl.) was positive for CoV.

Flaviviridae

Pegivirus (BPgV) - 1 of 2 Kenyan specimens examined by Quan *et al.* (2013: Table S5) (50.0 %) was infected by clade G type *Pegivirus*.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:

"Africa", Angola, Benin, Botswana, Burkina Faso, Burundi, Cameroon, Central African Republic, Congo, Congo (Democratic Republic of the), Côte d'Ivoire, Eritrea, Ethiopia, Ghana, Kenya, Malawi, Mali, Mozambique, Namibia, Nigeria, Rwanda, Senegal, Sierra Leone, Somalia, South Africa, South Sudan, Sudan, Swaziland, Tanzania, The Gambia, Togo, Uganda, Zambia, Zimbabwe.

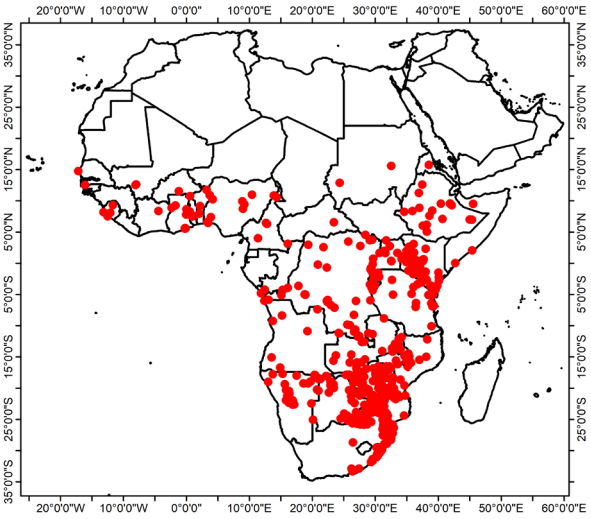

Figure 257. Distribution of *Scotophilus dinganii*

*2014. *Scotophilus ejetai* Brooks and Bickham, Occ. Pap. Mus. Texas Tech Univ., 326: 1, 14, fig. 5. Publication date: 26 Jun 2014. Type locality: Ethiopia: Orimaya region: Dogy River Bridge [08 21 43 N 35 53 02 E, 1390 m] [Goto Description]. Holotype: BRTC 57950: ad ♂, skin and skull. Collected by: Dr. Duane Albert Schlitter; collection date: 23 February 2001; original number: 10310. Presented/Donated by: ?: Collector Unknown. Muscle tissue sample AK 21235. Paratype: BRTC 57954: ad ♀, skin and skull. Collected by: Dr. Duane Albert Schlitter; collection date: 21 February 2001; original number: 10292. Presented/Donated by: ?: Collector Unknown. Tissue sample AK 21213. Paratype: CM 114043: ad ♀, skin and skull. Collected by: Dr. Duane Albert Schlitter; collection date: 2 April 1995; original number: 9986. Presented/Donated by: ?: Collector Unknown. Tissue sample SP 13027. - Etymology: In honour of Dr. Gebisa Ejeta, distinguished professor of plant breeding & genetics and international agriculture at Purdue University (see Brooks and Bickham, 2014: 14).

TAXONOMY:
Brooks and Bickham (2014) described four new species in the genus *Scotophilus*. However, they did not compare them with a number of already described taxa such as *colias* Thomas, 1904 or *flavigaster* Heuglin, 1861, which make the validity of (some of) these names doubtfull.

COMMON NAMES:
English: Ejeta's House Bat. German: Äthiopische Hausfledermaus.

GENERAL DISTRIBUTION:
Known from three localities in Ethiopia.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Ethiopia, Kenya.

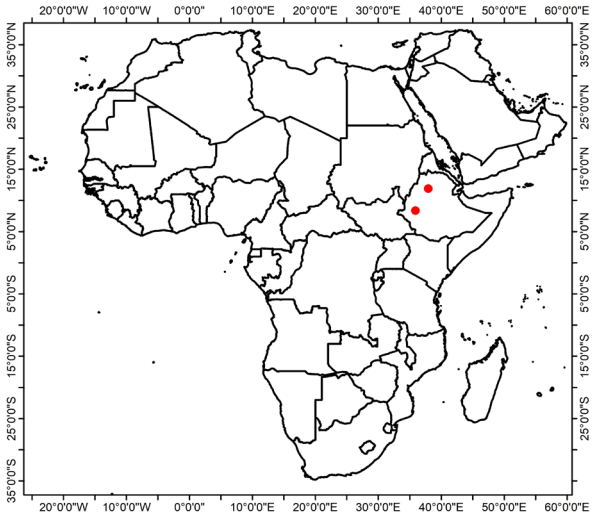

Figure 258. Distribution of *Scotophilus ejetai*

Scotophilus leucogaster (Cretzschmar, 1826)

*1826. *Nycticejus leucogaster* Cretzschmar, in: Rüppell, Atlas Reise Nördlichen Afrika, Zoologie Säugethiere, 1: 71, pl. 28a, 1, 2. Publication date: 1826. Type locality: Sudan: Kordofan province: Brunnen Nedger [=Nedger Wel; Bir Nedger]: [Goto Description]. Holotype: RMNH MAM.27432: ad. Mertens (1925: 22) mentions SMF 4309 (old catalog II.O.1.b, coll. E. Rüppell, 1825) as lectotype). Lectotype: SMF 4309: Collected by: Wilhem Peter Edward Simon Rüppell. Mertens (1925: 22) old catalog II.O.1.b. - Comments: The publication date of Cretzschmar's work is sometimes indicated as "1826" (as mentioned on the title page), but also as "1827", "1828", "1830-1831". - Etymology: From the masculine Greek adjective "*λευκος*" (leukós), meaning "white" and the feminine Greek substantive "*γαστήρ*" (gastér), meaning "stomach", referring to the relatively light belly colour of the type specimen (see Lanza *et al.*, 2015: 487).

1861. *Nycticejus flavigaster* Heuglin, Nov. Act. Acad. Cæs. Leop.-Carol., 29 (8): 5, 14. Publication date: 1861. Type locality: Eritrea: Kérén [ca. 15 45 N 38 20 E] [Goto Description]. Syntype: SMNS 983: ad ♂, skull and alcoholic. Collected by: Martin Theodor von Heuglin; collection date: 1861. Presented/Donated by: ?: Collector Unknown. See Dieterlen *et al.* (2013: 294). Syntype: SMNS 983a: ad ♀, skull and alcoholic. Collected by: Martin Theodor von Heuglin; collection date: 1861. Presented/Donated by: ?: Collector Unknown. See Dieterlen *et al.* (2013: 294).

1861. *Nycticejus murino-flavus* Heuglin, Nov. Act. Acad. Cæs. Leop.-Carol., 29 (8): 5, 15. Publication date: 1861. Type locality: Ethiopia: near Massaua [=Massawa]: M'kullu [15 38 N 39 24 E] [Goto Description]. Holotype: [Unknown] ad ♂.

1878. *Scotophilus borbonicus:* Dobson, Catalogue of the Chiroptera of the collection of the British Museum, 260. - Comments: .

1906. *Scotophilus damarensis* Thomas, Ann. Mag. nat. Hist., ser. 7, 17 (98): 175. Publication date: 1 February 1906. Type locality: Namibia: Ovamboland: Olifants Vlei [18 00 S 17 30 E] [Goto Description]. Holotype: BMNH 1907.1.1.463: ad ♂, skin and skull. Collected by: Mr. C.J. Andersson; collection date: 10 August 1859; original number: 276. Received in the Tomes collection. - Comments: Included in *borbonicus* by Meester *et al.* (1986: 61), in *viridis* by Koopman (1993a: 228), but in *leucogaster* by Simmons (2005).
1938. *[Pachyotus] altilis:* Frechkop, Exploration du Parc National Albert, 53.
? *Scotophilus borbonicus damarensis:* (Name Combination)
? *Scotophilus cf. leucogaster:*
? *Scotophilus leucogaster damarensis:* (Name Combination)
? *Scotophilus leucogaster leucogaster:* (Name Combination)
? *Scotophilus leucogaster:* (Name Combination, Current Combination)
? *Scotophilus nigrita leucogaster:* (Name Combination)
? *Scotophilus viridis damarensis:*

TAXONOMY:
Does not include *damarensis*, see Koopman (1986); but see Robbins *et al.* (1985). Herkt *et al.* (2017: Appendix S9) found that *damarenis* occupies a noticeably different ecological niche as compared with the northern populations of *leucogaster*.

Included *nucella*; but see Robbins *et al.* (1985).

For scope of this species see Koopman (1975: 414 - 416); as *nigrita*) and Koopman *et al.* (1978: 4 - 5). However Robbins (1978a: 212 - 213) has shown that the name *nigrita* was misapplied to another species, for which the next available name was *dinganii*, and which would be included in *leucogaster* if Koopman (1975)'s reasoning were followed. However Schlitter *et al.* (1980) listed *dinganii* as distinct from *leucogaster*, as did Robbins *et al.* (1985). See Koopman (1986).

COMMON NAMES:
Chinese: 白腹黃蝠. Czech: mračník bělobřichý, netopýr bělobřichý. English: Lesser Yellow House Bat, White-bellied House Bat, White-bellied Yellow Bat, Cretzschmar's Brown Bat. French: Scotophile à ventre blanc. German: Weißbäuchige Hausfledermaus, Weissbauchige Schwirrfledermaus, Gelbbauchige Schwirrfledermaus, Olivenbraune Schwirrfledermaus. Italian: Scotòfilo panciabianca.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Griffin, 2008b; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Griffin, 2008b; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Griffin, 2004a; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - LC ver 3.1 (2001) (Taylor *et al.*, 2016e).

MAJOR THREATS:
There appear to be no major threats to this species as a whole (Griffin, 2008b; IUCN, 2009).

CONSERVATION ACTIONS:
Griffin (2008b) [in IUCN (2009)] reports that in view of the species wide range it is presumably present in many protected areas. No direct conservation measures are currently needed for this species as a whole.

GENERAL DISTRIBUTION:
Scotophilus leucogaster has been recorded in much of West Africa (including northern parts of Cameroon, Nigeria, Benin, Togo, Ghana, Côte d'Ivoire, Sierra Leone, and Guinea, much of Senegal, Gambia, and Burkina Faso, and southern parts of Mali and Niger). There are isolated records from southwestern Mauritania, as well as western parts of the Central African Republic. The eastern parts of the distribution include records from Sudan, and the northern parts of Uganda and Kenya. Further south this species is found in Mozambique, Angola and Namibia, Zambia, northern Botswana, and northern South Africa.

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 426,596 km^2.

Native: Angola (Crawford-Cabral, 1989; Monadjem *et al.*, 2010d: 575; Taylor *et al.*, 2018b: 60); Benin (Capo-Chichi *et al.*, 2004: 163); Botswana (Archer, 1977; Monadjem *et al.*, 2010d: 575); Burkina Faso (Kangoyé *et al.*, 2015a: 626); Cameroon; Central African Republic; Chad; Côte d'Ivoire; Ethiopia; Gambia; Ghana; Guinea;

Guinea-Bissau (Vaughan *et al.*, 1997b; Robbins *et al.*, 1985; Lopes and Crawford-Cabral, 1992; Rainho and Ranco, 2001: 70); Kenya; Mali (Meinig, 2000: 105); Mauritania; Mozambique (Monadjem *et al.*, 2010d: 575; Monadjem *et al.*, 2010c: 385); Namibia (Monadjem *et al.*, 2010d: 575); Niger; Nigeria; Senegal; Saudi Arabia; Sierra Leone; South Africa (Monadjem *et al.*, 2010d: 575); Sudan; Togo; Uganda (Kityo and Kerbis, 1996: 62); Yemen; Zambia (Monadjem *et al.*, 2010d: 575); Zimbabwe (Monadjem *et al.*, 2010d: 575).

DETAILED MORPHOLOGY:
Baculum - Unknown
Brain - Amrein *et al.* (2007), from specimens collected from Bénin, reported that proliferating cells, detected with Ki-67 and MCM2, in the subgranular layer of the dentate gyrus was found to be absent. Amrein *et al.* (2007) also reported moderate to ample proliferating cells (Ki-67 positive cells) and migrating young neurons (DCX positive cells) in the rostral migratory stream. Amrein *et al.* (2007) furthermore detected few DCX positive cells in the rostral migratory stream and the olfactory bulb. Hippocampal granule cells were homogeneously positive for NeuroD (Bigalke, 1968).

SEXUAL DIMORPHISM:
In Burkina Faso, Kangoyé *et al.* (2015a: 626) found the averages of the body measurements (except 3ph2) to be larger in females than in males, but the averages of the cranial measurements were larger in males.

ECHOLOCATION:
12 FM/QCF type calls from Maroua (Cameroon) were reported by Manga Mongombe (2012: 79) and Bakwo Fils *et al.* (2018: 4) with the following parameters: F_{max}: 55.7 ± 4.3 (48.5 - 64.1) kHz, F_{min}: 50.6 ± 3.0 (46.1 - 56.3) kHz, F_{mean}: 53.2 ± 3.6 (47.3 - 59.3) kHz, F_{knee}: 55.7 ± 4.3 (48.5 - 64.1) kHz, F_{char}: 50.7 ± 3.0 (46.1 - 55.0) kHZ, and duration: 0.81 ± 0.23 (0.44 - 1.00) msec.

Thiagavel *et al.* (2017: Suppl.) mention a F_{peak} of 46.27 kHz.

MOLECULAR BIOLOGY:
DNA - See Hoofer and Van Den Bussche (2003) for the results of a specimen from Kenya.
Karyotype - See discussion in generic account.
Protein / allozyme - Unknown.

HABITAT:
In southern Africa, it occurs in Savanna (89 %) and SW arid (10 %) habitats (Cooper-Bohannon *et al.*, 2016: Table S2).

POPULATION:
Structure and Density - Little information is available on the population abundance or size of this species (Griffin, 2008b; IUCN, 2009).
Trend - 2008 - Unknown (Griffin, 2008b; IUCN, 2009).

PARASITES:
ACARI
Dermanyssidae: Zumpt and Till (1954: 50) reported the presence of *Steatonyssus nyassae* (Hirst, 1922) on a "*Scolophilus murinoflavus*" from near Torit, South Sudan.
Trombiculidae: Stekolnikov (2018a: 114) reported *Schoutedenichia (Schoutedenichia) trombiculoides* Vercammen-Grandjean, 1958 and *Microtrombicula scotophili* Vercammen-Grandjean, 1965 from *S. leucogaster leucogaster* from South Sudan.

VIRUSES:
Coronaviridae - Coronaviruses
SARS-CoV - In Nigeria during June 2008, Quan *et al.* (2010) screened the gastrointestinal tissue for the presence of coronaviruses by PCRs, none tested positive.

Rhabdoviridae
Lyssavirus - Rabies related viruses
In Nigeria during June 2008, Quan *et al.* (2010) did not detect any lyssavirus-specific antigens from the brains by use of direct fluroescent anitbody testing.

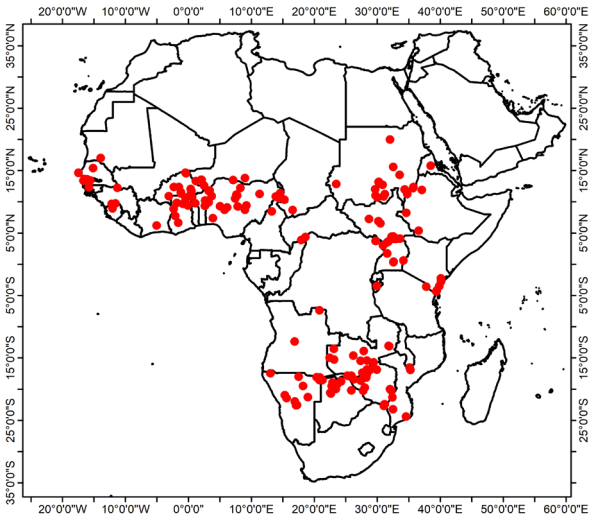

Figure 259. Distribution of *Scotophilus leucogaster*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Angola, Benin, Botswana, Burkina Faso, Burundi, Cameroon, Central African Republic, Chad, Congo (Democratic Republic of the), Côte d'Ivoire, Eritrea, Ethiopia, Ghana, Guinea-Bissau, Kenya, Malawi, Mali, Mauritania, Mozambique, Namibia, Niger, Nigeria, Senegal, Sierra Leone,

South Africa, South Sudan, Sudan, Tanzania, The Gambia, Togo, Uganda, Zambia, Zimbabwe.

Scotophilus livingstonii Brooks and Bickham, 2014

*2014. *Scotophilus livingstonii* Brooks and Bickham, Occ. Pap. Mus. Texas Tech Univ., 326: 1, 11, fig. 4. Publication date: 26 June 2014. Type locality: Kenya: Western province: Kakamega district: Ikuywa River Bridge, 6.5 km S, 19 km E Kakamega [00 13 N 34 55 E] [Goto Description]. Holotype: CM 98051: ad ♂, skin and skull. Collected by: Dr. Duane Albert Schlitter; collection date: 8 November 1985; original number: 7394. Presented/Donated by: ?: Collector Unknown. Muscle tissue sample TK 33534. Paratype: CM 98053: ad ♀, skin and skull. Collected by: Dr. Duane Albert Schlitter; collection date: 8 November 1985; original number: 7396. Presented/Donated by: ?: Collector Unknown. Muscle tissue sample TK 33536. Paratype: USNM 412150: ad ♀, skin and skull. Collected by: Bruce Joliffe Hayward; collection date: 22 July 1967; original number: 4135. Presented/Donated by: ?: Collector Unknown. Collected at University of Ghana Botanical Garden (5º40'N, 10º12'W [sic]), Legon, Eastern (Greater Accra) Region, Ghana (Brooks and Bickham, 2014: 13). - Etymology: In honour of David Livingstone (1813 - 1873) (see Brooks and Bickham (2014: 13).

TAXONOMY:
Brooks and Bickham (2014) described four new species in the genus *Scotophilus*. However, they did not compare them with a number of already described taxa such as *colias* Thomas, 1904 or *flavigaster* Heuglin, 1861, which make the validity of (some of) these names doubtfull.

The analyses performed by Demos *et al.* (2018: 2) confirmed the validity of the taxon, but these authors also indicate that they cannot vouch for the validity of the name with respect to older taxa that would have nomenclatural priority.

COMMON NAMES:
Chinese: 利文斯顿黄蝠. English: Livingstone's House Bat. German: Livingstone-Hausfledermaus.

GENERAL DISTRIBUTION:
This species is known from SW Kenya and SE Ghana, with a gap of about 4,000 km between them.

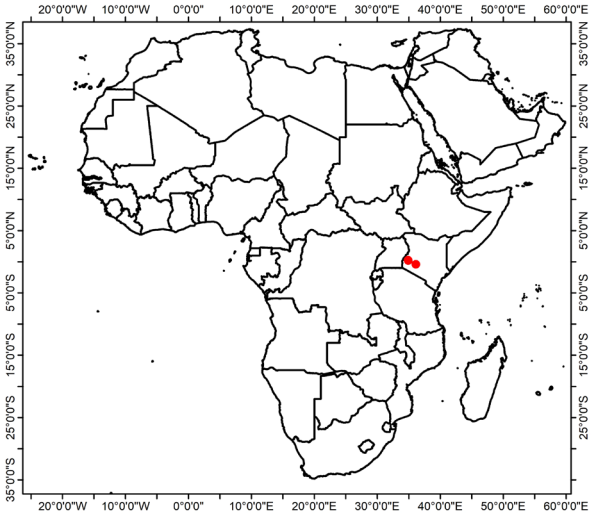

Figure 260. Distribution of *Scotophilus livingstonii*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Ghana, Kenya.

Scotophilus marovaza Goodman, Ratrimomanarivo and Randrianandrianina, 2006

2005. *Scotophilus nov. sp.:* Ratrimamanarivo and Goodman, ABCN, 6: 4.
*2006. *Scotophilus marovaza* Goodman, Ratrimomanarivo and Randrianandrianina, Acta Chiropt., 8 (1): 23, figs 2 - 5. Type locality: Madagascar: Mahajanga province: Marovaza [14 56 S 47 16 E, 5 m] [Goto Description]. Holotype: FMNH 184050: ad ♂, skull and alcoholic. Collected by: Steven M. Goodman and Fania H. Ratrimomanarivo; collection date: 11 December 2004. Paratype: FMNH 184051: Collected by: Steven M. Goodman and Fania H. Ratrimomanarivo; collection date: 21 - 22 April 2005. locality: Madagascar: Province de Mahajanga - Marovaza [14 56 S 47 16 E, 5 m asl]. Paratype: FMNH 184052: Collected by: Steven M. Goodman and Fania H. Ratrimomanarivo; collection date: 21 - 22 April 2005. Presented/Donated by: ?: Collector Unknown. Locality: Madagascar: Province de Mahajanga - Marovaza [14 56 S 47 16 E, 5 m asl]. Paratype: FMNH 184085: Collected by: Steven M. Goodman and Fania H. Ratrimomanarivo; collection date: 21 - 22 April 2005.

Locality: Madagascar: Province de Mahajanga - Marovaza [14 56 S 47 16 E, 5 m asl]. Paratype: FMNH 184086: Collected by: Steven M. Goodman and Fania H. Ratrimomanarivo; collection date: 21 - 22 April 2005. Locality: Madagascar: Province de Mahajanga - Marovaza [14 56 S 47 16 E, 5 m asl]. Paratype: MNHN ZM-MO-1984-433: Collected by: Steven M. Goodman and Fania H. Ratrimomanarivo; collection date: 29 April 1869. Paratype: UADBA 46965: Collected by: Richard K.B. Jenkins; collection date: 24 November 2004; original number: RBJ 215. Locality: Madagascar: Antafinimihakatra, Parc National d' Ankarafantsika [16 16 S 46 48 E). - Comments: Publication date: prior to 15 May 2006. - Etymology: The name of the type locality (Marovaza) is placed in apposition to the generic name (Goodman *et al.*, 2006b). (Current Combination)

TAXONOMY:
See Goodman *et al.* (2006b).

COMMON NAMES:
Czech: mračník Goodmanův. English: Marovaza House Bat. French: Scotophile de Marovaza. German: Marovaza-Hausfledermaus.

ETYMOLOGY OF COMMON NAME:
Refers to the name of the type locality (Marovaza).

CONSERVATION STATUS:
Global - This species is listed as Least Concern (LC ver 3.1 (2001)) because it is widely distributed in lowland areas of western Madagascar, there are no major threats, and its survival is not dependent on the conservation of intact forests (Jenkins *et al.*, 2008b; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Jenkins *et al.*, 2008b; IUCN, 2009).

MAJOR THREATS:
Jenkins *et al.* (2008b) [in IUCN (2009)] report that there are no major threats known. It is a widely distributed species and is tolerant of habitat disturbance (Goodman *et al.*, 2006b; Rakotoarivelo and Randrianandrianina, 2007).

CONSERVATION ACTIONS:
Jenkins *et al.* (2008b) [in IUCN (2009)] report that given the wide distribution of this species and occurrence in heavily disturbed habitats there are no pressing conservation measures. However, it should be noted that prevalence for synanthropic roosts does not automatically indicate a bat species is not of conservation concern. Furthermore, it should be noted that *S. marovaza* was not found in many of the sites surveyed for bats in western Madagascar (Goodman *et al.*, 2005a) which included areas from where it is suspected of being present (Goodman *et al.*, 2006b). Additional field studies are therefore needed to define its range, local abundance and habitat needs, but this is not a conservation priority (Goodman *et al.*, 2006b).

GENERAL DISTRIBUTION:
Scotophilus marovaza is known from a wide area of western Madagascar from near Morondava in the south, to the holotype locality at Marovaza in the north near Mahajanga (Goodman *et al.*, 2006b; Rakotoarivelo and Randrianandrianina, 2007). Goodman *et al.* (2006b) suspect that *S. marovaza* is distributed across much of western lowland Madagascar although specimen evidence for this is still lacking (Goodman *et al.*, 2005a). Current records are from below 200 m.

Native: Madagascar (Goodman *et al.*, 2006b).

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
See Goodman *et al.* (2006b).

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:
See Goodman *et al.* (2006b).

DETAILED MORPHOLOGY:
Baculum:
Rakotondramanana and Goodman (2017: 64) mention that the baculum is a flat triangular structure, with a rounded, expanded proximal portion and which gradually tapers to a rounded distal tip; length: 1.60 ± 0.155 (1.47 - 1.77) mm, width: 0.99 ± 0.071 (0.93 - 1.07) mm.

For a description of the crania, teeth, ears and tragus see Goodman *et al.* (2006b).

ECHOLOCATION:
Kofoky *et al.* (2009: 384) reported the calls of nine individuals, characterized by broadband steep FM followed by QCF, and emitted low duty cycle calls with a maximum energy at about 45.9 kHz.

MOLECULAR BIOLOGY:
DNA, karyotype, protein / allozyme - Unknown.

HABITAT:
See Goodman *et al.* (2006b).

Ravelomanantsoa *et al.* (2019: 110) caught it over a pool surrounded by banana trees.

ROOST:
The type specimen was collected day roosting in dry palm leaves (*Bismarckia nobilis*) forming the roof of a building (Goodman *et al.*, 2006b).

PREDATORS:
Goodman *et al.* (2015c: 78) found the remains of one individual in pellets of Bat Hawk *Macheiramphus alcinus* Bonaparte, 1850 in western central Madagascar.

POPULATION:
Structure and Density - There is very little information on this species. Only singletons are known from two of the four sites from which it has been recorded (Goodman *et al.*, 2006b). It has been found in small roosting colonies (< 5 individuals) in huts made from palm leaves (Ratrimomanarivo and Goodman, 2005).
Trend - 2008 - Unknown (Jenkins *et al.*, 2008b; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
See Goodman *et al.* (2006b).

PARASITES:
BACTERIA
Gomard *et al.* (2016: 5) found the single specimen they tested to be posifive for *Leptospira*.

INSECTA
Diptera:
Nycteribiidae: Wilkinson *et al.* (2016) reported the presence of *Basilia (Paracyclopodia)* sp. Ramasindrazana *et al.* (2017: Suppl.) refer to this bat fly as "*Basilia* sp. 2". Szentiványi *et al.* (2019: Suppl.) indicated that these flies were, in turn, infected by bacteria belonging to: Enterobacteriales, *Wolbachia* sp., *Bartonella* sp.

ANTHROPOPHILOUS:
Known to roost in the palm roofs of houses (Goodman *et al.*, 2006b).

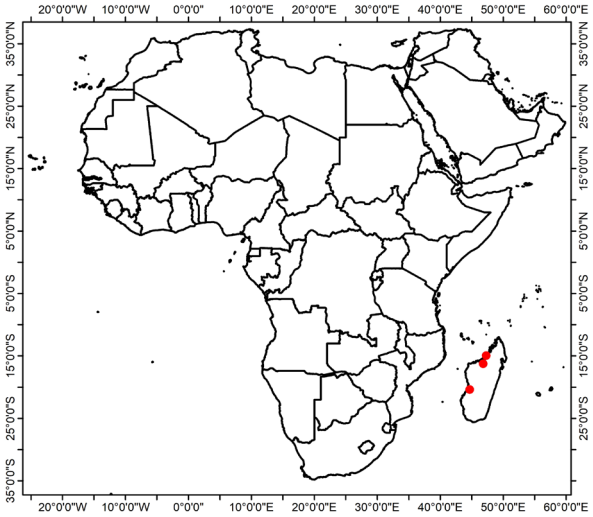

Figure 261. Distribution of Scotophilus *marovaza*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Madagascar.

Scotophilus nigrita (Schreber, 1774)

*1774. *Vespertilio Nigrita* Schreber, Die Säugethiere in Abbildungen nach der Natur mit Beschreibungen, 1 (8): pl. 58 + 1 (9): 171. Publication date: 1774. Type locality: Senegal: "Senegal" [Goto Description]. - Etymology: Lanza *et al.* (2015: 493) state: "From the scientific Latin *nigritus*, diminutive of the masculin Latin adjective *nìger* (nìger) 'black', (masculine *nigrìtus*; feminin *nigrìta*, neuter *nigrìtum*), referring to the blackish uropatagial colour of the type specimen: 'Die Schwanzhaut ist schwärzlich' (Schreber 1774). Note that Schreber erroneously used a feminine adjective with the masculine gender noun *Vespertilio*, unless he did not consider *nigrita* as a noun in apposition (noun seemingly non-existent even in the post-classic Latin; instead, there exists in classic Latin the noun *nigritia*, meaning 'black or blackish colour').
1855. *N[ycticejus] nigrita:* Giebel, Die Säugethiere, 928. (Name Combination)
1875. *Scotophilus gigas* Dobson, Ann. Mag. nat. Hist., ser. 4, 16 (92): 122. Publication date: 1 August 1875. Type locality: Nigeria: Western region: Lagos [06 27 N 03 23 E] [Goto Description]. Holotype: BMNH 1872.10.24.5: ad ♀, skull and alcoholic.
1965. *Scotophilus alvenslebeni* Dalquest, J. Mamm., 46 (2): 254, 258. Publication date: May 1965. Type locality: Mozambique: S bank Save River: Zinave National Park [ca. 21 26 S 33 52 E] [Goto Description]. Holotype: KU 105222: ad ♂, skin and skull. Collected by: Prof. Dr. Walter Woelberg Dalquest; collection date: 9 October 1963; original number: MWUC 18767. Presented/Donated by: ?: Collector Unknown. See Jones and Genoways (1969: 132). - Comments: Type locality originally as "S Bank Save River, bei Zinave, 212 km SSW Beira": see Kock (1969a: 204). - Etymology: In honour of Baron Werner von Alvensleben, in partial recognition of his labors in behalf of our work in Mozambique (see Dalquest, 1965: 258).
2016. *Scotophilus nigritta:* Mikula, Morelli, Lucan, Jones and Tryjanowski, Mammal Rev., Suppl. Data. Publication date: 20 January 2016. (Lapsus)

? *Scotophilus nigrita alvenslebeni:* (Name Combination)
? *Scotophilus nigrita nigrita:* (Name Combination)
? *Scotophilus nigrita:* (Name Combination, Current Combination)

TAXONOMY:
For a review of this species see Robbins (1978a). The identity of this species is clear and *nigrita* is the senior synonym of *gigas*. Most specimens called *nigrita* prior to 1978 should be called *dinganii* (see Robbins, 1978a: 212 - 213).

Based on cytochrome *b*, Vallo *et al.* (2014: 225) found *N. nigrita* to be paraphyletic with respect to the other continental African species *S. colias, S. dinganii, S. nigritellus* and *S. viridis*. They also found that cytochrome *b* from West and Southern African *S. nigrita* specimens differed between 7.6 and 8.1 %, which suggest that *S. nigrita* might differ on specific level from *alvenslebeni*. However, they (p. 229) find it too preliminary to officialize this split, and suggest further, more extensive genetic sampling and morphological analyses.

See Lanza *et al.* (2015: 493)'s remark on the taxon's suffix in the synonymy list above.

COMMON NAMES:
Afrikaans: Groot geel dakvlermuis. Chinese: 非洲大黄蝠. Czech: mračník olbřímí. English: Giant House Bat, Giant Brown House Bat, Brown House Bat, Great Brown House Bat, Giant Yellow House Bat, Schreber's Yellow Bat, Geat Brown Bat, Giant Brown Bat, Senegal Bat, Schreber's Brown Bat. French: Grand scotophile africain. German: Riesen-Hausfledermaus, Hundkopf-Schwirrfledermaus. Italian: Scotòfilo scùro. Portuguese: Morcego gigante amarelo das casas. Spanish (Castillian): Murciélago Amarillo.

ETYMOLOGY OF COMMON NAME:
Most of the colloquial names refer to its colour (yellow) and being a House bat. The colloquial name Schreber's Yellow bat refers to J. von Schreber, who originally described the species (Taylor, 2005).

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Cotterill, 2008d; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Cotterill, 2008d; IUCN, 2009). 2004 - NT ver 3.1 (2001) (Cotterill, 2004d; IUCN, 2004). 1996 - LR/nt (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - NT D2 ver 3.1 (2001) (Fernsby *et al.*, 2016). 2004 - considered a vagrant not assessed, not recorded in SA (Friedmann and Daly, 2004).

MAJOR THREATS:
This species is threatened by the conversion of its habitat to agricultural use in parts of its range (Cotterill, 2008d; IUCN, 2009).

CONSERVATION ACTIONS:
Cotterill (2008d) [in IUCN (2009)] reports that there appear to be no direct conservation measures in place. It is not known if the species is present in any protected areas. Management of protected areas is necessary.

GENERAL DISTRIBUTION:
Scotophilus nigrita has been recorded as scattered records from West, East, and south-east Africa. It has been reported from Senegal, Côte d'Ivoire, Ghana, Togo, Nigeria and Cameroon in West Africa, from central Sudan, and from western Democratic Republic of the Congo, western Kenya and Tanzania, south to Mozambique, Malawi, eastern Zimbabwe and north-eastern South Africa.

Native: Cameroon (Bakwo Fils *et al.*, 2012: 55); Congo (The Democratic Republic of the) (Hayman *et al.*, 1966; Monadjem *et al.*, 2010d: 575); Côte d'Ivoire; Ghana; Kenya; Malawi (Ansell and Dowsett, 1988: 37; Monadjem *et al.*, 2010d: 575); Mozambique (Dalquest, 1965; Smithers and Lobão Tello, 1976; Monadjem *et al.*, 2010d: 575); Nigeria; Senegal; South Africa (Monadjem *et al.*, 2010d: 575); Sudan; Tanzania; Togo; Uganda (Kityo and Kerbis, 1996: 63); Zimbabwe (Cotterill, 1996a; Monadjem *et al.*, 2010d: 575).

DETAILED MORPHOLOGY:
Baculum - Hill and Harrison (1987).

ECHOLOCATION:
Thiagavel *et al.* (2017: Suppl.) mention a peak frequency of 32.85 kHz.

PREDATORS:
Mikula *et al.* (2016: Supplemental data) mention the African goshawk (*Accipiter tachiro* (Daudin, 1800)) preying upon *S. nigrita*. They also mention this bat to be a possible prey of the Lanner falcon

(*Falco biarmicus* Temminck, 1825), Peregrine falcon (*Falco peregrinus* Tunstall, 1771), and Bat hawk (*Macheiramphus alcinus* Bonaparte, 1850).

POPULATION:
Structure and Density - It appears to be a rare, or rarely recorded, species (Cotterill, 2008d; IUCN, 2009).
Trend - 2008 - Decreasing (Cotterill, 2008d; IUCN, 2009).

VIRUSES:
Bunyaviridae
Nairovirus
Qalyub virus was reported by Luis *et al.* (2013: suppl.).

Coronaviridae - Coronaviruses
SARS-CoV - In Nigeria during June 2008, Quan *et al.* (2010) screened the gastrointestinal tissue for the presence of coronaviruses by PCRs, none tested positive.

Flaviviridae
Flavivirus
The presence of Dakar bat virus was mentioned by Luis *et al.* (2013: Suppl.), Blitvich and Firth (2017: 3), Willoughby *et al.* (2017: Suppl.).

Rhabdoviridae
Lyssavirus - Rabies related viruses
In Nigeria during June 2008, Quan *et al.* (2010) did not detect any lyssavirus-specific antigens from the brains by use of direct fluroescent anitbody testing.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Benin, Burundi, Cameroon, Congo, Congo (Democratic Republic of the), Côte d'Ivoire, Ghana, Guinea, Kenya, Malawi, Mozambique, Niger, Nigeria, Senegal, South Africa, South Sudan, Sudan, Tanzania, Togo, Zambia, Zimbabwe.

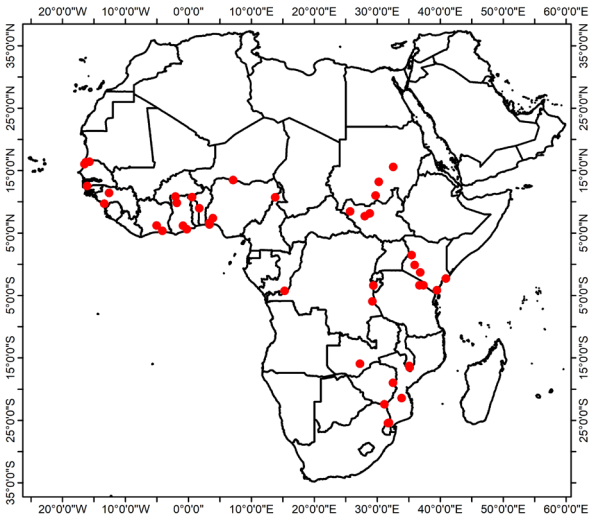

Figure 262. Distribution of *Scotophilus nigrita*

Scotophilus nigritellus de Winton, 1899

1899. *Scotophilus nigritellus* de Winton, Ann. Mag. nat. Hist., ser. 7, 4 (23): 355. Publication date: 1 November 1899. Type locality: Ghana: Gambaga [10 32 N 00 26 W] [Goto Description]. Holotype: BMNH 1899.6.15.9: ad ♂. Collected by: Captain W. Giffard; collection date: 9 January 1899.
? *Scotophilus leucogaster nigritellus:*
? *Scotophilus viridis nigritellus:* (Name Combination)

TAXONOMY:
This small sized *Scotophilus* has been included in *leucogaster* (Robbins *et al.*, 1985) or *viridis*, but see Vallo and Van Cakenberghe (2017) and Demos *et al.* (2018)

Vallo *et al.* (2011a: 45) showed that their cytochrome *b* analyses indicated that *S. viridis* contains two paraphyletic lineages, differing by about 12 %. They indicated that the greenish-yellow specimens from West Africa could be reliably identified with *S. nigritellus*. mtDNA analyses performed by Trujillo *et al.* (2009: 553) confirm that *S. viridis* is distinct from *S. nigritellus*, as suggested by Grubb *et al.* (1998).

Vallo *et al.* (2012: 5), who analyses the cytochrome *b* gene of West African "*S. nigritellus*" specimens, found that two paraphyletic lineages were present (agreeing with the belly colour of the specimens), with a genetic divergence ranging between 12.3 and 13.5 %. The white bellied lineage differed only 2.6 to 2.8 % from *S. leucogaster*. Their analysis of the *zfy* gene (zinc finger protein on the Y-chromosome) indicated that the white bellied lineage differed by 10 substitutions from the yellow bellied lineage, and that the white bellied lineage furthermore differed by 9 substitutions from *S. leucogaster*. Vallo *et al.* (2012: 10) concluded that the yellow bellied form agrees with the form *S. nigritellus* described by de Winton in 1899 but were unable to provide a name for the white bellied form.

GENERAL DISTRIBUTION:
Scotophilus nigritellus is widespread in West Africa, ranging from Senegal and Gambia to northern Cameroon and the Central African Republic.

Native: Benin (Capo-Chichi *et al.*, 2004: 163); Burkina Faso (Kangoyé *et al.*, 2015a: 626); Cameroon; Central African Republic; Chad; Côte d'Ivoire; Gambia; Ghana; Guinea-Bissau (Peters, 1870; Seabra, 1900a; Rainho and Ranco, 2001: 72); Mali; Niger; Nigeria; Senegal; Togo.

Scotophilus nucella Robbins, 1983

*1983. *Scotophilus nucella* Robbins, Ann. Kon. Mus. Mid. Afr., Zool. Wetensch., 273: 19. Type locality: Ghana: Eastern region: Nkawkaw, 1 mi N [06 33 N 00 44 W]. Holotype: USNM 412141: ad ♂, skin and skull. Collected by: Bruce Joliffe Hayward; collection date: 5 August 1967. - Etymology: *nucella* is a diminutive of *nux*. Following the rules for construction of a diminutive, the latin root of *nux* is used (=*nuc*). Although *Scotophilus* is masculine in gener, formation of a diminutive of a noun in apposition (*nux*) must retain the same gender as its root (*nuc*) which is feminine. The only ending then possible are *-ula* or *-ella*. (Current Combination)

TAXONOMY:
Included in *leucogaster* by Koopman (1993a: 227), Grubb *et al.* (1998: 91).

Vallo *et al.* (2016: 302) showed that cytochrome *b* sequences separated *S. nucella* 7.8 - 9.4 % from *S. nux* and puts both in a sister position. This was corroborated by the nuclear zinc finger protein gene on the Y-chromosome. Both species were separated from one another at the Pliocene-Pleistocene transition, some 2.5 MYA.

COMMON NAMES:
Czech: mračník guinejský. English: Lesser Nut-coloured House Bat, Rainforest House Bat, Robbins's House Bat, Robbin's House Bat, Nucella House Bat, Little Nut-coloured House Bat, Robbins's Yellow Bat. French: Scotophile de Robbins, Scotophile des hauteurs. German: Robbins Hausfledermaus.

CONSERVATION STATUS:
Global - Listed as Data Deficient (DD ver 3.1 (2001)) in view of the absence of recent information on its extent of occurrence, ecological requirements, threats and conservation status. The range is very poorly known, and it is unclear if the species is declining (Fahr, 2008o; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) (Fahr, 2008o; IUCN, 2009). 2004 - VU A2a; B2ab(iii) ver 3.1 (2001) (Fahr, 2004b; IUCN, 2004).

MAJOR THREATS:
The threats to this species are not known (Fahr, 2008o; IUCN, 2009).

CONSERVATION ACTIONS:
Fahr (2008o) [in IUCN (2009)] reports that there appear to be no direct conservation measures in place. It is not known if the species is present in any protected areas. Further research is needed.

GENERAL DISTRIBUTION:
Scotophilus nucella has only been recorded from southeastern Côte d'Ivoire, southern Ghana, and western Uganda close to the border with the Democratic Republic of the Congo, and Kambai Forest Reserve in the East Usambara Mountains of Tanzania (Cunneyworth, 1996b). Known from the high forest vegetation zone in Ghana (Decher and Fahr, 2007: 20) and Uganda, but it may occur in the high forest areas of West, Central and East Africa (Robbins, 1983).

Native: Côte d'Ivoire; Ghana (Decher and Fahr, 2007: 20); Tanzania Cunneyworth, 1996b); Uganda.

POPULATION:
Structure and Density - Little information is available on the population abundance or size of this species. It is suspected to be declining as it appears that the species has not been collected since 1984 (Fahr, 2008o; IUCN, 2009).
Trend - 2008 - Unknown (Fahr, 2008o; IUCN, 2009).

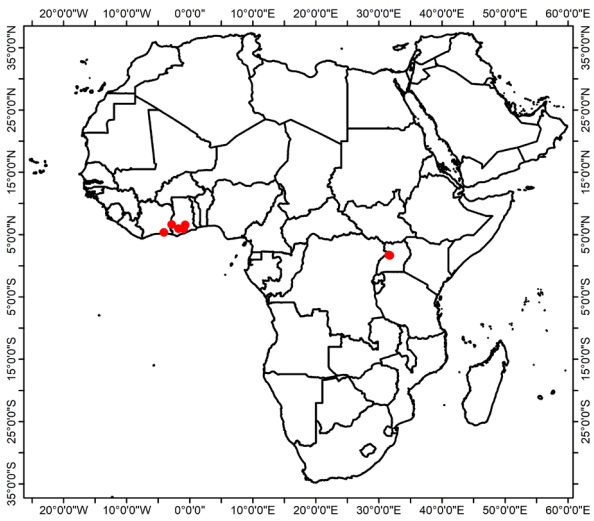

Figure 263. Distribution of *Scotophilus nucella*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:

Scotophilus nux Thomas, 1904

*1904. *Scotophilus nigrita nux* Thomas, Ann. Mag. nat. Hist., ser. 7, 13 (75): 208. Publication date: 1 March 1904. Type locality: Cameroon: Efulen [02 46 N 10 42 E] [Goto Description]. Holotype: BMNH 1903.2.4.5: ad ♂. Collected by: George Latimer Bates Esq. - Etymology: From the Latin "*nux*" meaning nut.
1915. *Scotophilus nux:* Thomas, Ann. Mag. nat. Hist., ser. 8, 16 (96): 468. Publication date: 1 December 1915. (Name Combination, Current Combination)
1938. *[Pachyotus] nux:* Frechkop, Exploration du Parc National Albert, 53. (Name Combination)
1938. *Pachyotus mux:* Frechkop, Exploration du Parc National Albert, 59. (Lapsus)
1938. *Pachyotus nigrita mux:* Frechkop, Exploration du Parc National Albert, 59. - Comments: Mentioned in the synonymy of *Pachyotus mux* (sic). (Lapsus)
1938. *Scotophilus nigrita mux:* Frechkop, Exploration du Parc National Albert, 59. - Comments: Mentioned in the synonymy of *Pachyotus mux* (sic). (Lapsus)
? *Scotophilus dinganii nux:* (Name Combination)
? *Scotophilus leucogaster nux:* (Name Combination)

TAXONOMY:
S. nux has been most often recognized as a subspecies of *nigrita*, when *nigrita* was used for the species now called *dinganii*; see Allen (1939a), Rosevear (1965), and Hayman and Hill (1971: 50). Koopman (1965: 4 - 5) listed it as a subspecies of *leucogaster*. Grubb *et al.* (1998: 90) include *nux* as a subspecies of *dinganii*.

Vallo *et al.* (2016: 306) found that the cyt *b* of specimens from Guinea differs 3.4 - 4.5 % from that of conspecifics from other parts of Africa and therefore these specimens might probably be assigned to a separate subspecies.

COMMON NAMES:
Chinese: 喀麦隆黄蝠. Czech: mračník ořechový. English: Nut-coloured House Bat, Dark House Bat, Nut-colored Yellow Bat, Nux Yellow House Bat. French: Scotophile noisette, Scotophile nux. German: Nußfarbene Hausfledermaus.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Fahr, 2008p; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Fahr, 2008p; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Fahr, 2004q; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
There appear to be no major threats to this species. Some populations may be impacted by general deforestation, however, this needs to be confirmed (Fahr, 2008p; IUCN, 2009).

CONSERVATION ACTIONS:
Fahr (2008p) [in IUCN (2009)] reports that there appear to be no direct conservation measures in place. It is not known if the species is present in any protected areas.

GENERAL DISTRIBUTION:
Scotophilus nux has been patchily recorded from West Africa (Sierra Leone, Guinea, Liberia Côte d'Ivoire, Ghana and Nigeria), Central Africa (Cameroon and Democratic Republic of the Congo) and East Africa (Uganda and Kenya), and is believed to likely occur more widely than is currently known. It is possibly present in Equatorial Guinea, however, this needs to be confirmed.

Native: Cameroon; Congo (Bates *et al.*, 2013: 337); Congo (The Democratic Republic of the); Côte d'Ivoire; Ghana (Decher and Fahr, 2007: 21); Guinea (Fahr *et al.*, 2006a: 74; Decher *et al.*, 2016: 274); Kenya; Liberia (Fahr, 2007a: 104); Nigeria; Rwanda; Sierra Leone; Uganda.
Presence uncertain: Equatorial Guinea.

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
From western Uganda, Monadjem *et al.* (2011: 30) reported the following data: Fa: 55.6 mm, mass: 30 g, wing loading: 6.4 N/m^2, aspect ratio: 5.5.

ECHOLOCATION:
From western Uganda, Monadjem *et al.* (2011: 32) reported the following values: F_{min}: 40.71 kHz, F_{max}: 54.05 kHz, F_{char}: 43.01 kHz, F_{knee}: 45.07 kHz, and duration: 2.0 ms.
For a *S.* cf. *nux* specimen from Gabon, Peereboom and van Lieshout (2015: 6) mention F_{min}: 38.49 ± 0.83 (37.82 - 40.04) kHz, F_{max}: 59.45 ± 7.23 (52.54 - 75.79) kHz, $F_{min\ dom}$: 44.54 ± 1.91 (41.11 - 47.37) kHz, duration: 1.87 ± 0.30 (1.60 - 2.50) ms, interpulse interval: 57.08 ± 33.44 (16.20 - 108.60) ms.

Thiagavel *et al.* (2017: Suppl.) mention a peak frequency of 26.09 kHz.

MOLECULAR BIOLOGY:
DNA - See Hoofer and Van Den Bussche (2003).
Karyotype - Unknown.
Protein / allozyme - Unknown.

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:

Figure 264. Clockwise from top lateral, ventral and dorsal skull images of BMNH 1903.2.4.5, holotype of *Scotophilus nigrita nux* Thomas, 1904.

HABITAT:
Monadjem *et al.* (2016y: 371) collected two specimens over water in a disturbed forest habitat on the Liberian side of Mount Nimba at 520 m.

POPULATION:
Structure and Density - Little information is available on the population abundance or size of this species (Fahr, 2008p; IUCN, 2009).
Trend - 2008 - Unknown (Fahr, 2008p; IUCN, 2009).

VIRUSES:
Coronaviridae
Anthony *et al.* (2017b: Suppl.) mention the alpha-coronavirus Predict_CoV_33.

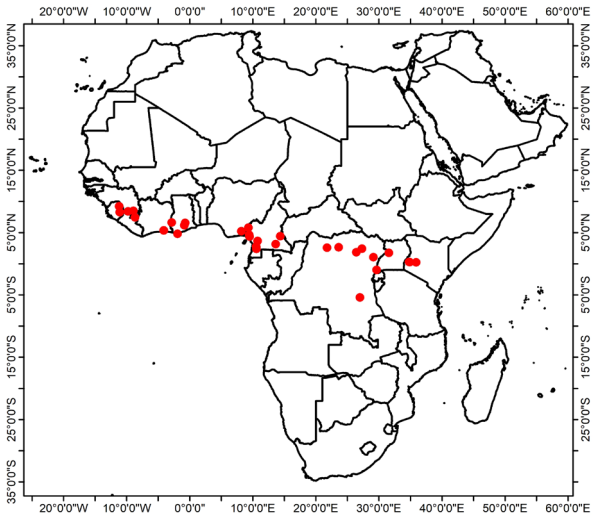

Figure 265. Distribution of *Scotophilus nux*

Scotophilus robustus A. Milne-Edwards, 1881

*1881. *Scotophilus robustus* A. Milne-Edwards, C. R. séances Acad. Sci., Paris, 91: 1035. Publication date: 1881. Type locality: Madagascar: "Madagascar" [Goto Description]. Holotype: MNHN 218: ♀. Presented/Donated by: ?: Collector Unknown. Holotype: MNHN ZM-MO-1997-1883a: ad ♀, alcoholic (skull not removed). Collected by: Léon Humblot. Number 218 in Rode (1941: 248). See also Peterson *et al.* (1995: 112), Goodman *et al.* (2005b: 873). Paratype: MNHN ZM-MO-1997-1883b: ad ♀, alcoholic (skull not removed). Collected by: Léon Humblot. Number 218a in Rode (1941: 248). Goodman *et al.* (2005b: 873) additionally mention that the jar with the type specimen contains two specimens (1997-1883a and 1997-1883b), but that not can be determined which of the two is the holotype. - Comments: Goodman *et al.* (2005b: 873) mention "entre Foulpointe et le lac d'Alaoutre" in the central portion of het eastern humid forest as type locality. Goodman *et al.* (2005b: 873) also mention that the jar with the type specimen contains two specimens (1997.1883a and 1997.1883b), but that not can be determined which of the two is the holotype. (Current Combination)

? *Scotophilus nigrita robustus:* (Name Combination)

TAXONOMY:
Recognized as a subspecies of *nigrita* (when *nigrita* was used for the species now called *dinganii*) by Hayman and Hill (1971: 50). However, Robbins *et al.* (1985) considered it specifically distinct from *dinganii* and *borbonicus*.

COMMON NAMES:
Czech: mračník statný. English: Robust Yellow Bat. French: Scotophile de Madagascar, Chauve-souris domestique malgache, Scotophile robuste. German: Madagaskar-Hausfledermaus.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) as although the species is not thought to be abundant and has not often been recorded, the available information indicates that the species is widespread across Madagascar occurring in a wide variety of habitats, including in human habitations. While the threats affecting the species are imperfectly known, there is no reason to expect that the species is currently undergoing a decline that would warrant listing in a threatened category (Andriafidison *et al.*, 2008k; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Andriafidison *et al.*, 2008k; IUCN, 2009). 1996 - LR/nt ver 2.3 (1994).

MAJOR THREATS:
Andriafidison *et al.* (2008k) [in IUCN (2009)] report that the major threats to this species are not well known. This species uses forest habitat, but it also occurs outside of forested areas. There is one reported occurrence of this species being hunted by food by local people, but there is no evidence that this constitutes a major threat (Goodman *et al.*, 2008d).

CONSERVATION ACTIONS:
Andriafidison *et al.* (2008k) [in IUCN (2009)] report that this species is known from a number of protected areas across Madagascar and does not appear to require specific conservation measures but, like many other Malagasy bats that are not

considered to be threatened, there is a lack of basic natural history data.

GENERAL DISTRIBUTION:
Scotophilus robustus is endemic to the island of Madagascar, where it is broadly distributed from the coast to the highland plateau up to 1,400 m in Tsinjoarivo (Goodman *et al.*, 2005a). This species is rarely recorded, but as more surveys are conducted it is likely that this species will be found to have a wider distribution.

Native: Madagascar (Russ *et al.*, 2001).

DETAILED MORPHOLOGY:
Baculum:
This bone has a flat triangular structure, with a distinct indentation to the proximal margin (Rakotondramanana and Goodman, 2017: 64); length: 2.02 ± 0.048 (.94 - 2.09) mm, width: 1.18 ± 0.096 (0.98 - 1.29) mm.

ECHOLOCATION:
Kofoky *et al.* (2009: 382) reported the calls which were characterized by a broadband steep FM followed by a QCF calls at low duty cycle. The fundamental was always the most intense with peak energy at about 38.1 kHz.

HABITAT:
Ravelomanantsoa *et al.* (2019: 110) indicated that this large species occurs in wet and dry deciduous forests. It is known for inhabiting human constructions. They also caught it near the base of a *Ficus cocculifolia* and near a *Mangifera indica* plantation.

DIET:
The following prey volume percentages were reported from the faeces of 2 *S. robustus* specimens by Rakotondramanana *et al.* (2015: 74): Coleoptera: 14.5 ± 20.51; Lepidoptera: 50.0 ± 70.71; Homoptera: 8.0 ± 11.31; Blattoidea: 27.5 ± 38.90. Expressed as frequency percentages, the values are: Coleoptera: 50.0 ± 70.71; Lepidoptera: 50.0 ± 70.71; Homoptera: 60.0 ± 42.43; Blattoidea: 50.0 ± 70.71.

Rasoanoro *et al.* (2015: 63) found that Coleoptera formed about 68 % of the diet, whereas sampling in the feeding area revealed that only 3 % of the available prey consisted of Coleoptera. They indicated that - at least in the hot season - *S. robustus* is a Coleopteran specialist. The droppings of three bats contained the following volume percentages of prey types: Aranea: 5.7 ± 0.33, Coleoptera: 68.0 ± 10.08, Diptera: 1.9 ± 1.88, Homoptera: 2.1 ± 2.06, Hymenoptera: 8.7 ± 3.87, Lepidoptera: 9.1 ± 4.50, and Orthoptera: 4.3 ± 2.15.

POPULATION:
Structure and Density - A number of bat surveys have failed to locate this species (Goodman *et al.*, 2005b; Robinson *et al.*, 2006; Rakotoarivelo and Randrianandrianina, 2007) and it appears not to be locally abundant (Andriafidison *et al.*, 2008k; IUCN, 2009).
Trend - 2008 - Unknown (Andriafidison *et al.*, 2008k; IUCN, 2009).

PARASITES:
Diptera:
Nycteribiidae: Duron *et al.* (2014: 2108) refer to a *Basilia* nov. sp. collected from this bat species.
Wilkinson *et al.* (2016) reported the presence of *Basilia (Paracyclopodia)* sp., which was carrying *Bartonella* bacteria, as well as Enterobacteriales. Ramasindrazana *et al.* (2017: Suppl.) refer to the bat fly as "*Basalia* sp. 1". They also mention (p. 6) a *Basilia (Paracyclopodia) madagascarensis*, which was collected from a "*Scotophilus borbonicus*" from Nosy Be, but this bat most probably should be assigned to *S. robustus*. Szentiványi *et al.* (2019: Suppl.) furthermore indicated that a new bat fly (Basilia nov. spec.) found on a *S. robustus* bats, was parasited by an *Arsenophonus* sp. Bacteria.

VIRUSES:
Flaviviridae
Flavivirus
Dakar Bat Virus (DBV)- Isolated from salivary glands (Coulanges *et al.*, 1974; Rousset and Andrianarivelo, 2003).

UTILISATION:
See Goodman *et al.* (2008d).

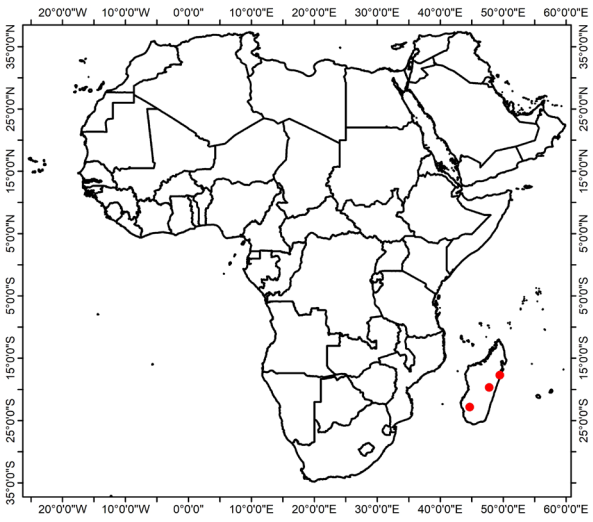

Figure 266. Distribution of *Scotophilus robustus*

Madagascar.

Scotophilus tandrefana Goodman, Jenkins and Ratrimomanarivo, 2005

*2005. *Scotophilus tandrefana* Goodman, Jenkins and Ratrimomanarivo, Zoosystema, 27 (4): 867, 875, figs 3 - 5. Type locality: Madagascar: Mahajanga province: just outside the Parc national de Bemaraha: 1.8 km SE Bekopake and 0.6 km NE Andadoany [19 08 S 44 49 E, 50 m] [Goto Description]. Holotype: UADBA 46923: ad ♂, skull and alcoholic. Collected by: Richard K.B. Jenkins and Fania H. Ratrimomanarivo; collection date: 27 July 2003; original number: RBJ 161. - Etymology: From the Malagasy meaning "from the west" (see Goodman *et al.*, 2005b: 875). (Current Combination)

TAXONOMY:
Goodman *et al.* (2005b) described this species based on three specimens which were collected in 1868, 1869 and 2003 (the latter being designated as the holotype). One of these (the specimen collected in 1869) was later reassessed as *S. marovaza* (Goodman *et al.*, 2006b).

Trujillo *et al.* (2009: 553) indicate that inferred phylogenies do not support the separation of *S. tandrefana* and *S. marovaza* as the cytochrome *b* phylogeny only reveals a genetic divergence of 0.6 %, a level indicative of within-species divergence. This might indicate that cytochrome *b* is not representative or that the separation between the two taxa occurred too recent to be already reflected in that gene.

COMMON NAMES:
Czech: mračník madagaskarský. English: Western Yellow Bat. French: Scotophile d'Andadoany. German: Westliche Hausfledermaus.

CONSERVATION STATUS:
Global - Listed as Data Deficient (DD ver 3.1 (2001)) as the species is known from only two specimens (one collected as recently as 2003) and there is no information on its population status or threats (Jenkins *et al.*, 2008c; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) (Jenkins *et al.*, 2008c; IUCN, 2009).

MAJOR THREATS:
The major threats to this species are not known (Jenkins *et al.*, 2008c; IUCN, 2009).

CONSERVATION ACTIONS:
Jenkins *et al.* (2008c) [in IUCN (2009)] report that this species has been recorded from near Parc National Tsingy de Bemaraha and the managed forest of Kirindy CFPF (Goodman *et al.*, 2005a), but evidence is lacking that it actually roosts or feeds in these forests.

GENERAL DISTRIBUTION:
Scotophilus tandrefana is endemic to Madagascar where it is known from two localities: near Parc National Tsingy de Bemaraha in the west and Sarodrano in the south (Goodman *et al.*, 2005a). Photographs and forearm measurements of an individual from Kirindy (CFPF) forest in the west represents the third known locality for this species (Goodman *et al.*, 2005a).

Native: Madagascar.

ECHOLOCATION:
Kofoky *et al.* (2009: 382) reported the calls from a single individual in a flight cage, which emitted broadband FM/QCF calls at low duty cycle with frequency containing most energy at about 48.2 kHz.

POPULATION:
Structure and Density - There are no data on the population of this species and all existing information is based on two specimens that were collected in 1868 and 2003 (Goodman *et al.*, 2005b; 2006b).
Trend - 2008 - Unknown (Jenkins *et al.*, 2008c; IUCN, 2009).

Scotophilus trujilloi Brooks and Bickham, 2014

*2014. *Scotophilus trujilloi* Brooks and Bickham, Occ. Pap. Mus. Texas Tech Univ., 326: 1, 16, fig. 6. Publication date: 26 Jun 2014. Type locality: Kenya: Coastal province: Kwale district: Moana Marine Station, 1 km S, 2 km E Ukunda [04 18 S 39 35 E] [Goto Description]. Holotype: CM 98038: ad ♂, skin and skull. Collected by: Dr. Duane Albert Schlitter; collection date: 18 October 1985; original number: 7086. Presented/Donated by: ?: Collector Unknown. Muscle tissue sample TK 33263. Paratype: CM 98040: ad ♀, skin and skull. Collected by: Dr. Duane Albert Schlitter; collection date: 18 October 1985; original number: 7087. Presented/Donated by: ?: Collector Unknown. Tissue sample TK 33266. Paratype: CM 98041: ad ♀, skin and skull. Collected by: Dr. Duane Albert Schlitter; collection date: 18 October 1985; original number: 7090. Presented/Donated by: ?: Collector Unknown. - Etymology: In honour of Dr. Robert Trujillo (b. 1975), who's ground-breaking doctoral dissertation on the molecular systematics of *Scotophilus* paved the way for the description of the four cryptic species described in this paper (Trujillo 2005; Trujillo *et al*. 2009) (see Brooks and Bickham (2014 18).

TAXONOMY:
Brooks and Bickham (2014) described four new species in the genus *Scotophilus*. However, they did not compare them with a number of already described taxa such as *colias* Thomas, 1904 or *flavigaster* Heuglin, 1861, which make the validity of (some of) these names doubtfull.

The analyses performed by Demos *et al.* (2018: 2) confirmed the validity of the taxon, but these authors also indicate that they cannot vouch for the validity of the name with respect to older taxa that would have nomenclatural priority.

Musila *et al.* (2018a: 29) indicate that *trujilloi* should be used for the Kenyan animals formerly included in *S. viridis*.

COMMON NAMES:
Chinese: 特鲁黄蝠. English: Trujillo's House Bat. German: Trujillos Hausfledermaus.

ECHOLOCATION:
Musila *et al.* (2018c: 43) [referring to Monadjem *et al.* (2010d)] mention a shallow frequency modulated call, with a peak frequency of 40 kHz and a bandwidth of 25 kHz, but Monadjem *et al.* (2010d: 528) had these parameters assigned to *S. viridis*.

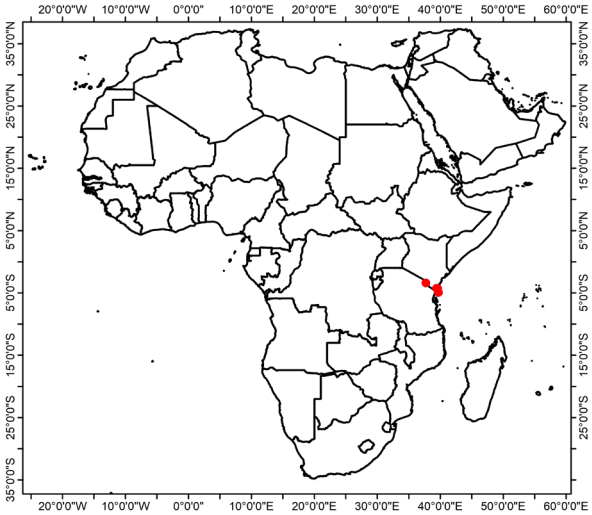

Figure 268. Distribution of *Scotophilus trujilloi*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Kenya, Tanzania.

Scotophilus viridis (Peters, 1852)

*1852. *Nycticejus viridis* Peters, Naturwissenschaftliche Reise nach Mossambique, Zoologie, Säugethiere, 67, pl. 17, fig. 2, a-e. Publication date: 1852. Type locality: Mozambique: Mozambique Island [15 S 40 42 E] [Goto Description]. Holotype: ZMB 73610: ad ♂, skin and skull. Collected by: Prof. Wilhelm Carl Hartwig Peters; collection date: March 1845. Formerly ZMB 526 [=An 16362]; see Turni and Kock (2008: 53). - Etymology: From the masculine Latin adjective *viridis*, meaning "green", referring to the body colour: "Die Farbe der Rückseite ist ein schönes dunkles Olivengrün, die Haare der Bauchseite sind grünlichgelb" (Peters (1852: 68) (see Lanza *et al.*, 2015: 498).

2018. *Scotophilus viridus:* Adams and Kwiecinski, Diversity, 10 (3) 103: 1. Publication date: 18 September 2018. (Lapsus)
? *Scotophilus borbonicus viridis:* (Name Combination)
? *Scotophilus cf. viridis*
? *Scotophilus leucogaster viridis:* (Name Combination)
? *Scotophilus viridis viridis:* (Name Combination)
? *Scotophilus viridis:* (Name Combination, Current Combination)

TAXONOMY:
Included in *leucogaster* by Hayman and Hill (1971: 50) but see Koopman (1975: 414 - 416) and Schlitter *et al.* (1980). Included *damarensis* but see Robbins *et al.* (1985).

Vallo *et al.* (2011a: 45) showed that their cytochrome *b* analyses indicate that *S. viridis* contained two paraphyletic lineages, differing by about 12 %. They indicated that the greenish-yellow specimens from West Africa could be reliably identified with *S. nigritellus*. mtDNA analyses performed by Trujillo *et al.* (2009: 553) confirm that *S. viridis* is distinct from *S. nigritellus*, as suggested by Grubb *et al.* (1998). They also found that *S. viridis* s.s. is not monophyletic because it is found in 2 divergent clades; specimens from Kenya group with *S. dinganii* from South Africa, and specimens of *S. viridis* from South Africa group with *S. robustus* from Madagascar.

COMMON NAMES:
Afrikaans: Klein geel dakvlermuis. Czech: mračník zelený. English: Green House Bat, Greenish Yellow Bat, Lesser Yellow House Bat. French: Petit scotophile africain, Scotophile verdâtre. German: Grünliche Hausfledermaus, Olivengrüne Schwirrfledermaus. Italian: Scotòfilo vérde.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Griffin, 2008c; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Griffin, 2008c; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Griffin, 2004c; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - LC ver 3.1 (2001) (Richards *et al.*, 2016a). 2004 - LC ver 3.1 (2001) (Friedmann and Daly, 2004).

MAJOR THREATS:
There appear to be no major threats to this species (Griffin, 2008c; IUCN, 2009).

CONSERVATION ACTIONS:
Griffin (2008c) [in IUCN (2009)] reports that there appear to be no direct conservation measures in place. It has been recorded from the Matusadona National Park in Zimbabwe, and likely is present in several other protected areas.

GENERAL DISTRIBUTION:
Scotophilus viridis is widespread in sub-Saharan Africa, ranging from Sudan and Ethiopia southwards through much of East Africa and southeastern Africa, being reported as far south as eastern South Africa and Swaziland. For South Africa, Babiker Salata (2012: 49) found that its distribution is strongly associated with the mean temperature of the coldest quarter.

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 895,732 km^2.

Native: Angola (Crawford-Cabral, 1989; Monadjem *et al.*, 2010d: 575); Botswana; Ethiopia; Kenya; Malawi (Ansell and Dowsett, 1988: 38; Happold *et al.*, 1988; Monadjem *et al.*, 2010d: 575); Mozambique (Monadjem *et al.*, 2010d: 575; Monadjem *et al.*, 2010c: 385 as *S.* cf. *viridis*); Namibia; South Africa (De Graaf, 1960; Monadjem *et al.*, 2010d: 575); Sudan; Swaziland (Monadjem *et al.*, 2010d: 575); Tanzania (Stanley and Goodman, 2011: 45) (including the islands of Pemba and Mafia [O'Brien, 2011: 290]); Zambia (Monadjem *et al.*, 2010d: 575); Zimbabwe (Cotterill, 2004a: 262; Monadjem *et al.*, 2010d: 575).

ECHOLOCATION:
See Taylor (1999b).

Schoeman and Waddington (2011: 291) mention a peak frequency of 46.9 ± 1.1 kHz and a duration of 2.9 ± 1.2 msec for *S.* cf. *viridis* specimens from St. Lucia Wetland Park, South Africa.

From Swaziland, Monadjem *et al.* (2017c: 179) reported F_{min}: 39.8 ± 1.33 (38.5 - 41.2) kHz, F_{knee}: 42.7 ± 1.05 (41.6 - 43.7) kHz, F_c: 40.1 ± 1.31 (38.8 - 42.4) kHz and duration: 3.5 ± 1.55 (2.0 - 5.0) msec. The calls could be detected up to a distance of 15 m.

Thiagavel *et al.* (2017: Suppl.) mention a peak frequency of 40.1 kHz.

In the Kalahari Desert, Adams and Kwiecinski (2018: 4) recorded three calls with the following parameters: F_{char}: 37.5 ± 1.6 kHz, F_{max}: 70.6 ± 6.6 kHz, F_{min}: 36.7 ± 1.8 kHz, duration: 4.3 ± 0.3 msec.

MOLECULAR BIOLOGY:
DNA - See Hoofer and Van Den Bussche (2003) for the results of a specimen from Tanzania.
Karyotype - See discussion in generic account.
Protein / allozyme - Unknown.

HABITAT:
In southern Africa, the species primarily occurs in Savanna (77 %) and Coastal mosaic (13 %) habitats (Cooper-Bohannon *et al.*, 2016: Table S2).

HABITS:
Cotterill and Giddings (1987: 175) studied the activitypatterns of *S. viridis* in Zimbabwe and found that most of the females were active between 7 and 9 p.m (when there is a peak in insect abundance)., whereas most of the males were active between 9 and 10 p.m.

ROOST:
Monadjem *et al.* (2010b: 74) found that they roosted in *Combretum imberbe* and *Acacia nigrescens* trees in Swaziland, where they found that 4 of the 5 radio tracked individuals roosted simultaneously in the same *Combretum imberbe* on a single night, and then one individual switched roosts to a different *Combretum imberbe* for two nights.

PREDATORS:
Mikula *et al.* (2016: Supplemental data) mention the following diurnal avian predators: Red-necked falcon (*Falco ruficollis* Daudin, 1800), Bat hawk (*Macheiramphus alcinus* Bonaparte, 1850) [although the prey might have been a *S. nigrita*]; Grey-headed bushshrike (*Malaconotus blanchoti* Stephens, 1826).

POPULATION:
Structure and Density - This is a common species (Griffin, 2008c; IUCN, 2009).
Trend - 2008 - Unknown (Griffin, 2008c; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
Delayed development (van der Merwe *et al.*, 1988).

VIRUSES:
Astroviridae
Neither of the two bats from Mozambique tested by Hoarau *et al.* (2018: 2) was positive for these viruses.

Coronaviridae - Coronaviruses
SARS-CoV - Müller *et al.* (2007b) tested [as *S. borbonicus*] between 1986 to 1999, for antibody to SARS-CoV in sera in one individual from Limpopo Province, South Africa, which turned out to be negative.

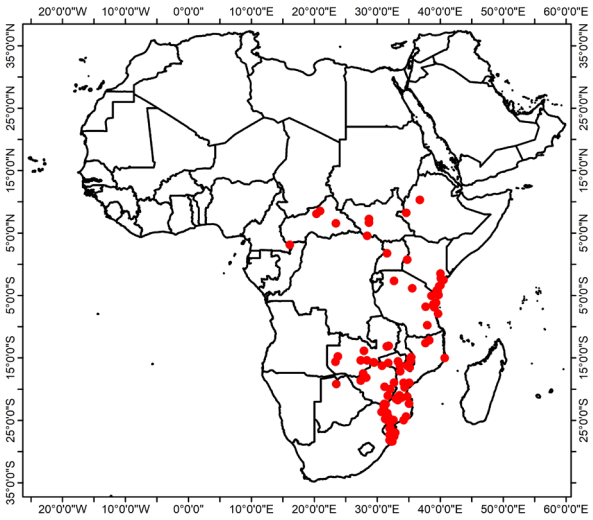

Figure 269. Distribution of *Scotophilus viridis*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Botswana, Central African Republic, Ethiopia, Kenya, Malawi, Mozambique, South Africa, South Sudan, Swaziland, Tanzania, Uganda, Zambia, Zimbabwe.

Scotophilus "incertae-sedis"

? *Scotophilus sp.:*

†Genus *Vampyravus* Schlosser, 1910

*1910. *Vampyravus* Schlosser, Zool. Anz., 35: xxx. (Current Combination)

1911. *Provampyrus* Schlosser, Beitr. Paläont. Geol. Öst.-Ung., 24: xxx. - Comments: This is possibly a synonym of *Vampyravus* Schlosser, 1910.

TAXONOMY:
The position of this genus is still uncertain.

Sigé (1985) [in Ravel *et al.* (2014: 696)] found some similarities between the humerus (the only known specimen of this species) and the Natalidae, but Gunnell *et al.* (2009) indicated that the morphology of this bone was more compatible with that of the Emballonuridae and Rhinopomatidae.

Known species of the genus *Vampyravus*: †***orientalis*** Schlosser, 1910.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Time frame - Late Eocene, Early Oligocene (Rupelian).

†***Vampyravus orientalis*** Schlosser, 1910

*1910. *Vampyravus orientalis* Schlosser, Zool. Anz., 35: xxx. Type locality: Egypt: Fayum: Jebel Qatrani Formation. Holotype: SMNS unnumbered:. - Comments: This is a fossil form from Egypt's Lower Oligocene, of which the type (the right humerus) is in the collection of the SMNS. (Current Combination)
1911. *Provampyrus orientalis* Schlosser, Beitr. Paläont. Geol. Öst.-Ung.. (Name Combination)

TAXONOMY:
Gunnell *et al.* (2008: 5) indicate that the holotype is from an unknown horizon in the Jebel Qatrani Formation. The humerus resembles in size to *Rousettus aegyptiacus* (49 mm) and could possible represent the same taxon as *Philisis sphingis*, only known from teeth.

Bown *et al.* (1982: 624) include this taxon in the "*Phyllostomatidae*?".

Subfamily Vespertilioninae Gray, 1821

*1821. *Vespertilioninae* Gray, London Med. Repos., 15: 299. Publication date: 1 April 1821. - Comments: Type genus: *Vespertilio* Linnaeus, 1758. (Current Combination)
1821. *Vespertilionini* Gray, London Med. Repos., 15: 299. - Comments: Type genus: *Vespertilio* Linnaeus, 1758. Originally included the genera *Megadermes* [sic = *Megaderma*] É. Geoffroy, 1810; *Rhynolophus* [sic = *Rhinolophus*] Lacépède, 1799; *Nycterus* [sic = *Nycteris*] É. Geoffroy and G. Cuvier, 1795; *Rhynopoma* [sic = *Rhinopoma*] É. Geoffroy, 1818; *Thaphosores* [sic = *Taphozous*] É. Geoffroy, 1818; *Vespertilio* Linnaeus, 1758; *Pecotus* [sic = *Plecotus* É. Geoffroy, 1818; and Barbastella *J. Gray*, 1821 (see Jackson and Groves, 2015: 271). Accepted as tribe by Koopman and Jones (1970: 27), McKenna and Bell (1997: 318), Hoofer and Van Den Bussche (2003: 38) and Simmons (2005: 484) (see Jackson and Groves, 2015: 271).
1842. *Pipistrellini* Tate, Bull. Am. Mus. Nat. Hist., 80 (7): 221, 231. Publication date: 27 November 1942. - Comments: Type genus: *Pipistrellus* Kaup, 1829. Introduced as tribe, and originally including the genera *Pipistrellus* Kaup, 1829 and *Glischropus* Dobson, 1875 (see Jackson and Groves, 2015: 274).
1855. *Nycticeiini* Gervais, in: F. Comte de Castelnau, Exped. Partes Cen. Am. Sud.Zool., Zool. (Sec. 7), Vol. 1, pt. 2: 71 footnote. Publication date: 23 July 1855. - Comments: Type genus: *Nycticeius* Rafinesque, 1819. Introducted as tribe (Nycticéins) and originally included the genera *Atalapha* Rafinesque, 1814 [= *Nyctalus* Bowdich, 1825] and *Nycticejus* [sic = *Nycticeius*] Rafinesque, 1819 (see Jackson and Groves, 2015: 275, who also recognized it as a valid tribe). (Current Spelling)
*1855. *Nycticeina* Gervais, in: F. Comte de Castelnau, Exped. Partes Cen. Am. Sud., Zool. (Sec. 7), Vol. 1, pt. 2: 71 footnote. Publication date: 23 July 1855. - Comments: Type genus: *Nycticeius* Rafinesque, 1819. Introducted as tribe (Nycticéins) and originally included the genera *Atalapha* Rafinesque, 1814 [= *Nyctalus* Bowdich, 1825] and *Nycticejus* [sic = *Nycticeius*] Rafinesque, 1819 (see Jackson and Groves, 2015: 275).
1865. *Nyctophilinae* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, 1865: 524. - Comments: Type genus: *Nyctophilus* Leach, 1821. Considered a valid subfamily by Hall and Kelson

(1959: 201) [including *Antrozous*], Corbet and Hill (1992: 156), but see Hoofer and Van Den Bussche (2003: 1), who reject this (actually Peters uses "Nyctophili").

1872. *Nycticejinae* Gill, Smiths. Misc. Coll., 11 (1): 17. Publication date: November 1872. - Comments: Type genus: *Nycticeius* Rafinesque, 1819. Introduced as subfamily, but considered a synonym of the tribe Nycticeiini by Jackson and Groves (2015: 276).

1878. *Vespertiliones* Dobson, Catalogue of the Chiroptera of the collection of the British Museum., 168. - Comments: Type genus: *Vespertilio* Linnaeus, 1758. Dobson (1878: 168) introduced the name Vespertiliones in his key as "Group II" including the bats of the Vespertilioninae subfamily (see Jackson and Groves, 2015: 227). Originally included the genera *Vesperugo* Keyserling and Blasius, 1839 [= *Vespertilio* Linnaeus, 1758]; *Chalinolobus* Peters, 1865; *Scotophilus* Tomes, 1857; *Nycticejus* [sic = *Nycticeius*] Rafinesque, 1819; *Atalapha* Rafinesque, 1814 [= *Nyctalus* Bowdich, 1825]; *Harpiocephalus* J. Gray, 1842; *Vespertilio* Linnaeus, 1758; and *Kerivoula* J. Gray, 1842. Not Vespertiliones Pallas, 1767, nor Vespertiliones Peters, 1865.

1897. *Plecotinæ* Miller, N. Am. Fauna, 13: 41, 46. Publication date: 16 October 1897. - Comments: Type genus: *Plecotus* E. Geoffroy, 1818. Originally included the genera *Euderma* H. Allen, 1891 and *Plecotus* É. Geoffroy, 1818 (see Jackson and Groves, 2015: 270).

1897. *Vespertilioninæ* Miller, N. Am. Fauna, 13: 41, 54. Publication date: 16 October 1897. - Comments: Type genus: *Vespertilio* Linnaeus, 1758. Originally included the genera *Dasypterus* Peters, 1870 [= *Lasiurus* J. Gray, 1831]; *Rhogeëssa* H. Allen, 1866; *Nycticeius* Rafinesque, 1819; *Lasiurus* J. Gray, 1831; *Vespertilio* Linnaeus, 1758; *Pipistrellus* Kaup, 1829; *Lasionycteris* Peters, 1865; and *Myotis* Kaup, 1829 (see Jackson and Groves, 2015: 270).

1942. *Nycticeini* Tate, Bull. Am. Mus. Nat. Hist., 80 (7): 280. Publication date: 27 November 1942. - Comments: type genus: *Nycticeius* Rafinesque, 1819. Introducted as tribe and originally included the genera *Scoteinus* Dobson, 1875 [= *Scotomanes* Dobson, 1875; *Nycticeius* Rafinesque, 1819; *Rhogeëssa* H. Allen, 1866; *Baeodon* Miller, 1906 [= *Rhogeëssa* H. Allen, 1866; *Scotoecus* Thomas, 1901; *Scotophilus* Leach, 1821; *Scotomanes* Dobson, 1875; and *Otonycteris* Peters, 1859 (see Jackson and Groves, 2015: 276).

1987. *Eptésiformes* Menu, Palaeovert., 17 (3): 78, 104, 134. Publication date: 31 March 1987. - Comments: Type genus: *Eptesicus* Rafinesque, 1820. Originally included the genera *Eptesicus* Rafinesque, 1820 and *Nycterikaupius* Menu, 1987. Emended by McKenna and Bell (1997: 318) as published as ‘les eptésiformes’ as it seems to meet the requirements of Article 11 of the Code (ICZN, 1985a: 19) (see Jackson and Groves, 2015: 271).. Jackson and Groves (2015: 271) erroneously mentioned the genus *Nyctalus* Bowdich, 1825 as type genus.

1987. *Leuconoïdes* Menu, Palaeovert., 17 (3): 77, 82. Publication date: 31 March 1987. - Comments: Type genus: *Leuconoe* Boie, 1830. Introduced without formal rank, and originally including the genera *Leuconöe* Boie, 1830 [= *Myotis* Kaup, 1829]; *Pizonyx* Miller, 1906 [= *Myotis* Kaup , 1829]; and *Perimyotis* Menu, 1984 [= *Pipistrellus* Kaup, 1829] (see Jackson and Groves, 2015: 271). Emended by McKenna and Bell (1997: 316) to 'les leuconoïdes" as it apparently meets the requirements of Article 11 of the Code (ICZN, 1985a: 19) (see Jackson and Groves, 2015: 271).

1987. *Néoeptésiformes* Menu, Palaeovert., 17 (3): 77, 123, 134. Publication date: 31 March 1987. - Comments: Type genus: *Nyctalus* Bowdich, 1825. Originally included the genera *Hypsugo* Kolenati, 1856; *Tylonycteris* Peters, 1872; and *Mimetillus* Thomas, 1904. Emended by McKenna and Bell (1997: 318) as published as ‘les néoeptésiformes’ as it seems to meet the requirements of Article 11 of the Code (ICZN, 1985a: 19) (see Jackson and Groves, 2015: 271)..

1987. *Nyctaliformes* Menu, Palaeovert., 17 (3): 77, 95, 133. Publication date: 31 March 1987. - Comments: Type genus: *Nyctalus* Bowdich, 1825. Its original rank was unclear, but it was ranked in the "Les Nyctaloïdes" and included the genera *Pipistrellus* Kaup, 1829; *Glischropus* Dobson, 1875; *Philetor* Thomas, 1902; *Scotoecus* Thomas, 1901; and *Nyctalus* Bowdich, 1825 (see Jackson and Groves, 2015: 274). Synonymized with Vespertilioninae by McKenna and Bell (1997: 318), but with the tribe Pipistrellini by Jackson and Groves (2015: 274).

1987. *Nyctaloïdes* Menu, Palaeovert., 17 (3): 77, 94. Publication date: 31 March 1987. - Comments: Type genus: *Nyctalus* Bowdich, 1825. Originally, the rank was unclear, and it

included the Nyctaliformes Menu, 1987, Eptésiformes Menu, 1987 and Néoeptésiformes Menu, 1987 (see Jackson and Groves, 2015: 274). McKenna and Bell (1997: 318) synonymized it with the subfamily Vespertilioninae, whereas Jackson and Groves (2015: 274) synonymized it with the tribe Pipistrellini.

2018. *Vespertilininae:* Foord, Swanepoel, Evans, Schoeman, Erasmus, Schoeman, Keith, Smith, Mauda, Maree, Nembudani, Dippenaar-Schoeman, Munyai and Taylor, PLoS ONE, 13(5): e0194336: 6. Publication date: 8 May 2018. (Lapsus)

TAXONOMY:

Bronner *et al.* (2003) state that the classification of the subfamily Vespertilioninae was historically based on facial shortening and dental reduction characters (Miller, 1907), and augmented by bacula morphology (Hill and Harrison, 1987). Interrelationships among *Eptesicus* and *Pipistrellus* species have long been contentious and have for the most part remained unresolved. The principal character used to diagnose these genera was the presence (*Pipistrellus*) or absence (*Eptesicus*) of the anterior upper premolar. However, this character is variable in both genera Wallin, 1969; Koopman, 1975; Heller and Volleth, 1984). Baculum morphology (Heller and Volleth, 1984; Hill and Harrison, 1987) and karyological properties (Heller and Volleth, 1984; Zima and Horácek, 1985) also vary markedly among species assigned to *Pipistrellus* using dental characters. Heller and Volleth (1984) concluded that the genus *Eptesicus* is characterised by a distinct karyotype of 2*n* = 50, and removed those taxa with 2*n* = >44 (*E. capensis* and some Australian species) from *Eptesicus* to *Pipistrellus*, a treatment they considered consistent with patterns of variation in baculum morphology.

After extensively reviewing variation in baculum morphology, Hill and Harrison (1987) divived *Pipistrellus* into seven subgenera. They transferred *anchietae* (see Kock (2001c: 246) for justification of spelling) to the subgenus *Hypsugo* and four African species of *Eptesicus* (*capensis, melckorum, zuluensis* and *rendalli*) to the subgenus *Neoromicia* within *Pipistrellus*. *Hypsugo* was subsequently raised to generic rank on the basis of detailed morphological and biochemical analyses (Horácek and Hanák, 1986; Ruedi and Arlettaz, 1991), a treatment supported also by cytogenetic evidence showing radical reorganization of the genome and karyotypic evolution in *H. anchietae* (Kearney *et al.*, 2002). Most of the other (extralimital) subgenera were subsequently also awarded full genus status, with the exception of *Pipistrellus* and *Neoromicia*. McBee *et al.* (1987) and Morales *et al.* (1991) provided further cytogenetic and electrophoretic evidence supporting the findings of Heller and Volleth (1984), but argued that further studies were needed to justify the inclusion of these species in *Pipistrellus*. Koopman (1993a), therefore, recognised *Neoromicia*, but retained it as a subgenus of *Eptesicus*.

Volleth and Heller (1994) subsequently published more karyotypic evidence supporting the inclusion of *Neoromicia* within *Pipistrellus*, a treatment formalised by Koopman (1994). Most recently, Volleth *et al.* (2001) showed that the four African species included in *Neoromicia* (*capensis, nanus, rendalli* and *zuluensis*) display karyotypic synapomorphies typical of the Vespertilionini, in contrast to the other African *Pipistrellus* that show cytogenetic traits characteristic of the Pipistrellini. *Neoromicia* should thus be elevated to full generic rank to avoid recognising a paraphyletic *Pipistrellus*. Cladistic analysis of chromosomal data (showing that the four *Neoromicia* species also share three Roberstonian fusions), and of baculum characters in southern African species, provide additional support for recognising *Neoromicia* as a distinct genus (Kearney *et al.*, 2002). Consequently, the genus *Eptesicus* in southern Africa is represented by only one species, namely *E. hottentotus*.

Using digenomic DNA, Roehrs *et al.* (2010: 1073) were able to distinguish 6 tribes in the Vespertilioninae: Antrozoini, Lasiurini, Scotophilini, Vespertilionini, and 2 new unnamed tribal clades, the perimyotine group and the hypsugine group. They were unable to confirm a Nycticeiini-Eptesicini group, nor were they able to separate the Plecotini.

COMMON NAMES:

Czech: praví netopýři.

PARASITES:

Nycteribiidae: *Nycteribia tecta* Theodor, 1957 (Haeselbarth *et al.*, 1966: 110 as *Eptesicus sp.*).

SIPHONAPTERA

Ischnopsyllidae: *Dampfia grahami* (Waterston, 1915) collected in the Free State and KwaZulu Natal, South Africa where the host is assumed to belong to the genus *Eptesicus* now possibly referring to *Neoromicia* (Haeselbarth *et al.*, 1966: 187).

Genus ***Barbastella*** Gray, 1821

*1821. *Barbastella* Gray, London Med. Repos., 15 (1): 300. Publication date: 1 April 1821. - Comments: Type species: *Vespertilio barbastellus* Schreber, 1774. - Etymology: From Latin "*barba*" meaning bearded and "*stella*" meaning star (see Rydell and Bogdanowicz, 1997: 5). (Current Combination)

1829. *Barbastellus* Kaup, Skizzierte Entwicklungs-Geschichte Natürliche Systematik der Europäische Thierwelt, 1: ???. Publication date: 1829.

1839. *Synotus* Keyserling and Blasius, Arch. Naturgesch. Berlin, 5 (1): 305. Publication date: 1839. - Comments: Type species: *Vespertilio barbastellus* Schreber, 1774. - Etymology: From the Greek "*σύν*", meaning together and "*οὖς*" or "*ὠτός*", meaning ear (see Palmer, 1904: 657).

TAXONOMY:
See Simmons (2005), Kruskop *et al.* (2019).

Known species of the genus *Barbastella*: ***barbastellus*** (Schreber, 1774); *caspica* Satunin, 1908, *darjelingensis* Hodgson, 1855, ***leucomelas*** (Cretzschmar, 1826), *pacifica* Kruskop, Kawai and Tiunov, 1919..

Slovak: Uchaňa čierna. Slovenian: Širokouhi netopir. Swedish: Barbastell. Turkish: Basıkburunlu Yarasa. Ukrainian: Широковух європейський. Welsh: Ystlum du.

CONSERVATION STATUS:
Global - Listed as Near Threatened (NT ver 3.1 (2001)) (approaching A4c), as it is suspected that population declines will approach 30 % over a 15 year period including both the past and the future. Although this species has a large range, it is generally rare, occurring in low density and numbers. It is mainly sedentary. The population is fragmented and linked to particular kinds of old forest habitats, which are declining. The species does not easily colonise new areas. Declines are widely reported in most of its range with a few exceptions in recent years. The status of this species is linked to forestry practices and the decline in the number of old trees (one colony may use up to 30 old trees with holes each summer season). Has specific habitat and diet requirements (Hutson *et al.*, 2008b; IUCN, 2009).

Assessment History -
2008 - NT ver 3.1 (2001) (Hutson *et al.*, 2008b; IUCN, 2009). 1996 - VU A2c ver 2.3 (1994).

It is protected by national legislation in most range states. There are also international legal obligations for its protection through the Bonn Convention (Eurobats) and Bern Convention where these apply. It is included in Annex II (and IV) of EU Habitats and Species Directive, and hence requires special measures for conservation including designation of Special Areas for Conservation. Some habitat protection through Natura 2000.

MAJOR THREATS:
Loss of old mature woodland and ancient trees with loose bark or wood crevices (reforested areas are not suitable for this species); disturbance and loss of underground habitats, disturbance and loss of roost sites in older buildings (Hutson *et al.*, 2008b; IUCN, 2009). In Germany, habitat loss and fragmentation (caused by inter alia infrastructure development, forestry, and the renovation or demolition of old buildings used as roost sites), and disturbance (e.g. from cave tourism) are major threats (Schulenberg, 2005); accidental mortality (roadkill) is also a problem (Rudolph *et al.*, 2003).

CONSERVATION ACTIONS:
Hutson *et al.* (2008b) [in IUCN (2009)] indicate that research is underway to establish conservation requirements for this species. Recommendations include adopting forestry practices that maintain old trees in sufficient numbers.

GENERAL DISTRIBUTION:
Barbastella barbastellus is largely restricted to central and southern Europe, although its range extends into the Caucasus, Anatolia, Morocco (North Africa) and the Canary Islands (La Gomera and Tenerife only). It has recently been recorded from Iran on the Arabian Peninsula. It occurs to 1,800 m in the Alps (Spitzenberger, 2002), 1,900 m in the Caucasus and 2,260 m in the Pyrenees (Mitchell-Jones *et al.*, 1999).

Native: Andorra; Armenia; Austria; Azerbaijan; Belarus; Bosnia and Herzegovina; Bulgaria; Croatia; Czech Republic; Denmark; France; Georgia; Germany; Greece; Holy See [Vatican City State]; Hungary; Iran (Benda *et al.*, 2008b) [in Karami *et al.*, 2009: 69]); Ireland; Italy (Sardegna,

Sicilia); Latvia; Liechtenstein; Lithuania; Luxembourg; Macedonia, the former Yugoslav Republic of; Moldova; Monaco; Montenegro; Morocco (Benda *et al.*, 2010a: 158; Rebelo *et al.*, 2012: 2763; El Ibrahimi and Rguibi Idrissi, 2015: 364); Netherlands; Poland; Portugal; Romania; Russian Federation; San Marino; Serbia; Slovakia; Slovenia; Spain [Baleares, Canary Is.]; Sweden; Switzerland; Ukraine; United Kingdom.

Presence uncertain: Norway; Senegal; Turkey.

ECHOLOCATION:
Walters *et al.* (2012: suppl.) report the following figures for 28 calls from bats from France, Slovenia, Switzerland and the UK: duration: 3.57 ± 1.84 msec, F_{max}: 43.23 ± 8.31 kHz, F_{min}: 28.87 ± 3.18 kHz, bandwidth: 14.36 ± 8.29 kHz, F_{peak}: 35.48 ± 4.32 kHz.

Barataud (2011: 95) indicates that Barbastelles alter their echolocation signals to mislead their prey, which primilary consists of tympanic moths. He reports (p. 96) two sets of data from France:
A) F_{start}: 37.5 ± 1.8 kHz, F_{end}: 27.6 ± 1.1 kHz, F_{peak}: 34.5 ± 1.5 kHz, bandwidth: 9.8 ± 2.0 kHz, duration: 3.2 ± 0.9 msec, interpulse interval: 82.6 ± 40.2 msec (based on 18 calls);
B) F_{start}: 45.5 ± 2.1 kHz, F_{end}: 34.2 ± 4.0 kHz, F_{peak}: 43.1 ± 2.3 kHz, bandwidth: 11.3 ± 3.8 kHz, duration: 5.9 ± 2.5 msec, interpulse interval: 58.5 ± 8.4 msec (based on 17 calls).
These calls are alternately emitted. The interval between type A and type B calls was 58.5 ± 8.4 msec, and between type B and type A 82.6 ± 40.2 msec.

MOLECULAR BIOLOGY:
DNA - See García-Mudarra *et al.* (2009).

Karyotype - Capanna (1968: 624) reported 2*n* = 32. Rushton (1970: 463) reported 2 *n* = 32, FN = 50, X = metacentric, Y = minute. Arslan and Zima (2014: 14) mention 2*n* = 32, FNa = 50, FN = 54, a metacentric X and an acrocentric Y.

MIGRATION:
Movements up to 290 km in Austria (Kepka, 1960).

DIET:
Andreas *et al.* (2012: 81) indicate that, in the Czech Republic, this bat's main food source are larger species of moths. At the end of Autumn (November) the bats switched to smaller preys (e.g. *Operophtera brumata*, wingspan <= 30 mm) as the larger species were no longer flying around. These findings confirmed that *B. barbastellus* is primarily an aerial hawking species.

POPULATION:
Structure - See Hutson *et al.* (2008b) and IUCN (2009) for information on European populations.
Density - See Hutson *et al.* (2008b) and IUCN (2009) for information on European populations.
Trend - 2008 - Decreasing (Hutson *et al.*, 2008b; IUCN, 2009).

In Africa, population size and trends are unknown (Hutson *et al.*, 2008b; IUCN, 2009).

VIRUSES:
Despite sampling and testing of 35 individuals of this species, no evidence of influenza A-like viruses (Orthomyxoviridae) were obtained (Fereidouni *et al.*, 2015).

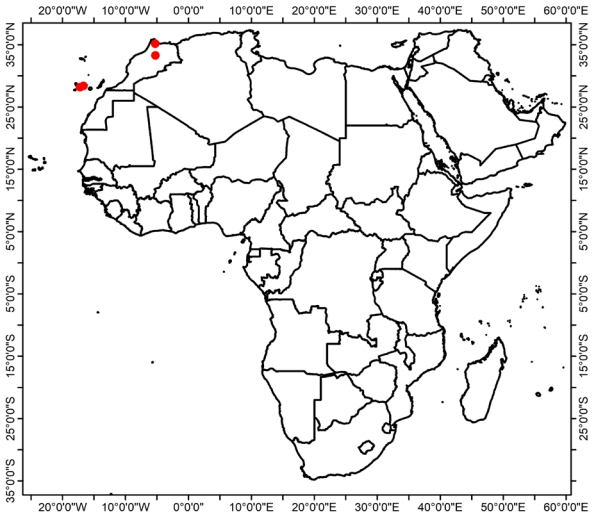

Figure 270. Distribution of *Barbastella barbastellus*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Canary Islands (Spain), Morocco.

Barbastella leucomelas (Cretzschmar, 1826)

*1826. *Vespertilio leucomelas* Cretzschmar, in: Rüppell, Atlas Reise Nördlichen Afrika, Zoologie Säugethiere, 1: 73, pl. 28b [Goto Description]. Lectotype: SMF 4373: mounted skin and skull. Collected by: Wilhem Peter Edward Simon Rüppell; collection date: 1860; original number: II.M.1.a. See Mertens (1925: 21). - Comments: For an extensive discussion on the type locality see Benda *et al.* (2008f: 50 - 54), who conclude: "From the Rüppell's (1829) descriptions and according to his traveling schedule, it is fully clear, that in his concept the 'Arabia Petraea' represent 'the area of the Sinaitic peninsula to the south of the connecting line between the towns of Suez and Aqaba', as pointed out above, see also

Fig. 52. Since it seems to be appropriate to consider localities given by Cretzschmar to be in accordance with those given by the collector, with the above 'area' is most convenient to associate the type locality of the species Vespertilio leucomelas Cretzschmar, 1830 = Barbastella leucomelas (Cretzschmar, 1830). In this area the type series lectotype: SMF II.M.1.a = SMF 4343; paralectotype: SMF II.M.1.b = SMF 12393; Mertens (1925), Kock (1969a) was collected in 1822 and/or 1826."
Benda and Mlíkovský (2008: 36) mention "Several authors believed that the name *Vespertilio leucomelas* was published in 1826, i.e. in the year when "Rüppell's Atlas" (see Cretzschmar, 1826) begun to be issued. According to Mertens (1925: 19), the sheets 18-19 associated with Tables 27-30 of Cretzschmar (1826-1830), containing also the description of *V. leucomelas* (sheet 18 and Table 28, respectively), were published in 1830 (see also Kock, 1969a, Corbet and Hill, 1992, Bates and Harrison, 1997, and/or Rydell and Bogdanowicz, 1997).". - Etymology: From the Greek "leucos" and "melas".

? *Barbastella barbastellus leucomelas:* (Name Combination)

? *Barbastella leucomelas:* (Name Combination, Current Combination)

TAXONOMY:
Included in *barbastellus* by Kock (1969a: 176). Horácek *et al.* (2000: 133 - 134) indicate that western *leucomelas* might be conspecific with *barbastellus*, but retain it as a valid species. If both are conspecific, the correct name for the eastern Barbastelle would be *Barbastella darjelingensis* Hodgson, in Horsfield, 1855. Zhang (2007: 1393) indicate that *leucomelas* from Sichuan, Taiwan, and Japan is different from the Egyptian one, and should therefore not be considered conspecific with *darjelingensis*.
.
Benda *et al.* (2008f: 49) confirmed that *leucomelas* represents a separate species.

COMMON NAMES:
Arabian: Khaffash. Czech: dasík arabský (netopýr skalní). Dutch: Arabische mopsvleermuis. English: Eastern Barbastelle, Eastern Barbastelle Bat, Arabian barbastelle, Sinai Barbestelle, Asiatic Barbastelle, Asian Barbastelle. French: Barbastelle orientale. German: Östliche Mopsfledermaus. Hebrew: Blumaf Shahor. Russian: Азиатская широкоушка [= Aeiatskaya shirokouchka];

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)), although it seems to be rare, it is very widespread and is unlikely to be declining fast enough to qualify for listing in a more threatened category (Benda *et al.*, 2008b; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Benda *et al.*, 2008b; IUCN, 2009).

It is included in Eurobats (Bonn Convention) and so should be protected in party range states (e.g. Georgia).
1996 - Lower Risk/least concern.

MAJOR THREATS:
More information is needed regarding threats to this species throughout its range. In South Asia (India, Nepal, and Pakistan) deforestation has decreased the area and quality of the species' habitat. Activities associated with war may be a threat to this species in all parts of its western Palaearctic range (damage and disturbance to caves and old buildings, disruption to habitat) (Benda *et al.*, 2008b; IUCN, 2009).

CONSERVATION ACTIONS:
Further surveys and monitoring are needed for this species to determine the current population status, range and major threats (Benda *et al.*, 2008b; IUCN, 2009).
It probably occurs in several protected areas throughout its range (Benda *et al.*, 2008b; IUCN, 2009).

GENERAL DISTRIBUTION:
Barbastella leucomelas was considered to be a very widespread species, with a distribution reaching from the Caucasus eastwards to Iran, Afghanistan and India, and onwards to China and Japan. These populations were, however, reassigned to *B. darjelingensis*. In the western part of the distribution area, there were isolated populations known from Sinai (Egypt) and the southern tip of Israel, as well as Eritrea in North Africa (Benda *et al.*, 2008b). It occurs up to 2,500 m asl.

Native: Eritrea, Egypt (Sinai); Israel, Jordan (Benda *et al.*, 2010b: 185; Kruskop *et al.*, 2019: 463), and perhaps Saudi Arabia.

ECHOLOCATION:
In Jordan, Benda *et al.* (2010b: 204) recorded three different types of calls, which they called A, A2, and B. These calls had the following parameters:

A: Start frequency: 37.1 ± 1.3 (34.9 - 40.3) kHz, End frequency: 29.2 ± 1.1 (27.7 - 31.8) kHz, Peak frequency: 33.8 ± 1.0 (32.7 - 36.0) kHz, Pulse duration: 2.9 ± 0.4 (1.9 - 3.5) msec, and Inter-pulse duration: 76.8 ± 39.3 (50.5 - 146.0) msec.
A2: Inter-pulse duration: 125.8 ± 30.5 (94.0 - 201.0) msec.
B: Start frequency: 44.1 ± 0.5 (43.0 - 45.0) kHz, End frequency: 34.3 ± 2.9 (29.8 - 38.5) kHz, Peak frequency: 42.7 ± 1.3 (40.0 - 44.2) kHz, Pulse duration: 13.0 ± 4.2 (6.9 - 17.6) msec, and Inter-pulse duration: 52.6 ± 6.4 (43.0 - 65.0) msec.

In Israel, *B. leucomelas* alternates between two call types (Hackett *et al.*, 2016: 223, 225): type I (8 calls): Pulse duration: 1.81 ± 0.11 msec, F_{start}: 35.85 ± 0.71 kHz, F_{end}: 29.70 ± 0.53 kHz, F_{peak}: 33.20 ± 0 kHz. Type II (6 calls): Pulse duration: 4.62 ± 0.40 msec, F_{start}: 43.90 ± 0 (43.8 - 44.0) kHz, F_{end}: 32.33 ± 2.67 (29.1 - 35.2) kHz, F_{peak}: 39.83 ± 0.75 (38.9 - 41.1) kHz.

ROOST:
It roosts in caves, tunnels, crevices, old buildings, mines, tree hollows, and can be found beneath bark (Benda *et al.*, 2008b).

POPULATION:
Structure - It is a sedentary insectivore, with 3 - 8 females in nursery colonies, with females normally living separately to males (Benda *et al.*, 2008b).
Density - Considering its wide range there seems to be little information available about the population of this species. Within its range in Africa the population size and trends are currently unknown. In Southwest Asia, it is considered to be rare and is poorly known. In 2005, the species was found in Sinai (Egypt) in surveys for the first time in 180 years (D. Kock *pers. comm.,* in Benda *et al.*, 2008b). For the former Soviet Union, the species is listed in the second edition of the Red Book of the USSR (1984) as Rare but was considered to be "least concern" (K. Tsytsulina *pers. comm.,* in Benda *et al.*, 2008b). In Japan, it has been observed only rarely except in Hokkaido. In the past 30 years there have also been records from the prefectures of Iwate, Saitama, Gifu and Ehime (Abe *et al.*, 2005).
Trend - 2008 - Unknown (Benda *et al.*, 2008b; IUCN, 2009).

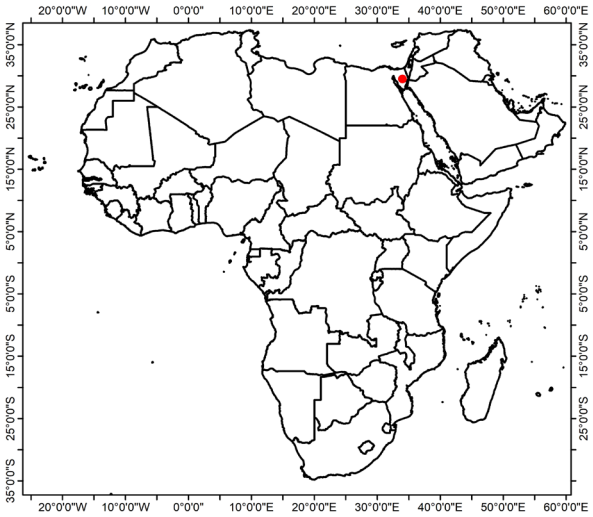

Figure 271. Distribution of *Barbastella leucomelas*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Egypt.

Genus ***Eptesicus*** Rafinesque, 1820

*1820. *Eptesicus* Rafinesque, Annals of nature or annual synopsis of new genera and species of animals, plants &c. discovered in North America, 2. Publication date: 1 March 1820 [Goto Description]. - Comments: Type species: *Eptesicus melanops* Rafinesque, 1820 (=*Vespertilio fuscus* Beauvois, 1796). - Etymology: From the Greek "*επτην*" (aor. of "*πέτομαι*"), meaning to fly or flying and "*οίκος*", meaning house (house flier) (see Palmer, 1904: 268; Flannery, 1995a: 367; Kozhurina, 2002: 15; Álvarez-Castañeda and Álvarez Solórzano, 1996: 43). Braun and Mares (1995: 179) state: "*eptesicus* (NL), a name coined by Rafinesque that he said he derived from *epien* (Greek), to fly + *oikos* (Greek), house (Palmer, 1904; Gotsch, 1979). However, the correct Greek word would more likely be *eptén*, which means "I flew".". - ZooBank: A96CB3CB-AA8F-4450-9EB0-FCEC51D29B8B.

1829. *Cnephæus* Kaup, Skizzierte Entwicklungs-Geschichte Natürliche Systematik der Europäische Thierwelt, 1: 103. Publication date: 1829. - Comments: Type species: *Vespertilio serotinus* Schreber, 1774. Considered a valid subgenus by Hoofer and Van Den Bussche (2003: 38), including *serotinus* and *hottentotus*.

1837. *Noctula* Bonaparte, Iconografia Fauna italiana, 1, fasc. 21 [Goto Description]. - Comments: Type species: *Noctula serotina*: Bonaparte (=*Vespertilio serotinus* Schreber, 1774). Allen (1939a: 92) mentioned it in the genus *Nyctalus*, but referred to a publication from 1841. - Etymology: From the French noctule, common name of a bat, which in turn comes from the Latin "*nox*" or "*noctis*", meaning night (see Palmer, 1904: 460).

1839. *Vesperugo* Keyserling and Blasius, Arch. Naturgesch. Berlin, 5 (1): 312. Publication date: 1839. - Comments: In part (see Allen, 1939a: 92; Pavlinov *et al.*, 1995: 104). Included 13 species now referred to *Eptesicus, Pipistrellus, Neoromicia, Hypsugo*.
1839. *Vesperus* Keyserling and Blasius, Arch. Naturgesch. Berlin, 5 (1): 313. Publication date: 1839. - Comments: In part (see Allen, 1939a: 84; Pavlinov *et al.*, 1995: 112). Allen (1939a: 84) assigned it to Dobson, Cat. Chiropt. Brit. Mus., p. 184, 1878. Not of Latreille: see Cabrera (1914: 129). Allen (1894: 111 - 112) mentions that Mr. F.W. True has called his attention to the fact that the *Vesperus* of Keyserling and Blasius, 1840, is antedated by *Vesperus* of Dejean, 1821. The latter was a *nomen nudum* until 1829, when it was taken up by Latreille and described. The *Vesperus* of Keyserling and Blasius is, therefore, untenable. *Vesperus* is valid only in Latreille, 1829 (Coleoptera, Cerambycidae).
1856. *Cateorus* Kolenati, Allg. deutsche naturh. Zeitung, N.F., 2 (2): 131. Publication date: 1856. - Comments: Type species: *Vespertilio serotinus* Schreber, 1774. - Etymology: From the Greek "*κατήορος*", meaning hanging down, referring to the position of the animal when at rest (see Palmer, 1904: 163).
1856. *Meteorus* Kolenati, Allg. deutsche naturh. Zeitung, N.F., 2 (2): 131. Publication date: 1856. - Comments: Mentioned by Allen (1939a: 83) as "in part". Included with a question mark in the synonymy of *Eptesicus* by Pavlinov *et al.* (1995: 112). - Etymology: From the Greek "*μετέωρ*", meaning meteor, referring to the flight (see Palmer, 1904: 419).
1858. *Amblyotus* Kolenati, Sber. k. Akad. Wiss. Wien, math. naturw. Kl., 29: 252. Publication date: 1858. - Comments: Type species: *Amblyotus atratus* Kolenati, 1858 (=*Vespertilio nilssonii* Keyserling and Blasius, 1839). Considered a valid subgenus by Pavlinov *et al.* (1995: 112). However, based on mtDNA analyses, Artyushin *et al.* (2009: 40) doubt the validity of *Amblyotis* as a subgenus.
1863. *Aristippe* Kolenati, Beitrage zur Kenntniss der Phthiriomyiarien, Petersburg. - Comments: (in part).
1866. *Pachyomus* Gray, Ann. Mag. nat. Hist., ser. 3, 17 (98): 90. Publication date: 1 February 1866. - Comments: Type species: *Scotophilus pachyomus* Tomes, 1857 (=*Vespertilio serotinus* Schreber, 1774). - Etymology: From the Greek "*παχύς*", meaning thick and "*ώμος*", meaning shoulder referring to the specific name of the type species (see Palmer, 1904: 494).
1870. *Nyctiptenus* Fitzinger, Sber. k. Akad. Wiss. Wien, math. naturw. Kl., 62 (1): 424. - Comments: Type species: *Vespertilio smithii* Wagner, 1855 (=*Vespertilio hottentota* A. Smith, 1833). - Etymology: From the Greek "*νύξ*" or "*νυκτός*", meaning night and "*πτήν*" or "*πτηρόν*", meaning winged referring to to winged nocturnal creature (see Palmer, 1904: 467).
1892. *Adelonycteris* H. Allen, Proc. Acad. nat. Sci. Philad., 43: 466 (for 1891). Publication date: 19 January 1892. - Comments: Allen (1939a: 84) mentioned it "in part; substitute for *Vesperus*, preoccupied". Ellerman and Morrison-Scott (1951: 153), Hall and Kelson (1959: 184) and Hall (1981: 213) stated that it is a renaming of *Vesperus* Keyserling and Blasius, 1839, which included part of both *Vespertilio* and *Eptesicus* and which is an homonym of *Vesperus* Latreille, 1829, an insect.
1906. *Rhinopterus* Miller, Proc. Biol. Soc. Wash., 19: 85. Publication date: 4 June 1906 [Goto Description]. - Comments: Type species: *Glauconycteris floweri* de Winton, 1901. The date mentioned on the publication is 4 June 1906, although in many cases 23 July 1906 is found as publication date.
1917. *Pareptesicus* Bianchi, Ann. Mus. zool. Acad. Impér. Sci. St. Petersbourg, 21: lxxvii. - Comments: Type species: *Vesperugo pachyotis* Dobson, 1871.
1917. *Rhyneptesicus* Bianchi, Ann. Mus. zool. Acad. Impér. Sci. St. Petersbourg, 21: lxxvii. - Comments: Type species: *Vesperugo nasutus* Dobson, 1877.
1931. *Tuitatus* Kishida and Mori, Zool. Mag., Tokyo, 43: 372-391. - Comments: Nomen nudum (see Ellerman and Morrison-Scott, 1951: 153; Meester *et al.*, 1986: 56; Pavlinov *et al.*, 1995: 112).
1959. *Amblyotis:* Hall and Kelson, Mammals of North America, 1: 183. (Lapsus)
1959. *Nyctiptennis* Hall and Kelson, Mammals of North America, 1: 183.
1975. *Eptiscus:* Dean, Zool. Afr., 10: 218. (Lapsus)
1986. *Rhineptesicus:* Horácek and Hanák, Myotis, 23-24: 16. (Lapsus)
2017. *Eptisecus:* Ahmim, JOTT, 9 (1): 9723. Publication date: 26 January 2017. (Lapsus)
? *Cnephaeus:* (Current Spelling)
? *Eptesicus sp.:*

TAXONOMY:
Does not include *Neoromicia* Roberts, 1926, see Volleth *et al.* (2001), Kearney *et al.* (2002), and Hoofer and Van Den Bussche (2003).

Artyushin *et al.* (2018: 475) indicate that the previously proposed inclusion of the Old World representatives in the subgenus *Cnephaeus* could not be confirmed by their analyses of five nuclear and one mitochondrial (cyt-*b*) genes.

Known species of the genus *Eptesicus*: *andinus* J. A. Allen, 1914 – Colombia, Ecuador, Peru, Venezuela, Amozonian Brazil (Simmons, 2005: 453); *bobrinskoi* Kuzyakin, 1935 - (Simmons, 2005: 453); ***bottae*** (Peters, 1869); *brasiliensis* (Desmarest, 1819) – Veracruz (Mexico) south to northern Argentina, Paraguay and Uruguay, Trinidad and Tobago (Simmons, 2005: 453); *chiriquinus* Thomas, 1920 – Costa Rica, Panama, Colombia, Ecuador, Peru, Venezuela, Guyana, French Guiana, Amozonian Brazil (Simmons, 2005: 454); *diminutus* Osgood, 1915 – Venezuela, eastern Brazil, Paraguay and northern Argentina (Simmons, 2005: 454); ***floweri*** (de Winton, 1901); *furinalis* (d'Orbigny, 1847) – northern Argentina, Paraguary, Bolivia, Brazil and the Guinas east to Peru and north to Jalisco and Tamaulipas (Mexico); *fuscus* (Beauvois, 1796) – southern Canada to Colombia and northern Brazil, Greater Antilles, Bahamas, Dominica and Barbados (Lesser Antilles), Alaska (Simmons, 2005: 454); *gobiensis* Bobrinskii, 1926 – Iran, northern Afghanistan, Kashmir, Pakistan and Nepal, southern Russia, Mongolia (Simmons, 2005: 454); *guadeloupensis* Genoways and Baker, 1975 – Guadeloupe (Lesser Antilles) (Simmons, 2005: 455); ***hottentotus*** (A. Smith, 1833); *innoxius* (Gervais, 1841) – northwestern Peru, western Ecuador, Puna Isl (Ecuador) (Simmons, 2005: 455); ***isabellinus*** Temminck, 1840; *japonensis* Imaizumi, 1953 – Honshû Isl (Japan) (Simmons, 2005: 455); *kobayashii* Mori, 1928 – Korea (Simmons, 2005: 455); *nasutus* (Dobson, 1877) – Saudi Arabia, Oman, Yemen, Iraq, Iran, Afghanistan, Pakistan (Simmons, 2005: 456); *nilssonii* (Keyserling and Blasius, 1839) – western and eastern Europe to eastern Siberia and northwestern China, north beyond Artic Circle in Scandinavia, south to Bulgaria, Iraq, the Elburz Mtns (northern Iran), The Pamirs and western China (not Tibet), Korea, Hokkaido (Japan), Sakhalin Isl (Russia) (Simmons, 2005: 456); *pachyotis* (Dobson, 1871) – Bangladesh, northeastern India, Tibet (China), northern Burma, northern Thailand (Simmons, 2005: 456); ***platyops*** (Thomas, 1901); *serotinus* (Schreber, 1774) – western Europe through Turkey and southern Asiatic Russia to Himalayas, Thailand and China, north to Korea, Taiwan, south England, most islands in Mediterranean, possibility north Africa (Simmons, 2005: 456); *tatei* Ellerman and Morrison-Scott, 1951 – northeastern India (Simmons, 2005: 456).

COMMON NAMES:
Czech: večerní netopýři, podvečerníkové. English: Big-brown bats, Serotines, Greater Serotine Bats, Serotine Bats. French: Sérotines. German: Breitflügelfledermäuse.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Avery (2007: 619) reported on the presence of *Eptesicus* sp. in Pleistocene deposits at Wonderwerk Cave, South Africa.

ZOOBANK:
A96CB3CB-AA8F-4450-9EB0-FCEC51D29B8B

Eptesicus bottae (Peters, 1869)

*1869. *Vesperus Bottae*Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, 406. Type locality: Yemen: "Yemen": Restricted to W Yemen, between Al Hudayda, Ta'izz and Al Mukha, according to Karami *et al.* (2009: 70).. Holotype: MNHN ZM-MO-1987-297: ad, skull and alcoholic. Collected by: Dr. Paolo Emilio Botta; collection date: 1837. Number 212 in Rode (1941: 247). Rode (1941) mentions a male specimen, whereas Peters (1869a: 406) mentions a female. - Etymology: In honour of Paul-Emile Botta (1802 - 1870), who collected the type specimen (see Kozhurina, 2002: 14).

1887. *Vesperugo (Vesperus) Innesi* Lataste, Ann. Mus. civ. Stor. nat. Genova, ser. 2, 4 (O.S. 24): 625, 2 text-figs. Publication date: 25 July 1887. Type locality: Egypt: Cairo [30 03 N 31 15 E] [Goto Description]. Lectotype: BMNH 1919.7.7.3528: sad ♀, skull and alcoholic. Collected by: Dr. Walter F. Innes Bey; collection date: 1885. See Qumsiyeh (1985). Paralectotype: MSNG unknown: ♂. - Etymology: In honour of M. Walter Innes, curator of the Medical Museum, who collected the type specimens (see Lataste, 1887b: 628).

1891. *Vesperugo innesi:* Noack, Jb. Hamb. Wiss. Anst., 9: 139. (Name Combination)

1902. *Vespertilio innesi:* Anderson and de Winton, Zoology of Egypt: Mammalia, 121. (Name Combination)

1971. *Eptesicus [(Eptesicus)] bottae innesi:* Hayman and Hill, Mammals of Africa: Chiroptera, 45. (Name Combination)
1990. *Eptesicus (Eptesicus) bottae bottae:* Nader and Kock, Senckenb. biol., 79 (1/3): 2 (for 1989).
1994. *E[ptesicus (Eptesicus)] b[ottae] bottae:* Koopman, in: Niethammer, Schliemann and Starck, Handbook of Zoology, volume II (Mammalia) Chiroptera, (60) 120. (Name Combination)
1994. *E[ptesicus (Eptesicus)] b[ottae] innesi:* Koopman, in: Niethammer, Schliemann and Starck, Handbook of Zoology, volume II (Mammalia) Chiroptera, (60) 120. (Name Combination)

TAXONOMY:
Revised by Nader and Kock (1990). Ellerman and Morrison-Scott (1966: 156) considers *isabellinus* to be a synonym of this species rather than of *E. serotinus*.

Populations in Turkey and northern Syria (and possibly other areas) are considered by Felten (1971) and Benda *et al.* (2006) to be a separate species: *Eptesicus anatolicus* Felten 1971.

Based on mtDNA analyses, Artyushin *et al.* (2018: 473) distinguished two clusters in . bottae: one including *E. b. ognevi* and the second including *E. b. hingstoni*, *E. b. innesi* and *E. b. taftanimontis*, and the differences between them are almost large enough to distinguish them as separate species. The relation of these taxa to *E. b. bottae* still needs to be determined.

COMMON NAMES:
Albanian: Serotinë e Botta's. Arabian: Khaffash. Armenian: Ասպպատայինմաշկեղ. Azerbaijani: Səhra gönlücəsi. Basque: Botta serotino. Belarusian: Кажан Бота. Bosnian: Botin šišmiš. Breton: Serotin Botta. Bulgarian: Полунощен прилеп на Бот. Castilian: Murciélago hortelano de Botta. Catalan: Ratpenat dels graners de Botta. Croatian: Bottin noćnjak. Czech: Netopýr Bottův, Netopýr Ogněvův. Danish: Bottas sydflagermus. Dutch: Botta's vleermuis. English: Botta's Serotine, Botta's Serotine Bat. Estonian: Kõrbe-nahkhiir. Finnish: Turkinserotiini. French: Sérotine de Botta. Frisian: Botta's lette flearmûs. Galician: Morcego das hortas de Botta. Georgian: ჭდაბნოს მეგვიანე. German: Bottas Breitflügelfledermaus, Bottas Fledermaus. Greek: Ασιατική τρανονυχτερίδα Hebrew: aflul matzuy, Aflul Matsui. Hungarian: Botta-késeidenevér. Irish Gaelic: Ialtóg Botta. Italian: Serotino di Botta. Latvian: Botas sikspārnis. Lithuanian: Uolinis šikšnys. Luxembourgish: Botta-Fliedermaus. Maltese: Serotin ta' Botta. Montenegrin: Svijetlotrbušasti slijepi miš. Norwegian: Blekflaggermus. Polish: Mroczek Botty. Portuguese: Morcego-hortelão de Botta. Rhaeto-Romance: Serotin da Botta. Romanian: Liliacul lui Botta. Russian: Кожан пустынный. Serbian: Блискоисточни поноћњак [= Bliskoistoč ni ponoć njak]. Scottish Gaelic: Ialtag Botta. Slovak: Več ernica Bottova. Slovenian: Svetlotrebuš ni poznik. Swedish: Blek sydfladdermus. Turkish: Bottae'nin Geniş kanatlı Yarasası. Ukrainian: іилик (Пергач) пустельний. Welsh: Ystlum adain-lydan Botta.

CONSERVATION STATUS:
Global - The species as described has a relatively wide range. Although generally considered uncommon it is described as locally common in at least part of the range (Egypt). No major threats are known. Hence it is listed as Least Concern (LC ver 3.1 (2001)) (Aulagnier *et al.*, 2008d; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Aulagnier *et al.*, 2008d; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Benda and

Juste, 2004; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

Protected through Eurobats (Bonn Convention) and Bern Convention, and included in Annex IV of EU Habitats and Species Directive in the very small part of the range where these apply.

MAJOR THREATS:
The species requires ruins which are decreasing in number and can be disturbed by tourists (A. Karatas *pers. comm.,* 2007), however, this is not thought to be a major threat to the species as a whole at present (Aulagnier *et al.*, 2008d; IUCN, 2009). Bilgin *et al.* (2012: 434) predict that climatic change will result in a major range contraction for this species.

CONSERVATION ACTIONS:
Aulagnier *et al.* (2008d) [in IUCN (2009)] suggest that taxonomic work is required to determine if more than one species is involved here and what the ranges of these are, and what their population status is.

GENERAL DISTRIBUTION:
Eptesicus bottae is a Palaearctic species, occuring from the eastern Mediterranean around margins of Arabian peninsula to Iraq, Iran and southern Caucacus states; also central Asia to India, northwestern China and possibly Mongolia.

Native: Afghanistan; Armenia; Azerbaijan; Egypt (Sinai); Georgia; Greece (East Aegean Is.); India; Iran, Islamic Republic of; Iraq; Israel; Jordan; Kazakhstan; Kyrgyzstan; Lebanon; Oman; Pakistan; Palestinian Territory, Occupied; Saudi Arabia; Syrian Arab Republic; Tajikistan; Turkey; Turkmenistan; United Arab Emirates; Uzbekistan; Yemen.
Presence uncertain: Djibouti; Eritrea; Mongolia; Russian Federation; Somalia; Sudan.

DETAILED MORPHOLOGY:
Baculum - Hill and Harrison (1987).

ECHOLOCATION:
Walters *et al.* (2012: suppl.) report the following figures for 26 calls (21 sequences) from bats from Egypt and Israel: duration: 8.35 ± 2.16 msec, F_{max}: 44.18 ± 6.90 kHz, F_{min}: 30.44 ± 1.10 kHz, bandwidth: 13.73 ± 6.25 kHz, F_{peak}: 33.47 ± 1.80 kHz.

In Jordan, the following parameters were reported by Benda *et al.* (2010b: 204) for 146 calls: F_{start} 53.6 ± 9.3 (37.9 - 83.0) kHz, F_{end}: 30.4 ± 1.5 (27.0 - 33.7) kHz, F_{peak}: 34.3 ± 1.8 (29.6 - 39.5) kHz, Pulse duration: 5.5 ± 1.3 (2.7 - 9.4) msec, and Inter-pulse interval: 123.6 ± 39.7 (52.0 - 241.0) msec.

Hackett *et al.* (2016: 223) reported on 147 calls from Israel: Pulse duration: 6.19 ± 1.51 msec, F_{start}: 42.63 ± 4.05 (38 - 51) kHz, F_{end}: 30.51 ± 1.21 (28.8 - 35.0) kHz, F_{peak}: 32.08 ± 1.29 (29.2 - 37.1) kHz.

MOLECULAR BIOLOGY:
DNA - Unknown.
Karyotype - Volleth *et al.* (2001) reported 2*n* = 50, FN = 48, BA = 0, a metacentric X chromosome and a metacentric Y chromosome for a male from Greece.
Protein / allozyme - Unknown.

DIET:
Hackett *et al.* (2013: 7) classify *E. bottae* as a background cluttered space aerial insectivore.
In the Dead Sea area of Israel Hymenoptera, Lepidoptera and Coleoptera form the most important groups of food items, whereas in Syria, Coleoptera were the prime food category, followed by Heteroptera and Auchenorrhyncha, and in Iran Hymenoptera (Formicoidea) (89 % volume) and Coleoptera (Scarabaeidae) were the most important food items, indicating that *E. bottae* is a flexible species feeding opportunistically especially on ants and beetles. (Benda *et al.*, 2012a: 387).

POPULATION:
Structure and Density - Reported to be locally common in Egypt, with colonies of up to 200 females being reported (African Mammal Assessment Workshop, 2004).
Trend - 2008 - Unknown (Aulagnier *et al.*, 2008d; IUCN, 2009). *Eptesicus bottae* populations within the Asia Minor and Levant region are unknown population trend, under predictive climate change scenarios (Bilgin *et al.*, 2012: 433).

ACTIVITY AND BEHAVIOUR:
In the Negev desert, Polak *et al.* (2011: 25) found that this species only passed through areas lighted by street lamps (flight speed: 9.25 ± 1.19 m/s), and never foraged there (contrary to *Pipistrellus kuhlii*. The flight speed during foraging in dark areas was 5.7 ± 1.3 m/s.

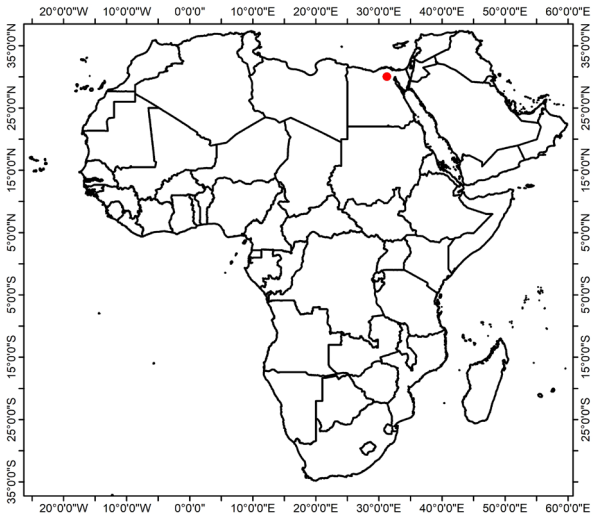

Figure 272. Distribution of *Eptesicus bottae*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Egypt, Yemen.

Eptesicus floweri (de Winton, 1901)

*1901. *Glauconycteris Floweri* de Winton, Ann. Mag. nat. Hist., ser. 7, 7 (37): 46. Publication date: 1 January 1901. Type locality: Sudan: 12 mi (18 km) S from Khartoum, on White Nile: Wad Marium [ca. 15 25 N 32 25 E] [Goto Description]. Holotype: BMNH 1903.2.7.14: ad ♂, skin and skull. Collected by: Mrs. Anderson and H.F. Witherby; collection date: 12 May 1900; original number: 35. - Comments: de Winton (1901b: 45) mentions Mr. H.F. Witherby as collector and the late Dr. John Anderson as aquirer.

1908. *S[cabrifer] floweri:* G.M. Allen, Bull. Mus. comp. Zool., 52 (3): 46. (Name Combination)

1915. *Rhinopterus lowei* Thomas, Ann. Mag. nat. Hist., 8, 15 (90): 559. Publication date: 1 June 1915. Type locality: Sudan: Blue Nile province: Sennaar, 20 mi (30 km) above [ca. 15 35 N 33 38 E, 450 m] [Goto Description]. Holotype: BMNH 1915.3.6.70: ad ♂, skull and alcoholic. Collected by: Willoughby P. Lowe; collection date: 13 December 1913.

1918. *Scabrifer floweri:* Wettstein, Denkschr. k. Akad. Wiss. Wien, Math.-Naturw. Kl., 94: 651. (Name Combination)

1939. *Rhinopterus floweri:* G.M. Allen, Bull. Mus. comp. Zool., 83: 97. (Name Combination)

1969. *Eptesicus (Rhinopterus) floweri:* Kock, Abh. Senckenberg. naturforsch. Ges., 521: 166. (Name Combination)

1971. *Eptesicus (Rhinopterus) lowei:* Hayman and Hill, Mammals of Africa: Chiroptera, 45. (Name Combination)

1974. *Eptesicus floweri:* Seal and Makey, ISIS Mammalian Taxonomic Director, ???. (Name Combination, Current Combination)

? *Eptesicus (Rhinopterus) floweri lowei:* (Name Combination)

TAXONOMY:
Includes *lowei*; see Bræstrup (1935b: 92); but also see Hayman and Hill (1971).

COMMON NAMES:
Czech: netopýr Flowerův. English: Horn-skinned Pipistrelle Bat, Flower's Pipistrelle Bat, Horn-skinned Bat, Sudan Horn-skinned Bat, Lesser Sudan Horn-skinned Bat, Sudan Serotine, Horn-skinned Serotine. French: Sérotine de Flower, Sérotine du Soudan. German: Chagrin Fledermaus, Warzen-Breitflügelfledermaus.

CONSERVATION STATUS:
Global - Although this species is known mainly from isolated records from a large area, it is listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, tolerance of a broad range of non-threatened habitats, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Jacobs *et al.*, 2008ah; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Jacobs *et al.*, 2008ah; IUCN, 2009). 2004 - VU D2 ver 3.1 (2001) (Jacobs *et al.*, 2004at; IUCN, 2004). 1996 - LR/nt (Baillie and Groombridge, 1996).

MAJOR THREATS:
There appear to be no major threats to this species (Jacobs *et al.*, 2008ah; IUCN, 2009).

CONSERVATION ACTIONS:
Jacobs *et al.* (2008ah) [in IUCN (2009)] report that there appear to be no direct conservation measures in place, and it is not known if the species is present within any protected areas. Further studies are needed into the distribution and natural history of this poorly known species.

GENERAL DISTRIBUTION:
Eptesicus floweri has been recorded from Mali (Timbuktu) and Sudan (all records within a 200-mile radius of Ed Dueim) and Mahmûdé Lake, Wilaya Hodh Ech Chargui in Mauritania.

Native: Mali (Koopman, 1975); Mauritania (Padial and Ibáñez, 2005: 240); Sudan (Bræstrup, 1935b; Koopman, 1975).

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:

Figure 273. Clockwise from top lateral, ventral and dorsal skull images of BMNH 1903.2.7.14, holotype of *Glauconycteris floweri* de Winton, 1901.

DETAILED MORPHOLOGY:
Baculum - Hill and Harrison (1987).

POPULATION:
Structure and Density - It is known from very few specimens.
Trend - 2008 - Stable (Jacobs *et al.*, 2008ah; IUCN, 2009).

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Mauritania, Sudan.

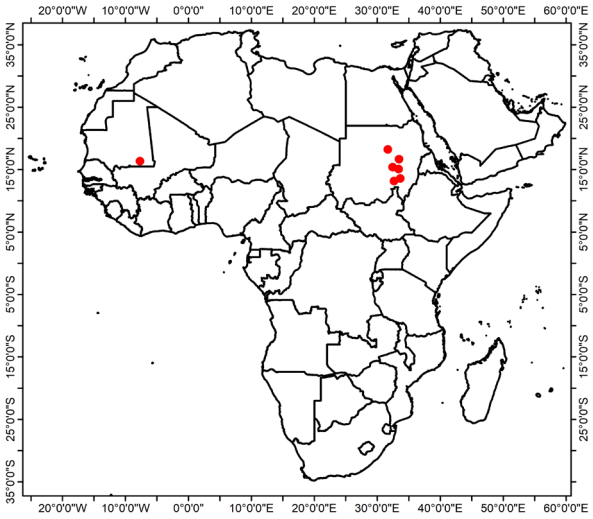

Figure 274. Distribution of *Eptesicus floweri*

Eptesicus hottentotus (A. Smith, 1833)

*1833. *Vespertilio Hottentota* A. Smith, S. Afr. Quart. J., ser. 2, 1 (2): 59. Publication date: November 1833. Type locality: South Africa: Cape province: Uitenhage [ca. 33 45 S 25 25 E] [Goto Description]. - Comments: Type locality restricted to Uitenhage (from Uitenhage and Albany) by Ellerman *et al.* (1953): see Meester *et al.* (1986: 57).

1835-1841. *Vespertilio megalurus* Temminck, Monographies de mammalogie ou description de quelques genres de mammifères, dont les espèces ont été observées dans les différens musées de l'Europe. Tome Seconde, 2: 206. Publication date: 1835 - 1841. Type locality: South Africa: "Interior of South Africa" [Goto Description]. - Comments: Type specimen: RMNH.

1849. *Vespertilio minutus* A. Smith, Illustrated Zoology of South African Mammals, pl. 51 and text. - Comments: Preoccupied by *Vespertilio minutus* Montagu, 1808 and *Vespertilio minuta* Temminck, 1840.

1855. *V[espertilio] Smithii* Wagner, in: Schreber, Die Säugethiere in Abbildungen nach der Natur mit Beschreibungen, Suppl. 5: 747, footnote. Publication date: 28 September 1855. Type locality: South Africa: "South Africa". - Comments: .

2003. *Eptesicus (Cnephaeus) hottentotus:* Hoofer and Van Den Bussche, Acta Chiropt., 5 (Suppl.): 38. (Name Combination)

Taxonomy:

Figure 275. *Eptesicus hottentotus* (TM 48193) caught at Farm Schaapplaats, Free State, South Africa.

Revised by Schlitter and Aggundey (1986), who described a new subspecies from Kenya - *Eptesicus hottentotus portavernus*. Besides the nominate form and the newly described subspecies, their work recognised one other subspecies *E. h. bensoni* (Roberts, 1946), but not *E. h. pallidior* (Shortridge, 1942), which they synonomised with the nominate subspecies (Schlitter and Aggundey, 1986). Simmons (2005: 455) recognised the same subspecies. An analysis of specimens from southern Africa showed support for the synonomization of *E. h. pallidior*, but also indicated that either the subspecies delineation between *E. h. hottentotus* and *E. h. bensoni* is also not as distinct, or the distribution of *E. h. bensoni*, described from Malawi, requires revision (Kearney, 2005). Although the distribution of *E. h. bensoni* in Meester *et al.* (1986: 57) included parts of South Africa, as well as Mozambique, Zimbabwe and Malawi, Hayman and Hill (1971) listed only Malawi and Zambia, and the subspecies was not included in the list of mammals from South Africa by Roberts (1951, 1954). Included in the subgenus *Cnephaeus* by Hoofer and Van Den Bussche (2003: 38).

Based on mitochondrial and nuclear DNA analyses, Juste *et al.* (2013: 449) retain two subspecies: *R. h. hottentotus* and *R. h. pallidior*, but they only included material from South Africa.

Common Names:

Afrikaans: Langstert-dakvlermuis. Chinese: 长尾棕蝠. Czech: netopýr hotentotský. English: Long-tailed Serotine Bat, Hottentot Serotine Bat, Long-tailed Greater Serotine Bat, Long-tailed House Bat, Hottentot bat. French: Sérotine hottentote, Sérotine des maisons à longue queue, Sérotine hottentote. German: Hottentotten-Breitflügelfledermaus, Capische Trugfledermaus. Portuguese: Morcego caseiro Hottentot.

Etymology of common name:

The colloquial name is derived from the fact that the tail of this species is much longer than in its sister taxa (see Smithers, 1983; Skinner and Smithers, 1990: 108; Taylor, 2005).

Similar Species:

Has been confused with *Scotophilus* (Roberts, 1946; 1951: 86; 1954: 86; Kearney and Seamark, 2004), although *E. hottentotus* has bicoloured hair and two upper incisors, while *Scotophilus* has single coloured hair and one upper incisor.

Palaeontological or archaeological records:

Butler (1978) reported as *Eptesicus* cf. *hottentotus* (Smith) from the early Pleistocene deposits at Olduvai. *E. hottentotus* was found from the upper Pleistocene at Border Cave and possibly the late Holocene at Nkupe, South Africa (Avery, 1991: 6). Further South African Pleistocene (Wonderwerk) and Holocene (Blinkklipkop) findings were reported by Avery and Avery (2011: 19).

Conservation status:

Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, it occurs in a number of protected areas, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Jacobs and Cotterill, 2008a; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Jacobs and Cotterill, 2008a; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Jacobs and Cotterill, 2004a; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - LC ver 3.1 (2001) (Watson *et al.*, 2016). 2004 - LC ver 3.1 (2001) (Friedmann and Daly, 2004).

MAJOR THREATS:
There appear to be no major threats to this species (Jacobs and Cotterill, 2008a; IUCN, 2009).

CONSERVATION ACTIONS:
Jacobs and Cotterill (2008a) [in IUCN (2009)] indicate that *E. hottentotus* has been recorded from several protected areas in South Africa, and presumably is present in protected areas within other parts of the species range. Further studies are needed into the distribution of this species.

GENERAL DISTRIBUTION:
Eptesicus hottentotus is largely a Southern African species ranging from southern Angola in west, through parts of Namibia, South Africa, southern Lesotho, Botswana, Zimbabwe, Mozambique, Malawi and Zambia, with a single record as far north as southwestern Kenya.

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 813,384 km^2. In the RSA, its distribution is best predicted by geology (Babiker Salata, 2012: 50).

Native: Angola (Crawford-Cabral, 1966: 137; 1989; Feiler, 1990; Kearney *et al.*, 2008b; Monadjem *et al.*, 2010d: 562; Taylor *et al.*, 2018b: 63); Kenya (Schlitter and Aggundey, 1986; Kearney *et al.*, 2008b); Lesotho (Lynch, 1994: 196; Kearney *et al.*, 2008b; Monadjem *et al.*, 2010d: 562); Malawi (Kershaw, 1922b: 182; Roberts, 1946: 305;Happold *et al.*, 1988; Ansell and Dowsett, 1988: 38; Kearney *et al.*, 2008b; Monadjem *et al.*, 2010d: 562); Mozambique (Smithers and Lobão Tello, 1976: 60; Kearney *et al.*, 2008b; Monadjem *et al.*, 2010d: 562; Monadjem *et al.*, 2010c: 382); Namibia (Griffin, 1999: 30; Rautenbach *et al.*, 1993: 93; Kearney *et al.*, 2008b; Monadjem *et al.*, 2010d: 562); South Africa (Shortridge and Carter, 1938: 282; Shortridge, 1942: 38; Roberts, 1951: 86; 1954; Rautenbach *et al.*, 1981b; Rautenbach and Espie, 1982; Herselman and Norton, 1985: 100; Rautenbach *et al.*, 1993: 93; Lynch, 1994; Taylor, 1998; Watson, 1998; Avery, 1991: 6; Kearney and Seamark, 2004; Seamark and Brand, 2005: 8; Seamark and Kearney, 2007: 4; Kearney *et al.*, 2008b; Monadjem *et al.*, 2010d: 562); Zambia (Ansell, 1960a: 20; Kearney *et al.*, 2008b; Monadjem *et al.*, 2010d: 562); Zimbabwe (Peterson and Nagorsen, 1975; Cotterill, 1996a: 78; Kearney *et al.*, 2008b; Monadjem *et al.*, 2010d: 562).

GEOGRAPHIC VARIATION:
See also the section on "Taxonomy". *E. h. bensoni* is smaller than either *E. h. hottentotus* or *E. h. portavernus* (Schlitter and Aggundey, 1986). *E. h. bensoni* is darker in colour, "tawny olive" (Roberts, 1946), than *E. h. portavernus* (Schlitter and Aggundey, 1986), and *E. h. hottentotus* (Roberts, 1946: 305). Morphometric analysis of cranial size supported the synonomization of *E. h. pallidior* with the nominate species (Schlitter and Aggundey, 1986; Kearney, 2005), which had been described on the basis of the paler colour, "rufous-buff" (Shortridge, 1942), that is found in specimens from the Northern Cape and Namibia. Although, colour is darker in specimens from Taung in the North West Province of South Africa (Herselman and Norton, 1985: 100), and in specimens from Angola - "gold brownish" (Crawford-Cabral, 1966; 1989: 19). Relative to *E. h. hottentotus*, *E. h. portavernus* has a deeper braincase and shorter palatal length (Schlitter and Aggundey, 1986).

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
For a general description of overall size, and pelage and membrane colour see Temminck (1840), Sclater (1901: 126), Shortridge and Carter (1938: 282), Shortridge (1942), Roberts (1946), Smithers (1983), Skinner and Smithers (1990: 108), Taylor (2000), Taylor (2005: 318). For a general description of the ear and tragus see Temminck (1840), Sclater (1901: 126), Smithers (1983), Skinner and Smithers (1990: 108), Taylor (2000), Taylor (2005: 318).

Schoeman and Jacobs (2002: 157) reported the following parameters for 6 specimens from the Algeria Forestry Station (RSA): Fa: 48.9 ± 1.4 mm, Wing area: 173.7 ± 14.1 cm^2, Wing span: 33.0 ± 0.5 cm, Wing loading: 10.3 ± 1.6 N/m^2, and aspect ratio: 6.3 ± 0.6.

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:
For a general description of the skull, see Shortridge and Carter (1938: 282), Roberts (1946). For a general description of the teeth, see Sclater (1901: 126).

DETAILED MORPHOLOGY:
Baculum - See Hill and Harrison (1987) and Kearney *et al.* (2002).
Dental - See Menu (1985; 1987).

SEXUAL DIMORPHISM:
An analysis of specimens from southern Africa showed no significant difference between the sexes in 12 cranial and dental, and eight external measurements, but females were significantly larger than males by 5.21 and 6.78 percent respectively for forearm and third metatarsal lengths (Kearney, 2005).

ECHOLOCATION:
Based on a single room-flown individual the call was recorded as a short duration (2 - 4 msex), broad-band (20 - 54 kHz) call with a dominant frequency of 28 - 32 kHz, and harmonic components (Taylor, 2000: 89). The call frequency, outside the sensitivity range of moths, is suggested to have evolved in response to moth hearing (Schoeman and Jacobs, 2002). These authors (p. 157) also reported the call type to be a low duty echolocation dominated by frequency modulated calls, with a F_{peak}: 31.8 ± 1.0 kHz.

Taylor *et al.* (2013b: 17) recorded the following parameters for 3 *E. hottentotus* calls from Soutpansberg, South Africa: F_{max}: 60.6 ± 8.23 (54.0 - 69.8) kHz, F_{min}: 30.1 ± 1.74 (28.2 - 31.6) kHz, F_{knee}: 35.2 ± 1.48 (34.2 - 36.9) kHz, F_{char}: 32.2 ± 1.75 (30.4 - 33.8) kHz, duration: 3.1 ± 0.86 (2.6 - 4.1) msec.
Linden *et al.* (2014: 40) reported the following parameters from the Soutpansberg area (RSA): F_{min}: 28 - 32 khz, F_{char}: 30 - 34 kHz, F_{knee}: 34 - 37 kHz, Slope: 367 - 773 OPS, duration: 3 - 4 msec.

MOLECULAR BIOLOGY:
DNA - See Hoofer and Van Den Bussche (2003), Stadelmann *et al.* (2004b), Eick *et al.* (2005) and Matthee *et al.* (2006).
Karyotype - Results of all analyses, based on specimens from Zimbabwe (Peterson and Nagorsen, 1975), Namibia and Limpopo Province in South Africa (Rautenbach *et al.*, 1993: 93), and the Western Cape Province in South Africa (Kearney *et al.*, 2002: 59), agreed the diploid number is $2n$ = 50, with 24 pairs of acrocentric autosomes, hence a fundamental number of FN = 48. The X chromosome is a medium-sized submetacentric, and the Y a small acrocentric (Peterson and Nagorsen, 1975; Rautenbach *et al.*, 1993: 93; Kearney *et al.*, 2002: 59).
Protein / allozyme - See Morales *et al.* (1991) for results from ten specimens from Namibia.

HABITAT:
Often associated with mountainous country, in close proximity to water (see references under "Habits"). Sirami *et al.* (2013: 34) recorded in the Western Cape Province, South Africa that *E. hottentotus* activity was not significantly, nor positively influenced by size of wetland, while habitats 100 m surrounding wetlands were also significantly and positively influenced by the water body.

HABITS:
In Angola specimens collected from Capolopopo were "performing sweeping flights over a water tank, apparently catching insects" (Crawford-Cabral, 1989: 19), as was also noted by Roberts, 1951: 87) for individuals observed at Eronga Mountain in Namibia. In Mozambique a single specimen was mistnetted in the Zambezi Valley northwest of Tete (Smithers and Lobão Tello, 1976: 60). Specimens collected at Goodhouse in the Northern Cape Province of South Africa were shot "whilst 'planing' very slowly in wide circles around a cattle kraal, to which they were attracted by a swarm of flies" (Shortridge, 1942: 38). Shortridge (1942: 38) also observed them to be weak fliers, coming out at late dusk after *Cistugo* and *Sauromys*. In 1985, near Buxton in the North West Province of South Africa, some 11 years after this species had been taken from a roost at the entrance to an old mine tunnel (see below under "Roost"), three females were netted flying out of the tunnel, two at 20h45, and another at 21h40, while a male was caught returning at 23h30 (James, 1986: 219). The first specimen of this bat caught in the northern part of the Kruger National Park in South Africa was mistnetted after sunset in a figtree forest on the banks of the Luvuvhu River (Rautenbach and Espie, 1982: 112). In the Free State Province of South Africa a specimen was netted at Sterkfontein Dam in "well-wooded, broken country with patches of marshy open grassland" (Watson, 1998). A specimen from Ithala Game Reserve in northern KwaZulu-Natal Province of South Africa was netted over a river with well-wooded banks (Rautenbach *et al.*, 1981b: 24). At Rocherpan in the Western Cape Province of South Africa specimens were netted flying low over a marsh (Herselman and Norton, 1985: 100). In the Cederberg region of the Western Cape Province of South Africa specimens were netted, in January and February between 20h45-21h52, at the edges of water bodies (Seamark and Brand, 2005: 8). In Lesotho specimens were netted over grassy banks adjacent to rivers in mountainous terrain, at Malealea the species was caught in October at 20h30 (Lynch, 1994: 197).

ROOST:
In Zimbabwe a specimen was found "clinging to a wall in an open building with a corrugated iron roof" (Smithers and Lobão Tello, 1976: 60), and at Marandellas "hanging on the wall of a squash court" (Smithers and Wilson, 1979: 45). Specimens from Taung in the North West Province of South Africa were taken (between 1976 - 1979)

from a hollow in rocks at the entrance to an old mine tunnel inhabited by *Miniopterus schreibersii* (Herselman and Norton, 1985: 100).

DIET:
Insectivorous (Smithers, 1983; Skinner and Smithers, 1990: 108; Taylor, 2005: 318). Schoeman and Jacobs (2002) identified tympanate moths in the diet of individuals from the Western Cape Province of South Africa.

From the Algeria Forestry Station (RSA) Schoeman and Jacobs (2002: 157) reported the following prey groups based on 67 faecal pellets from 6 bats (in volume percent): Coleoptera (88.3 ± 9.0), Diptera (4.5 ± 9.0), Hemiptera (1.5 ± 3.0), and unknown (1 ± 2).

PREDATORS:
Avery *et al.* (2005: 1054) found this species to be present in pellets from *Tyto alba* in South Africa.

Mikula *et al.* (2016: Supplemental data) mention the Bat hawk (*Macheiramphus alcinus* Bonaparte, 1850) as diurnal avian predator.

POPULATION:
Structure and Density - Shortridge (1942:38) indicated this bat was not plentiful around Goodhouse in the Northern Cape of South Africa and only observed half a dozen individuals. In other instances specimens have either been found singly or in groups of two to five (Smithers and Wilson, 1979; Herselman and Norton, 1985: 100; Smithers, 1983; Watson, 1998).
Trend - 2008 - Unknown (Jacobs and Cotterill, 2008a; IUCN, 2009).

PARASITES:
Ectoparasite - *Pteracarus pusillus* (Fain, 1978: 78).

VIRUSES:
Paramyxoviridae
Mortlock *et al.* (2015: 1841) reported that one of two examined South African *E. hottentotus* specimens tested positive for *Paramyxovirus* sequences.

Rhabdoviridae
Lyssavirus - Rabies related viruses
Rabies - Oelofsen and Smith (1993) tested one individual brain, by means of the "Rapid rabies enzyme immunodiagnosis" (RREID) test (Diagnostic Pasteur), none were tested positive.

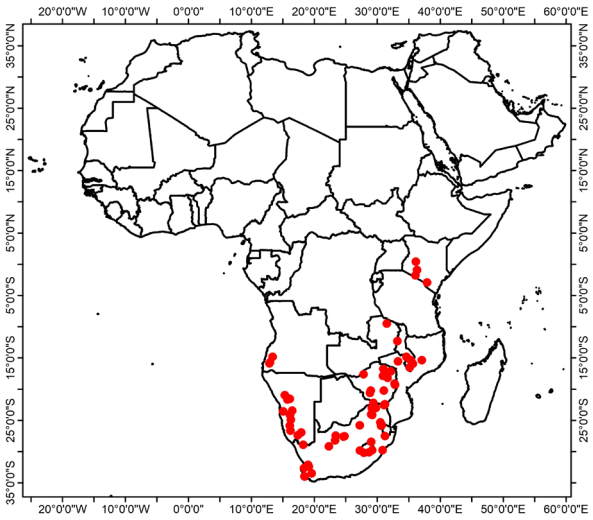

Figure 276. Distribution of *Eptesicus hottentotus*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Angola, Kenya, Lesotho, Malawi, Mozambique, Namibia, South Africa, Zambia, Zimbabwe.

Eptesicus isabellinus (Temminck, 1840)

*1835-1841. *Vespertilio isabellinus* Temminck, Monographies de mammalogie ou description de quelques genres de mammifères, dont les espèces ont été observées dans les différens musées de l'Europe, 2: 205, pl. 52, fig. 1, 2. Publication date: 1835 - 1841. Type locality: Libya: near Tripoli [ca. 32 58 N 13 12 E] [Goto Description]. - Comments: Considered a valid subspecies by Horácek *et al.* (2000: 124). Considered a valid species of *serotinus* by Benda *et al.* (2004b: xx), and Mayer *et al.* (2007: Additional file 1) based on mitochondrial DNA analyses.
Dalhoumi *et al.* (2017b: 142) indicate that the original specimens were collected by J. F. H. Clifford Cocq van Breugel.

1855. *Vespertilio (Vesperus) isabellinus:* Wagner, in: Schreber, Die Säugethiere in Abbildungen nach der Natur mit Beschreibungen, Suppl. 5: 746. (Name Combination)

1860. *Meteorus isabellinus:* Kolenati, Monographie der Europäischen Chiroptern, 20. (Name Combination)

1880. *Vesperugo (Vesperus) serotinus, Sous-espèce A, Vesperus isabellinus:* Dobson, Bull. Soc. zool. France, 5: 234. (Name Combination)

1885. *Vesperugo serotinus isabellinus:* Lataste, Act. Soc. Linn. Bordeaux, 39: 189. (Name Combination)

1887. *Vesperugo isabellinus:* Lataste, Catalogue critique des Mammifé apélagiques sauvages de Tunisie, 2. Publication date: 1887. (Name Combination)
1897. *[Vesperugo (Vesperus) serotinus] Var. Gabonensis* Trouessart, Catalogus Mammalium tam viventium quam fossilium, nov. ed 1, 1: 108. Publication date: 1897. Type locality: Gabon: "Gaboon" [Goto Description]. Holotype: BMNH 1873.4.16.19:. - Comments: The type specimen came allegedly from 'Gabon', Africa, but actually is almost certainly from Kashmir or N India (see Hayman and Hill, 1971: 44; Ibáñez and Valverde, 1985; Corbet and Hill, 1992: 131). However, see also Grubb (2004: 92); who indicates that Gabon might not be rejected. Based on *V. s.* var. *a* of Dobson, 1878: 192 (see Corbet and Hill, 1992: 131). Considered a subspecies by Corbet and Hill (1992), but not attributable to any subspecies according to Simmons (2005). Grubb (2004: 92) indicates it might be a junior synonym of *pachyomus* or a senior synonym of *platyops*.
1904. *Vespertilio Boscai* Cabrera, Mem. Soc. Esp. Hist. Nat., 2: 265, pl. 3, figs. 5, 6, 8. Type locality: Spain: Alicante, Muchamiel.
1905. *Vespertilio (Eptesicus) serotinus isabellinus:* Trouessart, Caus. sci. Soc. zool. France, 1 (10): 369. (Name Combination)
1905. *Vespertilio (Eptesicus) serotinus:* Trouessart, Caus. sci. Soc. zool. France, 1 (10): ???. (Name Combination)
1909. *Eptesicus serotinus isabellinus:* Satunin, Mitt. Kauk. Mus., 4: 297. - Comments: However, this is not *isabellinus* Temminck, 1835-1841, but *isabellinus* Blyth, 1851. (Name Combination)
1937. *Eptesicus isabellinus:* Laurent, Mammalia, 1: 153. (Name Combination, Current Combination)
1938. *[Eptesics] serotinus gaboensis:* Frechkop, Exploration du Parc National Albert, 52. (Lapsus)
1939. *Eptesicus serotinus gabonensis:* Allen, Bull. Mus. comp. Zool., 83: 87. (Name Combination)
1939. *Eptesicus serotinus isabellinus:* G.M. Allen, Bull. Mus. comp. Zool., 83: 87. - Comments: First use for *isabellinus* Temminck, 1835-1841. (Name Combination)
1942. *Eptesicus [(Eptesicus)] isabellinus:* Tate, Bull. Am. Mus. Nat. Hist., 80: 275. (Name Combination)
1951. *Eptesicus isabellinus isabellinus:* Ellerman and Morrison-Scott, 156. (Name Combination)
1962. *E[ptesicus] gabonensis:* Basilio, La vida animal en la Guinea Española, 182. (Name Combination)
1971. *Eptesicus (Eptesicus) serotinus isabellinus:* Hayman and Hill, Mammals of Africa: Chiroptera, 44. (Name Combination)
2013. *Eptesicus isabellinus boscai:* Juste, Benda, Garcia-Mudarra, and Ibáñez, Zool. Scr., 42 (5): 447. Publication date: 19 May 2013. (Name Combination)
? *Eptesicus (Amblyotus) isabellinus:* (Name Combination)
? *Eptesicus serotinus boscai:* (Name Combination)

TAXONOMY:
Recent genetic studies (Ibañez *et al.*, 2006; Mayer *et al.*, 2007; García-Mudarra *et al.*, 2009) support the specific status of this serotine which occurs sympatrically with *E. serotinus* in the Iberian Peninsula.

Le Berre (1990: 102) considers *Eptesicus isabellinus* to be a synonym of *Eptesicus bottae* (see also comments under that species).

The study of five nuclear genes and the mitochondrial cytochrome *b* gene led Artyushin *et al.* (2018: 471) to the conclusion that *E. serotinus* and *E. isabellinus* form a monophyletic clade, but with significant genetic differences, which confirm the species status of the later taxon.

The status of *gabonensis* still remains unclear. Although originally described by Trouessart (1897: 108) from Gabon, Hayman and Hill (1971: 44) and Ibáñez and Valverde (1985: 242) suggest it almost certainly originated from Kashmir or Northern India. Kock (1969a: 162) considered it to be senior synonym of *Eptesicus platyops*, which is supported by Grubb (2004: 92), who discussed this in detail (and who indicates that Gabon might not be rejected as country of origin). Pending further analyses, we retain *gabonensis* in the synonymy of *Eptesicus isabellinus*.

COMMON NAMES:
Albanian: Serotinë Isabeline. Armenian: Իզաբելլայի մաշկեղ. Azerbaijani: İzabel gönlücə. Basque: Baratze-saguzar isabeldar. Belarusian: Кажан ізабэлавы. Bosnian: Izabelin šišmiš.

Breton: Serotin melenwenn. Bulgarian: Изабелинов прилеп. Castilian: Murciélago hortelano pardo, Murciélago hortelano mediterráneo. Catalan: Ratpenat dels graners meridional. Croatian: Izabelin noćnjak. Czech: Netopýr tripolitánský. Danish: Isabellasydflagermus. Dutch: Isabelvleermuis. English: Isabelline Serotine Bat, Meridional serotine. Estonian: Ibeeria nahkhiir. Finnish: Vaaleaetelänlepakko. French: Sérotine isabelle, Vespertilion isabelle, Sérotine isabelline. Frisian: Isabelkleurde lette flearmûs. Galician: Morcego das hortas meridional. Georgian: ტყის მეგვიანე. German: Isabellfledermaus, Isabell-Breitflügelfledermaus, isabellfarbenen Abendfledermaus. Greek: Ωχρή τρανονυχτερίδα. Hungarian: Izabella-késeidenevér. Irish Gaelic: Ialtóg isibéalach. Italian: Serotino isabellino. Latvian: Izabellas sikspā rnis. Lithuanian: Izabelos šikšnys. Luxembourgish: Isabel-Fliedermaus. Macedonian: Изабелов лилјак. Maltese: Serotin tas-Sider Pallidu. Montenegrin: Kraljičin slijepi miš. Norwegian: Isabellaflaggermus. Polish: Mroczek pustynny. Portuguese: Morcego-hortelão-claro. Rhaeto-Romance: Serotin isabellin. Romanian: Liliacul cu aripi late mediteranean. Russian: Кожан изабелловый. Serbian: Магребски поноћњак [= Magrebski ponoć njak]. Scottish Gaelic: Ialtag isibealach. Slovak: večernica tripolitánska. Slovenian: Kraljičin poznik. Swedish: Isabellfladdermus. Turkish: Izabel Geniş kanatlı Yarasası. Ukrainian: Лилик ізабеліновий. Welsh: Ystlum adain-lydan llwydfelyn.

SIMILAR SPECIES:
Santos *et al.* (2014: 158) indicate that *E. isabellinus* and *E. serotinus* have an extensive niche overlap, indicating that they explore very similar conditions. Each species thrives in a specific biogeographical zone, *E. serotinus* in Atlantic climates and *E. isabellinus* in Mediterranean areas, but considering the large niche overlap it is quite possible that competition may occur if prey resources are limited in contact zones.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Gunnell *et al.* (2015a: 13) report on a right distal humerus from the Olduvai Gorge (Tanzania), which they assigned to cf. *E. isabellinus*.

CONSERVATION STATUS:
Global - Assessed as as part of *Eptesicus serotinus* which is very widespread (most of Europe) and abundant species. Global and regional population trends are difficult to determine, as the species is decreasing in some range states (sometimes dramatically) whilst increasing in others. Overall, it is not believed to approach the threshold for the population decline criterion of the IUCN Red List (i.e. declining more than 30% in ten years or three generations). For these reasons, it is evaluated as Least Concern (LC ver 3.1, 2001; Hutson *et al.*, 2008h; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) [as part of *Eptesicus serotinus*] (Hutson *et al.*, 2008h; IUCN, 2009).

MAJOR THREATS:
Sherwin *et al.* (2012: 174) report the aerial hawking feeding style and the long-distance disperal of *E. serotinus* in Europe and NW Africa to be important risk factors related to climatic change.

CONSERVATION ACTIONS:
No specific conservation actions known (Hutson *et al.*, 2008h; IUCN, 2009).

GENERAL DISTRIBUTION:
Eptesicus isabellinus has been recorded from North Africa and the Iberian Peninsula.

Native: Algeria; Libya; Morocco (Benda *et al.*, 2010a: 157; El Ibrahimi and Rguibi Idrissi, 2015: 363 [as "*Eptesicus serotinus (= E. isabellinus)*"]); Portugal; Spain; Tunisia (Dalhoumi *et al.*, 2014: 53; 2016b: 867).

GEOGRAPHIC VARIATION:
The populations from the Iberian Peninsula, Morocco and western Algeria are assigned to *E. isabellinus boscai* by Juste *et al.* (2013: 443), whereas those from the remaining part of Algeria, Tunisia and western Libya are assigned to *E. i. isabellinus*. However, they do indicate (p. 450) that the specimens from western Libya seem to form a supported, separate clade.

SEXUAL DIMORPHISM:
In a year-round study in Tunisia, Dalhoumi *et al.* (2016a: 157) found adult females to be significantly heavier than males.

ECHOLOCATION:
Benda *et al.* (2010a: 163) report for 23 Moroccan specimens a start frequency of 35.1 ± 1.0 (33.7 - 36.3) kHz, a maximum energy frequency of 26.9 ± 0.7 (25.8 - 28.3) kHz, an end frequency of 23.3 ± 0.8 (22.4 - 24.2), with a duration of 9.7 ± 2.8 (5.6 - 16.3) ms, and an inter-pulse interval of 244.2 ± 66.7 (128.5 - 362.7) msec.

Also from Morocco, Disca *et al.* (2014: 226) indicate that the type of call is FM-QFC, with the following parameters: F_{start}: 42.3 ± 13.0 kHz, F_{end}:

25.3 ± 1.5 kHz, F_{peak}: 27.4 ± 2.2 kHz, bandwidth: 17.0 ± 11.6 kHz, duration: 11.5 ± 3.0 msec.

In Tunisia, Dalhoumi *et al.* (2016b: 867; 2017b: 143) reported FM/QCF calls with a short constant frequency at 18.5 - 27.1 kHz and maximum energy at 21.7 - 30.3 kHz (25.3 ± 2.0 kHz).

MOLECULAR BIOLOGY:
DNA - See Ibañez *et al.* (2006), Mayer *et al.* (2007), García-Mudarra *et al.* (2009), Juste *et al.* (2009).
Karyotype - Baker *et al.* (1974) reported 2n = 50, aFN = 48, X = submetacentric for specimens from Tunisia.
Protein / allozyme - Unknown.

HABITAT:
In the Iberian Peninsula, Lisón *et al.* (2014: 59) found that *E. isabellinus* is primarily found near water courses, scrublands, and zones with high primary productivity. Non-irrigated croplands are avoided, and no preferences were found for human settlements or irrigated croplands. The preference for water bodies was also confirmed in Tunisia by Dalhoumi *et al.* (2017b: 149).

HABITS:
In Spain, Lisón and Calvo (2014: 99) found that the activity of this species increases with high temperatures, showing the highest activity in June.

ROOST:
Benda *et al.* (2014c: 46) reported solitary males to roost in the ruined Roman town of Leptis Magna (Libya), and additional specimens were found in fissures in ceilings and walls of other ruins. Kelm *et al.* (2015: 27) indicate that this species' roosts are mostly found in anthropogenic structures. Dalhoumi *et al.* (2017b: 142) also mentions rock crevices, tree holes and bridges.

DIET:
Benda *et al.* (2014c: 51) examined four sets of faecal pellets and three digestive tracts from Libya *E. isabellinus* and found primarily ants (Hymenoptera: Formicoidea) and beetles (Coleoptera: mostly Scarabaeidae and Cerambycidae, but also Carabidae, Curculionidae, Staphylinidae, and Tenebrionidae). A set of five pellets from one animal was dominated by moths (Lepidoptera).

POPULATION:
Structure and Density - *Eptesicus isabellinus* is the most common bat species in northwest Algeria and Libya (Hutson *et al.*, 2008h; IUCN, 2009).
Trend - 2008 - Unknown [as part of *E. serotinus* (Hutson *et al.*, 2008h; IUCN, 2009)].

LIFESPAN:
In southern Spain, Papadatou *et al.* (2010: 925) followed six colonies over a period varying between 8 and 26 years and found a mean annual survival probability of 0.71.

REPRODUCTION AND ONTOGENY:
Baker *et al.* (1974: 701) mentions four lactating females collected on 5 June 1973. In Tunisia, Dalhoumi *et al.* (2017b: 141) captured pregnant females from April to June (one even in August) and lactating females from May to June.

Benda *et al.* (2014c: 48) refer to a record of two juvenile females made by Hanák and Elgadi (1984) in the spring of 1978 from Janzur (Libya), and to a non-volant juvenile they observed at Sabratha on 28 May 2002.

PARASITES:
Benda *et al.* (2014c: 52) reported the following parasites from Libya:
Argasidae: *Argas vespertilionis* (Latreille, 1802),
Ischnopsyllidae: *Ischnopsyllus intermedius* (Rothschild, 1898)

From Algeria, Bendjeddou *et al.* (2013: 325) reported the Nycteribiid *Phthiridium biarticulatum* Hermann, 1804 from "*E. serotinus*": Bendjeddou *et al.* (2017: 15) added the following species: Siphonaptera:*Nycteridopsylla longiceps* Rothschild, 1908, *Ischnopsyllus intermedius* (Rothschild, 1898); Heteroptera: *Cimex pipistrelli* Jenyns, 1839, *Cacodmus vicinus* Horváth, 1934; Arachnida: *Argas transgariepinus* White, 1846.

VIRUSES:
Coronaviridae - Coronaviruses
Betacoronavirus
Kohl and Kurth (2014: 3112) reported this virus from Spain.

Papillomaviridae – Papillomaviruses
García-Pérez *et al.* (2014: 100) pointed out that there is no strict species specificity in papillomaviruses as they found DNA from EserPV2 and EserPV3 in pharyngeal swaps of both *Eptesicus serotinus* and *E. isabellinus*.

Rhabdoviridae
"Various European bat lyssaviruses" were reported from various European countries by Kohl and Kurth (2014: 3114).

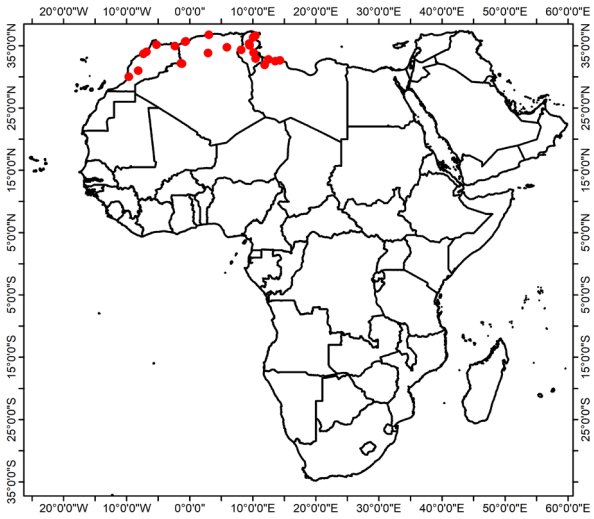

Figure 277. Distribution of *Eptesicus isabellinus*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Algeria, Libya, Morocco, Tunisia.

Eptesicus platyops (Thomas, 1901)

*1901. *Vespertilio platyops* Thomas, Ann. Mag. nat. Hist., ser. 7, 8 (43): 31. Publication date: 1 July 1901. Type locality: Nigeria: Western region: Lagos [06 27 N 03 23 E] [Goto Description]. Holotype: BMNH 1888.5.17.3: ad ♀, skull and alcoholic. Presented/Donated by: George Edward Dobson. - Etymology: From the Greek "*platyops*" for broad-faced or flat-faced.

1939. *Eptesicus platyops:* G.M. Allen, Bull. Mus. comp. Zool., 83: 86. (Name Combination, Current Combination)

1969. *Eptesicus serotinus platyops:* Kock, Abh. Senckenberg. naturforsch. Ges., 521: 214. (Name Combination)

1980. *Eptesicus (Eptesicus) platyops:* Corbet and Hill, A world list of mammalian species, 69. (Name Combination)

1994. *E[ptesicus (Eptesicus)] s[erotinus] platyops:* Koopman, in: Niethammer, Schliemann and Starck, Handbook of Zoology, volume II (Mammalia) Chiroptera, (60) 120. (Name Combination)

TAXONOMY:
Considered a subspecies of *E. serotinus* by Ibáñez and Valverde (1985) and Koopman (1994: 120), but no comparison with *E. bottae* was made.

COMMON NAMES:
Czech: netopýr nigerijský. English: Lagos Serotine Bat, Flat-faced Serotine Bat, Lagos Serotine. French: Sérotine à grands yeux, Sérotine de Lagos. German: Lagos-Breitflügelfledermaus.

CONSERVATION STATUS:
Global - Listed as Data Deficient (DD ver 3.1 (2001)) in view of the absence of recent information on its extent of occurrence, ecological requirements, threats and conservation status (Schlitter, 2008a; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) (Schlitter, 2008a; IUCN, 2009). 2004 - DD ver 3.1 (2001) (IUCN, 2004; Schlitter, 2004e). 1996 - VU (Baillie and Groombridge, 1996).

MAJOR THREATS:
The threats to this species are not known (Schlitter, 2008a; IUCN, 2009).

CONSERVATION ACTIONS:
Schlitter (2008a) [in IUCN (2009)] reports that it is not known if the species is present in any protected areas and additional surveys are needed to try to locate and study a population of this species.

GENERAL DISTRIBUTION:
Eptesicus platyops is a poorly known West African species known only from a few specimens. It is known from the type locality at Lagos in Nigeria, from specimens from the island of Bioko (Equatorial Guinea) (although these specimens may not have originated on Bioko) and from an unspecified locality in Senegal (Schlitter, 2008a). Senegal specimens were collected around 1900 (Happold, 1987).

Native: Nigeria (Happold, 1987).

Presence uncertain: Equatorial Guinea [= Bioko]; Senegal (Happold, 1987).

POPULATION:
Structure and Density - There is no good information on the population abundance or size of this bat (Schlitter, 2008a; IUCN, 2009).
Trend - 2008 - Unknown (Schlitter, 2008a; IUCN, 2009).

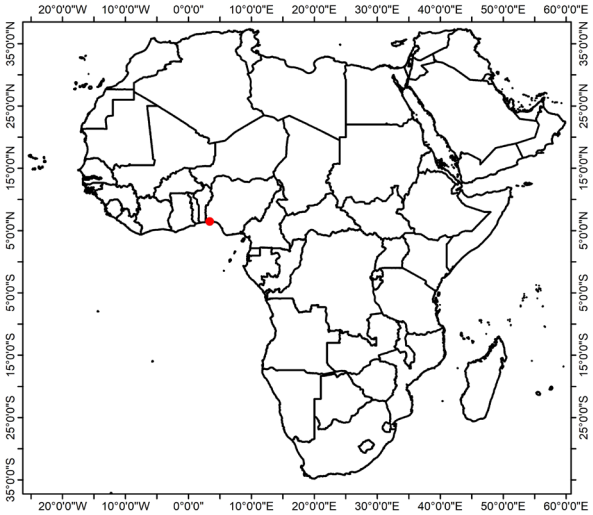

Figure 278. Distribution of *Eptesicus platyops*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Nigeria, Senegal.

Genus ***Glauconycteris*** Dobson, 1875

1867. *Chalinolobus* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, 1866: 680. - Comments: in part. Type species: *Vespertilio tuberculatus* Forster, 1844 [= *Chalinolobus tuberculatus* (Forster, 1844: 62)], by monotypy (see Jackson and Groves, 2015: 271).

*1875. *Glauconycteris* Dobson, Proc. zool. Soc. Lond., 1875, III: 383. Publication date: October 1875. - Comments: Type species: *Kerivoula poensis* Gray, 1842. - Etymology: From the Greek "*γλαυκός*", meaning gray and "*γλαυκός*", meaning bat, referring to the fur, which is light gray or cream-colored at the tips (see Palmer, 1904: 295). Rambaldini (2010: 252) indicates that the Greek "glaucos" means bluish gray. Lanza *et al.* (2015: 349) indicate that the first part of the name is a feminine Latin adjective *glàuca*, meaning "glaucous, blue-green". (Current Combination)

2013. *Niumbaha* Reeder, Helgen, Vodzak, Lunde and Ejotre [Goto Description]. - ZooBank: EDF16BEE-0749-41BC-AE19-BAE130BE58F8.

TAXONOMY:
Bronner *et al.* (2003) state that although occasionally treated as a subgenus of *Chalinolobus* (Koopman, 1971; Swanepoel *et al.*, 1980; Koopman, 1982; Meester *et al.*, 1986; Koopman, 1993a; Taylor, 1998: 49; Wilson and Cole, 2000), *Glauconycteris* has often been considered as a distinct genus (Allen, 1939a; Roberts, 1951; Ellerman *et al.*, 1953; Hayman and Hill, 1971; Corbet and Hill, 1980, 1992). Despite some superficial cranial resemblance, the marked difference in baculum morphology (Hill and Harrison, 1987) and karyotypic properties (Rautenbach *et al.*, 1993). Ansell and Dowsett (1988), Volleth and Heller (1994) and Eger and Schlitter (2001: 1) support the recognition of these taxa as discrete genera (N. Simmons in litt.). *Glauconycteris* is thus represented in the southern African subregion by a single species, *G. variegata* (butterfly bat), while *Chalinolobus* is extralimital (Australia).

Hassanin *et al.* (2017: 1) analysed the *Cytb* and RAG2 data of the various members of this genus and distinguished three lineage in the small sized species: the "*poensis*" (*G. poensis, G. alboguttata, G. argentata* and *G. egeria*); the "*beatrix*" group (*G. beatrix* and *G. curryae*); and the "*humeralis*" group (*G. humeralis* and *G. atra*).

Known species of the genus *Glauconycteris*: ***alboguttata*** J. A. Allen, 1917; ***argentata*** (Dobson, 1875); ***beatrix*** Thomas, 1901; ***curryae*** Eger and Schlitter, 2001; ***egeria*** Thomas, 1913; ***gleni*** Peterson and Smith, 1973; ***humeralis*** J. A. Allen, 1917; ***kenyacola*** Peterson, 1982; ***machadoi*** Hayman, 1963; ***poensis*** (Gray, 1842); ***superba*** Hayman, 1939; ***variegata*** (Tomes, 1861).

COMMON NAMES:
Czech: motýlí netopýři. English: Butterfly Bats, Lobe-lipped Bats, Silvered Bats, Blue-grey Bats, Dobson's Bats, Glauconycterids. French: Glauconyctères, Murins à bajoues. German:

Schmetterlingsfledermäuse. Italian: Glauconittèridi. Glauconictèridi.

Glauconycteris alboguttata J.A. Allen, 1917

*1917. *Glauconycteris alboguttatus* J.A. Allen, Bull. Am. Mus. Nat. Hist., 37 (18): 449, text-fig. 7 B. Publication date: 29 September 1917. Type locality: Congo (Democratic Republic of the): Oriental province: Medje [02 25 N 27 18 E, 800 m] [Goto Description]. Holotype: AMNH 49317: ad ♀, skull and alcoholic. Collected by: Herbert Lang, James Paul Chapin and The American Museum Congo Expedition; collection date: 14 March 1914; original number: 2351. - Etymology: From the Latin "*alboguttata*" meaning white spotted.
? *Chalinolobus alboguttatus:* (Name Combination)
? *Glauconycteris alboguttata:* (Current Combination, Current Spelling)

TAXONOMY:
See Simmons (2005).

COMMON NAMES:
Czech: netopýr pruhovaný. English: Allen's Butterfly Bat, Striped Butterfly Bat, White-spotted Butterfly Bat, Allen's Striped Bat. French: Glauconyctère à gorge blanche, Murin à bajoues d'Allen, Barbastelle d'Allen. German: Gestreifte Schmetterlingsfledermaus.

CONSERVATION STATUS:
Global - Although this species is known mainly from isolated records from a large area, it is listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution (that is likely to be even wider than is currently known), extensive available habitat, presumed large overall population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Jacobs *et al.*, 2008c; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Jacobs *et al.*, 2008c; IUCN, 2009). 2004 - DD ver 3.1 (2001) (Jacobs *et al.*, 2004e; IUCN, 2004). 1996 - VU [assessed as *Chalinolobus alboguttatus*] (Baillie and Groombridge, 1996).

MAJOR THREATS:
The threats to this species are poorly known (Jacobs *et al.*, 2008c; IUCN, 2009).

CONSERVATION ACTIONS:
Jacobs *et al.* (2008c) [in IUCN (2009)] report that there appear to be no direct conservation measures in place. It is not known if the species is present in any protected areas. Further research is needed into the species distribution, natural history and threats.

GENERAL DISTRIBUTION:
Glauconycteris alboguttata is distributed in Central Africa where it has been recorded from Cameroon and the Democratic Republic of the Congo. The range is poorly known, and it may be distributed more widely (Jacobs *et al.*, 2008c).

Native: Cameroon; Congo (Bates *et al.*, 2013: 323 - 1st record); Congo (The Democratic Republic of the).

HABITAT:
This species is associated with lowland tropical moist forest (Jacobs *et al.*, 2008c).

POPULATION:
Structure and Density - It is generally considered to be rare, however, there have been few recent surveys within the species range (Jacobs *et al.*, 2008c; IUCN, 2009).
Trend - 2008 - Unknown (Jacobs *et al.*, 2008c; IUCN, 2009).

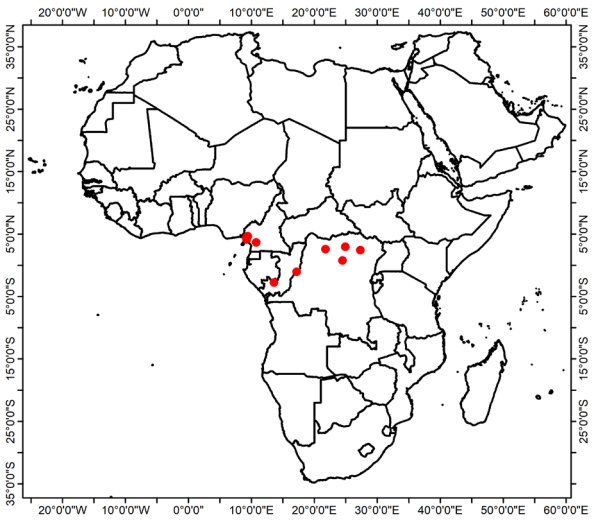

Figure 279. Distribution of *Glauconycteris alboguttata*

Presented/Donated by: ?: Collector Unknown. Paralectotype: SMF 2522: Collected by: P. Hesse. Presented/Donated by: ?: Collector Unknown. - Comments: Noack (1889: 22) refers to 8 specimens in alcohol 4 ♂♂ and 4 ♀♀, collected in April - May, by P. Hesse).

? *Glauconycteris argentata:* (Name Combination, Current Combination, Current Spelling)

? *Glauconycteris argentatus:* (Name Combination, Alternate Spelling)

TAXONOMY:
See Simmons (2005).

Monadjem *et al.* (2016y: 368) collected a *Glauconycteris* specimen in the Mount Nimba area, which looked very similar to this species in measurements and colouration but differed from it by the colouration of its wings (not pale). They also indicated that as *G. argentata* has not been found west of Cameroon, their specimen might represent an undescribed species. Tentatively, they assigned their specimen to *G.* cf. *argentata*.

COMMON NAMES:

Chinese: 银彩蝠. Czech: netopýr stříbrný. English: Common Butterfly Bat, Silvery Butterfly Bat, Silvered Butterfly Bat, Silvered Bat. French: Glauconyctère argentée, Murin à bajoues argenté, Barbastelle argentée. German: Silberne Schmetterlingsfledermaus. Italian: Glauconitterìde argentàta, Glauconicterìde argentàta.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Jacobs *et al.*, 2008d; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Jacobs *et al.*, 2008d; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Jacobs *et al.*, 2004g; IUCN, 2004). 1996 - LR/lc [assessed as part of *Chalinolobus argentatus*] (Baillie and Groombridge, 1996).

MAJOR THREATS:
Glauconycteris argentata is threatened in the western and eastern parts of its range by deforestation resulting from logging activities, and the conversion of land to agricultural use (Jacobs *et al.*, 2008d; IUCN, 2009).

CONSERVATION ACTIONS:
Jacobs *et al.* (2008d) [in IUCN (2009)] report that there appear to be no direct conservation measures in place. It is not known if the species is present in any protected areas. Further studies are needed into the distribution, natural history and threats to this little recorded species.

GENERAL DISTRIBUTION:
Glauconycteris argentata is widespread in Central and East Africa. It ranges from Cameroon and Equatorial Guinea (Rio Muni), into the Democratic Republic of the Congo, Rwanda, Burundi, Uganda, Kenya, Tanzania and possibly northern Malawi, with the southernmost record from northwestern Angola. The range is not well-known, and the species is expected to be distributed more widely than is currently known.

Native: Angola (Crawford-Cabral, 1989; Monadjem *et al.*, 2010d: 562); Burundi (Hayman *et al.*, 1966); Cameroon; Congo (The Democratic Republic of the) (Hayman *et al.*, 1966; Monadjem *et al.*, 2010d: 562); Equatorial Guinea (Jones, 1971); Gabon (1st record: Peereboom *et al.*, 2012 3); Kenya (Aggundey and Schlitter, 1984); Malawi (Ansell and Dowsett, 1988: 39; Monadjem *et al.*, 2010d: 562); Rwanda (Baeten *et al.*, 1984); Tanzania (Stanley and Goodman, 2011: 43).

DETAILED MORPHOLOGY:
Baculum - Hill and Harrison (1987).

ECHOLOCATION:
Peereboom *et al.* (2012: 4) report the following values: F_{min}: 28.42 - 34.45 (31.59 ± 1.48) kHz; F_{max}: 77.95 - 101.60 (89.16 ± 7.11) kHz, F_{peak}: 40.26 - 47.14 (43.96 ± 1.8) kHz, duration: 2.0 - 3.0 (2.4 ± 0.31) msec; first harm: 81.82 - 104.60 (94.04 ± 8.55), and interpulse interval: 24 - 128 (55 ± 34) msec.

From Kenya, López-Baucells *et al.* (2017: 24) reported some different values: F_{min}: 16.32 - 40.62 (35.20 ± 3.11) kHz, F_{max}: 41.37 - 75.09 (56.45 ± 9.40) kHz, F_{peak}: 36.19 - 44.77 (40.38 ± 1.68) kHz, duration: 0.7 - 8.52 (4.03 ± 1.86) msec, slope: -48.51 - -0.69 (-5.28 ± 6.19) kHz/ms.

MOLECULAR BIOLOGY:
DNA - See Hoofer and Van Den Bussche (2003).
Karyotype - Unknown.
Protein / allozyme - Unknown.

HABITAT:
Recorded from lowland tropical moist forest and moist savanna habitats.

ROOST:
At Uzungwa Scarp Forest Reserve, Tanzania, Trentin and Rovero (2011: 51) reported a group of 10 females and their young to roost underneath the leaves of palm trees.

POPULATION:
Structure and Density - This is a rarely recorded, poorly known species (Jacobs *et al.*, 2008d; IUCN, 2009).
Trend - 2008 - Unknown (Jacobs *et al.*, 2008d; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
Trentin and Rovero (2011: 51) observed about 10 adult females with young in December 2005 at Uzungwa Scarp Forest Reserve, Tanzania.

VIRUSES:
Phenuiviridae
Phlebovirus
de Jong *et al.* (2011: 11), Luis *et al.* (2013: Suppl.), and Willoughby *et al.* (2017: Suppl.) report the occurrence of Rift Valley fever virus.

? *Chalinolobus beatrix:* (Name Combination)

TAXONOMY:
Koopman (1993a: 199) included *humeralis*; see Koopman (1971: 7, 8), but see Simmons (2005).

COMMON NAMES:
Czech: netopýr rovníkový. English: Beatrix Bufferfly Bat, Beatrix's Bat. French: Glauconyctère de Béatrix, Murin à bajoues de Béatrice, Barbastelle de Béatrix. German: Kleine Schmetterlingsfledermaus. Spanish (Castillian): Murciélago Mariposa.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1, 2001) in view of its wide distribution, presumed large population (especially in Central Africa), and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Jacobs *et al.*, 2008e; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Jacobs *et al.*, 2008e; IUCN, 2009). 2004 - NT ver 3.1 (2001) (Jacobs *et al.*, 2004f; IUCN, 2004). 1996 - LR/nt [assessed as *Chalinolobus beatrix*] (Baillie and Groombridge, 1996).

MAJOR THREATS:
This species is threatened by general habitat loss, often resulting from logging activities and the conversion of land to agricultural use (Jacobs *et al.*, 2008e; IUCN, 2009).

CONSERVATION ACTIONS:
Jacobs *et al.* (2008e) [in IUCN (2009)] suggest that this species has been recorded from a number of protected areas and further studies are needed into the distribution, natural history and threats to this little-known bat.

GENERAL DISTRIBUTION:
Glauconycteris beatrix is distributed in West and Central Africa. It ranges from Côte d'Ivoire in the west, through Ghana and Nigeria to Cameroon and Equatorial Guinea (Rio Muni and Bioko), with scattered records from Gabon, Central African

Republic, Angola and the Democratic Republic of the Congo.

Native: Angola (Eger and Schlitter, 2001; Monadjem *et al.*, 2010d: 562); Cameroon; Central African Republic (Heller *et al.*, 1994; Lunde *et al.*, 2001: 537); Congo (Bates *et al.*, 2013: 324 - 1st authenticated record); Congo (The Democratic Republic of the) (Monadjem *et al.*, 2010d: 562); Côte d'Ivoire; Equatorial Guinea; Gabon; Ghana; Guinea-Bissau (Rainho and Ranco, 2001: 69); Nigeria (Happold, 1987).

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Sanborn (1953: 166) reports a male specimen, collected in Gabon, which looks very similar to the description of *G. beatrix*, but has a small tuft of white hairs on each shoulder, but he also indicates that this character is sometimes variable, as was already mentioned by Hayman and Jones (1950: 762).

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:
In their study on the reversibility of the mandibular symphyseal fusion, Scott *et al.* (2012: 2943) mention that in this species the symphyse is unfused with smooth surfaces.

DETAILED MORPHOLOGY:
Baculum - Hill and Harrison (1987) and Heller *et al.* (1994: 6).

MOLECULAR BIOLOGY:
DNA - See Hoofer and Van Den Bussche (2003).
Karyotype - Volleth and Heller (2008) reported 2*n* = 22, FN = 40, only bi-armed chromosomes and an autosome-X translocation for a female from the Democratic Republic of Congo. Porter *et al.* (2010) report for Gabon 2*n* = 22, with all chromosomes being distinctly biarmed, with ten pairs are metacentric or slightly submetacentric and one pair (the smallest) is subtelocentric. 2 *n* = 22 was also reported by Volleth and Eick (2012: 167), who also mention a segment number of 24.
Protein / allozyme - Unknown.

HABITAT:
This species is generally associated with lowland tropical moist forest (Happold, 1987).

ROOST:
There appears to be little information available on the roosting habits of this species, but presumably it can be found within hollow trees and dense vegetation (Jacobs *et al.*, 2008e).

POPULATION:
Structure and Density - This appears to be a rare, or at least a rarely recorded, species (Jacobs *et al.*, 2008e; IUCN, 2009).
Trend - 2008 - Unknown (Jacobs *et al.*, 2008e; IUCN, 2009).

VIRUSES:
Coronaviridae - Coronaviruses
SARS-CoV - One fecal sample, collected in Febuary 2008 in Ghana, tested negative for coronavirus (CoV) RNA (Pfefferle *et al.*, 2009).

Paramyxoviridae
Drexler *et al.* (2012a: Suppl. Table S1) indicated that the single specimen they examined from Ghana did not test positive for *Repirovirus, Henipavirus, Morbillivirus, Rubulavirus* or *Pneumovirus*.

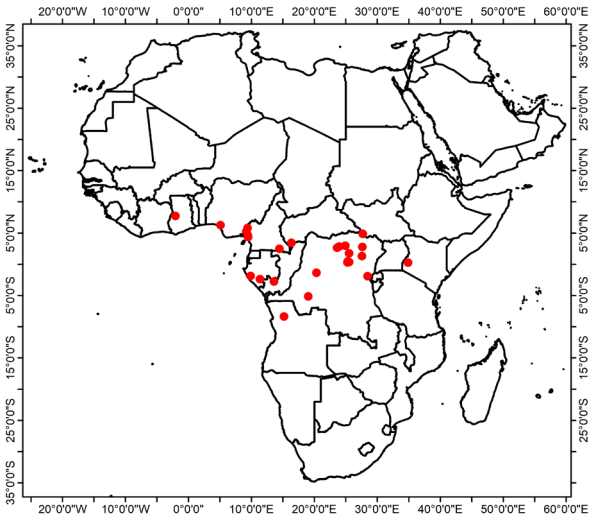

Figure 282. Distribution of *Glauconycteris beatrix*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Angola, Cameroon, Central African Republic, Congo, Congo (Democratic Republic of the), Côte d'Ivoire, Equatorial Guinea, Gabon, Ghana, Kenya, Nigeria, South Sudan, Uganda.

Glauconycteris cf. beatrix Hassanin, Colombo, Gembu, Merle, Tu, Görföl, Musaba Akawa, Csorba, Kearney, Monadjem and Ing, 2017

2017. *G[lauconycteris] cf. beatrix:* Hassanin, Colombo, Gembu, Merle, Tu, Görföl, Musaba Akawa, Csorba, Kearney, Monadjem and Ing, J. Zool. Syst. Evol. Res., xxx (x): 7. Publication date: 22 August 2017.

TAXONOMY:
In their study on the multilocus phylogeny of *Glauconycteris* specimens from the DRC, Hassanin *et al.* (2017: 7) found a number of specimens in the collection of the ROM that were identified as *G. beatrix* but scored very different in their analyses as compared to other specimens assigned to this species. Their scores were much more like those of *G. curryae*, which seemed to be related to the length of the tail and the skull profile. Their analyses of the mitochondrial tree (*CO1, Cytb* and *12S* genes), however, showed these specimens not to be directly related to either *beatrix* or *curryae*, but closer to *humeralis*. Further investigation is necessary to elucidate this problem.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Côte d'Ivoire.

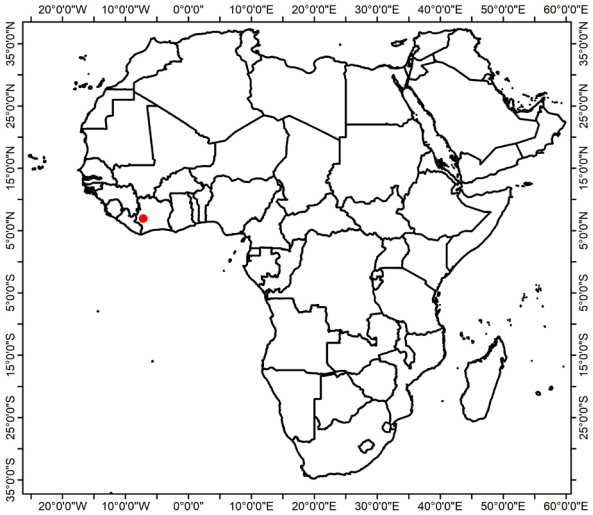

Figure 283. Distribution of *Glauconycteris* cf. *beatrix*

Glauconycteris cf. humeralis Hassanin, Colombo, Gembu, Merle, Tu, Görföl, Musaba Akawa, Csorba, Kearney, Monadjem and Ing, 2017

2017. *G[lauconycteris] cf. humeralis:* Hassanin, Colombo, Gembu, Merle, Tu, Görföl, Musaba Akawa, Csorba, Kearney, Monadjem and Ing, J. Zool. Syst. Evol. Res., xxx (x): 6. Publication date: 22 August 2017.

TAXONOMY:
For their study on the multilocus phylogeny of *Glauconycteris* specimens from the DRC, Hassanin *et al.* (2017: 6) used data collected from two specimens from the Central African Republic, which were originally identified as *G. humeralis*. Their analyses indicated that these specimens were quite different from the other *humeralis* included and suggested that they might represent a new species. Unfortunately, however, these two animals were released after the biopsy was taken. Therefore, Hassanin *et al.* (2017: 16) did not describe this species as new.

Glauconycteris curryae Eger and Schlitter, 2001

2001. *Glauconycteris curryae:* Eger, Acta Chiropt., 3 (2): 248. (Current Combination, Emendation, Current Spelling)
*2001. *Glauconycteris curryi* Eger and Schlitter, Acta Chiropt., 3 (1): 2, figs 1 - 4. Type locality: Cameroon: Bipindi, 10 km W [03 05 N 10 25 E, ca. 300 m] [Goto Description]. Holotype: ROM 56243: ad ♀, skin and skull. Collected by: Randolph L. Peterson, Robert M. Glen and Philip Imbayi; collection date: 19 February 1970. Note: netted over a pool in a vast stand of bamboo, by a river (see Eger and Schlitter (2001: 2). - Etymology: Named in honour of Noreen Curry, in recognition of her interest in bats and her support of Royal Ontario Museum field research in Africa and bat education at the ROM (see Eger and Schlitter, 2001).
? *Chalinolobus curryi:*

TAXONOMY:
See Simmons (2005).

COMMON NAMES:
Czech: netopýr konžský. English: Curry's Butterfly Bat, Curry's Bat. French: Glauconyctère de Curry. German: Currys Schmetterlingsfledermaus.

CONSERVATION STATUS:
Global - Listed as Data Deficient (DD ver 3.1 (2001)) since it has only recently been described, and there is still very little information on its extent of occurrence, status, threats and ecological requirements (Schlitter, 2008b; IUCN, 2009).

Assessment History -

2008 - DD ver 3.1 (2001) (Schlitter, 2008b; IUCN, 2009). 2004 - DD ver 3.1 (2001) (Schlitter, 2004f; IUCN, 2004).

MAJOR THREATS:
The threats to this species are not known (Schlitter, 2008b; IUCN, 2009).

CONSERVATION ACTIONS:
Schlitter (2008b) [in IUCN (2009)] suggests that there appear to be no direct conservation measures in place. It is not known if the species is present in any protected areas. Further research is needed into the distribution, natural history and threats to this species.

GENERAL DISTRIBUTION:
Glauconycteris curryae is a Central African species, known only from southern Cameroon, Gabon and a single locality in the Democratic Republic of the Congo (Yalosemba North of the River).

Native: Cameroon; Congo (The Democratic Republic of the), Gabon.

HABITAT:
This species has been recorded from lowland tropical moist forest and swamp forest (Schlitter, 2008b).

POPULATION:
Structure and Density - Unknown (Schlitter, 2008b; IUCN, 2009).
Trend - 2008 - Unknown (Schlitter, 2008b; IUCN, 2009).

Glauconycteris egeria Thomas, 1913

*1913. *Glauconycteris egeria* Thomas, Ann. Mag. nat. Hist., ser. 8, 11 (61): 144. Publication date: 1 January 1913. Type locality: Cameroon: Western province: Bibundi [04 15 N 08 58 E] [Goto Description]. Holotype: BMNH 1912.12.13.3: ♂. Original number: 22. Presented/Donated by: Prof. E. Lampe (Wiesbaden Museum). (Current Combination)
2015. *Chalinolo busegeria:* Carr et al., Ecosystem profile, 18. Publication date: 31 December 2015. (Lapsus)
? *Chalinolobus egeria:* (Name Combination)
? *Chalinolobus egerius:* (Name Combination)
? *G[lauconycteris] cf egeria:*

TAXONOMY:
See Simmons (2005).

COMMON NAMES:
Czech: netopýr bibundinský. English: Bibundi Bufferfly Bat, Bibundi Bat. French: Glauconyctère de Bibundi, Murin à bajoues de Bibundi, Barbastelle du Bibundi. German: Bibundi Schmetterlingsfledermaus.

CONSERVATION STATUS:
Global - Listed as Data Deficient (DD ver 3.1 (2001)) in view of the absence of sufficient information on its extent of occurrence, natural history, threats and conservation status (Jacobs *et al.*, 2008f; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) (Jacobs *et al.*, 2008f; IUCN, 2009). 2004 - DD ver 3.1 (2001) (Jacobs *et al.*, 2004n; IUCN, 2004). 1996 - LR/lc [concern assessed as *Chalinolobus egeria*] (Baillie and Groombridge, 1996: 137).

MAJOR THREATS:
The threats to this species are not known (Jacobs *et al.*, 2008f; IUCN, 2009).

CONSERVATION ACTIONS:
Jacobs *et al.* (2008f) [in IUCN (2009)] report that it has been recorded from the Dzanga-Sangha Special Dense Forest Reserve in the Central

African Republic (Lunde *et al.*, 2001), and may be present in additional protected areas. Further field surveys are needed to better determine the distribution, natural history and possible threats to this little-known bat.

GENERAL DISTRIBUTION:
Currently only been recorded from three localities. The type locality is Bibundi in the Western Province of Cameroon (Thomas, 1913b); three individuals (as *G.* cf. *egeria*) were collected from Dzanga-Sangha Special Dense Forest Reserve in the Central African Republic (Lunde *et al.*, 2001); the species indicated as being present in western Uganda by Koopman (1993a: 199), although further details are needed of the collection site in this country (Jacobs *et al.*, 2008f; IUCN, 2009).

Native: Cameroon (Thomas, 1913b); Central African Republic (Lunde *et al.*, 2001).
Presence uncertain: Uganda (Koopman, 1993a; Simmons, 2005: 487).

HABITAT:
Lunde *et al.* (2001) recorded three specimens (allocated to *G.* cf. *egeria*) collected in dense secondary tropical lowland forest and along a forest road.

POPULATION:
Structure and Density - This species is known from very few specimens (Jacobs *et al.*, 2008f; IUCN, 2009).
Tend - 2008- Unknown (Jacobs *et al.*, 2008f; IUCN, 2009).

Glauconycteris gleni Peterson and Smith, 1973

*1973. *Glauconycteris gleni* Peterson and Smith, Life Sci. Occ. Pap., R. Ont. Mus., 22: 3, figs 1 - 4. Publication date: 17 August 1973. Type locality: Cameroon: near Lomie [ca. 03 10 N 13 37 E] [Goto Description]. Holotype: ROM 57125: ad ♀, skin and skull. Collected by: Robert M. Glen and V.N. Ngam; collection date: 16 June 1970. - Etymology: In honour of Mr. Robert Glenn, Nairobi, Kenya, who collected the holotype, assisted in the collection of the Uganda series of the new species, and who has been a field companion extraordinaire. (see Peterson and Smith, 1973: 1). (Current Combination)
? *Chalinolobus gleni:* (Name Combination)

TAXONOMY:
See Simmons (2005).

COMMON NAMES:
Czech: netopýr Glenův. English: Glen's Butterfly Bat, Glen's Wattled Bat. French: Glauconyctère de Glen, Murin à bajoues de Glen, Barbastelle de Glen. German: Glens Schmetterlingsfledermaus.

CONSERVATION STATUS:
Global - Listed as Data Deficient in view of the absence of sufficient information on its extent of occurrence, natural history, threats and conservation status (Jacobs *et al.*, 2008g; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) (Jacobs *et al.*, 2008g; IUCN, 2009). 2004 - VU D1 ver 3.1 (2001) (Jacobs *et al.*, 2004m; IUCN, 2004). 1996 - LR/nt [assessed as *Chalinolobus gleni*] (Baillie and Groombridge, 1996).

MAJOR THREATS:
It is presumably threatened in parts of its range by logging and the conversion of forest habitat to agricultural use (Jacobs *et al.*, 2008g; IUCN, 2009).

CONSERVATION ACTIONS:
Jacobs *et al.* (2008g) [in IUCN (2009)] report that there appear to be no direct conservation measures in place for this species. It is not known if the species is present within any protected areas. Additional studies are needed into the

distribution, abundance, general ecology and potential threats to this species.

GENERAL DISTRIBUTION:
Glauconycteris gleni is a poorly known species and has only been recorded from the three localities in Africa. The type locality 'near Lomie' in Cameroon, from a single site in western Uganda and Tanzania (1st record: Stanley and Foley, 2008: 119).

Native: Cameroon, Tanzania (Stanley and Foley, 2008: 119); Uganda.

HABITAT:
This poorly known bat is associated with lowland tropical moist forest.

POPULATION:
Structure and Density - Little information is available on the population abundance or size of this species (Jacobs *et al.*, 2008g; IUCN, 2009).
Trend - 2008 - Unknown (Jacobs *et al.*, 2008g; IUCN, 2009).

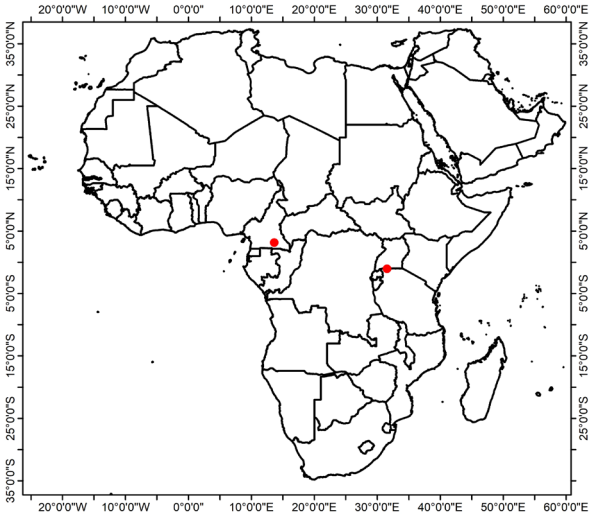

Figure 286. Distribution of *Glauconycteris gleni*

Glauconycteris humeralis J.A. Allen, 1917

*1917. *Glauconycteris humeralis* J.A. Allen, Bull. Am. Mus. Nat. Hist., 37 (18): 448, text-fig. 7 A. Publication date: 29 September 1917. Type locality: Congo (Democratic Republic of the): Oriental province: Medje [02 25 N 27 18 E, 800 m] [Goto Description]. Holotype: AMNH 49013: ad ♀, skin and skull. Collected by: Herbert Lang, James Paul Chapin and The American Museum Congo Expedition; collection date: 7 September 1910; original number: 956. (Current Combination)
? *Chalinolobus humeralis:* (Name Combination)
? *Glauconycteris beatrix humeralis:* (Name Combination)

TAXONOMY:
Included in *beatrix* by Koopman (1993a: 199), considered a subspecies of *beatrix* by Eger and Schlitter (2001), but considered a valid species by Simmons (2005).

COMMON NAMES:
Chinese: 花蝶蝠. Czech: netopýr medžeský. English: Allen's Spotted Bat. French: Glauconyctère tachetée. German: Gefleckte Schmetterlingsfledermaus.

CONSERVATION STATUS:
Global - Listed as Data Deficient (DD ver 3.1 (2001)) in view of the absence of sufficient information on its extent of occurrence, natural history, threats and conservation status (Schlitter, 2008c; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) (Schlitter, 2008c; IUCN, 2009). 2004 - DD ver 3.1 (2001) (Schlitter, 2004k; IUCN, 2004).

MAJOR THREATS:
The threats to this species are not known. It may be threatened within parts of its range by deforestation resulting from logging and mining activities, and the conversion of forest to farmland (Schlitter, 2008c; IUCN, 2009).

CONSERVATION ACTIONS:
Schlitter (2008c) [in IUCN (2009)] reports that there appear to be no direct conservation measures in place. It is not known if the species is present in any protected areas. Further research is needed into the distribution, natural history and threats to this poorly known forest species.

GENERAL DISTRIBUTION:
Native: Congo (The Democratic Republic of the) (Stephan *et al.*, 1987: 71; Heller *et al.*, 1994: 6; Eger and Schlitter, 2001: 7); Tanzania (Stanley and Foley, 2008: 119); Uganda.
Presence uncertain: Kenya (Aggundey and Schlitter, 1984).

DETAILED MORPHOLOGY:
Baculum - Hill and Harrison (1987).

POPULATION:
Structure and Density - Little information is available on the population abundance or size of this species (Schlitter, 2008c; IUCN, 2009).
Trend - 2008 - Unknown (Schlitter, 2008c; IUCN, 2009).

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Congo (Democratic Republic of the), Kenya, Tanzania, Uganda.

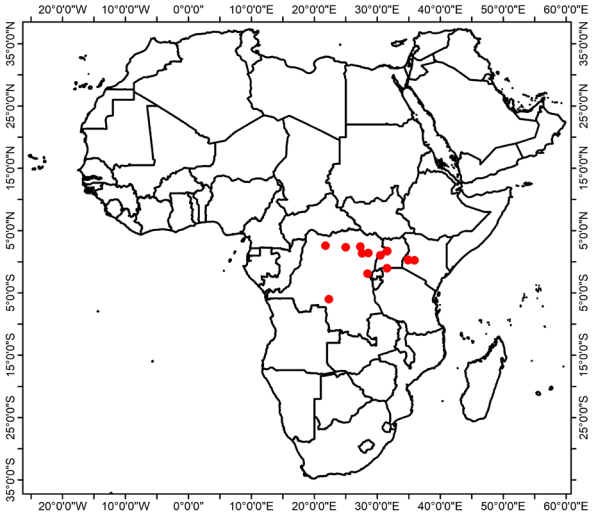

Figure 287. Distribution of *Glauconycteris humeralis*

Glauconycteris kenyacola Peterson, 1982

*1982. *Glauconycteris kenyacola* Peterson, Can. J. Zool., 60: 2521, figs 1 - 4. Type locality: Kenya: Coast province: on Galole road: Garsen, 8.5 km N [02 12 S 40 05 E] [Goto Description]. Holotype: ROM 71305: ad ♀, skin and skull. Collected by: Judith L. Eger and Robert M. Glen; collection date: 30 December 1970. - Etymology: From the geographical scientific Latin substantive *Kènya* and the Latin suffix -còla (-còla) "denoting one who inhabits", i.e. the species is an inhabitant of Kenya (see Peterson, 1982: 2522; Lanza *et al.*, 2015: 355. (Current Combination)
? *Chalinolobus kenyacola:* (Name Combination)
? *Chalinolobus kenyacolus (?):* (Name Combination)

TAXONOMY:
See Simmons (2005).

COMMON NAMES:
Chinese: 肯尼亚蝶蝠. Czech: netopýr keňský. English: Kenyan Butterfly Bat, Kenyan Wattled Bat, Kenya Barbastelle. French: Glauconyctère du Kenya, Murin à bajoues du Kenya, Barbastelle du Kenya. German: Kenya-Schmetterlingsfledermaus. Italian: Glauconitterìde keniòta, Glauconicterìde keniòta.

CONSERVATION STATUS:
Global - Listed as Data Deficient (DD ver 3.1 (2001)) in view of the absence of recent information on its extent of occurrence, ecological requirements, threats and conservation status (Jacobs *et al.*, 2008h; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) (Jacobs *et al.*, 2008h; IUCN, 2009). 2004 - DD ver 3.1 (2001) (Jacobs *et al.*, 2004l; IUCN, 2004). 1996 - DD [assessed as *Chalinolobus kenyacola*] (Baillie and Groombridge, 1996).

MAJOR THREATS:
The threats to this species are unclear. If it is associated with coastal forest habitats, it is likely to be threatened by extraction of wood and conversion of land to agricultural use (Jacobs *et al.*, 2008h; IUCN, 2009).

CONSERVATION ACTIONS:
Jacobs *et al.* (2008h) [in IUCN (2009)] report that it is not known if this species is present in any protected area. There is a need for additional field surveys to better understand the distribution, natural history and possible threats to this little-known species.

GENERAL DISTRIBUTION:
Glauconycteris kenyacola has only been recorded from the type locality of 'Galole Road, 8.5 km north of Garsen, Coast Province, Kenya' (Peterson, 1982).

Native: Kenya (Peterson, 1982; Aggundey and Schlitter, 1984).

POPULATION:
Structure and Density - This species is known only from the type collection (Jacobs *et al.*, 2008h; IUCN, 2009)..

Trend - 2008 - Unknown (Jacobs *et al.*, 2008h; IUCN, 2009).

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Kenya.

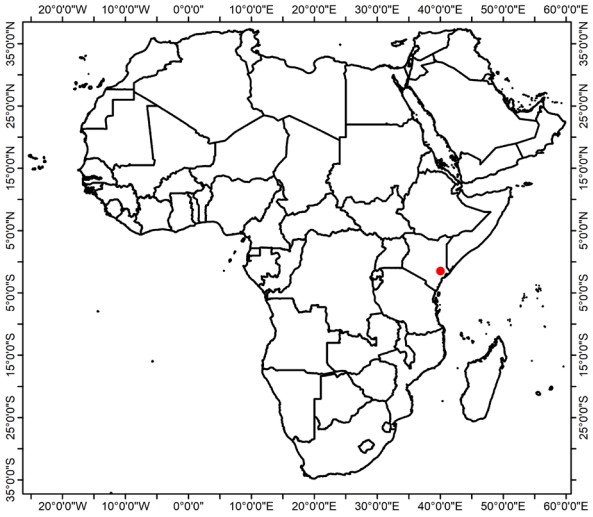

Figure 288. Distribution of *Glauconycteris kenyacola*

Glauconycteris machadoi Hayman, 1963

*1963. *Glauconycteris machadoi* Hayman, Publ. Cult. Comp. Diamantes Angola, Lisboa, 66: 107. Type locality: Angola: Lac Calundo [11 48 S 20 52 E]. Holotype: BMNH 1962.2074:. (Current Combination)
? *Chalinolobus machadoi:* (Name Combination)

TAXONOMY:
Included in *variegata* as a melanistic population by Koopman (1993a: 200), but considered a valid species by Simmons (2005).

COMMON NAMES:
Czech: netopýr Machadův. English: Machado's Butterfly Bat. French: Glauconyctère de Machado. German: Machados Schmetterlingsfledermaus.

CONSERVATION STATUS:
Global - Listed as Data Deficient (DD ver 3.1 (2001)) in view of the absence of recent information on its extent of occurrence, ecological requirements, threats and conservation status (Schlitter, 2008d; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) (Schlitter, 2008d; IUCN, 2009). 2004 - DD ver 3.1 (2001) (Schlitter, 2004d; IUCN, 2004).

MAJOR THREATS:
The threats to this species are not known (Schlitter, 2008d; IUCN, 2009).

CONSERVATION ACTIONS:
Schlitter (2008d) [in IUCN (2009)] reports that this species does not appear to be present in a protected area. Further taxonomic studies are needed for this species, as is field research into the distribution, natural history and possible threats to this little-known species.

GENERAL DISTRIBUTION:
Glauconycteris machadoi has only been recorded from the type locality of 'Lac Calundo'. in eastern Angola (see Rambaldini, 2010: 252).

Native: Angola (Hayman, 1963).

POPULATION:
Structure and Density - It is known only from the holotype (Schlitter, 2008d; IUCN, 2009).
Trend - 2008 - Unknown (Schlitter, 2008d; IUCN, 2009).

Glauconycteris poensis (Gray, 1842)

*1842. *Kerivoula poensis* Gray, Ann. Mag. nat. Hist., [ser. 1], 10 (65): 258. Publication date: 1 December 1842. Type locality: Nigeria: Lower Niger River: Abo [=Aboh] [05 33 N 06 32 E]. Holotype: BMNH 1842.11.4.33:. - Comments: Type locality originally "Fernando Po", but in reality Abo, Lower Niger: see Allen and Thomson, Exp. Niger, 2: 479, 1848 in Allen, 1939a: 88, Grubb *et al.*, 1998: 89). Dobson (1878: 256) mentions an ad skull, as type presented by T. Thompson, Esq. R.N., originating from Fernando Po.

1868. *Vesperus (Hesperoptenus) kraussii* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, 638. Publication date: 1868. Type locality: Nigeria: S Nigeria: Yoruba. - Comments: Type specimen: SMNH ???, ad ♀ (see Dobson, 1878: 255). (Name Combination)

? *Chalinolobus poensis:* (Name Combination)

? *Glauconycteris poensis:* (Name Combination, Current Combination)

TAXONOMY:
See Simmons (2005).

COMMON NAMES:
Czech: netopýr abonský. English: Abo Butterfly Bat, Abo Bat. French: Glauconyctère d'Abo, Murin à bajoues d'Abo, Barbastelle d'Abo. German: Abo-Schmetterlingsfledermaus, Westafrikanische Nachtfledermaus.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Jacobs *et al.*, 2008l; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Jacobs *et al.*, 2008l; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Jacobs *et al.*, 2004k; IUCN, 2004). 1996 - LR/nt [assessed as *Chalinolobus poensis*] (Baillie and Groombridge, 1996).

MAJOR THREATS:
It is presumably threatened in parts of its range by habitat loss resulting from logging and similar activities (Jacobs *et al.*, 2008l; IUCN, 2009).

CONSERVATION ACTIONS:
Jacobs *et al.* (2008l) [in IUCN (2009)] report that there appear to be no direct conservation measures in place. It is not known if the species is present in any protected area. Further field surveys are needed to better determine the distribution of this species, and to gather additional information on the natural history of this little-known bat.

GENERAL DISTRIBUTION:
Glauconycteris poensis is largely distributed in West and Central Africa, with a possible record from northeastern Tanzania. It ranges from Senegal in the west, through much of West Africa to Cameroon, Equatorial Guinea (the island of Bioko) and the Democratic Republic of the Congo in Central Africa.

Native: Benin (Capo-Chichi *et al.*, 2004: 162); Cameroon; Congo (The Democratic Republic of the) (Hayman *et al.*, 1966); Côte d'Ivoire; Equatorial Guinea (Bioko); Ghana (Jeffrey, 1975; Decher and Fahr, 2007: 20); Guinea (Fahr *et al.*, 2006a: 74); Guinea-Bissau (Rainho and Ranco, 2001: 68); Liberia (Koopman, 1989b; Koopman *et al.*, 1995; Monadjem and Fahr, 2007: 50); Nigeria (Happold, 1987); Senegal; Sierra Leone; Tanzania (Stanley and Foley, 2008: 119); Togo.
Presence uncertain: Kenya.

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Hayman and Jones (1950) mention a large variation in shoulder spots and flank stripes in individuals from Sierra Leone, sometimes being asymmetrical (a spot on one shoulder only). During their study of *Glauconycteris*, Hassanin *et al.* (2017: 16) never found asymmetrical spots in *G. poensis*, and they therefore caution the statement by Hayman and Jones (1950) and indicate that the specimens from Sierra Leone should be re-examined to confirm their identification.

DETAILED MORPHOLOGY:
Baculum - Hill and Harrison (1987) and Heller *et al.* (1994: 6).

MOLECULAR BIOLOGY:
DNA - See Hoofer and Van Den Bussche (2003).
Karyotype - Porter *et al.* (2010) report for Gabon $2n = 22$, with all chromosomes being distinctly biarmed, with ten pairs are metacentric or slightly submetacentric and one pair (the smallest) is subtelocentric. The lack of chromosomal heteromorphism in the male suggests a neo-XY sex determining system in this species.
Protein / allozyme - Unknown.

HABITAT:
Associated with lowland tropical moist forest (Happold, 1987).

In the Mount Nimba area, Monadjem *et al.* (2016y: 368) found this species widely present in forested habitats, in degraded secondary forests as well as on the edge of a small village, at altitudes between 450 and 880 m.

ROOST:
Roost in holes in trees, on the fronds of coconut palms, and presumably in similar vegetation (Rosevear, 1965; Jeffrey, 1975; Happold, 1987).

POPULATION:
Structure and Density - Colonies are formed of small groups of animals, up to eight individuals. While the species is generally rare, it is considered to be one of the more common forest species of the genus *Glauconycteris* (Jacobs *et al.*, 2008l; IUCN, 2009).
Trend - 2008 - Unknown (Jacobs *et al.*, 2008l; IUCN, 2009).

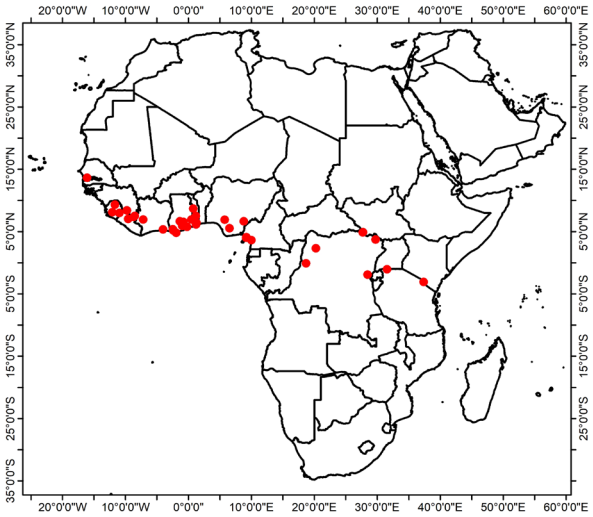

Figure 290. Distribution of *Glauconycteris poensis*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Benin, Cameroon, Congo (Democratic Republic of the), Côte d'Ivoire, Ghana, Liberia, Nigeria, Senegal, Sierra Leone, South Sudan, Tanzania, Togo.

Glauconycteris superba Hayman, 1939

*1939. *Glauconycteris superba* Hayman, Ann. Mag. nat. Hist., ser. 11, 3 (14): 219, figs 1 - 2. Publication date: 1 February 1939. Type locality: Congo (Democratic Republic of the): Oriental province: Ituri District: about 30 mi (45 km) ENE of Medje: Pawa [02 32 N 27 40 E] [Goto Description]. Holotype: RMCA 14765: ad ♂, skull and alcoholic. Collected by: Dr. Albert Dubois. Hayman (1939: 220) mentions that this specimen is probably a male as the sexual organs were cut away by Dr. Dubois when preparing the specimen. (Current Combination)

1947. *Glauconycteris superba sheila* Hayman, Ann. Mag. nat. Hist., ser. 11, 13 (103): 503 (for 1946). Publication date: 7 August 1947. Type locality: Ghana: Central province: Oda district: Oda [05 55 N 00 56 W] [Goto Description]. Holotype: BMNH 1947.10: ad ♀, skull and alcoholic. Collected by: George Soper Cansdale; collection date: 6 December 1946;

original number: 807. - Etymology: In honour of Mrs. Cansale, wife of the collector (see Hayman, 1947c: 550).
2013. *Niumbaha superba:* Reeder, Helgen, Vodzak, Lunde and Ejotre. (Name Combination)
? *Chalinolobus superbus:* (Name Combination)

TAXONOMY:
See Simmons (2005).

Reeder *et al.* (2013: 93) proposed to place *superba* into a separate, new genus: *Niumbaha* Reeder, Helgen, Vodzak, Lunde and Ejotre, 2013 as they found most external features to be different from *Glauconycteris sensu stricto*. However, as this view is not yet confirmed, we tentatively retain this species in the genus *Glauconycteris*.

Using *Cytb* and RAG2 data, Hassanin *et al.* (2017: 1) found that *superba* is a sister-group of *G. variegata*, which seems to confirm that *Niumbaha* should probably be considered a synonym of *Glauconycteris*.

COMMON NAMES:
Czech: netopýr iturijský. English: Superb Butterfly Bat, Pied Butterfly Bat, Pied Bat, Badger bat. French: Glauconyctère pie, Murin à bajoues pie, Barbastelle bariolée. German: Schwarz-Weiße Schmetterlingsfledermaus, Große Schmetterlingsfledermaus.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Fahr *et al.*, 2008; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Fahr *et al.*, 2008; IUCN, 2009). 2004 - VU B2ab(iii) ver 3.1 (2001) (Fahr *et al.*, 2004; IUCN, 2004). 1996 - VU [assessed as *Chalinolobus superbus*] (Baillie and Groombridge, 1996).

MAJOR THREATS:
As it has only been recorded from closed forest, it may be threatened by deforestation due to general logging and conversion of land to agricultural use (Fahr *et al.*, 2008; IUCN, 2009).

CONSERVATION ACTIONS:
Fahr *et al.* (2008) [in IUCN (2009)] report that there appear to be no direct conservation measures in place for this species. It may be protected within the Ituri Forest, although this needs to be confirmed. There is a need for further directed field surveys to better determine the distribution, natural history and possible threats to this species.

GENERAL DISTRIBUTION:
Recorded from Côte d'Ivoire (locality not given) (Peterson and Smith, 1973); from Oda in Oda Province, Ghana (Hayman, 1947c; Grubb *et al.*, 1998); and from the Ituri Forest in northeastern Congo (Hayman, 1939; Hayman *et al.*, 1966). It has previously been reported to occur in Uganda, however, this is now considered to be in error. It may be present in Sierra Leone, however, it has yet to have been recorded in this country (Grubb *et al.*, 1998).
In 2013, two new records were reported: one from the Democratic Republic of the Congo (Gembu Tungaluna *et al.*, 2013), and one from South Sudan (Reeder *et al.*, 2013).

Native: Congo (The Democratic Republic of the) (Hayman, 1939; Hayman *et al.*, 1966; Gembu Tungaluna *et al.*, 2013); Côte d'Ivoire (Peterson and Smith, 1973); Ghana (Hayman, 1947c; Grubb *et al.*, 1998), South Sudan (Reeder *et al.*, 2013)
Presence uncertain: Sierra Leone (Grubb *et al.*, 1998).

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Based on a series of 10 specimens, Ing *et al.* (2016: 479) found that both males and females have the same coloration pattern: three white markings on the head; a large white ruff on the throat, which is disconnected from two large white lateral stripes; and two white spots on the shoulders. One specimen had three shoulderspots. They also have four white stripes on the back. Around the sexual organs, the white colour is not pure, but yellowish, possibly the result of polution by bodily fluids.

Based on the Fa (47.5 mm) and Tibia (21.3 mm), Ing *et al.* (2016: 482) suspect that the holotype of *G. superba* is rather a female than "probably a male" as indicated by Hayman (1939).

SEXUAL DIMORPHISM:
On a series consisting of four ♀♀ and six♂♂, Ing *et al.* (2016: 479) found the females to be 5 % larger (Fa, Tib and 5th finger) and 10 % heavier than males.

ECHOLOCATION:
Ing *et al.* (2016: 481) found that the bats emitted sounds alternating between two distinct frequencies: **A**: range: 20.5 - 57.0 kHz, F_{min}: 22.9 ± 1.4 (20.5 - 25.1) kHz, F_{max}: 36.8 ± 6.6 (29.1 -

57.0) kHz, $F_{max\ energy}$: 25.7 ± 2.2 (22.4 - 30.9) kHz, bandwidth: 13.8 ± 6.3 (5.9 - 32.6) kHz, duration: 5.6 ± 1.9 (3.1 - 9.6) ms; and **B**: range: 27.3 - 73.3 kHz, F_{min}: 29.8 ± 1.3 (27.3 - 31.3) kHz, F_{max}: 57.0 - 13.5 (38.8 - 73.3) kHz, $F_{max\ energy}$: 33.0 ± 3.0 (28.8 - 38.2) kHz, bandwith: 27.1 ± 13.2 (9.1 - 43.3) kHz, duration: 6.4 ± 1.8 (4.0 - 10.1) ms. The B type of call is produced when the wing beat becomes constant.

HABITAT:
This species is associated with 'heavy' or closed lowland tropical moist forest (Rosevear, 1965; Hayman and Hill, 1971).

Based on wing measurements, however, Ing *et al.* (2016: 482) found that *G. superba* has long wings, which are adapted for high-speed flight. The high wing loading values, furthermore, indicate low manoeuvrability. These are features which are generally found in bats flying in uncluttered or open space, i.e., above the canopy.

HABITS:
After being released, the bats flew at speeds of about 1 to 9 m/s (average 4 - 6 m/s) (Ing *et al.*, 2016: 482).

POPULATION:
Structure and Density - It is currently known only from three specimens. It is very rare, or at least rarely collected (Hayman and Hill, 1971; Grubb *et al.*, 1998).
Trend - 2008 - Unknown (Fahr *et al.*, 2008; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
Two of the four females that were captured on Mbiye island (DRC) by Ing *et al.* (2016: 479) in December 2013 were lactating.

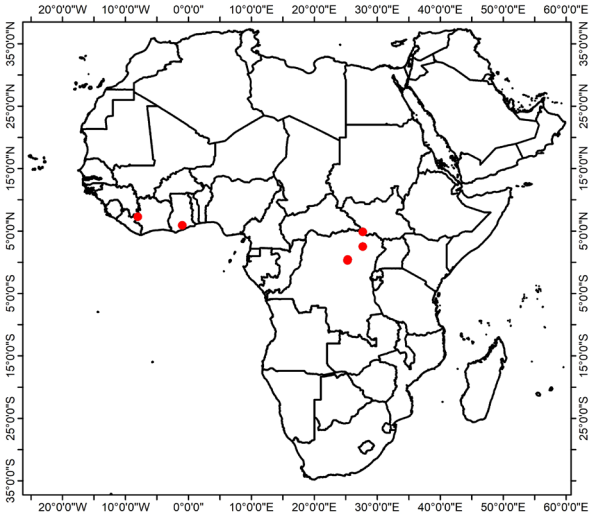

Figure 291. Distribution of *Glauconycteris superba*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Congo (Democratic Republic of the), Côte d'Ivoire, Ghana, South Sudan.

Glauconycteris variegata (Tomes, 1861)

*1861. *Scotophilus variegatus* Tomes, Proc. zool. Soc. Lond., 1861, I: 31, 36. Publication date: May 1861. Type locality: Namibia: Ovamboland: about 32 km west of Ondongwa: Otjoro [=Otjihoro] [ca. 17 54 S 15 38 E] [Goto Description]. Syntype: BMNH 1907.1.1.437: skin and skull. Collected by: 1 Anderson; collection date: 1 December 1859. See Tomes (1861b: 39). Syntype: BMNH 1907.1.1.438: skin and skull. Collection date: 1 December 1859. See Tomes (1861b: 39). Syntype: ZMB 3033: ♂, skin and skull. Collected by: Andersson; collection date: 1 December 1859. See Turni and Kock (2008). - Comments: For details about the type locality, see Shortridge (1934), Meester *et al.* (1986: 54). - Etymology: From the feminine scientific Latin adjective *variegàta*, meaning "variegated", referring to the dark reticular pattern on the wings (see Lanza *et al.*, 2015: 356).

1905. *Glauconycteris papilio* Thomas, Ann. Mag. nat. Hist., ser. 7, 15 (85): 77. Publication date: 1 January 1905. Type locality: Uganda: Entebbe [00 04 N 32 28 E, 3 800 ft] [Goto Description]. Holotype: BMNH 1899.8.4.14: ♀, skin and skull. Collected by: F.J. Jackson Esq. Collection date: 10 April 1895. Presented/Donated by: F.J. Jackson Esq. Thomas (1905a: 77), who also mentions specimens from "Gambaga, Gold Coast (Giffard), and Tette, Zambesi (Boyd Alexander)".

1915. *Glauconycteris phalæna* Thomas, Ann. Mag. nat. Hist., 8, 15 (90): 560. Publication date: 1 June 1915. Type locality: Sudan: White Nile province: Malakal district: Fashoda, near [09 50 N 32 00 E] [Goto Description]. Holotype: BMNH 1915.3.6.67: ad ♀. Collected by: Willoughby P. Lowe; collection date: 27 January 1914; original number: 71. - Etymology: From the Greek for moth (see Jaeger, 1972).

2015. *Glauconycteris variegate:* Gunnell, Butler, Greenwood and Simmons, Am. Mus. Novit., 3846: 34. Publication date: 16 December 2015. (Lapsus)

? *Chalinolobus (Glauconycteris) variegata:* (Name Combination, Alternate Spelling)

? *Chalinolobus (Glauconycteris) variegatus:* (Name Combination)

? *Chalinolobus variegatus:* (Name Combination)
? *Glauconycteris variegata papilio:* (Name Combination)
? *Glauconycteris variegata variegata:* (Name Combination)
? *Glauconycteris variegata:* (Name Combination, Current Combination)
? *Glauconycteris variegatus:* (Name Combination, Alternate Spelling)

TAXONOMY:
Koopman (1971: 6; Koopman, 1993a: 200) included *machadoi*, and believed it to be a melanistic mutant population, but see Simmons (2005).

COMMON NAMES:
Afrikaans: Vlindervlermuis. Chinese: 彩蝶蝠. Czech: netopýr motýlí. English: Variegated Butterfly Bat, Butterfly Bat, Leaf-winged bat. French: Glauconyctère papillon, Murin à bajoues papillon, Chauve-souris réticulée, Chauve-souris papillon. German: Genetzte Schmetterlingsfledermaus. Italian: Glauconitterìde variegàta, Glauconicterìde variegàta. Portuguese: Morcego borboleta.

ETYMOLOGY OF COMMON NAME:
The colloguial name may be derived from the dark reticulated pattern on the wings, which has led to their being called leaf-winged bats (Taylor 2005). Although it is said that they resemble a large butterfly in flight, they are by no means butterfly-like in this respect (Taylor, 2005).

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Rambaldini (2010: 255) refers to Avery (1991), who mentioned finding fossil remains in very late Holocene layers at Border Cave, KwaZulu Natal.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Jacobs *et al.*, 2008j; IUCN, 2009; Rambaldini, 2010: 256).

Assessment History -
2008 - LC ver 3.1 (2001) (Jacobs *et al.*, 2008j; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Jacobs *et al.*, 2004j; IUCN, 2004). 1996 - LR/lc [assessed as *Chalinolobus variegatus*] (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - LC ver 3.1 (2001) [assessed as (Schoeman *et al.*, 2016c).2004 - NT ver 3.1 (2001) [assessed as *G. variegatus*] (Friedmann and Daly, 2004). 1986 - Indeterminate (Smithers, 1986).

MAJOR THREATS:
In view of the species wide range and availability of extensive suitable habitat, there are no major threats to this species. This species is threatened in parts of its range by habitat loss resulting from logging activities and the conversion of land to agricultural use (Jacobs *et al.*, 2008j; IUCN, 2009).

CONSERVATION ACTIONS:
Jacobs *et al.* (2008j) [in IUCN (2009)] report that there appear to be no direct conservation measures in place. In view of the species wide distribution it is presumably present in some protected areas.

GENERAL DISTRIBUTION:
Glauconycteris variegata is widely, but patchily, recorded throughout much of sub-Saharan Africa. It ranges from Senegal and The Gambia in West Africa, through West and Central Africa to Ethiopia and Somalia in the east, from here it ranges south through East Africa and southern Africa, being recorded as far south as northeastern South Africa.

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 976,983 km^2.

Rambaldini (2010: 254-255) confirms that there are no records from the central regions of The Democratic Republic of the Congo, northern Congo Republic, northeastern Gabon, Equatorial Guinea, and the southern parts of Cameroon, Nigeria and Benin. Furthermore, it seems missing from the coastal areas of southwestern Ghana, Côte d'Ivoire, Liberia and Sierra Leone.

Native: Angola (Crawford-Cabral, 1989; Monadjem *et al.*, 2010d: 562); Benin (Capo-Chichi *et al.*, 2004: 162); Botswana (Archer, 1977; Monadjem *et al.*, 2010d: 562); Burkina Faso (Kangoyé *et al.*, 2012: 6025; 2015a: 618); Cameroon; Chad; Congo; Congo (The Democratic Republic of the) (Schouteden, 1944; Hayman *et al.*, 1966; Monadjem *et al.*, 2010d: 562); Ethiopia (Yalden *et al.*, 1996; Lavrenchenko *et al.*, 2004b: 137); Gabon; Gambia; Ghana; Kenya; Malawi (Happold *et al.*, 1988; Ansell and Dowsett, 1988; Happold and Happold, 1997b: 821; Monadjem *et al.*, 2010d: 562); Mozambique (Smithers and Lobão Tello, 1976; Monadjem *et al.*, 2010d: 562; Monadjem *et al.*, 2010c: 383); Namibia (Cotterill,

2004a: 262; Monadjem *et al.*, 2010d: 562); Nigeria (Happold, 1987); Rwanda; Senegal; Somalia; South Africa (Monadjem *et al.*, 2010d: 562); Sudan (Koopman, 1975); Swaziland; Tanzania; Togo; Uganda (Kityo and Kerbis, 1996: 62); Zambia (Ansell, 1957; Ansell, 1969; Ansell, 1973; Ansell, 1974; Monadjem *et al.*, 2010d: 562); Zimbabwe (Monadjem *et al.*, 2010d: 563).

DENTAL FORMULA:
$^{2113}/_{3123}$ = 32.

DETAILED MORPHOLOGY:
Baculum - Hill and Harrison (1987).

SEXUAL DIMORPHISM:
Rambaldini (2010: 253) indicates that females are slightly larger than males in body dimensions, but not in weight.

ECHOLOCATION:
Rambaldini (2010: 255) mentions that the echolocation vocalizations are high-intensity, frequency-modulated calls typically starting from 70 kHz and ending at 30 kHz, and are sometimes including a 2nd harmonic, and rarely a 3rd one.

MOLECULAR BIOLOGY:
DNA - See Hoofer and Van Den Bussche (2003).
Karyotype - Rautenbach *et al.* (1993) reported 2*n* = 18, FN = 32, BA = 16, a medium sized subtelocentric X chromosome, and a small metacentric Y chromosome, for specimens from South Africa.
Protein / allozyme - Unknown.

HABITAT:
Glauconycteris variegata is an inhabitant ot savannah, woodland, or open country–bushveldt habitats (see Rambaldini, 2010: 255).

ROOST:
Thatched roofs of abandoned huts and among dense vegetation (Allen *et al.*, 1917; Ansell and Dowsett, 1988; Taylor, 1998).

DIET:
Glauconycteris variegata eats airborne prey, primarily soft-bodied insects such as moths (see Kingdon, 1974; Fenton *et al.*, 1977a).

POPULATION:
Structure and Density - Colonies of this species are small, and there are believed to be less than 10,000 individuals in total (Jacobs *et al.*, 2008j; IUCN, 2009).
Trend - 2008 - Unknown (Jacobs *et al.*, 2008j; IUCN, 2009, Rambaldini, 2010: 256).

REPRODUCTION AND ONTOGENY:
Anciaux de Faveaux (1970) in Rambaldini (2010: 255) indicates that this species is monoestrus, but that the seasonal reproductive cycle can change across its range. Kingdon (1974) reported sexually active males from southern Uganda in July and October, whereas Monard (1935) did not find any sexually active adults in July in Angola. Lang and Chapin (1917b) reported pregnant females from the Democratic Republic of the Congo in March. From Zimbabwe, Smithers and Wilson (1979) reported pregnant females in August.

Bernard and Cumming (1997) [in Krutzsch (2000: 116)] suggested that *H. caffer* poses some kind of a problem as it is clearly monoestrous in some parts of its range but possibly bimodally or continuously polyoestrous in other parts.

PARASITES:
BACTERIA
Dietrich *et al.* (2016b: 3) found one out of three bats tested positive for *Rickettsia* in Rocktail Bay (RSA). Also from the RSA, Dietrich *et al.* (2018a: 4) reported the presence of *Leptospira kirschneri*.

Protozoa
Kassahun *et al.* (2015: 168) examined eight Ethiopian *G. variegata* specimens and found one of them (from Bedele) to be infected by *Leishmania* parasites.

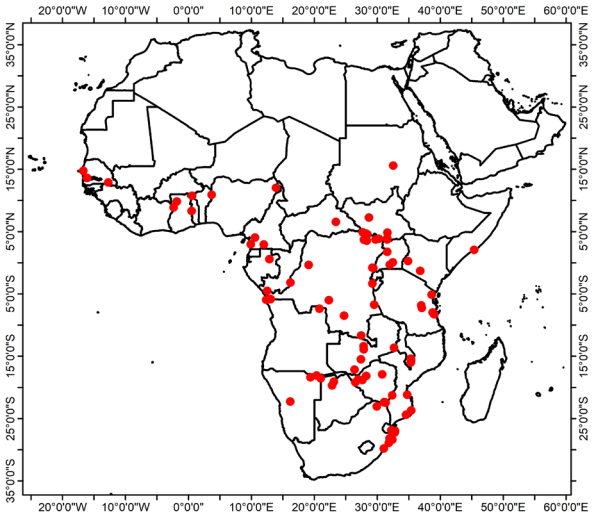

Figure 292. Distribution of *Glauconycteris variegata*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Angola, Benin, Botswana, Cameroon, Central African Republic, Congo, Congo (Democratic Republic of the), Côte d'Ivoire, Ethiopia, Gabon, Ghana, Kenya, Malawi, Mozambique, Namibia, Nigeria, Senegal, Somalia, South Africa, South Sudan, Sudan, Tanzania, Togo, Uganda, Zambia, Zimbabwe.

Genus ***Hypsugo*** Kolenati, 1856

*1856. *Hypsugo* Kolenati, Allg. deutsche naturh. Zeitung, N.F., 2 (2): 131. Publication date: 1856. - Comments: Type species: *Vespertilio savii* Bonaparte, 1837. - Etymology: From the Greek "*υψι*", (hýpsi) meaning "on high" or "aloft" and the ending -"ugo" (as in *Nannugo* and *Vesperugo*) (see Palmer, 1904: 343). Lanza *et al.* (2015: 380) suggest the following "From the neuter Greek substantive "*ύψος*" (hýpsos) "height" + the suffix *-ugo* of the feminine Latin substantive *vesperùgo* 'evening star', i.e. a bright planet (as Venus), seen in the western sky after sunset, corresponding to the Latin 'stella matutina', the planet Venus, appearing first in the nocturnal sky and disappearing first from the morning one. By extension *Vesperugo* has assumed also the meaning of 'bat'; hence *Hypsugo* means 'mountain bat' as *H. maurus* Kolenati, 1856 a synonym of *savii*, was collected in the central chain of Alps". (Current Combination)

1993. *Ypsugo:* Ariagno, Le Bièvre, 13: 118. (Lapsus)

TAXONOMY:

Meester *et al.* (1986: 50) mention *Vespertilio maurus* Blasius (=*Vespertiio savii* Bonaparte) and *Vesperugo kraschenikovii* Eversmann as type species, but this was fixed to *Vespertilio savii* Bonaparte by Wallin (1969: 329), see Corbet and Hill (1992: 133).

Helbig *et al.* (2010: 168) suggest that *Hypsugo* is actually a para- or polyphyletic group, which would become monophyletic if the African forms are transferred to the genus *Nycticeinops*.

Monadjem *et al.* (2016y: 369) mention an undescribed species, belonging to the genus *Hypsugo* from the Mount Nimba area in Liberia.

Known species of the genus *Hypsugo*: *affinis* (Dobson, 1871) – Cambodia, NE Burma (=Myanmar), Yunnan, SE Tibet (China), N India, Nepal, Sri Lanka; *alaschanicus* Bobrinskii, 1926 – Mongolia, China, Russian Far East to Korea and Tsushima Isl (Japan) (Simmons, 2005: 489); ***anchietae*** (de Seabrae, 1900); *anthonyi* (Tate, 1942) – Burma (Simmons, 2005: 489); *arabicus* (Harrison, 1979) – Oman, Iran (Simmons, 2005: 489); ***ariel*** (Thomas, 1904); *bodenheimeri* (Harrison, 1960) – Israel, Saudi Arabia, southern Yemen, Oman (Yemen) (Simmons, 2005: 490); *cadornae* (Thomas, 1916) – northeastern India, Burma, Thailand, Vietnam, Laos (Simmons, 2005: 490); ***crassulus*** (Thomas, 1904); ***eisentrauti*** (Hill, 1968); *imbricatus* (Horsfield, 1824) – Java, Kangean Isl, Bali and Lesser Suda Isls, Borneo (Simmons, 2005: 490); *joffrei* (Thomas, 1915) – northern Burma (Simmons, 2005: 490); *kitcheneri* (Thomas, 1915) – Borneo (Simmons, 2005: 491); ***lanzai*** Benda, Al-Jumaily, Reiter and Nasher, 2011; *lophurus* (Thomas, 1915) – Burma Peninsular (Simmons, 2005: 491); *macrotis* (Temminck, 1840) – western Malaysia, Sumatra, Bali and adjacent small islands (Simmons, 2005: 491); *mordax* (Peters, 1867) – Java, Philippines; ***musciculus*** (Thomas, 1913); *petersi* (A. Meyer, 1899) – Borneo, Sulawesi, Buru and Ambon (Molucca Islands), Philippines (Luzon, Mindanao); *pulveratus* (Peters, 1871) – Szechwan, Yunnan, Hunan, Kiangsu, Fukien (China), Hong Kong, Thailand, Laos, Vietnam (Simmons, 2005: 491); *savii* (Bonaparte, 1837) – France, Portugal, Spain, Italy, southern Switzerland, Austria, eastern Hungary, Balkan countries, Morocco, Crimea and Caucasus, Turkey, Lebanon, Syria, Israel, Iran, Kazakhstan, Turkmenistan, Uzbekistan, Kyrgyzstan, Tajikistan, Afghanistan to northern India and Burma (Simmons, 2005: 491); *vordermanni* (Jentink, 1890) – Belitung Isl (Indonesia), Borneo (Sarawak, Malaysia) (Simmons, 2005: 492).

COMMON NAMES:

Czech: skalní netopýři. English: Mountain Pipistrelle Bats. French: Vespères. Italian: Ipsùghi.

Hypsugo anchietae (Seabra, 1900)

1900. *V[esperugo] Anchietæ:* Bocage, Bull. Mus. natn. Hist. nat., Paris, 6: 164. (Name Combination, Alternate Spelling)

*1900. *Vesperugo Anchieta* Seabra, J. Sci. mat. phys. nat., ser. 2, 6 (21): 26. Publication date: August 1900. Type locality: Angola: Cahata [12 20 S 14 50 E] [Goto Description]. Paratype: MNHN ZM-MO-1900-538: ad ♀, skull and alcoholic. Collected by: José Alberto de Oliveira Anchieta. Number 211 in Rode (1941: 246). Syntype: BMNH 1906.1.3.1: ad ♀, skull and alcoholic. - Etymology: This species is named after Mr Anchieta, a Portuguese

national, who was a prolific collector of zoology material in Angola in the 1860's and who has numerous reptiles, birds and mammals named after him (Taylor, 2005).

1935. *Pipistrellus anchietae:* Monard, Arq. Mus. Bocage, 6: 31. (Name Combination, Current Spelling)

TAXONOMY:

Figure 293. *Hypsugo anchietae* (ECJS-119/2009) caught in the Okavango, Botswana.

The oldest name for this species may be *bicolor*; see Koopman (1975: 404). Koopman (1994: 114) mentions this species as *P. bicolor* in the subgenus *Pipistrellus*. Incorrect original spelling as *anchieta*, corrected to *anchietae* by Seabra (1900b: 120).

COMMON NAMES:
Afrikaans: Anchieta-vlermuis. Czech: netopýr Anchietův. English: Anchieta's Pipistrelle, Anchieta's Bat, Miombo pipistrelle. French: Vespère d'Anchieta, Pipistrelle du Miombo, Pipistrelle d'Anchieta. German: Anchietas Zwergfledermaus, Anchietas Pipistrelle.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, it occurs in a number of protected areas, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Jacobs *et al.*, 2008ap; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) [assessed as *Pipistrellus anchietae*] (Jacobs *et al.*, 2008ap; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Jacobs *et al.*, 2004aq; IUCN, 2004). 1996 - VU [assessed as *Pipistrellus anchietai*] (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - LC ver 3.1 (2001) (Monadjem *et al.*, 2016i). 2004 - NT ver 3.1 (2001) [assessed as *Pipistrellus anchietae*] (Friedmann and Daly, 2004).

MAJOR THREATS:
There appear to be no major threats to this species, although further research is needed to confirm this (Jacobs *et al.*, 2008ap; IUCN, 2009).

Trend - 2008 - Unknown (Jacobs *et al.*, 2008ap; IUCN, 2009).

CONSERVATION ACTIONS:
Jacobs *et al.* (2008ap) [in IUCN (2009)] report that it is present in a number of protected areas in Zimbabwe and South Africa. Further studies are needed into the distribution, natural history and possible threats to this species.

GENERAL DISTRIBUTION:
Hypsugo anchietae is largely a southern African species which ranges from Angola in the west, through southern Democratic Republic of the Congo, and from here south into Zambia, Zimbabwe, and eastern South Africa. It could be more widespread in southern Africa than is currently understood (Skinner and Chimimba, 2005). The species has recently been recorded from Madagascar for the first time, where it was collected from four localities (Kirindy Forest [CFPF]; Sept Lacs; Parc National de Kirindy-Mitea; Parc National de Zombitse-Vohibasia) (Bates *et al.*, 2006: 319).

South of 8° S, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 987,832 km^2.

Native: Angola (Crawford-Cabral, 1989; Monadjem *et al.*, 2010d: 563; Taylor *et al.*, 2018b: 60); Botswana (Monadjem *et al.*, 2010d: 563); Congo (The Democratic Republic of the); Madagascar (Bates *et al.*, 2006: 319); Mozambique (Monadjem *et al.*, 2010d: 563); South Africa (Koopman, 1994: 114; Kearney and Taylor, 1997: 54; Monadjem *et al.*, 2007c as *H. cf. anchietae*; Monadjem *et al.*, 2010d: 563); Swaziland (Monadjem *et al.*, 2010d: 563); Zambia (Ansell, 1973; Monadjem *et al.*, 2010d: 563); Zimbabwe (Monadjem *et al.*, 2010d: 563).
Presence uncertain: Namibia (Cotterill, 2004a: 261).

DETAILED MORPHOLOGY:
Baculum - Hill and Harrison (1987) and Kearney *et al.* (2002).

ECHOLOCATION:
Schoeman and Waddington (2011: 291) mention a peak frequency of 55.9 ± 0.3 kHz and a duration of 2.1 ± 0.1 msec for specimens from Durban, South Africa.

MOLECULAR BIOLOGY:
DNA - Unknown.

Karyotypic - Rautenbach *et al.* (1993) and Kearney *et al.* (2002) both reported 2*n* = 26, FN = 32, BA = 8, a submetacentric X chromosome, and an acrocentric Y chromosome, for specimens from South Africa.
Protein / allozyme - Unknown.

HABITAT:
In southern Africa, the species primarily occurs in Savanna (85 %) and Coastal mosaic (10 %) habitats (Cooper-Bohannon *et al.*, 2016: Table S2).

POPULATION:
Structure and Density - It is a locally common species in southern Africa. Very few specimens are currently known from Madagascar (Jacobs *et al.*, 2008ap; IUCN, 2009).
Trend - 2008 - Unknown (Jacobs *et al.*, 2008ap; IUCN, 2009).

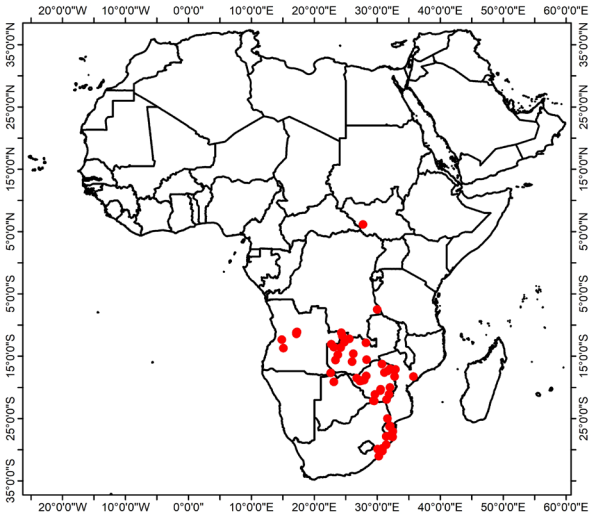

Figure 294. Distribution of *Hypsugo anchietae*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Angola, Botswana, Congo (Democratic Republic of the), Ethiopia, Mozambique, South Africa, South Sudan, Swaziland, Zambia, Zimbabwe.

Hypsugo ariel (Thomas, 1904)

*1904. *Pipistrellus ariel* Thomas, Ann. Mag. nat. Hist., ser. 7, 14 (80): 157. Publication date: 1 August 1904. Type locality: Sudan: Kassala province: Wadi Alagi [ca. 22 N 35 E, 2 000 ft] [Goto Description]. Holotype: BMNH 1904.11.4.7: ad ♀, skin and skull. Collected by: Arthur M. MacKilligan; collection date: 12 August 1903; original number: 28. See Qumsiyeh (1985: 54).
1966. *Pipistrellus (Pipistrellus) ariel:* Ellerman and Morrison-Scott, Checklist of Palaearctic and Indian Mammals 1758 to 1946. (Second Edition), 171. (Name Combination)
1987. *Pipistrellus (Hypsugo) ariel:* Hill and Harrison, Bull. Br. Mus. (nat. Hist.) Zool., 52 (7): 281. (Name Combination)
1991. *Pipistrellus ariel ariel:* Harrison and Bates, Mammals of Arabia, 92. (Name Combination)

2000. *Hypsugo ariel:* Horácek, Hanák and Gaisler, Bats of the Palearctic region, 126. (Name Combination, Current Combination)

TAXONOMY:
Mentioned in the subgenus *Pipistrellus* by Koopman (1994: 115). Harrison and Bates (1991: 93) assign the Arabian specimens to *P. a. ariel*, although they do not mention any other subspecies. Horácek *et al.* (2000: 126) mention it in the genus *Hypsugo*.

COMMON NAMES:
Arabian: Khaffash. Czech: netopýr pouštní. Dutch: Woestijndwergvleermuis. English: Pygmy Pipistrellus, Ariel Pipistrelle, Egyptian Desert Pipistrelle, Desert Pipistrelle, Fairy Pipistrelle. French: Vespère ariel, Pipistrelle ariel. German: Elfen-Zwergfledermaus, Elfen-Pipistrelle. Hebrew: Atalfon Ariel.

CONSERVATION STATUS:
Global - Listed as Data Deficient (DD ver 3.1 (2001)) in view of the absence of recent information on its extent of occurrence, status and ecological requirements (Benda and Aulagnier, 2008; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) [assessed as *Pipistrellus ariel*] (Benda and Aulagnier, 2008; IUCN, 2009). 2004 - DD ver 3.1 (2001) (Benda, 2004c; IUCN, 2004). 1996 - LR/nt assessed as *Pipistrellus ariel* (Baillie and Groombridge, 1996).

MAJOR THREATS:
Loss of natural habitat because of agricultural intensification. The species is affected by pesticides, although this is not considered a major threat (Z. Amr *pers. comm.*, 2005 [in Benda and Aulagnier (2008) in IUCN (2009))].

CONSERVATION ACTIONS:
Benda and Aulagnier (2008) [in IUCN (2009)] report that no conservation actions are in place. Further research on the taxonomy, population ecology and trends is required and the extent of the range requires further clarification.

GENERAL DISTRIBUTION:
Hypsugo ariel has been recorded from Israel, Jordan and Egypt (including the Sinai) within the Mediterranean (Dietz, 2005). Outside the area the range extends to Saudi Arabia, and Yemen. In Africa it is recorded from northern Sudan (type locality, see Simmons, 2005). Approximately five localities known in northeast Africa, including Egypt and Sudan.

The specimens from Socotra (Yemen) are now considered to belong to a separate species: *Hypsugo lanzai* (see Benda *et al.*, 2011b: 37).

Native: Egypt (Sinai); Israel; Jordan; Palestinian Territory, Occupied; Saudi Arabia; Sudan; Yemen (South Yemen).

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:

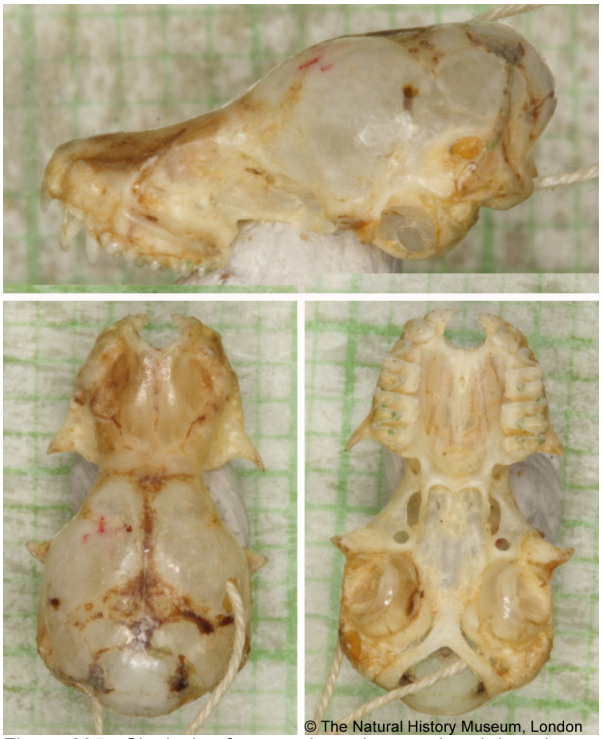

Figure 295. Clockwise from top lateral, ventral and dorsal skull images of BMNH 1904.11.4.7, holotype of *Pipistrellus ariel* Thomas, 1904.

DETAILED MORPHOLOGY:
Baculum - Benda *et al.* (2011b: 38).

ECHOLOCATION:
From Jordan, Benda *et al.* (2010b: 204) reported the following parameters for 129 calls: F_{start}: 58.1 ± 4.1 (47.7 - 75.0) kHz, F_{end}: 43.0 ± 2.1 (30.0 - 47.4) kHz, F_{peak}: 46.4 ± 1.3 (43.4 - 49.0) kHz, Pulse duration: 4.1 ± 0.8 (2.4 - 7.2) msec., and Inter-pulse interval: 81.9 ± 18.9 (45.0 - 193.0) msec.

POPULATION:
Structure and Density - The population is apparently small but is probably stable (Z. Amr *pers. comm.*, 2005 in Benda and Aulagnier (2008) [in IUCN (2009)]).
Trend - 2008 - Unknown (Benda and Aulagnier, 2008; IUCN, 2009). *P. ariel* populations within the Asia Minor and Levant region are unknown

population trend, under predictive climate change scenarios (Bilgin *et al.*, 2012: 433).

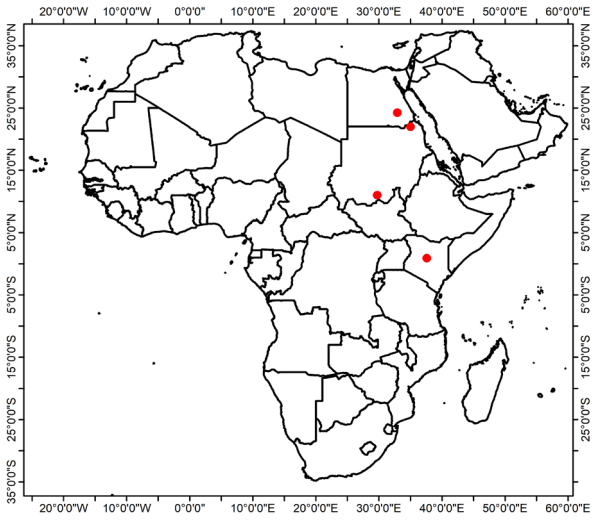

Figure 296. Distribution of *Hypsugo ariel*

DISTRIBUTION BASED ON VOUCHER SPECIMENS: "Africa", Egypt, Kenya, Sudan.

Hypsugo bemainty Goodman, Rakotondramanana, Ramasindrazana, Kearney, Monadjem, Schoeman, Taylor, Naughton and Appleton, 2015

*2015. *Hypsugo bemainty* Goodman, Rakotondramanana, Ramasindrazana, Kearney, Monadjem, Schoeman, Taylor, Naughton and Appleton, Zool. J. Linn. Soc., 173 (4): 992, 1008, figs 9 - 12. Type locality: Madagascar: Province de Toliara: 60 km N Morondava, along the Kirindy River: Kirindy Forest (CNFEREF) [20°4'29.1"S, 44°40'14.4"E, 45 m] [Goto Description].

HABITAT:
Ravelomanantsoa *et al.* (2019: 111) captured this bat in a marshy zone near Ambereny.

DIET:
Rakotondramanana *et al.* (2015: 77) reported the following volume percentages present in the diet of *H. bemainty*: Coleoptera: 14.1 ± 12.56; Hymenoptera: 12.0 ± 14.60; Lepidoptera: 18.6 ± 20.27; Isoptera: 52.0 ± 33.78; Homoptera: 2.2 ± 3.59; Arachnida: 0.5 ± 1.73; Orthoptera: 0.5 ± 1.73. Expressed as frequency percentages, the values are: Coleoptera: 61.7 ± 37.62; Hymenoptera: 53.3 ± 47.74; Lepidoptera: 58.3 ± 48.59; Isoptera: 80.0 ± 39.08; Homoptera: 13.3 ± 23.09; Arachnida: 6.7 ± 23.09; Orthoptera: 6.7 ± 23.09.

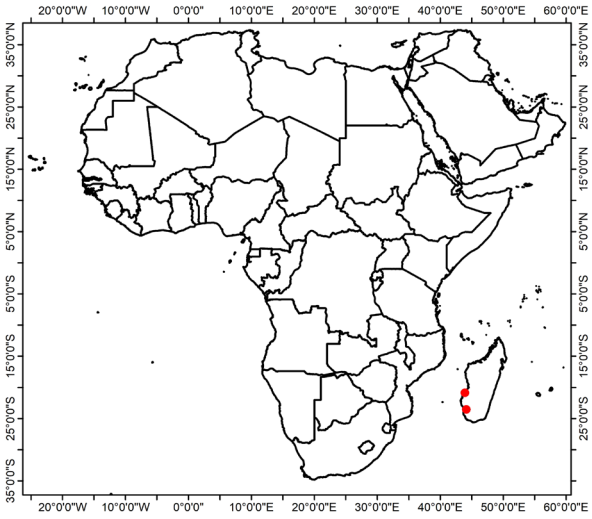

Figure 297. Distribution of *Hypsugo bemainty*

DISTRIBUTION BASED ON VOUCHER SPECIMENS: Madagascar.

Hypsugo cf. eisentrauti Hill, 1968

2013. *Hypsugo cf. eisentrauti:* Kerbis Peterhans, Fahr, Huhndorf, Kaleme, Plumptre, Marks and Kizungu, Bonn. Zool. Bull., 62 (2): 189. Publication date: November 2013. (Name Combination)

GENERAL COMMENTS:
As already indicated by Van Cakenberghe and Happold (2013i: 622) *eisentrauti* records from the DRC, Uganda, Kenya and Somalia do not resemble closely to the holotype and paratype of *P. eisentrauti* to be considered respresentatives of this species. Kerbis Peterhans *et al.* (2013: 189) therefore assigned these tentatively to *H.* cf. *eisentrauti*, indicating that they could represent a yet undescribed species.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Congo (Democratic Republic of the), Rwanda, Somalia.

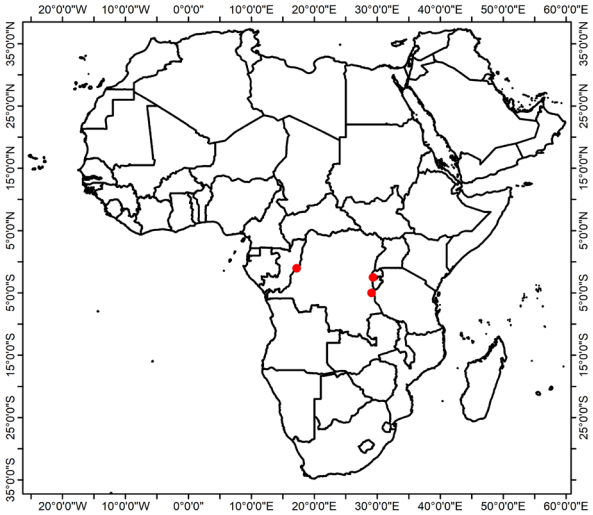

Figure 298. Distribution of *Hypsugo* cf. *eisentrauti*

Hypsugo crassulus (Thomas, 1904)

*1904. *Pipistrellus crassulus* Thomas, Ann. Mag. nat. Hist., ser. 7, 13 (75): 206. Publication date: 1 March 1904. Type locality: Cameroon: Efulen [02 46 N 10 42 E] [Goto Description]. Holotype: BMNH 1904.2.8.1: ad ♂, skull and alcoholic. Collected by: George Latimer Bates Esq.

1966. *Pipistrellus (Pipistrellus) crassulus:* Hayman, Misonne and Verheyen, Ann. Kon. Mus. Mid. Afr., Zool. Wetensch., (8) 154: 17. (Name Combination)

1972. *Pipistrellus eisentrauti bellieri* De Vree, Rev. Zool. Bot. afr., 85 (3 - 4): 412. Publication date: 30 June 1972. Type locality: Côte d'Ivoire: NW of Abidjan: Adiopodoumé [05 19 N 04 08 W, 0 - 30 m] [Goto Description]. Holotype: RMCA 35686: ad ♀, skin and skull. Collected by: Prof. Dr. Frits De Vree; collection date: 19 November 1969; original number: AX0104. Prepared and labelled in the Laboratoire d'Ecologie (L. Bellier) of the ORSTROM; see De Vree (1972). - Comments: Included in *eisentrauti* by Koopman (1993a: 221), and in *crassulus* by Simmons (2005). Considered a valid species by Fahr *et al.* (2006b: 245).

1987. *[Attalepharca] crassulus:* Menu, Palaeovert., 17 (3): 126. (Name Combination)

1994. *Hypsugo crassulus bellieri:* Heller, Volleth and Kock, Senckenb. biol., 74 (1/2): 1. (Name Combination)

1994. *Hypsugo crassulus:* Heller, Volleth and Kock, Senckenb. biol., 74 (1/2): 1. (Name Combination, Current Combination)

1994. *P[ipistrellus (Pipistrellus)] e[isentrauti] bellieri:* Koopman, in: Niethammer, Schliemann and Starck, Handbook of Zoology, volume II (Mammalia) Chiroptera, (60) 114.

1994. *P[ipistrellus (Vansonia)] crassulus:* Koopman, in: Niethammer, Schliemann and Starck, Handbook of Zoology, volume II (Mammalia) Chiroptera, (60) 115. (Name Combination)

1998. *P[ipistrellus (Hypsugo)] e[isentrauti] bellieri:* Grubb, Jones, Davies, Edberg, Starin and Hill, Mammals of Ghana, Sierra Leone and The Gambia, 84.

2003. *Nycticeinops eisentrauti:* Hoofer and Van Den Bussche, Acta Chiropt., 5 (Suppl.): 38. - Comments: Although Hoofer *et al.* (2003) believed they were referring to an *eisentrauti* specimen, this was actually a *belieri* (see also the *eisentrauti bellieri* synonym by Grubb *et al.*, 1998).

TAXONOMY:
Mentioned in the genus *Pipistrellus* and the subgenus *Vansonia* by Koopman (1994: 116). Volleth *et al.* (2001: 27) assigned this species to the genus *Hypsugo*. Includes *bellieri*; see Heller *et al.* (1994), Simmons (2005). Hoofer and Van Den Bussche (2003: 38) and Roehrs *et al.* (2011: 26, 31) mentioned "*eisentrauti*" to belong to the genus *Nycticeinops*, but they used a specimen from Côte d'Ivoire which should be assigned to *crassulus bellieri*. However, Monadjem *et al.* (2016y: 369) and Herkt *et al.* (2017: Appendix S9) report that the ecological niches for *crassulus* and *bellieri* differ and that their geographic distributions are

separated by a gap, suggesting that they might represent different species.

COMMON NAMES:

Chinese: 宽首伏翼. Czech: netopýr obtloustlý. English: Broad-headed Pipistrelle Bat, Broad-headed Pipistrelle. French: Vespère à grosse tête, Pipistrelle à grosse tête. German: Breitköpfige Zwergfledermaus, Breitköpfige Pipistrelle. Spanish (Castillian): Pipistrelo.

CONSERVATION STATUS:

Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Fahr, 2008g; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) [assessed as *Pipistrellus crassulus*] (Fahr, 2008g; IUCN, 2009). 2004 - LC ver 3.1 (2001) [assessed as *Hypsugo crassulus*] (Fahr, 2004o; IUCN, 2004). 1996 - LR/lc [assessed as *Pipistrellus crassulus*] (Baillie and Groombridge, 1996).

MAJOR THREATS:

There appear to be no major threats to this widespread species as a whole (Fahr, 2008g; IUCN, 2009).

CONSERVATION ACTIONS:

Fahr (2008g) [in IUCN (2009)] report that there appear to be no direct conservation measures in place, and it is not known if the species is present within any protected areas. Further studies are needed into the taxonomy, distribution and natural history of this species.

GENERAL DISTRIBUTION:

Hypsugo crassulus has been recorded from Guinea, Liberia and Côte d'Ivoire in the west, from Cameroon, Democratic Republic of the Congo, northern Angola, southern Sudan, Uganda and western Kenya (Kakamega Forest).

Native: Angola; Cameroon; Congo (Bates *et al.*, 2013: 325 - 1st authenticated record); Congo (The Democratic Republic of the); Côte d'Ivoire; Guinea (Decher *et al.*, 2016: 266); Kenya; Liberia; Sudan; Uganda.
Presence uncertain: Nigeria.

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:

Tragus: Monadjem *et al.* (2013c: 204) provide a line drawing of tragi of specimen DNSM 13222 from Mount Nimba, Liberia.

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:

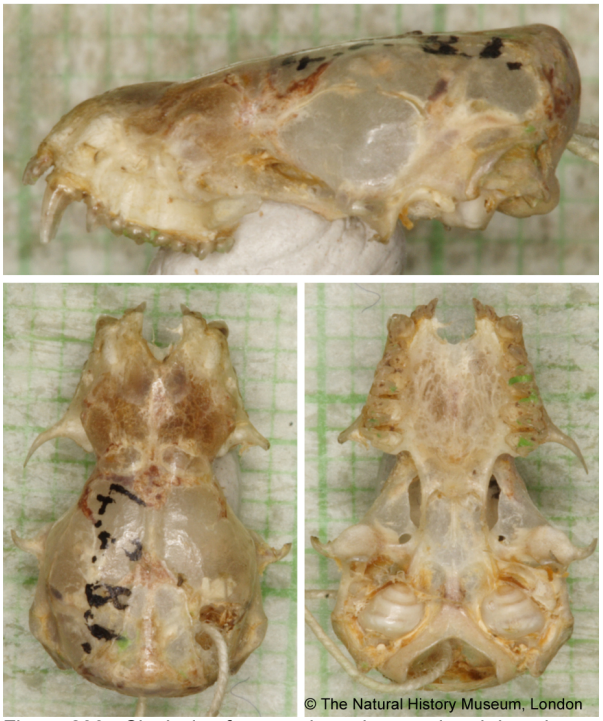

Figure 299. Clockwise from top lateral, ventral and dorsal skull images of BMNH 1904.2.9.1, holotype of *Pipistrellus crassulus* Thomas, 1904.

DETAILED MORPHOLOGY:

Baculum - See Hill and Harrison (1987) and Heller *et al.* (1994: 5). *H. c. bellieri* and *P. nanulus* were much longer in total length than any of the *Neoromicia* species that were examined by Monadjem *et al.* (2013c). The shaft tip of *H. c. bellieri* was distinctly spatulate and dorsoventrally flattened baculum shaft in both species was moderately ventrally curved, ending in a fluted base that was broader in *P. nanulus* (0.71 - 0.82 mm) than in *H. c. bellieri* (0.38 - 0.41 mm) (Monadjem *et al.*, 2013c: 197). Line drawing of dorsal and ventral bacula of specimen DNSM 13222 from Mount Nimba, Liberia are shown in Monadjem *et al.* (2013c: 204).

MOLECULAR BIOLOGY:

DNA - Unknown.
Karyotype - Volleth *et al.* (2001) reported 2*n* = 30, FN = 56, BA = 28, a metacentric X chromosome and a metacentric Y chromosome.
Protein / allozyme - Unknown.

HABITAT:

Monadjem *et al.* (2016y: 369) found this species (as *H. crassulus bellieri*) in old growth forest habitats in the Mount Nimba area.

POPULATION:

Structure and Density - This species has rarely been recorded (Fahr, 2008g; IUCN, 2009).

Trend - 2008 - Unknown (Fahr, Fahr, 2008g; IUCN, 2009).

DISTRIBUTION BASED ON VOUCHER SPECIMENS: Angola, Cameroon, Congo, Congo (Democratic Republic of the), Côte d'Ivoire, Gabon, Ghana, Guinea, Kenya, Liberia, South Sudan, Uganda.

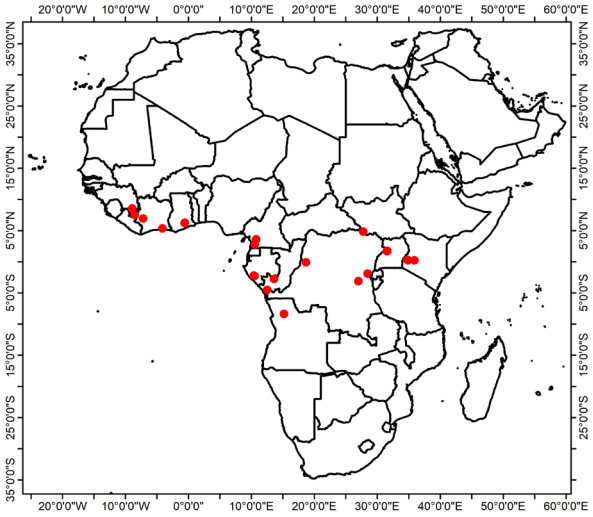

Figure 300. Distribution of *Hypsugo crassulus*

Hypsugo eisentrauti (Hill, 1968)

*1968. *Pipistrellus eisentrauti* Hill, Bonn. zool. Beitr., 19 (1/2): 45. Publication date: 10 April 1968. Type locality: Cameroon: Western province: Rumpi Highlands, Dikume-Balue: Camp V [ca. 04 13 N 09 32 E] [Goto Description]. Holotype: ZFMK 1968.0005: ad ♂, skin and skull. Collected by: Prof. Dr. Martin Eisentraut; collection date: 18 February 1957; original number: 498. See Hill (1968: 45), Thorn *et al.* (2007), Hutterer and Peters (2010: 12). Paratype: BMNH 1967.2129: ad ♀, skin and skull. Collected by: Prof. Dr. Martin Eisentraut; collection date: 30 November 1966; original number: 198. Paratype: ZFMK 1968.0006: ad ♀, skin and skull. Collected by: Prof. Dr. Martin Eisentraut; collection date: 30 November 1966; original number: 198. Presented/Donated by: ?: Collector Unknown. Lager II [=Camp II], ca. 1,100 m; Mount Kupe (see Hutterer and Peters, 2010: 12). - Comments: Thorn *et al.* (2009: 53) situate Camp V at 05 00 N 09 15 E. - Etymology: In honour of Prof. Martin Eisentraut (1902 - 1994), collector of the type specimen.

1971. *Pipistrellus [(Pipistrellus)] eisentrauti:* Hayman and Hill, Mammals of Africa: Chiroptera, 39. (Name Combination)

1972. *P[ipistrellus] e[isentrauti] eisentrauti:* De Vree, Rev. Zool. Bot. afr., 85 (3 - 4): 415. (Name Combination)

1987. *Pipistrellus (Hypsugo) eisentrauti:* Hill and Harrison, Bull. Br. Mus. (nat. Hist.) Zool., 52 (7): 274. (Name Combination)

1994. *Hypsugo eisentrauti:* Heller, Volleth and Kock, Senckenb. biol., 74 (1/2): 1. (Name Combination, Current Combination)

1994. *P[ipistrellus (Pipistrellus)] e[isentrauti] eisentrauti:* Koopman, in: Niethammer, Schliemann and Starck, Handbook of Zoology, volume II (Mammalia) Chiroptera, (60) 114. (Name Combination)

? *Hypsugo eisentrauti bellieri:*

TAXONOMY:
Koopman (1994: 114) mentions this species as belonging to the subgenus *Pipistrellus*. Volleth *et al.* (2001: 27) assigned this species to the genus *Hypsugo*. Koopman (1993a: 221) included *bellieri*, but see Heller *et al.* (1994), Simmons (2005). Hoofer and Van Den Bussche (2003: 38) and Roehrs *et al.* (2011: 26, 31) include *eisentrauti* in *Nycticeinops*, but they used a specimen from Côte d'Ivoire, which should be assigned to *crassulus bellieri*.

COMMON NAMES:
Czech: netopýr guinejský. English: Eisentraut's Pipistrelle Bat, Eisentraut's pipistrelle. French: Pipistrelle d'Eisentraut, Vespère d'Eisentraut. German: Eisentrauts Zwergfledermaus, Eisentrauts Pipistrelle. Italian: Pipistrèllo di Eisentràut.

CONSERVATION STATUS:
Global - Listed as Data Deficient in view of continuing problems with its taxonomy as well as absence of recent information on its extent of

occurrence, status, ecological requirements and threats. This species is most probably restricted to SW Cameroon. However, there are supposedly records from four other countries. Those records may all be misidentifications. If that is the case, then it is likely that this species has a very restricted range and is probably threatened (Fahr, 2008h; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) [assessed as *Pipistrellus eisentrauti*] (Fahr, 2008h; IUCN, 2009). 2004 - DD ver 3.1 (2001) (Fahr, 2004n; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
The threats to this species are not well known, but in Cameroon are likely to include encroachment on montane forest by subsistence agriculture (Fahr, 2008h; IUCN, 2009).

CONSERVATION ACTIONS:
Fahr (2008h) [in IUCN (2009)] reports that it is unclear if the species is present within any protected areas. Further studies are needed into the taxonomy, distribution, and threats to this species.

GENERAL DISTRIBUTION:
Hypsugo eisentrauti was initially described from Cameroon, where it has been recorded from localities including the Rumpi Highlands, Mount Kupe and Mount Cameroon. Although there are additional records of this species from Kenya, Somalia, Uganda and from the Democratic Republic of the Congo, it is uncertain that these actually refer to *Hypsugo eisentrauti*.

Confirmation of the possible distribution outside of Cameroon is needed.

Native: Cameroon.

Presence uncertain: Congo (The Democratic Republic of the); Kenya; Somalia; Uganda.

DETAILED MORPHOLOGY:
Baculum - Hill and Harrison (1987) and Heller *et al.* (1994: 2).

MOLECULAR BIOLOGY:
DNA - See Hoofer and Van Den Bussche (2003).
Karyotype - Volleth *et al.* (2001) reported 2*n* = 42, FN = 58, BA = 18, a metacentric X and a dot-like Y chromosome for a male specimen from Ruanda.
Protein / allozyme - Unknown.

POPULATION:
Structure and Density - The population is little known, but it may be locally common in Cameroon (Fahr, 2008h; IUCN, 2009).
Trend - 2008 - Unknown (Fahr, 2008h; IUCN, 2009).

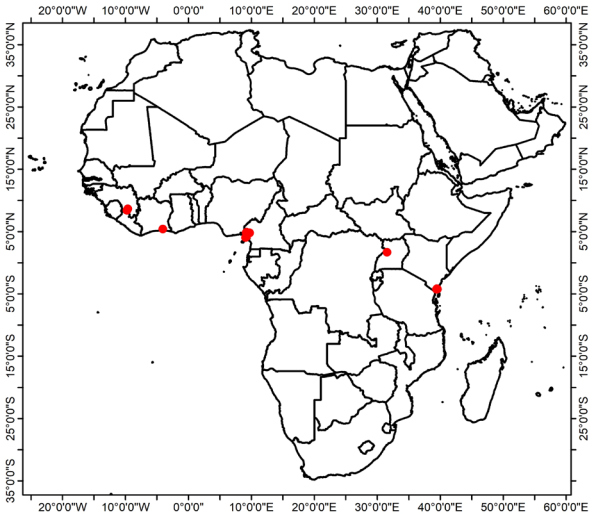

Figure 301. Distribution of *Hypsugo eisentrauti*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Cameroon, Côte d'Ivoire, Guinea, Kenya, Liberia, Uganda.

Hypsugo musciculus (Thomas, 1913)

*1913. *Pipistrellus musciculus* Thomas, Ann. Mag. nat. Hist., ser. 8, 11 (63): 316. Publication date: 1 March 1913. Type locality: Cameroon: Ja River: Bitye [03 13 N 12 22 E, 2 000 ft] [Goto Description]. Holotype: BMNH 1913.2.8.1: ad ♂, skin and skull. Collected by: George Latimer Bates Esq. Collection date: 3 September 1912; original number: 622.
1966. *Pipistrellus (Pipistrellus) musciculus:* Hayman, Misonne and Verheyen, Ann. Kon. Mus. Mid. Afr., Zool. Wetensch., (8) 154: 16. (Name Combination)
1987. *Attalepharca musciculus:* Menu, Palaeovert., 17 (3): 128. - Comments: Menu used *Attalepharca* as "groupe collectif" not as genus name. (Name Combination)
1987. *Pipistrellus (Hypsugo) musciculus:* Hill and Harrison, Bull. Br. Mus. (nat. Hist.) Zool., 52 (7): 281. (Name Combination)
? *Hypsugo musciculus:* (Name Combination, Current Combination)

TAXONOMY:
Mentioned in the genus *Pipistrellus* and the subgenus *Pipistrellus* by Koopman (1994: 113).

COMMON NAMES:
Czech: netopýr mechový. English: Mouse-like Pipistrelle Bat, Least Pipistrelle Bat, Mouselike Pipistrelle, Western Africa Pipistrelle. French: Vespère murin, Pipistrelle d'Afrique occidentale, Pipistrelle murine. German: Mäuschen-Zwergfledermaus, Mäuschen-Pipistrelle.

CONSERVATION STATUS:
Global - Listed as Data Deficient (DD ver 3.1 (2001)) in view of continuing problems with its taxonomy as well as absence of recent information on its extent of occurrence, status and ecological requirements (Jacobs *et al.*, 2008u; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) [assessed as *Pipistrellus musciculus*] (Jacobs *et al.*, 2008u; IUCN, 2009). 2004 - DD ver 3.1 (2001) (Jacobs *et al.*, 2004i; IUCN, 2004). 1996 - LR/nt [assessed as *Pipistrellus musciculus*] (Baillie and Groombridge, 1996).

MAJOR THREATS:
The threats to this species are not known (Jacobs *et al.*, 2008u; IUCN, 2009).

CONSERVATION ACTIONS:
Jacobs *et al.* (2008u) [in IUCN (2009)] report that it is not known if the species is present within any protected area. Further studies are needed into the taxonomy, distribution, natural history and threats to this species.

GENERAL DISTRIBUTION:
Hypsugo musciculus has been recorded from a few localities in Ghana, Sierra Leone, southern Cameroon, Gabon, the eastern tip of Congo, and the Democratic Republic of the Congo.

Native: Cameroon; Congo (The Democratic Republic of the); Gabon; Ghana; Sierra Leone.

Bates *et al.* (2013: 339) reject the occurrence of *H. musciculus* in the Republic of Congo as Malbrant and Maclatchy (1949) only suggested it to be 'likely' occurring in that country.

POPULATION:
Structure and Density - The abundance of this species is not well known (Jacobs *et al.*, 2008u; IUCN, 2009).
Trend - 2008 - Unknown (Jacobs *et al.*, 2008u; IUCN, 2009).

Hypsugo savii (Bonaparte, 1837)

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:

Figure 302. Clockwise from top lateral, ventral and dorsal skull images of BMNH 1913.2.8.1, holotype of *Pipistrellus musciculus* Thomas, 1913.

PARASITES:
HEMIPTERA
Cimicidae: *Cacodmus villosus* (Stål) recorded from the Congo (Haeselbarth *et al.*, 1966: 11).

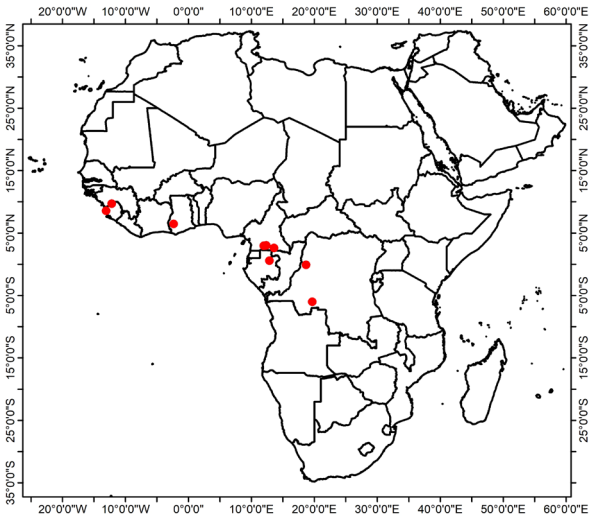

Figure 303. Distribution of *Hypsugo musciculus*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Cameroon, Congo (Democratic Republic of the), Gabon, Ghana, Sierra Leone.

*1837. *Vespertilio Savii* Bonaparte, Iconografia Fauna italiana, 1, fasc. 20 and pl. Publication date: 1837. Type locality: Italy: Tuscany: Pisa [43 43 N 10 24 E]. Holotype: BMNH 1907.1.1.732: sad, partial skeleton. Collected by: Prince Charles Lucien ("Carlo") Jules Laurent Bonaparte. - Etymology: In honour of Gaetano Savi (1769 - 1844) (see Kozhurina, 2002: 17).
1839. *V[esperugo (Vesperus)] Savii:* Keyserling and Blasius, Arch. Naturgesch. Berlin, 5 (1): 316. (Name Combination)

2002. *H[ypsugo] s[avii] darwini:* Trujillo, Ibáñez and Juste, Rev. suisse Zool., 109 (3): 549. (Name Combination)
2003. *H[ypsugo] savii darwinii:* Pestano, Brown, Suárez, and Fajardo, Mol. Phylogenet. Evol., 26 (1): 57. (Lapsus)
2007. *Hypsugo cf. darwinii:* Mayer, Dietz and Kiefer, Front. Zool., 4: 4. (Name Combination)

? *Pipistrellus savi:* (Name Combination, Lapsus)

TAXONOMY:
Koopman (1994: 114) considers this species to belong to the subgenus *Pipistrellus*. Horácek *et al.* (2000: 125) and Volleth *et al.* (2001: 27) assigned this species to the genus *Hypsugo*.

Based on mitochondrial DNA, Veith *et al.* (2011: 95, 98) report the presence of "*H.* cf. *darwinii*" on Sardinia, Turkey, the Canary Islands, Morocco, and Sicily), but they also indicate that "taxonomic conclusions, which are solely based on mitochondrial genes, may be misleading due to effects such as incomplete lineage sort ing, introgression, and selection on mitochondrial loci". However, as indicated by Puechmaille *et al.* (2012: 226), the mitochondrial data suggest the presence of cryptic species within "*H. savii*", which led these authors to use "*H.* cf. *savii*" for the North African populations.

COMMON NAMES:
Albanian: Pipistrel i Savi-it. Arabian: Khaffash. Armenian: Մաշեղանման փոքրաչղջիկ. Azerbaijani: Savi şəbpərəsi. Basque: Savi saguzar, Savi saguzarra. Belarusian: Нетапыр Саві. Bengali: Savir Chamchika. Bosnian: Savijev šišmiš. Breton: Gousper Savi. Bulgarian: Савиево прилепче. Castilian: Murciélago montañero, Murciélago de montaña. Catalan: Ratpenat muntanyenc, Rat penat muntanyero, Ratapinyada muntayenca. Croatian: Primorski šišmiš. Czech: Netopýr Saviů v, Netopýr alpský. Danish: Savis flagermus. Dutch: Alpendwergvleermuis, Alpenvleermuis, Savi's dwergvleermuis. English: Savi's Pipistrelle, Savi's Pipistrelle Bat. Estonian: Alpi nahkhiir. Finnish: Vuoristopiippa. German: Alpenzwergfledermaus, Alpenfledermaus, Alpen-Pipistrelle, herzohrige Abendfledermaus. Greek: Βουνονυχτερίδα. Hebrew: atalefon savi, Atalfon Savi. Hungarian: Alpesi denevér, Nycteris i alpios. Irish Gaelic: Ialtóg Savi. Italian: Pipistrello di Savi. Latvian: Sāvi sikspārnis. Lithuanian: Savio šikšniukas. Luxembourgish: Alpen-Fliedermaus. Macedonian: Савиев лилјак [= Saviev Liljak]. Maltese: Pipistrell ta' Savi. Montenegrin: Savijev slijepi mišić. Norwegian: Klippeflaggermus. Polish: Pzymroczek Saviego. Portuguese: Morcego de Savii. Rhaeto-Romance: Pipistrel da Savi, Pipistrel da las alps. Romanian: Liliacul lui Savi. Russian: Нетопырь кожановидный, Кожановидный нетопырь [= Kozhanovidny netopyr]. Serbian: Дугодлаки сл[ij]епи мишић [= Dugodlaki sl[ij]epi mišić]. Scottish Gaelic: Ialtag Savi. Slovak: Večernica Saviho. Slovenian: Savijev netopir. Swedish: Alpfladdermus. Turkish: Savi'nin Cüce Yarasası. Ukrainian: Нетопир скельний (Саві). Welsh: Ystlum lleiaf Savi.

CONSERVATION STATUS:
Global - The species is widespread and abundant and there is no evidence of population decline. Consequently, it is assessed as Least Concern (LC ver 3.1 (2001)) (Hutson *et al.*, 2008p; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) [assessed as *Pipistrellus savii*] (Hutson *et al.*, 2008p; IUCN, 2009).

MAJOR THREATS:
No major threats are known (Hutson *et al.*, 2008p; IUCN, 2009). Water stress and the aerial hawking feeding style are, however, identified as being major risk factors linked with climatic change (Sherwin *et al.*, 2012: 174). Bilgin *et al.* (2012: 434) predict that the range retraction for *H. savii* as a result of climatic change may pose severe threats to its survival as this species has the bulk of its range in the Mediterranean region.

CONSERVATION ACTIONS:
Hutson *et al.* (2008p) [in IUCN (2009)] report that it is protected by national legislation in some range states. There are also international legal obligations for its protection through the Bonn Convention (Eurobats) and Bern Convention in parts of its range where these apply. It is included in Annex IV of EU Habitats and Species Directive. It occurs in protected areas.

GENERAL DISTRIBUTION:
Hypsugo savii has a wide range in the Palaearctic (and marginally in Indomalaya), extending from southern Europe and north Africa (Morocco, Algeria, Tunisia, the Canary Islands of La Palma, Tenerife, La Gomera, Gran Canaria, and El Hierro, and the Cape Verde Islands of Santiago and San Vicente) through the Middle East and the Caucasus to Kazakhstan, Turkmenistan, Uzbekistan, Kyrgyzstan, Tajikistan, Afghanistan and northern India (Horácek and Benda, 2004; Simmons, 2005). It occurs from sea level to 3,000 m.

Bilgin *et al.* (2012) examining climate change scenarios within the Asia Minor and Levant region, predict *H. savii* to have a range contraction, which may pose severe threats to the survival of this species.

Native: Afghanistan; Albania; Algeria; Andorra; Austria; Azerbaijan; Bangladesh; Bosnia and Herzegovina; Bulgaria; Cape Verde Isls (Azzaroli Puccetti and Zava, 1988); China; Croatia; Cyprus; Czech Republic; France [Corse]; Georgia; Gibraltar; Greece [East Aegean Is., Kriti]; Holy See [Vatican City State]; Hungary; India; Iran, Islamic Republic of; Iraq; Israel; Italy [Sardegna, Sicilia]; Japan; Kazakhstan; Korea, Democratic People's Republic of; Korea, Republic of; Lebanon; Monaco; Mongolia; Montenegro; Morocco (Benda *et al.*, 2010a: 157; El Ibrahimi and Rguibi Idrissi, 2015: 362); Palestinian Territory, Occupied; Portugal; Russian Federation; San Marino; Serbia; Slovakia; Slovenia; Spain [Baleares, Canary Is.]; Switzerland; Syrian Arab Republic; Tunisia (Dalhoumi *et al.*, 2014: 53); Turkey; Turkmenistan; Ukraine.
Regionally extinct: Germany.
Vagrant: United Kingdom (Great Britain).
Presence uncertain: Armenia; Bhutan; Macedonia, the former Yugoslav Republic of.

DETAILED MORPHOLOGY:
Baculum - Hill and Harrison (1987) and Benda *et al.* (2011b: 38).

Park and Lee (2009: 267) found three types of lingual papillae in Korean specimens: filiform, fungiform, and circumvallate.

SEXUAL DIMORPHISM:
In Italian *H. savii* specimens, Rughetti and Toffoli (2014: 149) found a seasonal variability in body conditions, which was sex dependent. In late spring equal sized (Fa) females were heavier than males, although these differences were small in late summer. Additionally, the female's body mass decreased during late spring and summer most probably as the result of higher energy requirements for lactation. The male's mass did not change during this period.

ECHOLOCATION:
Papadatou *et al.* (2008b: 133) report the following data for 53 Greek specimens: F_{start}: 55.5 ± 10.64 kHz, F_{end}: 33.7 ± 1.43 kHz, F_{peak}: 36.7 ± 1.23 kHz, bandwidth: 8.7 ± 2.18 kHz, duration 6.8 ± 1.57 msec and interpulse interval: 148.5 ± 59.63 msec. For 32 calls from animals from France, Greece and Switzerland, Walters *et al.* (2012: suppl.) present the following numbers: duration: 8.23 ± 3.19 msec, F_{max}: 46.59 ± 12.95 kHz, F_{min}: 32.64 ± 2.26 kHz, bandwidth: 13.95 ± 11.88 kHz, F_{peak}: 34.87 ± 3.15 kHz.
Five calls of animals from Iran had the following values reported by Benda *et al.* (2012a: 182): F_{start}: 42.5 ± 2.1 (40.9 - 45.9) kHz, F_{end}: 36.1 ± 0.3 (35.7 - 36.3) kHz, F_{peak}: 37.4 ± 0.7 (36.7 - 38.4) kHz, duration: 9.4 ± 0.4 (8.8 - 9.7) msec, and interpulse interval: 185.6 ± 4.0 (182.1 - 191.3) msec.

In Morocco, Disca *et al.* (2014: 226) report the type of call for "*Hypsugo* cf. *savii*" as FM-QFC, with the following parameters: F_{start}: 52.7 ± 7.2 kHz, F_{end}: 32.3 ± 0.7 kHz, F_{peak}: 34.0 ± 1.0 kHz, bandwidth: 20.3 ± 6.8 kHz, duration: 6.8 ± 0.7 msec.

MOLECULAR BIOLOGY:
DNA - See Hoofer and Van Den Bussche (2003), Mayer *et al.* (2007), and García-Mudarra *et al.* (2009).

Karyotype - Capanna (1968), Zima (1982) and Volleth *et al.* (2001) reported 2*n* = 44, Fna = 50, BA = 8, a metacentric X and a submetacentric Y chromosome. Rushton (1970: 465) reported 2*n* = 44, FN = 50, X = metacentric, and Y = acrocentric. Arslan and Zima (2014: 13) added that the autosomal complement consists of three large and one small metacentrics, 15 acrocentrics and two dot-like pairs. Capanna and Manfredi Romanini (1971: 474) described the autosomal chromosomes as 3 pairs of metacentric, 1 submetacentric and 17 acrocentrics.

Protein / allozyme - Unknown.

DIET:
Benda *et al.* (2012a: 402 - 403) report the following major food groups for different areas, indicating that this species is an opportunistic feeder:
* Lepidoptera, Diptera, Hymenoptera and Neuroptera (Switzerland);
* Homoptera, Heteroptera and smaller representatives of Lepidoptera (Balkans and West Turkestan);
* Formicoidea, Heteroptera, Coleoptera and Lepidoptera (Syria);
* Coleoptera and Formicoidea (Turkey);
* Auchenorrhyncha, small Lepidoptera, Coleoptera (mainly Staphilinidae), nematoceran Diptera (Chironomidae, Culicidae), Sternorrhyncha (Aphididae), Neuroptera (Chrysopidae, Hemerobiidae), Heteroptera, Hymenoptera (small Apocrita), and Trichoptera (Iran: Fars);
* Small Lepidoptera, Neuroptera (Chrysopidae), Sternorrhyncha (Aphididae), Heteroptera, Coleoptera,and nematoceran Diptera (Culicidae) (Iran: Khorasan).

POPULATION:
Structure and Density - In the western part of its range it generally occurs at low densities and is restricted by its habitat requirements, but it is abundant in some European areas bordering the Mediterranean. Summer maternity colonies usually number 20 - 70 females. In the Canary

Islands it is the commonest bat species. In the eastern part of its range population size and trends are not known (Molur *et al.*, 2002).
Trend - 2008 - Stable (Hutson *et al.*, 2008p; IUCN, 2009). *H. savii* populations within the Asia Minor and Levant region are predicted to have a stable population trend, under climate change scenarios (Bilgin *et al.*, 2012: 433).

PARASITES:
In Italy, Voyron *et al.* (2011: 193) reported *Aspergillus sydowii* and *Cladosporium cladosporioides* (Fungi) from live *H. savii* specimens.

In Algeria, Bendjeddou *et al.* (2013: 325) found *Rhipicephalus sanguineus* (Latreille, 1806) (Arachnidae: Ixodida: Ixodidae). The following ectoparasites were reported by Bendjeddou *et al.* (2017: 15): Siphonaptera: *Ischnopsyllus octactenus* (Kolenati, 1856); Heteroptera: *Cimex pipistrelli* Jenyns, 1839; Arachnida: *Argas transgariepinus* White, 1846.

VIRUSES:
Coronaviridae:
Alphacoronavirus
This virus was reported by Kohl and Kurth (2014: 3112) from Italy.
Betacoronavirus
Kohl and Kurth (2014: 3112) reported this virus from Spain and Italy.

Orthomyxoviridae
Despite sampling and testing of 2 individuals of this species, no evidence of influenza A-like viruses (*Orthomyxoviridae*) were obtained (Fereidouni *et al.*, 2015).

Rhabdoviridae
"Various European bat lyssaviruses" were reported by Kohl and Kurth (2014: 3114) from various European countries.

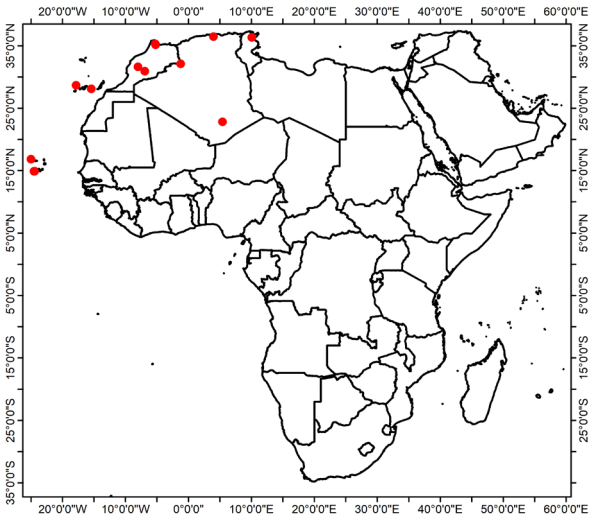

Figure 304. Distribution of *Hypsugo savii*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Algeria, Canary Islands (Spain), Cape Verde, Italy, Morocco, Spain, Tunisia.

Genus ***Laephotis*** Thomas, 1901

*1901. *Læphotis* Thomas, Ann. Mag. nat. Hist., ser. 7, 7 (41): 460. Publication date: 1 May 1901 [Goto Description]. - Comments: Type species: *Læphotis Wintoni* Thomas, 1901. - Etymology: From the Greek "*laephotis*" meaning cloaked, veiled. Although, a note in the description of the genus suggested the name meant "sail" in Greek (Thomas, 1901d: 460). Palmer (1904: 359) mentions it as from the Greek "*λαίφος*", meaning sail and "*οὖς*" or "*ὠτός*", meaning ear, referring to the large ears. Gardner (2005: 184) considers this name to be masculine (*Leaph* = sail + *ot* = ear(ed) + is (Latin third declension ending).
? *Laephotis:* (Current Spelling)

TAXONOMY:
The genus *Laephotis* was considered monotypic with two subspecies). But Peterson (1971b) introduced *wintoni* and *angolensis* as distinct species, while Setzer (1971) described two further species, *namibensis* and *botswanae*. However, inter-specific relations remain unresolved largely because specimens are few and in scattered collections (Kock and Howell, 1988, Stanley and Kock, 2004). Several specimens from South Africa were assigned to *L. wintoni* and *L.* cf. *wintoni* on the basis of multivariate analyses (Rautenbach and Nel, 1978b, Watson, 1990a, Kearney and Taylor, 1997). Given the distance of South African localities from other populations of *L. wintoni* in Kenya and Ethiopia, this identification was considered with some scepticism and not followed by Honacki *et al.* (1982) or Andrianaivoarivelo *et al.* (2007). Specimens described by Rautenbach and Nel (1978b) were subsequently provisionally placed with *L. namibensis* (Skinner and Smithers, 1990: 105). Kock and Howell (1988) and Stanley and Kock (2004) identified several cases where specimens identified as *L. angolensis* have been re-identified as *L. botswanae* or *L.* cf. *angolensis*. Morphometric analyses that included palatal and post-palatal measurements (Kearney and Seamark, 2005) allowed the distinction of *L.*

botswanae and *L.* cf. *angolensis* from other species of *Laephotis*, and suggested the assignment of specimens from KwaZulu Natal previously identified as *L.* cf. *wintoni* to *L. botswanae*. However, the distinction between *L. wintoni* and *L. namibensis* was not confirmed and still remains to be clarified (Kearney and Seamark, 2005).
In his initial description of the genus *Laephotis*, Thomas (1901d) suggested the genus was most closely allied to *Vespertilio*. Tate (1942) considered *Laephotis* the closest relative of the Neotropical big-eared genus, *Histiotus*, which in turn was considered an offshoot of *Eptesicus*. However, the ears in *Laephotis* are not as greatly enlarged as in *Histiotus*, nor are they connected across the forehead (Hayman and Hill, 1971). On geographic grounds, Williams and Mares (1978) doubted the association with *Histiotus*. Hill (1974a) considered *Laephotis* an independent offshoot of *Eptesicus*.

Placed in tribe Vespertilionini by Hill and Harrison (1987) on basis of baculum morphology and retained in that tribe by Simmons (2005).

In a cladistic analysis of bacular morphology *Laephotis* nested within *Neoromicia* (Kearney *et al.*, 2002). The molecular results of Stadelmann *et al.* (2004b) support this, and those of Hoofer and Van Den Bussche (2003) would be similar, if the suggestion that *nanus* is moved to the genus *Neoromicia*, as indicated by chromosomal analysis and bacular morphology (Kearney *et al.*, 2002), had been followed.

Although considered monotypic by Hayman and Hill (1971), four species are currently recognised (Simmons, 2005); *L. angolensis* Monard, 1935, *L. botswanae* Setzer, 1971, *L. namibensis* Setzer, 1971, and *L. wintoni* Thomas, 1901, see review by Jobling (1939). Specimens of this rarely caught bat, from the Western Cape Province in South Africa, were initially identified as *Laephotis wintoni* (Rautenbach and Nel, 1978b), and then later as *Laephotis namibensis* (Skinner and Smithers, 1990). This change in species identification has led to considerable confusion in the literature (Honacki *et al.*, 1982; Corbet and Hill, 1991; Koopman, 1994; Bronner *et al.*, 2003; Jacobs *et al.*, 2005; Simmons, 2005). Separation of *L. namibensis* and *L. wintoni* using morphometric analyses of cranial and dental characters, which include Hill (1974a)'s palatal and post-palatal measurements, that Stanley and Kock (2004) found useful in the separation of *L. botswanae* and *L. wintoni*, remains problematic (Kearney and Seamark, 2005).

Bacular studies have also failed to show differences between some species of *Laephotis* (Kearney *et al.*, 2002). Monadjem *et al.* (2010d: 430) suggests that molecular studies may be necessary to sort out the current confusion over species limits within this genus.

Without mentioning a reason, Taylor and Tuttle (2019: 282, 283) transferred all of the *Neoromicia* species (as well as *Hypsugo anchietae*) to the genus *Laephotis*.

Known species of the genus *Laephotis*: ***angolensis*** Monard, 1935; ***botswanae*** Setzer, 1971; ***namibensis*** Setzer, 1971; ***wintoni*** Thomas, 1901.

COMMON NAMES:
Czech: de Wintonovi netopýři. English: Long-eared Bats, African Long-eared Bats, Tropical Long-eared Bats. French: Oreillards d'Afrique, Noctophiles, Chauves-souris à longues oreilles. German: Afrikanische Langohrfledermäuse. Italian: Lefòti.

GENERAL DISTRIBUTION:
A small genus with four species, endemic to Africa south of the Sahara (Kearney, 2013a: 578).

BIOGEOGRAPHY:
A fairly wide range of biotic zones and habitats are exploited by this genus: the Somalia Masai Bushland, Zambezian Woodland, the Southern Rainforest—Savanna Mosaic (marginally), Afromontane Afroalpine, Highveld, South West Arid and South West Cape BZs (Kearney, 2013a: 579).

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
The genus *Laephotis* is distinguished from all other African vespertilionid in part by the relatively long ears (> 16.5 mm, almost half the length of the FA) and large triangular tragus (Monadjem *et al.*, 2010d: 430). Distinguishing the four species of *Laephotis* from each other is not currently possible on external features (Monadjem *et al.*, 2010d: 430). There is a slight difference in mean size between *L. botswanae* and *L. angolensis*, with the former being larger, but this difference may be due to the very small sample size of measured *L. angolensis* (Monadjem *et al.*, 2010d: 430).

DENTAL FORMULA:
$^{2113}/_{3123}$ = 32 (like *Otonycteris* but as in *Glauconycteris*, *Eptesicus*, some *Pipistrellus* and *Mimitellus*) (Kearney, 2013a: 578). The upper and lower premolars are tall teeth, almost the same height as the canines, and this, together with toothwear on the canines, might account for the

suggestion that the canines are extremely reduced (Hayman and Hill, 1971, Kingdon, 1974).

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:
Kearney and Seamark (2005) identified four cranial measurements based on a multivariate morphometric analysis to separate *L. botswanae* from the other three congeners. The post-palatal measurement of the distance from a line across the rear margins of the third upper molar to the anterior edge of the mesopterygoid fossa is shorter than the distance from the anterior edge of the mesopterygoid fossa to the tips of the pterygoid hamulars in the *L. botswanae*/*L. angolensis* group, but longer in the *L. namibensis*/*L. wintoni* group (Hill, 1974a,Stanley and Kock, 2004, Kearney and Seamark, 2005).

DETAILED MORPHOLOGY:
Bacula- Bacular studies have also failed to show differences between some species of *Laephotis* (Kearney *et al.*, 2002). Monadjem *et al.* (2010d: 430) suggests that molecular studies may be necessary to sort out the current confusion over species limits within this genus.

Laephotis angolensis Monard, 1935

*1935. *Laephotis angolensis* Monard, Arq. Mus. Bocage, 6: 45. Type locality: Angola: 15 km W Dala: Tyihumbwe [=Tschiumbe / Tyiumbwe / Tyhumbwe / Chiu [11 02 S 20 04 E] [Goto Description]. Holotype: MHNC ♀. Collection date: September 1932. - Etymology: Referring to the country where the type specimen was collected. (Current Combination)
? *Laephotis cf. angolensis*
? *Laephotis wintoni angolensis:* (Name Combination)

TAXONOMY:
Described, as a distinct species, from a single specimen, ♀ with damaged skull, but subsequently considered a subspecies of *L. wintoni* (Ellerman *et al.*, 1953, Hayman and Hill, 1971). Although currently treated as a distinct species, the relationship between *L. angolensis* and *L. botswanae* is obscure, partly because specimens of *L. angolensis* are so scarce that variation within this form cannot be assessed (Kearney, 2013b: 580). Peterson (1973) suggests that *L. botswanae* may prove to be a larger, southern race of *L. angolensis*. However, both species occur together in S DR Congo (Setzer, 1971). Several specimens originally considered to represent *L. w. angolensis* were later reassigned to *L. botswanae* (Smithers, 1971, Hill, 1974a).
Laephotis botswanae and *L. angolensis* may be conspecific, which would make the former a larger race of the latter (Peterson, 1971b, Kearney and Seamark, 2005). This possibility is reflected in records of both taxa from southeastern Katanga, DRC (Monadjem *et al.*, 2010d: 430).
Stanley and Kock (2004), being concerned about the correct assigment of the species that is known from very few specimens, referred to specimens in the Natural History Museum, London collection, as cf. *angolensis*. In a morphometric analysis with specimens of the other *Laephotis* taxa, these specimens were distinct from *L. botswanae*, and *L. wintoni* / *L. namibensis*, however, it was suggested this small difference, based on two specimens of *angolensis*, may disappear with the addition of more specimens of both *angolensis* and *botswanae* (Kearney and Seamark, 2005: 85). Peterson (1973: 602) had suggested that "*L. bostwanae* may prove to be a larger, southern race of *L. angolensis*".

No subspecies currently recognized.

COMMON NAMES:
Czech: netopýr angolský. English: Angolan Long-eared Bat. French: Oreillard d'Angola, Chauve-souris à longues oreilles d'Angola, Noctophile d'Angola. German: Angola-Langohrfledermaus.

SIMILAR SPECIES:
Not easily distinguished from other *Laephotis* (Monadjem *et al.*, 2010d: 430, Kearney, 2013b: 580).
Laephotis botswanae - Ventral pelage paler. Tragus broader; posterior margin more angular. Skull longer (GLS: 14.1 - 15.5 mm) and usually broader (GWS: 8.0 - 8.8 mm). Rostrum slightly longer and broader, palate longer (Hill l 974a). and relationship with *L. botswanae* is uncertain.
L. wintoni - Forearm longer (37 - 41 mm). Ears longer (21 - 24 mm) and broader. Skull longer and broader (GLS: 15.6 - 16.3 mm, GWS: 8.8 - 9.5 mm, C-M3: 5.1 - 5.3 mm).
L. namibensis - Forearm usually longer 37.8 (36 - 40 mm). Ears longer (22 - 25 mm). Skull larger (GLS: 16.1 - 17.0 mm, GWS: 8.4 - 9.2 mm, C-M3: 4.8 - 5.4 mm).

CONSERVATION STATUS:
Global - Listed as Data Deficient (DD ver 3.1 (2001)) in view of continuing doubts as to its taxonomic validity as well as absence of recent

information on its extent of occurrence, status, ecological requirements and threats (Jacobs *et al.*, 2008m; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) (Jacobs *et al.*, 2008m; IUCN, 2009). 2004 - NT ver 3.1 (2001) (Jacobs *et al.*, 2004c; IUCN, 2004). 1996 - LR/nt (Baillie and Groombridge, 1996).

MAJOR THREATS:
The threats to this species are not known (Jacobs *et al.*, 2008m; IUCN, 2009).

CONSERVATION ACTIONS:
Jacobs *et al.* (2008m) [in IUCN (2009)] report that there appear to be no direct conservation measures in place, and it is not known if the species is present within any protected areas. Further studies are needed into the taxonomy, distribution, natural history and potential threats to this poorly known species.

GENERAL DISTRIBUTION:
Laephotis angolensis is known from two localities in Angola (including the type locality of Tyihumbwe [Chiumbe], 15 km west of Dala) and a single locality in the Democratic Republic of the Congo (Mumeme, East of Likasi, Shaba Province). Hill and Carter (1941) suggest that the species may occur throughout eastern Angola, but more sampling is needed here.

Laephotis angolensis is endemic to southern Africa (Kearney and Seamark, 2005). Apparently restricted to the Zambezian Woodland BZ and the southern fringe of the Southern Rainforcst Savanna Mosaic (Kearney, 2013b: 580). *Laephotis angolensis* is known from just four specimens collected at three localities (Kearney and Seamark, 2005) in Angola and SE DR Congo (Peterson, 1973, Setzer, 1971, Hill, 1974a).

Native: Angola (Monard, 1935; Hill and Carter, 1941; Kearney and Seamark, 2005: 87; Monadjem *et al.*, 2010d: 563; Taylor *et al.*, 2018b: 60); Congo (The Democratic Republic of the) (Hayman *et al.*, 1966; Stanley and Kock, 2004; Kearney and Seamark, 2005: 87 as *L.* cf. *angolensis*); Kearney and Seamark, 2005: 85; Simmons, 2005; Monadjem *et al.*, 2010d: 563).
Presence uncertain: Namibia (Griffin, 1999: 30).

GEOGRAPHIC VARIATION:
None (Kearney, 2013b: 580).

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Laephotis angolensis is a small bat with an estimated mass of around 5 - 6 g (Monadjem *et al.*, 2010d: 430), it is very similar in size and appearance to the slightly larger *L. botswanae*, from which it cannot be reliably separated on external characters (Kearney and Seamark, 2005, Monadjem *et al.*, 2010d: 430).
The face is plain, without noseleaf and with tail more or less fully enclosed in interfemoral membrane.
Dorsal pelage yellowish-brown to reddish-brown; hairs distinctly bicoloured (Monadjem *et al.*, 2010d: 430), mid-dorsal hairs ca. 7 mm: basal 5 mm blackish-brown, terminal 2 mm yellowish-brown or reddish-brown (Kearney, 2013b: 580).
Ventral pelage pale grey on chin, paler on throat, becoming cream or white in pelvic region; hairs (except pelvic region) blackish-brown with pale grey, cream or white tip. Ventral hairs in pelvic region pure white (Kearney, 2013b: 580).
The naked skin on muzzle and around eyes is dark brown.
The long ears are dark brown, roughly triangular but very elongated; tip rounded; inner margins almost meeting on forehead but not joined at base. Ears may he held erect above head or (when resting) held sideways at right angles to head (Kearney, 2013b: 580). Ears separated, of medium length for a vespertilionid (15 – 18 mm) and of medium relative length (45 - 46 % of FA, n = 2) (Kearney, 2013b: 580).
Tragus with notch at base of posterior margin as in *L. botswanae*, but diagnostic differences between the tragi of these species, if present, are not known (Kearney, 2013b: 580).
Wings dark brown (Monard, 1935); arm-wing with whitish hind border. Interfemoral membrane medium-brown, more translucent.

DENTAL FORMULA:
$^{2113}/_{3123}$ = 32.
Four upper and five lower cheekteeth and two upper incisors on each side.

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:
In lateral profile the braincase is slightly flattened, but raises slightly above the rostrum (Monadjem *et al.*, 2010d: 430); rostrum rather narrow; zygomatic arches slender; no sagittal crest; lambdoid crest weakly developed. Skull apparently shorter and usually narrower than in other *Laephotis* but data very limited (GLS: 13.7 13.8 mm; GWS: 6.7, 8.1 mm, n 2). Palatal length 6.1, 6.2 mm (n 2) (cf. > 6.4 mm in *L. botswanae* and *L. wintoni*) (Hill 1974a).
The upper premolar is sharply pointed and rises above the molars (Monadjem *et al.*, 2010d: 430).

DETAILED MORPHOLOGY:
Karyotype - Not recorded (Monadjem *et al.*, 2010d: 430, Kearney, 2013b). Monadjem *et al.* (2010d:

430) suggests the diploid number is likely to be 2n = 34 as in other species of *Laephotis*.

SEXUAL DIMORPHISM:
No information (Kearney, 2013b: 580).

ECHOLOCATION:
The echolocation call of this species has not been recorded (Monadjem *et al.*, 2010d: 430).

HABITAT:
Nothing is currently known on the habitat of *L. angolensis* (Monadjem *et al.*, 2010d: 430, Kearney, 2013b: 580). All records have come from the savanna biome (Kearney and Seamark, 2005: 85).

HABITS:
Nothing else is known about the habits of this species (Kearney, 2013b: 580; Monadjem *et al.*, 2010d: 430).

ROOST:
Nothing is known about the roosting sites (Monadjem *et al.*, 2010d: 430).

DIET:
There is no information on the diet of this species (Monadjem *et al.*, 2010d: 430).

PREDATORS:
Mikula *et al.* (2016: Supplemental data) mention the Bat hawk (*Macheiramphus alcinus* Bonaparte, 1850) as diurnal avian predator.

POPULATION:
Structure and Density - The populations abundance is not well known, however, 25 specimens were collected at one locality (Jacobs *et al.*, 2008m; IUCN, 2009). Rare (Kearney, 2013b: 580).
Trend - 2008 - Unknown (Jacobs *et al.*, 2008m; IUCN, 2009).

PARASITES:
ACARI
Ixodidae: *Rhipicephalus simus*, (Anciaux de Faveaux, 1984), although the information is uncertain because the identity of the host still needs to be confirmed (Kearney, 2013b: 580).
Spinturnicidae: *Spinturnix walkei*, (Anciaux de Faveaux, 1984), although the information is uncertain because the identity of the host still needs to be confirmed (Kearney, 2013b: 580).
Macronyssidae: *Steatonyssus* sp., (Anciaux de Faveaux, 1984), although the information is uncertain because the identity of the host still needs to be confirmed (Kearney, 2013b: 580).

HEMIPTERA
Cimicidae: *Cacodmus villosus* (Stâl, 1855) (Kock and Aellen, 1987: 876; Kearney, 2013b: 580).

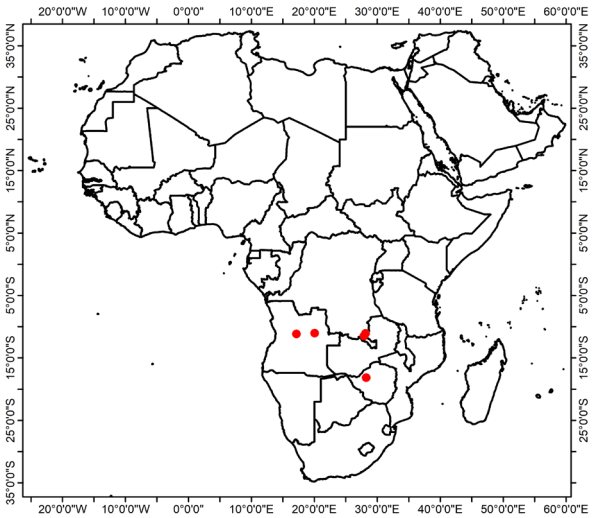

Figure 305. Distribution of *Laephotis angolensis*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Angola, Congo (Democratic Republic of the), Zambia, Zimbabwe.

Laephotis botswanae Setzer, 1971

1957. *Laephotis wintoni angolensis:* Ansell, Ann. Mag. nat. Hist., ser. 12, 10 (115): 538. (Name Combination)

*1971. *Laephotis botswanae* Setzer, Proc. Biol. Soc. Wash., 84 (32): 260, fig. 1b, 1d. Publication date: 4 November 1971. Type locality: Botswana: 50 mi (80 km) W and 12 mi (19 km) S Shakawe [18 21 S 21 52 E] [Goto Description]. Holotype: USNM 425349: ad ♀, skin and skull. Collected by: S.W. Goussard; collection date: 24 May 1967; original number: 691. - Comments: Although Schmidt *et al.* (2008: 35) mention the coordinates of the type locality as 18 32 S 21 05 E. - Etymology: The specimen from which the species was described originated near Shakawe in north-western Botswana (Taylor, 2005). (Current Combination)

1974. *Laephotis wintoni:* Hill, Bull. Br. Mus. (nat. Hist.) Zool., 27 (2): 75. Publication date: 18 July 1974. - Comments: Not of Thomas, 1901. (Name Combination)

? *Laephotis angolensis:* - Comments: Not of Monard, 1935. (Name Combination)

? *Laephotis cf. wintoni:*

TAXONOMY:
The distinction between *L. botswanae* and *L. angolensis* remains obscure and many specimens originally described as *L. angolensis* have been reassigned to *L. botswanae* (Hill, 1974a, Ansell, 1978) or remain of unsettled identity (Fenton and Bell, 1981, Fenton, 1985). Both species occur together in S DR Congo (Setzer, 1971), for this reason Kock and Howell (1988) question the validity of the species status of *botswanae*. As *Laephotis botswanae* and *L. angolensis* may be conspecific, which would make the former a larger race of *L. angolensis* (Peterson, 1971b, Kearney and Seamark, 2005).

In a morphometric analysis with specimens of the other *Laephotis* taxa, *L. bostwanae* was distinct from *L. angolensis* and *L. wintoni*/*L. namibensis*, however, it was suggested the small difference, based on two specimens of *angolensis*, may disappear with the addition of more specimens of both *angolensis* and *botswanae* (Kearney and Seamark, 2005: 85). Peterson (1973: 602) had suggested that "*L. bostwanae* may prove to be a larger, southern race of *L. angolensis*".

No subspecies recognized (Kearney, 2013c: 581).

COMMON NAMES:
Afrikaans: Botswana-langoorvlermuis. Czech: netopýr bečuánský. English: Botswana Long-eared Bat, Botswanan Long-eared Bat. French: Oreillard du Botswana, Chauve-souris à longues oreilles du Botswana, Noctophile du Botswana. German: Botswana-Langohrfledermaus.

SIMILAR SPECIES:
Not easily distinguished from other *Laephotis*, and relationship with *L. angolensis* is uncertain.
Laephotis angolensis - Ventral pelage darker. Tragus narrower, posterior margin less angular. Skull shorter (GLS: 13.7 - 13.8 mm) and usually narrower (GWS: 6.7, 8.1 mm), but data very limited. Rostrum slightly shorter and narrower; palate shorter (Hill, 1974a).
L. wintoni - Forearm on average longer 39.6 (37 - 41) mm). Skull usually larger, GLS: 16.0 (15.6 - 16.3) mm; C-M^3: 5.2 (5.1 - 5.3) mm.
L. namibensis - Skull longer, GLS: 16.1 - 17.0 mm.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Schlitter, 2008e; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Schlitter, 2008e; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Schlitter, 2004c; IUCN, 2004). 1996 - LR/nt (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - LC ver 3.1 (2001) (Taylor *et al.*, 2016f). 2004 - VU D2 ver 3.1 (2001) (Friedmann and Daly, 2004). 1986 - Indeterminate (Smithers, 1986).

MAJOR THREATS:
There appear to be no major threats to this species as a whole (Schlitter, 2008e; IUCN, 2009).

CONSERVATION ACTIONS:
Schlitter (2008e) [in IUCN (2009)] report that there appear to be no direct conservation measures in place, however, it is possible that given the species wide range, it is present in some protected areas. Further studies are needed into the taxonomy, distribution, abundance and possible threats to this species.

GENERAL DISTRIBUTION:
Laephotis botswanae is near-endemic to southern Africa, occurring marginally beyond this region in the extreme southwest of Tanzania (Kearney and Seamark, 2005). *Laephotis botswanae* is known from several apparently disjunct locations in Southern and East Africa. Known from scattered localities in the Zambezian Woodland BZ and marginally in one part of the Kalahari Desert area in the South-West Arid BZ (Kearney, 2013c: 581). Recorded from Angola, S DR Congo, S Tanzania, Zambia, Malawi, N Botswana, the Caprivi of Namibia, Zimbabwe, South Africa. The most southern record is based on re-identified specimens from Hella-Hella (KwaZulu Natal, South Africa) (Kearney and Seamark, 2005). Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 988,632 km^2.

It has been recorded from Huila in Angola; northeastern Namibia and adjacent Botswana; central and southern Zimbabwe and adjacent northeastern South Africa; northern Zambia and extreme southern Democratic Republic of the Congo; Malawi and Mozambique); and from a single locality in southern Tanzania.

Native: Angola (Kearney and Seamark, 2005: 87; Monadjem *et al.*, 2010d: 563); Botswana (Kearney and Seamark, 2005: 87; Monadjem *et al.*, 2010d: 563); Congo (The Democratic Republic of the) (Kearney and Seamark, 2005: 87; Monadjem *et*

al., 2010d: 564); Malawi (Ansell and Dowsett, 1988; Happold and Happold, 1997a; Kearney and Seamark, 2005: 87; Monadjem *et al.*, 2010d: 564); Mozambique (Monadjem *et al.*, 2010c: 383); Namibia (Cotterill, 2004a: 261; Monadjem *et al.*, 2010d: 564); South Africa (Kearney and Seamark, 2005: 87; Simmons, 2005; Monadjem *et al.*, 2010d: 564); Tanzania (Kock and Howell, 1988; Bauer, 1992; Stanley and Kock, 2004: 176; Kearney and Seamark, 2005: 87); Zambia (Ansell, 1960a, Kearney and Seamark, 2005: 87; Monadjem *et al.*, 2010d: 564); Zimbabwe (Cotterill, 1996a; Kearney and Seamark, 2005: 87; Monadjem *et al.*, 2010d: 564).
Presence uncertain: Mozambique.

GEOGRAPHIC VARIATION:
Pelage colour varies according to locality. The dorsal pelage of TM specimens from South Africa are reddish-brown, those from Zimbabwe are paler brown (Kearney, 2013c: 581).

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Laephotis botswanae is a small bat with a mass of around 6 - 7 g, plane faced without noseleaf and with tail more or less fully enclosed in interfemoral membrane; four upper and five lower cheekteeth and two upper incisors on each side; ears separated, of medium length for a vespertilionid (17- 22 mm) and of medium relative length (44 - 64 % of FA, n = 22).
Pelage soft, slightly shaggy on rump; mid-dorsal hairs ca. 8 mm.
Dorsal pelage reddish-brown, chocolate brown or pale brown; hairs distinctly bicoloured, basal 6 mm blackish-brown, terminal 2 mm reddish-brown, chocolate brown or pale brown.
Ventral pelage creamy-brown on chin, paler on throat, becoming cream or white in pelvic region; hairs (except in pelvic region) with basal 4 mm blackish-brown, terminal 4 mm creamy-brown, cream or white. Hairs in pelvic region pure white.
The naked skin on muzzle and around eyes is brown.
Ears pale to medium brown, roughly triangular with broad base and rounded tip; reaching well beyond snout when laid forward; inner margins almost meeting on forehead, but not joined. Ears may be held erect above the head or (when resting) held horizontally at right-angles to head (Kearney, 2013c: 581). Wings dark brown; arm-wing usually with whitish hind-border; interfemoral membrane paler and more translucent.

DENTAL FORMULA:
$^{2113}/_{3123}$ = 32.
The upper premolar is sharply pointed and rises above the molars.

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:
As in all *Laephotis* spp. With braincase slightly flattened (rises slightly above the rostrum); rostrum rather narrow; zygomatic arches slender and weak; no sagittal crest; lambdoid crest weakly developed. Skull on average medium-short and of medium width for the genus (CBS: 14.4 - 15.5 mm; GWS: 8.0 - 8.8 mm). Palatal length 6.7 (6.2 - 7.3) mm, n = 21 (Kearney and Seamark, 2005), CBS: 14.1 - 15.5 mm (Kearney, 2013c: 581). Scott *et al.* (2012: 2943) report that the mandibular symphyse is unfused, with smooth surfaces.

DETAILED MORPHOLOGY:
Baculum - Hill and Harrison (1987) and Kearney *et al.* (2002), which showed no difference to *L. namibensis*.

FUNCTIONAL MORPHOLOGY:
Aspect ratio low; wing-loading very low (Malawi; M. Happold *pers. comm.* in Kearney (2013c: 582)). Flight highly manoeuvrable; turns by banking (minimum radius < 25 cm) and by stalling-and-twisting; individuals were able to sustain flight in a 1 x 1 x 1 m enclosure for up to three circuits/flight (6 bats, 10 flights each; M. Happold *pers. comm.* in Kearney (2013c: 582)). Can take off from ground. Not easily able to climb or scuttle.

SEXUAL DIMORPHISM:
Sexes similar (Monadjem *et al.*, 2010d, Monadjem *et al.*, 2010d: 432, Kearney, 2013c: 581).

ECHOLOCATION:
Pierce *et al.* (2012: 41) report a mean peak frequency of 37.13 ± 2.37 kHz, and a mean bandwidth of 26.43 ± 11.49 kHz, with a duration of 2.68 ± 1.09 ms. Hand-released specimens from Malawi produced slightly longer FM-QCF (quasi-constant frequency) calls that had similar frequency parameters: duration: 4.73 ± 1.10 ms, mean peak frequency: 32.34 ± 1.42 kHz, and mean bandwidth of 29.72 ± 9.62 kHz. The maximum frequency in cluttered space was found to be 48.94 ± 4.6 kHz, as compared with 60.78 ± 9.33 kHz in open space.
Laephotis botswanae produces LD-FM echolocation calls with an intermediate peak frequency (33 kHz), broad bandwidth (22 kHz), and intermediate duration (5 ms). Besides the fundamental, the second and third harmonics are often present on the spectrogram (Fenton and Bell, 1981; also see Fenton and Thomas (1980).
Search-phase call-shape (Malawi) (a) steep FM/ QCF and (b) smooth steep/shallow FM (six bats recorded as released, one tethered; M. Happold *pers. comm.* in Kearney (2013c: 582). Start-frequency 60 - 72 kHz; end-frequency 29 - 33 kHz; peak- frequency 29 - 33 kHz; call-duration ca. 3 -

5 ms (155 calls). (b) Start- frequency 47 - 49 kHz; end-frequency 32 - 33 kHz; call-duration 15 ms (12 calls). Fenton and Bell (1981) reported calls from *Laephotis* of uncertain identity from Zimbabwe (see above) for which call-shape (based on one illustrated call) was angular steep/shallow FM; start- frequency 55 kHz; end-frequency 32 kHz; peak-frequency 33 kHz; maximum call-duration 5 ms. Although call shapes differed, the peak-frequency was the same in calls from Malawi and Zimbabwe, suggesting that the bats in both localities represent *L. botswanae* (Kearney, 2013c: 582).

Taylor *et al.* (2013b: 17) recorded two *L. botswanae* calls in Waterberg, South Africa, with the following parameters: F_{max}: 51.6 (50.3 - 53.0) kHz, F_{min}: 32.0 (31.8 - 32.2) kHz, F_{knee}: 35.6 (35.3 - 35.8) kHz, F_{char}: 33.0 (32.8 - 33.3) kHz, duration: 3.0 (2.9 - 3.1) msec. In the Mapungubwe National Park (RSA), Parker and Bernard (2018: 57) recorded 20 calls with F_{char}: 31.46 ± 1.47 kHz, F_{max}: 53.20 ± 7.20 kHz, F_{min}: 30.75 ± 1.28 kHz, F_{knee}: 37.38 ± 1.77 kHz, duration: 6.49 ± 2.68 msec and 6.79 ± 2.71 calls/sec.

3 calls recorded by Adams and Kwiecinski (2018: 4) had the following characteristics: F_{char}: 38.8 ± 0.7 kHz, F_{max}: 68.5 ± 0.5 kHz, F_{min}: 37.9 ± 0.9 kHz, duration: 2.2 ± 0.3 msec.

MOLECULAR BIOLOGY:
DNA - Unknown.
Karyotype - Rautenbach *et al.* (1993) reported 2*n* = 34,FN = 50, BA = 18, a submetacentric X chromosome, and an acrocentric Y chromosome, for specimens from South Africa.
Protein / allozyme - Unknown.

HABITAT:
Most specimens have been caught in mist-nets, usually over or close to water, in riverine woodland or woodland savanna (Monadjem *et al.*, 2010d: 435, Kearney, 2013c: 582). Their association with rocky outcrops has been noted in some localities (Herholdt, 1989, Cotterill, 1996a). In Malawi, recorded near streams, and lakes in montane and sub montane evergreen forest at 1520 - 1700 m, from miombo woodland near sub-montane rainforest at 1350 - 1500 m, from mosaic of miombo woodland, farmland and riverine woodland near rocky hills, dams, streams and marshes at 1000 m, and in ornamental gardens in the town of Zomba (800 900 m), with rocky hills nearby (Happold and Happold, 1997b).

Found in both savanna (75 % of specimen records) and grassland biomes (25 % of specimen records) (Kearney and Seamark, 2005: 85). However, since all the grassland biome records are from high altitude localities in Malawi (Happold and Happold, 1997b), it was suggested the identification of the specimens from Malawi should be confirmed using palatal and post-palatal measruements (Kearney and Seamark, 2005: 85).

Cooper-Bohannon *et al.* (2016: Table S2) mention its habitat preferences as Savanna (83 %) and Afromontane (16 %).

HABITS:
Becomes torpid during day at ambient temperatures 21 - 24 °C. Predicted mean maximum urine concentration is medium (3745 mOsmol/kg); captive bats drank regularly every night (Kearney, 2013c: 582).
Forages by slow hawking. A light-tagged individual, released in an area with marshland, a large dam, some woodland and farmland, observed for 53 min, foraged mainly between 1 - 3 m over the marsh, making straight level traverses to and fro with some jerky zig-zagging and some wide circling, but no diving or swooping upwards or any other acrobatic manoeuvres; also foraged over tall grass in spaces between trees, and flew over a banana plantation; did not fly above other trees and did not forage over the open water (M. Happold *pers. comm.* in Kearney (2013c: 582)).
Of 20 individuals sampled in Malawi, one post-lactating ♀ and one sub adult ♂ were mist netted together; one reproductively inactive ♀, one lactating ♀ and one ♂ with abdominal testes were caught in one mist-net at intervals of 15 mm and 5 mm respectively; and all others were caught singly on different dates and at different localities (M. Happold *pers. comm.* in Kearney (2013c: 582). All of four individuals mist-netted by Herholdt (1989) in the Waterberg area in the Limpopo Province of South Africa were caught singly.

ROOST:
A pair was found roosting under the bark of a broken limb of a tree (HZM specimen label written by W F. H. Ansell); no other roosts known (Kearney, 2013c: 582).

DIET:
In Zimbabwe, *Laephotis botswanae* has been recorded feeding on Coleoptera, Lepidoptera and Trichoptera (Fenton *et al.*, 1977a, Fenton and Thomas, 1980). Fenton (1985) reported Coleoptera, Lepidoptera and Trichoptera in cool season diet of *Laephotis* in Zimbabwe, and Lepidoptera only in wet season; however, he was not sure if the bats represented *L. botswanae* or *L. angolensis* and this is still unresolved.

POPULATION:
Structure and Density - The abundance of this species is not well known. It seems to be rarely

collected, and may be naturally rare (Schlitter, 2008e; IUCN, 2009). Rare in some parts of their distribution, although Herholdt (1989) and Happold and Happold (1997b) have suggested it is not uncommon, but seldom caught at other localities (Kearney, 2013c: 582). There was a marked change in numbers recorded in Malawi between a survey in 1984 - 85 with three specimens (Happold *et al.*, 1988), and 1993 - 94 with 17 specimens (Happold and Happold, 1997b). Herholdt (1989) suggested that their being caught singly might indicate they are not easily captured in mist-nets. Numbers in museum collections are growing (Kearney, 2013c:582).
Trend - 2008 - Unknown (Schlitter, 2008e; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
Litter-size not known (Kearney, 2013c: 582).
Reproductive chronology not known (data inconclusive) (Monadjem *et al.*, 2010d: 435, Kearney, 2013c: 582). At 15° 31' 5 (near Namadzi, Malawi), 2 of 3 adult ♀♀ were lactating and one was reproductively inactive in Dec; 2 of 2 were reproductively inactive in Jan; 2 of 2 were post-lactating in Feb; no data for other months (M. Happold *pers. comm.* in Kearney (2013c: 582)). Two subadults were captured in Jan and Feb. These data suggest that ♀♀ might not reach sexual maturity until second year.

PARASITES:
HEMIPTERA

A bed bug *Cocodmus viliosus* (Hemiptera: Cimieidae) has been recorded on *L. botswanae* from Huila, Angola, and found on *Laephotis* from S DR Congo, of which most of the host series have been identified as *L. botswanae*, although two specimens are considered to represent *L.* cf. *angolensis* (Stanley and Kock, 2004).

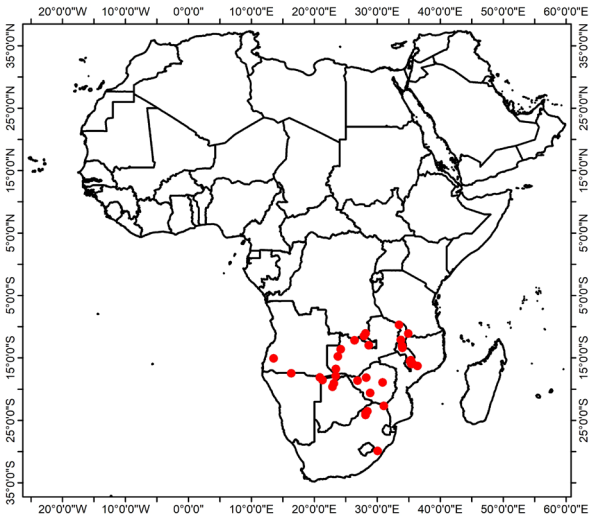

Figure 306. Distribution of *Laephotis botswanae*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Angola, Botswana, Congo (Democratic Republic of the), Malawi, Mozambique, Namibia, South Africa, Tanzania, Zambia, Zimbabwe.

Laephotis namibensis Setzer, 1971

*1971. *Laephotis namibensis* Setzer, Proc. Biol. Soc. Wash., 84 (32): 259, fig. 1a, 1c. Publication date: 4 November 1971. Type locality: Namibia: Namib Desert, Kuiseb River: Gobabeb (Namib Desert Research Station) [23 30 S 15 03 E, 407 m] [Goto Description]. Holotype: USNM 342152: ad ♀, skin and skull. Collected by: Ronald E. Cole; collection date: 22 November 1963; original number: 270. Paratype: USNM 342153: ♀. See Setzer (1971: 259). - Etymology: Referring to the country where the type specimen was collected. (Current Combination)

? *Laephotis cf. wintoni:*

TAXONOMY:
In a morphometric analysis with specimens of the other *Laephotis* taxa, specimens of *L. wintoni* and *L. namibensis* were not clearly separated (Kearney and Seamark, 2005: 85). Additional characters, or other systematic techiques will be required to clarify the species distinction. Unfortunately, specimens from the Western Cape province in South Africa have been identified as both *L. wintoni* (Rautenbach and Nel, 1978b) and *L. namibensis* (Skinner and Smithers, 1990). Hence, see also the account for *L. wintoni* for the results of a study based in the Western Cape province of South Africa that identified the specimens as *L. wintoni* (Jacobs *et al.*, 2005).
Laephotis namibensis and *L. wintoni* may be conspecific, which would make the former a paler, western race of *L. wintoni* (Kearney and Seamark, 2005).
Bacular studies have also failed to show differences between selected species of *Laephotis* (Kearney *et al.*, 2002). Kearney and Seamark (2005) could not find a clear distinction between *L. namibensis* and *L. wintoni* and echoed the suggestion that they might be geographic races of the same species (Peterson, 1973). These results endorse the use of molecular studies to clarify the

current confusion over species limits within this genus (Monadjem *et al.*, 2010d).

No subspecies are currently recognized.

COMMON NAMES:
Afrikaans: Namib-langoorvlermuis. Czech: netopýr namibský. English: Namibian Long-eared Bat, Namib Long-eared Bat. French: Oreillard de Namibie, Oreillard du Namib, Chauve-souris à longues oreilles de Namibie, Noctophile du Namib. German: Namibia-Langohrfledermaus.

SIMILAR SPECIES:
Not easily distinguished from other *Laephotis*:
Laephotis angolensis - FA shorter (34.3 (32 - 36) mm). Ears shorter, 15 -18 mm and narrower. Skull smaller, GLS: 13.7 - 13.8 mm; GWS: 6.7 - 8.1 mm; C-M^3: 4.3 mm.
L. botswanae - Skull shorter, GLS: 14.1 - 15.5 mm.
L. wintoni - Skull usually shorter, GLS: 15.6 - 16.3 mm. Dorsal pelage and wings apparently never creamy-brown (as far as is known).

CONSERVATION STATUS:
Global - Although this species is known mainly from isolated records from a relatively large area, it is listed as Least Concern (LC ver 3.1 (2001)), as most of the range is within well protected areas, wherer there are no significant threats, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Schlitter, 2008f; IUCN, 2009). Type locality (Gobabeb) is close to Namib Naukluft Park, which includes some of the Naukluftberge where this species probably roosts (Kearney, 2013d: 583).

Assessment History -
2008 - LC ver 3.1 (2001) (Schlitter, 2008f; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Schlitter, 2004b; IUCN, 2004). 1996 - EN (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - VU D2 ver 3.1 (2001) (Jacobs *et al.*, 2016a). 2004 - considered a vagrant not assessed, not recorded in SA, Cederberg specimens considered to be *L. wintoni* (Friedmann and Daly, 2004). 1986 - Indeterminate, assessed as *L. wintoni* (Smithers, 1986).

MAJOR THREATS:
There appear to be no major threats to this species as a whole (Schlitter, 2008f; IUCN, 2009).

CONSERVATION ACTIONS:
Schlitter (2008f) [in IUCN (2009)] reports that much of the range of this species is protected within the Namib-Naukluft National Park, Namibia. Further studies are needed into the distribution and general natural history of this species.

GENERAL DISTRIBUTION:
Laephotis namibensis has been recorded from a few localities in Namibia (Kuiseb River, Gobabeb, Zwartmodder, Klein Aus and Helmeringshausen), and a single area in South Africa (Algeria in the Cedarberg Mountains of the Western Cape) (Skinner and Chimimba, 2005).

Found in the South West Arid BZ (Namib Desert) and in the South West Cape BZ. Recorded from Namibia (Gobabeb, Zwartmodder, Klein Aus, Helmeringshausen) and South Africa (Algeria Forest) (Setzer, 1971, Kearney, 2013d: 583).

Although, specimens from South Africa have also been identified as *L. wintoni*, see the discussion in the generic account.

Native: Namibia (Setzer, 1971; Kearney and Seamark, 2005: 87; Simmons, 2005; Monadjem *et al.*, 2010d: 564); South Africa (Kearney and Seamark, 2005: 87; Simmons, 2005; Monadjem *et al.*, 2010d: 564).

GEOGRAPHIC VARIATION:
Specimens from Namibia have much paler pelage and flight-membranes than those from South Africa (Kearney, 2013d: 583).

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Laephotis namibensis is a small bat with a mass of around 10 g, without noseleaf and with tail more or less fully enclosed in interfemoral membrane; ears separated, of medium length for a vespertilionid (22 - 25 mm) and of medium relative length (54 - 65 % of FA, n= 11).
Pelage soft, slightly shaggy on rump; mid-dorsal hairs ca. 7 mm. Dorsal pelage creamy-brown or yellowish-brown, varies geographically: the upper parts are pale brown in the Namib, but buffy-brown in the Western Cape; hairs distinctly bicoloured, basal 4 mm dark brown, terminal 3 mm creamy-brown or yellowish-brown. Ventral pelage (except in pelvic region) pale cream to whitish; hairs with basal 4 mm blackish-brown, terminal 3 mm pale cream or white (Kearney, 2013d: 583). Hairs in pelvic region pure white. The naked skin on muzzle and around eyes is pale brown. Ears pale to medium-brown, roughly triangular but elongated; tip rounded; inner margins almost meeting on forehead but not joined. Ears may be held erect above the head or (when resting) held horizontally at right-angles to head. Tragus shape much like that of *L. botswanae* except that in *L. namibensis* the bulge above the basal, posterior notch extends further out, making the tragus much wider at that point (Kearney, 2013d: 583). Wings

pale creamy-brown (when dorsal pelage is pale) or dark brown (when dorsal pelage is yellowish-brown); arm-wing usually with whitish hind-border. Interfemoral membrane paler and more translucent (Kearney, 2013d: 583).

DENTAL FORMULA:
$^{2113}/_{3123}$ = 32.
Four upper and five lower cheekteeth and two upper incisors on each side. The upper premolar is sharply pointed and rises above the molars.

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:
As in all *Laephotis* spp. with braincase slightly flattened (rises slightly above the rostrum); rostrum rather narrow; zygomatic arches slender; no sagittal crest; lambdoid crest weakly developed. Skull on average long and wide for the genus (GLS: 16.1 - 17.0 mm; GWS: 8.4 - 9.2 mm). Palatal length: 8.0 (7.6 - 8.7) mm, n = 10 (Kearney and Seamark, 2005).

DETAILED MORPHOLOGY:
Baculum - See Kearney *et al.* (2002), which showed no difference to *L. botswanae*.

FUNCTIONAL MORPHOLOGY:
Laephotis namibensis has relatively broad wings with intermediate wing loading (7.0 N/m^2) and low aspect ratio (5.7) (Jacobs *et al.*, 2005; also see Schoeman and Jacobs (2008). It is a clutter-edge forager.

SEXUAL DIMORPHISM:
Sexes similar (Monadjem *et al.*, 2010d, Kearney, 2013d: 583).

ECHOLOCATION:
Laephotis namibensis produces low- intensity LD-FM echolocation calls with a low peak frequency (22 ± 0.6 kHz, n = 5), narrow bandwidth (13.5 ± 2.9 kHz, n = 5), and short duration (2.6 ± 0.8 ma, n = 5) (Jacobs *et al.*, 2005; also see Schoeman and Jacobs (2008). Besides the fundamental, the second harmonic is often present on the spectrogram (Monadjem *et al.*, 2010d).

MOLECULAR BIOLOGY:
DNA - See Hoofer and Van Den Bussche (2001) for the results of a specimen from Namibia. See Stadelmann *et al.* (2004b) for the results of a specimen from the Western Cape in South Africa identified as *L. wintoni*, but from a locality where the species identification has also been assigned to *L. namibensis* (Skinner and Smithers, 1990).
Karyotype - Rautenbach *et al.* (1993) reported 2*n* = 34, FN = 50, BA = 18, a submetacentric X chromosome, and an acrocentric Y chromosome, for specimens from Namibia. Rautenbach *et al.* (1993) also obtained the same results for specimens from the Western Cape, which were identified as *L. wintoni*, but reassigned to *L. namibensis* (Skinner and Smithers, 1990).
Protein / allozyme - Unknown.

HABITAT:
Found in desert (60 % of specimen records), fynbos (20 % of specimen records), and savanna (20 % of specimen records) biomes (Kearney and Seamark, 2005: 85). Arid, mountainous habitat, in close proximity to open water (Kearney, 2013d: 583). Sirami *et al.* (2013: 35) recorded in the Western Cape Province, South Africa that *L. namibensis* activity was not significantly, nor positively influenced by size of wetland or habitats located 100 m from surrounding these wetlands. *L. namibensis* preferentially near trees, orchards surrounding wetlands and over these wetlands (Sirami *et al.*, 2013: 35).

HABITS:
The holotype and paratype were mist-netted over a waterhole in the bed of the Kuiseb R. near Namib Desert Research Station (Setzer, 1971). Individuals from Algeria Forest were mist netted as they flew along a water course, close to the water surface, between 20:30 and 21 :00h.

ROOST:
Roosts not known, but the association of this bat with cliffs (in South Africa) indicates that it might roost in cracks and crevices of cliff faces (Jacobs *et al.*, 2005, Kearney, 2013e: 585). Specimens have been caught while foraging for insects from early to mid-evening (18h30 - 21h40).

Three radio tagged females in the Western Cape province of South Africa roosted in different crevices or narrow fissures in a cliff face above the valley where they foraged (Jacobs *et al.*, 2005). They also moved roost from one day to the next (Jacobs *et al.*, 2005).

DIET:
In the Cedarberg, Western Cape, its diet comprised mainly Lepidoptera and Coleoptera (Jacobs *et al.*, 2005, Schoeman 2006).

POPULATION:
Structure and Density - Although the species appears to be naturally rare in the Namib desert, it is rather commonly captured in mist-nets set around water tanks outside of the Namib (Schlitter, 2008f; IUCN, 2009). Rare (Kearney, 2013d: 583).
Trend - 2008 - Stable (Schlitter, 2008f; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
In the Cedarberg, Western Cape, a pregnant ♀ was caught in November (Jacobs *et al.*, 2005) and a post-lactating ♀ was collected in late January (Seamark and Brand, 2005).

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Namibia, South Africa.

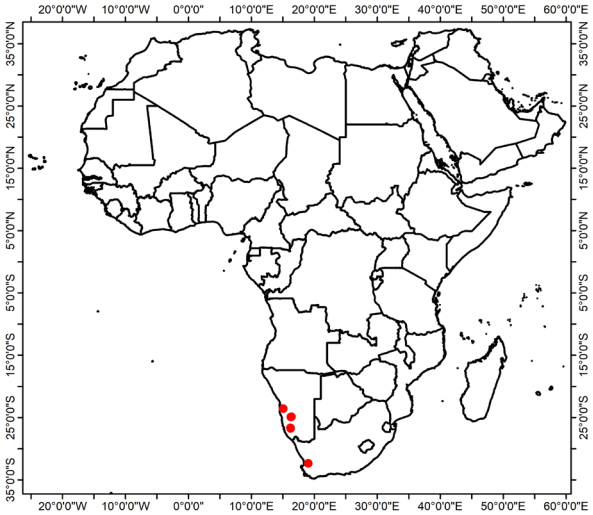

Figure 307. Distribution of *Laephotis namibensis*

Laephotis wintoni Thomas, 1901

*1901. *Læphotis Wintoni* Thomas, Ann. Mag. nat. Hist., ser. 7, 7 (41): 460. Publication date: 1 May 1901. Type locality: Kenya: Kitui [01 22 S 38 01 E, 3 500 ft] [Goto Description]. Holotype: BMNH 1901.5.6.5: ♂, skin and skull. Collected by: Dr. Sidney Langford Hinde; collection date: 7 January 1901; original number: S.L.H.64. - Etymology: In honour of Mr W.E. de Winton, "whose labours on the small mammals of Africa all naturalists...have been so constantly indebted for assistance" (Thomas, 1901d: 462). (Current Combination)
? *Laephotis cf. wintoni:*
? *Laephotis wintoni:* (Current Spelling)

TAXONOMY:
In a morphometric analysis with specimens of the other *Laephotis* taxa, specimens of *L. wintoni* and *L. namibensis* were not clearly separated (Kearney and Seamark (2005: 85). Unfortunately, specimens from the Western Cape province in South Africa have been identified as both *L. wintoni* (Rautenbach and Nel, 1978b) and *L. namibensis* (Skinner and Smithers, 1990). Specimens from Lesotho and the Free State province in South Africa were assigned to cf. *wintoni* pending clarification of the species distinctions (Kearney and Taylor, 1997). Additional characters, or other systematic techiques will be required to clarify the species distinction. Specimens from KwaZulu-Natal Province in South Africa previously identified as cf. *wintoni* (Kearney and Taylor, 1997) were reassigned to *L. botswanae* (Kearney and Seamark, 2005: 85).

South African specimens were assigned to *L. wintoni* based on multivariate analysis of external and cranial measurements (Rautenbach and Nel, 1978b, Watson, 1990a, Kearney and Taylor, 1997). However, on the basis of post-palatal measurements and morphometric analyses of cranial characters including palatal measurements by Hill (1974a), the specimens assigned to *L. wintoni* by Kearney and Taylor (1997) have now been re-identified as *L. botswanae* (Kearney and Seamark, 2005). Specimens from Algeria Forest in the Western Cape (South Africa) originally described by Rautenbach and Nel (1978b) as *L. wintoni* were subsequently re-identified as *L. namibensis* in Skinner and Smithers (1990). However, new specimens from Algeria have been referred to as *L. wintoni* (based on Rautenbach and Nel, 1978b) by Jacobs *et al.* (2005). On the basis of morphometric analyses of cranial characters, including palatal measurements, the distinction between *L. wintoni* and *L. namibensis* could not be confirmed by Kearney and Seamark (2005); therefore, pending clarification of the status of *namibensis*, information from Jacobs *et al.* (2005) is mentioned in the profile for *L. namibensis*.

Laephotis namibensis and *L. wintoni* may be conspecific, which would make the former a paler, western race of the latter (Kearney and Seamark, 2005).

No subspecies are currently recognized.

COMMON NAMES:
Afrikaans: Winton se langoorvlermuis, Winton-langoorvlermuis. Chinese: 温氏长耳蝠. Czech:

netopýr Wintonův. English: De Winton's Long-eared Bat, Winton's Long-eared Bat. French: Oreillard de De Winton, Chauve-souris à longues oreilles de De Winton, Noctophile de De Winton. German: De Wintons Langohrfledermaus. Italian: Lefòte di Wìnton.

SIMILAR SPECIES:
Not easily distinguished from other *Laephotis*:
Laephotis angolensis - FA shorter (32 - 36 mm). Ears shorter (15 - 18 mm) and narrower. Skull shorter and broader (GLS: 13.7 - 13.8 mm; GWS: 6.7 - 8.1 mm; C-M^3: 4.3 mm).
L. botswanae - FA on average shorter, 36.3 (30 - 39) mm. Skull usually smaller, GLS: 14.6 (14.1 - 15.5) mm; C-M^3: 4.7 (4.5 - 4.9) mm.
L. namibensis - Skull usually longer, GLS: 16.1 - 17.0 mm. Dorsal pelage and wings sometimes creamy-brown (see Geographic Variation).

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) because, although it is seldom recorded, it has a relatively wide distribution, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Schlitter, 2008g; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Schlitter, 2008g; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Schlitter, 2004a; Jacobsen *et al.*, 1986). 1996 - LR/nt (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - VU D2 ver 3.1 (2001) (Avenant *et al.*, 2016a). 2004 - VU D2 ver 3.1 (2001), included *L. botswanae* from Hella-Hella and *L. namibensis* from Cederberg (Friedmann and Daly, 2004).

MAJOR THREATS:
There appear to be no major threats to this species (Schlitter, 2008g; IUCN, 2009).

CONSERVATION ACTIONS:
Schlitter (2008g) [in IUCN (2009)] reports that it has been recorded from the Sehlabathebe National Park in Lesotho, and may be present in additional protected areas. Additional studies into the population abundance and distribution are needed.

GENERAL DISTRIBUTION:
Recorded from Ethiopia in the north of its range, south through parts of Kenya (including Nyeri, Mount Kenya) and Tanzania (Mazumbai Forest Reserve, West Usambara Mountains (Kock and Howell, 1988); Kebebe Farms, Iringa district (Stanley and Kock, 2004), southern Zambia, Lesotho (including Sehlabathebe National Park), and South Africa (the Clarens district in the eastern Free State).

Laephotis wintoni occurs at high altitude (> 1,500 m above sea level) in Lesotho and the Free State (Kearney and Seamark, 2005), where it has been collected from montane grasslands. In Lesotho, it was netted over water (Lynch, 1994).

Specimens recorded from the Western Cape Province in South Africa have also been identified as *L. namibensis*, see the discussion in the generic account. The specimens from Game Valley Estates (Hella Hella) near Richmond, KwaZulu Natal, South Africa (Kearney and Taylor, 1997; Skinner and Chimimba, 2005: 317) are infact *L. botswanae* (Kearney and Seamark, 2005).

Native: Ethiopia (Kearney and Seamark, 2005: 87; Simmons, 2005: 492; Skinner and Chimimba, 2005: 317); Kenya (Kearney and Seamark, 2005: 87; Simmons, 2005: 492; Skinner and Chimimba, 2005: 317); Lesotho (Lynch and Watson, 1990; Lynch, 1994: 194; Kearney and Seamark, 2005: 87 as *L.* cf. *wintoni*; Skinner and Chimimba, 2005: 317; Monadjem *et al.*, 2010d: 564 as *L* cf. *wintoni*); South Africa (Lynch, 1994; Kearney and Taylor, 1997; Kearney and Seamark, 2005: 87 as *L.* cf. *wintoni*; Simmons, 2005: 492; Skinner and Chimimba, 2005: 317; Monadjem *et al.*, 2010d: 564 as *L.* cf. *wintoni*); Tanzania (Kock and Howell, 1988; Stanley and Kock, 2004: 174; Simmons, 2005: 492).

BIOGEOGRAPHY:
There are scattered records in the Afromontane Afroalpine and Somalia Masai BZs of Ethiopia and East Africa, and records much further south in the Afromontane Afroalpine and Highveld BZs of South Africa.

GEOGRAPHIC VARIATION:
None recorded (Kearney, 2013e: 584).

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Laephotis wintoni is a small bat with a mass of around 10 g, without noseleaf and with tail more or less fully enclosed in interfemoral membrane; ears separated, of medium length for a vespertilionid (21 - 21 mm) and of medium relative length (53 - 60% of FA, n= 12). Mid-dorsal hairs ca. 8 mm. Dorsal pelage yellowish-brown to reddish-brown; hairs distinctly bicoloured, basal 6 mm dark brown, terminal 2 mm yellowish-brown or reddish-brown. Ventral pelage with chin yellowish-orange, reddish-brown or pale brown, throat paler, pelvic region cream or white. Hairs (except in pelvic region) blackish- brown with yellowish-orange, reddish-brown, cream or white tips. Hairs in pelvic

region pure white. Head fairly flat; naked skin on muzzle and around eyes is dark brown. Buccal pads observed in one ♂. Ears dark brown, roughly triangular but very elongated; tip rounded; inner margins almost meeting on forehead hut not joined. Ears may be held erect above the head or (when resting) held horizontally at right-angles to head. Wings dark brown or blackish-brown; presence or absence of hind-border is not known. Interfemoral membrane paler and more translucent.

DENTAL FORMULA:
$^{2113}/_{3123}$ = 32.
Four upper and five lower cheekteeth and two upper incisors on each side. The upper premolar is sharply pointed and rises above the molars.

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:

Figure 308. Clockwise from top lateral, ventral and dorsal skull images of BMNH 1901.5.6.5, holotype of *Laephotis Wintoni* Thomas, 1901.

As in all *Laephotis* spp. with braincase slightly flattened (rises slightly above the rostrum); rostrum rather narrow; zygomatic arches slender; no sagittal crest; lambdoid crest weakly developed. Skull on average medium-long and wide for the genus (GLS: 15.6 -16.3 mm; GWS: 8.8 - 9.5 mm). Palatal length: 8.1 (7.9 - 8.5) mm, n= 15.

DETAILED MORPHOLOGY:
Baculum - Hill and Harrison (1987) and Kearney *et al.* (2002) as *L.* cf. *wintoni*.

SEXUAL DIMORPHISM:
Sexes similar (Monadjem *et al.*, 2010d, Kearney, 2013e: 584).

ECHOLOCATION:
The echolocation call of this species has not been recorded (Monadjem *et al.*, 2010d). However, Thiagavel *et al.* (2017: Suppl.) mention a peak frequency of 23.08 kHz.

MOLECULAR BIOLOGY:
DNA - See Stadelmann *et al.* (2004b) for the results of a specimen from the Western Cape in South Africa, for a locality that has had the taxa reassigned to *L. namibensis* (Skinner and Smithers, 1990).
Karyotype - Rautenbach *et al.* (1993) reported 2*n* = 34, FN = 50, BA = 18, a submetacentric X chromosome, and an acrocentric Y chromosome, for specimens from the Western Cape Province in South Africa, which were identified as *L. wintoni*, but reassigned to *L. namibensis* (Skinner and Smithers, 1990). Rautenbach *et al.* (1993) also obtained the same results for specimens from Namibia identified as *L. namibensis*.
Protein / allozyme - Unknown.

HABITAT:
Excluding records from the Western Cape province locality in South Africa that have also been assigned to *L. namibensis* (Skinner and Smithers, 1990), it is a montane species found at high altitudes above 1000 m (Kock and Howell, 1988; Stanley and Kock, 2004: 176; Kearney and Seamark, 2005). *L. wintoni* has been found in East Africa in both forest (62.5 % of specimen records) and savanna (37.5 % of specimen records) biomes (Kock and Howell, 1988; Kearney and Seamark, 2005: 85). Specimens assigned to *L.* cf. *wintoni* from the Free State Province of South Africa and Lesotho are from the grassland biome (Kearney and Seamark, 2005: 85).

HABITS:
In Ethiopia, found at 1700 m, near a large Rift Valley reservoir on the Awash R. surrounded by Acacia woodland that has been extensively degraded to provide open farmland (Largen *et al.*, 1974). In East Africa, recorded from highland and mountainous areas with mosaics of evergreen bushland, secondary Acacia wooded grasslands and farmlands, and forests on the mountains: caught in forests, near forests and in woodlands. In the Free State Province of South Africa, recorded amongst large exotic trees in a drainage line flanked by sandstone cliffs (Watson, 1990a). In Lesotho, recorded from the vicinity of a dam surrounded by a vlei overgrown with medium-height (600 mm) vegetation in Sehlabathebe N. P. (Lynch and Watson, 1990). In Sehlabathebe N. P.,

there is no significant cover of tall grass, forbs or woody vegetation; the climate is harsh; the topographical relief is fairly uniform, and the altitude is 2,300 - 2,650 m (Kearney, 2013e 584). See Jacobs *et al.*, 2005).

ROOST:
One individual was found under exfoliating rock (TM) (Kearney, 2013d: 583).

DIET:
A study in the Western Cape province of South Africa found the diet was dominated by tympanate moths in three of four individuals studied, the fourth individual's diet was dominated by beetles (Jacobs *et al.*, 2005). Hemiptera and Tricoptera were also eaten but in much smaller proportions (Jacobs *et al.*, 2005).

POPULATION:
Structure and Density - This seems to be an uncommon species, possibly having large population fluctuations. Multiple individuals have been caught in Lesotho and South Africa, however, in East Africa it is known from many localities, but as one or two animals only (Schlitter *pers. comm.* [in Schlitter (2008g) in IUCN (2009)]). Rare, but numbers in museum collections are increasing (Kearney, 2013e: 584).
Trend - 2008 - Unknown (Schlitter, 2008g; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
In Lesotho, a pregnant ♀ was collected in November (Lynch, 1994).

VIRUSES:
Bunyaviridae
Phlebovirus
Rift Valley Fever Virus (RVFV) - Oelofsen and Van der Ryst (1999) tested two and four individuals from Clarens, South Africa and Lesotho respectively for RVFV antigen using an enzyme linked immunosorbet assay (ELISA), none tested positive.

Coronaviridae - Coronaviruses
SARS-CoV - Müller *et al.* (2007b) tested between 1986 and 1999, for antibodies to SARS-CoV in serum of one individual from Limpopo Province, South Africa, and found none (0/1).

Rhabdoviridae
Lyssavirus - Rabies related viruses
Rabies - Oelofsen and Smith (1993) tested two and four individuals from Clarens, South Africa and Lesotho respectively using "Trousse Platelia Rage" ELISA kit (Diagnostic Pasteur), none tested positive for antibodies to rabies virus glycoprotein G. Oelofsen and Smith (1993) also tested two and four individuals from Clarens, South Africa and Lesotho respectively by means of the "Rapid rabies enzyme immunodiagnosis" (RREID) test (Diagnostic Pasteur), none were tested positive.

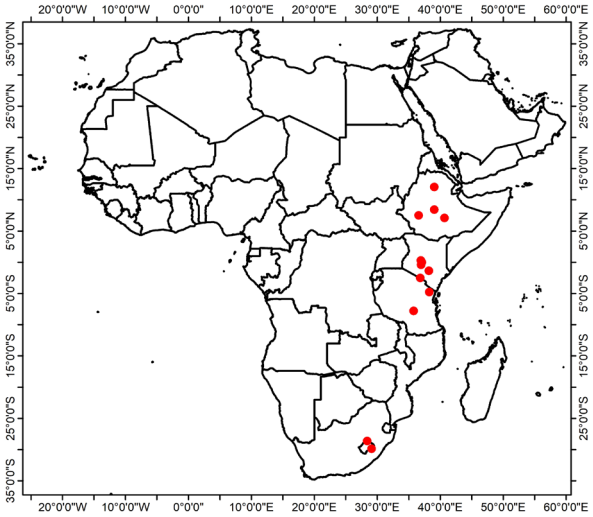

Figure 309. Distribution of *Laephotis wintoni*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Ethiopia, Kenya, Lesotho, South Africa, Tanzania.

Genus ***Mimetillus*** Thomas, 1904

*1904. *Mimetillus* Thomas, Abstr. Proc. Zool. Soc. Lond., 10: 12. Publication date: 22 November 1904. - Comments: Type species: *Vesperugo (Vesperus) moloneyi* Thomas, 1891. - Etymology: Lanza *et al.* (2015: 361 - 362) indicate that it possibly is derived from the masculine scientific Latin adjective *mimèticus*, meaning "mimetic" and the end of the masculine scientific Latin substantive *(Pipistre)llus*, meaning "bat", which combines to a "bat miming a member of the genus *Pipistrellus* (= *Vesperugo*)". (Current Combination)

? *Mimetillus sp.:*

TAXONOMY:
Pending revision, considered here to be a monotypic genus endemic to tropical Africa including Bioko Island (Happold, 2013da: 585). See Simmons (2005), Cotterill (2001 d) and Monadjem *et al.* (2010d).
Placed in tribe Vespertilionini (Simmons, 2005).

Known species of the genus *Mimetillus*: ***moloneyi*** (Thomas, 1891); ***thomasi*** Hinton, 1920.

COMMON NAMES:
Czech: Moloneyovi netopýři. English: Flat-headed Vesper Bats, Mimic Bats, Narrow-winged Bats, Flat-headed Bats. French: Mimétille, Chauve-souris à tête plate. German: Schmalflügel-Fledermäuse. Italian: Mimetìlli.

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Diagnostic combination of characters: four upper and five lower cheekteeth and two upper incisors on each side; head conspicuously flattened; ears relatively short and not joined at base; outer margin of ear not reaching mouth; phalanges of third, fourth and fifth fingers very short (third finger shorter than HB); no body pattern; wings not reticulated (Happold, 2013da: 585).

DENTAL FORMULA:
$^{2113}/_{3123}$ = 32.

Mimetillus moloneyi (Thomas, 1891)

*1891. *Vesperugo (Vesperus) Moloneyi* Thomas, Ann. Mag. nat. Hist., ser. 6, 7 (42): 528, text-fig. Publication date: 1 June 1891. Type locality: Nigeria: Western region: Lagos [06 27 N 03 23 E] [Goto Description]. Holotype: BMNH 1891.5.5.2: ad ♂, alcoholic (skull not removed). Collected by: Sir Alfred Moloney. Presented/Donated by: Sir Alfred Moloney. See Thomas (1891a: 529). - Etymology: In honour of Sir Cornelius Alfred Moloney (1848 - 1913), a British civil cervant, collector of the type specimen (see Lanza *et al.*, 2015: 363).
? *Mimetillus moloneyi moloneyi:* (Name Combination)
? *Mimetillus moloneyi:* (Name Combination, Current Combination)

TAXONOMY:
Koopman (1993a: 207) included *thomasi* and *berneri*; but see Cotterill (2001c) and Simmons (2005).

COMMON NAMES:
Chinese: 非洲扁颅蝠. Czech: netopýr Moloneyův. English: Moloney's Flat-headed Vesper Bat, Moloney's Mimic Bat, Moloney's Flat-headed Bat. French: Mimétille de Moloney, Chauve-souris à tête plate de Moloney. German: Moloneys Schmalflügel-Fledermaus, Moloneys Flachkopf-Fledermaus. Italian: Mimetìllo di Moloney. Spanish (Castillian): Murciélago de cabeza Plana.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Jacobs *et al.*, 2008ai; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Jacobs *et al.*, 2008ai; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Jacobs *et al.*, 2004ah; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
There appear to be no major threats to this species as a whole (Jacobs *et al.*, 2008ai; IUCN, 2009).

CONSERVATION ACTIONS:
Jacobs *et al.* (2008ai) [in IUCN (2009)] report that there appear to be no direct conservation measures in place. It is not known if the species is present in any protected areas. Additional research into the taxonomy of this species is needed.

GENERAL DISTRIBUTION:
Widespread over much of sub-Saharan Africa. It ranges from Sierra Leone in the west, through West Africa and Central Africa (although seemingly absent from much of the Congo basin), to southern Sudan and western Ethiopia in the east, from here it ranges southwards through East Africa to Zambia and Angola, with the southernmost record from south-central Mozambique. It is found at elevations of up to 2,300 m asl.

Native: Angola; Cameroon; Central African Republic (Lunde *et al.*, 2001: 537); Congo (Bates *et al.*, 2013: 325 - 1st authenticated record); Congo (The Democratic Republic of the) (Hayman *et al.*, 1966; Monadjem *et al.*, 2010d: 564); Côte d'Ivoire; Equatorial Guinea; Ethiopia; Gabon; Ghana; Guinea (Fahr *et al.*, 2006a; Decher *et al.*, 2016: 266); Kenya (Start, 1969: 223); Liberia (Fahr, 2007a: 104); Mozambique; Nigeria; Sierra Leone; Sudan; Tanzania; Togo; Uganda; Zambia.

DETAILED MORPHOLOGY:
Baculum - Hill and Harrison (1987).

HABITAT:
Monadjem *et al.* (2016y: 369) recorded this species from forested and disturbed habitats between 400 and 520 m at the Mount Nimba area.

PREDATORS:
Mikula *et al.* (2016: Supplemental data) mention the Bat hawk (*Macheiramphus alcinus* Bonaparte, 1850) as diurnal avian predator.

POPULATION:
Structure and Density - Although the species is difficult to catch, it is not considered to be especially rare (Jacobs *et al.*, 2008ai; IUCN, 2009).
Trend - 2008 - Unknown (Jacobs *et al.*, 2008ai; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
Krutzsch (2000: 124) indicates that males have enlarged testes in January and June and that females parturate in February/March and in August.

PARASITES:
ACARI:
Fain (1963: 256) reported the presence of a *Notoedres (Notoedres) mimetilli* Fain, 1959 on a *M. moloneyi* from Bio [=Bo?], Sierra-Leone.

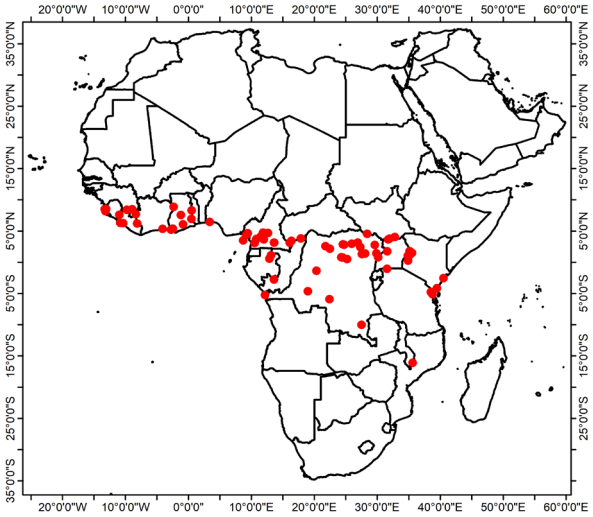

Figure 310. Distribution of *Mimetillus moloneyi*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Angola, Cameroon, Central African Republic, Congo, Congo (Democratic Republic of the), Côte d'Ivoire, Equatorial Guinea, Gabon, Ghana, Guinea, Kenya, Liberia, Malawi, Nigeria, Sierra Leone, South Sudan, Tanzania, Uganda, Zambia, Zimbabwe.

Mimetillus thomasi Hinton, 1920

*1920. *Mimetillus thomasi* Hinton, Ann. Mag. nat. Hist., ser. 9, 6 (32): 240. Publication date: 1 August 1920. Type locality: Zambia: Ndola [12 58 S 28 38 E, 1 400 m] [Goto Description]. Holotype: BMNH 1920.11.3.28: ad ♀. Collected by: Captain Guy Chester Shortridge; collection date: 4 October 1919; original number: 481. - Etymology: In honour of Oldfield Thomas. (Current Combination)
1933. *Mimetillus berneri* Monard, Bull. Soc. Neuchât. Sci. nat., 57: 49 (for 1932?). Type locality: Angola: South-Central Angola: Vila da Ponte [14 25 S 16 15 E]. - Comments: Allen (1939a:89) mentions 1932 as year of publication.
? *Mimetillus moloneyi berneri:*
? *Mimetillus moloneyi thomasi:*

TAXONOMY:
Koopman (1993a: 207) included *thomasi* and *berneri* in *moloneyi*; but see Cotterill (2001c), Monadjem *et al.* (2010d: 444; 2010c: 390) who consider *thomasi* to be a separate species.

COMMON NAMES:
English: Thomas's Flat-headed Bat. French: Mimétille de Thomas. German: Thomas' Schmalflügel-Fledermaus.

CONSERVATION STATUS:
Global - Not assessed (IUCN, 2004).

GENERAL DISTRIBUTION:
Mimetillus thomasi is found from Bioko, Zambia and southern Congo south to Tanzania, Angola and Mozambique.

Native: Angola (Crawford-Cabral, 1989; Monadjem *et al.*, 2010d: 564; Taylor *et al.* (2018b: 60); Congo (Democratic Republic of) (Schouteden, 1944; Monadjem *et al.*, 2010d: 564); Mozambique (Monadjem *et al.*, 2010d: 564); Zambia (Monadjem *et al.*, 2010d: 564).

PARASITES:
Acari:

Fain (1959d: 155) described *Notoedres (Notoedres) mimetilli* (Sarcoptidae) from *Mimetillus thomasi* from Katanga, DRC.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Angola, Congo (Democratic Republic of the), Mozambique, Tanzania, Zambia.

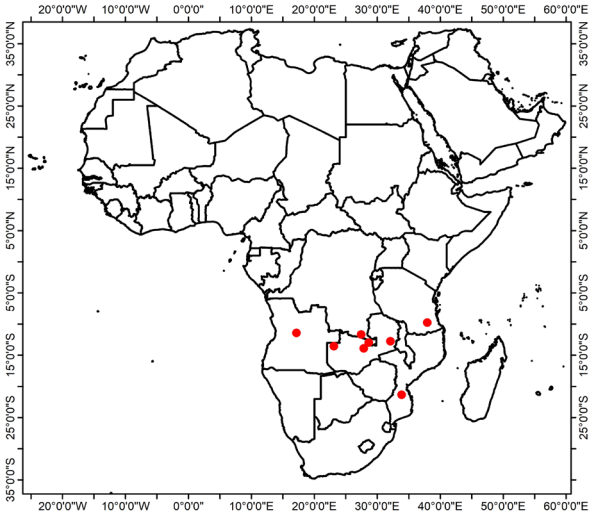

Figure 311. Distribution of *Mimetillus thomasi*

Genus ***Neoromicia*** Roberts, 1926

1908. *Scabrifer* G.M. Allen, Bull. Mus. comp. Zool., 52 (3): 46. Publication date: July 1908. - Comments: Type species: *Scabrifer notius* G.M. Allen, 1908. Originally described as substitute for *Rhinopterus* Miller, preoccupied by *Rhinoptera* Kuhl, 1841 (see Allen, 1908: 46; 1939a: 97).

*1926. *Neoromicia* Roberts, Ann. Transv. Mus., 11: 245. Publication date: 14 September 1926 [Goto Description]. - Comments: Type species: *Eptesicus zuluensis* Roberts, 1924. - Etymology: From the Greek prefix "*νεο*" (nèo), meaning "new" and the feminine scientific Latin substantive *Romìcia*, which in turn is a feminine scientific Latin substantive almost surely deriving from the Greek substantive "*ῥόμιξα*" (rhómiksa), corresponding to the masculine Latin substantive *rùmex* (genitive *rùmicis*), meaning "dock", a plant with spear-shaped leaves. *Neoromicia calcarata,* the type species of the genus, is really provided of a well developed calcar, i.e. of a well developed uropatagial spur (see Lanza *et al.*, 2015: 380). - ZooBank: 7173CFF6-F27B-44D7-948E-23FC40080224. (Current Combination)

1956. *Ephesicus:* Theodor, Parasitology, 46: 391. - Comments: used in combination with the species *tenuipinnis*, and therefore synonym of *Neoromicia*, not of *Eptesicus*. (Lapsus)

1987. *Nycterikaupius* Menu, Palaeovert., 17 (3): 108, pl. 4, fig. 1. Publication date: 15 November 1987 [Goto Description]. - Comments: In part.

1995. *Scabifer:* Peterson, Eger and Mitchell, Faune de Madagascar, Chiroptères, 84: 95. (Lapsus)

2000. *Pipestrellus:* Nwoha, Caxton-Martins and Baxter-Grillo, Folia Morphol., 59 (3): 154. Publication date: 6 July 2000. (Lapsus)

2003. *Neuromicia:* Avery, Avery and Colahan, Navors. nas. Mus., 19 (1): 8. Publication date: April 2003. (Lapsus)

2013. *Epseticus:* Bitty, Kadjo, Gonéndélé, Okon and Kouassi, Int. J. Biol. Chem. Sci., 7 (4): 1684. Publication date: August 2013. (Lapsus)

2013. *Necroromicia:* Fenton, Koedoe, 55 (1): 1140 (p.3). Publication date: 19 March 2013. (Lapsus)

2015. *Neoromycia:* Thies and Lewis, Occ. Pap. Mus. Texas Tech Univ., 330: 7. Publication date: 10 February 2015. (Lapsus)

? *Neoromicia sp.:*

TAXONOMY:
Considered a subgenus of *Eptesicus* by Koopman (1993a: 201); considered a subgenus of *Pipistrellus* by Grubb *et al.* (1998: 85) and Hill and Harrison (1987: 248), but considered a valid genus by Volleth *et al.* (2001: 25), Simmons (2005). See also Riccucci and Lanza (2008) for a discussion on the gender of this genus name.

Helbig *et al.* (2010: 168) suggest that *Neoromicia* is actually a para- or polyphyletic group.

Without any further explication, Taylor and Tuttle (2019: 282, 283) placed all *Neoromicia* species in the genus *Laephotis*.

Known species of the genus *Neoromicia*: ***brunneus*** (Thomas, 1880); ***capensis*** (A. Smith, 1829); ***guineensis*** (Bocage, 1889); ***helios*** (Heller, 1912); sp. aff. ***melckorum*** (Roberts, 1919); ***nana*** (Peters, 1852); ***rendalli*** (Thomas, 1889); ***somalicus*** (Thomas, 1901); ***tenuipinnis*** (Peters, 1872); ***zuluensis*** (Roberts, 1924).

COMMON NAMES:
Czech: banánoví netopýři. English: Neoromicia Pipistrelle Bats. Italian: Neoromìcie.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Avery (2007: 619) reported on the presence of *Neoromicia* sp. in Pleistocene deposits at Wonderwerk Cave, South Africa.

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Tragus: Monadjem *et al.* (2013c: 204) present a line drawing of the tragi of specimen DNSM 13225 (identified as *N.* sp. 1) from Mount Nimba, Liberia.

DETAILED MORPHOLOGY:
Baculum: The shaft tip of the baculum was bulbous and lobed in all the *Neoromicia* species from Liberia examined (Monadjem *et al.*, 2013c: 197).

ECHOLOCATION:
Kofoky *et al.* (2009: 382) reported the calls potentially from *N. melckorum* and *N. matroka*, which had steep FM followed by a shallow QFM pulse at a low duty cycle.

PREDATORS:
Goodman *et al.* (2015c: 78) found the remains of five *Pipistrellus/Neoromicia* sp. individuals in pellets of Bat Hawk *Macheiramphus alcinus* Bonaparte, 1850 in western central Madagascar.

VIRUSES:
Coronaviridae
None of the 34 Kenyan *Neoromicia* sp. tested by Tao *et al.* (2017: Suppl.) was positive for CoV.

Geldenhuys *et al.* (2018: 5) investigated fecal, rectal and intestinal swaps of 58 *Neoromicia* (*N. capensis, N. zuluensis, N. nana* and *N.* cf. *helios*) specimens collected over an eight-year period (2007 - 2015) in northeastern RSA. In these, they found the following virus families: ssRNA viruses: *Orthomyxoviridae* (30.49 %), *Picornaviridae* (22.56 %), *Bunyaviridae* (10.98 %), *Coronaviridae* (9.15 %), *Virgaviridae* (2.44 %), *Caliciviridae* (2.44 %), *Tymoviridae* (2.44 %), *Flaviviridae* (1.83 %), *Rhabdoviridae* (1.22 %) *Sobemoviridae* (0.61 %), and unclassified (15.9 %); ssDNA viruses: *Microviridae* (86 %), *Circoviridae* (8 %), *Parvoviridae* (6 %), *Inoviridae* (0.9 %), and *Anelloviridae* (0.05 %); dsDNA viruses: *Herpesviridae*(48 %), *Caudoviridae* (26.7 %), *Adenoviridae* (17 %), *Papillomaviridae* (2.7 %), *Ampullavirida* (1.8 %), *Iridoviridae* (0.9 %), *Phycodnaviridae* (0.9 %), *Baculoviridae* (0.6 %), *Polydnaviridae* (0.6 %), *Nimaviridae* (0.3 %), and unclassified (0.3 %). One of the *Ciroviridae* (genus *Cyclovirus*) was found to be a new species: *Neoromicia*-associated cyclovirus 1 strain 19681/RSA (or NeoCycloV-1), for which the closest relative was retrieved from human stool (Geldenhuys *et al.*, 2018: 10). Furthermore, they (p. 13) reported the a novel *Neoromicia* picornavirus sequence (BatPicV/NeoC21877/RSA), which should be the first bat picornavirus from an insectivorous bat genus in Africa.

ZOOBANK:
7173CFF6-F27B-44D7-948E-23FC40080224

Neoromicia aff. guineensis Bocage, 1889

2016. *Neoromicia sp. (aff. guineensis):* Kruskop, Benda, Vasenkov and Lavrenchenko, Lynx, 47: 62. (Name Combination)

TAXONOMY:
Although very similar to *N. guineensis* morphologically, preliminary molecular genetic analyses by Kruskop *et al.* (2016: 62) indicated that a number of animals differed from other Ethiopian specimens belonging to *N. guineensis, N.* cf. *zuluensis* and *N. somalica*. Further comparisons with specimens from other areas from Africa will be required to assess the taxonomic status of these specimens.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Ethiopia.

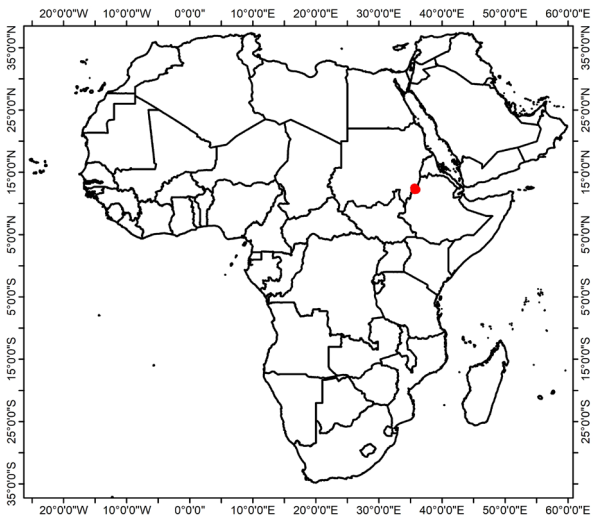

Figure 312. Distribution of *Neoromicia* aff. *guineensis*

Neoromicia brunnea (Thomas, 1880)

*1880. *Vesperugo (Vesperus) brunneus* Thomas, Ann. Mag. nat. Hist., ser. 5, 6 (32): 165, 1 text-fig. Publication date: 1 August 1880. Type locality: Nigeria: Eastern region: Calabar [04 56 N 08 22 E]. Holotype: BMNH 1880.7.21.7: ad ♀, skull and alcoholic. Collected by: Dr. A. Robb. Presented/Donated by: Dr. J.A. Smith. - Comments: Allen (1939a: 84), Grubb *et al.* (1998: 86) mentioned "Old Calabar, West Africa" as type locality.

1880. *Vesperugo brunneus:* Dobson, Report 50th Meeting British Association Advancement Science, 1880: 185. - Comments: (redescription of type). (Name Combination)

1939. *Eptesicus brunneus:* G.M. Allen, Bull. Mus. comp. Zool., 83: 84. (Name Combination)

1971. *Eptesicus [(Eptesicus)] brunneus:* Hayman and Hill, Mammals of Africa: Chiroptera, 44. (Name Combination)

1987. *Nycterikaupius brunneus:* Menu, Palaeovert., 17 (3): 109. Publication date: 15 November 1987. (Name Combination)

1987. *Pipistrellus (Neoromicia) brunneus:* Hill and Harrison, Bull. Br. Mus. (nat. Hist.) Zool., 52 (7): 282. (Name Combination)

1989. *P[ipistrellus] brunneus:* Koopman, Am. Mus. Novit., 2946: 10. - Comments: (This might be a lapsus, since Koopman used *Eptesicus brunneus* on page 7). (Name Combination, Lapsus)

1993. *Eptesicus (Neoromicia) brunneus:* Koopman, in: Wilson and Reeder, Mammal species of the World (2nd Edition): Chiroptera, 201. (Name Combination)

1995. *Pipistrellus brunneus:* Koopman, Kofron and Chapman, Am. Mus. Novit., 3148: 11. (Name Combination)

2003. *? (Hypsugo) brunneus:* Hoofer and Van Den Bussche, Acta Chiropt., 5 (Suppl.): 38. (Name Combination)

2008. *N[eoromicia] brunnea:* Riccucci and Lanza, Hystrix, It. J. Mamm., (n.s.) 19 (2): 176. - Comments: Riccucci and Lanza (2008: 176) indicate that the genus *Neoromicia* is feminine, therefore the spelling of the species ending must also be feminine according to Art. 31.2 of the ICZN (1999). (Current Combination, Current Spelling)

2019. *L[aephotis] brunnea:* Taylor and Tuttle, Bats: An illustrated guide to all species, 283. Publication date: 11 April 2019. (Name Combination)

? *Neoromicia brunnea:*

? *Neoromicia brunneus:* (Name Combination)

TAXONOMY:
Mentioned in the genus *Pipistrellus* by Koopman (1994: 117). Included (as "*(Hypsugo) brunneus*") in a separate, unnamed genus by Hoofer and Van Den Bussche (2003: 38).

Helbig *et al.* (2010: 168) suggest that *brunnea* needs to be transferred to a genus that needs to be newly created or resurrected from the current synonymy.

Riccucci and Lanza (2008) indicate that the genus *Neoromicia* is feminine, therefore the species name *brunneus* must be corrected into *brunnea*.

COMMON NAMES:
Czech: netopýr kalabarský. English: Brown Pipistrelle Bat, Dark-brown Pipistrelle Bat, Dark-brown Serotine. French: Sérotine brune d'Afrique, Sérotine brun-noire. German: Dunkelbraune Zwergfledermaus, Dunkelbraune Pipistrelle.

CONSERVATION STATUS:
Global - Listed as Near Threatened (NT ver 3.1 (2001)) because this species is probably in significant decline (but at a rate of less than, but close, to 30 % over a ten year period) because of widespread habitat loss through much of its range, thus making the species close to qualifying for Vulnerable A4c (Fahr, 2008f; IUCN, 2009).

Assessment Histroy -
2008 - NT ver 3.1 (2001) [assessed as *Pipistrellus brunneus*] (Fahr, 2008f; IUCN, 2009). 2004 - NT ver 3.1 (2001) [assessed as *Neoromicia brunneus*] (Fahr, 2004k; IUCN, 2004). 1996 - LR/nt [assessed as *Eptesicus brunneus*] (Baillie and Groombridge, 1996).

MAJOR THREATS:
This species is threatened by deforestation resulting from logging operations, and the conversion of its habitat to agricultural use (Fahr, 2008f; IUCN, 2009).

CONSERVATION ACTIONS:
Fahr (2008f) [in IUCN (2009)] reports that there appear to be no conservation measures in place for this species. There is a need to establish and manage suitable protected areas for this species.

GENERAL DISTRIBUTION:
Neoromicia brunnea is known from a few widespread localities in West and Central Africa. It ranges from Sierra Leone in the west, to Congo in the east. The distribution is believed to be patchy, as surveys have generally been unable to locate this species outside of its known range.

Native: Cameroon; Congo (Bates *et al.*, 2013: 325 - 1st authenticated record); Côte d'Ivoire; Equatorial Guinea (Bioko); Gabon; Ghana; Liberia; Nigeria; Sierra Leone.

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Tragus: Monadjem *et al.* (2013c: 204) present a line drawing of the tragi of specimen DNSM 13229 from Mount Nimba, Liberia.

DETAILED MORPHOLOGY:
Baculum: The basal lobes in the lateral view were broadest near the shaft base, tapering to a rounded end and were flattened at the bottom, giving them a 'shoe-like' appearance (Monadjem *et al.*, 2013c: 197). Line drawing of dorsal and ventral bacula of specimen DNSM 13229 from Mount Nimba, Liberia are shown in Monadjem *et al.* (2013c: 204).

MOLECULAR BIOLOGY:
DNA - See Hoofer and Van Den Bussche (2003).
Karyotype - McBee *et al.* (1987) reported 2*n* = 36, FN = 50, BA = 16, a submetacentric X chromosome and an acrocentric Y chromosome.
Protein / allozyme - Unknown.

HABITAT:
Monadjem *et al.* (2016y: 369) recorded this species from forested habitats between 400 and 520 m altitude in the Mount Nimba area.

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:

Figure 313. Clockwise from top lateral, ventral and dorsal skull images of BMNH 1880.7.21.7, holotype of *Vesperugo* (*Vesperus*) *brunneus* Thomas, 1880.

POPULATION:
Structure and Density - Little information is available on the population abundance or size of this species (Fahr, 2008f; IUCN, 2009).
Trend - 2008 - Decreasing (Fahr, 2008f; IUCN, 2009).

PARASITES:
Nycteribiidae: *Tripselia echinata* Theodor 1957 from Old Calabar, Nigeria (Haeselbarth *et al.*, 1966: 113).

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Cameroon, Congo, Congo (Democratic Republic of the), Côte d'Ivoire, Equatorial Guinea, Gabon, Ghana, Liberia, Nigeria, Sierra Leone.

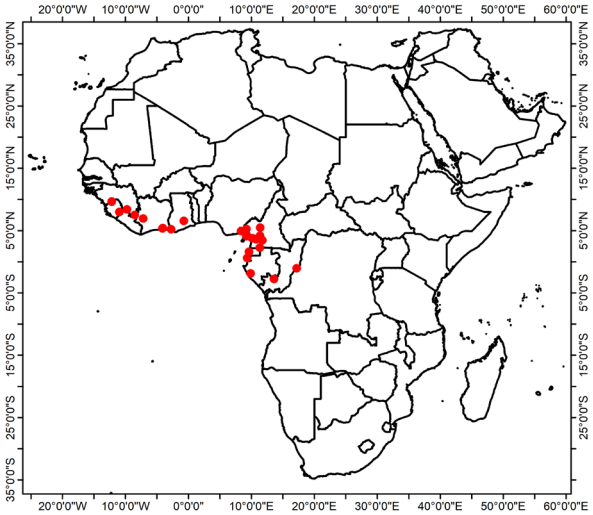

Figure 314. Distribution of *Neoromicia brunnea*

Neoromicia capensis (A. Smith, 1829)

*1829. *Vespertilio Capensis* A. Smith, Zool. Journ., 4 (16): 435. Publication date: May 1829. Type locality: South Africa: Cape province: Grahamstown [33 18 S 26 32 E] [Goto Description]. Lectotype: BMNH 1848.6.12.18: ad, skin only. Collected by: Dr. J.A. Smith. This skin should match skull BMNH 1848.6.12.21. Lectotype: BMNH 1849.8.16.21: ad, skull only. Collected by: Dr. J.A. Smith. Presented/Donated by: ?: Collector Unknown. This skull should match skin BMNH 1849.8.16.18. - Comments: Thorn *et al.* (2009: 56) mention that the "Lectotype (Thomas 1926) probably does not match the Grahamstown type-locality selected by Roberts (1951), see Thorn (1988a).". - Etymology: The name *capensis* refers to the Cape, where the type specimen was collected.

1840. *Vespertilio minuta* Temminck, Monographies de mammalogie ou description de quelques genres de mammifères, dont les espèces ont été observées dans les différens musées de l'Europe. Tome Seconde, 2: 209. Type locality: South Africa: Cape of Good Hope [ca. 33 56 S 18 28 E] [Goto Description]. - Comments: Preoccupied by *Vespertilio minutus* Montagu, 1808.

1855. *Vespertilio (Vesperus) minutus:* Wagner, in: Schreber, Die Säugethiere in Abbildungen nach der Natur mit Beschreibungen, Suppl. 5: 747.

1860. *Hypsugo minutus:* Kolenati, Monographie der Europäischen Chiroptern, 20.

1861. *Scotophilus capensis:* Tomes, Proc. zool. Soc. Lond., 1861, I: 36. (Name Combination)

1861. *Scotophilus minutus:* Tomes, Proc. zool. Soc. Lond., 1861, I: 32.

1878. *Vesperugo (Vesperus) capensis:* Dobson, Catalogue of the Chiroptera of the collection of the British Museum, 198. (Name Combination)

1878. *Vesperugo (Vesperus) minutus:* Dobson, Catalogue of the Chiroptera of the collection of the British Museum, 197.

1886. *Vesperugo capensis?:* Nehring, Katalog der Säugethiere, 5. (Name Combination)

1887. *Vesperus minutus:* Jentink, Mus. Hist. nat. Pays-Bas, Leyden, 275.

1889. *Vesperus damarensis* Noack, Zool. Jb. Syst., 4: 213, pl. 5, fig. 59. Publication date: 28 February 1889. Type locality: Namibia: Damaraland: Omburu and Golabie [Goto Description]. Syntype: ZMB 86231: ad ♀, skin and skull. Collected by: Heinrich Rudolph Schinz; collection date: August 1886. Formerly A4902; see Turni and Kock (2008: 65). Syntype: ZMB A.4903: ad ♀, alcoholic (skull missing). Collected by: Heinrich Rudolph Schinz; collection date: August 1886. From Omburo; see Turni and Kock (2008: 65) [missing]. Syntype: ZMZ ad ♀, skin and skull. Collected by: Heinrich Rudolph Schinz. Locality Golabie, see Turni and Kock (2008: 65).

1897. *Eptesicus minutus:* Matschie, Arch. Naturgesch. Berlin, 63 (1): 84.

1897. *Vesperugo (Vesperus) damarensis:* Trouessart, Catalogus Mammalium tam viventium quam fossilium, fasc. I: 110.

1901. *Vespertilio (Eptesicus) capensis:* Sclater, Mammals of South Africa, 123, 125. (Name Combination)

1901. *Vespertilio (Eptesicus) damarensis:* Sclater, Mammals of South Africa, 123, 128.

1901. *Vespertilio (Eptesicus) minutus:* Sclater, Mammals of South Africa, 123, 124.
1905. *Vespertilio capensis gracilior* Thomas and Schwann, Proc. zool. Soc. Lond., 1905, I, II: 257. Publication date: 10 August 1905. Type locality: South Africa: KwaZulu-Natal: Eshowe [28 54 S 31 28 E]. Holotype: BMNH 1904.8.31.3: ad? ♂, skin and skull. Collected by: Captain Claude Henry Baxter Grant and C.D. Rudd; collection date: 15 February 1904; original number: 678. (Name Combination)
1907. *Vespertilio (Vespertilio) minutus:* Elliot, Field Columbian Mus., Zool. Ser., 115 (8): 512.
1908. *Scabrifer notius* G.M. Allen, Bull. Mus. comp. Zool., 52 (3): 46. Publication date: July 1908. Type locality: South Africa: SW Cape province: [=Western Cape]: Cape Town [33 56 S 18 28 E] [Goto Description]. Holotype: MCZ 4555: ad ♂, skull and alcoholic. Collected by: Edgar Leopold Layard; collection date: August 1864. Presented/Donated by: Edgar Leopold Layard. See Allen (1908: 46); Helgen and McFadden (2001: 147).
1917. *Eptesicus garambæ* J.A. Allen, Bull. Am. Mus. Nat. Hist., 37 (18): 445. Publication date: 29 September 1917. Type locality: Congo (Democratic Republic of the): Garamba [04 11 N 30 00 E] [Goto Description]. Holotype: AMNH 49340: ad ♂, skull and alcoholic. Collected by: Herbert Lang, James Paul Chapin and The American Museum Congo Expedition; collection date: 14 March 1912; original number: 1888.
1917. *Eptesicus minutus minutus:* J.A. Allen, Bull. Am. Mus. Nat. Hist., 37 (18): 410, 445.
1919. *Eptesicus melckorum* Roberts, Ann. Transv. Mus., 6(3): 113. Type locality: South Africa: SW Cape province: Berg River: Kersfontein [32 51 S 18 42 E] [Goto Description]. Holotype: TM 2283: ad ♀, skin and skull. Collected by: Austin Roberts and Adendorff; collection date: 21 November 1917; original number: 533. Note: In loft, under eaves of house. - Etymology: In honour of R. Melck of Kersfontein, Berg River, Cape Province, on whose property the original specimen was taken (Smithers, 1983: 102).
1923. *Eptesicus capensis:* Kershaw, Rev. Zool. afr., 11 (4): 358. (Name Combination)
1924. *Eptesicus capensis gracilior:* Roberts, Ann. Transv. Mus., 10: 60. (Name Combination)
1926. *Eptesicus damarensis:* Thomas, Proc. zool. Soc. Lond., 1926, I: 286.
1932. *Eptesicus capensis nkatiensis* Roberts, Ann. Transv. Mus., 15 (1): 16. Publication date: 1 October 1932. Type locality: Botswana: N Bechuanaland: Nkate [20 00 S 26 10 E] [Goto Description]. Holotype: TM 6549: ad ♀, skin and skull. Collected by: The Vernay-Lang Kalahari Expedition 1930; collection date: 18 August 1930; original number: 999. (Name Combination)
1934. *Eptesicus capensis capensis:* Shortridge, Mammals of South West Africa, 61. (Name Combination)
1939. *Rhinopterus notius:* G.M. Allen, Bull. Mus. comp. Zool., 83: 97.
1953. *Eptesicus (Eptesicus) capensis capensis:* Ellerman, Morrison-Scott and Hayman, Southern African mammals 1758 to 1951, 75. (Name Combination)
1953. *Eptesicus (Eptesicus) capensis damarensis:* Ellerman, Morrison-Scott and Hayman, Southern African mammals 1758 to 1951, 75. (Name Combination)
1953. *Eptesicus (Eptesicus) capensis gracilior:* Ellerman, Morrison-Scott and Hayman, Southern African mammals 1758 to 1951, 75. (Name Combination)
1953. *Eptesicus (Eptesicus) capensis:* Ellerman, Morrison-Scott and Hayman, Southern African mammals 1758 to 1951, 75. (Name Combination)
1953. *Eptesicus (Rhinopterus) notius:* Ellerman, Morrison-Scott and Hayman, Southern African mammals 1758 to 1951, 78.
1961. *Eptesicus notius:* Bateman, Koedoe, 4: 82.
1965. *Eptesicus capensis garambae:* Koopman, Am. Mus. Novit., 2219: 15. (Name Combination)
1975. *Eptiscus capensis:* Dean, Zool. Afr., 10: 218. (Lapsus)
1984. *[Pipistrellus] capensis:* Heller and Volleth, Z. zool. Syst. Evolut.-forsch., 22: 72. (Name Combination)
1984. *Eptesicus (Eptesicus) capensis garambae:* Anciaux de Faveaux, Ann. Kon. Mus. Mid. Afr., Zool. Wetensch.. (Name Combination)
1984. *Eptesicus (Eptesicus) capensis grandidieri:* Anciaux de Faveaux, Ann. Kon. Mus. Mid. Afr., Zool. Wetensch.. (Name Combination)
1987. *Nycterikaupius capensis:* Menu, Palaeovert., 17 (3): 109. Publication date: 15 November 1987. (Name Combination)
1987. *Pipistrellus (Neoromicia) capensis:* Hill and Harrison, Bull. Br. Mus. (nat. Hist.) Zool., 52 (7): 282. (Name Combination)
1988. *P[ipistrellu]s c[apensis] notius:* Thorn, Mammalia, 52 (2): 202. (Name Combination)

1988. *Pipistrellus (Neoromicia) capensis capensis:* Ansell and Dowsett, Mammals of Malawi, 41. (Name Combination)
1988. *Pipistrellus (Neoromicia) capensis gracilior:* Ansell and Dowsett, Mammals of Malawi, 41. (Name Combination)
1988. *Pipistrellus capensis capensis:* Thorn, Mammalia, 52 (2): 199. (Name Combination)
1988. *Pipistrellus capensis gracilior:* Thorn, Mammalia, 52 (2): 204. (Name Combination)
1988. *Pipistrellus capensis:* Thorn, Mammalia, 52 (2): 199. (Name Combination)
1993. *Eptesicus (Neoromicia) capensis:* Koopman, in: Wilson and Reeder, Mammal species of the World (2nd Edition): Chiroptera, 201. (Name Combination)
1994. *P[ipistrellus (Neoromicia)] c[apensis] damarensis:* Koopman, in: Niethammer, Schliemann and Starck, Handbook of Zoology, volume II (Mammalia) Chiroptera, (60) 55. (Name Combination)
1994. *P[ipistrellus (Neoromicia)] c[apensis] garambae:* Koopman, in: Niethammer, Schliemann and Starck, Handbook of Zoology, volume II (Mammalia) Chiroptera, (60) 55. (Name Combination)
1994. *P[ipistrellus (Neoromicia)] c[apensis] grandidieri:* Koopman, in: Niethammer, Schliemann and Starck, Handbook of Zoology, volume II (Mammalia) Chiroptera, (60) 55. (Name Combination)
1994. *P[ipistrellus (Neoromicia)] c[apensis] matroka:* Koopman, in: Niethammer, Schliemann and Starck, Handbook of Zoology, volume II (Mammalia) Chiroptera, (60) 55. (Name Combination)
1994. *P[ipistrellus (Neoromicia)] c[apensis] notius:* Koopman, in: Niethammer, Schliemann and Starck, Handbook of Zoology, volume II (Mammalia) Chiroptera, (60) 55. (Name Combination)
2001. *Hypsugo capensis:* Volleth, Bronner, Göpfert, Heller, von Helversen and Yong, Chromosome Res., 9 (1): 25. - Comments: Possibly a lapsus since this combination is only mentioned once in the abstract, as is *Pipistrellus (Neoromicia) capensis*. All other references to this taxon refer to it as *Neoromicia capensis*. (Name Combination, Lapsus)
2001. *Neoromicia capensis:* Volleth, Bronner, Göpfert, Heller, von Helversen and Yong, Chromosome Res., 9 (1): 26. (Name Combination, Current Combination)
2019. *L[aephotis] capensis:* Taylor and Tuttle, Bats: An illustrated guide to all species, 283. Publication date: 11 April 2019. (Name Combination)
? *Eptesicus capensis damarensis:* (Name Combination)

TAXONOMY:

Figure 315. *Neoromicia capensis* (SMG-15768) caught at Marloth Park, Mpumalanga, South Africa.

Includes *notius*; see Koopman (1975: 405). Mentioned in the genus *Pipistrellus* by Koopman (1994: 117). Most of the West African populations have not been allocated to subspecies. Volleth *et al.* (2001: 27) assigned this species to the genus *Neoromicia*. Koopman (1993a: 201) included *matroka*, but see Peterson *et al.* (1995: 104). Thorn *et al.* (2007: 70) removed *grandidieri* Dobson, 1876.

Helbig *et al.* (2010: 168) suggest transferring *capensis* to the genus *Laephotis*.

COMMON NAMES:

Afrikaans: Kaapse dakvlermuis. Chinese: 南非伏翼. Czech: netopýr kapský, netopýr hnědý, netopýr damarský. English: Cape bat, Cape Serotine, Cape Pipistrelle Bat, Cape Serotine Bat,

Cape House Bat. French: Sérotine du Cap. German: Kap-Zwergfledermaus, Kap-Pipistrelle, Capische Abendfledermaus. Italian: Pipistrèllo capènse. Kiluba (DRC): Kasusu. Portuguese: Morcego caseiro do cabo.

ETYMOLOGY OF COMMON NAME:
The colloquial name serotine is derived from the Latin *serotinus*, late in the evening (*serus*) (Taylor, 2005). The name serotine is referring to *Eptesicus serotinus* and was in general use when the current species was still considered to belong to that genus.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
This species has been recovered from the upper Pleistocene at Border Cave (Avery, 1991: 6) and Wonderwerk (Avery and Avery, 2011: 19), South Africa, as well as from Holocene deposits at Blinkklipkop, Limerock, Wonderwerk (Avery and Avery, 2011: 19).

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Jacobs *et al.*, 2008r; IUCN, IUCN, 2009).

Assessment Histroy -
2008 - LC ver 3.1 (2001) [assessed as *Pipistrellus capensis*] (Jacobs *et al.*, 2008r; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Jacobs *et al.*, 2004t; IUCN, 2004). 1996 - LR/lc [assessed as *Eptesicus capensis*] (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - LC ver 3.1 (2001) (Monadjem *et al.*, 2016w). 2004 - LC ver 3.1 (2001) (Friedmann and Daly, 2004).

MAJOR THREATS:
There appear to be no major threats to this species as a whole (Jacobs *et al.*, 2008r; IUCN, 2009), although Doty and Martin (2012: 75) report on fatalities due to wind turbines in the Eastern Cape, South Africa.

CONSERVATION ACTIONS:
Jacobs *et al.* (2008r) [in IUCN (2009)] report that in view of the species wide range and adaptability it is expected to occur in many protected areas (such as the Udzungwa Mountains National Park (Stanley *et al.*, 2005b)). There are no direct conservation measures currently needed for this species as a whole.

GENERAL DISTRIBUTION:
Neoromicia capensis is widespread over much of sub-Saharan Africa. It has been recorded from Guinea Bissau in the west, to Somalia, southern Sudan and Eritrea in the east, ranging south to most of South Africa. In the RSA, the species' distribution is linked with land use/land cover (Babiker Salata, 2012: 50).

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 1,719,255 km^2.

Native: Angola (Crawford-Cabral, 1989; Monadjem *et al.*, 2010d: 565; Taylor *et al.*, 2018b: 60); Benin (Capo-Chichi *et al.*, 2004: 163); Botswana (Archer, 1975; Cotterill, 2004a: 261; Monadjem *et al.*, 2010d: 565); Burkina Faso (Kangoyé *et al.*, 2012: 6026; 2015a: 619); Burundi; Cameroon; Central African Republic; Congo (The Democratic Republic of the) (Hayman *et al.*, 1966; Monadjem *et al.*, 2010d: 565); Côte d'Ivoire; Equatorial Guinea; Eritrea; Ethiopia (Largen *et al.*, 1974; Yalden *et al.*, 1996; Lavrenchenko *et al.*, 2004b: 142); Gabon; Ghana (Decher and Fahr, 2007: 16 as *N.* cf. *capensis*); Guinea; Guinea-Bissau (Veiga-Ferreira, 1949; Lopes and Crawford-Cabral, 1992; Rainho and Ranco, 2001: 63); Kenya; Lesotho (Lynch, 1994: 195; Monadjem *et al.*, 2010d: 565); Liberia (Fahr, 2007a: 104); Malawi (Happold *et al.*, 1988; Monadjem *et al.*, 2010d: 565); Mozambique (Smithers and Lobão Tello, 1976; Monadjem *et al.*, 2010d: 565; Monadjem *et al.*, 2010c: 384); Namibia (Monadjem *et al.*, 2010d: 565); Nigeria; Sierra Leone; Somalia; South Africa (Seamark and Kearney, 2007; Monadjem *et al.*, 2010d: 566); Sudan; Swaziland (Monadjem *et al.*, 2010d: 567); Tanzania; Togo; Uganda (Kityo and Kerbis, 1996: 62); Zambia (Ansell, 1967; Ansell, 1969; Ansell, 1973; Monadjem *et al.*, 2010d: 567); Zimbabwe (Monadjem *et al.*, 2010d: 567).
Presence uncertain: Djibouti.

Bates *et al.* (2013: 339) reject the presence of *N. capensis* in the Republic of Congo as the data presented by Lavrenchenko *et al.* (2004b: 142) are actually from the DRC.

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Fisk (1890: 97) reported on an albino specimen shot at Broadlands farm (Somerset West, South Africa), see also Allen (1939b) and Lucati and López-Baucells (2016: Suppl.).

Schoeman and Jacobs (2002: 157) mention the following parameters for 10 specimens from the Algeria Forestry Station (RSA): Fa: 35.9 ± 1.2 mm, Wing area: 87.6 ± 7.4 cm^2, Wing span: 24.0 ± 0.8

cm, Wing loading: 7.3 ± 1.0 N/m^2, and aspect ratio: 6.6 ± 0.4.

DETAILED MORPHOLOGY:
Baculum - Hill and Harrison (1987) and Kearney *et al.* (2002).

ECHOLOCATION:
See Jacobs (1996), Taylor (1999b) and Taylor *et al.* (2005).

For the Algeria Forest Station (RSA), Schoeman and Jacobs (2002: 157) reported the call type to be a low duty echolocation dominated by frequency modulated calls, with a F_{peak}: 41.9 ± 1.4 kHz.

Schoeman and Waddington (2011: 291) mention a peak frequency of 39.4 ± 1.1 kHz and duration of 5.1 ± 1.2 msec for specimens from Durban, South Africa.

Taylor *et al.* (2013b: 17) recorded the following parameters for 7 calls from Soutpansberg, South Africa: F_{max}: 48.9 ± 6.15 (41.4 - 61.4) kHz, F_{min}: 37.6 ± 1.86 (34.7 - 40.9) kHz, F_{knee}: 40.0 ± 1.92 (37.0 - 42.4) kHz, F_{char}: 38.2 ± 1.68 (35.8 - 41.2) kHz, duration: 3.6 ± 1.05 (2.1 - 5.0) msec.
Linden *et al.* (2014: 40) reported the following parameters from the Soutpansberg (RSA): F_{min}: 34 - 39 kHz, F_{char}: 36 - 41 kHz, F_{knee}: 37 - 42 kHz, Slope: 254 - 509 OPS, duration: 2 - 5 msec.
At Farm Welgevonden, South Africa, Taylor *et al.* (2013a: 556) report a F_{knee} value of 40 (37 - 42) kHz. 10 calls from the Kalahari Desert, recorded by Adams and Kwiecinski (2018: 4), had the following values: F_{char}: 36.9 ± 0.6 kHz, F_{max}: 39.6 ± 4.3 kHz, F_{min}: 36.7 ± 0.6 kHz, duration: 3.5 ± 0.5 msec. 20 calls from the Mapungubwe National Park (RSA) recorded by Parker and Bernard (2018: 57) had the following features: F_{char}: 39.54 ± 1.17 kHz, F_{max}: 63.06 ± 5.75, F_{min}: 38.59 ± 1.21 kHz, F_{knee}: 46.16 ± 3.94 kHz, duration: 5.18 ± 1.45 msec and 7.36 ± 2.31 calls/sec.

In the Telperion Nature Reserve (RSA), Kearney *et al.* (2019: 37) recorded the release calls of 37 bats (559 pulses) with the following characteristics: F_{char}: 37.10 ± 1.42 (32.65 - 42.11) kHz, slope at start of call: 53.67 ± 42.21 (-42.66 - 261.53), time from start of call to F_{char}: 4.25 ± 1.14 (1.66–7.64) msec and duration: 4.61 ± 1.12 (3.01 - 8.19). Subdivided according to sexe, these data were respectively: ♂♂:37.26 ± 1.46 (32.65 - 42.11) kHz, 58.29 ± 46.30 (-18.07 - 261.53), 4.24 ± 1.09 (1.66–6.99) msec, 4.63 ± 1.07 (3.01 - 7.74) msec;♀♀: 36.93 ± 1.36 (33.20 - 40.20) kHz, 48.68 ± 36.75 (-42.66 - 205.01), 4.26 ± 1.19 (1.76–7.64) msec, 4.59 ± 1.18 (3.02 -8.19) msec. As February is probably in the mating season of *N. capensis*, this dimorphism in calls might be playing a social role within the reproductive context (Kearney *et al.* (2019: 41).

MOLECULAR BIOLOGY:
DNA -
Karyotype - Peterson and Nagorsen (1975), Rautenbach *et al.* (1993), Volleth *et al.* (2001), and Kearney *et al.* (2002) all reported 2*n* = 32, FN = 50, BA = 20. While Rautenbach *et al.*, 1993) and Kearney *et al.* (2002) reported a metacentric X chromosome, Peterson and Nagorsen (1975) reported a submetacentric X chromosome. Peterson and Nagorsen (1975) and Rautenbach *et al.* (1993) both reported an acrocentric Y chromosome. GTG-bands identified three Robertsonian fusion chromosomes (7/11, 8/9, 10,12), considered as distinguishing characters for the genus *Neoromicia* Kearney *et al.* (2002).
Protein / allozyme - See Morales *et al.* (1991) for results from seven specimens from South Africa.

HABITAT:
Sirami *et al.* (2013: 34) recorded in the Western Cape Province, South Africa that *N. capensis* activity was significantly and positively influenced by size of wetland, while habitats 100 m surrounding wetlands were also significantly and positively influenced by the water body. *N. capensis* favoured open habitats surrounding wetlands (Sirami *et al.*, 2013: 35).

Minnaar *et al.* (2014a: 522) found that moth consumption by *N. capensis* was low under unlit conditions (mean percentage volume ± SD: 5.91 ± 6.25 %), while moth consumption increased sixfold (35.42 ± 17.90 %) under artificially lit conditions despite a decrease in relative moth abundance. They conclude (p. 529) that the "introduction of artificial lights into previously unlit environments may allow syntonic bats [such as *N. capensis*, which are audible to eared moths] access to an historically unavailable resource in eared moths".

ROOST:
Taylor *et al.* (1999: 69) reported on a single roost found in the Durban area, which was located in the roof and spaces between wooden shutters and the outer wall of a school building in the Kloof suburb.

Kearney *et al.* (2019: 30) indicate that there seems to be a shift in roosting sites from natural crevice and vegetation types to to man-made structures, which seems to be accompanied by a change in roosting group size. Vegetation roosts were usually inhabited by two or three individuals, whereas buildings can house groups of over 50 animals.

DIET:
From the Algeria Forestry Station (RSA), Schoeman and Jacobs (2002: 157) reported the following prey groups based on 89 faecal pellets from 10 bats (in volume percent): Hemiptera (46.6 ± 33.7), Diptera (37.6 ± 28.4), Coleoptera (12.5 ± 21.5), Ephemeroptera (2.3 ± 5.5), and unknown (1 ± 3.2).

PREDATORS:
Thomas and Jacobs (2013: 127) [referring to Avery *et al.* (2005)] indicate that *N. capensis* is more often taken by owls due to its clutter-edge foraging style, which combines slow flight with foraging at the edge of the vegetation.

Dean (1975: 218) reports on one specimen being found in a barn owl (*Tyto alba* pellet in South Africa (see also Avery *et al.*, 2005: 1054). Avery *et al.* (2003: 7) found *N. capensis* to be the best represented prey in barn owl pellets collected in the Free State during the summer.

Mikula *et al.* (2016: Supplemental data) mention the Bat hawk (*Macheiramphus alcinus* Bonaparte, 1850), the Pied crow (*Corvus albus* Statius Muller, 1776) and the Southern fiscal (*Lanius collaris* Linnaeus, 1766) as diurnal avian predators of "*Eptesicus capensis*".

POPULATION:
Structure and Density - In general, this is a locally common species (Jacobs *et al.*, 2008r; IUCN, 2009).
Trend - 2008 - Stable (Jacobs *et al.*, 2008r; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
van der Merwe and Rautenbach (1990: 540) reported that "*Eptesicus capensis*" commonly gives birth to twins and occasionally even triplets. van der Merwe (1990: 202) examined five pregnant females and found three of them having two foetuses (one in each uterine horn), one had three foetuses (two in the right and one in the left uterine horn) and one even four foetuses.

Monadjem *et al.* (2010d) [in Weier *et al.* (2018: Suppl.)] mentioned births from late October to November.

PARASITES:
Genov *et al.* (1992) reported the Nematode *Molinostrongylus omatus* (Mönnig, 1927) from an "*Eptesicus capensis*" specimen from South Africa.

Schaer *et al.* (2013a: 17416) report the presence of hemosporidian parasites of the genus *Polychromophilus* in one out of three investigated bats.

BACTERIA:
Dietrich *et al.* (2016a: 4) found *Rickettsia* in the faeces of bats from South Africa.

HEMIPTERA
Cimicidae: *Cacodmus villosus* (Stål, 1855) in the Transvaal, South Africa (Haeselbarth *et al.*, 1966: 11). Haeselbarth *et al.* (1966: 11) suggests that Bedford (1932)'s record of *Cimex pipistrelli* Jenyns from Cape Town most probably refers to *Cacodmus villosus* (Stål, 1855) (see also Reinhardt and Jacobs, 2006).

DIPTERA
Nycteribiidae: *Nycteribia schmidlii* Schiner, 1853 (Haeselbarth *et al.*, 1966: 108).

SIPHONAPTERA
Ischnopsyllidae: *Ischopsyllus emminus* Jordan and Rothschild, 1921 only known from the type series collected at Greenwood Park, Natal, South Africa (Haeselbarth *et al.*, 1966: 187). *Dampfia grahami* (Waterston, 1915) from Malawi (Beaucournu and Kock, 1996); *Araeopsylla scitula* (Rothschild, 1909) a single record from Kanye, Botswana (Haeselbarth *et al.*, 1966: 189).

Brennan *et al.* (2015: 145) found no antibodies against *Pseudogymnoascus destructans* (White-nose syndrome) in blood samples from bats from Botswana.

VIRUSES:
Bunyaviridae
Hantavirus
Tešíková *et al.* (2017: 279) found Hantavirus RNA in dried blood samples of *N. capensis* from the Dhati Walel National Park in Ethiopia.

Coronaviridae - Coronaviruses
Geldenhuys *et al.* (2013: 516) found one *N. capensis* specimen (out of 10) testing positive for CoV RNA in Taung, RSA. Ithete *et al.* (2013: 1697) reported on a new virus from a *N.* cf. *capensis* (incorrectly identified as *N.* cf. *zuluensis*) from South Africa, which is related to Middle East respiratory syndrome (MERS)-CoV. Corman *et al.* (2014) determined the full genome sequence of the MERS-related CoV identified in Ithete *et al.* (2013: 1697) and found that 85 % of its genome was identical to Middle East respiratory syndrome (MERS)-CoV.
In South Africa, Cronjé *et al.* (2019: 2) found that female *N. capensis* [and bats trapped at low altitude sites with low body condition scores] were most likely to be infected with coronaviruses.

Phenuiviridae
Phlebovirus

Rift Valley Fever Virus (RVFV) - Oelofsen and Van der Ryst (1999) tested 28 individuals from four localities in the Free State Province, South Africa for RVFV antigen using an enzyme linked immunosorbet assay (ELISA), none tested positive.

Rhabdoviridae
Lyssavirus - Rabies related viruses
Rabies - Oelofsen and Smith (1993) tested 101 individuals from 5 localities using "Trousse Platelia Rage" ELISA kit (Diagnostic Pasteur), none tested positive for antibodies to rabies virus glycoprotein G. Oelofsen and Smith (1993) tested 145 individual brains, from 12 localities by means of the "Rapid rabies enzyme immunodiagnosis" (RREID) test (Diagnostic Pasteur), none were tested positive.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Angola, Benin, Botswana, Burundi, Cameroon, Congo (Democratic Republic of the), Eritrea, Ethiopia, Ghana, Kenya, Lesotho, Liberia, Madagascar, Malawi, Mozambique, Namibia, Nigeria, Senegal, Sierra Leone, South Africa, South Sudan, Sudan, Swaziland, Tanzania, Togo, Uganda, Zambia, Zimbabwe.

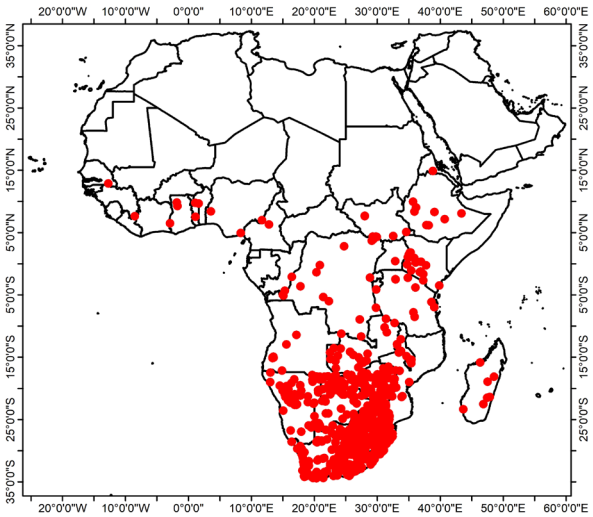

Figure 316. Distribution of *Neoromicia capensis*

Neoromicia guineensis (Bocage, 1889)

*1889. *Vesperus guineensis* Bocage, J. Sci. mat. phys. nat., ser. 2, 1 (1): 6. Publication date: March 1889. Type locality: Guinea-Bissau: Bissau (island) [11 52 N 15 39 W] [Goto Description]. - Comments: Bocage (1889a: 7) mentions 2 ♀♀; sent from Bissau in 1879 by Mr. Rodrigo da Costa. - Etymology: From the feminine scientific Latin *guineènsis*, meaning "inhabitnig Guinea", referring to the provenance of the type specimen (Guinea-Bissau) (see Lanza *et al.*, 2015: 403).

1897. *Vesperugo (Vesperus) guineensis:* Trouessart, Catalogus Mammalium tam viventium quam fossilium, fasc. I: 110. (Name Combination)

1916. *Eptesicus rectitragus* Wettstein, Anz. kais. Akad. Wiss., Wien, 53: 191. Publication date: 1916. Type locality: Sudan: S Kordofan, N edge of Nuba Mountains: Dilling [12 02 N 29 39 E, 660 m] [Goto Description]. Holotype: NMW 8411: juv ♂. Collected by: Otto Ritter von Westersheim Wettstein; collection date: 20 March 1914; original number: AM 96/2. - Comments: Wettstein (1916: 189) mentions Prof. Dr. Franz Werner as collector.

1923. *Eptesicus guineensis:* de Beaux, Atti Soc. ital. Sci. nat., 62: 98. (Name Combination)

1975. *Eptesicus (Eptesicus) guineensis:* Koopman, Bull. Am. Mus. Nat. Hist., 154 (4): 406. (Name Combination)

1987. *Pipistrellus (Neoromicia) guineensis:* Hill and Harrison, Bull. Br. Mus. (nat. Hist.) Zool., 52 (7): 282. (Name Combination)

1993. *Eptesicus (Neoromicia) guineensis:* Koopman, in: Wilson and Reeder, Mammal species of the World (2nd Edition): Chiroptera, 202. (Name Combination)

1995. *Pipistrellus guineensis:* Koopman, Kofron and Chapman, Am. Mus. Novit., 3148: 11. (Name Combination)

2006. *Neoromicia guineensis:* Van Cakenberghe, Kearney and Seamark, African Chiroptera Project, Pretoria, 133 - 134. (Name Combination, Current Combination)

2007. *Eptesicus quineensis:* Lameed, Biodiversity, 8 (4): 8. (Lapsus)

2011. *N[eoromicia] guineenesis:* Benda, Al-Jumaily, Reiter and Nasher, Hystrix, It. J. Mamm., (n.s.) 22 (1): 41. Publication date: July 2011. (Lapsus)

2019. *L[aephotis] guineensis:* Taylor and Tuttle, Bats: An illustrated guide to all species, 284. Publication date: 11 April 2019. (Name Combination)
? *Eptesicus guineensis rectitragus:* (Name Combination)
? *Neoromicia guineensis guineensis:* (Name Combination)
? *Neoromicia guineensis rectitragus:* (Name Combination)

TAXONOMY:
This species is called *pusillus* by Hayman and Hill (1971); but see Koopman (1975: 406, 407). Mentioned in the genus *Pipistrellus* by Koopman (1994: 117).

COMMON NAMES:
Czech: netopýr savanový. English: Guinean Pipistrelle Bat, Tiny Serotine, Guinea Serotine. French: Sérotine de Guinée, Sérotine minuscule, Pipistrelle de Guinée. German: Guinea-Zwergfledermaus, Guinea-Pipistrelle. Italian: Pipistrèllo guineàno.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Fahr, 2008l; IUCN, 2009).

Assessment Histroy -
2008 - LC ver 3.1 (2001) [assessed as *Pipistrellus guineensis*] (Fahr, 2008l; Bocage, 1889c). 2004 - LC ver 3.1 (2001) (Fahr, 2004g; IUCN, 2004). 1996 - LR/nt (Baillie and Groombridge, 1996).

MAJOR THREATS:
There appear to be no major threats to this species as a whole (Fahr, 2008l; IUCN, 2009).

CONSERVATION ACTIONS:
Fahr (2008l) [in IUCN (2009)] reports that there appear to be no direct conservation measures in place. It is not known if the species is present in any protected areas.

GENERAL DISTRIBUTION:
Neoromicia guineensis is widely distributed in West and Central Africa, ranging into East Africa. Western distribution ranges from Senegal and Gambia to Ghana, Burkina Faso, and Benin. Recorded as far east as the border between Ethiopia and Somalia, and in Yemen. The southernmost records are from Congo and the DRC (close to the border areas with Angola).

Specimens reported from Tanzania might pertain to *N. somalica*, see Koopman (1994: 117)).

Native: Benin (Capo-Chichi *et al.*, 2004: 163); Burkina Faso (Kock *et al.*, 2002: 89; Kangoyé *et al.*, 2015a: 620); Cameroon; Central African Republic; Chad (Kock *et al.*, 2002: 89); Congo (The Democratic Republic of the); Côte d'Ivoire; Ethiopia; Gambia (Kock *et al.*, 2002: 89); Ghana; Guinea; Guinea-Bissau (Bocage, 1889a; Seabra, 1900a; Monard, 1939; Veiga-Ferreira, 1949;; Rainho and Ranco, 2001; Kock *et al.*, 2002: 89); Liberia (Monadjem and Fahr, 2007: 47); Nigeria; Senegal; Sudan; Togo; Uganda; Yemen (Entwistle and Corp, 1997a: 40).

Bates *et al.* (2013: 339) rejected the presence of *N. guineensis* in the Republic of Congo as Van Cakenberghe and Happold (2013k: 625) only mark a locality on the map without providing further data.

DETAILED MORPHOLOGY:
Baculum - Hill and Harrison (1987) and Benda *et al.* (2011b: 41).
Brain - Amrein *et al.* (2007) from specimens collected from Bénin reported that proliferating cells, detected with Ki-67 and MCM2, in the subgranular layer of the dentate gyrus was found to be absent. Amrein *et al.* (2007) also reported moderate to ample proliferating cells (Ki-67 positive cells) and migrating young neurons (DCX positive cells) in the rostral migratory stream.

SEXUAL DIMORPHISM:
In Burkina Faso, Kangoyé *et al.* (2015a: 620) found that females have higher average values than males for both body (except Ear and 3ph2) and cranial measurements.

POPULATION:
Structure and Density - This species is relatively common (Fahr, 2008l; IUCN, 2009).
Trend - 2008 - Unknown (Fahr, 2008l; IUCN, 2009).

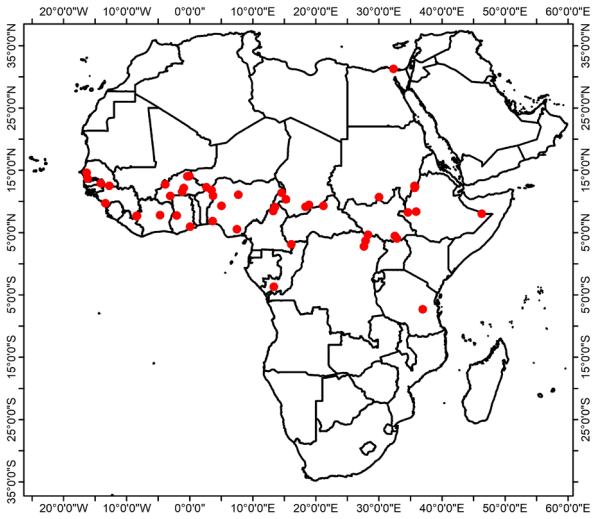

Figure 317. Distribution of *Neoromicia guineensis*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Benin, Burkina Faso, Cameroon, Central African Republic, Chad, Congo, Congo (Democratic Republic of the), Côte d'Ivoire, Egypt, Ethiopia, Ghana, Guinea, Kenya, Nigeria, Senegal, South Sudan, Sudan, Tanzania, The Gambia.

Neoromicia helios (Heller, 1912)

*1912. *Pipistrellus helios* Heller, Smiths. Misc. Coll., 60 (12): 3. Publication date: 4 November 1912. Type locality: Kenya: 30 mi (48 km) S Mount Marsabit: Merelle Water [01 23 S 37 44 E] [Goto Description]. Holotype: USNM 181813: ad ♂, skin and skull. Collected by: Edmund Heller; collection date: 22 July 1911; original number: 3065. - Etymology: From the masculine Greek substantive "*ἥλιος*" (hèlios), meaning "sun", referring to the ochraceous-buff colour of the dorsal fur (see Lanza *et al.*, 2015: 407).

1951. *Pipiestrellus helios:* Watson, Uganda J., 15 (1): xx. - Comments: Lapsus. (Lapsus)

1968. *Pipistrellus nanus helios:* Funaioli and Lanza, Mon. Zool. ital., (N.S.) 2 (Suppl.): 199. (Name Combination)

1987. *Pipistrellus (Hypsugo) helios:* Hill and Harrison, Bull. Br. Mus. (nat. Hist.) Zool., 52 (7): 281. (Name Combination)

1994. *P[ipistrellus (Pipistrellus)] a[fricanus] helios:* Koopman, in: Niethammer, Schliemann and Starck, Handbook of Zoology, volume II (Mammalia) Chiroptera, (60) 113. (Name Combination)

2002. *Hypsugo helios:* Kruskop, Plecotus et al., pars spec.: 21. (Name Combination)

2006. *Neoromicia helios:* Van Cakenberghe, Kearney and Seamark, African Chiroptera Project, Pretoria, 134. (Name Combination, Current Combination)

2019. *L[aephotis] helios:* Taylor and tuttle, Bats: An illustrated guide to all species, 283. Publication date: 11 April 2019. (Name Combination)

TAXONOMY:
Hayman and Hill (1971) indicated that the shape of the baculum supports the separation of *helios* from *Pipistrellus nanus*, which is confirmed by Kock (pers. Comm.). See discussion in Simmons (2005).

COMMON NAMES:
Chinese: 桑布魯伏. Czech: netopýr slunečný. English: Samburu Pipistrelle Bat, Helios Pipistrelle Bat, Heller's Pipistrelle Bat, Heller's Pipistrelle. French: Pipistrelle soleil. German: Samburu-Zwergfledermaus, Samburu-Pipistrelle. Italian: Pipistrèllo di Hèller.

CONSERVATION STATUS:
Global - Listed as Data Deficient (DD ver 3.1 (2001)) in view of the absence of sufficient information on its extent of occurrence, natural history, threats and conservation status (Jacobs *et al.*, 2008t; IUCN, 2009).

Assessment Histroy -
2008 - DD ver 3.1 (2001) [assessed as *Pipistrellus helios*] (Jacobs *et al.*, 2008t; IUCN, 2009). 2004 - DD ver 3.1 (2001) (Jacobs *et al.*, 2004z; IUCN, 2004).

MAJOR THREATS:
The threats to this species are not known (Jacobs *et al.*, 2008t; IUCN, 2009).

CONSERVATION ACTIONS:
Jacobs *et al.* (2008t) [in IUCN (2009)] report that it is not known if the species is present in any protected area. There is a need for studies into the distribution, abundance, natural history and possible threats to this species.

GENERAL DISTRIBUTION:
Neoromicia helios is an East African species, which has been recorded from Djibouti, southern Somalia, southern Sudan, northeastern Uganda, Kenya and northern Tanzania. It may be more widely distributed (Peterson, 1987; Simmons, 2005).

Native: Djibouti; Kenya; Somalia; Sudan; Tanzania; Uganda.

DETAILED MORPHOLOGY:
Baculum - Hill and Harrison (1987).

HABITS:
Keeley and Keeley (2004: 116) [referring to O'Shea (1980) and Happold and Happold (1996)] mention that male "*Pipistrellus nanus*" roosting in palm-thatched roofs show territoriality and aggressive competition for spacious roosts, whereas males in populations roosting in banana leaves appear not to defend territories aggressively, and indicate that this difference might be based on the availability of preferred roosts. However, the more likely explanation being that these differences are due to these two groups belonging to different species, as the thatched roof inhabiting form is most likely *N. helios*.

POPULATION:
Structure and Density - Little information is available on the population abundance or size of this species (Jacobs *et al.*, 2008t; IUCN, 2009).

Trend - 2008 - Unknown (Jacobs *et al.*, 2008t; IUCN, 2009).

PARASITES:
Nycteribiidae: *Basilia ansifera* Theodor, 1956 - mainly a West African species reaching Lake Victoria in the east and Lake Nyasa in the south - nearly all localities lie between 15° latitude north and south (Haeselbarth *et al.*, 1966: 110).

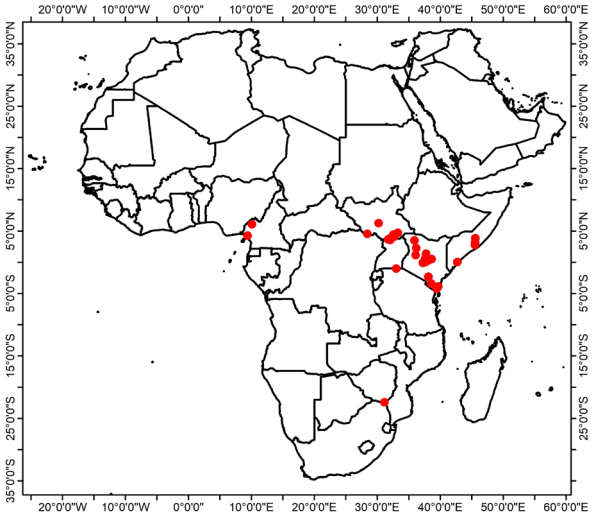

Figure 318. Distribution of *Neoromicia helios*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Cameroon, Ghana, Kenya, Somalia, South Africa, South Sudan, Tanzania, Uganda.

Neoromicia humbloti (A. Milne-Edwards, 1881)

*1881. *Vesperus Humbloti* A. Milne-Edwards, C. R. séances Acad. Sci., Paris, 91: 1035. Publication date: 1881. Type locality: Madagascar: "Madagascar" [Goto Description]. Syntype: MNHN ZM-MO-1986-1074: juv, alcoholic (skull not removed). 1 ad ♀, 2 ad ♂♂, 1 ad? ♂, 2 imm ♀♀, 3 imm ♂♂. Syntype: MNHN ZM-MO-1986-1075: juv, alcoholic (skull not removed). Syntype: MNHN ZM-MO-1986-1076: juv, alcoholic (skull not removed). Syntype: MNHN ZM-MO-1986-1077:. Syntype: MNHN ZM-MO-1986-1078:. Syntype: MNHN ZM-MO-1986-1079:. Syntype: MNHN ZM-MO-1986-1080:. Syntype: MNHN ZM-MO-1986-1081:. Syntype: MNHN ZM-MO-1986-1082:. - Comments: The label on the type specimen mentions: "between Foulepoint and Lake Alaoutr".
1897. *Vesperugo (Vesperus) humbloti:* Trouessart, Catalogus Mammalium tam viventium quam fossilium, fasc. I: 110. (Name Combination)
1939. *Eptesicus humbloti:* G.M. Allen, Bull. Mus. comp. Zool., 83: 85. (Name Combination)
1994. *P[ipistrellus (Neoromicia] s[omalicus] humbloti:* Koopman, in: Niethammer, Schliemann and Starck, Handbook of Zoology, volume II (Mammalia) Chiroptera, (60) 117. (Name Combination)
2006. *E[ptesicus] humblotii:* Hoofer, Van den Bussche and Horácek, J. Mamm., 87 (5): 991. Publication date: October 2006. (Lapsus)
2006. *Neoromicia humbloti:* Van Cakenberghe, Kearney and Seamark, African Chiroptera Project, Pretoria, 135. (Name Combination, Current Combination)
2012. *Vespertilio humbloti:* Goodman, Taylor, Ratrimomanarivo and Hoofer, Zootaxa, 25: 25. (Name Combination)

TAXONOMY:
The status of *humbloti* can not be validated (see Peterson *et al.*, 1995: 104). It is sometimes mentioned as synonym of *somalicus* Thomas, 1901. However, if this is correctly assigned to that form, then *humbloti* A. Milne-Edwards, 1881 should be the valid name for what is now known as *Neoromicia somalica*.
We consider *humbloti* to be an island species, allied to *N. somalica* Thomas, 1901, but differing from it on specific level. The relation with *N. malagasyensis* Peterson, Eger and Mitchell, 1975 still needs to be evaluated.

CONSERVATION STATUS:
Global - Not assessed (IUCN, 2004).

GENERAL DISTRIBUTION:
Madagascar.

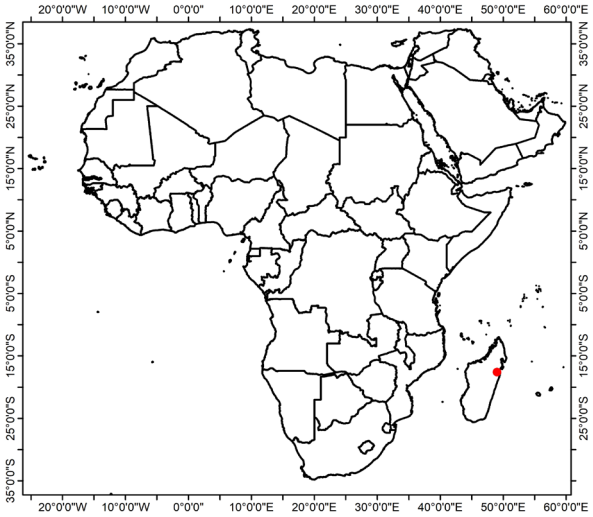

Figure 319. Distribution of *Neoromicia humbloti*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Madagascar.

Neoromicia isabella Decher, Hutterer and Monadjem, 2016

2013. *Neoromicia cf. rendalli:* Monadjem, Richards, Taylor and Stoffberg, Zool. J. Linn. Soc., 167 (1): 194. Publication date: 18 January 2013. (Name Combination)

*2016. *Neoromicia isabella* Decher, Hutterer and Monadjem, in: Decher et al., Acta Chiropt., 17 (2): 260, 74867, figs 4,6,7B-C, 8 (for 2015). Publication date: 27 January 2016. Type locality: Guinea: Macenta Province: Simandou Range: Foko Confluence [08 29 48.62 N 08 54 48.22 W, 765 m] [Goto Description]. Holotype: ZFMK 2008.0292: ad ♂, skull and alcoholic. Collected by: Jan Decher; collection date: 7 March 2008; original number: JD 650. Presented/Donated by: ?: Collector Unknown. COI sequence GenBank nr. KT598187 (see Decher *et al.*, 2016: 267). Paratype: ZFMK 2008.0291: ad ♀, alcoholic (skull not removed). Collected by: Jan Decher; collection date: 7 March 2008; original number: JD 647. Presented/Donated by: ?: Collector Unknown. - Etymology: "The species epithet refers (as a noun in apposition) to the 'Isabella' colouration (sensu Ridgeway, 1912) of the dorsal fur of this bat, and also recalls the name of Jan Decher's daughter Isabelle." (see Decher *et al.*, 2016: 267). - ZooBank: 5F782E04-64B5-40EA-8315-92A56DAE3EA8.

? *Eptesicus malagasyensis:* (Name Combination)
? *Neoromicia malagasyensis:* (Name Combination, Current Combination)

TAXONOMY:
Only known from a very limited number of specimens. Originally considered a subspecies of *somalicus* Thomas, 1901 by Peterson *et al.* (1995), but see Goodman and Ranivo (2004: 438), who elevate it to species rank, which is supported by Bates *et al.* (2006). However, they did not discuss the relation of this form with *humbloti* A. Milne-Edwards, 1881.

COMMON NAMES:
English: Isalo Serotine. French: Sérotine de Sakahara. German: Madagaskar-Zwergfledermaus, Madagaskar Pipistrelle.

CONSERVATION STATUS:
Global - This species is listed as Endangered (EN B1ab(iii) ver 3.1 (2001)) because it has a range of only 2,000 km^2, and is currently known only from the area around the Isalo Massif where it is presumably at risk of habitat loss (Andriafidison *et al.*, 2008c; IUCN, 2009).

Assessment History -
2008 - EN B1ab(iii) ver 3.1 (2001) [as *Eptesicus malagasyensis*] (Andriafidison *et al.*, 2008c; IUCN, 2009).

MAJOR THREATS:
The threats to this species are not known, but its habitat is presumably undergoing some decline. It has yet to be recorded from synanthropic settings and probably relies on natural roost sites in trees and other vegetation (Andriafidison *et al.*, 2008c; IUCN, 2009).

CONSERVATION ACTIONS:
Andriafidison *et al.* (2008c) [in IUCN (2009)] report that this species is present in Parc National d'Isalo. Future conservation measures should focus on roosting sites, but further research is needed to investigate the roosting and foraging habitats of this species.

GENERAL DISTRIBUTION:
Neoromicia malagasyensis is endemic to Madagascar, where it is restricted to an area of 1,905 km^2 around the Isalo Massif (Bates *et al.*, 2006). It has been recorded between 450 and 700 m above sea level (Goodman and Ranivo, 2004) and is currently known from four localities (Bates *et al.*, 2006).

Native: Madagascar (Peterson *et al.*, 1995; Goodman and Ranivo, 2004: 438; Bates *et al.*, 2006).

ECHOLOCATION:
Kofoky *et al.* (2009: 382) reported the calls of six individuals which consisted of FM/QCF components produced at low duty cycle, with maximum energy in the fundamenetal at about 45.8 kHz.

PARASITES:
Ramasindrazana *et al.* (2016: 7) report the presence of an unnamed filarial Nematode.

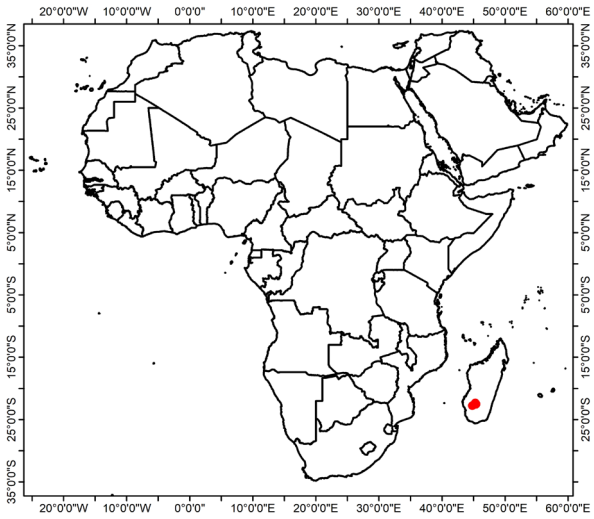

Figure 321. Distribution of *Neoromicia malagasyensis*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Madagascar.

Neoromicia matroka (Thomas and Schwann, 1905)

*1905. *Vespertilio matroka* Thomas and Schwann, Proc. zool. Soc. Lond., 1905, I, II: 258. Publication date: 10 August 1905. Type locality: Madagascar: Betsileo: Ambositra [20 31 S 47 15 E, 1 100 m]. Holotype: BMNH 1897.9.1.32: ad ♂, skull and alcoholic. Collected by: Dr. Charles Immanuel Forsyth Major; collection date: 2 February 1875; original number: 177. See Peterson *et al.* (1995: 104).
1939. *Eptesicus matroka:* G.M. Allen, Bull. Mus. comp. Zool., 83: 86. (Name Combination)
1987. *Nycterikaupius matroka:* Menu, Palaeovert., 17 (3): 109. Publication date: 15 November 1987. (Name Combination, Lapsus)
2006. *Neoromicia matroka:* Van Cakenberghe, Kearney and Seamark, African Chiroptera Project, Pretoria, 136. (Name Combination, Current Combination)
2019. *L[aephotis] matroka:* Taylor and Tuttle, Bats: An illustrated guide to all species, 283. Publication date: 11 April 2019. (Name Combination)

TAXONOMY:
Considered a synonym of *capensis* by Hayman and Hill (1971) and Koopman (1993a: 201), but see Peterson *et al.* (1995: 104), Russ *et al.* (2001), Simmons (2005: 456) who consider it a valid species.
Simmons (2005: 456) placed *matroka* within the genus and subgenus *Eptesicus*.

COMMON NAMES:
Czech: netopýr malgašský. English: Madagascar serotine, Matroka Bat, Malagasy Serotine. French: Sérotine de Madagascar. German: Matroka-Zwergfledermaus, Matroka-Pipistrelle.

CONSERVATION STATUS:
Global - This species is listed as Least Concern (LC ver 3.1 (2001)) because there is no evidence of a severe decline in habitat or population size and it occurs across a wide range of habitats which includes built-up areas (Andriafidison *et al.*, 2008r; IUCN, 2009).

Assessment History - 2008 - LC ver 3.1 (2001) [as *Eptesicus matroka*] (Andriafidison *et al.*, 2008r; IUCN, 2009). 2000 - Data Deficient.

MAJOR THREATS:
There are no known major threats to this species (Andriafidison *et al.*, 2008r; IUCN, 2009).

CONSERVATION ACTIONS:
Andriafidison *et al.* (2008r) [in IUCN (2009)] report that this species has yet to be recorded from inside protected areas, but is known to use agricultural land adjacent to Parc National de Mantadia (Randrianandriananina *et al.*, 2006).

GENERAL DISTRIBUTION:
Neoromicia matroka is endemic to Madagascar and appears to be largely restricted to an area in the eastern highlands between 970 and 1,300 m above sea level (Bates *et al.*, 2006).

Native: Madagascar (Peterson *et al.*, 1995: 105; Bates *et al.*, 2006; Randrianandriananina *et al.*, 2006).

GEOGRAPHIC VARIATION:
Goodman *et al.* (2012b: 3) found geographical variation in the cranio-dental measurements, which lead them to divide this species into geographical units or Operational Taxonomic Units (OTUs): OTU 1 - the Central Highlands above 1,000 m, which includes the type locality near Ambositra (Thomas and Schwann, 1905b: 258); OTU 2 - areas in central western Madagascar less than 900 m; OTU 3 - eastern lowlands from sea-level to 200 m; and OTU 4 - eastern lowlands from 201 - 900 m.

DETAILED MORPHOLOGY:
Baculum - See Bates *et al.* (2006).

HABITAT:
It is found alongside humid forests and has also been recorded from open anthropogenic agricultural and grassland areas (Bates *et al.*, 2006; Randrianandriananina *et al.*, 2006).

ROOST:
It has been netted emerging from buildings (Bates *et al.*, 2006).

DIET:
On Madagascar, Rakotondramanana *et al.* (2015: 74) report the following volume percentages for: Coleoptera: 49.7 ± 22.44; Hymenoptera: 18.7 ± 17.57; Lepidoptera: 16.3 ± 16.34; Trichoptera: 9.2 ± 8.74; Homoptera: 5.5 ± 6.93; Arachnida: 0,2 ± 0,80. The frequencies for these groups were: Coleoptera: 97.6 ± 6.63; Hymenoptera: 64.0 ± 37.86; Lepidoptera: 55.2 ± 42.54, Trichoptera: 48.0 ± 40.82; Homoptera: 25.6 ± 28.0, and Arachnida: 0.8 ± 4.00. Rasoanoro *et al.* (2015: 64) mention the following volume percentages: Coleoptera: 53.4, Diptera: 11.0, Hemiptera: 17.6, and Hymenoptera: 18.0.

POPULATION:
Structure and Density - The population and local abundance of this species are not known, but it is thought to be locally common (Bates *et al.*, 2006). Trend - 2008 - Unknown (Andriafidison *et al.*, 2008r; IUCN, 2009).

PARASITES:
Zhu *et al.* (2014: 2160) report the presence of the flea *Dampfia grahami grahami* (Waterston, 1915) (Ischnopsyllidae), which is a carrier of *Bartonella* bacteria. This flea was also reported by Hastriter (2016: 16).

Ramasindrazana *et al.* (2016: 6) report the presence of an unnamed filariod in this bat species.

Richard (1966: 413) reported the Trematode *Plagiorchis (Plagiochis) vespertilionis* (Müller, 1784) Braun, 1900.

TAXONOMY:

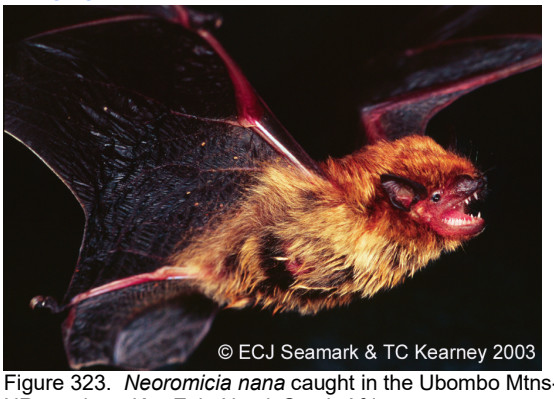

Figure 323. *Neoromicia nana* caught in the Ubombo Mtns-NR, northern KwaZulu Natal, South Africa.

The oldest name for this species is (possibly) *africana*; see Koopman (1975: 400), but most authors still remained using the name *nana*, until Koopman (1994: 112) and Simmons (2005), who mention this species under the name *Pipistrellus africanus*. In Opinion 2120 (Anonymus, 2005), however, the ICZN ruled that the name *Pipistrellus nanus* (currently *Neoromicia nana*) should be given precedence over *africana*, whenever the two are considered to be synonyms.

Bronner *et al.* (2003) state that Volleth *et al.* (2001) and Kearney *et al.* (2002) provided karyotypic evidence for the inclusion of the banana bat (*"Pipistrellus" nanus*) in *Neoromicia*. Ansell and Dowsett (1988) and Koopman (1966) point out that *africanus* Ruppell, 1842 antedates *nanus* (Peters, 1852) as the valid name for this species. However, they continue to use the better-known name *nanus*, as topotypical *africanus* is restricted to Ethiopia (and is thus unlikely to be conspecific with *nanus*) and Happold (2003) has applied to the International Commission on Zoological Nomenclature for conservation of this specific epithet on the grounds of nomenclatural stability.

Grubb *et al.* (1998: 85) include it - as *nanus* - in the subgenus *Hypsugo*. Kearney *et al.* (2002: 68) states that *nana* belongs to the genus *Neoromicia*.

Hoofer and Van Den Bussche (2003: 38) include this taxon as "*(Hypsugo) nanus*" in a separate, unnamed genus.

The generic allience of *nana* is certainly not clear at this stage. Most authors mention this species in the genus *Pipistrellus*, but as pointed out in the previous paragraphs, present taxonomical investigations seem to indicate that it should be included in *Neoromicia*. However, the assignement to *Hypsugo* or even a new genus is not yet excluded. Further research is needed to fix its generic assignment.

Helbig *et al.* (2010: 168) suggest that *nana* needs to be transferred to a genus that needs to be newly created or resurrected from the current synonymy.

Recently, Meri Happold (pers. Comm.) reported that unlike all other pipistrelles placed in *Neoromicia* by Simmons (2005) and also unlike all African species placed in *Hypsugo* (ibid.), "*P. nanus*" has nyctalodont lower molars (as have all

African species in *Pipistrellus*). The taxonomic implications need further investigation.

Happold (ibid) also reported that the following subspecies of *P. nanus* (as *P. africanus*) were recognized by Koopman (1994) and/or Kock (2001a), but their status and geographic ranges are uncertain:
P. n. stampflii. Sierra Leone to Côte d'Ivoire.
P. n. culex. Nigeria, Ghana.
P. n. africanus. Zaire to Ethiopia, mostly in highlands.
P. n. nanus. Zaire, Kenya and Tanzania to South Africa, also Cameroon (Rosevear 1965).
P. n. fouriei. S Angola, W Zambia, N Namibia.
P. n. meesteri. Transkei, South Africa.
P. n. minusculus. Liberia.

COMMON NAMES:
Afrikaans: Piesangvlermuis. Arabian: Khouchaf al matoussat. Azande (DRC): Fulo. Chewa: Ndemia. Chinese: 香蕉伏翼. Czech: netopýr banánový, netopýr šplhavý. English: Banana Pipistrelle Bat, Banana Bat, Banana Pipistrelle. French: Pipistrelle naine, Pipistrelle naine aux ailes brunes. German: Bananen Zwergfledermaus, Bananen-Fledermaus, Bananen-Pipistrelle, Mozambique Dämmerungsfledermaus, Zwerg-Hausfledermaus. Italian: Pipistrèllo di Pèters, Pipistrèllo nàno déi banàni. Kiluba (DRC): Kasusu. Manganja (Malawi): Chuchu. Misuku (Malawi): Kashusha. Portuguese: Morcego das bananeiras, Morcego-das-bananas. Spanish (Castillian): Pipistrelo Enano; Yao: Liputiputi (Malawi; applied to all small bats).

ETYMOLOGY OF COMMON NAME:
Characteristically this species roosts during the day in the rolled-up, sprouting terminal leaves of banana plants and has become associated with them in particular (Taylor, 2005).

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, tolerance of a degree of habitat modification, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Hutson *et al.*, 2008g; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Hutson *et al.*, 2008g; IUCN, 2009). 2004 - LC ver 3.1 (2001) [assessed as *Neoromicia nanus*] (Jacobs, 2004d; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - LC ver 3.1 (2001) (Monadjem *et al.*, 2016m). 2004 - LC ver 3.1 (2001) [assessed as *Neoromicia nanus*] (Friedmann and Daly, 2004).

MAJOR THREATS:
There appear to be no major threats to this widespread and seemingly adaptable species (Hutson *et al.*, 2008g; IUCN, 2009), although Aronson *et al.* (2013: 9) report a fatality due to wind turbines in South Africa.

CONSERVATION ACTIONS:
Hutson *et al.* (2008g) [in IUCN (2009)] report that in view of the species wide range it is likely that it is present in many protected areas. Further research is needed into the taxonomy of this species.

GENERAL DISTRIBUTION:
Neoromicia nana is widely distributed throughout most of sub-Saharan Africa. It ranges from Senegal in the west, through West and Central Africa, to Eritrea, Ethiopia and Somalia in the east; from here it is found southwards to southeastern South Africa. The species has been recorded from Madagascar, where it has only been reported from the Kirindy CFPF forest in western Madagascar, and from Zombitse (Rasolozaka, 1994). It has also been recorded from the Tanzanian islands of Pemba, Unguja [= Zanzibar], and Mafia (O'Brien, 2011: 290).

It appears to be absent, or largely absent, from northern Kenya, Namibia, southern Botswana, western Zimbabwe, northern Mozambique, Lesotho and much of South Africa. It is possible that the species ranges more widely in these areas than is currently known, and further field studies are needed to investigate the distribution of the species.

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 1,165,508 km^2. In South Africa, its distribution is mainly affected by the mimimum temperature of the coldest month (Babiker Salata, 2012: 49).

Besides *Neoromicia nana*, Taylor *et al.* (2018b: 63) also mentioned *Neoromicia* cf. *nana*, whose echolocation calls do not match any known species.

Bates *et al.* (2006) recommend that the identity of the specimens from Madagascar need to be reviewed.

Native: Angola (Crawford-Cabral, 1989; Monadjem *et al.*, 2010d: 568; Taylor *et al.*, 2018b:

63); Benin (Capo-Chichi *et al.*, 2004: 163); Botswana (Archer, 1975; Monadjem *et al.*, 2010d: 568); Burkina Faso (Kangoyé *et al.*, 2015a: 620); Burundi; Cameroon; Central African Republic; Chad; Congo (Bates *et al.*, 2013: 337); Congo (The Democratic Republic of the) (Schouteden, 1944; Hayman *et al.*, 1966; Van Cakenberghe *et al.*, 1999; Dowsett *et al.*, 1991: 259; Monadjem *et al.*, 2010d: 568); Côte d'Ivoire; Djibouti (Pearch *et al.*, 2001: 388); Equatorial Guinea; Eritrea; Ethiopia; Gabon; Gambia (Emms and Barnett, 2005: 50); Ghana (Decher and Fahr, 2007: 18); Guinea (Fahr *et al.*, 2006a: 73); Guinea-Bissau (Veiga-Ferreira, 1949; Lopes and Crawford-Cabral, 1992; Rainho and Ranco, 2001:60); Kenya; Liberia (Monadjem and Fahr, 2007: 50 [as *Neoromicia nanus*]); Madagascar; Malawi (Happold *et al.*, 1988; Ansell and Dowsett, 1988: 41; Monadjem *et al.*, 2010d: 568); Mali; Mozambique (Smithers and Lobão Tello, 1976; Monadjem *et al.*, 2010d: 568; Monadjem *et al.*, 2010c: 384); Namibia (Monadjem *et al.*, 2010d: 569); Niger; Nigeria; Rwanda; Senegal; Sierra Leone; Somalia; South Africa (De Graaf, 1960; Monadjem *et al.*, 2010d: 569); Sudan; Swaziland (Monadjem *et al.*, 2010d: 569); Tanzania (Stanley and Goodman, 2011: 47); Togo; Uganda (Kityo and Kerbis, 1996: 61); Zambia (Ansell, 1978; Monadjem *et al.*, 2010d: 569); Zimbabwe (Monadjem *et al.*, 2010d: 569).
Presence uncertain: Lesotho.

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Tragus: Monadjem *et al.* (2013c: 204) contains a line drawing of the tragus of specimen DNSM 12594 from Mount Nimba, Liberia.

From western Uganda, Monadjem *et al.* (2011: 30) reported the following data for 5 specimens: Fa: 31.60 ± 0.758 mm, mass: 3.6 ± 0.89 g, wing loading: 4.2 ± 0.59 N/m^2, aspect ratio: 6.2 ± 0.14.

DENTAL FORMULA:
Dorst (1949: 47) indicates that the milk dentition of "*P. nanus*" is very similar to that of *P. kuhlii*. He also indicated that the milk teeth form a clearly separated arcade outside the pernanent tooth series.

DETAILED MORPHOLOGY:
Baculum - Hill and Harrison (1987) and Kearney *et al.* (2002).

Skull - Using CT-microscans, Curtis and Simmons (2018: 1390) investigated the presence of mineralized elements in the rostra of bats, and found these to be present in *N. nana*. However, the shape and size of these was different in the two specimens they examined. As both specimens were males, the differences are not sex-based.

ECHOLOCATION:
See Jacobs (1996), Taylor (1999b) and Taylor *et al.* (2005).

Schoeman and Waddington (2011: 291) mention a peak frequency of 67.1 ± 1.9 kHz and duration of 4.0 ± 0.9 msec for specimens from Durban, South Africa. Naidoo *et al.* (2011: 23) report a peak frequency of 68.1 ± 1.0 kHz and a duration of 3.1 ± 0.8 msec from the same area.

At Uzungwa Scarp Forest Reserve, Tanzania, Trentin and Rovero (2011: 57) indicate that the starting frequency is very variable (mean 86.9 kHz). In about 2 msecs the call decreases from its maximum to its minimum at 60.7 kHz, after which it increases slightly to 64.5 kHz. The maximum intensity occurs at 66 kHz.

Taylor *et al.* (2013b: 17) recorded the following parameters for 4 calls from Swaziland: F_{max}: 77.2 ± 3.34 (74.4 - 80.9) kHz, F_{min}: 66.2 ± 0.92 (64.9 - 67.0) kHz, F_{knee}: 68.2 ± 1.60 (66.1 - 69.9) kHz, F_{char}: 66.9 ± 0.96 (65.4 - 67.4) kHz, duration: 3.2 ± 0.59 (2.4 - 3.6) msec. Also from Swaziland, Monadjem *et al.* (2017c: 179) reported: F_{min}: 69.7 ± 2.29 (66.8 - 71.8) kHz, F_{knee}: 72.3 ± 2.08 (70.6 - 75.1) kHz, F_c: 70.2 ± 2.25 (67.5 - 72.2) kHz and duration: 2.8 ± 0.32 (2.6 - 3.2) msec. The maximum distance over which they were able to dectect the calls was 10 m (mean: 5.8 ± 1.07 m).

At Farm Welgevonden, South Africa, Taylor *et al.* (2013a: 556) report a F_{knee} value of 68 (66 - 70) kHz. In the Mapungubwe National Park, Parker and Bernard (2018: 57) recorded 20 calls with F_{char}: 68.53 ± 2.10, F_{max}: 85.09 ± 10.70 kHz, F_{min}: 67.61 ± 2.57 kHz, F_{knee}: 72.45 ± 3.38 kHz, duration: 4.24 ± 0.83 msec and 8.15 ± 3.64 calls/sec.

From western Uganda, Monadjem *et al.* (2011: 32) reported the following parameters for 5 calls: F_{min}: 71.06 ± 6.019 kHz, F_{max}: 98.94 ± 4.751 kHz, F_{char}: 79.76 ± 8.196 kHz, F_{knee}: 84.89 ± 7.145 kHz, duration: 1.1 ± 0.089 msec.

Eisenring *et al.* (2016: SI 2) reported PF: 66.8 ± 2.0 (63.0 - 69.9), HF: 94.7 ± 17.5 (69.6 - 117.9), LF: 63.7 ± 2.1 (59.8 - 66.9), DT: 0.0 ± 0.0 (0.0 - 0.1), DF: 31.0 ± 16.9 (4.9 - 55.8), IPI: 0.7 ± 0.3 (0.3 - 1.5) for 27 calls from the Aberdares Range in Kenya.

For 1 FM/QCF type call from Maroua, Cameroon, Manga Mongombe (2012: 79) reported: F_{max}: 106.4 kHz, F_{min}: 96.6 kHz, F_{mean}: 101.7 kHz, F_{knee}: 106.4 kHZ, F_{char}: 96.9 kHz, and duration: 0.42 msec.

Two calls recorded by Adams and Kwiecinski (2018: 4) in the Kalahari Desert had the following characteristics: F_{char}: 61.5 ± 8.9 kHz, F_{max}: 74.3 ± 6.2 kHz, F_{min}: 61.1 ± 3.5 kHz, duration: 3.7 ± 0.3 msec.

MOLECULAR BIOLOGY:
DNA - See Hoofer and Van Den Bussche (2003) for the results of a specimen from Kenya.

Karyotype - Both Peterson and Nagorsen (1975) and Rautenbach *et al.* (1993) reported 2*n* = 36, FN = 50, BA = 16, a metacentric X chromosome, and an acrocentric Y chromosome. GTG-bands identified three Robertsonian fusion chromosomes (7/11, 8/9, 10,12), considered as distinguishing characters for the genus *Neoromicia* Kearney *et al.* (2002).

From Senegal, Koubínová *et al.* (2013: 3) report the following karyotype for 9 ♂♂ and 7 ♀♀: 2*n* = 34, FNa = 50, FN = 54, X = Subtelocentric and Y = dot-like (probably acrocentric). They also found (p. 7) that two pairs of acrocentric autosomes were missing compared to previous findings, but contained an additional metacentric pair, which could be the result of a Robersonian fusion. Due to these differences, they assigned their specimens to *N.* cf. *nana*.

Protein / allozyme - See Morales *et al.* (1991) for results from two specimens from South Africa.

HABITAT:
Monadjem *et al.* (2010a) found that there was no difference in use by *N. nana* between logged and undisturbed forested areas; however, the species exhibited higher levels of activity along the wide tracks running through the two forests than either 30 m off these tracks or along the narrow forest trails. Naidoo *et al.* (2009: 30) showed that the abundance and feeding activity of *N. nana* at sludge tank sites and at sites downstream of wastewater treatment works (WWTWs) was significantly higher than at sites upstream of these, probably due to insect abundance, specifically pollution tolerant chironomid midges. Naidoo *et al.* (2013b: 108) found that haematocrits were significantly higher in *N. nana* foraging at WWTWs indicating that *N. nana* may be compensating for a chronically low oxygen circulation within the body or kidney damage. They also report that hepatosomatic and renalsomatic indices were significantly higher suggesting hypertrophy of the detoxification organs. Additionally, the gonadosomatic index of the testes were also significantly larger at WWTWs, suggesting that reproductive potential of males may be compromised.

Naidoo *et al.* (2013a: 51) found that essential metals (Cu, Zn and Fe) were detected in all tissue samples from *N. nana* foraging at upstream and wastewater-polluted sites. Non-essential metals (Cd, Ni and Cr) were detected only in *N. nana* foraging at wastewater-polluted sites (except one upstream occurrence of Cd). The first set of metals is essential for normal cellular processes and bodily function, the latter are considered harmful to organisms.
Significant differences for essential metals and mineral nutrients (Fe and Zn in liver; Cu and K in kidneys) were also reported by Naidoo *et al.* (2015a: 830).
The effects of WWTWs on energy stores and leptin levels was examined by Mehl *et al.* (2016), whereas Hill *et al.* (2018: 232) investigated the arsenic concentrations and acetylcholinesterase activity.

Naidoo *et al.* (2014) reported that *N. nana* specimens captured at WWTWs also had higher DNA damage, lower antioxidant capacity, and higher haematocrits than bats from non-polluted sites.

In another study at WWTWs, Hill *et al.* (2016: 92) found that bats rely on iBrAT (interscapular brown adipose tissue) as an energy source, and that opportunistic foraging on abundant, pollutant-tolerant prey may change fatty acid profiles in their tissue, with possible effects on mitochondrial functioning, torpor and energy usage.

LaVal and LaVal (1977) [in Naidoo *et al.* (2014)] indicate that *N. nana* has a relatively small home range of about 300 m around its roost.

In the Mount Nimba area, Monadjem *et al.* (2016y: 370) recorded this species from forested and forest edge habitats ranging from 450 to 530 m.

HABITS:
Monadjem *et al.* (2010a) found that *N. nana* was most active in the first 5 hrs after sunset with activity declining rapidly after midnight.

Keeley and Keeley (2004: 116) [referring to O'Shea (1980) and Happold and Happold (1996)] mention that male "*Pipistrellus nanus*" roosting in palm-thatched roofs show territoriality and aggressive competition for spacious roosts, whereas males in populations roosting in banana leaves appear not to defend territories aggressively, and indicate that this difference might be based on the availability of preferred roosts. However, the more likely explanation being that these differences are due to these two groups belonging to different species, as the

thatched roof inhabiting form is most likely *N. helios*.

DIET:
From the Umbilo River (KwaZulu Natal, RSA), Naidoo *et al.* (2011: 26) reported the following prey volume percentages: during summer: Lepidoptera (2.3 ± 1.4), Hemiptera (34.6 ± 14.1), Diptera (43.6 ± 17.4), and Trichoptera (19.6 ± 6.8); during winter: Coleoptera (36.4 ± 2.5), Coleoptera (3.2 ± 0.9), Hemiptera (19.1 ± 7.5), Diptera (29.5 ± 3.7), and Trichoptera (12 ± 7.2).

Weier *et al.* (2019b: 6) examined droppings from this species in the Levubu region (Limpopo, RSA) and found DNA sequences of: Lepidoptera: *Cryptophlebia peltastica* (Meyrick, 1921) and *Thaumatotibia batrachopa* (Meyrick, 1908); Hemiptera: *Bathycoelia distincta* Distant, 1878 and *Nezara viridula* (Linnaeus, 1758).

PREDATORS:
Broadley (1982) [in Schätti (1984: 338)] reported the killing of a "*Pipistrellus nanus*" specimen by an opisthoglyphe treesnake (*Thelotornis capensis* A. Smith, 1849).

Nyffeler and Knörnschild (2013: 5) refer to Rosevear (1953: 267) for a dead bat being recovered by T.S. Jones from a spider's web near Kerema, Sierra Leone.

Mikula *et al.* (2016: Supplemental data) mention the Bat hawk (*Macheiramphus alcinus* Bonaparte, 1850) as diurnal avian predator.

POPULATION:
Structure and Density - Probably not uncommon in suitable habitats (Happold, 1987).
Trend - 2008 - Unknown (Hutson *et al.*, 2008g; IUCN, 2009).

ACTIVITY AND BEHAVIOUR:
N. nana uses territorial calls (possibly with a courtship function) consising of a simple syllable type in series (O'Shea, 1980 in Smotherman *et al.*, 2016: 537).

REPRODUCTION AND ONTOGENY:
van der Merwe and Stirnemann (2007: 53) report that *N. nana* is a seasonal monoestrous breeder. In Mpumalanga Province (South Africa), they found that spermatogensis began in late September and spermatozoa were present in the caudae epididymides from late April throughout August. Mating started in May and ovulation and fertilization occurred from the beginning of August, when the first implantations also occurred. Parturition took place between late October and the end of November. Lactating females were found until mid January. They also indicate that reproduction timing was about one month earlier than in Malawi, where Happold and Happold (1998a: 67) found pregnant females from late August to mid-November, and births and lactating females were observed from mid-November to the end of April.

Trentin and Rovero (2011: 51) report five lactating females, captured at the end of November 2005 at Uzungwa Scarp Forest Reserve, Tanzania.

Monadjem *et al.* (2010d) [in Weier *et al.* (2018: Suppl.)] mentioned births taking place between November and early December.

Happold (2001: 397) - referring to Bernard *et al.* (1997) - indicates that sperm storage and delayed fertilisation is used to alter the interval between copulation and parturition, and as such their chronology of reproduction.

MATING:
McCracken and Wilkinson (2000: 329) indicate that *N. nana* mating groups consist of a single male and multiple females, but can not be considered as harems. Males are often visited simultaneously by several females, and some males are visited more frequently by more females than others (see also Happold and Happold, 1996).

PARASITES:
ACARI
Sarcoptidae: Fain (1959d: 157) described *Notoedres (Metanotoedres) miniopteri* from a "*Pipistrellus nanus*" from Bukavu, DRC.

DIPTERA
Nycteribiidae: *Nycteribia schmidlii* Schiner, 1853 (Haeselbarth *et al.*, 1966: 108, host referred to both *N. nana* and *P. culex*). *Basilia ansifera* Theodor, 1956 mainly a West African species, reaches Lake Victoria in the east and Lake Nyasa in the south, nearly all localities lie between 15° latitude north and south (Haeselbarth *et al.*, 1966: 110, host referred to *N. nana*, *P. culex* and *P. stampflii*). *Basilia robusta* Theodor, 1956 (Haeselbarth *et al.*, 1966: 111).

ACARINA
Dermanyssidae: Zumpt and Till (1954: 49) described *Steatonyssus eos* from "*Pïpistrellus nanus*" specimens from Kenya.

NEMATODA
Durette-Desset and Chabaud (1975: 323) described *Allintoschius dunni* from a *Myotis mystacinus* specimen from Malaysia, but also indicated that this Nematode was also found in five

"*Pipistrellus nanus*" specimens from Maboké (CAR).

VIRUSES:

Astroviridae

Neither of the two Mozambican bats tested by Hoarau *et al.* (2018: 2) was positive for this group of viruses.

Coronaviridae - Coronaviruses

SARS-CoV - During Febuary 2008 in Ghana, Pfefferle *et al.* (2009) tested negative five fecal samples for coronavirus (CoV) RNA.

Hantaviridae (formerly included in Bunyaviridae)

Mouyassué virus - MOYV (or MOUV)

Sumibcay *et al.* (2012: 2) reported hantavirus RNA from 2 out ot 12 banana pipistrelles captured near Mouyassué village, in Côte d'Ivoire. However, Gu *et al.* (2014) were unable to find any additional bats infected with this virus. Arai *et al.* (2019: 2) tentatively assigned this virus to the genus *Loanvirus*).

Paramyxoviridae

Mortlock *et al.* (2015: 1841) reported that two out of seven examined South African specimens tested positive for *Paramyxovirus* sequences.

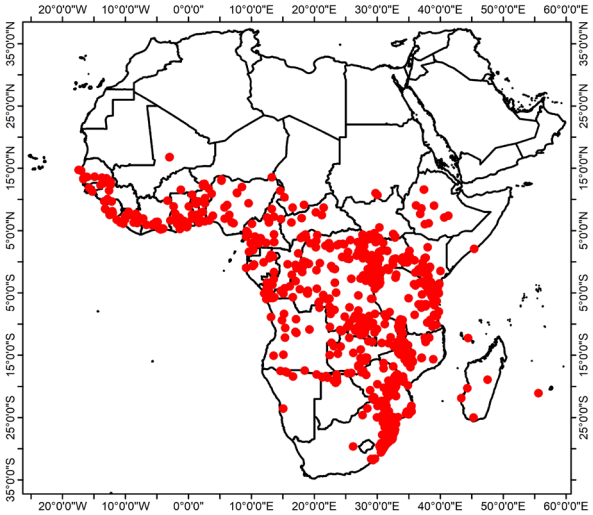

Figure 324. Distribution of *Neoromicia nana*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:

"Africa", Angola, Benin, Botswana, Burkina Faso, Burundi, Cameroon, Central African Republic, Chad, Comoros, Congo, Congo (Democratic Republic of the), Côte d'Ivoire, Djibouti, Equatorial Guinea, Ethiopia, Gabon, Ghana, Guinea, Guinea-Bissau, Kenya, Liberia, Madagascar, Malawi, Mali, Mozambique, Namibia, Niger, Nigeria, Réunion, Rwanda, Senegal, Sierra Leone, Somalia, South Africa, South Sudan, Sudan, Swaziland, Tanzania, The Gambia, Togo, Uganda, Zambia, Zimbabwe.

Neoromicia rendalli (Thomas, 1889)

*1889. *Vesperugo (Vesperus) Rendalli* Thomas, Ann. Mag. nat. Hist., ser. 6, 3 (16): 362, fig. 1. Publication date: 1 April 1889. Type locality: The Gambia: Bathurst [=Banjul] [13 28 N 16 39 W] [Goto Description]. Holotype: BMNH 1889.3.2.3: ad ♂, skull and alcoholic. Collected by: Dr. Percy Rendall. See Thomas (1889: 26-7). - Etymology: In honour of Dr. Percy Rendall (1861 - 1948), an English zoologist and the collector of the type specimen (see Thomas, 1889: 364; Smithers, 1983: 102; Taylor, 2005; Lanza *et al.*, 2015: 428).

1897. *Vesperugo (Eptesicus) rendalli:* Thomas, Proc. zool. Soc. Lond., 1896, IV: 791. Publication date: April 1897. (Name Combination)

1899. *Vesperugo Rendalli:* Trouessart, Catalogus Mammalium tam viventium quam fossilium, fasc VI: 1280. (Name Combination)

1911. *Eptesicus phasma* G.M. Allen, Bull. Mus. comp. Zool., 54 (6): 327. Publication date: December 1911. Type locality: Kenya: Northern Guaso Nyiro: Meru River: effluent of northern Guaso Nyiro [=Ewaso Ngiro] [00 03 N 37 39 E] [Goto Description]. Holotype: MCZ 8279: ad ♂, skin and skull. Collected by: Glover Morrill Allen; collection date: 6 August 1909; original number: 94. See Allen (1911: 327). - Comments: Coordinates of the type locality mentioned as 00 31 N 37 40 E by Thorn *et al.* (2009: 56). The MCZ also has a small series of paratypes (see Helgen and McFadden, 2001: 14).

1917. *Eptesicus faradjius* J.A. Allen, Bull. Am. Mus. Nat. Hist., 37 (18): 444. Publication date: 29 September 1917. Type locality: Congo (Democratic Republic of the): Oriental province: Uele district: Faradje [03 44 N 29 43 E] [Goto Description]. Holotype: AMNH 49045: ad ♀, skin and skull. Collected by: Herbert Lang, James Paul Chapin and The American Museum Congo Expedition; collection date: 21 February 1911; original number: 1914. Topotype: AMNH 49044: ♀, skin and skull. Collected by: Herbert Lang, James Paul Chapin and The American Museum Congo Expedition. Presented/Donated by: ?: Collector Unknown. Topotype: AMNH 49048: ♂, skin and skull. Collected by: Herbert Lang, James Paul Chapin and The American Museum Congo Expedition. Presented/Donated by: ?: Collector Unknown. Topotype: AMNH 49049: ♀, skin only.

TAXONOMY:
Mentioned in the genus *Pipistrellus* by Koopman (1994: 117). Volleth *et al.* (2001: 44) assigned this species to the genus *Neoromicia*. Reviewed by Kock *et al.* (2002: 89). Included (as (*Hypsugo*) *rendalli*) in a separate, unnamed genus by Hoofer and Van Den Bussche (2003: 38).

Helbig *et al.* (2010: 168) suggest that *rendalli* needs to be transferred to a genus that needs to be newly created or resurrected from the current synonymy.

COMMON NAMES:
Afrikaans: Rendall se dakvlermuis, Rendal-dakvlermuis. Chinese: 任氏伏翼. Czech: netopýr Rendallův. English: Rendall's Serotine, Rendall's Serotine Bat, Rendall's Pipistrelle Bat, Rendall's Pipistrelle. French: Serotine de Rendall, Pipistrelle de Rendall. German: Rendalls Zwergfledermaus, Rendalls Pipistrelle. Italian: Pipistrèllo di Rèndall. Portuguese: Morcego caseiro de Rendall.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Jacobs *et al.*, 2008w; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) [assessed as *Pipistrellus rendalli*] (Jacobs *et al.*, 2008w; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Jacobs *et al.*, 2004ad; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - LC ver 3.1 (2001) (Monadjem *et al.*, 2016ab). 2004 - CR B2ab(iii) ver 3.1 (2001) (Friedmann and Daly, 2004).

MAJOR THREATS:
In general, there appear to be no major threats to this species. In some parts of its range, this species is threatened by the conversion of its habitat to agricultural use (Jacobs *et al.*, 2008w; IUCN, 2009).

CONSERVATION ACTIONS:
Jacobs *et al.* (2008w) [in IUCN (2009)] report that there appear to be no direct conservation measures in place. It is not known if the species is present in any protected areas. Further research is needed into the distribution of this patchily recorded species.

GENERAL DISTRIBUTION:
Neoromicia rendalli has been widely, but patchily, recorded over much of sub-Saharan Africa. It ranges from Senegal in the west, through West and Central Africa to Somalia in the east, and as far south as eastern South Africa.

Native: Benin (Capo-Chichi *et al.*, 2004: 163); Botswana (Archer, 1975; Monadjem *et al.*, 2010d: 569); Burkina Faso (Kangoyé *et al.*, 2012: 6026; 2015a: 621); Cameroon; Central African Republic; Chad; Congo; Congo (The Democratic Republic of the) (Hayman *et al.*, 1966; Gallagher and Harrison, 1977; Monadjem *et al.*, 2010d: 569); Gambia; Ghana; Kenya; Liberia (Fahr, 2007a: 104); Malawi (Happold *et al.*, 1988; Monadjem *et al.*, 2010d: 569); Mali (Meinig, 2000: 105); Mozambique (Smithers and Lobão Tello, 1976; Monadjem *et al.*, 2010d: 569; Monadjem *et al.*, 2010c: 384); Niger; Nigeria; Rwanda; Senegal; Sierra Leone; Somalia; South Africa [KwaZulu Natal] (Kearney and Taylor, 1997: 54; Monadjem *et al.*, 2010d: 569); Sudan; Tanzania; Togo; Uganda; Zambia (Ansell, 1969; Ansell, 1974; Cotterill, 2004a: 261; Monadjem *et al.*, 2010d: 569); Zimbabwe (Monadjem *et al.*, 2010d: 569).

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Tragus: Monadjem *et al.* (2013c: 204) line drawing of tragi of specimen DNSM 12619 referred to as *N. cf. rendalli* from Mount Nimba, Liberia.

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:

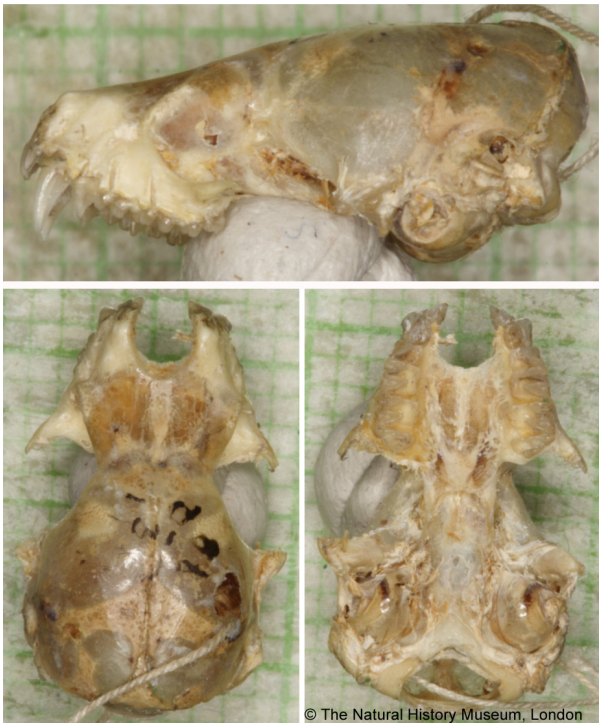

Figure 325. Clockwise from top lateral, ventral and dorsal skull images of BMNH 1889.3.2.3, holotype of *Vesperugo* (*Vesperus*) *rendalli* Thomas, 1889.

In their study on the reversibility of the mandibular symphyseal fusion, Scott *et al.* (2012: 2943) report that this symphyse is unfused, with smooth surfaces.

DETAILED MORPHOLOGY:
Baculum - Hill and Harrison (1987) and Kearney *et al.* (2002). The baculum of *N.* cf. *rendalli* was longer in total length (2.97 mm). The angle of shaft curvature, measured from mid-shaft to the shaft base, was more acute in *N. tenuipinnis* (43°) than in *N.* cf. *rendalli* (58°) (Monadjem *et al.*, 2013c: 197). Line drawing of the dorsal and ventral view of the baculum of specimen DNSM 12619 from Mount Nimba, Liberia referred to as *N.* cf. *rendalli* are shown in Monadjem *et al.* (2013c: 204).
Brain - Amrein *et al.* (2007), from specimens collected from Benin, reported that proliferating cells, detected with Ki-67 and MCM2, in the subgranular layer of the dentate gyrus was found to be absent. Amrein *et al.* (2007) also reported moderate to ample proliferating cells (Ki-67 positive cells) and migrating young neurons (DCX positive cells) in the rostral migratory stream. Amrein *et al.* (2007) furthermore detected few DCX positive cells in the rostral migratory stream and the olfactory bulb.

ECHOLOCATION:
Musila *et al.* (2018c: 43) [referring to Van Cakenberghe and Happold (2013p: 646)] mention a starting frequency of up to 76 kHz and an ending frequency of 42 - 44 kHz.

MOLECULAR BIOLOGY:
DNA - See Hoofer and Van Den Bussche (2003).

Karyotype - McBee *et al.* (1987), Rautenbach and Fenton (1992) and Kearney *et al.* (2002) all recorded 2*n* = 38, FN = 50, BA = 14, and a submetacentic X chromosome. Rautenbach and Fenton (1992) and Kearney *et al.* (2002) also recorded an acrocentric Y chromosome. GTG-bands identified three Robertsonian fusion chromosomes (7/11, 8/9, 10,12), considered as distinguishing characters for the genus *Neoromicia* Kearney *et al.* (2002).
In Senegal, Koubínová *et al.* (2013: 3) found a very similar karyotype, although they mention the Y chromosome as dot-like and presumably acrocentric.

Protein / allozyme - Unknown.

POPULATION:
Structure and Density - This appears to be a locally rare species, usually occurring as moderately small colonies of several individuals up to a few dozen animals (Jacobs *et al.*, 2008w; IUCN, 2009). Trend - 2008 - Unknown (Jacobs *et al.*, 2008w; IUCN, 2009).

PARASITES:
DIPTERA
Nycteribiidae: *Basilia ansifera* Theodor, 1956 mainly a West African species, reaching Lake Victoria in the east and Lake Nyasa in the south, nearly all localities lie between 15° latitude north and south (Haeselbarth *et al.*, 1966: 110). *Basilia bouvieri* (Falcoz, 1924) from Tanzania, Sudan, Senegal and Sierra Leone (Haeselbarth *et al.*, 1966: 111, host referred to as *E. phasma*).

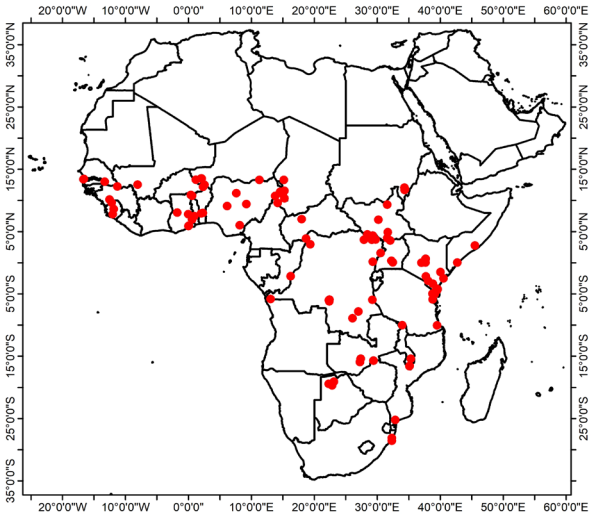

Figure 326. Distribution of *Neoromicia rendalli*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Benin, Botswana, Cameroon, Central African Republic, Chad, Congo (Democratic Republic of the), Ghana, Guinea, Kenya, Malawi, Mali, Mozambique, Niger, Nigeria, Senegal, Sierra Leone, Somalia, South Africa, South Sudan, Sudan, Tanzania, The Gambia, Togo, Uganda, Zambia, Zimbabwe.

Neoromicia robertsi Goodman, Taylor, Ratrimomanarivo and Hoofer, 2012

*2012. *Neoromicia robertsi* Goodman, Taylor, Ratrimomanarivo and Hoofer, Zootaxa, 3250: 1, 11, figs 3A, 4, 5A, 6A. Publication date: 29 March 2012. Type locality: Madagascar: Province d'Antananarivo, Anjozorobe, Amboasary [18 24.295 S 47 56.699 E] [Goto Description]. Holotype: UADBA 43677: ad ♂, skull and alcoholic. Collected by: Richard K.B. Jenkins; collection date: 25 September 2002; original number: RBJ 105. Presented/Donated by: ?: Collector Unknown. Paratype: FMNH 213931: ad ♂, skull and

alcoholic. Collected by: Richard K.B. Jenkins; original number: RBJ 119. Presented/Donated by: ?: Collector Unknown. Formerly UADBA 43679. Madagascar: Province de Toamasina, Parc National de Mantadia, between PK 9 and PK 10, 18 48.941 S, 48 25.633 E (see Goodman *et al.*, 2012b: 11). Paratype: UADBA 43678: ad ♀, skull and alcoholic. Collected by: Richard K.B. Jenkins; original number: RBJ 118. Presented/Donated by: ?: Collector Unknown. Madagascar: Province de Toamasina, Parc National de Mantadia, between PK 9 and PK 10, 18 48.941 S, 48 25.633 E (see Goodman *et al.*, 2012b: 11). - Etymology: In honour of Austin Roberts, who conducted systematic research on African mammals at the Transvaal Museum in Pretoria, and studied southern Africa bats, including small vespertilionids, during which he provided important insights into sorting out their generic affiliations (see Goodman *et al.*, 2012b: 11). (Current Combination)

2017. *N[eoromicia] roberti:* Goodman, Kearney, Ratsimbazafy and Hassanin, Zootaxa, 4236 (2): 358. Publication date: 23 February 2017. (Lapsus)

2019. *L[aephotis] robertsi:* Taylor and Tuttle, Bats: An illustrated guide to all species, 283. Publication date: 11 April 2019. (Name Combination)

TAXONOMY:
Bates *et al.* (2006: 303) previously assigned these Madagascan specimens to *Neoromicia melckorum*, but see Goodman *et al.* (2012b: 2).

Goodman *et al.* (2012b: 7) indicate that *N. robertsi* forms a sister-species pair with *N. malagasyensis*.

COMMON NAMES:
German: Roberts Zwergfledermaus.

GENERAL DISTRIBUTION:
Eastern Madagascar.

BIOGEOGRAPHY:
Only known from two localities in eastern Madagascar, at altitudes between 900 and 1,300 m (see Goodman *et al.*, 2012b: 20).

MOLECULAR BIOLOGY:
N. robertsi is separated from its sister-species (*N. malagasyensis*) by a 1.8 % (12S rRNA) and 2.3 % (16S rRNA) sequence divergence. It is separated by a 3.3 % (12S rRNA) and 5.1 % (16S rRNA) sequence divergence from the other sister-species pair: *N. matroka* and *N. capensis*. The divergence between *N. robertsi* and other related taxa is greater than 6.0 % (12S rRNA) and 8.0 % (16S rRNA) (see Goodman *et al.* (2012b: 7).

DIET:
Rakotondramanana *et al.* (2015: 74) report the following prey volume percentages: Coleoptera: 55.0 ± 9.01; Hymenoptera: 25.3 ± 15.73; Lepidoptera: 7.5 ± 7.87; Trichoptera: 2.5 ± 2.95, and Homoptera: 9.7 ± 14.00. The frequency by which these occur are: Coleoptera: 96.7 ± 8.16; Hymenoptera: 80.0 ± 25.30; Lepidoptera: 50.0 ± 45.16; Trichoptera: 26.7 ± 30.11, and Homoptera: 40.0 ± 33.47.

PARASITES:
BACTERIA
Gomard *et al.* (2016: 5) found the single specimen they tested to be posifive for *Leptospira*.

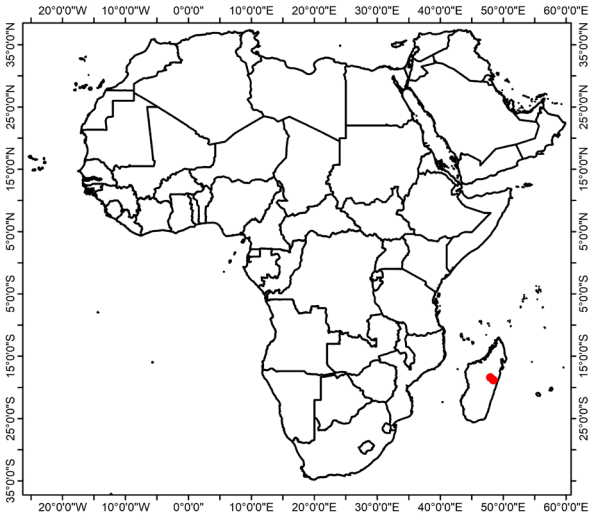

Figure 327. Distribution of *Neoromicia robertsi*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Madagascar.

Neoromicia roseveari Monadjem, Richards, Taylor and Stoffberg, 2013

*2013. *Neoromicia roseveari* Monadjem, Richards, Taylor and Stoffberg, Zool. J. Linn. Soc., 167 (1): 191, 197, figs 4 - 7. Publication date: 18 January 2013. Type locality: Liberia: Nimba province: Yiti River [07 29 N 08 35 W] [Goto Description]. Holotype: DNSM 12617: ad ♂, skull and alcoholic. Collected by: Dr. Ara Monadjem; collection date: 23 December 2010; original number: AM2010_12_23_1. Presented/Donated by: ?: Collector Unknown.

Paratype: DNSM 13226: ad ♂. Collected by: Dr. Ara Monadjem; collection date: 23 December 2011; original number: AM2011_12_23_03. Presented/Donated by: ?: Collector Unknown. - Etymology: In honour of Donovan Reginald Rosevear who made a significant contribution to West African bat research in the 20th century, culminating in his book 'The bats of West Africa' (see Monadjem *et al.*, 2013c: 201). (Current Combination)

2019. *L[aephotis] roseveari:* Taylor and Tuttle, Bats: An illustrated guide to all species, 283. Publication date: 11 April 2019. (Name Combination)

TAXONOMY:
Monadjem *et al.* (2013c) distinguish *Neoromicia roseveari* from other similar taxa on molecular grounds, craniodental morphology, and baculum structure.

COMMON NAMES:
German: Rosevears Zwergfledermaus.

GENERAL DISTRIBUTION:
Native: Guinea (Decher *et al.*, 2016: 273).

HABITAT:
This species has only been recorded in forested habitats at the base of Mount Nimba (Monadjem *et al.*, 2016y: 370).

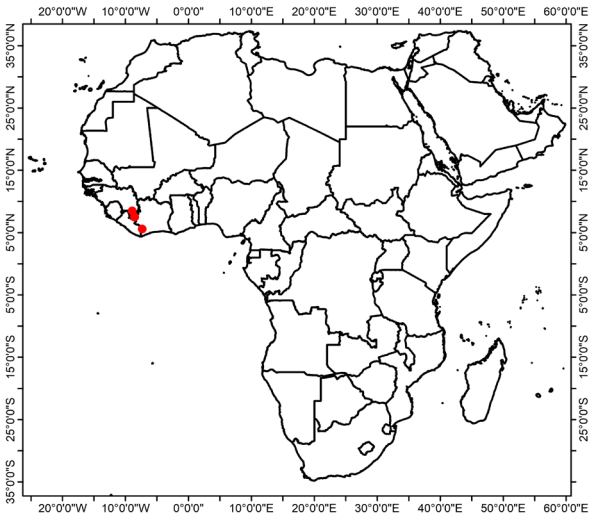

Figure 328. Distribution of *Neoromicia roseveari*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Côte d'Ivoire, Guinea, Liberia.

Neoromicia somalica (Thomas, 1901)

*1901. *Vespertilio minutus somalicus* Thomas, Ann. Mag. nat. Hist., ser. 7, 8 (43): 32. Publication date: 1 July 1901. Type locality: Somalia: Northwest province: Hargeisa [09 33 N 44 04 E, 3 500 ft] [Goto Description]. Holotype: BMNH 1898.6.9.1: ad, skin and skull. Collected by: R. McDonald Hawker Esq. Collection date: 14 November 1897; original number: RH5. - Etymology: From the masculin scientific Latin adjecrive *somàlicus*, meaning "inhabiting Somalia", referring to the provenance of the type specimen (see Lanza *et al.*, 2015: 447).

1907. *Vespertilio somalicus:* Matschie, Liste der von Herrn V.B. Schillings gesammelten Säugetier-Arten, 534. (Name Combination)

1911. *Eptesicus minutus somalicus:* G.M. Allen, Bull. Mus. comp. Zool., 54 (9): 326. (Name Combination)

1916. *Eptesicus ugandæ*Hollister, Smiths. Misc. Coll., 66 (1) (2406): 3. Publication date: 10 February 1916. Type locality: South Sudan: [formerly in Uganda]: between Nimule and Gondokoro: Ledgus: Thorn *et al.* (2009: 54-6) indicate that Ledgus was situated within the Uganda protectorate at the time the taxon was described. Currently, this locality is in the Central Equatoria province of South Sudan (see also Fisher and Ludwig, 2015: 80). [04 11 N 31 32 E] [Goto Description]. Holotype: USNM 166520: ad ♀, skull and alcoholic. Collected by: John Alden Loring; collection date: 15 February 1910; original number: 9022. - Comments: Type locality might be in Uganda rather than Sudan as originally mentioned.

1918. *Eptesicus capensis somalicus:* Hollister, Bull. U.S. natl. Mus., 99: 92. (Name Combination)

1930. *Pipistrellus minutus somalicus:* Zammarano, Le colonie Italiane, ???. (Name Combination)

1962. *E[ptesicus] somalicus:* Rosevear, Mammalia, 26 (4): 457. (Name Combination)

1965. *[Eptesicus somalicus] ugandae:* Koopman, Am. Mus. Novit., 2219: 14. (Name Combination)

1995. *P[ipistrellus] somalius:* Burland, Jones, Racey, and Wayne, Symp. zool. Soc. Lond., 67: 379. (Lapsus)
1995. *Pipistrellus somalicus:* Koopman, Kofron and Chapman, Am. Mus. Novit., 3148: 11. (Name Combination)
2003. *Neoromicia somalicus:* Hoofer and Van Den Bussche, Acta Chiropt., 5 (Suppl.): 19. (Name Combination, Current Combination, Alternate Spelling)
2004. *N[eoromicia] s[omalicus] somalicus:* Goodman and Ranivo, Mamm. biol., 69 (6): 434. (Name Combination)
2008. *N[eoromicia] somalica:* Riccucci and Lanza, Hystrix, It. J. Mamm., (n.s.) 19 (2): 176. - Comments: Riccucci and Lanza (2008: 176) indicate that the genus *Neoromicia* is feminine, therefore the spelling of the species ending must also be feminine according to Art. 31.2 of the ICZN (1999). (Name Combination)
2019. *L[aephotis] somalica:* Taylor and Tuttle, Bats: An illustrated guide to all species, 283. Publication date: 11 April 2019. (Name Combination)
? *Eptesicus somalicus:* (Name Combination)
? *Neoromicia somalica:* (Current Spelling)
? *Neoromicia somalicus somalicus:* (Name Combination, Alternate Spelling)
? *Neoromicia somalicus ugandae:* (Name Combination, Alternate Spelling)
? *Neoromicia somalicus vansoni:* (Name Combination, Alternate Spelling)

TAXONOMY:
Koopman (1993a: 203) included *zuluensis*; see Koopman (1975: 404, 405), but see Peterson *et al.* (1995), Simmons (2005). Mentioned in the genus *Pipistrellus* by Koopman (1994: 117). The subspecific allocations of West African and Tanzanian populations are uncertain (Koopman, 1994: 117).

Riccucci and Lanza (2008) indicated that the genus *Neoromicia* is feminine, therefore the ending of the species name *somalicus* must be *somalica*.

Helbig *et al.* (2010: 168) suggest transferring *somalica* to the genus *Laephotis*.

COMMON NAMES:
Afrikaans: Somali-dakvlermuis. Chinese: 索马里伏翼. Czech: netopýr somálský. English: Somali Serotine, Somali Pipistrelle Bat, Somalian Pipistrelle Bat, Somali Serotine Bat. French: Sérotine de Somalie, Pipistrelle de Somalie. German: Somalia-Zwergfledermaus, Somalia-Pipistrelle. Italian: Pipistrèllo sòmalo.

CONSERVATION STATUS:
Global - Although this species is known mainly from patchy records from a large area, it is listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, tolerance of a broad range of habitats, presumed large overall population, and because it is unlikely to be declining fast enough

to qualify for listing in a more threatened category (Jacobs, 2008g; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) [assessed as *Pipistrellus somalicus*] (Jacobs, 2008g; IUCN, 2009). 2004 - LC ver 3.1 (2001) [assessed as *Neoromicia somalicus*] (Jacobs, 2004c; IUCN, 2004). 1996 - LR/lc [assessed as *Eptesicus somalicus*] (Baillie and Groombridge, 1996).

MAJOR THREATS:
There appear to be no major threats to this species as a whole (Jacobs, 2008g; IUCN, 2009).

CONSERVATION ACTIONS:
Jacobs (2008g) [in IUCN (2009)] report that there appear to be no direct conservation measures in place. It is not known if the species is present in any protected area, although it seems likely to occur in some East African parks. Further studies are needed into the taxonomy, distribution, natural history and threats to this species.

GENERAL DISTRIBUTION:
Neoromicia somalica has been recorded over much of West, Central and East Africa. It ranges from Guinea Bissau in the west, to Sudan, Eritrea and Somalia in the east, being found as far south as Tanzania and southern Democratic Republic of the Congo adjacent to the border with northern Angola.

Happold and Happold (1997b: 825) record *N. somalica* in Malawi, with reservations.
Specimens from southern Africa might possibly represent *Neoromicia zuluensis*, since the distinction between the two species (*zuluensis* and *somalica*) has not been made throughout the literature.
Earlier records from Madagascar are now assigned to *Neoromicia malagasyensis*.

Native: Benin; Botswana; Burkina Faso (Kangoyé *et al.*, 2015a: 621); Cameroon; Central African Republic; Chad; Congo (The Democratic Republic of the); Côte d'Ivoire; Eritrea; Ethiopia (Lavrenchenko *et al.*, 2004b: 147); Ghana; Guinea (Decher *et al.*, 2016: 273); Guinea-Bissau (Veiga-Ferreira, 1949; Lopes and Crawford-Cabral, 1992; Koopman, 1993a; Rainho and Ranco, 2001:64); Kenya; Liberia; Malawi (Happold and Happold, 1997b: 825); Namibia; Nigeria; Rwanda; Senegal; Sierra Leone; Somalia; Sudan; Tanzania; Togo; Uganda (Kityo and Kerbis, 1996: 62); Zimbabwe (Cotterill, 2004a: 261).

Bates *et al.* (2013: 339) reject the presence of *N. somalica* in the Republic of Congo as Van Cakenberghe and Happold (2013q: 654) only marked a locality on their map, but did not provide further details.

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Tragus: Monadjem *et al.* (2013c: 204) line drawing of tragi of specimen DNSM 12612 from Mount Nimba, Liberia.

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:

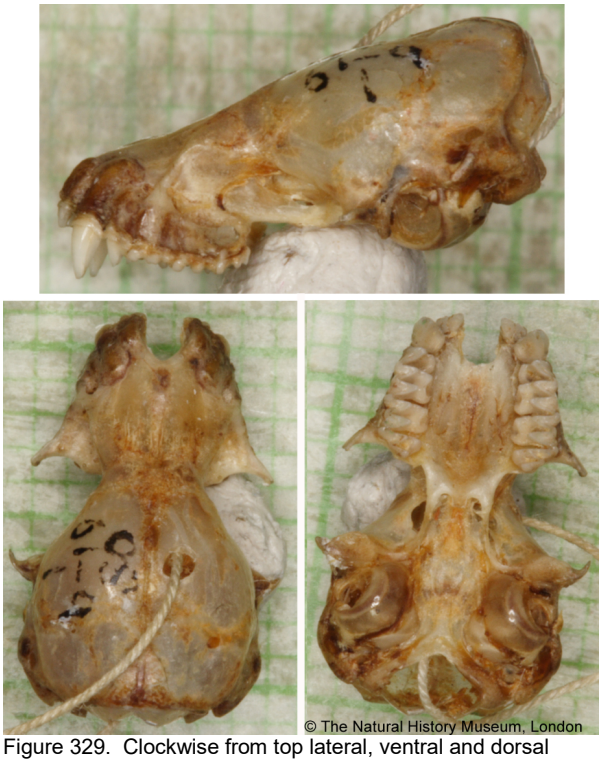

Figure 329. Clockwise from top lateral, ventral and dorsal skull images of BMNH 1898.6.9.1, holotype of *Vespertilio* (*minutus*) *somalicus* Thomas, 1901.

DETAILED MORPHOLOGY:
Baculum - Hill and Harrison (1987).

MOLECULAR BIOLOGY:
DNA - See Hoofer and Van Den Bussche (2003) for the results of a specimen from Kenya.

Karyotype - McBee *et al.* (1987) reported 2*n* = 26, FN = 48, BA = 24, a subtelocentric X chromosome, and an acrocentric Y chromosome.

From Senegal, Koubínová *et al.* (2013: 3) report the following karyotype for 13 ♂♂ and 7 ♀♀: 2*n*: 28, FNa = 50, FN = 54, X = metacentric, Y = submetacentric. There is one additional pair of acrocentric autosomes as compared to specimens from Cameroon. Koubínová *et al.* (2013: 10) assign these Senegalese specimens to *N.* cf. *somalica*.

Protein / allozyme - Unknown.

HABITAT:
Monadjem *et al.* (2016y: 370) recorded this species from an urban environment in the Mount Nimba area, whereas it is otherwise known from savanna areas.

POPULATION:
Structure and Density - Little information is available on the population abundance or size of this species. It may be locally rare, or at least rarely recorded (Jacobs, 2008g; IUCN, 2009).
Trend - 2008 - Unknown (Jacobs, 2008g; IUCN, 2009).

PARASITES:
Protozoa
Kassahun *et al.* (2015: 168) examined 6 Ethiopian specimens and found two of them (from Aba-Roba) to be infected by *Leishmania* parasites.

INSECTA:
Siphonaptera: Hastriter (2016: 16) reported *Lagaropsylla consularis* Smit, 1957 from a *N. somalica* specimen from Maji Moto, Kenya.

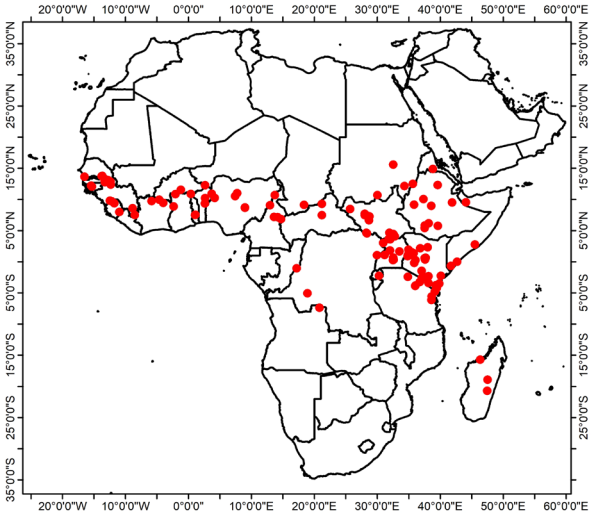

Figure 330. Distribution of *Neoromicia somalica*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Angola, Benin, Burkina Faso, Cameroon, Central African Republic, Chad, Congo (Democratic Republic of the), Côte d'Ivoire, Eritrea, Ethiopia, Ghana, Guinea, Guinea-Bissau, Kenya, Liberia, Madagascar, Mali, Nigeria, Rwanda, Senegal, Sierra Leone, Somalia, South Sudan, Sudan, Swaziland, Tanzania, Togo, Uganda.

Neoromicia stanleyi Goodman, Kearney, Ratsimbazafy and Hassanin, 2017

1971. *Eptesicus melckorum:* Hayman and Hill, in: Meester and Setzer, Order Chiroptera., 44. - Comments: in part. (Name Combination)
1987. *Pipistrellus (Neoromicia) melckorum:* Hill and Harrison, Bull. Br. Mus. (nat. Hist.) Zool., 52: 249, 274. - Comments: in part. (Name Combination)
1993. *Eptesicus (Neoromicia) melckorum:* Koopman, in: Wilson and Reeder, Order Chiroptera., 202.. - Comments: in part. (Name Combination)
1993. *Pipistrellus cf. melckorum:* Rautenbach, Bronner and Schlitter, Koedoe, 36 (2): 93. (Name Combination)
1995. *Eptesicus cf. melckorum:* Rautenbach, Fenton and Braack, Koedoe, 28: ???. (Name Combination)
2002. *Neoromicia cf. melckorum:* Kearney, Volleth, Contrafatto and Taylor, Acta Chiropt., 4 (1): 58. (Name Combination)
2005. *Neoromica melckorum:* Simmons, in: Wilson and Reeder, Order Chiroptera., 494. - Comments: in part. (Name Combination)
2011. *Neoromicia sp. aff. melckorum:* ACR, African Chiroptera Report 2011. (Name Combination)
*2017. *Neoromicia stanleyi* Goodman, Kearney, Ratsimbazafy and Hassanin, Zootaxa, 4236 (2): 351, 361, figs 2A, 4, 5, 6A, 7,. Type locality: Botswana: Okavango Delta, Chitabe, Gomoti River, Highbanks [19.41979 S 23.40413 E, 950m] [Goto Description]. Holotype: TM 48487: ad ♂, skull and alcoholic. Collected by: Dr. Teresa Catherine Kearney and Ernest Charles James Seamark; collection date: 11 April 2009; original number: ECJS 48/2009. Presented/Donated by: ?: Collector Unknown. - Etymology: Named in honour of the William ("Bill") T. Stanley (1957 - 2015), who conducted active field and systematic research on African small mammals, particularly in east Africa, until his sudden death. (Current Combination)
2017. *Pipistrellus krugeri* Herkt, Skidmore and Fahr, Global Ecol. Biog., 26 (8): Appendix S9. Publication date: 16 June 2017. - Comments: Herkt *et al.* (2017: Appendix S9) refer to the IUCN (2013) attribute table for the shapefile for "*Pipistrellus melckorum*", which notes "that

these records must be referred to *Pipistrellus* sp., which will probably become *Pipistrellus krugeri*". As such, the name has no taxonomic value whatsoever.

2019. *L[aephotis] stanleyi:* Taylor and Tuttle, Bats: An illustrated guide to all species, 283. Publication date: 11 April 2019. (Name Combination)

? *Eptesicus melckorum subsp.:*

? *Pipistrellus melckorum:*

TAXONOMY:

Bronner *et al.* (2003) state that most previous authors recognised *Eptesicus (=Neoromicia) melckorum* as distinct from *N. capensis* (Roberts, 1951); Ellerman *et al.*, 1953; Hayman and Hill, 1971; Corbet and Hill, 1980; Meester *et al.*, 1986). Koopman (1982), however, questioned the status of *N. melckorum*, since it cannot be clearly distinguished from *N. capensis*. Specimens from the type locality (Kersefontein Farm in the Western Cape Province) are morphologically and karyotypically indistinguishable from *N. capensis*, but specimens from the Kruger National Park with a unique karyotype (2*n* = 40, aFN = 50) agree with the original description of *melckorum* (Rautenbach *et al.*, 1993; Kearney *et al.*, 2002 for Kersefontein chromosomal data). The Kruger National Park specimens are also well differentiated from *N. capensis* by allozymes (Morales *et al.*, 1991). *Neoromicia melckorum* should thus be synonymised under *N. capensis*, whereas specimens from the Kruger National Park probably represent a distinct species that remained unnamed (Koopman, 1994), and which were referred to as *Neoromicia cf. melckorum*. It seems likely that the Zimbabwe specimens reported by Cotterill (1996a) represent this latter species. Goodman *et al.* (2017a) studied these (and other southern African) specimens and provided a name and description for this taxon: *Neoromicia stanleyi*.

COMMON NAMES:

English: Kruger serotine bat (Taylor, 2005: 305 - first use). French: Pipistrelle des Melcks. German: Stanleys Serotine bat.

CONSERVATION STATUS:

Global - DD ver 3.1 (2001) assessed as *Pipistrellus melckorum* (IUCN, 2009).

Regional -

South Africa: 2016 - LC ver 3.1 (2001) [assessed as *Neoromicia* cf. *melckorum*] (Taylor *et al.*, 2016c). 2004 - considered a vagrant (*Pipistrellus spp* - Kruger Serotine bat) not assessed, single locality (Friedmann and Daly, 2004).

GENERAL DISTRIBUTION:

Kenya to Zambia and N South Africa (Simmons, 2005). For South Africa, Babiker Salata (2012: 49) found that "*N. melckorum*" has a distribution which is strongly associated with the amount of precipitation in the coldest quarter of the year.

Native: Botswana (Monadjem *et al.*, 2010d: 568); Malawi (Happold *et al.*, 1988: 568); South Africa (Monadjem *et al.*, 2010d: 568); Zambia (Ansell, 1967; Monadjem *et al.*, 2010d: 568); Zimbabwe (Monadjem *et al.*, 2010d: 568).

DETAILED MORPHOLOGY:

Baculum - In general appearance, this is very similar to the bacula of the closely related *N. capensis, N. matroka, N. robertsi* and *N. malagasyensis*. They all have a ventrally deflected tip, with a small dorsally projecting heel. Compared with the one of *capensis*, its longer and has a broader, shorter tip. The lateral tip flanges in *N. stanleyi* are only curved or notched on the distal edge, whereas there are distally and proximally curved edges on the tip flanges of *N. capensis*. The shaft in *stanleyi* is slender and eveny wide from end to end (see Fig. 2 in Goodman *et al.*, 2017a)..

MOLECULAR BIOLOGY:

DNA - Unknown.

Karyotype - Rautenbach *et al.* (1993) reported 2*n* = 40; FN = 50, BA = 12, a metacentric X chromosome, and an acrocentric Y chromosome, for specimens from Zimbabwe and South Africa.

Protein / allozyme - See Morales *et al.* (1991) for results from nine specimens from South Africa.

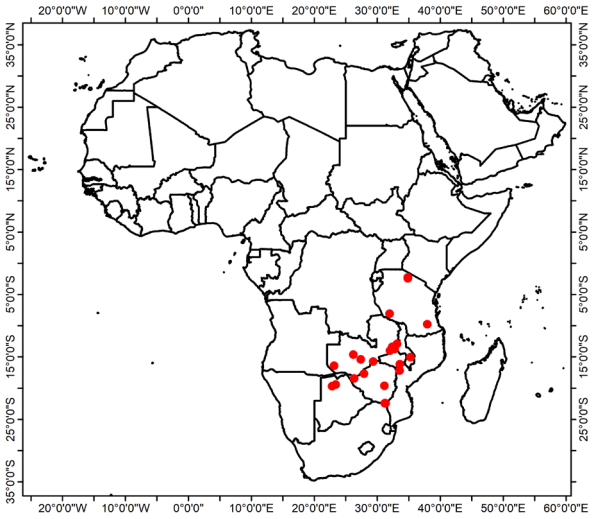

Figure 331. Distribution of *Neoromicia stanleyi*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Botswana, Kenya, Malawi, Mozambique, South Africa, Tanzania, Zambia, Zimbabwe.

Neoromicia tenuipinnis (Peters, 1872)

*1872. *Vesperus tenuipinnis* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, 263. Publication date: 1872. Type locality: Guinea: "Guinea" [Goto Description]. Holotype: ZMB 4096: ad ♀. Presented/Donated by: Schlegel. See Turni and Kock (2008), who report it as missing. Neotype: DNSM 13235: ad ♂, skull and alcoholic. Collected by: Dr. Ara Monadjem; collection date: 7 January 2012. Presented/Donated by: ?: Collector Unknown. Neotype designated by Decher *et al.* (2016: 270). Locality: Liberia: base of Mount Nimba: near Yekepa. - Comments: The publication covers a meeting held on 18 April 1872. Kock (1969a: 162) indicated that the type locality quoted by Ellerman *et al.* (1953: 77, Kuilu River, Congo [B]) is an unjustified assumption. - Etymology: From the feminine scientific Latin adjective *tenuipìnnis*, meaning "slender-winged", made up of the Latin adjective *tènuis*, meaning "slender" and the Latin substantive *pìnna*, meaning "wing": the adjective refers to the slender shape of the wings (see Lanza *et al.*, 2015: 455).

1878. *Vesperugo (Vesperus) tenuipinnis:* Dobson, Catalogue of the Chiroptera of the collection of the British Museum, 200. (Name Combination)

1889. *Vesperus bicolor* Bocage, J. Sci. mat. phys. nat., ser. 2, 1 (1): 5. Publication date: March 1889. Type locality: Angola: Caconda [13 42 S 15 05 E, 1 900 m] [Goto Description]. Syntype: BMNH 1889.5.1.3: ad ♂, skull and alcoholic. Collected by: José Alberto de Oliveira Anchieta. Syntype: BMNH 1889.5.1.5: ad ♂. Presented/Donated by: ?: Collector Unknown. - Comments: Bocage (1889a: 6) mentions 2 ♀♀ specimens.

1889. *Vesperus tenuipennis:* Noack, Zool. Jb. Syst., 4: 215, 239, 261. (Lapsus)

1897. *Eptesicus tenuipinnis:* Matschie, Arch. Naturgesch. Berlin, 63 (1): ??. (Name Combination)

1897. *Vesperugo (Vesperus) bicolor:* Trouessart, Catalogus Mammalium tam viventium quam fossilium, fasc. I: 110.

1900. *Vespertilio tenuipennis:* Miller, Proc. Wash. Acad. Sci., 2: 649. Publication date: 28 December 1900. (Lapsus)

1916. *E[ptesicus] bicolor:* Wettstein, Anz. kais. Akad. Wiss., Wien, 53: 201.

1917. *Eptesicus ater* J.A. Allen, Bull. Am. Mus. Nat. Hist., 37 (18): 443. Publication date: 29 September 1917. Type locality: Congo (Democratic Republic of the): Oriental province: Uele district: Faradje [03 44 N 29 43 E] [Goto Description]. Holotype: AMNH 48988: ad ♂, skin and skull. Collected by: Herbert Lang, James Paul Chapin and The American Museum Congo Expedition; collection date: 1 March 1911; original number: 1466. Topotype: AMNH 49423: alcoholic (skull not removed). Collected by: Herbert Lang, James Paul Chapin and The American Museum Congo Expedition. Presented/Donated by: ?: Collector Unknown.

1923. *Eptesicus tenuipennis:* Kershaw, Rev. Zool. afr., 11 (4): 358. (Lapsus)

1935. *Pipistrellus bicolor:* Monard, Arq. Mus. Bocage, 6: 31.

1936. *Eptesicus bicolor:* St. Leger, Novit. Zool., 40: 79.

1950. *Eptesicus tenuipinnis ater:* Sanborn, Publ. Cult. Comp. Diamantes Angola, Lisboa, 10: ???. (Name Combination)

1952. *Eptesicus tennuipinnis:* Cozens and Marchant, Niger. Fld. , 17 (3): 127. (Lapsus)

1953. *Eptesicus (Eptesicus) bicolor:* Ellerman, Morrison-Scott and Hayman, Southern African mammals 1758 to 1951, 77.

1953. *Eptesicus (Eptesicus) tenuipinnis ater:* Ellerman, Morrison-Scott and Hayman, Southern African mammals 1758 to 1951, 77. (Name Combination)

1953. *Eptesicus (Eptesicus) tenuipinnis tenuipinnis:* Ellerman, Morrison-Scott and Hayman, Southern African mammals 1758 to 1951, 77. (Name Combination)

1953. *Eptesicus (Eptesicus) tenuipinnis:* Ellerman, Morrison-Scott and Hayman, Southern African mammals 1758 to 1951, 77. (Name Combination)

1956. *Ephesicus tenuipinnis:* Theodor, Parasitology, 46: ???. (Lapsus)

1956. *Eptesicus tenuipinnis tenuipinnis:* Eisentraut, Zool. Jb. Syst., 84 (3): 531. (Name Combination)

1987. *Nycterikaupius tenuipinnis:* Menu, Palaeovert., 17 (3): 109. Publication date: 15 November 1987. (Name Combination)

1987. *Pipistrellus (Neoromicia) tenuipinnis:* Hill and Harrison, Bull. Br. Mus. (nat. Hist.) Zool., 52 (7): 282. (Name Combination)
1992. *Pipistrellus tenuipinnis:* Duckworth and Timmins, The bats of Nechisar National Park, 36. (Name Combination)
1993. *Eptesicus (Neoromicia) tenuipinnis:* Koopman, in: Wilson and Reeder, Mammal species of the World (2nd Edition): Chiroptera, 218. (Name Combination)
1994. *P[ipistrellus (Neoromicia)] t[enuipinnis] ater:* Koopman, in: Niethammer, Schliemann and Starck, Handbook of Zoology, volume II (Mammalia) Chiroptera, (60) 117. (Name Combination)
1994. *P[ipistrellus (Neoromicia)] t[enuipinnis] tenuipinnis:* Koopman, in: Niethammer, Schliemann and Starck, Handbook of Zoology, volume II (Mammalia) Chiroptera, (60) 117. (Name Combination)
1994. *P[ipistrellus (Pipistrellus)] bicolor:* Koopman, in: Niethammer, Schliemann and Starck, Handbook of Zoology, volume II (Mammalia) Chiroptera, (60) 114.
2002. *Eptesicus tennnuipinnis:* Fenton and Bogdanowicz, Can. J. Zool., 80: 1008. (Lapsus)
2002. *Eptesicus tenuippinis:* Fenton and Bogdanowicz, Can. J. Zool., 80: 1013. (Lapsus)
2006. *Neoromicia tenuipinnis:* Van Cakenberghe, Kearney and Seamark, African Chiroptera Project, Pretoria, 140 -142. (Name Combination, Current Combination)
2008. *Vesperus hösemanni* Turni and Kock, Zootaxa, 1869: 82. - Comments: Turni and Kock (2008: 82) mention this name as a label name, introduced by Matschie, on ZMB 10096 from Tanzania, Lake Tanganyika, Ujiji, an adult male, skull and alcoholic. Since this name has not been published before, Turni and Kock should be considered the authors.
2019. *L[aephotis] tenuipinnis:* Taylor and Tuttle, Bats: An illustrated guide to all species, 283. Publication date: 11 April 2019. (Name Combination)
? *Neoromicia tenuipinnis ater:* (Name Combination)
? *Neoromicia tenuipinnis tenuipinnis:* (Name Combination)

GENERAL COMMENTS:
Bocage (1889a: 6) mentions two female specimens only.

TAXONOMY:
Eptesicus bicolor was tentatively included here by Hayman and Hill (1971: 43), but this may be an older name for *Pipistrellus anchietai*; see Koopman (1975: 404). Koopman (1994: 117) mentions this species in the genus *Pipistrellus*.

Helbig *et al.* (2010: 168) suggest that *tenuipinnis* needs to be transferred to a genus that needs to be newly created or resurrected from the current synonymy.

COMMON NAMES:
Chinese: 白翼伏翼. Czech: netopýr běloblanný. English: Slender-winged Pipistrelle Bat, White-winged Pipistrelle Bat, White-winged Serotine, White-winged Bat. French: Sérotine à ailes blanches, Pipistrelle à ailes blanches. German: Weißflügel-Zwergfledermaus, Weißflügel Pipistrelle, Weissfluegel-Hausfledermaus. Italian: Pipistrèllo di Peters. Spanish (Castillian): Murciélago.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Fahr, 2008a; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) [assessed as *Pipistrellus tenuipinnis*] (Fahr, 2008a; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Fahr, 2004j; IUCN, 2004). 1996 - LR/lc [assessed as *Eptesicus tenuipinnis*] (Baillie and Groombridge, 1996).

MAJOR THREATS:
There appear to be no major threats to this species as a whole (Fahr, 2008a; IUCN, 2009).

CONSERVATION ACTIONS:
Fahr (2008a) [in IUCN (2009)] reports that there appear to be no direct conservation measures in place. It is not known if the species is present in any protected areas.

GENERAL DISTRIBUTION:
Neoromicia tenuipinnis is a sub-Saharan species which is widely distributed through West, Central and parts of East Africa. It ranges from Senegal in the west, through West Africa, to Cameroon and Central Africa including much of the Congo basin, into Uganda and East Africa including Ethiopia, Kenya and Tanzania. It has been recorded as far south as southern Democratic Republic of the Congo and northern Angola. It occurs at elevations of up to 3,200 m asl.

Native: Angola (Crawford-Cabral, 1989; Monadjem *et al.*, 2010d: 569); Burundi; Cameroon; Central African Republic; Congo (Bates *et al.*, 2013: 337); Congo (The Democratic Republic of the) (Schouteden, 1944; Hayman *et al.*, 1966; Van Cakenberghe *et al.*, 1999; Dowsett *et al.*, 1991: 259; Monadjem *et al.*, 2010d: 569); Côte d'Ivoire; Equatorial Guinea; Ethiopia (Lavrenchenko *et al.*, 2004b: 147); Gabon; Gambia; Ghana; Guinea (Konstantinov *et al.*, 2000: 145); Guinea-Bissau (Rainho and Ranco, 2001: 66); Kenya; Liberia (Monadjem and Fahr, 2007: 50); Nigeria; Rwanda; Senegal; Sierra Leone; Tanzania; Togo; Uganda (Kityo and Kerbis, 1996: 62).

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Tragus: Monadjem *et al.* (2013c: 204) gives a line drawing of the tragus of specimen DNSM 13235 from Mount Nimba, Liberia.

DETAILED MORPHOLOGY:
Baculum - The basal lobes of *N. tenuipinnis* were long and elongate, terminating in a rounded lobular structure, the total length (1.97 mm), the angle of shaft curvature, measured from mid-shaft to the shaft base, was more acute in *N. tenuipinnis* (43°) than in *N.* cf. *rendalli* (58°) (Monadjem *et al.*, 2013c: 197). Line drawing of dorsal and ventral of specimen DNSM 13235 from Mount Nimba, Liberia are shown in Monadjem *et al.* (2013c: 204). See Hill and Harrison (1987).

ECHOLOCATION:
Musila *et al.* (2018c: 43) [referring to Monadjem *et al.* (2010d: 478)] mention a shallow, frequency modulate call, which sweeps down from 62 to 37 kHz.

MOLECULAR BIOLOGY:
DNA - Unknown.
Karyotype - McBee *et al.* (1987) reported 2*n* = 36, FN = 52, BA = 18, a submetacentric X chromosome and an acrocentric Y chromosome.
Protein / allozyme - Unknown.

HABITAT:
In their study at the Mount Nimba area, Monadjem *et al.* (2016y: 370) recorded this species in two small settlements.

PREDATORS:
Mikula *et al.* (2016: Supplemental data) mention the Bat hawk (*Macheiramphus alcinus* Bonaparte, 1850) as diurnal avian predator of "*E. tenuipinnis*".

POPULATION:
Structure and Density - This species is rather common in suitable habitat. It is most often found in small groups of fewer than 20 animals (Fahr, 2008a; IUCN, 2009).
Trend - 2008 - Unknown (Fahr, 2008a; IUCN, 2009).

PARASITES:
ACARI
Sarcoptidae: Fain (1959d: 145) described *Notoedres (Notoedres) schoutedeni* from "*Eptesicus tenuipinnis*" and "*E. ater*" from Buta, Stanleyville (=Kisangani), Mauda, and Tshuapa, DRC.

HEMIPTERA
Cimicidae: *Aphrania recta* Ferris and Usinger, 1957, recorded from Sierra Leone (Haeselbarth *et al.*, 1966: 12), and DRC (Kock and Aellen, 1987: 876).

DIPTERA
Streblidae: *Raymondia intermedia* Jobling, 1936 in Sierra Leone (Haeselbarth *et al.*, 1966: 102).
Nycteribiidae: *Basilia ansifera* Theodor, 1956 mainly a West African species, reaching Lake Victoria in the east and Lake Nyasa in the south, nearly all localities lie between 15° latitude north and south (Haeselbarth *et al.*, 1966: 110). *Basilia robusta* Theodor, 1956 (Haeselbarth *et al.*, 1966: 111).

VIRUSES:
In their overview table, Maganga *et al.* (2014a: 8) reported that no viruses were ever found in this bat species.

Coronaviridae
None of the 33 Kenyan bats tested by Tao *et al.* (2017: Suppl.) was positive for CoV.

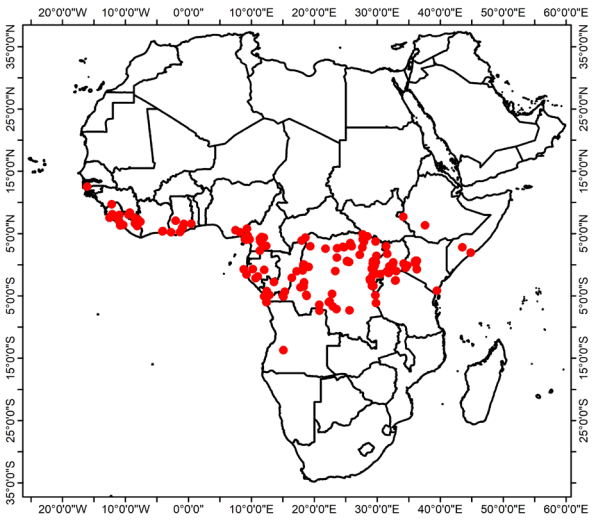

Figure 332. Distribution of *Neoromicia tenuipinnis*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Angola, Burundi, Cameroon, Central African Republic, Congo, Congo (Democratic Republic of the), Côte d'Ivoire, Ethiopia, Gabon,

Ghana, Guinea, Kenya, Liberia, Nigeria, Rwanda, Senegal, Sierra Leone, Somalia, South Sudan, Tanzania, Togo, Uganda.

Neoromicia zuluensis (Roberts, 1924)

*1924. *Eptesicus zuluensis* Roberts, Ann. Transv. Mus., 10: 60, text-fig. 1. Publication date: 31 January 1924. Type locality: South Africa: KwaZulu-Natal: White Umfolosi Game Reserve [28 19 S 31 50 E] [Goto Description]. Holotype: TM 3024: ad ♀, skin and skull. Collected by: Austin Roberts; collection date: 29 June 1922; original number: 14. [Second label has G.M. Allen as collector]; note: shot at dusk.

? *Neoromicia zuluensis:* (Name Combination)

TAXONOMY:

Figure 333. A female *Neoromicia zuluensis* (TM 48097) caught at Lapalala Wilderness Area, Limpopo Province, South Africa.

Bronner *et al.* (2003) state that although Ellerman *et al.* (1953) and Hayman and Hill (1971) recognised *Eptesicus (=Neoromicia) zuluensis* as a distinct species, Koopman (1975, 1982, 1993a), Meester *et al.* (1986) and Corbet and Hill (1992) treated it as a subspecies of *Eptesicus* (=*Pipistrellus*) *somalicus*. Rautenbach *et al.* (1993) confirmed its distinctness from the latter on the grounds of interspecific chromosomal differences.

As a separate species by many authors, e.g. Volleth *et al.* (2001: 44), who assigned it to the genus *Neoromicia*.

COMMON NAMES:
Afrikaans: Aalwyndakvlermuis; Aalwynvlermuis. Chinese: 祖鲁伏翼. Czech: netopýr zuluský. English: Zulu Pipistrelle Bat, Aloe Bat, Aloe Serotine, Aloe Serotine Bat, Zulu Serotine Bat. French: Sérotine des aloes, Pipistrelle zouloue. German: Zulu-Zwergfledermaus, Zulu-Pipistrelle.

ETYMOLOGY OF COMMON NAME:
Roberts (1924) collected the original specimen at his camp and records in his description of the species that it was the Cape serotine bat, *N. capensis*, that he found in an aloe. He used the name aloe bat and it has remained associated with *N. zuluensis* (Taylor, 2005).

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Jacobs and Cotterill, 2008b; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) [assessed as *Pipistrellus zuluensis*] (Jacobs and Cotterill, 2008b; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Jacobs and Cotterill, 2004b; IUCN, 2004). 2000 - LR/nt [assessed as *Eptesicus zuluensis*] (Hilton-Taylor, 2000).

Regional -
South Africa: 2016 - LC ver 3.1 (2001) (Monadjem *et al.*, 2016n). 2004 - LC ver 3.1 (2001) (Friedmann and Daly, 2004). 1986 - Indeterminate (Smithers, 1986).

MAJOR THREATS:
There appear to be no major threats to this species as a whole (Jacobs and Cotterill, 2008b; IUCN, 2009).

CONSERVATION ACTIONS:
Jacobs and Cotterill (2008b) [in IUCN (2009)] report that it seems probable that this adaptable species is present within a number of protected areas. It has been recorded from Kruger National Park, South Africa. No direct conservation measures are currently needed for the species as a whole.

GENERAL DISTRIBUTION:
Neoromicia zuluensis is widespread in East and southern Africa. The eastern distribution ranges from Ethiopia and South Sudan to Uganda and Kenya. The southern range extends from Zambia and southern parts of the Democratic Republic of the Congo to southern South Africa, and from eastern Angola to central Zambia and Zimbabwe. In the RSA, the species' distribution is linked with land use/land cover (Babiker Salata, 2012: 50).

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 1,198,714 km^2.

Native: Angola (Crawford-Cabral, 1989; Monadjem *et al.*, 2010d:570; Taylor *et al.*, 2018b: 60); Botswana (Archer, 1977; Monadjem *et al.*, 2010d: 570); Congo (The Democratic Republic of the); Ethiopia (Lavrenchenko *et al.*, 2004b: 153; 2011: 54); Kenya; Malawi (Ansell and Dowsett, 1988: 42); Mozambique (Monadjem *et al.*, 2010d: 570; Monadjem *et al.*, 2010c: 384); Namibia (Monadjem *et al.*, 2010d: 570); South Africa (Monadjem *et al.*, 2010d: 570); Sudan; Swaziland (Monadjem *et al.*, 2010d: 570); Uganda; Zambia (Ansell, 1978; Monadjem *et al.*, 2010d: 570); Zimbabwe (Monadjem *et al.*, 2010d: 570).

ECHOLOCATION:
In Waterberg, South Africa, Taylor *et al.* (2013b: 17) recorded the following parameters for 5 calls: F_{max}: 73.8 ± 14.93 (59.1 - 92.8) kHz, F_{min}: 48.1 ± 1.94 (45.7 - 50.5) kHz, F_{knee}: 51.3 ± 2.85 (48.4 - 55.8) kHz, F_{char}: 49.0 ± 1.81 (46.3 - 51.2) kHz, duration: 2.4 ± 0.52 (1.7 - 3.0) msec.

At Farm Welgevonden, South Africa, Taylor *et al.* (2013a: 556) report a F_{knee} value of 51 (48 - 56) kHz.
Linden *et al.* (2014: 40) reported the following parameters from the Soutpansberg range (RSA): F_{min}: 46 - 50 kHz, F_{char}: 46 - 51 kHz, F_{knee}: 48 - 56 kHz, Slope: 487 - 867 OPS, duration: 2 - 3 msec. 20 calls were recorded by Parker and Bernard (2018: 57) in the Mapungubwe National Park (RSA): F_{char}: 48.11 ± 1.17 kHz, F_{max}: 63.23 ± 4.44 kHz, F_{min}: 47.70 ± 1.36 kHz, F_{knee}: 52.09 ± 2.33 kHz, duration: 4.91 ± 1.36 msec, at 7.47 ± 2.12 calls/sec.
At Telperion Nature Reserve (RSA), Kearney *et al.* (2019: 37) recorded a release call (6 pulses) with the following characteristics: F_{char}: 45.89 ± 0.43 (45.45 - 46.51) kHz, slope at start of call: 52.41 ± 16.85 (31.71 - 68.40), time between start of call and F_{char}: 3.43 ± 0.84 (2.26 - 4.83) msec and duration: 3.82 ± 0.58 (3.13 - 4.83) msec.

From Swaziland, the following parameters were reported by Monadjem *et al.* (2017c: 179): F_{min}: 46.1 ± 2.82 (39.9 - 45.3) kHz, F_{knee}: 46.6 ± 2.91 (43.3 - 48.5) kHz, F_c: 43.6 ± 3.10 (40.1 - 45.9) kHz and duration: 3.7 ± 0.67 (3.0 - 4.2) msec.

General description of cranial and dental morphology:

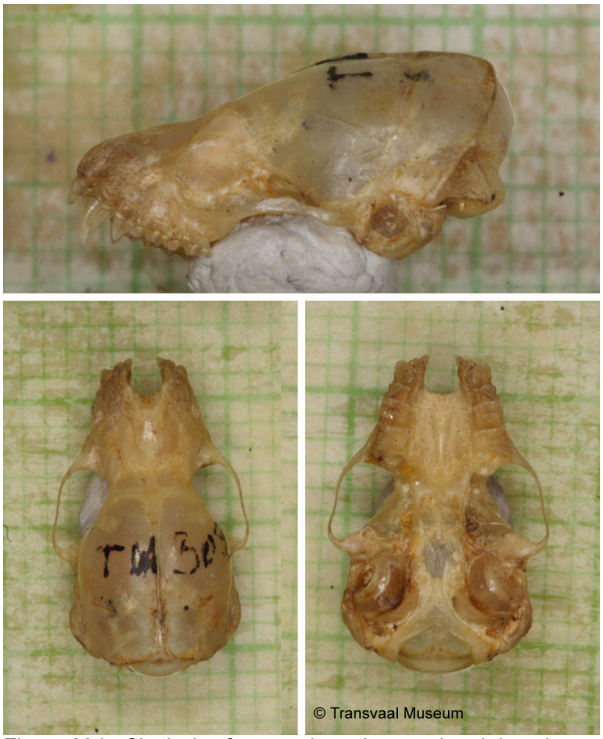

Figure 334. Clockwise from top lateral, ventral and dorsal skull images of TM 3024, holotype of *Eptesicus zuluensis* Roberts, 1924.

Detailed morphology:

Baculum - Hill and Harrison (1987) and Kearney *et al.* (2002).

Molecular Biology:

DNA - Unknown.
Karyotype - Both Rautenbach *et al.* (1993) and Kearney *et al.* (2002) recorded 2*n* = 28, FN = 48, BA = 22, and a subtelocentric X chromosome. However, as can been seen from Figure 9 in Kearney *et al.* (2002), the FN number was incorrectly reported and should be FN = 50, and BA = 24. Rautenbach *et al.* (1993) also reported an acrocentric Y chromosome. GTG-bands identified three Robertsonian fusion chromosomes (7/11, 8/9, 10,12), considered as distinguishing characters for the genus *Neoromicia* Kearney *et al.* (2002).
Protein / allozyme - See Morales *et al.* (1991) for results from three specimens from South Africa.

Habitat:

In southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) found that *N. zuluensis* is primarily present in Savanna (81 %) and SW arid (10 %) habitats.

Population:

Structure and Density - In general, this is a locally uncommon species (Jacobs and Cotterill, 2008b; IUCN, 2009).
Trends - 2008- Unknown (Jacobs and Cotterill, 2008b; IUCN, 2009).

Reproduction and ontogeny:

Monadjem *et al.* (2010d) [in Weier *et al.* (2018: Suppl.)] mentioned births from late November to early December.

Parasites:

Protozoa:
Harris *et al.* (2018: 2, 3) reported the presence of *Hepatozoon* sp. From a *Neoromicia zuluensis* from Louis Trichardt, in the Limpopo province (RSA).

Viruses:

Coronaviridae - Coronaviruses
The report of a new virus by Ithete *et al.* (2013: 1697) that was closely related to Middle East respiratory syndrome (MERS)-CoV, the host was incorrectly identified and is related to *N. capensis*.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Angola, Botswana, Ethiopia, Kenya, Malawi, Mozambique, Namibia, Rwanda, South Africa, South Sudan, Swaziland, Tanzania, Uganda, Zambia, Zimbabwe.

Neoromicia "incertae-sedis"

1857. *Vespertilio pusillus* Leconte, Proc. Acad. nat. Sci. Philad., 10. Type locality: "Africa": "Western Africa". - Comments: Kock (1969a: 228) indicates that this paper was published in 1858.
1897. *Vesperugo (Vesperus) pusillus:* Trouessart, Catalogus Mammalium tam viventium quam fossilium, fasc. I: 110. (Name Combination)
1929. *Eptesicus pusillus:* Thomas, Proc. zool. Soc. Lond., 101. - Comments: Thomas (1929: 101) assigned this name to Noack. (Name Combination)
1953. *Eptesicus (Eptesicus) pusillus:* Ellerman, Morrison-Scott and Hayman, Southern African mammals 1758 to 1951, 76. (Name Combination)
2013. *Neoromicia cf. nana:* Koubínová *et al.*, Front. Zool., 10: 1-48. - Comments: Koubínová *et al.* (2013: 7) found found differences in dipoloid chromosome number and/or in chromosome morphology between the populations from Senegal and other regions in Africa. (Name Combination)
2013. *Neoromicia cf. somalica:* Koubínová *et al.*, Front. Zool., 10: 1-48. - Comments: Koubínová *et al.* (2013: 7) found found differences in dipoloid chromosome number and/or in chromosome morphology between the populations from Senegal and other regions in Africa. (Name Combination)
? *Neoromicia "incertae-sedis"* (Current Combination)
? *Neoromicia capensis B:*

TAXONOMY:
Allen (1939a: 86) indicates that *Vespertilo pusillus* might possibly be the same form as *Vesperugo pusillus* Noack, 1887, but that the description is insufficient to identify the species. Ansell (1978: 25) - referring to Rosevear (1962) and Hayman and Hill (1971) - indicates that the status of *pusillus* Leconte is uncertain in relation to *Eptesicus minuta* Temminck, *"Eptesicus" somalicus* and *"Eptesicus" capensis*. Crawford-Cabral (1989) also points out that in southern Africa, *"Eptesicus" zuluensis* might be involved too.

Koopman (1965) and Kock (1969a: 138) consider this name to be indeterminable, and they suggest placing the small northern African *Eptesicus* specimens in the species *guineensis* Bocage, 1889.

According to Kock it is even uncertain that *pusillus* Leconte represents *Eptesicus* [= *Neoromicia* in the current context].

Kock (1969a: 159) also pointed out that the skull of the type of *Vesperugo pusillus* Noack, 1887 actually represents a non-adult *Pipistrellus nanus*.

The fact that *pusillus* Leconte and *pusillus* Noack have been considered synonymys throughout the literature, also render much of the literature data indeterminable, unless these are supported by voucher specimens.

PARASITES:
In their description of the Nematode parasite *Molinostrongylus richardae*, Durette-Desset and Chabaud (1975: 312) also mention an "*Eptesicus pusillus* from Tananarive, Madagascar as an

additional host. From the same host (species) and locality, Richard (1966: 413, 419) reported the Trematode *Plagiorchis (Plagiochis) vespertilionis* (Müller, 1784) Braun, 1900 and described another one: *Papillatrium (Papillatrium) inversum*.

Genus ***Nyctalus*** Bowdich, 1825

*1825. *Nyctalus* Bowdich, Excur. Madeira and Porto Santo, 36, and footnote. Publication date: 1825. - Comments: Type species: *Nyctalus verrucosus* Bowdich, 1825 (=*Vespertilio leisleri* Kuhl, 1817). - Etymology: From the Greek "*νυκταλός*" (="*νυσταλός*"), meaning drowsy, referring to its crepuscular habits (see Palmer, 1904: 464). From the Greek "*nyctos*" meaning night and "*ala*" meaning wing (see Kapteyn, 1995: 115). (Current Combination)

1829. *Pterygistes* Kaup, Skizzierte Entwicklungs-Geschichte Natürliche Systematik der Europäische Thierwelt, 1: 90. Publication date: 1829. - Comments: Type species: *Vespertilio noctula* Schreber, 1774. - Etymology: From the Greek "*πτερυγίζω*", meaning to flutter, referring to the manner of flight (see Palmer, 1904: 596).

1839. *Vesperugo* Keyserling and Blasius, Arch. Naturgesch. Berlin, 5 (1): 312. Publication date: 1839. - Comments: In part (see Allen, 1939a: 92; Pavlinov *et al.*, 1995: 104). Included 13 species now referred to *Eptesicus, Pipistrellus, Neoromicia, Hypsugo*.

1842. *Noctulinia* Gray, Ann. Mag. nat. Hist., [ser. 1], 10 (65): 258. Publication date: 1 December 1842. - Comments: Mentioned as "in part" by Allen (1939a: 92). Contained two species (*Noctulinia proterus* Kuhl, 1818 =*Nyctalus noctula* Schreber, 1774, and *N. fulvus* Grey, 1843 =*Scotophilus kuhlii* Leach, 1821; see Allen (1939a: 92), one a synonym of *Vespertilio noctula* Schreber, 1774 (see Corbet and Hill, 1992: 143). - Etymology: From the Latin of, or belonging to night (from "*noctus*" = "*nox*", meaning night), referring to the animal's crepuscular habits (see Palmer, 1904: 461).

1856. *Panugo* Kolenati, Allg. deutsche naturh. Zeitung, N.F., 2 (2): 131. Publication date: 1856. - Comments: Type species: *Vespertilio noctula* Schreber, 1774 and *Vespertilio leisleri* Kuhl, 1817.

1914. *Noctulinia* Cabrera, Fauna Ibérica, 123. - Comments: (also mentioned by Allen (1939a: 92), Corbet (1978: 54), and Simmons (2005))?.

2002. *Nyctalis:* Sheshurak and Kedrov, Plecotus et al., pars spec.: 62. (Lapsus)

2019. *Nyactulus:* Fagre and Kading, Viruses, 11 (3): 215 (p. 4). Publication date: 3 March 2019. (Lapsus)

? *Noctulina* Macalister, Ann. Mag. nat. Hist., ser. 4, 9 (53): 402. Publication date: 1 May 1872.

TAXONOMY:
Species referred by Koopman (1994) in the *Stenopterus* group are placed into *Pipistrellus* by Corbet and Hill (1992) and Hoofer and Van Den Bussche (2003: 38). Whereas Simmons (2005) placed it as a subgenus of *Hypsugo*.

Known species of the genus *Nyctalus*: ***azoreum*** Thomas, 1901; ***lasiopterus*** Schreber, 1780; ***leisleri*** Kuhl, 1817; *noctula* Schreber, 1774.

COMMON NAMES:
Czech: lesní netopýři (lesní létači). English: Noctules, Noctule Bats. French: Noctules, Chauves-souris à nez large. German: Abendsegler.

GENERAL DISTRIBUTION:
Species of the genus *Nyctalus* are distributed across the entire Palaerctic region, and enter only marginally into the Indomalay region (Koopman, 1994; Simmons, 2005)

Nyctalus azoreum (Thomas, 1901)

*1901. *Pterygistes azoreum* Thomas, Ann. Mag. nat. Hist., ser. 7, 8 (43): 33. Publication date: 1 July 1901. Type locality: Azores (Portugal): St. Michael [Goto Description]. Holotype: BMNH 1865.10.2.1: ♂. Collected by: Frederick DuCane Godman Esq. Presented/Donated by: Frederick DuCane Godman Esq. - Etymology: The name refers to the Island group where the species occurs.

? *Nyctalus azoreum:* (Name Combination, Current Combination)

? *Nyctalus leisleri azoreum:* (Name Combination)

TAXONOMY:
Listed as a subspecies of *N. leisleri* by Corbet (1978) and Koopman (1994: 118). But recognised as a species by Palmeirim (1991), Koopman (1993a: 216), Horácek *et al.* (2000: 133), Salgueiro *et al.* (2004: 3357), Simmons (2005: 471), Salgueiro *et al.* (2006: 169) and Salgueiro *et al.* (2008: 1163; 2010: 26).

COMMON NAMES:
Albanian: Noktulë e Azoreve. Armenian: Ազորյան իրիկնաչղջիկ Azerbaijani: Azor axşam yarasası. Basque: Gau-saguzar azoretar. Belarusian: Вячэрніца азорская. Bosnian: Azorski noćni šišmiš. Swedish: Azorfladdermus. Turkish: Azorlar Akşamcı Yarasası. Ukrainian: Вечірниця азорська. Welsh: Ystlum mawr yr Asores.

SIMILAR SPECIES:
Salgueiro *et al.* (2010: 26) provide a summary of the differences between *N. azoreum* and its closest relative *N. leisleri*. *N. azoreum* is darker and considerably smaller. It is also present in a broader ecological niche, occupying a variety of roosts like buildings, coastal cliffs and trees, whereas *leisleri* is primarily a tree dweller. Finally, it has an echolocation call with a higher peak frequency than its continental counterpart, and it is often active during the day.

CONSERVATION STATUS:
Global - Endangered (EN) (Conenna *et al.*, 2017: Suppl.)
Assessment History -
1994 - VU A2c, B1+2c ver 2.3 (1994).

MAJOR THREATS:
Sherwin *et al.* (2012: 174) identified the small distribution range, the species's aerial hawking feeding style and its long-distance dispersal to be the major risk factors linked with climatic change.

GENERAL DISTRIBUTION:
Nyctalus azoreum is endemic to the archipelago of the Azores, where it is present on seven of the nine islands (Rainho, 2017: 161).

Native: Azores (Palmeirim, 1991; Koopman, 1993a: 216; Speakman and Webb, 1993; Horácek *et al.*, 2000: 133; Salgueiro *et al.*, 2004: 3357; Simmons, 2005: 471; Salgueiro *et al.*, 2006: 169; Salgueiro *et al.*, 2008: 1163).

BIOGEOGRAPHY:
Molecular data suggest that *N. azoreum* originated from a European population of *N. leisleri*, and that the colonisation of the Azores occurred at the end of the Pleistocene (Salgueiro *et al.*, 2006). Salgueiro *et al.* (2006) suggest the minimum divergence time of insular (Azores) and continental lineages is comprised between 0 and 55,000 years BP. This corresponds roughly to a late Pleistocene/Holocene divergence, which is consistent with previous estimates based on demographic parameters (12,000 and 25,000 years BP) calculated by Salgueiro *et al.* (2004). As humans only colonized the Azores less than 600 years ago, molecular estimates of divergence times suggest that the first bats which arrived on the archipelago were unlikely to be brought by man (Salgueiro *et al.*, 2006).

MOLECULAR BIOLOGY:
Moussy *et al.* (2012: 188), referring to Salgueiro *et al.* (2004; 2008), indicate that *N. azoreum* is one of the species that shows significant genetic differentiation and/or haplotype segregation between islands or groups of islands but not within them.

Boston *et al.* (2015) examined the mitochondrial DNA of *N. azoreum* and *N. leisleri* and found that two separate lineages were present and that *N. azoreum* forms one lineage with *N. leisleri* from Britain and Ireland, whereas the second lineage consists of continental European *N. leisleri*.

HABITS:
Speakman and Webb (1993: 28) refer to Moore (1975) to point out that *N. azoreum* is one of those exceptional bats, which fly during the day. Irwin

and Speakman (2003: 185) furthermore found that *N. azoreum* clusters when emering from their roosts. This was quite unexpected as no flying predators are present on the Azores which could capture bats while leaving the roosts.

POPULATION:
Based on a survey, conducted in September-October 1988, Speakman and Webb (1993: 27) estimated the population of *N. azoreum* to consists of between 1,750 (from daytime activity) and 23,650 (from nighttime activity) animals. The latter figure would lead to a population density of 1 bat per 10 ha.

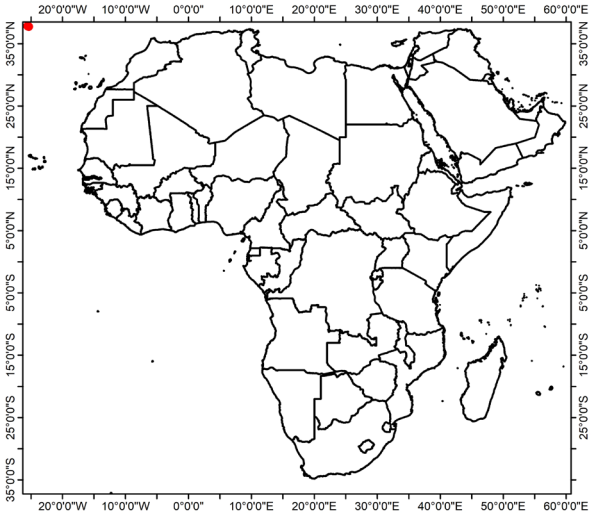

Figure 336. Distribution of *Nyctalus azoreum*

Lithuanian: Didysis nakviša. Luxembourgish: Riseg Bëschfliedermaus. Macedonian: Голем вечерник. Maltese: Noktula Kbir. Montenegrin: Veliki noćnik. Norwegian: Riseflaggermus. Polish: Borowiec olbrzymi. Portuguese: Morcego-arboricola-gigante. Rhaeto-Romance: Sgolanotg gigant. Romanian: Liliacul mare de amurg. Russian: Вечерница гигантская, Гигантская вечерница [= Gigantskaya vechernicha]. Serbian: Велики ноћник [= Veliki noćnik]. Scottish Gaelic: Mòr-ialtag oidhcheach. Slovak: Raniak obrovský. Slovenian: Veliki mračnik. Swedish: Pälsvingad brunfladdermus. Turkish: Büyük Akşamcı Yarasa.

Ukrainian: Вечірниця гігантська. Welsh: Ystlum mwyaf.

CONSERVATION STATUS:
Global - Deforestation, particularly the loss of old trees, is a problem in many parts of the range and is likely to be causing a population decline. The range is fragmented and the colonies tend to be mainly small. Although there are no precise figures on population decline it seems reasonable to list this species as Near Threatened (NT ver 3.1 (2001)) given what is currently known about the threats, the population numbers and the range. Almost qualifies as VU under criteria A4c (Hutson *et al.*, 2008a; IUCN, 2009).

Assessment History -
2008 - NT ver 3.1 (2001) (Hutson *et al.*, 2008a; IUCN, 2009). 1996 - LR/nt ver 2.3 (1994).

MAJOR THREATS:
Little is known about potential threats, but loss of mature woodland and loss of or disturbance to roost sites (in old trees and buildings) may have a negative impact on the species. Some individuals were found dead at wind farms in Spain (J.T. Alcalde *pers. comm.,* 2006 in Hutson *et al.* (2008a) in IUCN (2009)), and all pups were found dead in 2005 at one of the two known colonies in Spain (located in a city park). The cause of these deaths was not known (J.T. Alcalde *pers. comm.,* 2006 [in Hutson *et al.* (2008a) in IUCN (2009)]). In Spain cutting of old trees, which are used as roosts, is a threat (Hutson *et al.*, 2008a; IUCN, 2009).

Small distribution range, cave/tree roosting, and the aerial hawking feeding style were considered to be risk factors linked with climatic change by Sherwin *et al.* (2012: 174).

CONSERVATION ACTIONS:
Hutson *et al.* (2008a) [in IUCN (2009)] report that it is protected by national legislation in most range states. There are also international legal obligations for its protection through the Bonn Convention (Eurobats) and Bern Convention, in parts of its range where these apply. It is included in Annex IV of EU Habitats and Species Directive. No specific conservation actions are known. It occurs in a number of national parks and protected areas within its range (K. Tsytsulina *pers. Comm.,* 2005). However, in Spain the two known colonies are outside protected areas (J.T. Alcalde *pers. Comm.,* 2006). More information is needed on population size and trends, ecology, and potential threats.

GENERAL DISTRIBUTION:
Nyctalus lasiopterus has a very scattered distribution through central and southern Europe (Iberia to the Balkans, Urals) and north Africa (Morocco [only three records in northwest Morocco, the first of which was reported as *N. noctula* by Laurent (1937d), but see Palmeirim (1982: 402)], Libya [five records in Cyrenaica], and possibly Algeria [possibly one record in Algeria identified as *Nyctalus noctula* by Loche (1867), the specimen is lost]). There are an increasing number of records from Turkey (Karatas *et al.*, 2007). Outside the Mediterranean region the range extends eastwards through Asia Minor to the Caucasus, northern Iran, Kazakhstan and the Urals in Russia. Of the Mediterranean islands, recorded on Sicily. Until 1999, it had been recorded in 120-130 localities in Europe (Benzal, 1999). It occurs up to 1,900 m in Switzerland

Native: Azerbaijan; Belarus; Bulgaria; Cyprus (Benda *et al.*, 2007: 71); Croatia; Czech Republic; France; Georgia; Germany; Gibraltar; Greece; Hungary; Iran, Islamic Republic of; Italy (Sicilia); Kazakhstan; Libyan Arab Jamahiriya; Macedonia, the former Yugoslav Republic of; Moldova; Monaco; Morocco (El Ibrahimi and Rguibi Idrissi, 2015: 363); Poland; Portugal; Romania; Russian Federation; Slovakia; Slovenia; Spain; Switzerland; Turkey; Turkmenistan; Ukraine.
Presence uncertain: Algeria; Andorra; Bosnia and Herzegovina; Uzbekistan.

ECHOLOCATION:
Walters *et al.* (2012: suppl.) report the following figures for 26 calls (22 sequences) from French bats: duration: 22.87 ± 2.92 msec, F_{max}: 17.00 ± 4.68 kHz, F_{min}: 13.28 ± 1.55 kHz, bandwidth: 3.72 ± 3.24 kHz, F_{peak}: 14.29 ± 1.66 kHz.

MOLECULAR BIOLOGY:
Karyotype - Arslan and Zima (2014: 12) reported $2n$ = 42, FNa = 50, FN = 54, a medium-sized metacentric X, and a small acrocentric Y. The autosomal complement contains four large metacentric, one small submetacentric and 15 acrocentric autosomal pairs.

ROOST:
The only specimen found in a roost in Libya by Benda *et al.* (2014c: 87) was in a fist-sized hole in an overhang, some 6 m above the ground. This represented the first non-tree roost site found for this species.

DIET:
In Russia, Smirnov and Vekhnik (2013: 207) found that the diet of *N. lasiopterus* included the following orders of insects: Orthoptera, Coleoptera, Lepidoptera, Diptera, Homoptera, and Neuroptera. They also found an amount of feathers: Out of 14 fecal pellets, the feathers made up 80 - 90 % of the total fecal volume in six pellets, 50 - 60 % in three

pellets, 20 - 40 % in four pellets, and less than 10 % in one pellet.

Andreas (2010: 266) referred to three hypotheses concerning the occurrence of feathers in the bat's feaces: "The first possibility was that *N. lasiopterus* is not able to distinguish between flying feathers and its usual preys and eats a lot of this indigestible material. The second possibility was that *N. lasiopterus* regularly feeds on birds and consumes prey that can represent some 30 % of its body weight on the wing. The third possibility can be a predation in tree hollows.", of which Popa-Lisseanu *et al.* (2007: 1) proved the second to be correct, especially during the migration season of the small passerine birds. Benda *et al.* (2012a: 455) furthermore indicate that carnivory is probably a local and/or seasonal phenomenon.

Digestive tracts from five bats collected in Cyrenaica, Libya, contained moths, carabid beetles, heteropterans, neuropterans, and cockroaches (Benda *et al.*, 2014c: 93). 30 faecal pellets from Cyprus contained mainly Hymenoptera, Auchenorrhyncha and Scarabaeid beetles, and also some moths and heteropterans Andreas (2010: 266).

POPULATION:
Structure and Density - The patchy distribution and low population density in most of range suggest a relatively small global population. Breeding colonies are typically small (up to 35 females), and few are known. Only two larger-sized (50 - 100 females) breeding colonies are known in the world. It is rare throughout the range in the Russian Federation (K. Tsytsulina *pers. comm.,* in Hutson *et al.*, 2008a) [in IUCN, 2009)]). There is a strong population in northern Hungary (Hutson *et al.*, 2008a; IUCN, 2009).
Trend - 2008 - Decreasing (Hutson *et al.*, 2008a; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
Tuttle and Stevenson (1982: 123) indicate that females are sexually mature at about four months, and males at about 16 months.
From Japan, Maeda (1972: 270) reported that in captivity, young were born between 26 June and 13 July. Six of the nine captive females had two young each, while the others had one. The dissection of 10 free-living females indicated that seven had twin embryos (one in each uterine horn). Of the fifteen young born in the laboratory, 10 were females, but of eight embryos from free-living females, five were males. This resulted in an overall sex ratio (♂/♀) of 0.77.

POSTNATAL DEVELOPMENT:
Maeda (1972: 272 - 276) reported that twin young were born either naked or with very few hairs on their backs, whereas single young had scattered, thin hairs. The body hair starts to grow from the dorsal side of the rump to the head and to the ventral sides, and reaches the same length as in the adults at about 40 days, but its colour is still darker. For singletons, the eyes opened after four to seven days, but in twins this happened only after seven to 11 days. In some animals there were four days between the opening of one of the eyes and the second. The body size of the single youngs was larger than for twins. Single young grew up to become larger adults. At birth, the young's hind foot already measured 83 % of the adult size, and their thumbs were 77 % of the adult size, whereas the forearm length was only 36 %, and the fingers were even smaller (23, 24 and 27 % respectively for fingers 3, 4 and 5). At 40 to 45 days, the forearm reaches almost adult size. For the fifth finger, this takes 45 to 50 days and for the third and fourth fingers, this is 50 to 55 days. The hind feet and thumbs were almost fully grown after 20 to 28 days. The body weight increases to about 22 to 30 grams at about 30 days after birth and then decreases until the young starts to feed itself. The young started to fly between 40 and 45 days of age.

VIRUSES:
Coronaviridae
Alphacoronavirus
Kohl and Kurth (2014: 3112) report this virus from bats in Spain.

Nyctalus leisleri (Kuhl, 1817)

*1817. *Vespertilio Leisleri* Kuhl, Die Deutschen Fledermäuse, Hanau, 14, 46. Type locality: Germany: Hessen: Hanau [50 07 N 08 56 E]. Syntype: ZMB 471: skin and skull. See Turni and Kock (2008). Syntype: ZMB 472: skull only. See Turni and Kock (2008). - Comments: Koopman (1992) mentions 1817 as year of publication. Corbet and Hill (1992: 144), however, mention "1819: 46". Baagøe (2001: 90) mentions 1818. - Etymology: In honour of Philipp Achilles Leisler (1772 - 1813) (see Kozhurina, 2002: 16).

1819. *Vespertilio dasykarpos* Kuhl, Die Deutschen Fledermäuse, Hanau, 49. - Comments: Alternative for *leisleri*: see Ellerman and Morrison-Scott (1951: 159).

1825. *Nyctalus verrucosus* Bowdich, Excur. Madeira and Porto Santo, 36, and footnote. Publication date: 1825. Type locality: Madeira (Portugal): "Madeira" [32 44 N 15 58 W] [Goto Description].

1839. *Vespertilio pachygnathus* Michahelles, in: Wagner, Schreber's Säugeth, Suppl. 1: pl. 55b. Type locality: Croatia: Dalmatia.

1906. *Pterygistes madeiræ* Barrett-Hamilton, Ann. Mag. nat. Hist., ser. 7, 17 (97): 98. Publication date: 1 January 1906. Type locality: Madeira (Portugal): "Madeira" [32 44 N 15 58 W] [Goto Description]. Holotype: BMNH 1907.1.1.392: ♀, skull and alcoholic. - Comments: Type specimen procured by Mason, nr 1 Tomes collection (see Barrett-Hamilton, 1906: 99).

? *Nyctalus leisleri:* (Name Combination, Current Combination)

TAXONOMY:
Includes *verrucosus*, see Corbet (1978: 55), who also included *azoreum*; but see Palmeirim (1991) and Salgueiro *et al.* (2006). Based on mitochondrial DNA, Boston *et al.* (2007: 120) indicate that Irish populations belong to the same lineage as *azoreum* and differ from *leisleri* in the rest of Europe, but this is not confirmed by Boston *et al.* (2008).

Simmons (2005: 472) recognises *verrucosus* Bowditch, 1825 as a valid subspecies.

COMMON NAMES:
Albanian: Noktulë e Leisler-it. Armenian: Փոքր իրիկնաչղջիկ. Azerbaijani: Kicik axşam yarasası. Basque: Leisler gau-saguzar. Belarusian: Вячэрніца малая. Turkish: Küçük Ağaç Yarasası. Ukrainian: Вечірниця мала. Welsh: Ystlum Leisler.

CONSERVATION STATUS:
Global - The species is widespread and abundant, and there is no evidence of current significant population decline. Consequently, it is assessed as Least Concern LC ver 3.1 (2001) (Hutson *et al.*, 2008l; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Hutson *et al.*, 2008l; IUCN, 2009). 1996 - LR/nt ver 2.3 (1994).

MAJOR THREATS:
Threats include disturbance to and destruction of roosts in trees and buildings, and loss or degradation of foraging habitat. However, these

are not thought to be major threats at present (Hutson *et al.*, 2008l; IUCN, 2009).

The major risk factors related to climatic change were identified by Sherwin *et al.* (2012: 174) as being cave/tree roosting and aerial hawking.

CONSERVATION ACTIONS:
Hutson *et al.* (2008l) [in IUCN (2009)] reported that it is protected by national legislation in most range states. There are also international legal obligations for its protection through the Bonn Convention (Eurobats) and Bern Convention, in parts of its range where these apply. It is included in Annex IV of EU Habitats and Species Directive, and there is some habitat protection through Natura 2000. It occurs in protected areas throughout its range. No specific conservation actions known.

GENERAL DISTRIBUTION:
Nyctalus leisleri is largely a western Palaearctic species (Europe and north-west Africa), with scattered records in the western parts of the eastern Palaearctic (Pakistan, Afghanistan, the Himalayas). It is widely distributed in Europe from southern Scotland and Ireland more or less along southern edge of the Baltic Sea south and parts of Mediterranean coast to western Russia. It is present on Madeira and the Canary Islands (on Tenerife and La Palma only) but absent from southwestern Italy and Sicily, eastern Spain, most of Fennoscandia and northern Russia. In North Africa it is recorded from Mediterranean montane Morocco and Algeria and there is one record from Cyrenaica (Libya). It occurs from sea level to 2,400 m.

Native: Afghanistan; Albania; Algeria (Hanák and Gaisler, 1983: 585; Gaisler, 1984: 89); Andorra; Armenia; Austria; Azerbaijan; Belarus; Belgium; Bosnia and Herzegovina; Bulgaria; China; Croatia; Cyprus (Benda *et al.*, 2007: 71); Czech Republic; France (Corse); Georgia; Germany; Gibraltar; Greece; Hungary; India; Iran, Islamic Republic of; Ireland; Italy; Kazakhstan; Latvia; Libyan Arab Jamahiriya (Hanák and Gaisler, 1983: 585); Liechtenstein; Lithuania; Luxembourg; Macedonia, the former Yugoslav Republic of; Moldova; Montenegro; Morocco (Benda *et al.*, 2004d; 2010a: 158; El Ibrahimi and Rguibi Idrissi, 2015: 363); Netherlands; Pakistan; Poland; Portugal (Madeira); Romania; Russian Federation; Serbia; Slovakia; Slovenia; Spain (Canary Is.); Sweden; Switzerland; Turkey; Ukraine; United Kingdom.

BIOGEOGRAPHY:
Molecular data suggest that *N. leisleri* from the Canary Islands probably came from North Africa (Morocco) population (Salgueiro *et al.* (2006).

DENTAL FORMULA:
Matthews (1950: 12) describes the milk dentition, consisting of two trilobed incisors, one canine with one large central lobe and two very small lateral lobes, and two trilobed premolars in the upper cheek. The lower cheek contains two trilobed incisors and one bilobed one, a well developed, trilobed canine, and two trilobed premolars (but the posterior lobe of the second one is very much reduced).

ECHOLOCATION:
For 6 Greek specimens, Papadatou *et al.* (2008b: 132) report a start frequency of 47.5 ± 3.67 kHz, a terminating frequency of 27.0 ± 1.10 kHz, a peak frequency of 31.7 ± 0.87 kHz, and a bandwidth of 12.3 ± 2.96 kHz. The duration of the call is 4.2 ± 1.30 msec, and the interpulse interval is 153.4 ± 62.36 msec.
Walters *et al.* (2012: suppl.) present the following numbers for 76 calls from bats from France, Greece, Switzerland and the UK: duration: 9.39 ± 3.86 msec, F_{max}: 42.20 ± 14.77 kHz, F_{min}: 25.75 ± 2.75 kHz, bandwidth: 16.45 ± 12.45 kHz, F_{peak}: 28.61 ± 5.27 kHz.

Benda *et al.* (2012a: 183) present two series of data for specimens from Iran: **1**: F_{start}, 47.4 ± 4.2 (41.7 - 56.2) kHz, F_{end}: 30.3 ± 0.8 (28.7 - 31.3) kHz, F_{peak}: 34.0 ± 1.1 (31.2 - 35.2) kHz, duration: 3.8 ± 1.1 (2.6 - 6.8) msec, and interpulse interval: 112.8 ± 63.2 (48.2 - 262.9) msec; **2** (hand released): F_{start}: 43.3 ± 2.7 (40.4 - 46.7) kHz, F_{end}: 26.3 ± 0.8 (24.8 - 26.8) kHz, F_{peak}: 28.4 ± 0.4 (28.0 - 28.9) kHz, duration: 6.1 ± 0.3 (5.7 - 6.5) msec, and interpulse interval: 106.2 ± 2.0 (104.9 - 109.3) msec.

MOLECULAR BIOLOGY:
Karyotype - Arslan and Zima (2014: 12) reported $2n$ = 44 + Bs, FNa = 50, FN = 54, a medium-sized metacentric X, and a dot-like acrocentric Y. The autosomal component consists of three large metacentric, one small submetacentric and 17 acrocentric autosomal pairs. They also indicate that this set can also include 1 to 3 dot-like supernumerary chromosomes (Bs). In one Turkish male, Arslan and Zima (2014: 12) furthermore found a dot-like supernumerary chromosome, leading to $2n$ = 45.

Molecular analyses performed by Boston *et al.* (2015: 1) revealed that two distinct mitochondrial DNA lineages are present: an eastern lineage of *N. leisleri* distributed throughout continental

Europe and a western lineage, including *N. leisleri* from Ireland and Britain, but also *N. azoreum* from the Azores.

HABITAT:
In Switzerland, Szentkuti *et al.* (2013: 110) found that foraging *N. leisleri* selected deciduous woodlands over other habitat types (pasture, confirous forest and settlements). They also reported that the bat's nightly mean (± SE) distance travelled was 1,969 ± 1,754 m, and that the maximum distance between the most distant location and the previous roost was on average (4,678 ± 1,082; 1,080 - 13,614 m).

ROOST:
In southern Switzerland, Spada *et al.* (2008: 81) found that *N. leisleri* prefers to roost in live chestnut trees (*Castanea sativa*), with large diameter and in absence of vegetation near the entrance.

DIET:
Kanuch *et al.* (2005: 253) identified seven orders of insects in 154 faecal pellets examined from Slovakian bats. These belonged to the Aphididae (Homoptera), Heteroptera, Chrysopidae (Neuroptera), Coleoptera, Ichneumonidae and Formicidae (Hymenoptera), Lepidoptera, Nematocera and Brachycera (Diptera). The most important group (in both frequency [100 %] and volume [55.7 %]) were Lepidoptera.
Benda *et al.* (2012a: 460 - 461) indicate that European studies showed that this species' diet is relatively variable depending on the foraging habitat. In forests, Lepidoptera and nematoceran Diptera are most often present, whereas in the landscapes with a larger proportion of pastures the dung flies (Scatophagidae) and scarabaeid beetles were more significantly represented. Other groups that were present include Trichoptera, Neuroptera, and Hymenoptera. In more arid habitats in the Middle East, Hymenoptera (Formicoidea), Trichoptera, and Coleoptera (namely Carabidae and Curculionidae) are the main groups present in the diet.

POPULATION:
Structure and Density - It is widespread although patchily distributed in Europe. Common in parts of range (e.g., Ireland), scarce in other parts (Stebbings and Griffith, 1986). Local extinctions have been reported for the central part of Russian Federation (K. Tsytsulina *pers. comm.* 2005), although the species remains common in other parts of Russia and the Caucasus (S. Kruskop *pers. comm.,* 2005). In North Africa it is limited by the distribution of suitable habitat, but is particularly abundant in Djurdjura, NE Algeria (Hutson *et al.*, 2008l; IUCN, 2009).

LIFESPAN:
Szekely *et al.* (2015: Suppl.) report a maximum longevity of 16 years.

PARASITES:
The Nematode *Molinostrongylus vespertilionis* Morosov and Spassky, 1961 was reported by Genov *et al.* (1992) from Hungary, Moldova and Ukraine.

Estrada-Peña and Sanchez (1988: 305) described *Steatonyssus (Steatonyssus) balcellsi* from a *N. leisleri* specimen from Frontera, Canary Islands.

In Slovakia, Kanuch *et al.* (2005: 252) reported the presence of the following ectoparasites:
mites: *Steatonyssus spinosus* (family Dermanyssidae), *Macronyssus flavus* (Macronyssidae), *Spinturnix helvetiae* (Spinturnicidae); fleas: *Ischnopsyllus intermedius, I. variabilis* (Ischnopsyllidae); and flies: *Nycteribia latreillii, N. (Acrocholidia) vexata* (Nycteribiidae).
They found that 100 out of 177 (56.5 %) of the examined bats carried at least one parasite, but only 15.3 % of these had two different species of parasites. Only *S. spinosus* and *S. helvetiae* were found abundantly (resp. 31.3 and 55.4 %), all other species occurred on less than 5 % of the bats.

VIRUSES:
Coronaviridae
Alphacoronavirus
This virus was reported from bats from Germany by Kohl and Kurth (2014: 3112).
Betacoronavirus
The virus was reported by Kohl and Kurth (2014: 3112) from Bulgaria and Germany.

Orthomyxoviridae
Despite sampling and testing of 64 individuals of this species, no evidence of influenza A-like viruses (*Orthomyxoviridae*) were obtained (Fereidouni *et al.*, 2015).

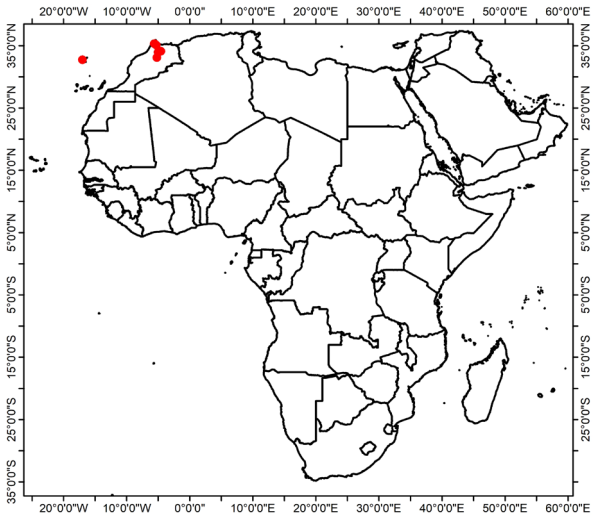

Figure 338. Distribution of *Nyctalus leisleri*

DISTRIBUTION BASED ON VOUCHER SPECIMENS: "Africa", Azores (Portugal), Madeira (Portugal), Morocco.

Genus ***Nycticeinops*** Hill & Harrison, 1987

*1987. *Nycticeinops* Hill and Harrison, Bull. Br. Mus. (nat. Hist.) Zool., 52 (7): 254. - Comments: Type species: *Nycticejus schlieffeni* Peters, 1859. - Etymology: Lanza *et al.* (2015: 364) mention the following: "masculin scientific Latin substantive made up of the masculine scientific Latin substantive *Nycticeius* (Nicticèius) and the feminine Greek substantive "*ὄφις*" (ópsis) 'aspect, appearance', referring to the likeness of the genus *Nycticeinops* to the genus *Nycticeius*, The etymology proposed by Hill and Harrison (1987) is imperfect". (Current Spelling)

TAXONOMY:
Bronner *et al.* (2003) state that the genus *Nycticeius* has long been considered to comprise two species: *N. humeralis*, from North America, and *N. schlieffenii* from Africa and Arabia. Koopman (1978) found these species so similar that he retained them in the same genus, a treatment disputed by Kitchener and Caputi (1985). Hill and Harrison (1987) demonstrated consistent differences between these species in baculum morphology and proposed the allocation of *schlieffeni* to the distinct genus *Nycticeinops*. Extensive karyotypic differences between the American *humeralis* (2*n* = 46 and FN = 48; Baker and Patton, 1967; Bickham, 1979) and East African *schlieffeni* (2*n* = 34 and FN = 52) provide additional evidence that the two species are not congeneric (Ruedas *et al.*, 1990) and mtDNA sequence divergence data strongly support their allocation to distinct genera (Hoofer and Van Den Bussche, 2001). However, Rautenbach *et al.* (1993) report an intermediate karyotype of 2*n* = 42 and FN = 50 for *schlieffeni* from South Africa. This not only suggests the existence of two species in Africa, but also casts some doubt on the karyotypic basis for generic distinction between these forms. We nevertheless recognise these as distinct genera owing to clearcut differences in bacular and mtDNA properties.

Meester *et al.* (1986) state that *Scoteinus* Dobson, 1875 has frequently been included in this genus for the species *schlieffenii*, either as a subgenus (Ellerman *et al.*, 1953; Hayman and Hill, 1971), or as a synonym (Rosevear, 1965). Allen (1939a) and Roberts (1951) regard *Scoteinus* as a valid genus, which includes *schlieffenii*. However, Sinha and Chakraborty (1971) place *Nycticeius emarginatus* (Dobson, 1871), the type species of *Scoteinus*, in the distinct Indo-Malayan genus *Scotomanes*, and Koopman (1975, 1978) accordingly regards *schlieffenii* as a *Nycticeius* sensu stricto.

Known species of the genus *Nycticeinops*: ***schlieffeni*** (Peters, 1859), ***†serengetiensis*** Gunnell, Butler, Greenwood and Simmons, 2015.

COMMON NAMES:
Czech: Schlieffenovi netopýři. English: Twilight bats. French: Nycticeinops. German: Abendfledermäuse. Italian: Nitticèinopi, Nicticèinopi.

†***Nycticeinops serengetiensis*** Gunnell, Butler, Greenwood and Simmons, 2015

*2015. *Nycticeinops serengetiensis* Gunnell, Butler, Greenwood and Simmons, Am. Mus. Novit., 3846: 1, 17, figs 9C-H, 10. Publication date: 16 December 2015 [Goto Description]. - Etymology: Named for the famed Serengeti region in northern Tanzania where Olduvai Gorge is located (Gunnell *et al.* (2015a: 18).

SIMILAR SPECIES:
The teeth of *N. serengetiensis* are on average 20 % larger than those of *N. schlieffeni*.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Timeframe: Pleistocene.

Nycticeinops schlieffenii (Peters, 1859)

*1859. *Nycticejus Schlieffenii* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, p. 224. Type locality: Egypt: Cairo [30 03 N 31 15 E] [Goto Description]. Holotype: ZMB 585: ad ♂, alcoholic and cranium only (no mandibula). Collected by: Graf Afred von Schlieffen. See Turni and Kock (2008: 53). - Comments: Allen (1939a: 97) mentioned 1860 as year of publication, Kock (1969a: 186) mentions 1859. The publication covers a meeting held on 28 February 1859. - Etymology: In honour of the collector Count Wilhelm von Schlieffen-Schlieffenburg (Smithers, 1983: 111). Johnston (2006: 3) mentions Schlieffen-Schlieffiennburg. Lanza *et al.* (2015: 366) [referring to Beolens *et al.* (2009)] mention Graf Wilhelm Schlieffen von Schlieffenberg (1833 - ?).

1877. *N[ycticejus] adovanus* Heuglin, Reise in Nordost Afrika, 2: 34. Publication date: 1877. Type locality: Ethiopia: Tigre province: As(s)am river: Adowa [14 10 N 38 54 E, 1 900 m] [Goto Description].

1887. *Scotophilus minimus* Noack, Zool. Jb. Syst., 2 (2): 280, pl. 10, fig. 36 - 37. Publication date: 7 May 1887. Type locality: Tanzania: (formerly indicated as in Democratic Republic of the Congo): Marungu: Qua Mpala [06 43 S 29 31 E] [Goto Description]. - Comments: Kock (1969a: 187), Meester *et al.* (1986: 62) situate Qua Mpala in the Democratic Republic of the Congo, not in Tanzania. Noack (1887: 280) refers to the type specimen as a female with separate skull.

1905. *Scotophilus schliefferri:* Schwann, Novit. Zool., 12 (1): 1. (Lapsus)

1908. *Scoteinus schlieffeni albiventer* Thomas and Wroughton, Proc. zool. Soc. Lond., 1908, III: 540. Publication date: 30 October 1908. Type locality: Sudan: Northern province: Naikhala.

1908. *Scoteinus schlieffeni australis* Thomas and Wroughton, Proc. zool. Soc. Lond., 1908, III: 539. Publication date: 30 October 1908. Type locality: Mozambique: 120 km SW Inhambane: Coguno [24 23 S 34 32 E] [Goto Description]. - Comments: Considered a valid subspecies of *Nycticeius schlieffeni* by Taylor (1998: 56).

1908. *Scoteinus schlieffeni bedouin* Thomas and Wroughton, Proc. zool. Soc. Lond., 1908, III: 540. Publication date: 30 October 1908. Type locality: : Jemen, Aden, Lahej.

1911. *Nycticeius africanus* G.M. Allen, Bull. Mus. comp. Zool., 54 (6): 328. Publication date: December 1911. Type locality: Kenya: Northern Guaso Nyiro: Meru River: effluent of northern Guaso Nyiro [=Ewaso Ngiro] [00 03 N 37 39 E] [Goto Description]. Holotype: MCZ 8272: ♂, skin and skull. Collected by: Glover Morrill Allen; collection date: 11 August 1909; original number: 113. See Allen (1911: 328); Helgen and McFadden (2001: 147). - Comments: Thorn *et al.* (2009: 57) mention 00 29 N 37 40 E as coordinates for the type locality.

1916. *Scotoecus cinnamomeus* Wettstein, Anz. kais. Akad. Wiss., Wien, 53: 191. Publication date: 1916. Type locality: Sudan: Kordofan province: Nubbaka [=En Nabbaka] [12 35 N 29 55 E] [Goto Description]. - Comments: Thorn *et al.* (2009: 57) mention 12 47 N 30 46 E as coordinates for the type locality. Type specimen: ♀, collected by Prof. Dr. Franz Werner, collection date 17 March 1914. Two cotypes [= paratypes], 1 ♀ from Nubbaka, collection date 17 March 1914; 1 ♀ from Dilling, collection date: 20 March 1914 (see Wettstein, 1916: 191).

1926. *Scoteinus schleiffeni:* Cabrera and Ruxton, Ann. Mag. nat. Hist., ser. 9, 17 (103): 594. Publication date: 1 May 1926. (Lapsus)

1932. *Scoteinus schlieffenii fitzsimonsi* Roberts, Ann. Transv. Mus., 15 (1): 17. Publication date: 1 October 1932. Type locality: Botswana: N Bechuanaland, Ngamiland,: Tsotsoroga Pan [18 40 S 24 25 E] [Goto Description]. Holotype: TM 6550: ad ♂, skin and skull. Collected by: The Vernay-Lang Kalahari Expedition 1930; collection date: 19 June 1930; original number: 833. . Cotype: TM 6551: ad ♂, skin and skull. Collected by: The Vernay-Lang Kalahari Expedition 1930; collection date: 19 June 1930; original number: 830.
2010. *Nycticeinops schlieffeni:* Monadjem, Taylor, Cotterill and Schoeman, Bats of Southern and Central Africa. A biogeographic and taxonomic synthesis. Wits University Press, Johannesburg, 486. (Alternate Spelling)
2012. *Nycticeinops schilieffeni:* Manga Mongombe, Master's thesis. University of Maroua, Cameroon, 12. (Lapsus)
2016. *Nycticeius schleifeni:* Mikula, Morelli, Lucan, Jones and Tryjanowski, Mammal Rev.. Publication date: 20 January 2016. (Lapsus)
? *Nycticeinops schlieffeni albiventer:* (Name Combination)
? *Nycticeinops schlieffeni fitzsimonsi:* (Name Combination)
? *Nycticeinops schlieffeni schlieffeni:* (Name Combination)
? *Nycticeinops schlieffenii:* (Name Combination, Current Combination)
? *Nycticeius (Scoteinus) schleiffenii:* (Name Combination)
? *Nycticeius schlieffeni australis:* (Name Combination)
? *Nycticeius schlieffeni:* (Alternate Spelling)
? *Nycticeius schlieffenii:* (Name Combination)

TAXONOMY:

Figure 339. A female *Nycticeinops schlieffenii* (TM 48141) caught at Makalali-GR, Limpopo, South Africa.

Includes *cinnamomeus*; see Koopman (1975: 412 - 413). Assigned to the genus *Nycticeinops* by Harrison and Bates (1991: 94) and Hutson *et al.* (2001: 29), which is considered a subgenus of *Nycticeius* by Pavlinov *et al.* (1995: 116).

COMMON NAMES:
Afrikaans: Schlieffen se vlermuis, Schlieffen-vlermuis, Klein dakvlermuis. Chinese: 施氏墓蝠. Czech: netopýr Schlieffenův, netopýr krátkouchý. Dutch: Schlieffens vleermuis. English: Schlieffen's Bat, Schlieffen's Twilight Bat. French: Nycticeinops de Schlieffen, Chauve-souris du crépuscule, Chauve-souris de Schlieffen. German: Schlieffens Abendfledermaus. Italian: Nitticèinope di Schlieffen, Nicticèinope di Schlieffen. Kiluba (DRC): Kasusu. Portuguese: Morcego de Schlieffens.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Butler and Greenwood (1965) found material in the early Pleistocene at Olduvai, which they referred to as "cf *Nycticeius* (*Scoteinus*) *schlieffeni* (Peters)" (see Butler (1978).

CONSERVATION STATUS:
Global - Widespread and rather common, with no major threats. Assessed as Least Concern LC ver 3.1 (2001) (Jacobs *et al.*, 2008b; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) [as *Nycticeinops schlieffeni*] (Jacobs *et al.*, 2008b; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Jacobs *et al.*, 2004am; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - LC ver 3.1 (2001) (Monadjem *et al.*, 2016o). 2004 - LC ver 3.1 (2001) (Friedmann and Daly, 2004).

MAJOR THREATS:
None known (Jacobs *et al.*, 2008b; IUCN, 2009).

CONSERVATION ACTIONS:
Jacobs *et al.* (2008b; IUCN, 2009).

GENERAL DISTRIBUTION:
Distribution is split into two: one range in W Africa (including N Senegal, S Mauritania, Burkina Faso, Togo, Benin, and Nigeria), and one covering much of E and S Africa (as far south as NE Swaziland). The species is absent from much of the Horn of Africa, NE Ethiopia, E Tanzania, and NE Mozambique. There is a smaller central African range in NE Democratic Republic of the Congo (DRC). There are also records from Niger, Central

African Republic (CAR), and the Nile delta in Egypt.

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 1,003,159 km^2. Babiker Salata (2012: 50) indicated that the distribution in the RSA is mostly affected by the annual mean temperature.

Native: Angola (Crawford-Cabral, 1989; Monadjem *et al.*, 2010d: 570; Taylor *et al.*, 2018b: 63); Benin (Capo-Chichi *et al.*, 2004: 163); Botswana (Archer, 1977; Monadjem *et al.*, 2010d: 570); Burkina Faso (Kangoyé *et al.*, 2015a: 621); Cameroon; Central African Republic; Chad; Congo (The Democratic Republic of the) (Noack, 1887; Hayman *et al.*, 1966; Monadjem *et al.*, 2010d: 570); Djibouti (Pearch *et al.*, 2001: 388); Egypt; Eritrea; Ethiopia (Lavrenchenko *et al.*, 2004b: 147); Ghana; Kenya; Malawi (Happold *et al.*, 1988; Monadjem *et al.*, 2010d: 570); Mali (Meinig, 2000: 105); Mauritania (Allegrini *et al.*, 2011: 3); Mozambique (Smithers and Lobão Tello, 1976; Monadjem *et al.*, 2010d: 570; Monadjem *et al.*, 2010c: 384); Namibia (Monadjem *et al.*, 2010d: 571); Niger; Nigeria; Saudi Arabia; Senegal; Somalia; South Africa (Monadjem *et al.*, 2010d: 571); Sudan; Swaziland (Monadjem *et al.*, 2010d: 571); Tanzania; Togo; Uganda (Kityo and Kerbis, 1996: 62); Yemen (Benda *et al.*, 2011b: 41); Zambia (Ansell, 1978; Monadjem *et al.*, 2010d: 571); Zimbabwe (Monadjem *et al.*, 2010d: 571).

GEOGRAPHIC VARIATION:
Koubínová *et al.* (2013: 9) indicate that *N. schlieffenii* is distributed in three areas in Africa: West, East, and South (respectively represented by Senegal, Somalia, and South Africa in their study) and found that the West and East areas differed in karyotype from the South, and that West and East differed in their *S12* gene.

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:
Scott *et al.* (2012: 2943) report that the mandibular symphyse is fully fused in *N. schlieffenii*.

DETAILED MORPHOLOGY:
Baculum - Hill and Harrison (1987) and Kearney *et al.* (2002).

SEXUAL DIMORPHISM:
In Burkina Faso, Kangoyé *et al.* (2015a: 621) found the average body (except Tragus and 3ph3) and cranial (except CM) measurements in females to be larger than in males.

ECHOLOCATION:
See Taylor (1999b) and Taylor *et al.* (2005).

From Maroua, Cameroon, Manga Mongombe (2012: 79) reported a FM call type for 1 call and the following parameters: F_{max}: 51.3 kHz, F_{min}: 40.0 kHz, F_{mean}: 45.7 kHz, F_{knee}: 51.3 kHZ, F_{char}: 41.0 kHz, and duration: 0.91 msec.

In Swaziland, Monadjem *et al.* (2017c: 179) recorded F_{min}: 40.1 ± 1.48 (38.7 - 42.4) kHz, F_{knee}: 43.4 ± 1.67 (41.7 - 45.4) kHz, F_c: 40.3 ± 1.29 (39.2 - 42.4) kHz and duration: 3.1 ± 0.64 (2.4 - 4.0) msec. They could detect the calls up to a distance of 15 m.

MOLECULAR BIOLOGY:
DNA - See Hoofer and Van Den Bussche (2003).

Karyotype - Ruedas *et al.* (1990) reported 2*n* = 34, FN = 52, and BA = 20, for specimens from Somalia, whereas Rautenbach *et al.* (1993) reported 2*n* = 42, FN = 50, and BA = 10, for specimens from South Africa. However, both Ruedas *et al.* (1990) and Rautenbach *et al.* (1993) reported submetacentric X, and acrocentric Y chromosomes. Unfortunately, Rautenbach *et al.* (1993) do not identify the actual voucher specimens associated with the work, since further work should be done to ascertain whether this variation is an indication of two distinct species.

From Senegal, Koubínová *et al.* (2013: 3) report the following karyotype for 4 ♂♂ and 1 ♀: 2*n* = 34, Fna = 52, FN = 56, X = metacentric, Y = dot-like. They also found a 5.56 - 5.91 % difference in the *12S* gene as compared with conspecifics from other areas available in GenBank.

Protein / allozyme - Unknown.

HABITAT:
In southern Africa, it primarily occurs in Savanna habitats (86 %; Cooper-Bohannon *et al.*, 2016: Tabls S2).

PREDATORS:
Nyffeler and Knörnschild (2013: 4) refer to Happold *et al.* (1988: 369) for one of two records of an identified African bat becoming entangled in a spider's web (the other being *Neoromicia nana*).

Mikula *et al.* (2016: Supplemental data) mention the Bat hawk (*Macheiramphus alcinus* Bonaparte, 1850) as diurnal avian predator.

POPULATION:
Structure and Density - Rather common (Jacobs *et al.*, 2008b; IUCN, 2009).
Trend - 2008 - Unknown (Jacobs *et al.*, 2008b; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
van der Merwe and Rautenbach (1987: 41) reported that in *N. schlieffenii* spermatogenesis occurs over a 10-month period with the first signs of spermatozoa in the epididymides by the end of April. From the end of April until the beginning of September, they found spermatozoa in the epididymides. Copulation begins during June (early winter in Transvaal) and the females have spermatozoa in the uterine horns from then until the end of August (late winter) when ovulation occurs. *N. schlieffenii* is seasonally monoestrous and most of the births occur in November.

van der Merwe and Rautenbach (1986: 48; 1990: 540) reported that "*Nycticeius schlieffeniii*" commonly gives birth to twins and occasionally even triplets. For 11 females, they found an average of 3.1 corpora lutea and 2.8 fetuses.

PARASITES:
HEMIPTERA
Cimicidae: *Aphrania recta* Ferris and Usinger, 1957 recorded 35 miles east of Kordofan, Sudan (Haeselbarth *et al.*, 1966: 11).

DIPTERA
Ischnopsyllidae: *Lagaropsylla consularis* Smit, 1957. Traditional host being Molossid Bats, but has been recorded from this taxa (Haeselbarth *et al.*, 1966: 1990). *Lagaropsylla idea* Smit, 1957, of which the primary host are molossids but recorded from this taxon (Haeselbarth *et al.*, 1966: 190).

SYPHONAPTERA
Hastriter (2016: 18) reported the flea *Lagaropsylla idae* Smit, 1957 from a *N. schlieffenii* specimen from Majo Moto, Kenya.

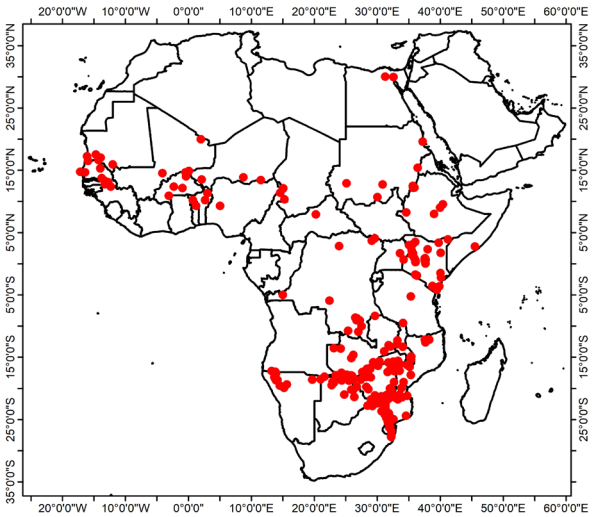

Figure 340. Distribution of *Nycticeinops schlieffenii*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Benin, Botswana, Burkina Faso, Cameroon, Central African Republic, Chad, Congo (Democratic Republic of the), Côte d'Ivoire, Egypt, Ethiopia, Ghana, Kenya, Madagascar, Malawi, Mali, Mauritania, Mozambique, Namibia, Niger, Nigeria, Senegal, Somalia, South Africa, Sudan, Swaziland, Tanzania, Togo, Uganda, Zambia, Zimbabwe.

Nycticeinops "incertae-sedis"

2013. *Nycticeinops cf. schlieffenii:* Koubínová *et al.*, Front. Zool., 10: 1-48. - Comments: Koubínová *et al.* (2013: 7) found found differences in dipoloid chromosome number and/or in chromosome morphology between the populations from Senegal and other regions in Africa. (Name Combination)

Genus ***Otonycteris*** Peters, 1859

*1859. *Otonycteris* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, 223. Publication date: 1859 [Goto Description]. - Comments: Type species: *Otonycteris hemprichi* Peters, 1859. This publication covers a meeting held on 28 February 1859. - Etymology: From the Greek "*ούς*" or "*ώτός*", meaning ear and "*νυκτερις*", meaning bat (see Palmer, 1904: 489; Gharaibeh and Qumsiyeh, 1995: 3). (Current Combination)

TAXONOMY:
Koopman (1993a) and McKenna and Bell (1997) placed it in the tribe Nycticeini, but recent phylogentic analysis have grouped this taxon within the tribe Plecontini (Bogdanowicz *et al.*, 1998; Qumsiyeh and Bickham, 1993; Simmons, 2005: 481). Pine *et al.* (1971) and Hoofer and Van Den Bussche (2001) who suggest a close relationship between *Otonycteris* and *Antrozous* which presently is within the subfamily Antrozoinae (Simmons, 2005). Simmons (2005: 498) places the subfamily Antrozoinae within the

Vespertilionidae based on recent molecular studies based on DNA sequence data (Hoofer and Van Den Bussche, 2001), a placement in line with more traditional classifications (Miller, 1897; Hill and Smith, 1984; Koopman, 1993a, 1994; McKenna and Bell, 1997). But, Simmons (1998) who raised this group to to family level also moved it to the family Molossidae. Simmons (2005: 498) retained Antrozoinae as a subfamily level within the Vespertilionidae, but its placement is unclear and further studies are needed to clarify it.

Miller (1907) suggested *Otonycteris* shares relationships with *Eptesicus*, *Scoetocus* and *Scotomanes*. Hill and Harrison (1987) included *Otonycteris* in the Plecotini but included *Rhogeessa*, *Baedon*, and *Nycticeis*. While Koopman (1993a) suggested that the genus *Otonycteris* is a distinct genus with no relationship to other vespertilionidae species.

Earlier systematics recognised six species, which Ellerman and Morrison-Scott (1951) synonomised all recognised forms within a single species *O. hemprichii*. Benda and Gvoždík (2010: 97) showed using morphological and molecular data, that a second species should be recognised *O. leucophaea* (Severcov, 1873) from central Asia.

Known species of the genus *Otonycteris*: ***hemprichii*** Peters, 1859.

COMMON NAMES:
Czech: pustinní ušani. English: Desert Bats, Desert Long-eared Bats, Long-eared Desert Bats, Desert Big-eared Bats. French: Oreillards du désert. German: Wüsten-Großohren.

GEOGRAPHIC VARIATION:
Benda and Gvoždík (2010: 87) using morphological comparison across the entire genus range supports the existance of three morphotypes which correspond to their geographic origin:
O. h. hemprichii Peters, 1859 - small and medium-sized bats from North Africa and the Levant with relatively wide and short rostra, wide braincases, large tympanic bullae and high coronoid processes of the mandible and rather small and robust bacula.
O. h. cinerea Satunin, 1909 and *O. h. jin* Cheesman and Hinton, 1924 - large bats from Iran and Saudi Arabia with relatively narrow and short rostra, narrow braincases, large tympanic bullae and high coronoid processes of the mandible and rather small, robust bacula.
O. leucophaea (Severcov, 1873) - medium-sized bats from Central Asia with relatively wide and long rostra, medium-wide braincase, small tympanic bullae, and low coronoid process of the mandible and rather large and narrow bacula.

Otonycteris hemprichii Peters, 1859

*1859. *Otonycteris Hemprichii* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, 223. Publication date: 1859. Type locality: Egypt: Nile Valley S of Assuan (Egypt) & Chondek (Sudan) [Goto Description]. Syntype: ZMB 441: skull in skin. Collected by: Friedrich Wilhelm Hemprich and Christian Gottfried Ehrenberg; collection date: September 1821 - 21 July 1822. See Qumsiyeh (1985: 59); Turni and Kock (2008). Syntype: ZMB 442: skull in skin. Collected by: Friedrich Wilhelm Hemprich and Christian Gottfried Ehrenberg; collection date: September 1821 - 21 July 1822. See Qumsiyeh (1985: 59); Turni and Kock (2008). - Comments: This publication covers a meeting held on 28 February 1859. Type locality restricted by Kock (1969a: 183 - 184), since originally no locality was given. - Etymology: In honour of Friedrich Wilhelm Hemprich (1796 - 1825) (see Kozhurina, 2002: 15). (Current Combination)

1866. *Plecotus ustus* Fitzinger and Heuglin, Sber. k. Akad. Wiss. Wien, math. naturw. Kl., 54 (1) 10: 546. Publication date: 1866. Type locality: Sudan: Northern province: Wadi Halfa [21 55 N 31 20 E]. Holotype: NMW 8604: skull only. Collected by: Theodor Von Heuglin. See Benda and Gvoždík (2010: 101). - Comments: *Nomen nudum*: see Anderson and de Winton (1902: 118), Ellerman and Morrison-Scott (1951: 180), Allen (1939a: 93), Kock (1969a: 183), Qumsiyeh (1985: 59), Gharaibeh and Qumsiyeh (1995: 1).

1902. *Otonycteris petersi* Anderson, Zoology of Egypt: Mammalia. Revised and completed by W.E. de Winton, F.Z.S. Hugh Ress, Ltd., London, 120. Type locality: Iraq: Fao: Persian Gulf.

1909. *Otonycteris cinereus* Satunin, Materials on the knowledge of mammals of Caucasus and Transcaspian Regions, XII-XVI. Izvestiya Kavkazskago Muzyeya (Tiflis). [in Russian, with German summary], 4: 281. Type locality: : "Nukendzag, Ge country, Persian Beluchestan". - Comments: Nevertheless, Ognev (1928: 579) restricted the type locality to "Zirkuh country, near Bamrud, Khorasan" (= Zarakkuh country, near Bamrud, Khorassan,

E Iran) and this change was accepted by subsequent authors (Etemad, 1967, 1969; DeBlase, 1980; Baranova et al., 1981; Gharaibeth and Qumsiyeh, 1995).

1924. *Otonycteris jin* Cheesman and Hinton, Ann. Mag. nat. Hist., Series 9, 14: 549. Type locality: Saudi Arabia: Hasa: Hufuf.

1936. *Plecotus auritus saharae* Laurent, Bull. Soc. Hist. nat. Afr. Nord, 27: 408, fig. Publication date: December 1936. Type locality: Algeria: El Goléa [30 35 N 02 53 E].

? *Otonycteris hemprichi hemprichi:* (Alternate Spelling)

? *Otonycteris hemprichi:* (Alternate Spelling)

? *Otonycteris hemprichii cinerea:* (Name Combination)

? *Otonycteris hemprichii hemprichii:* (Name Combination)

TAXONOMY:

Reviewed by Harrison and Bates (1991), Horácek (1991), Bates and Harrison (1997) and Benda and Gvoždík (2010).

Most of the forms currently attributed to the species rank of *O. hemprichii* (Simmons, 2005: 481), were originally described as separate species: *O. petersi* Anderson, 1902 (Anderson and de Winton, 1902; Kinnear, 1916; Bianchi, 1917; Cheesman and Hinton, 1924; Ognev, 1928); *O. cinerea* Satunin, 1909 (Bobrinskoy, 1925; Noack, 1887; Kuzyakin, 1950, 1965; Strelkov, 1963; Strelkov *et al.*, 1978). Ellerman and Morrison-Scott (1951) synonomised all recognised forms within *Otonycteris* into a single species *O. hemprichii*, with tree subspecies (*hemprichii, cinerea, jin*), but marked this combination with a question mark. Kock (1969a: 183) did not recognise any subspecies within *O. hemprichii*. Although Corbet (1978: 59) recognised five valid subspecies (*hemprichii, jin, petersi, leucophaeus, cinerea*, he noted that "it seems likely that variation will prove to be continuous throughout the range". While Nader and Kock (1983c) stated that pelage coloration was inadequate for subspecies definition, Horácek (1991) and Horácek *et al.* (2000: 133) carried out a partial analysis of geographic variation where they found that the differences in pelage coloration and size was clinal, and did not support the recognition of separate subspecies. Benda *et al.* (2006) performed a simple comparison of a set of *Otonycteris* specimens from North Africa and the Middle East, which showed clear morphotypes that confirmed categorial variation recognising two subspecies (*hemprichii, cinerea*). In the past, five subspecies have been recognized (Atallah, 1977; Ellerman and Morrison-Scott, 1951; Harrison and Bates, 1991; Gharaibeh and Qumsiyeh, 1995; Koopman, 1993a) - the nominotypical form *O. h. hemprichii* Peters, 1859, *O. h. leucophaeus* (Severcov, 1873); *O. h. cinerea* Satunin, 1909; *O. h. petersi* Anderson, 1902; and *O. h. jin* Cheesman and Hinton, 1924.

Benda and Gvoždík (2010), examining both morphological and molecular data, concluded that one of the previously recognized subspecies, *O. h. leucophaeus* (Severcov, 1873), should be elevated to full species rank *O. leucophaea* (Severcov, 1873), from central Asia. In *Otonycteris hemprichii*, they recognized three distinct subspecies: *O. h. hemprichii* Peters, 1859 from North Africa, Levant and Mesopotamia; *O. h. cinerea* Satunin, 1909, from the mountainous areas of eastern Arabia and Iran; and *O. h. jin* Cheesman and Hinton, 1924, from the lowland deserts of eastern Arabia and southeasternmost Iran.

COMMON NAMES:

Albanian: Lakuriq nate veshgjatë i Hemprich-it. Arabian: Khafash abiad, Khaffash. Armenian: Սպիտակափոր սրականջ. Azerbaijani: Ağqarın oxqulaq yarasa. Basque: Hemprich belarrihandi. Belarusian: Стрэлавух Хемрыха. Bosnian: Hemprihov dugouhi šišmiš. Breton: Skouarnegell Hemprich. Bulgarian: Пустинен дългоух прилеп. Castilian: Orejudo de Hemprich. Catalan: Orellut d'Hemprich. Croatian: Hemprichov dugouhi šišmiš. Czech: Netopýr pustinný (ušan pustinný). Danish: Storøret flagermus. Dutch: Woestijngrootoorvleermuis. English: Hemprich's Long-eared Bat, Hemprich's Desert Bat, Hemprich's Desert Long-eared Bat, Hemprich's Long-eared Desert Bat, Long-eared Desert Bat, Desert Long-eared bat, Hemprich's Arrow-headed Bat, Hemprich's Big-eared Bat, Hemprich´s arrow-eared bat. Estonian: Suur-teravkõrv. Finnish: Aavikkolepakko. French: Chauve-souris à oreilles pointues de Hemprich, Oreillard d'Hemprich. Frisian: Woastyngrutearflearmûs. Galician: Orelludo de Hemprich. Georgian: ჰემპრიხის ისარყურა. German: Wüsten-Großohr, Hemprichs Wüstengroßohr. Greek: Ωτονυχτερίδα της ερήμου. Hebrew: Udnan. Hungarian: Sivatagi hosszúfülű-denevér. Irish Gaelic: Ialtóg fhadchluasach Hemprich. Italian: Orecchione di Hemprich. Latvian: Hempriha sikspārnis. Lithuanian: Strėliaausis lygianosis. Luxembourgish: Wüstegroussouer. Macedonian:

Хемпричиев долгоушест лилјак. Maltese: Farfett il-Lejl Widnejħ Twal tad-Deż ert. Montenegrin: Pustinjski š korpiojed. Norwegian: Orkenlangøre. Polish: Uszorek pustynny. Portuguese: Morcego de Hemprich. Rhaeto-Romance: Ureglia lunga da Hemprich. Romanian: Liliacul urecheat de desert. Russian: Стрелоух белобрюхий. Serbian: Пустињски дугоушан [= Pustinjski dugoušan]. Scottish Gaelic: Ialtag fhad-chluasach Hemprich. Slovak: Večernica šípouchá. Slovenian: Škorpjonojedi pušcavež. Swedish: Okenlångöra. Turkish: UzunkulaklıÇöl Yarasası. Ukrainian: Стріловух білочеревий. Welsh: Ystlum hirglust Hemprich.

CONSERVATION STATUS:
Global - This is a relatively common species in desert and sub-desert habitats of the SW Palaearctic. It has a presumed large population, but the current trend is unknown. However, if it is in decline, it is unlikely to be at a rate which would qualify it for inclusion in the threatened categories. There are no major threats to the species, although it may be affected by pesticides in some parts of its range. Therefore, it is listed as Least Concern (LC ver 3.1 (2001)) (Benda *et al.*, 2008c; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Benda *et al.*, 2008c; IUCN, 2009). 1996 - LR/lc [as *Otonycteris hemprichi*.

MAJOR THREATS:
Although not a major threat this species is affected by pesticides (Benda *et al.*, 2008c; IUCN, 2009). Sherwin *et al.* (2012: 174), furthermore, list the small distribution range, water stress and the aerial hawking feeding style to be the risk factors related to climatic change. Bilgin *et al.* (2012: 434) predict that climatic change will result in a major range contraction for *O. hemprichii*.

CONSERVATION ACTIONS:
Benda *et al.* (2008c) [in IUCN (2009)] report that the species presumably occurs in some protected areas across its range. No other specific measures are known, although it will be protected under national legislation in some of the range states. A study on the impacts of pesticides is required, especially ways in which the impact might be minimised.

GENERAL DISTRIBUTION:
Otonycteris hemprichii occurs in the southern desert and sub-desert belt of Western and Central Palaearctic from Morocco and Niger as far east as north-west India. It is possibly present in the whole of the desert area in the north of Africa where there is suitable habitat. In the Mediterranean region it is recorded from Morocco, Algeria, Tunisia, Libya, Niger, northern Sudan and Egypt. In the Middle East it is found in Israel, Palestine, Jordan, Lebanon, Syria and a single locality from southeastern Turkey. It has an area of occupancy of >20,000 km^2 and occupies an altitude of up to 2,400 m (in Pakistan).
Albayrak and Asan (1999: 65) mention one specimen from a locality in southern Turkey.

Benda and Gvoždík (2010: 95) allocate specimens previously refered to *O. hemprichii* from Central Asian should be rather refered to *Otonycteris leucophaea* (Severcov, 1873).

Native: Afghanistan; Algeria; Egypt; Iran, Islamic Republic of; Israel; Jordan; Kazakhstan; Libyan Arab Jamahiriya; Morocco (Benda *et al.*, 2010a: 158; El Ibrahimi and Rguibi Idrissi, 2015: 363); Niger; Oman; Qatar; Saudi Arabia; Sudan; Syrian Arab Republic; Tajikistan; Tunisia (Dalhoumi *et al.*, 2016b: 867); Turkey; Turkmenistan; United Arab Emirates (Anonymus, 2008: 38); Uzbekistan.

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:
In their study on the reversibility of the mandibular symphyseal fusion, Scott *et al.* (2012: 2943) mention that this symphyse is fully fused in *O. hemprichii*.

DETAILED MORPHOLOGY:
Baculum - Hill and Harrison (1987), and Benda and Gvoždík (2010: 93). Benda and Gvoždík (2010: 87) found that the bacula from different parts of the distribution range were very similar in shape. The bones are simple, dorso-ventrally flattened, crescent-shaped sticks. The baculum length were 2.47 - 3.31 mm long. Slightly differing specimens, originating in northeastern Iran and Kirghizstan, possessed larger bacula (length= 3.02 - 3.31 mm), relatively narrower and in most cases also slightly less curved than bacula from other parts of the range (baculum length = 2.47 - 2.96 mm) (Benda and Gvoždík, 2010: 87).

FUNCTIONAL MORPHOLOGY:
In Israel, Marom *et al.* (2006: 954) found that the physiological responses of *O. hemprichii* to a range of ambient temperatures (both by night and by day) are characteristic of a mammal adapted to arid environments.

SEXUAL DIMORPHISM:
Bogdanowicz and Owen (1996: 494) found that females are approximately 4.4 % larger than males.

ECHOLOCATION:
Holderied *et al.* (2010: 425) indicate that *Otonycteris hemprichii* is a whispering bat (approx. 80 dB peSPL), with short, multiharmonic calls. The two dominant harmonics sweep from 39 to 22 kHz, and from 77 to 43 kHz, with average peak frequencies respectively 29.96 ± 5.3 kHz and 54.45 ± 5.5 kHz. The pulse duration is 2.46 ± 1.1 ms, the pulse interval 131.6 ± 82.0 ms.

In Jordan, Benda *et al.* (2010b: 204) recorded the following parameters for 66 calls: F_{start}: 46.8 ± 8.6 (34.2 - 68.3) kHz, F_{end}: 20.4 ± 3.0 (15.0 - 25.6) kHz, F_{peak}: 26.8 ± 3.2 (19.4 - 31.8) kHz, duration: 7.2 ± 2.4 (2.9 - 11.9) msec, and interpulse interval: 142.7 ± 52.9 (72.0 - 302.0) msec.

For Iran, Benda *et al.* (2012a: 183) provide two series of data: **1**: F_{start}: 38.8 ± 2.1 (28.6 - 32.8) kHz, F_{end}: 22.1 ± 0.2 (21.9 - 22.3) kHz, F_{peak}: 22.9 ± 6.1 (16.9 - 29.9) kHz, duration: 3.7 ± 0.3 (3.4 - 4.1) msec, interpulse interval: 157.9 ± 22.1 (143.0 - 190.1) msec; **2** (hand released in a close room): F_{start}: 35.0 ± 2.2 (30.5 - 38.6) kHz, F_{end}: 20.1 ± 0.7 (19.0 - 21.2) kHz, F_{peak}: 26.2 ± 2.6 (23.5 - 32.3) kHz, duration: 2.6 ± 0.5 (1.7 - 3.6) msec, interpulse interval: 44.4 ± 19.3 (26.8 - 80.5) msec.

From Israel, the following values were obtained by Hackett *et al.* (2016: 223) from 68 calls: Pulse duration: 5.19 ± 3.52 msec, F_{start}: 36.86 ± 2.95 (25.3 - 46.3) kHz, F_{end}: 20.94 ± 2.16 (18 - 25.3) kHz, F_{peak}: 24.45 ± 2.73 (20.5 - 34.1) kHz.

Disca *et al.* (2014: 226) indicate that the type of call is FM multi H for specimens from Morocco, with the following parameters: F_{start}: 42.4 ± 1.6 kHz, F_{end}: 17.0 ± 0.6 kHz, F_{peak}: 25.3 ± 1.0 kHz, $F_{max\ first\ harmonic}$: 45.3 ± 1.7 kHz, bandwidth: 25.3 ± 1.9 kHz, duration: 5.2 ± 0.3 msec.

In the United Arab Emirates, Davis (2007: 7) reports the ending frequency to be around 18 kHz.

Holderied *et al.* (2010: 425) also suggest that this bat is probably a passive gleaner, listening to noises generated by their prey. In a test environment, moving scorpions were found within 5 to 58 seconds, whereas non-moving or dead scorpions were not found at all.

Hackett *et al.* (2014: 3028), however, found that *O. hemprichii* switches between being a passive gleaner and an aerial hawker. Aerial hawking seems to occur when their usual prey becomes scarcer (e.g. desert scorpions - *Scorpio maurus palmatus* - at the end of a hot, dry summer) or less active (e.g. common yellow scorpions - *Buthus occitanus israelis* (Hackett *et al.*, 2014: 3031).

MOLECULAR BIOLOGY:
DNA - See Hoofer and Van Den Bussche (2003), Mayer *et al.* (2007), and Benda and Gvoždík (2010: 88).

Karyotype - Arslan and Zima (2014: 14) mention $2n$ = 28, FNa = 46, FN = 50, and a medium-sized submetacentric X. No data were available for the Y chromosome. The autosomal complement contains seven large metacentrics, two large submetacentrics, one small metacentric and three acrocentric pairs (of which one is dot-like). They also indicate that the karyotype with $2n$ = 30, FN = 48, BA = 20, a submetacentric X chromosome and a dot-like Y chromosome for specimens reported by Zima *et al.* (1992b) from Kyrgystan is actually for *O. leucophaea*.

Protein / allozyme - Unknown.

HABITS:
Horácek (1991) reported that *O. hemprichii* foraged in two different ways; very close to the ground (40 - 80 cm) or at a height of some 4 - 8 meters above the ground. Holderied *et al.* (2010: 429) reported a flight height of 2.19 ± 1.0 m above the ground while searching for prey at Park Sapir, Israel, and a flight speed of 3.52 ± 1.3 m/s.

Hackett *et al.* (2014: 3030) found that *O. hemprichii* specimens flew slower during aerial hawking than during their passive gleaning foraging flights.

ROOST:
Daniel *et al.* (2010: 295) found that during pregnancy, female bats roosted either alone, or in small groups of two to five individuals. While during lactation, female bats roosted without males in groups of two to five individuals. Korine *et al.* (2013: 131) reported that, in Israel, female bats roosted primarily in cracks during reproduction, and most of these were facing the morning sun. They also indicated that during pregnancy horizontal cracks were used, whereas vertical cracks were used by lactating females. Some of these roosts were used year after year.

DIET:
Studies from different parts of its range indicate that its prey includes mainly large ground arthropods (Coleoptera, Blattodae, Othoptera, Solpugida, Heteroptera, Hymenoptera, and Scorpionidae) (Horácek, 1991; Whitaker *et al.*, 1994: 75; Arlettaz *et al.*, 1995; Fenton *et al.*, 1999; Benda *et al.*, 2001, 2006, 2010: 83, 2012a: 469).

Andreas (2010: 265) mentions that it is suggested that *O. hemprichii* is a potential carnivore. However, there is no proof for this. Furthermore,

no perch feeding was observed for this species and this type of tactics is generally used when consuming relatively larger preys.

Holderied *et al.* (2010: 425) indicate that 70 % of the droppings can contain scorpion fragments. They also observed that while capturing the scorpions, the bats were frequently stung, even in their faces, without any indication of poisoning, and the scorpions' poison glands and stinger were eaten too.

Benda *et al.* (2014c: 100) analyzed 14 faecal pellets from one individual and found robust crickets (Ensifera; 97.1 % by volume), complemented by a small proportion of moth remnants (Lepidoptera; 2.9 %).

POPULATION:
Structure and Density - Mostly solitary animals, female colonies up to 18 individuals (Benda *et al.*, 2008c; IUCN, 2009).
Trend - 2008 - Unknown (Benda *et al.*, 2008c; IUCN, 2009). *O. hemprichii* populations within the Asia Minor and Levant region are unknown population trend, under predictive climate change scenarios (Bilgin *et al.*, 2012: 433).

ACTIVITY AND BEHAVIOUR:
Daniel *et al.* (2010: 296) showed that *O. hemprichii* delayed their forageing emergence time as gestation progressed from the first to the second trimester, while during nursing the bats' emergence time to forage did not change. Emergence time of female bats from their roosts during pregnancy was delayed from an average of 18h33 (about 40 min after sunset) in the first trimester of pregnancy (late March and beginning of April) to an average of 20h00 (about 1 h and 50 min after sunset) during the second trimester of pregnancy (Daniel *et al.*, 2010: 295). Contrary to the situation during pregnancy, emergence time of bats from their day roosts during nursing did not change with the sunset times, and was almost always between 20h00 and 21h00 (Daniel *et al.*, 2010: 295). Pregnant bats did not emerge to forage more than four times per night; the average was two bouts per night, whereas lactating bats made up to six foraging bouts per night (Daniel *et al.*, 2010: 296).

Daniel *et al.* (2010: 297) observed that female bats often used both deep and shallow daily torpor during the first two trimesters of pregnancy, with skin temperature frequently dropping as low as 15° C, while pregnant females used only shallow torpor during the last trimester of pregnancy and nursing.

Korine *et al.* (2015: 5) point out that the activity of *O. hemprichii* could be underestimated because of the whispering nature of their echolocation calls.

REPRODUCTION AND ONTOGENY:
Daniel *et al.* (2010: 295) estimated that pregnancy began by the end of March, and that parturition took place around the first week in June. Body mass of pregnant bats increased by over 50% from the beginning to the end of pregnancy (22 - 35 g).

In the United Arab Emirates, Davis (2007: 7) thinks the females are pregnant in May-June.

PARASITES:
The tick *Argas vespertilionis* (Latreille, 1802) was reported from Jordan by Benda *et al.* (2010b: 294), who also indicate that the only two other ectoparasites found in the Middle East are *Argas hermanni* Audouin, 1827 in Egypt, and the flea *Araeopsylla wassifi* Traub, 1954 in Turkey.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Algeria, Egypt, Libya, Morocco, Niger, Sudan.

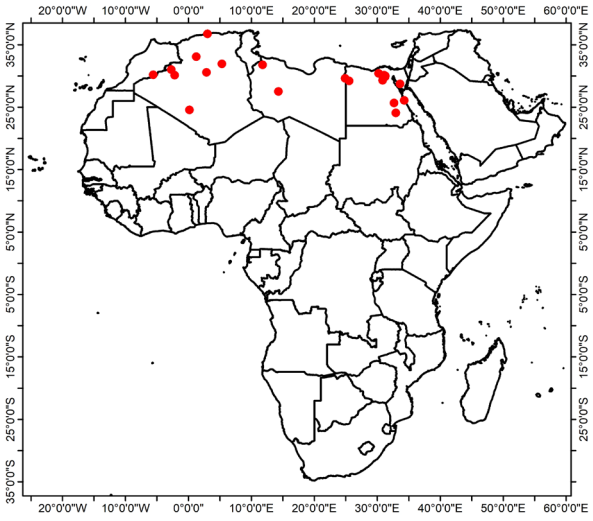

Figure 341. Distribution of *Otonycteris hemprichii*

Genus ***Pipistrellus*** Kaup, 1829

*1829. *Pipistrellus* Kaup, Skizzierte Entwicklungs-Geschichte Natürliche Systematik der Europäische Thierwelt, 1: 98. Publication date: 1829. - Comments: Type species: *Vespertilio pipistrellus* Schreber, 1774, by monotypy. Not *Pipistrellus* Gistel, 1848 (Insecta, Diptera, Hybotidae) (see Jackson and Groves, 2015: 274). - Etymology: From

the italian "*pipistrello*" meaning bat (see Fujita and Kunz, 1984: 4; Flannery, 1995a: 393). From the Latin "*pipio* meaning squeaking and "*strellus*", which is an attiona indicating a "small animal" (see Kapteyn, 1995: 83). - ZooBank: D3BD2230-B730-40BA-95D0-E95484EF21C7. (Current Combination)

1837. *Pipistrella* Bonaparte, Iconografia Fauna italiana. - Comments: Icon. fauna Ital.

1838. *Romicia* Gray, Mag. Zool. Bot., Edinburgh, 2 (12): 495. Publication date: 1 February 1838. - Comments: Type species: *Romicia calcarata* Gray, 1838 (=*Vespertilio kuhlii* Kuhl, 1817), by monotypy.

1839. *Vesperugo* Keyserling and Blasius, Arch. Naturgesch. Berlin, 5 (1): 312. Publication date: 1839. - Comments: In part (see Allen, 1939a: 92; Pavlinov *et al.*, 1995: 104). Included 13 species now referred to *Eptesicus, Pipistrellus, Neoromicia, Hypsugo*.

1840. *Romicius* Blyth, Cuvier's Animal Kingdom, 75. Publication date: 1840. - Comments: Variant of *Romicia* (see Allen, 1939a: 93; Meester *et al.*, 1986: 50), or invalid emendation (see Jackson and Groves, 2015: 274). (Emendation)

1856. *Nannugo* Kolenati, Allg. deutsche naturh. Zeitung, N.F., 2 (2): 131. Publication date: 1856. - Comments: Included *Vespertilio nathusii* Keyserling and Blasius, *V. kuhlii* Kuhl and *V. pipistrellus* Schreber (see Ellerman and Morrison-Scott, 1951: 152; Corbet and Hill, 1992: 133). - Etymology: From the Greek "*νάννος*", meaning dwarf and the suffix -ugo (in analogy with *Hypsugo* and *Vesperugo*) (see Palmer, 1904: 447).

1868. *Alobus* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, 707 (for 1867). Publication date: 1868 [Goto Description]. - Comments: Type species: *Vespertilio temminckii* Cretzschmar, 1826 (=*Pipistrellus rueppellii* Fischer, 1829), by monotypy. Not of Le Conte, 1856 (Insecta, Coleoptera, Scarabaeidae) (see Jackson and Groves, 2015: 274).

1899. *Euvesperugo* Acloque, Faune de France, Mammifères, 35. - Comments: In part: Included six species, one of which was *Vespertilio pipistrellus* Schreber, 1774 (see Ellerman and Morrison-Scott, 1951: 162; Meester *et al.*, 1986: 50). Cabrera (1914: 123) also included it in part into *Nyctalus*.

1926. *Eptesicops* Roberts, Ann. Transv. Mus., 11: 245. Publication date: 14 September 1926. - Comments: Type species: *Scotophilus rusticus* Tomes, 1861, by original designation (see Jackson and Groves, 2015: 275).

1946. *Vansonia* Roberts, Ann. Transv. Mus., 20 (4): 304 [Goto Description]. - Comments: Type species: *Pipistrellus vernayi* Roberts, 1932 (=*Vespertilio rüppellii* Fischer, 1829), by original designation. Not *Vansonia* Schein, 1956 (Insecta, Coleoptera, Scarabaeidae) (see Jackson and Groves, 2015: 275). - Etymology: The name *Vansonia* refers to George van Son, entomologist of the Transvaal Museum (see Lanza *et al.*, 2015: 382).

1951. *Pipiestrellus:* Watson, Uganda J., 15 (1): xx. (Lapsus)

1987. *Attalepharca* Menu, Palaeovert., 17 (3): 78, 126. Publication date: 15 November 1987 [Goto Description]. - Comments: Not type species designated, therefore not available (see Corbet and Hill, 1992: 133).

1987. *Nycterikaupius* Menu, Palaeovert., 17 (3): 108, pl. 4, fig. 1. Publication date: 15 November 1987 [Goto Description]. - Comments: In part.

1992. *Attelepharca:* Corbet and Hill, The mammals of the Indomalayan Region: A systematic review, 131. (Lapsus)

1999. *Pipistallus:* Salleh, Hang, Rahman and Abdulla, ASEAN Review of Biodiversity and Environmental Conservation (ARBEC), 1. Publication date: September - October 1999. (Lapsus)

2000. *Pipistrellis:* Qui, Han, Qi and Yufen, Acta Anthrop. Sin., 4 (1): 19. (Lapsus)

2007. *Afropipistrellus* Thorn, Kock and Cuisin, Mammalia, 71 (1/2): 70, 75 [Goto Description]. - Etymology: From the combination of "Africa" and "Pipistrellus"; gender masculine (see Thorn *et al.*, 2007: 75).

2007. *Pipistrellus (Afropipistrellus):* Thorn, Kock and Cuisin, Mammalia, 71 (1/2).

2008. *Pipistrillus:* Selim, Nahla, and Shelfeh, Tishreen Univ. J. Res. Sci. Stud. - Biol. Sci. Ser., 30 (1): 247. (Lapsus)

2008. *Pipstrillus:* Selim, Nahla, and Shelfeh, Tishreen Univ. J. Res. Sci. Stud. - Biol. Sci. Ser., 30 (1): 247. (Lapsus)

2018. *Pipistrelus:* Malekani, Musaba, Gembu, Bugentho, Toengaho, Badjedjea, Ngabu, Mutombo, Laudisoit, Ewango, Van Cakenberghe, Verheyen, Asimonyo, Masudi, Bongo and Ngbolua, Nat. Conserv. Res., 3 (2): 68. Publication date: January 2018. (Lapsus)

? *Pipistrellus sp.:*

? *Vansoni:* (Lapsus)

TAXONOMY:
For synonyms see Ellerman and Morrison-Scott (1951: 162); but also see Hill (1976: 25); Kitchener *et al.* (1986); and Menu (1984). *Hypsugo* was considered a full genus by Tiunov (1986). Hill and Harrison (1987) would transfer *Neoromicia* and *Vespadelus* to *Pipistrellus* from *Eptesicus*.

Known species of the genus *Pipistrellus*: *abramus* (Temminck, 1838) – southern Ussuri region (Russia and China), Taiwan, southern and central Japan, Korea, Vietnam, Burma, India (Simmons, 2005: 473); *adamsi* Kitchener, Caputi and Jones, 1986 – Queensland and Northern Territory (Australia) (Simmons, 2005: 473); ***aero*** Heller, 1912; *angulatus* Peters, 1880 – New Guinea, Bismarck Arch., Bougainville Isl and Solomon Isls, adjacent small islands (Simmons, 2005: 473); *ceylonicus* (Kelaart, 1852) – Pakistan, India, Sri Lanka, Bangladesh, Burma, Kwangsi and Hainan (China), Vietnam, Borneo (Simmons, 2005: 474); *collinus* Thomas, 1920 – Highlands of Papua New Guinea (Simmons, 2005: 474); *coromandra* (Gray, 1838) – Afghanistan, Bangladesh, India (including Nicobar Isls), Sri Lanka, Pakistan, Nepal, Bhutan, Burma, Cambodia, Thailand, southern China (Simmons, 2005: 474); ***deserti*** Thomas, 1902; *endoi* Imaizumi, 1959 – Honshu (Japan) (Simmons, 2005: 474); ***grandidieri*** (Dobson, 1876); ***hanaki*** Hulva and Benda, 2004; ***hesperidus*** (Temminck, 1840); *hesperus* H. Allen, 1864 – Washington to southwestern Oklahoma (USA) and Baja California, south to Hidalgo and Guerrero (Mexico) (Simmons, 2005: 475); ***inexspectatus*** Aellen, 1959; *javanicus* (Gray, 1838) – eastern Afghanistan, northern Pakistan, northern and central India, southeastern Tibet (China), Burma, Thailand, Vietnam, through southeast Asia to Lesser Sunda Isls and the Philippines (Simmons, 2005: 475); ***kuhlii*** (Kuhl, 1817); ***maderensis*** (Dobson, 1878); *minahassae* (Meyer, 1899) – northern Sulawesi (Simmons, 2005: 476); ***nanulus*** Thomas, 1904; *nathusii* (Keyserling and Blasius, 1839) – western Europe to Urals and Caucasus and western Asia Minor, southern England (Simmons, 2005: 476); *papuanus* Peters and Doria, 1881 – Seram, Aru Isls, Baik-Supiori, New Guinea, New Ireland (Bismarck Arch.) adjacent small islands (Simmons, 2005: 476); *paterculus* Thomas, 1915 – northern India, Burma, Thailand, Vietnam, and southwestern China (Simmons, 2005: 477); ***permixtus*** Aellen, 1957; ***pipistrellus*** (Schreber, 1774); *pygmaeus* (Leach, 1825) – British Isles, southern Scandinavia south to Spain, Portugal, Corsica, Sardinina, Italy, Slovenia and Greece, east to Ukaraine and western Russia, northern Algeria, Tunisia, Libya (Cyrenaica only) (Simmons, 2005: 477); ***rueppellii*** (J. Fischer, 1829); ***rusticus*** (Tomes, 1861); *stenopterus* (Dobson, 1875) – western Malaysia, Sumatra, Riau Arch., northern Borneo, Mindanao (Philippines) (Simmons, 2005: 478); *sturdeei* Thomas, 1915 – Bonin Isls (Japan) (Simmons, 2005: 478); *subflavus* (F. Cuvier, 1832) – Nova Scotia, southern Qubec (Canada) and Minnesota, south to Florida (USA) and Honduras (Simmons, 2005: 479); *tenuis* (Temminck, 1840) – Afghanistan to the Moluccas, southern China, Laos, Vietnam, Cocos Keeling Isl and Christmas Isl (Simmons, 2005: 479); *wattsi* Kitchener, Caputi and Jones, 1986 – southeastern Papua New Guinea and Sanari Isl (Simmons, 2005: 479); *westralis* Koopman, 1984 – northern Australia from Kimberly to eastern Gulf of Carpentaria (Simmons, 2005: 479).

COMMON NAMES:
Czech: zakrslí netopýři. English: Pipistrelle Bats, Pipistrelles. French: Pipistrelles. German: Zwergfledermäuse, Pipistrellen. Italian: Pipistrèlli.

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Tragus: Monadjem *et al.* (2013c: 204) line drawing of tragi of specimen DNSM 13220 referred to a *Pipistrellus* 1 from Mount Nimba, Liberia.

ECHOLOCATION:
Rakotondramanana *et al.* (2014: 80) studied the echolocation calls of Madagascan "*Pipistrellus sensu lato"* bat (including *Pipistrellus, Neoromicia* and *Hypsugo* in two different flight cages: A (12 x 3 x 3 m) and B (5.4 x 1.4 x 1.5 m), and found that the same bats used different types of calls depending on the cage they were flying in. In the large cage (A), the signal showed a frequency-modulated part followed by a short quasi-constant frequency (FM/QCF) component, whereas in the small cage (B) the QCF component was lacking. These authors, therefore, also warn against extrapolating the results of echolocation calls captured in flight cages.

PREDATORS:
Demeler (1981: 133) found remains of a "*Pipistrellus*" in pellets of *Bubo africanus* in the Yankari Game Reserve (Nigeria).

Mikula *et al.* (2016: Supplemental data) mention a *Pipistrellus* sp. being taken by a Grey-headed bushshrike (*Malaconotus blanchoti* Stephens, 1826).

In Algeria, Djilali *et al.* (2016: 161) found remains of 6 *Pipistrellus* specimens in 516 preys (1.2 %) captured by the Short-eared Owl (*Asio flammeus*).

Goodman *et al.* (2015c: 78) found the remains of five *Pipistrellus/Neoromicia* sp. individuals in pellets of Bat Hawk *Macheiramphus alcinus* Bonaparte, 1850 in western central Madagascar.

VIRUSES:
Paramyxoviridae

Mortlock *et al.* (2015: 1841) reported that twenty out of fourty examined "*Pipistrellus*" specimens from the same colony in the DRC tested positive for *Paramyxovirus* sequences, all of which were nearly identical.

ZOOBANK:
D3BD2230-B730-40BA-95D0-E95484EF21C7

Pipistrellus aero Heller, 1912

*1912. *Pipistrellus aero* Heller, Smiths. Misc. Coll., 60 (12): 3. Publication date: 4 November 1912. Type locality: Kenya: Mathews Range: Mount Gargues [00 57 N 37 24 E, 7 100 ft] [Goto Description]. Holotype: USNM 181812: ad ♂, skin and skull. Collected by: Edmund Heller; collection date: 26 August 1911; original number: 4110. (Current Combination)

1971. *Pipistrellus [(Pipistrellus)] aero:* Hayman and Hill, Mammals of Africa: Chiroptera, 41. (Name Combination)

1971. *Pipistrellus altae:* Hayman and Hill, Mammals of Africa: Chiroptera, 43. - Comments: Hayman and Hill (1971) refer to specimens in the BMNH labeled as "*P. altae*" but do not mention an original author.

TAXONOMY:
The Ethiopian specimens in the British Museum are clearly *P. kuhlii*; see Hayman and Hill (1971: 41). Koopman (1994: 114) states that this species is probably a subspecies of *P. aegyptius* (=*deserti*).

COMMON NAMES:
Chinese: 东非伏翼. Czech: netopýr gargueský. English: Mt Gargues Pipistrelle Bat, Aerial Pipistrelle Bat, Mt Gargues Pipistrelle, Mount Gargues Pipistrelle, Kenya Pipistrelle. French: Pipistrelle du Kenya. German: Luftige Zwergfledermaus, Luftige Pipistrelle.

CONSERVATION STATUS:
Global - Listed as Data Deficient (DD ver 3.1 (2001)) in view of the absence of recent information on its extent of occurrence, ecological requirements, threats and conservation status (Jacobs *et al.*, 2008q; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) (Jacobs *et al.*, 2008q; IUCN, 2009). 2004 - VU D2 ver 3.1 (2001) (Jacobs *et al.*, 2004ae; IUCN, 2004). 1996 - DD (Baillie and Groombridge, 1996).

MAJOR THREATS:
The threats to this species are not known (Jacobs *et al.*, 2008q; IUCN, 2009).

CONSERVATION ACTIONS:
Jacobs *et al.* (2008q) [in IUCN (2009)] report that it has been recorded in the Matthews Range Forest Reserve and Marsabit National Reserve. Further studies are needed into the distribution, natural history and possible threats to this little-known species.

GENERAL DISTRIBUTION:
Pipistrellus aero is endemic to northwestern Kenya, where it is known only from three localities (Mount Garguez; Marsabit Lake and Ngong). It is also present in adjacent Ethiopia.

Native: Ethiopia (Lavrenchenko *et al.*, 2004b: 135); Kenya.

POPULATION:
Structure and Density - Little information is available on the population abundance or size of this species (Jacobs *et al.*, 2008q; IUCN, 2009).
Trend - 2008 - Unknown (Jacobs *et al.*, 2008q; IUCN, 2009).

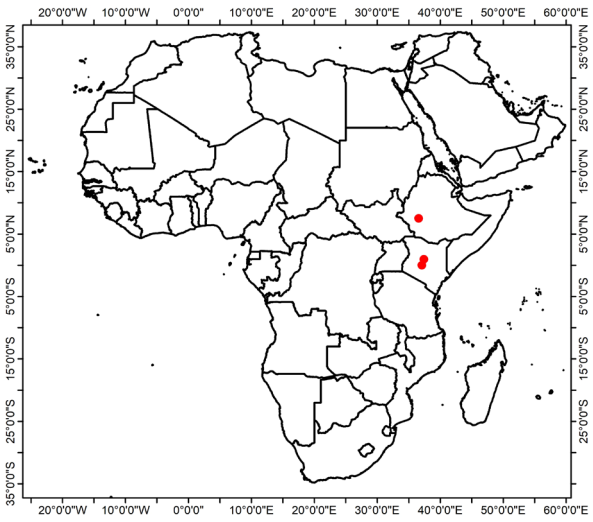

Figure 342. Distribution of *Pipistrellus aero*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Ethiopia, Kenya.

Pipistrellus grandidieri (Dobson, 1876)

*1876. *Vesperugo (Vesperus) grandidieri* Dobson, Ann. Mag. nat. Hist., ser. 4, 18 (108): 500. Publication date: 1 December 1876. Type locality: Tanzania: Zanzibar [ca. 06 10 S 39 12 E] [Goto Description]. Holotype: MNHN ZM-MO-1996-2129: ad ♀, skull and alcoholic. Collected by: Alfred Grandidier; collection date: 1864. Number 215 in Rode (1941). Opened ventrally, one foetus in uterus, skull extracted in 1999.
1895. *Vesperus grandidieri:* Matschie, Säugethiere Deutsch-Ost-Afrikas, 23. (Name Combination)
1897. *Eptesicus grandidieri:* Matschie, Zur Faunistik Deutsch-Ost-Afrikas. 5. Säugethiere, 84. (Name Combination)
1900. *Vesperugo (Vesperus) flavescens* Seabra, J. Sci. mat. phys. nat., ser. 2, 6: 23. Publication date: 1900. Type locality: Angola: Benguela district: East of Hanha: Galanga [12 04 S 15 09 E]. Cotype: MNHN ZM-MO-1900-536: ad? ♂, skull and alcoholic. Collected by: José Alberto de Oliveira Anchieta. Co- or topotype. Cotype: MNHN ZM-MO-1900-537: ad? ♂, skull and alcoholic. Collected by: José Alberto de Oliveira Anchieta. Co- or topotype. - Etymology: From the feminine scientific Latin adjective *flavèscens*, meaning "yellowish", referring to the colour of fur and membranes (see Lanza *et al.*, 2015: 401).
1900. *Vesperugo flavescens:* Bocage, Bull. Mus. natn. Hist. nat., Paris, 6: 164. (Name Combination)
1935. *Pipistrellus flavescens:* Monard, Arq. Mus. Bocage, 6: 31. (Name Combination)
1937. *Eptesicus capensis angolensis* J.Eric Hill, Am. Mus. Novit., 916: 1, fig. 1. Publication date: 17 April 1937. Type locality: Angola: Chitau [11 15 S 17 01 E, 4 900 ft] [Goto Description]. Holotype: AMNH 85535: ad ♂, skin and skull. Collected by: Herbert Lang and The Vernay Angola Expedition; collection date: 5 August 1925; original number: 620. Co- or Topotype: AMNH 88096: ad ♀. Co- or Topotype: CM 7018b: ♀.
1939. *Eptesicus flavescens:* G.M. Allen, Bull. Mus. comp. Zool., 83: 83. (Name Combination)
1953. *Eptesicus (Eptesicus) flavescens:* Ellerman, Morrison-Scott and Hayman, Southern African mammals 1758 to 1951, 76. (Name Combination)
1984. *Eptesicus (Eptesicus) capensis grandidieri:* Anciaux de Faveaux, Ann. Kon. Mus. Mid. Afr., Zool. Wetensch.. (Name Combination)
1987. *[Attalepharca] flavescens:* Menu, Palaeovert., 17 (3): 126. (Name Combination)
1987. *Pipistrellus (Neoromicia) flavescens:* Hill and Harrison, Bull. Br. Mus. (nat. Hist.) Zool., 52 (7): 282. (Name Combination)
1993. *Eptesicus (Neoromicia) flavescens:* Koopman, in: Wilson and Reeder, Mammal species of the World (2nd Edition): Chiroptera, 201. (Name Combination)
1994. *P[ipistrellus (Neoromicia)] c[apensis] grandidieri:* Koopman, in: Niethammer, Schliemann and Starck, Handbook of Zoology, volume II (Mammalia) Chiroptera, (60) 55. (Name Combination)
2006. *Neoromicia flavescens:* Van Cakenberghe, Kearney and Seamark, African Chiroptera Project, Pretoria, 132 - 133. (Name Combination, Current Combination)
2007. *Pipistrellus (Afropipistrellus) grandidieri angolensis:* Thorn, Kock and Cuisin, Mammalia, 72 (1/2): 76. (Name Combination)
2007. *Pipistrellus (Afropipistrellus) grandidieri grandidieri:* Thorn, Kock and Cuisin, Mammalia, 71 (1/2): 76. (Name Combination)
2007. *Pipistrellus (Afropipistrellus) grandidieri:* Thorn, Kock and Cuisin, Mammalia, 71 (1/2): 73. (Name Combination)
2019. *L[aephotis] flavescens:* Taylor and Tuttle, Bats: An illustrated guide to all species, 283. Publication date: 11 April 2019. - Comments: Taylor and Tuttle (2019 283) consider *flavescens* to be a species separate from *grandidieri*. (Name Combination)
? *Neoromicia grandidieri:* - Comments: . (Lapsus)
? *Pipistrellus grandidieri:* (Name Combination, Current Combination)

TAXONOMY:
Thorn *et al.* (2007: 73) recognize two subspecies: *P.* (*A.*) *g. grandidieri* for East African specimens and *P.* (*A.*) *g. angolensis*, a slightly larger western and southern African subspecies (Angola, Malawi and Cameroon).

Monadjem *et al.* (2013c: 194) mention a specimen from Mount Nimba as "*Pipistrellus* sp. 1", which was in a later publication (Monadjem *et al.*, 2016y: 370) assigned to "*Pipistrellus* cf. *grandidieri*". The latter authors indicate that the specimen involved has very similar cranial characters as *P. grandidieri*, but that species occurs only in eastern Africa, some 2,500 km away. Pending further genetical characterisation, they tentatively named it "cf. *grandidieri*".

Thorn *et al.* (2007: 70 - 71) consider "*flavescens*" to be a *nomen dubium*, since its description does not agree with the two "syntypes" attributed to it. They indicate that one syntype (MNHN ZM-MO-1900-536) is actually a representative of *Pipistrellus* (*Afropipistrellus*) *grandidieri* Dobson, 1876.

COMMON NAMES:
Czech: netopýr galangánský. Chinese: 黄伏翼. English: Grandidier`s Pipistrelle, Yellow Pipistrelle Bat, Yellow Serotine. French: Pipistrelle de Grandidier, Sérotine de Grandidier, Sérotine jaune, Pipistrelle jaune. German: Grandidiers Zwergfledermaus, Gelbe Zwergfledermaus, Gelbe Pipistrelle. Italian: Pipistrèllo giallàstro.

CONSERVATION STATUS:
Global - (as *Pipistrellus flavescens*) Listed as Data Deficient (DD ver 3.1 (2001)) in view of continuing problems with its taxonomy as well as absence of recent information on its extent of occurrence, status, ecological requirements and threats (Jacobs *et al.*, 2008s; IUCN, 2009).

Assessment Histroy -
2008 - DD ver 3.1 (2001) [assessed as *Pipistrellus flavescens*] (Jacobs *et al.*, 2008s; IUCN, 2009). 2004 - DD ver 3.1 (2001) (Jacobs *et al.*, 2004aa; IUCN, 2004). 1996 - DD [assessed as *Eptesicus flavescens*] (Baillie and Groombridge, 1996).

MAJOR THREATS:
The threats to this species are not known (Jacobs *et al.*, 2008s; IUCN, 2009) (as *Pipistrellus flavescens*).

CONSERVATION ACTIONS:
Jacobs *et al.* (2008s) [in IUCN (2009)] report that it (as *Neoromicia flavescens*) has been recorded from the Kambai Forest Reserve in Tanzania by Cunneyworth (1996b). There is a need to clarify the taxonomic status of animals currently allocated to this species, and thereby better understand the distribution, natural history and potential threats to it.

GENERAL DISTRIBUTION:
Ethiopia to SE Democratic Republic of the Congo, including Unguja [=Zanzibar]. Possibly Liberia (1st record, Monadjem and Fahr, 2007: 47; as "*Neoromicia* aff. *guineensis*"). Decher *et al.* (2016: 273) report *N.* cf. *grandidieri* specimens from Guinea. As *Pipistrellus/Neoromicia flavescens* recorded from Angola (type locality at Galanga), Burundi, Cameroon, Malawi (including the Shire Highlands (Happold and Happold, 1997b: 81), Mozambique, Uganda (Kampala) and Somalia (Shonto Forest).

Native: Angola (Crawford-Cabral, 1989; Thorn *et al.*, 2007; Monadjem *et al.*, 2010d: 571); Burundi; Cameroon; Congo (Democratic Republic of the) (Hayman *et al.*, 1966; Monadjem *et al.*, 2010d: 571); Malawi (Happold and Happold, 1997b: 81; Thorn *et al.*, 2007; Monadjem *et al.*, 2010d: 571); Mozambique; Somalia; Tanzania; Uganda.

DETAILED MORPHOLOGY:
Baculum - Thorn *et al.* (2007).

POPULATION:
Structure and Density - There are few details available on the population status of this species (Jacobs *et al.*, 2008s; IUCN, 2009).
Trend - 2008 - Unknown (Jacobs *et al.*, 2008s; IUCN, 2009 - as *Pipistrellus flavescens*).

PARASITES:
Schaer *et al.* (2013a: 17416) report the presence of hemosporidian parasites of the genus *Polychromophilus* in three out of three investigated *P.* aff. *grandidieri* specimens from West Africa, but they indicate that the bat might respresent an undescribed species. Rosskopf *et al.* (2018: Suppl.) refer to the same specimens, and mention them from Guinea.

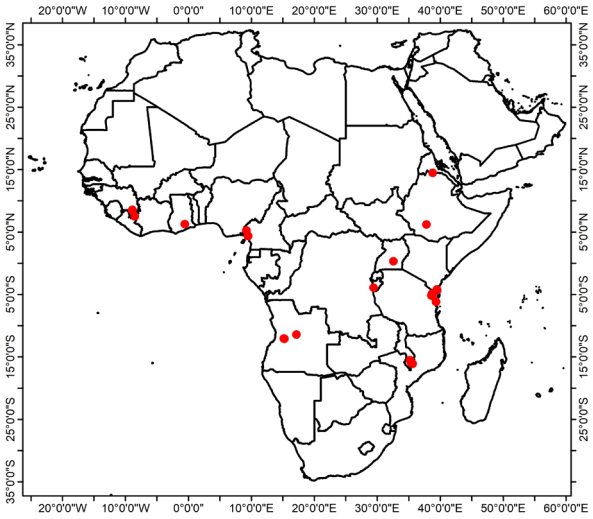

Figure 343. Distribution of *Pipistrellus grandidieri*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Angola, Burundi, Cameroon, Côte d'Ivoire, Ethiopia, Ghana, Guinea, Kenya, Liberia, Malawi, Tanzania, Uganda.

Pipistrellus hanaki Hulva and Benda, 2004

*2004. *Pipistrellus hanaki* Hulva and Benda, in: Benda, Hulva and Gaisler, Acta Chiropt., 6 (2): 207. Type locality: Libya: Cyrenaica: Al Jabal Al Akhdar district:: (ca. 5 km) SW of Al Bayda: Wadi al Kuf [32 44 N 21 41 E, 495 m] [Goto Description]. Holotype: NMP 49897: ad ♂, skull and alcoholic. Collected by: Petr Benda, Vladimir Hanák, Michal Andreas, Antonin Reiter and Marcel Uhrin; collection date: 19 May 2002. 3 paratypes: see Benda *et al.* (2004b: 207). Paratype: NMP 49890: ad ♀, skull and alcoholic. Collected by: Petr Benda, Vladimir Hanák, Michal Andreas, Antonin Reiter and Marcel Uhrin; collection date: 18 May 2002; original number: pb2135. Presented/Donated by: ?: Collector Unknown. Collected at: 'Arqub Ash Shafshaf, ca. 3 km south of Al Hilal, Cyrenaica, Libya; 32.87°N, 22.18°E. (see Benda in Mlíkovský *et al.*, 2011: 136). Paratype: NMP 49891: ad ♂, skull and alcoholic. Collected by: Petr Benda, Vladimir Hanák, Michal Andreas, Antonin Reiter and Marcel Uhrin; collection date: 18 May 2002; original number: pb2136. Presented/Donated by: ?: Collector Unknown. Collected at: 'Arqub Ash Shafshaf, ca. 3 km south of Al Hilal, Cyrenaica, Libya; 32.87°N, 22.18°E. (see Benda in Mlíkovský *et al.*, 2011: 136). Paratype: NMP 49892: ad ♀, skull and alcoholic. Collected by: Petr Benda, Vladimir Hanák, Michal Andreas, Antonin Reiter and Marcel Uhrin; collection date: 18 May 2002; original number: pb2137. Presented/Donated by: ?: Collector Unknown. Collected at: 'Arqub Ash Shafshaf, ca. 3 km south of Al Hilal, Cyrenaica, Libya; 32.87°N, 22.18°E. (see Benda in Mlíkovský *et al.*, 2011: 136). Paratype: NMP 49894: ad ♀, skull and alcoholic. Collected by: Petr Benda, Vladimir Hanák, Michal Andreas, Antonin Reiter and Marcel Uhrin; collection date: 19 May 2002; original number: pb2142. Presented/Donated by: ?: Collector Unknown. Paratype: NMP 49895: ad ♀, skull and alcoholic. Collected by: Petr Benda, Vladimir Hanák, Michal Andreas, Antonin Reiter and Marcel Uhrin; collection date: 19 May 2002; original number: pb2143. Presented/Donated by: ?: Collector Unknown. Paratype: NMP 49896: ad ♀, skull and alcoholic. Collected by: Petr Benda, Vladimir Hanák, Michal Andreas, Antonin Reiter and Marcel Uhrin; collection date: 19 May 2002; original number: pb2144. Presented/Donated by: ?: Collector Unknown. Paratype: NMP 49902: sad ♂, alcoholic (skull not removed). Collected by: Petr Benda, Vladimir Hanák, Michal Andreas, Antonin Reiter and Marcel Uhrin; collection date: 20 May 2002; original number: pb2150. Presented/Donated by: ?: Collector Unknown. Collected at a small cave in the central part of Wadi Al Kuf, 8 km southwest of Massah, Cyrenaica, Libya; 32.70 N 21.58 E (see Benda in Mlíkovský *et al.*, 2011: 136). Paratype: NMP 49903: ad ♀, skull and alcoholic. Collected by: Petr Benda, Vladimir Hanák, Michal Andreas, Antonin Reiter and Marcel Uhrin; collection date: 20 May 2002; original number: pb2151. Presented/Donated by: ?: Collector Unknown. Collected a :a small cave in the central part of Wadi Al Kuf, 8 km southwest of Massah, Cyrenaica, Libya; 32.70 N 21.58 E (see Benda in Mlíkovský *et al.*, 2011: 136). Paratype: NMP 49904: ad ♀, skull and alcoholic. Collected by: Petr Benda, Vladimir Hanák, Michal Andreas, Antonin Reiter and Marcel Uhrin; collection date: 20 May 2002; original number: pb2152. Presented/Donated by: ?: Collector Unknown. Collected at a small cave in the central part of Wadi Al Kuf, 8 km southwest of Massah, Cyrenaica, Libya; 32.70 N 21.58 E (see Benda in Mlíkovský *et al.*, 2011: 136). - Etymology: In honour of prof. Vladimír Hanák (Prague, Czech Republic), who signficantly contributed to the knowledge of the Palaearctic bat fauna (see Benda *et al.*, 2004b: 208). (Current Combination)

TAXONOMY:
See Benda *et al.* (2004b; 2009a).

Evin *et al.* (2011: 2095 - 2097) confirm that *hanaki* is composed of two different lineages: *P. hanaki hanaki* from Libya and *P. hanaki creticus* Benda, 2008 from Crete, which differ also in size and shape of the skull.

COMMON NAMES:
Albanian: Pipistrel i Hanak-ut. Armenian: Հանակի փոքրաչղջիկ. Azerbaijani: Hanaki cı rtdan şəbpərəsi. Basque: Hanak pipistrelo. Belarusian:

Нетапыр Ганака. Bosnian: Hanakov šišmiš. Breton: Pipistrell Libia. Bulgarian: Прилепче на Ханак. Castilian: Murciélago de Hanak. Catalan: Pipistrella de Hanak. Croatian: Hanakov patuljasti šišmiš. Czech: Netopýr Hanákův, Netopýr kyrénský. Danish: Hanaks flagermus. Dutch: Hanaks dwergvleermuis, Hanak's dwergvleermuis. English: Hanak's Pipistrelle. Estonian: Liibüa nahkhiir. Finnish: Libyanlepakko. French: Pipistrelle de Libye. Frisian: Hanaks dwerchflearmûs. Galician: Morcego de Hanak. Georgian: ჰანაკის ღამორი. German: Hanaks Zwergfledermaus, Hanaks Pipistrelle. Greek: Νανονυχτερίδα του Hanak. Hungarian: Hanák-törpedenevér. Irish Gaelic: Ialtóg Hanak. Italian: Pipistrello di Hanak. Latvian: Hanaka sikspārnis. Lithuanian: Hanako šikšniukas. Luxembourgish: Libesch Zwergfliedermaus. Macedonian: Ханаков лилјак. Maltese: Pipistrell ta' Hanak. Montenegrin: Libijski patuljasti slijepi mišić. Norwegian: Kyrenaikaflaggermus. Polish: Karlik cyrenejski. Portuguese: Morcego de Hanak. Rhaeto-Romance: Pipistrel da Hanak. Romanian: Liliacul pitic a lui Hanak. Russian: Нетопырь Ганака. Serbian: Либијски сл[ij]епи мишић [= Libijski sl[ij]epi mišić]. Scottish Gaelic: Ialtag Hanak. Slovak: večernica Hanákova. Slovenian: Libijski drobni netopir. Swedish: Kretapipistrell. Turkish: Hanak'ın Cüce Yarasası. Ukrainian: Нетопир Ганака. Welsh: Ystlum lleiaf Hanak.

SIMILAR SPECIES:
Pipistrellus hanaki differs from its nearest relatives *P. pipistrellus* and *P. pygmaeus* chromosomally, and by its larger skull and teeth, and a number of other characters (Benda *et al.*, 2004b).

CONSERVATION STATUS:
Global - This recently described species, little or no data is available on population size and trend, distribution, or potential threats. Assessed as Data Deficient DD ver 3.1 (2001) (Aulagnier and Palmeirim, 2008a; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) (Aulagnier and Palmeirim, 2008a; IUCN, 2009).

MAJOR THREATS:
Unknown (Aulagnier and Palmeirim, 2008a; Thorn *et al.*, 2009).

CONSERVATION ACTIONS:
Unknown (Aulagnier and Palmeirim, 2008a; IUCN, 2009).

GENERAL DISTRIBUTION:
Pipistrellus hanaki is known only from a small area on the Libyan coast (in the Cyrenaica area) (Benda *et al.*, 2004b), and from Crete (Greece) (see Benda *et al.*, 2009b).

Native: Greece (Benda *et al.*, 2009b); Libyan Arab Jamahiriya (Benda *et al.*, 2004b).

DETAILED MORPHOLOGY:
Herdina *et al.* (2013: 68) indicate that *P. hanaki* can not be separated from either *P. pipistrellus* or *P. pygmaeus* by the shape of its baculum. They found that the proximal third of the baculum shows the most interspecifice variation between these three species, whereas the shape of the curve in lateral view shows the most individual variation.

ECHOLOCATION:
Georgiakakis and Russo (2012: 168) report that the echolocation call has a FM-QCF structure, consisting of a frequency modulated component followed by an almost constant frequency part. They (p. 169) also were able to distinguish two types of social calls: type 'A' (primarily emitted by foraging bats) with a maximum energy frequency (FMAXE) of about 27.7 kHz, and a duration of 19.9 ms, of which type 'B' had a maximum energy frequency of all components (Freq) of about 20.9 kHz and a bandwidth of 28 kHz, and a duration of 24.8 ms. The number of calls of type 'B' increased from July to October and then decreased again, whereas those of type 'A' decreased from July to November.

MOLECULAR BIOLOGY:
DNA - See Benda *et al.* (2004b), Hulva *et al.* (2004).
Karyotype - Unknown
Protein / allozyme - Unknown.

DIET:
From Libya, Benda *et al.* (2014c: 60) reported the following food items: Smaller Lepidoptera and small Coleoptera (Scarabaeidae, Carabidae, Staphylinidae). Two digestive tracts contained high volumes of cockroaches (Blattodea), and small amounts of Nematocera (Culicidae and Chironomidae) as well as Hymenoptera (Ichneumonoidea).

POPULATION:
Structure and Density - Unknown (Aulagnier and Palmeirim, 2008a; IUCN, 2009).
Trend - 2008 - Unknown (Aulagnier and Palmeirim, 2008a; IUCN, 2009).

ACTIVITY AND BEHAVIOUR:
Smotherman *et al.* (2016: 537) refer to Georgiakakis and Russo (2012) in describing the song structure for this species as consisting of different syllable types in basic motif. These bats sing while flying.

REPRODUCTION AND ONTOGENY:
Benda *et al.* (2014c: 55) reported pregnant females (each containing one foetus) collected on 17, 18, and 19 May 2002 at different localities in Libya.

PARASITES:
Benda *et al.* (2014c: 60) reported the presence of two Nycteribiid bat flies: *Basilia daganiae* Theodor and Moscona, 1954 and *Basilia mediterranea* Hurka, 1970.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Libya.

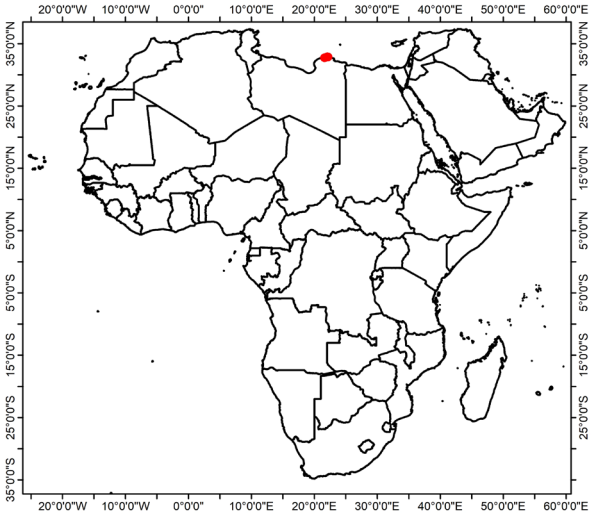

Figure 344. Distribution of *Pipistrellus hanaki*

Pipistrellus hesperidus (Temminck, 1840)

1832. *Vespertilio platycephalus* Temminck, in: Smuts, Enumer. Mamm. Capensium, 107. Type locality: South Africa: Cape Town [33 56 S 18 28 E].
*1840. *Vespertilio hesperida* Temminck, Monographies de mammalogie ou description de quelques genres de mammifères, dont les espèces ont été observées dans les différens musées de l'Europe, 2: 211. Type locality: Eritrea: Abyssinia: Red Sea, shores of the [ca. 09 N 39 E] [Goto Description]. Lectotype: SMF 12381: ad ♂, skin and skull. Collected by: Wilhem Peter Edward Simon Rüppell; collection date: 1842. Old catalog number II.N.9*. - Etymology: From the feminine scientific Latin adjective *hespèrida*, meaning "evening animal", deriving from the feminine Greek substantive "*ἑσπέρα*" (hespèra), meaning "evening", as this bat, as almost all Chiroptera, begins to fly at dusk (see Lanza *et al.*, 2015: 410).
1969. *Vesperugo hespirida:* Kock, Abh. Senckenberg. naturforsch. Ges., 521: 206. (Name Combination, Lapsus)
2001. *Pipistrellus hesperidus:* Kock, Senckenb. biol., 81 (1/2): 277. (Name Combination, Current Combination)
2002. *Pipistrellus cf. kuhlii:* Kearney, Volleth, Contrafatto and Taylor, Acta Chiropt., 4 (1): 55. - Comments: Not of Kuhl, 1817.
? *Pipistrellus (Pipistrellus) kuhlii:*
? *Pipistrellus hesperidus 3:*
? *Pipistrellus hesperidus fuscatus:* (Name Combination)
? *Pipistrellus kuhlii:* - Comments: Not of Kuhl, 1817.

TAXONOMY:
Pipistrellus hesperidus was separated from *kuhlii* by Kock (2001b: 277).

Vespertilio platycephalus Temminck, 1832 is according to Roberts (1951) a synonym of *P. kuhlii*, which would make this the senior synonym. However, both Allen (1939a) and Ellerman *et al.* (1953) regard this taxon as unidentifiable, besides which it seems to fall outside the known distribution of this species (Meester *et al.*, 1986: 52).

Koubínová *et al.* (2013: 8) suggest that three subspecies might deserve elevation to species rank: *hesperidus* (North-eastern Africa), *fuscatus* (Afro-tropical regions other than Southern Africa and Madagascar), and *subtilis* (Southern Africa and Madagascar), but they also indicate that the cyt *b* of Senegalese "*hesperidus*" differs considerably (13 %) from that in populations from South Africa, and might nieed to be considered a distinct species.

COMMON NAMES:
Chinese: 暗黑伏翼. Czech: netopýr jižní. English: African pipistrelle, dusky pipistrelle. French: Pipistrelle hespéride. German: Abendstern-Zwergfledermaus, Abendstern-Pipistrelle, Netzhäutigen Dämmerungsfledermaus, Flachköpfige Dämmerungsfledermaus. Italian: Pipistrèllo seràle.

ETYMOLOGY OF COMMON NAME:
Since sub-Saharan Africa populations are specifically distinct from Kuhl's pipistrelle occuring in the Palaeartic region (Kock 2001?a), the name African pipistrelle serves to distinguish it from Kuhl's pipistrelle (Bronner *et al.*, 2003; Taylor, 2005).

CONSERVATION STATUS:
Global - Listed as Least Concern in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008dp; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2008dp; IUCN, 2009). 2004 - LC ver 3.1 (2001) [assessed as part of *P. kuhlii*] (IUCN, 2004).

Regional -
South Africa: 2016 - LC ver 3.1 (2001) (Monadjem *et al.*, 2016p). 2004 - LC ver 3.1 (2001) (Friedmann and Daly, 2004). 1986 - Indeterminate [assessed as *P. kuhlii*] (Smithers, 1986).

MAJOR THREATS:
There appear to be no major threats to this species as a whole (Mickleburgh *et al.*, 2008dp; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008dp) [in IUCN (2009)] report that in view of the species wide range it is presumably present in a number of protected areas. It has been recorded from the Parc National de Kirindy-Mitea on Madagascar (Bates *et al.*, 2006). Additional taxonomic studies are needed to better define the extent of the species range relative to other species of *Pipistrellus*.

GENERAL DISTRIBUTION:
Pipistrellus hesperidus has been recorded over much of sub-Saharan Africa. It ranges from the Cape Verde Islands, to Liberia and Côte d'Ivoire, to Nigeria, Cameroon and Equatorial Guinea (Bioko), western Democratic Republic of the Congo, southern Sudan, Ethiopia, Eritrea and Somalia, into Kenya and Uganda, Rwanda, Burundi, Tanzania, Malawi, Mozambique, Zambia, Zimbabwe, Angola being found as far south as eastern and southern South Africa and possibly Swaziland. There are a few records of this species from central western Madagascar (Bates *et al.*, 2006: 317).

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 820,815 km^2.

In the RSA, the species' distribution is strongly associated with annual precipitation (Babiker Salata, 2012: 49).

The current identity of bats from the Arabian Peninsula formerly allocated to *Pipistrellus kuhlii* is unclear and some records might refer to *P. hesperidus*. Simmons (2005) also indicates that this species is present in the Canary Islands (Spain). However, this distribution needs to be confirmed. Records from North Africa are referable to *Pipistrellus kuhlii*.

Taylor *et al.* (2018b: 63) predict the species might occur in Angola.

Native: Botswana (Monadjem *et al.*, 2010d: 571); Burundi; Cameroon (Eisentraut, 1968: 171 - as "*P. kuhlii* - 1st record from West Africa); Cape Verde; Congo (The Democratic Republic of the); Equatorial Guinea (Bioko); Eritrea; Ethiopia (Lavrenchenko *et al.*, 2004b: 134); Kenya; Liberia (Fahr, 2007a: 104); Madagascar (Bates *et al.*, 2006: 317); Malawi (Ansell, 1974; Happold *et al.*, 1988; Monadjem *et al.*, 2010d: 571); Mozambique (Smithers and Lobão Tello, 1976; Monadjem *et al.*, 2010d: 571; Monadjem *et al.*, 2010c: 384); Nigeria; Rwanda; South Africa (Monadjem *et al.*, 2010d: 571); Swaziland (Monadjem *et al.*, 2010d: 572); Tanzania (Stanley and Goodman, 2011: 47); Uganda; Zambia (Ansell, 1978; Monadjem *et al.*, 2010d: 572); Zimbabwe (Cotterill, 2004a: 261; Monadjem *et al.*, 2010d: 572).
Presence uncertain: Spain (Canary Isands).

DETAILED MORPHOLOGY:
Baculum - Hill and Harrison (1987) as *P. kuhlii* and Kearney *et al.* (2002) as *P* cf. *kuhlii*.

ECHOLOCATION:
Schoeman and Waddington (2011: 291) mention a peak frequency of 56.3 ± 2.1 kHz and a duration of 2.2 ± 0.2 msec for specimens from Durban, South Africa.

In Soutpansberg, South Africa, Taylor *et al.* (2013b: 17) recorded the following parameters for 19 calls: F_{max}: 66.9 ± 8.91 (48.5 - 82.0) kHz, F_{min}: 44.9 ± 1.53 (41.3 - 47.2) kHz, F_{knee}: 50.3 ± 2.50 (44.9 - 54.7) kHz, F_{char}: 45.8 ± 1.78 (41.5 - 49.1) kHz, duration: 2.6 ± 0.85 (1.7 - 5.0) msec.
Linden *et al.* (2014: 40) reported the following parameters from the Soutpansberg area (RSA): F_{min}:41 - 47 kHz, F_{char}: 42 - 49 kHz, F_{knee}: 45 - 55 kHz, Slope: 154 - 829 OPS, duration: 2 - 5 msec.
At Farm Welgevonden, South Africa, Taylor *et al.* (2013a: 556) report a F_{knee} value of 50 (45 - 55) kHz.

Monadjem *et al.* (2017c: 179) reported the following values for Swaziland: F_{min}: 45.3 ± 1.87 (41.7 - 49.1) kHz, F_{knee}: 49.6 ± 2.42 (44.6 - 54.3) kHz, F_c: 46.0 ± 1.83 (42.5 - 50.0) kHz, and duration: 3.1 ± 0.63 (2.3 - 4.5) msec.

Adams and Kwiecinski (2018: 4) recorded two calls in the Kalahari Desert: F_{char}: 43.3 ± 3.1 kHz, F_{max}: 53.6 ± 1.6 kHz, F_{min}: 42.9 ± 3.4 kHz, duration: 2.3 ± 0.3 msec.

MOLECULAR BIOLOGY:
DNA - Unknown.

Karyotype - Rautenbach *et al.* (1993), Volleth *et al.* (2001) and Kearney *et al.* (2002) all reported 2*n* = 42, FN = 50, BA = 10, and a metacentric X chromosome, for specimens from South Africa and Madagascar. These results were the same as those obtained for *P. rusticus* (Kearney *et al.*, 2002). Rautenbach *et al.* (1993) also reported an acrocentric Y chromosome. GTG banding also identified that *P. hesperidus* and *P. rusticus* share the same Robertsonian fusion of chromosomes 11/12 (Kearney *et al.*, 2002). Volleth and Eick (2012: 169) indicate that the EMA segment order on chromosomal arm 2 of *P. hesperidus* is the same as that on human chromosome 4, but differs from that on chromosome 10 of *Rhinolophus hipposideros*, and conclude that the EMA segment order in the Vespertilioniformes is probably the ancentral one.

Koubínová *et al.* (2013: 3) report a different karyotype for 3 ♂♂ and 1 ♀ from Senegal: 2*n* = 46, Fna = 58, FN = 62, X = metacentric, and Y = dot-like. They also found that the cytochrome *b* in their specimens differed for about 13 % from that of South African specimens, which led them to the conclusion that Senegalese *P.* cf. *hesperidus* likely represents a different species.

Protein / allozyme - Unknown.

HABITAT:
Cooper-Bohannon *et al.* (2016: Table S2) indicate that, in southern Africa, *P. hesperidus* occurs primarily in Savanna (47 %), SW arid (20 %) and Afromontane (15 %) habitats.

In Madagascar, Ravelomanantsoa *et al.* (2019: 110) caught it in open spaces in a dry deciduous forest and near a banana plantation.

DIET:
Naidoo *et al.* (2011: 26) reported the following volume percentages from the Umbilo River (KwaZulu Natal, RSA): during summer: Lepidoptera (7.8 ± 2.8), Coleoptera (12.3 ± 5.5), Hemiptera (32.8 ± 2.8), Diptera (37.8 ± 8.1), and Trichoptera (9.2 ± 7.1); during winter: Lepidoptera (16.9 ± 19.0), Coleoptera (20.4 ± 20.3), Hemiptera (12.6 ± 13.2), Diptera (13.7 ± 5.1), and Trichoptera (36.4 ± 38.7). From the Westville River, they reported for the summer: Lepidoptera (10.0 ± 4.5), Coleoptera (8.0 ± 3.8), Hemiptera (31.2 ± 10.7), Diptera (42.7 ± 11.4), Trichoptera (2.7 ± 0), and Hymenoptera (5.4 ± 8.7).

From the Limpopo province (RSA), Taylor *et al.* (2017b: 245, 252 - 254) report the following food items, belonging to six insect orders: Lepidoptera (*Araeopteron* sp. + *Toxocampinae tathorhynchus* + *Eutelia polychorda* + *Chiasmia interrupta* + *Ennominae* sp. + *Isturgia roraria* + *Sena* sp. + *Sena prompta* + *Xenopseustis* sp. + *Athetis ignava* + *Copitarsia* sp. + *Cortyta canescens* + *Enmonodia capensis* + *Mythimna impura* + *Mythimna oxygala* + *Pandesma robusta* + *Pericyma atrifusa* + *Spodoptera exigua* + *Tycomarptes* sp. + *Maurilia arcuata* + *Pseudautomeris irene* + *Arotrura JFL201* + *Agrius convolvuli* + unmatched), Coleoptera (unmatched), Orthoptera (*Neoconocephalus spiza* + unmatched), Hemiptera (*Nezara viridula*), Diptera (*Culex quinquefasciatus* + 2 unmatched) and Blattodea (unmatched).

Bailey *et al.* (2019: 372) found that the Allotonic Frequency Hypothesis (eared moths are less available to syntonic bats due to their ability to detect these bat's echolocation, but become available around lights due to a reduction in efficacy of the moth's defences) is true for *Pipistrellus hesperidus*.

PREDATORS:
Mikula *et al.* (2016: Supplemental data) mention the following avian predators: Little sparrowhawk (*Accipiter minullus* (Daudin, 1800)); Southern fiscal (*Lanius collaris* Linnaeus, 1766). They also mention "*P. kuhli*" being preyed upon by the Lanner falcon (*Falco biarmicus* Temminck, 1825), the Eurasian hobby (*Falco subbuteo* Linnaeus, 1758), the Common kestrel (*Falco tinnunculus* Linnaeus, 1758), but some of these records might involve *P. hesperidus*. Their references to the Bat hawk (*Macheiramphus alcinus* Bonaparte, 1850) probably all refer to *P. hesperidus* as these all point to sub-Saharan countries.

POPULATION:
Structure and Density - There is little information available on the abundance of this species, however, it is not very common in southern Africa (Skinner and Chimimba, 2005: 301; Mickleburgh *et al.*, 2008dp; IUCN, 2009).
Trend - 2008 - Unknown (Mickleburgh *et al.*, 2008dp; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
Stanley and Goodman (2011: 46 - 47) report on two females collected in early July 1991 in the West Usambara Mountains (Tanzania) of which one had an embryo in each uterine horn. Three other females, collected on 1 September 1992, did not show any signs of reproduction.

Monadjem *et al.* (2010d) [in Weier *et al.* (2018: Suppl.)] mentioned that pregnant females were collected in October.

PARASITES:
Basilia robusta Theodor 1956 (Haeselbarth *et al.*, 1966: 111 - host recorded as *P. kuhlii*). Beaucournu and Noblet (1985: 635) also mention the possible presence of *Basalia daganiae* Theodor and Moscona, 1954 on a "*P. kuhlii*" from Kenya.

The bat fly "*Basilia* sp. 3" was reported from "*Pipistrellus* cf. *hesperidus*" by Ramasindrazana *et al.* (2017: 4).

Ramasindrazana *et al.* (2016: 6) report the presence of *Litosoma* Clade 2 (Nematoda: Onchocercidae) in Madagascan "*P.* cf. *hesperidus*".

The flea *Ischnopsyllus emminus* Jordan and Rothschild, 1921 was reported on "*P. kuhlii*" from Malawi by Beaucournu and Kock (1996).

The bat bugs *Cacodmus ignotus* Rothschild, 1912 and *Cacodmus sparsilis* Rothschild, 1914 (Hemiptera: Cimicidae) were reported from South Africa by Hornok *et al.* (2017a: 3).

Hornok *et al.* (2017b: 3) found larvae of the tick *Argas transgariepinus* White, 1846 (Ixodida: Argasidae) on a *P. hesperidus* from Makhado, RSA. Hornok *et al.* (2019: 2) probably refer to the same bat and tick and indicate that the latter was infected with *Rickettsia* sp. bacteria.

VIRUSES:
Coronaviridae

Anthony *et al.* (2017b: Suppl.) mention the beta-coronavirus MERS_like_CoV. Anthony *et al.* (2017a: 1) described a MERS_like CoV (strain PREDICT/PDF-2180) from *P.* cf. *hesperidus* from Uganda.

Paramyxoviridae
1 out of 11 Madagascan specimens tested by Mélade *et al.* (2016b: 4) was positive for paramyxoviruses.

Rhabdoviridae - Rabies like viruses
Lyssavirus - Rabies related viruses
Rabies - Oelofsen and Smith (1993) tested [as *P. kuhlii*] one individual brain, from Christiana, Free State Province South Africa by means of the "Rapid rabies enzyme immunodiagnosis" (RREID) test (Diagnostic Pasteur), and this did not test positive.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Botswana, Burkina Faso, Cameroon, Cape Verde, Côte d'Ivoire, Djibouti, Eritrea, Ethiopia, Ghana, Kenya, Liberia, Madagascar, Malawi, Mozambique, Niger, Nigeria, Rwanda, Senegal, Somalia, South Africa, South Sudan, Sudan, Swaziland, Tanzania, Uganda, Zambia, Zimbabwe.

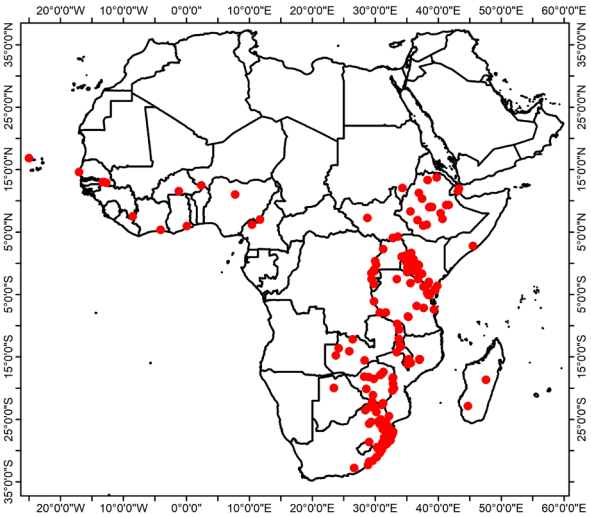

Figure 345. Distribution of *Pipistrellus hesperidus*

Pipistrellus hesperidus broomi Roberts, 1948

*1948. *Pipistrellus (Romicia) kuhlii broomi* Roberts, Special Publication of the Royal Society of South Africa, Robert Broom Commemorative volume, 9. Type locality: South Africa: KwaZulu-Natal: Durban: Malvern [29 53 S 30 56 E, 275 m]. Holotype: TM 1085: ad ♀. Collected by: Henry Paul William Lyster Jameson; collection date: 10 January 1908; original number: 425. Smithers *et al.* (1987: 463) also mention that three specimens have the number TM 1085 (both other specimens are probably TM 1081 [*P. nanus*] and TM 1087 [*P.* cf. *fuscatus* -> *P. hesperidus*]. - Comments: Type locality more likely to be Tzaneen Estates, Tzaneen, northeastern Transvaal (R.H.N. Smithers, in litt): see Meester

et al. (1986: 52). However, see also Smithers *et al.* (1987: 463) for a discussion on the type locality and type specimen. They confirm "Malvern" as type locality.

1951. *Romicia kuhlii broomi:* Roberts, Mammals of South Africa, 82. (Name Combination)
1953. *Pipistrellus (Pipistrellus) kuhli broomi:* Ellerman, Morrison-Scott and Hayman, Southern African mammals 1758 to 1951, 78. (Name Combination)
1957. *P[ipistrellus] k[uhli] broomi:* Ansell, Ann. Mag. nat. Hist., ser. 12, 10 (115): 538. Publication date: 29 October 1957. (Name Combination)
1968. *P[ipistrellus] k[uhlii] broomi:* Hill, Bonn. zool. Beitr., 19 (1/2): 44. (Name Combination, Alternate Spelling)
1969. *Pipistrellus (Romicia) kuhli broomi:* Kock, Abh. Senckenberg. naturforsch. Ges., 521: 167. - Comments: Alternate spelling for the name used by Roberts (1948). (Alternate Spelling)
1971. *Pipistrellus [(Pipistrellus)] kuhlii broomi:* Hayman and Hill, Mammals of Africa: Chiroptera, 40. (Name Combination, Alternate Spelling)
1992. *Pipistrellus kuhli broomi:* Trujillo, Murcielagos de las Islas Canarias, 23. (Name Combination)
? *Pipistrellus hesperidus broomi:* (Name Combination, Current Combination)
? *Pipistrellus kuhlii broomi:* (Name Combination)

GENERAL DISTRIBUTION:
KwaZulu-Natal (RSA).

Pipistrellus hesperidus hesperidus (Temminck, 1840)

*1840. *Vespertilio hesperida* Temminck, Monographies de mammalogie ou description de quelques genres de mammifères, dont les espèces ont été observées dans les différens musées de l'Europe, 2: 211. Type locality: Eritrea: Abyssinia: Red Sea, shores of the [ca. 09 N 39 E] [Goto Description]. Lectotype: SMF 12381: ad ♂, skin and skull. Collected by: Wilhem Peter Edward Simon Rüppell; collection date: 1842. Old catalog number II.N.9*. - Etymology: From the feminine scientific Latin adjective *hespèrida*, meaning "evening animal", deriving from the feminine Greek substantive "*ἑσπέρα*" (hespèra), meaning "evening", as this bat, as almost all Chiroptera, begins to fly at dusk (see Lanza *et al.*, 2015: 410).
1901. *Pipistrellus Kuhlii fuscatus* Thomas, Ann. Mag. nat. Hist., ser. 7, 8 (43): 34. Publication date: 1 July 1901. Type locality: Kenya: Naivasha [00 46 S 36 21 E] [Goto Description]. Holotype: BMNH 1901.8.9.96: ad ♂, skull and alcoholic. Collected by: Sir Harry Hamilton Johnston; collection date: 19 October 1900. Presented/Donated by: Sir Harry Hamilton Johnston.
1913. *Pipistrellus kuhli fuscatus:* Roberts, Ann. Transv. Mus., 4: 67. - Comments: Alternate spelling for the name used by Thomas, 1901. (Alternate Spelling)
1951. *Pipistrellus (Pipistrellus) kuhlii fuscatus:* Swynnerton and Hayman, J. East Afr. Nat. Hist. Soc., 20 (6-7) (90): 297 (for 1950).
? *Pipistrellus hesperidus hesperidus:* (Name Combination, Current Combination)

GENERAL DISTRIBUTION:
Sub-Saharan Africa with the exception of the extreme southeastern part of the continent.

Pipistrellus hesperidus subtilis (Sundevall, 1846)

*1846. *Vespertilio subtilis* Sundevall, Öfvers. kongl. Sv. Vet.-Akad. Förhandl., 3 (4): 119. Type locality: South Africa: "Interior of Caffraria". - Comments: Collector: J. Wahlberg.
1855. *Vespertilio (Vesperugo) subtilis:* Wagner, in: Schreber, Die Säugethiere in Abbildungen nach der Natur mit Beschreibungen, Suppl. 5: 746. (Name Combination)
1860. *Hypsugo subtilis:* Kolenati, Monographie der Europäischen Chiroptern, 6. (Name Combination)
1917. *Pipistrellus kuhlii subtilis:* G.M. Allen, Bull. Mus. comp. Zool., 83: 94. (Name Combination)
1931. *Pipistrellus subtilis:* Hewitt, A guide to the Vertebrate fauna of the Eastern Cape Province, 23. (Name Combination)

1951. *Eptesicops subtilis:* Roberts, Mammals of South Africa, 83. (Name Combination)
1953. *Pipistrellus (Pipistrellus) kuhli subtilis:* Ellerman, Morrison-Scott and Hayman, Southern African mammals 1758 to 1951, 78. (Name Combination)
1971. *Pipistrellus [(Pipistrellus)] kuhii subtilis:* Hayman and Hill, Mammals of Africa: Chiroptera, 40. (Name Combination)
1978. *Pipistrellus kuhli subtilis:* Ansell, Mammals of Zambia, 27. (Name Combination)
1993. *subtilus:* Koopman, in: Wilson and Reeder, Mammal species of the World (2nd Edition): Chiroptera, 221. (Lapsus)
? *Pipistrellus hesperidus subtilis:* (Name Combination, Current Combination)

GENERAL DISTRIBUTION:
SE Africa.

Pipistrellus inexspectatus Aellen, 1959

*1959. *Pipistrellus inexspectatus* Aellen, Archs Sci. Genève, 12 (2): 226. Type locality: Cameroon: Upper Benoue Valley: Ngaaouyanga [07 59 N 13 36 E] [Goto Description]. Holotype: MHNC ad ♂, alcoholic (skull not removed). Collected by: Villy Aellen and Albert Monard; collection date: 11 July 1947; original number: 954. See Aellen (1959a: 226). (Current Combination)
1966. *P[ipistrellus] inexpectatus:* Hayman, Misonne and Verheyen, Ann. Kon. Mus. Mid. Afr., Zool. Wetensch., (8) 154: 52. (Lapsus)
1971. *Pipistrellus [(Pipistrellus)] inexpectatus:* Hayman and Hill, Mammals of Africa: Chiroptera, 41. (Name Combination, Lapsus)
1987. *Nycterikaupius inexpectatus:* Menu, Palaeovert., 17 (3): 109. Publication date: 15 November 1987. (Name Combination, Lapsus)
1987. *Pipistrellus (Pipistrellus) inexspectatus:* Hill and Harrison, Bull. Br. Mus. (nat. Hist.) Zool., 52 (7): 281. (Name Combination)
1993. *Pipistrellus (Hypsugo) inexspectatus:* Koopman, in: Wilson and Reeder, Mammal species of the World (2nd Edition): Chiroptera, 220. (Name Combination)

TAXONOMY:
See Simmons (2005).

COMMON NAMES:
Czech: netopýr kamerunský. English: Aellen's Pipistrelle Bat, Aellen's Pipistrelle, Central Africa Pipistrelle. French: Pipistrelle d'Aellen, Pipistrelle d'Afrique centrale. German: Unerwartete Zwergfledermaus, Unerwartete Pipistrelle.

CONSERVATION STATUS:
Global - Listed as Data Deficient (DD ver 3.1 (2001)) in view of the absence of sufficient information on its extent of occurrence, natural history, threats and conservation status (Fahr, 2008q; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) (Fahr, 2008q; IUCN, 2009). 2004 - DD ver 3.1 (2001) (Fahr, 2004i; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
The threats to this species are poorly known (Fahr, 2008q; IUCN, 2009).

CONSERVATION ACTIONS:
Fahr (2008q) [in IUCN (2009)] reports that it is not known if the species is present in any protected areas. Further field surveys are needed to better understand the distribution, natural history and possible threats to this little known bats species.

GENERAL DISTRIBUTION:
Pipistrellus inexspectatus has been recorded from a few localities in West and Central Africa. It has been reported from Sierra Leone, Ghana, Benin and Nigeria and Cameroon.

There are also uncertain records from east Sudan and Uganda, although the specimens in question are difficult to certainly allocate to *Pipistrellus inexspectatus* (Koopman, 1975). The records of *P. inexspectatus* from the Democratic Republic of the Congo and Kenya are now allocated to *Pipistrellus eisentrauti* (Koopman *et al.*, 1995; Simmons, 2005).

Native: Benin; Burkina Faso (Kangoyé *et al.*, 2012: 6026; 2015a: 621); Cameroon; Ghana; Nigeria; Sierra Leone.
Presence uncertain: Sudan; Uganda.

ECHOLOCATION:
One FM/QCF call from Maroua (Cameroon), reported by Manga Mongombe (2012: 79) had the following parameters: F_{max}: 54.7 kHz, F_{min}: 47.7 kHz, F_{mean}: 51.2 kHz, F_{knee}: 54.7 kHZ, F_{char}: 47.7 kHz, and duration: 0.46 msec.

POPULATION:
Structure and Density - Little information is available on the population abundance or size of this species (Fahr, 2008q; IUCN, 2009).
Trend - 2008 - Unknown (Fahr, 2008q; IUCN, 2009).

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Benin, Cameroon, Côte d'Ivoire, Ghana, Kenya, Madagascar, Nigeria, Sierra Leone.

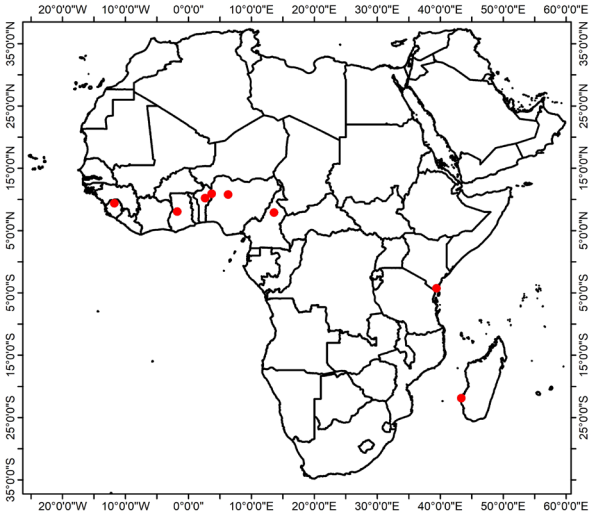

Figure 346. Distribution of *Pipistrellus inexspectatus*

Pipistrellus kuhlii (Kuhl, 1817)

*1817. *Vespertilio Kuhlii* Kuhl, Die Deutschen Fledermäuse, Hanau, 14. Type locality: Italy: Friuli-Venezia Giulia and Trieste. - Comments: Koopman (1993a: 221) mentioned 1817 as year of publication, whereas Meester *et al.* (1986: 51), Harrison and Bates (1991: 85), Corbet and Hill (1992: 137) and Bates and Harrison (1997: 179) mention "1819: Ann. Wetterau Ges. Naturk., 4 (2) 199".

1830. *Vespertilio marginatus* Cretzschmar, in: Rüppell, Atlas Reise Nördlichen Afrika, Zoologie Säugethiere, 1: 74, pl. 29a. Type locality: "Africa": Nile valley or eastern desert of Egypt [Goto Description]. Holotype: SMF 4307: ad ♀, skin and skull. Collected by: Wilhem Peter Edward Simon Rüppell; collection date: 1822. Don 1882; old catalog II.N.10.a: see Mertens (1925: 21). - Comments: Kock (1969a: 167) mentions "Arabia Petraea (=Sinai) und Nubien" as type locality. The publication date of Cretzschmar's work is sometimes indicated as "1826" (as mentioned on the title page), but also as "1827", "1828", "1830-1831".

1838. *Scotophilus Kuhlii:* Gray, Mag. Zool. Bot., Edinburgh, 2 (12): 497. (Name Combination)

1839. *Vesperugo Kuhlii:* Keyserling and Blasius, Arch. Naturgesch. Berlin, 5 (1): 319. (Name Combination)

1853. *V[esperugo (Vesperugo)] Kuhlii:* Blasius, Arch. Naturgesch. Berlin, 19 (1): 46. (Name Combination)

1855. *Vespertilio (Vesperugo) Kuhlii:* Wagner, in: Schreber, Die Säugethiere in Abbildungen nach der Natur mit Beschreibungen, Suppl. 5: 729. (Name Combination)

1856. *Nannugo Kuhlii:* Kolenati, Allg. deutsche naturh. Zeitung, N.F., 2 (4): 131. (Name Combination)

1857. *S[cotophilus] marginatus:* Tomes, Proc. zool. Soc. Lond., 1857, XXV (cccxxx): 50.

1862. *Vespertilio (Nannugo) Kuhlii:* Koch, Nass. Naturw. Jahrb., 18: 396. (Name Combination)

1862. *Vespertilio (Nannugo) marginatus:* Koch, Nass. Naturw. Jahrb., 18: 397.

1865. *V[espertilio] (Pipistrellus) marginatus:* De Filippi, Note di un viaggio in Persia nel 1862, 343. (Name Combination)

1866. *Vesperugo marginatus:* Heuglin and Fitzinger, Sber. k. Akad. Wiss. Wien, math. naturw. Kl., 54 (6 - 10): 546.

1867. *Pipistrella marginata:* Loche, Exploration scientifique de l'Algerie pendant les années 1840, 1841, 1842. Mammifères, Cheiroptères, 77. (Alternate Spelling)

1867. *Pipistrella minuta:* Loche, Exploration scientifique de l'Algerie pendant les années 1840, 1841, 1842. Mammifères, Cheiroptères, 78. Publication date: 1867. Type locality: Algeria: Messad Oasis [34 11 N 03 31 E] [Goto Description]. (Name Combination, Alternate Spelling)

1871. *Pipistrellus marginatus:* Dobson, J. Asiatic Soc. Bengal, 40 (2): 460.

1871. *V[esperugo] Kuhli:* Doderlein, Alcune generalita Intorno la Fauna Sicula de Vertebrati, 31. (Name Combination)

1878. *Vesperugo (Vesperugo) kuhlii:* Dobson, Catalogue of the Chiroptera of the collection of the British Museum, 230. (Name Combination)
1880. *Vesperugo Kühli:* Dobson, Bull. Soc. zool. France, 5: 235. (Name Combination)
1891. *Vesperugo (Vesperugo) kuhli:* Blanford, The fauna of British India, including Ceylon and Burma. Part II, 315. (Alternate Spelling)
1898. *P[ipistrellus] kuhli:* Thomas, Proc. zool. Soc. Lond., 1897, IV: 927. Publication date: April 1898. (Name Combination)
1899. *Vesperugo (Euvesperugo) kuhli:* Acloque, Faune de France, Mammifères, 36. (Name Combination)
1900. *Pipistrellus kuhlii:* Méhely, Monographia Chiropterorum Hungariae, 261. (Name Combination, Current Combination)
1902. *Pipistrellus deserti* Thomas, Proc. zool. Soc. Lond., 1902, II, I: 4. Publication date: October 1902. Type locality: Libya: Fezzan: Murzuk [25 56 N 13 57 E] [Goto Description]. Holotype: BMNH 1902.11.4.1: ad ♂, skin and skull. Collected by: Joseph Isaac Spadafora Whitaker; collection date: 30 May 1901; original number: 71. - Etymology: From *desèrti*, meaning "of the desert" (see Lanza *et al.*, 2015: 395).
1905. *Vespertilio (Pipistrellus) Kuhli:* Trouessart, Caus. sci. Soc. zool. France, 1 (10): 370/18. (Name Combination)
1909. *Pipistrellus kühli:* Satunin, Mitt. Kauk. Mus., 4: 299. (Name Combination)
1918. *Pipistrellus kuhli kuhli:* Wroughton, J. Bomb. nat. Hist. Soc., 25: 588. (Name Combination)
1936. *P[ipistrellus] k[uhlii] pallidus* Heim de Balsac, Supp. Bull. Biol. Fr. & Belg., 21: 43, 50, 180. Publication date: 1936. Type locality: Algeria: Northern Sahara: A'haggar, to the [ca. 23 30 N 06 00 E]. - Comments: Considered a nomen nudum by Allen (1939a: 94), Rode (1947: 138), Kock (1969a: 167). (Name Combination)
1936. *Pipistrellus kuhlii kuhlii:* Heim de Balsac, Supp. Bull. Biol. Fr. & Belg., 21: 91. (Name Combination)
1937. *[Pipistrellus Kühli] latastei* Laurent, Mammalia, 1: 157, footnote. Type locality: "Africa": Northern Africa [Goto Description]. - Comments: New name for *Pipistrellus kuhlii albolimbatus* Lavauden non Kuster (see Laurent, 1937c: 157 footnote). - Etymology: In honour of Mr. Lataste (see Laurent, 1937c: 157).
1937. *Pipistrellus Kühli Kühli:* Laurent, Mammalia, 1: 157. (Name Combination)
1951. *Pipistrellus kuhlii albolimbatus:* Panouse, Trav. Inst. Sci. Cherifien, 1: 80. (Name Combination)
1953. *Pipistrellus (Pipistrellus) kuhli kuhli:* Ellerman, Morrison-Scott and Hayman, Southern African mammals 1758 to 1951, 78. (Name Combination)
1953. *Pipistrellus (Pipistrellus) kuhli:* Ellerman, Morrison-Scott and Hayman, Southern African mammals 1758 to 1951, 81. (Name Combination)
1959. *Pipistrellus (Romicia) kuhli:* Anonymus, Koedoe, 3: 58. (Name Combination)
1966. *Pipistrellus (Pipistrellus) kuhli pallidus:* Ellerman and Morrison-Scott, Checklist of Palaearctic and Indian Mammals 1758 to 1946. (Second Edition), 169. (Name Combination)
1969. *[Pipistrellus kuhli] pallidus:* Aellen and Strinati, Rev. suisse Zool., 76 (16): 427. (Name Combination)
1971. *Pipistrellus [(Pipistrellus)] kuhlii kuhlii:* Hayman and Hill, Mammals of Africa: Chiroptera, 40. (Name Combination)
1971. *Pipistrellus [(Pipistrellus)] kuhlii pallidus:* Hayman and Hill, Mammals of Africa: Chiroptera, 40. (Name Combination)
1971. *Pipistrellus [(Pipistrellus)] kuhlii:* Hayman and Hill, Mammals of Africa: Chiroptera, 40. (Alternate Spelling)
1972. *P[ipistrellus] k[uhli] marginatus:* Gaisler, Madkour and Pelikan, Acta sc. nat. Brno, 6 (8): 32. (Name Combination)
1975. *Pipistrellus kuhli aegyptius:* Koopman, Bull. Am. Mus. Nat. Hist., 154 (4): 400.
1976. *Pipistrellus (Pipistrellus) kuhli palludus:* Anciaux de Faveaux, Bull. Soc. Hist. nat. Afr. Nord, 67 (1-2): 73. (Lapsus)
1978. *Pipistrellus kuhli marginatus:* Madkour, Zool. Anz., 201 (5/6): 387. (Name Combination)
1984. *Pipistrellus (Pipistrellus) kuhli aegyptius:* Anciaux de Faveaux, Ann. Kon. Mus. Mid. Afr., Zool. Wetensch..
1985. *Pipistrellus aegyptius:* Qumsiyeh, Spec. Publ. Mus. Texas Tech. Univ., 23: 51.
1985. *Pipistrellus kuhlii marginatus:* Qumsiyeh, Spec. Publ. Mus. Texas Tech. Univ., 23: 47. (Name Combination)

1986. *Pipistrellus kunli:* Chastel, Launay, Le Lay, Bailly-Choumara, Hellal, Valle, Bach-Hamba and Beaucournu, Cah. ORSTOM, sér Ent. méd. et Parasitol., 24 (1): 71. (Lapsus)
1993. *Pipistrellus (Pipistrellus) aegyptius:* Koopman, in: Wilson and Reeder, Mammal species of the World (2nd Edition): Chiroptera, 219.
1994. *P[ipistrellus (Pipistrellus)] k[uhlii] marginatus:* Koopman, in: Niethammer, Schliemann and Starck, Handbook of Zoology, volume II (Mammalia) Chiroptera, (60) 114. (Name Combination)
1997. *Pipistrellus aegyptiacus:* Decher, Z. Säugetierk., 62: 132. (Lapsus)
2008. *Pipistrillus kuhli:* Selim, Nahla, and Shelfeh, Tishreen Univ. J. Res. Sci. Stud. - Biol. Sci. Ser., 30 (1): 247. (Name Combination, Lapsus)
2008. *Pipstrillus Kuhli:* Selim, Nahla, and Shelfeh, Tishreen Univ. J. Res. Sci. Stud. - Biol. Sci. Ser., 30 (1): 247. (Name Combination, Lapsus)

? *Pipistrellus kuhli:* (Alternate Spelling)
? *Pipistrellus kuhlii pallidus:* (Name Combination)

TAXONOMY:
Koopman (1994: 114) states that the allocation of many populations to subspecies is uncertain. Additionally, sub-Saharan specimens belong to *hesperidus*.

Although most authors have considered *P. deserti* as a separate species (Heim de Balsac, 1934a, 1936, Allen, 1939a, Ellerman and Morrison-Scott, 1951, Kock, 1969a, Kock, 1999b, Hayman and Hill, 1971, Gaisler *et al.*, 1972, Koopman, 1975, 1993a, 1994, Anciaux de Faveaux, 1976b, Hanák and Elgadi, 1984, Qumsiyeh, 1985, Gaisler and Kowalski, 1986, Hill and Harrison, 1987, Le Berre, 1990, Kowalski and Rzebik-Kowalska, 1991, Horácek *et al.*, 2000), others (Corbet, 1978, Aulagnier and Thevenot, 1986, Pavlinov *et al.*, 1995, Benda and Ruedi, 2004, Benda *et al.*, 2004d, perhaps Rode, 1947) doubted the full species status and regarded it as conspecific with *P. kuhlii*, but *P. deserti* and *P. kuhlii* are two separate morphotypes which differ clearly in size (Gaisler *et al.*, 1972, Kowalski and Rzebik-Kowalska, 1991). As these forms do not occur in sympatry (but see Kowalski and Rzebik-Kowalska, 1991), they may perhaps represent two ecogeographic forms of one species. However, this question requires profound revision of the whole *P. kuhlii* complex both on morphologic and genetic bases (see Kock, 2001b). Mayer *et al.* (2007) reported genetic evidence that *P. deserti* are not distinct from *P. kuhlii*, while García-Mudarra *et al.* (2009) found a differentiation in the cytochrome *b*. Benda *et al.* (2014c: 75) indicate that the presence of bats of the *deserti* morphotype within two separate lineages of *P. kuhlii*, the Libyan-Egyptian and Morrocan, suggests two directions of origin of this morphotype, the west-Saharan and east-Saharan, which in turn indicate that the *deserti* morphotype is a local variation (ecomorphotype) of *P. kuhlii*, which does not deserve taxonomic expression even at the subspecific level.
Benda *et al.* (2014a: 419) presented sufficient prove to support the view that significant differences between the two morphotypes are grouped by geographic origin, and that *P. deserti* should be considered a junior synonym of *P. kuhlii*.

The authorship and description date for *Vespertilio kuhlii* has been debated for years. It has been assigned to either Kuhl, Natterer or "Natterer (in Kuhl)". The publication year was mentioned as either 1817 or 1819. This confusing situation has been cleared by Bogdanowicz and Kock (1998), who fixed author and date to Kuhl, 1817.

Similarly, the authorship of *marginatus* has been assigned to various authors: Cretzschmar, 1826-1830, Rüppell, 1826, Wagner, 1840, Bonaparte, 1841, and Kolenati, 1856.

In the synonyms list for this species, we did not make a difference for the author and/or year of publication mentioned by the various publications when dealing with *kuhlii*.

COMMON NAMES:
Afrikaans: Kuhl se vlermuis, Kuhl-vlermuis. Albanian: Pipistrel i Kuhl-it. Arabian: Khaffash. Armenian: Միջերկրածովային փոքրաչղջիկ. Azerbaijani: Küli şəbpərəsi. Basque: Kuhl pipistrelo, Kuhl saguzar. Belarusian: Нетапыр міжземнаморскі, Нетапыр Куля. Bosnian: Kulijev šišmiš. Breton: Pipistrell Kuhl. Bulgarian: Средиземноморско прилепче. Castilian: Murciélago de borde claro. Catalan: Pipistrel·la de vores clares, Rat penat de vores clares. Croatian: Bjelorubi šišmiš. Czech: Netopýr jižní, Netopýr vroubený, Nedopír celouchý, Netopýr červenohlavý. Danish: Kuhls flagermus. Dutch: Kuhls dwergvleermuis, Kuhl's dwergvleermuis.

English: Kuhl's pipistrelle, Kuhl's Pipistrelle Bat, Kuhl's Bat, Great pipistrelle, Flitter Mouse, White stripe bat. Estonian: Vahemere nahkhiir. Finnish: Kapearäpyläpiippa. French: Pipistrelle de Kuhl, Pipistrelle géante, le vespertilion de Kuhl. Frisian: Wytrâne dwerchflearmûs. Galician: Morcego de borde claro, Morcego de beira branca. Georgian: ხმელთაშუაზღვიური ღამორი, კულის. German: Weißrandfledermaus, Weißrand-Pipistrelle, Haarbindigen Dämmerungsfledermaus, Kuhlische Fledermaus. Greek: Λευκονυχτερίδα. Hebrew: Atalfon Leven Shulayim. Hungarian: Fehérszélű törpedenevér, Nycteris i leukogyros. Irish Gaelic: Ialtóg Kuhl. Italian: Pipistrello albolimbato, Pipistrello de Kühli. Latvian: Kūla sikspārnis. Lithuanian: Kulio šikšniukas. Luxembourgish: Wäissbordfliedermaus. Macedonian: Белорабен лилјак [= Beloraben Liljak]. Maltese: Pipistrell ta' Kuhl. Montenegrin: Bijelorubi slijepi mišić. Norwegian: Hvitrandflaggermus. Polish: Karlik średni, Karlik Kuhla. Portuguese: Morcego de Kuhl, Morcego anao de Kuhl. Rhaeto-Romance: Pipistrel da Kuhl. Romanian: Liliacul pitic al lui Kuhl, Liliacul cu dungã albã. Russian: Нетопырь средиземноморский, Средиземноморский нетопырь [= Sredizemnomorskij netopyr], Нетопырь Куля. Serbian: Б[ј]елоруби слепи мишић [= B[j]elorubi slepi mišić]. Scottish Gaelic: Ialtag Kuhl. Slovak: Večernica južná. Slovenian: Belorobi netopir. Swedish: Parkpipistrell, Kuhls fladdermus. Turkish: Beyazşeritli Yarasa. Ukrainian: Нетопир білосмугий. Welsh: Ystlum lleiaf Kuhl.

CONSERVATION STATUS:
Global - The species is widespread and abundant, and populations are increasing in parts of the range. Consequently, it is assessed as Least Concern (LC ver 3.1 (2001)) (Aulagnier *et al.*, 2008b; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Aulagnier *et al.*, 2008b; IUCN, 2009). 2004 - LC ver 3.1 (2001) [assessment included *P. hesperidus*] (Aulagnier, 2004c; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

For *P. deserti*, the assessment history was:
2008 - LC ver 3.1 (2001) (Benda *et al.*, 2008d; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Benda, 2004a; IUCN, 2004). 1996 - LR/lc [assessed as *P. aegyptius*] (Baillie and Groombridge, 1996).

MAJOR THREATS:
No major threats are known. Use of pesticides to eradicate mosquitos (especially in urban areas) may be a threat in places (Aulagnier *et al.*, 2008b; IUCN, 2009).

Sherwin *et al.* (2012: 174) name aerial hawking and its long-distance dispersal to be the most important risk factors related to climatic change. Bilgin *et al.* (2012: 434) indicate that climatic change is already influencing this species as it has been expanding its range northwards over the past 15 years.

CONSERVATION ACTIONS:
Aulagnier *et al.* (2008b) [in IUCN (2009)] report that it is protected by national law in most European range states. It is also protected under international legislation in parts of its range through the Bonn Convention (Eurobats) and Bern Convention, and is included in Annex IV of EU Habitats and Species Directive. It is found in a number of protected areas. No specific conservation actions are known.

GENERAL DISTRIBUTION:
Pipistrellus kuhlii is widespread in North Africa, Europe and Asia. It has a large range extending from Iberia through southern Europe through the Near East and the Caucasus to Kazakhstan, Pakistan, and India (Molur *et al.*, 2002). There is a single record from China (Smith and Xie, 2008). The northern limit of its range in Europe was formerly ca. 45°N, but the species has been expanding northwards. It arrived 1994 in Vienna/Austria (48°N) and was more recently recorded to 50°N in France and 51°N in Ukraine. It has been expanding northwards in Russia for the last half century from 46° N to c.53°N, with the highest record made at almost 57°N (S. Kruskop *pers. comm.*, 2006 in Aulagnier *et al.*, 2008b). It occurs from sea level to 2,000 m.

Native: Afghanistan; Albania; Algeria; Andorra; Angola; Armenia; Austria; Azerbaijan; Bosnia and Herzegovina; Burkina Faso (as *P. deserti*); Bulgaria; Cape Verde Isls (Azzaroli Puccetti and Zava, 1988); Croatia; Cyprus (Benda *et al.*, 2007: 71); Czech Republic (Reiter *et al.*, 2007: 47); Egypt; France [Corsica]; Georgia; Germany; Gibraltar; Greece [Crete]; Holy See [Vatican City State]; Hungary; India; Iran, Islamic Republic of; Iraq; Israel; Italy [Sardegna, Sicilia]; Jordan; Kazakhstan; Kuwait; Lebanon (Horácek *et al.*, 2008: 59); Libyan Arab Jamahiriya; Macedonia, the former Yugoslav Republic of; Malta; Monaco; Montenegro; Morocco (Benda *et al.*, 2004d; 2010a: 158; El Ibrahimi and Rguibi Idrissi, 2015: 362); Oman; Pakistan; Palestinian Territory, Occupied; Portugal; Romania; Russian Federation; San Marino; Saudi Arabia; Serbia; Slovakia; Slovenia; Spain [Baleares, Canary Is.] (Azzaroli Puccetti and Zava, 1988); Sudan (as *P. deserti*); Switzerland; Syrian Arab Republic; Tunisia (Dalhoumi *et al.*, 2014: 53; 2016b: 867); Turkey; Ukraine; United Arab Emirates

(Anonymus, 2008: 38); Western Sahara (Benda *et al.*, 2010a: 161); Yemen.

Presence uncertain: China. Additionally, its presence (as *P. deserti*) was reported as uncertain from Ghana, Kenya, Nigeria, Senegal, and Somalia.

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Alagaili *et al.* (2011: 466) describe the timing and molting patterns of *P. kuhlii* specimens from Saudi Arabia. They found that males were molting from the end of April to the end of August, whereas females were molting from the end of May/beginning of June to the end of August. The later molting in females was probably related to the fact that females gave birth between mid-April and mid-May. The molting itself starts at the back of the head and on the lower back and spreads from there over the entire head and back. Ventrally, the molt starts on the neck, around the nipples and along the sides of the body, then making its way to the centre of the chest.

DENTAL FORMULA:
Dorst (1949: 45-46, fig. 1) provides a description of the milk dentition of *P. kuhlii*. He also indicated (p. 47) that the milk teeth show some sort or heterodonty with the premolars being of different shape when compared with the insors and canines, which look more similar to one another. These latter teeth help the young to cling to the mother's nipples.

DETAILED MORPHOLOGY:
Ibraheem and Shelfeh (2008) report on the anatomy and histology of the digestive tract of Syrian *P. kuhlii*.
Selim *et al.* (2008: 247) studied the microscopical structure of the tongue of Egyptian and Syrian *P. kuhlii* specimens and found some differences between them.

SEXUAL DIMORPHISM:
In a year-round study in Tunisia, Dalhoumi *et al.* (2016a: 157) found adult females to be significantly heavier than males.

ECHOLOCATION:
For 31 Greek specimens, Papadatou *et al.* (2008b: 133) report a start frequency of 59.8 ± 14.75 kHz, a terminating frequency of 37.5 ± 1.33 kHz, a peak frequency of 39.7 ± 1.46 kHz, and a bandwidth of 9.4 ± 2.85 kHz. The duration of the call is 6.4 ± 1.38 msec, and the interpulse interval is 124.7 ± 44.55 msec.
Walters *et al.* (2012: suppl.) mention the following numbers for 47 calls of bats from France, Greece, Italy and Switzerland: duration: 5.62 ± 1.43 msec, F_{max}: 53.57 ± 10.08 kHz, F_{min}: 36.87 ± 2.15 kHz, bandwidth: 16.70 ± 9.93 kHz, F_{peak}: 39.77 ± 2.63 kHz.

In Jordan, Benda *et al.* (2010b: 204) reported the following parameters for 76 calls: F_{start}: 51.7 ± 6.2 (41.4 - 65.6) kHz, F_{end}: 39.1 ± 1.1 (41.4 - 65.6) kHz, F_{peak}: 41.1 ± 1.1 (37.2 - 43.2) kHz, duration: 6.4 ± 1.7 (3.4 - 10) msec, interpulse interval: 112.9 ± 38.0 (70.0 - 279.0) msec. For 37 calls from Iran, Benda *et al.* (2012a: 183) report: F_{start}: 48.9 ± 4.5 (43.26 - 60.5) kHz, F_{end}: 41.1 ± 1.6 (38.7 - 44.3) kHz, F_{peak}: 42.2 ± 1.9 (39.1 - 46.8) kHz, duration: 6.1 ± 1.3 (4.0 - 9.0) msec, and interpulse interval: 106.5 ± 38.7 (54.4 - 231.9) msec.

In Israel, the following values were recorded by Hackett *et al.* (2016: 223) for 84 calls: Pulse duration: 4.57 ± 2.05 msec, F_{start}: 51.27 ± 4.54 (40 - 71.2) kHz, F_{end}: 40.58 ± 1.54 (37 - 43.9) kHz, F_{peak}: 41.48 ± 1.53 (37 - 42.8) kHz.

Boonman *et al.* (2013b: 6) determined the detection range to be between 2 and 3.5 m at 20 dB and 4 and 7 m at 0 dB.

Corcoran and Moss (2017: 4560) refer to Amichai *et al.* (2015), who found that *P. kuhlii* solved the jamming problem of extreme acoustic interference from conspecifics not by adjusting call frequency but by emmiting calls of hither intensity, longer duration, and calling more often. This suggests that the bats try to increase the signal-to-noise ratio rather than avoiding spectral overlap.

MOLECULAR BIOLOGY:
DNA - See Mayer *et al.* (2007), García-Mudarra *et al.* (2009).
Karyotype - Both Baker *et al.* (1974) and Iliopoulou-Georgudaki and Giagia (1986) reported $2n = 44$, FN = 50, and BA = 8. However, Baker *et al.* (1974) reported a submetacentric X chromosome and an acrocentric Y chromosome, whereas Iliopoulou-Georgudaki and Giagia (1986) reported metacentric X and Y chromosomes. Rushton (1970: 465) reported $2n = 44$, FN = 50, X = metacentric and Y = acrocentric. Arslan and Zima (2014: 13) indicate that the autosomal set consists of three large and one small metacentric pairs, 15 acrocentric pairs and two dot-like pairs, and both sex chromosomes are medium-sized. According to Capanna and Manfredi Romanini (1971: 474) the autosomal chromosomes consist of 3 metacentric pairs, 1 submetacentric and 17 acrocentrics.

Bray *et al.* (2013: 5) indicate that widspread species - such as *P. kuhlii* - have extensive genetic diversity.

Protein / allozyme - Andriollo *et al.* (2015: 1) examined the COI gene in in European and North African *P. kuhlii* populations and found that all North African nuclear genotypes were grouped in a highly distinct subpopulation when compared with European samples sharing the same mitochondrial barcodes. In their figure 1 (p. 3), they show that the North African populations (including *deserti* have very similar haplotypes with the eastern European populations from the Balkan and Italy, but differ considerably from the western lineage found in France and Spain.

Locatelli *et al.* (2016: 423) determined the complete mitogenome and found it to contain 16,991 base pairs with 37 genes (13 protein-coding genes, 22 tRNA genes, 2 rRNA) and 1 control region.

HABITAT:
In Tunisia, Dalhoumi *et al.* (2018: 1) found this species to forage mainly around water bodies and streetlights. During summer, they also foraged in open Acacia woodlands (*Acacia tortilis raddiana*).

ROOST:
All of the roost found in Libya by Benda *et al.* (2014c: 64) were in ruins, with one exception for a single male in a rock fissure in an overhang.

DIET:
Benda *et al.* (2012a: 448) report that the diet is very variable over the species' distribution range: Diptera, Lepidoptera, Hymenoptera (particularly Formicoidea), Auchenorrhyncha, Coleoptera, and Heteroptera comprised a major part of the diet. For Iran, they found Coleoptera, Heteroptera, and Auchenorrhyncha to be the most important food items.

Also in Libya, Benda *et al.* (2014c: 77) report a very variable diet for *P. kuhlii*, where smaller moths (Lepidoptera) and beetles (Coleoptera) were the most important types of prey. The beetles belonged to the families Scarabaeidae, Carabidae (frequently Harpalini), Staphylinidae, Tenebrionidae, Chrysomelidae. Furthermore, ants (Hymenoptera: Formicoidea) formed a major part of the diet. Additionally, medium-sized brachyceran Diptera (Muscidae, Asilidae) were identified, as well as Neuroptera (Chrysopidae and Hemerobiidae).

PREDATORS:
Reuven (1991: 79) reported on *P. kuhlii* being captured by a Lanner Falcon (*Falco biarmicus* Temminck, 1825) in Israel. Mikula *et al.* (2016: Supplemental data) furthermore mention the same predator from either Botswana, Egypt, Ethiopia, Kenya, Nigeria, Sudan or South Africa. Part of these records might actually be for *P. hesperidus*. This is also the case for their record involving the Peregrine falcon (*Falco peregrinus* Tunstall, 1771).

Souttou *et al.* (2018: 136) found *P. kuhlii* to be a major part of the diet of the Common Kestrel (*Falco tinnunculus* Linnaeus, 1758) in Dergana (Algeria), where it made up to 16.4 % of the birds prey. In a second locality (El Harrach) if made up 0.7 % of the prey (and 0 % in seven other localities).

POPULATION:
Structure and Density - It is a relatively abundant species in the Mediterranean region and Middle East. Populations in South Asia seem to be stable and doing well (Molur *et al.*, 2002). Summer colonies typically number 30-100 individuals. In Iran and the Caucasus, the species' range is increasing, and it is displacing *P. pipistrellus* (M. Sharifi and K. Tsytsulina *pers. comm.*, 2005 in Aulagnier *et al.*, 2008b). The northern border of the species' range is also expanding. It is very numerous in urban areas across much of its range (Aulagnier *et al.*, 2008b; IUCN, 2009).
As *P. deserti*, it was reported to be the most common species in Sahara oases (Benda *et al.*, 2008d; IUCN, 2009).
Trend - 2008 - Unknown (Aulagnier *et al.*, 2008b; IUCN, 2009). *P. kuhlii* populations within the Asia Minor and Levant region are unknown population trend, under predictive climate change scenarios (Bilgin *et al.*, 2012: 433).

LIFESPAN:
Szekely *et al.* (2015: Suppl.) report a maximum longevity of 8 years.

ACTIVITY AND BEHAVIOUR:
In the Negev Desert, Polak *et al.* (2011: 24) found that *P. kuhlii* had a significantly higher flight speed when flying in areas with street lamps, than in in dark areas. They also found that flight height was higher in dark areas than in lighted areas (> 1 m).

Smotherman *et al.* (2016: 537) refer to Barak and Yom-Tov (1991) and Russo and Jones (1999) in describing the song-like structure for *P. kuhlii* as simple syllable type in a basic motif. Singing occurs while flying.

REPRODUCTION AND ONTOGENY:
Deleuil and Labbe (1955b: 238) reported three lactating females from El Hamaïn (Tunisia) on 24 July 1955. From the same country, Dalhoumi *et al.* (2018: 1) reported pregnant females from March to June, lactating females in June, and flying juveniles from June to August.

In Libya, Benda *et al.* (2014c: 71) report on four pregnant females colleced on 16 April, 16 on 20 April, 2 on 8 May, 3 on 22 May, and 1 on 23 May. Lactating females were found on 8, 21, 26 and 27 May. Szekely *et al.* (2015: Suppl.) report that weaning occurs after 60 days.

In the United Arab Emirates, Davis (2007: 8) indicates that females are sexually mature in their first year, and that two young are born.

POSTNATAL DEVELOPMENT:
Sharifi *et al.* (2012: 1235) studied the development of Iranian *P. kuhlii* specimens born in captivity and found that, at birth, young had a mean body mass of 1.04 ± 0.08 g and a forearm length of 11.48 ± 0.45 mm. During the first 23 days of their live, their body mass and forearm lenght increased on average with 0.10 ± 0.10 g/d and 0.64 ± 0.61 mm/d. Wingspan, handwing length and area, armwing length and area, and total wing area increased linearly until the age of the 1st flight (at 33 days), after which growth rates significantly declined. At the age of 60 d, the young had an average weight of 5.47 ± 0.07 g (87.56 % of the adult) and the mean forearm length of 35.97 ± 0.86 mm (89.46 % of the adult length).

PARASITES:
Korine *et al.* (2012: 1435) experimentally infested *P. kuhlii* specimens with the flea *Xenopsylla ramesis*, whose normal host is Sundevall's jird (*Meriones crassus*). They found that both male and female fleas engorged less blood from the bats than from the jird (and less than from *R. aegyptiacus* specimens tested during the same study). They also found that the survival time of the fleas was shorter when fed on *P. kuhlii* blood. Furthermore, fleas feeding from torpid bats were found to engorge more blood than those feeding from normothermic bats.

From Algeria, Bendjeddou *et al.* (2013: 325) reported *Phthiridium biarticulatum* Hermann, 1804 (Diptera: Nycteribiidae), *Cimex pipistrelli* Jenyns, 1839 (Hemiptera: Cimicidae), and *Ischnopsyllus octactenus* (Kolenati, 1856) (Siphonaptera: Ischnopsyllidae).
Bendjeddou *et al.* (2017: 15) mention the following ectoparasites: Siphonaptera: *Nycteridopsylla longiceps* Rothschild, 1908 and *Ischnopsyllus octactenus* (Kolenati, 1856); Heteroptera: *Cimex pipistrelli* Jenyns, 1839 and *Cacodmus vicinus* Horváth, 1934; Arachnida: *Hyalomma dromedarii* Koch, 1844.

Benda *et al.* (2014c: 80) report the following ectoparasites from Libya:
Argasidae: *Argas vespertilionis* (Latreille, 1802),
Macronyssidae: *Steatonyssus periblepharus* Kolenati, 1858,
Spinturnicidae: *Spinturnix acuminata* group,
Cimicidae: *Cimex lectularius* Linnaeus, 1758, *Cacodmus vicinus* Horváth, 1934,
Ischnopsyllidae: *Ischnopsyllus consimilis* (Wahlgren, 1904)

From Jordan, Benda *et al.* (2010b: 285) mention *Argas vespertilionis* (Latreille, 1802) (Argasidae), *Steatonyssus periblepharus* Kolenati, 1858 (Macronyssidae), and *Cacodmus vicinus* Kolenati, 1858 (Cimicidae).

Other parasites that were previously reported from the Middle East include the bat flies: *Nycteribia schmidlii* Schiner, 1853, *N. vexata* Westwood, 1835, *Penicillidia conspicua* Speiser, 1901, and *Basilia daganiae* Theodor and Moscona, 1954; the bat fleas *Ischnopsyllus octactenus* (Kolenati, 1856) (also from Tunisia by Beaucournu and Kock, 1996), *I. consimilis* (Wahlgren, 1904) *Xenopsylla cheopis* (Rothschild, 1903) and *Leptopsylla sengis* (Schoenherr, 1911); and the mite species *Spinturnix acuminatus* (Koch, 1836) and *Steatonyssus periblepharus* Kolenati, 1858.

Benda *et al.* (2012a: 449) report the following ectoparasites from Iran: Spinturnicidae: *Spinturnix* sp., *Meristaspis lateralis* Kolenati, 1857; Macronyssidae: *Steatonyssus periblepharus* Kolenati, 1858; Ischnopsyllidae: *Ischnopsyllus octactenus* (Kolenati, 1856). They also mention the presence of the bat flies *Basilia daganiae* Theodor et Moscona, 1954 in the Levant, *Ischnopsyllus consimilis* (Wahlgren, 1904) in Egypt, Israel and Lebanon, the bed bug *Cimex lectularius* Linnaeus, 1758 in Iraq, and *Cacodmus vicinus* Horváth, 1934 in Cyprus, Syria, Israel, Jordan, and Egypt.

Trypanosoma (Schizotrypanum) vespertilionis Battaglia, 1904 was reported from *P. kuhlii* specimens from the Assiut Governate, Egypt by Fahmy *et al.* (1978: 251).

Duszynski (2002: 16) indicates that Arabian *P. kuhlii* is the type host of *Eimeria chiropteri* Alyousif, 1999, *Eimeria kuhliensis* Alyousif, 1999, and *Eimeria pipistrellus* Alyousif, Al-Dakhil and Al-Shawa, 1999.

Greiman *et al.* (2016: 1006) reported the presence of a Trematode belonging to the genus *Lecithodendrium* Looss, 1896 in *P. kuhlii marginatus* from Egypt.

DIPTERA
Nycteribiidae: *Basilia bathybothyra* from Palestine, Egypt and Cyprus (Haeselbarth *et al.*, 1966: 110).

Ševcík *et al.* (2012: 35) report on the presence of the bat fly *Basilia daganiae* Theodor and Moscona, 1954 on bats from Cyprus. Beaucournu and Noblet (1985: 636) also plot a record for this bat fly in Egypt.

VIRUSES:

Coronaviridae

SARS-CoV - During Febuary 2008 in Ghana, one fecal sample of "*P. deserti*" tested negative for coronavirus (CoV) RNA by Pfefferle *et al.* (2009).

Alphacoronavirus

Kohl and Kurth (2014: 3112) reported this virus from Spain and Italy.

Betacoronavirus

Kohl and Kurth (2014: 3112) reported this virus from Italy.

Paramyxoviridae

Drexler *et al.* (2012a: Suppl. Table S1) indicated that the single specimen of "*P. deserti*" they examined from Ghana did not test positive for *Repirovirus, Henipavirus, Morbillivirus, Rubulavirus* or *Pneumovirus*.

Phenuiviridae

Phlebovirus

de Jong *et al.* (2011: 11), Luis *et al.* (2013: suppl.), and Kohl and Kurth (2014: 3111) report the occurrence of Toscana virus.

Reoviridae

Orthoreovirus

Kohl and Kurth (2014: 3113) reported this virus from Germany and Italy.

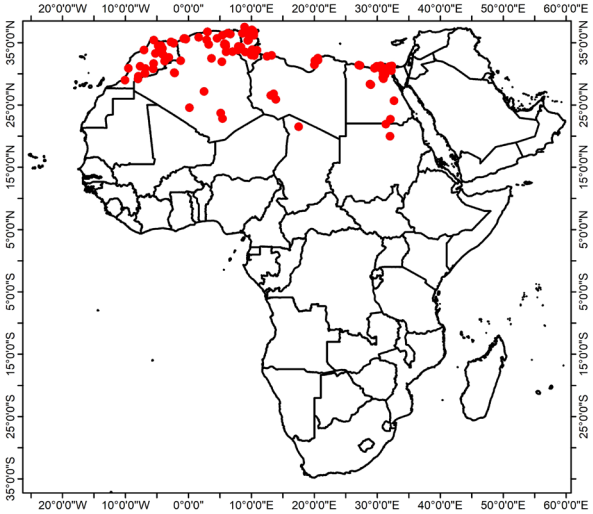

Figure 347. Distribution of *Pipistrellus kuhlii*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:

"Africa", Algeria, Canary Islands (Spain), Chad, Egypt, Libya, Madagascar, Morocco, Sudan, Tunisia.

Pipistrellus maderensis (Dobson, 1878)

*1878. *Vesperugo [(Vesperugo)] maderensis* Dobson, Catalogue of the Chiroptera of the collection of the British Museum, p. xxxix, 211, 231, pl. 12, fig. 5. Publication date: June 1878. Type locality: Madeira (Portugal): "Madeira" [32 44 N 15 58 W] [Goto Description]. Holotype: BMNH 1855.8.16.34: ad ♀, skull and alcoholic. Collected by: William S. MacGillivray. - Etymology: The name refers to the island where the type specimen was collected.

1908. *P[ipistrellus] maderensis:* K. Andersen, Ann. Mag. nat. Hist., ser. 8, 1 (5): 435. (Name Combination, Current Combination)

1922. *Pipistrellus maderensis:* Bannerman. - Comments: They Canary Islands: 153. (Name Combination)

1966. *Pipistrellus (Pipistrellus) maderensis:* Ellerman and Morrison-Scott, Checklist of Palaearctic and Indian Mammals 1758 to 1946. (Second Edition), 171. (Name Combination)

1999. *Pipistrellus madarensis:* Ohlendorf, Nyctalus (N.F.), 7: 193 - 195. (Lapsus)

TAXONOMY:

Pestano *et al.* (2003b: 61) indicate that *P. maderensis* is more closely related to the Canary Island *P. kuhlii* clade than the latter is to *P. kuhlii* from outside the Canaries.

Evin *et al.* (2010: 35) suggest that a Kuhl's pipistrelle-like bat colonized the Canary Islands and differentiated during the middle Pleistocene to give rise to the *maderensis* clade.

COMMON NAMES:

Albanian: Pipistreli i Madeiras. Armenian: Մադեյրական փոքրաչղջիկ. Azerbaijani: Maderiya vəya Kanar şəbpərəsi. Basque: Pipistrelo madeirar. Belarusian: Нетапыр мадэрскі. Bosnian: Madeirski šišmiš. Breton: Pipistrell Madeira. Bulgarian: Мадейрско прилепче. Castilian: Murciélago de Madeira. Catalan: Pipistrel·la de Madeira, Rat penat de Madeira. Croatian: Madeirski mali šišmiš. Czech: Netopýr makaronéský, Netopýr madeirský.

Danish: Madeiraflagermus. Dutch: Madeira dwergvleermuis, Madeiradwergvleermuis. English: Madeiran Pipistrelle Bat, Madeira pipistrelle. Estonian: Madeira nahkhiir. Finnish: Madeiranpiippa. French: Pipistrelle de Madère. Frisian: Madeira dwerchflearmûs. Galician: Morcego de Madeira. Georgian: მადეირული ღამორი German: Madeira-Fledermaus, Madeira-Zwergfledermaus, Madeira-Pipistrelle. Greek: Νυχτερίδας της Μαδέρας. Hungarian: Madeirai törpedenevér. Irish Gaelic: Ialtóg Mhaidéarach. Italian: Pipistrello di Madeira. Latvian: Madeiras sikspārnis. Lithuanian: Madeirinis šikšniukas. Luxembourgish: Madeira-Zwergfliedermaus. Macedonian: Медеирски лилјак. Maltese: Pipistrell ta' Madejra. Montenegrin: Slijepi mišićsa Madeire. Norwegian: Madeiraflaggermus. Polish: Karlik maderski. Portuguese: Morcego da Madeira. Rhaeto-Romance: Pipistrel da Madeira. Romanian: Liliacul pitic din Madeira. Russian: Нетопырь мадейрский. Serbian: Атлантски сл[ij]епи мишић [= Atlantski sl[ij]epi mišić]. Scottish Gaelic: Ialtag Mhaideurach. Slovak: Večernica madeirská. Slovenian: Madeirski mali netopir. Swedish: Madeirapipistrell. Turkish: Maderia Cüce Yarasası. Ukrainian: Нетопир мадейрський. Welsh: Ystlum lleiaf Madeira.

CONSERVATION STATUS:
Global - VU A2c, B1 + 2c ver 2.3 (1994, 2008).

MAJOR THREATS:
Sherwin *et al.* (2012: 174) name the small distribution range, water stress, the aerial hawking feeding style and the long-distance dispersal to be the most important risk factors linked with climatic change.

Jesus *et al.* (2013: 177) indicate that human activities (e.g. large-scale land use change, the use of biocids/pesticides and roost disturbance and destruction) as well as some natural events (e.g. floods and wildfires) form the major threats for this species. Additionally, introduced species such as *Rattus rattus* and *Felis catus* might pose important threats. The latter is also illustrated by Rocha (2015: 17), who reported on a domestic cat, which brought home three bats (of which one was identified as *P. maderensis*) over a period of one year.

Sagot and Chaverri (2015: 1670) mention roost loss or disturbance, and habitat degradation or loss as major threats for this species.

GENERAL DISTRIBUTION:
Madeira Islands (Portugal, where Rainho (2017: 161) reports its presence on six islands); Canary Islands (Spain).

GEOGRAPHIC VARIATION:
When comparing cytochrome *b* sequences from Madeiran and Canary Island specimens, Jesus *et al.* (2013: 119) found that the populations from both island groups represent "sister populations", showing a much higher sequence divergence than that observed within groups.

MOLECULAR BIOLOGY:
DNA - See Pestano *et al.* (2003b), Mayer *et al.* (2007).

POPULATION:
Queiroz *et al.* (2005) [in Jesus *et al.* (2013: "1")] indicate that the population on Madeira consists of about 1,000 individuals. They also indicate that on the Azores the total population is proably less than 300 (but they point out that the identity of these bats is uncertain).

ACTIVITY AND BEHAVIOUR:
Referring to Russo *et al.* (2009), Smotherman *et al.* (2016: 537) indicate that the song-like structure for this species consists of a simple syllable type in a basic motif. Singing occurs while flying.

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:

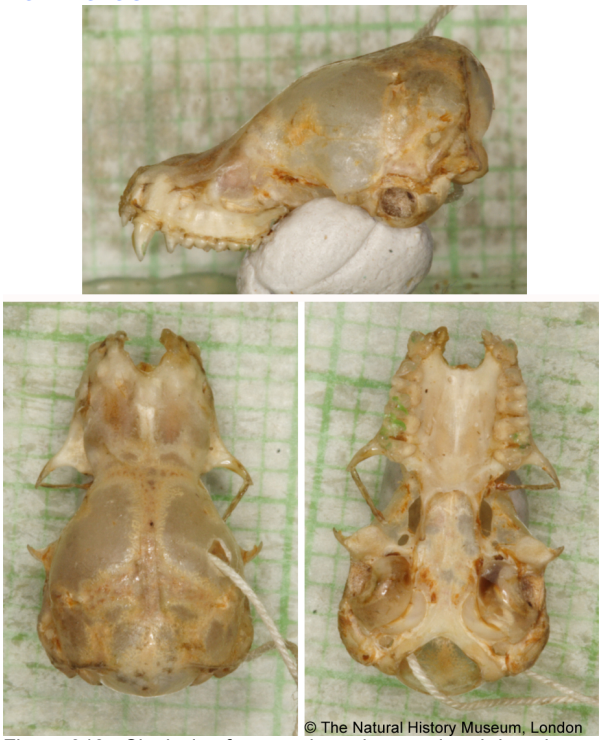

Figure 348. Clockwise from top lateral, ventral and dorsal skull images of BMNH 1955.8.16.34, holotype of *Vesperugo maderensis* Dobson, 1878.

PARASITES:
When describing *Steatonyssus (Steatonyssus) balcellsi*, Estrada-Peña and Sanchez (1988: 305) also mentioned the presence of this mite on *P. maderensis* specimens from El Lagar and Aguamansa, Canary Islands.

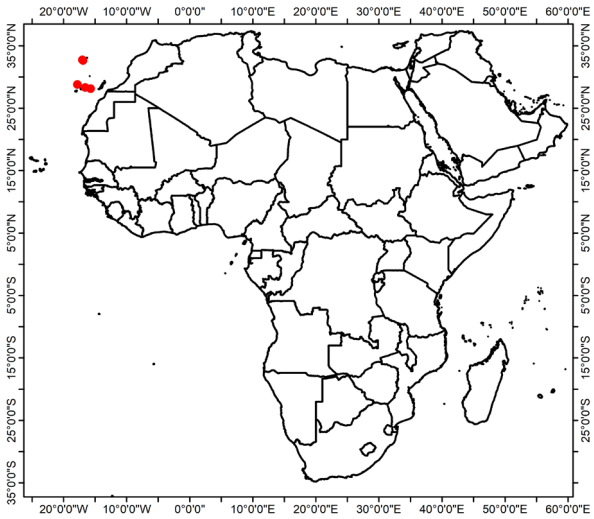

Figure 349. Distribution of *Pipistrellus maderensis*
DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Canary Islands (Spain), Madeira (Portugal).

Pipistrellus nanulus Thomas, 1904

*1904. *Pipistrellus nanulus* Thomas, Ann. Mag. nat. Hist., ser. 7, 14 (81): 198. Publication date: 31 August 1904. Type locality: Cameroon: Efulen [02 46 N 10 42 E] [Goto Description]. Holotype: BMNH 1904.2.8.8: ad ♂, skull and alcoholic. Collected by: George Latimer Bates Esq. (Current Combination)

1966. *Pipistrellus (Pipistrellus) nanulus:* Hayman, Misonne and Verheyen, Ann. Kon. Mus. Mid. Afr., Zool. Wetensch., (8) 154: 16. (Name Combination)

1994. *Pipistrellus (Vansonia) nanulus:* Koopman, in: Niethammer, Schliemann and Starck, Handbook of Zoology, volume II (Mammalia) Chiroptera, (60) 116. (Name Combination)

TAXONOMY:
See Simmons (2005).

COMMON NAMES:
Chinese: 中非小伏翼. Czech: netopýr efulenský. English: Tiny Pipistrelle Bat, Dwarf Pipistrelle Bat, Tiny Pipistrelle. French: Pipistrelle minuscule. German: Kleine Zwergfledermaus, Kleine Pipistrelle. Spanish (Castillian): Pipistrelo.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Fahr, 2008r; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Fahr, 2008r; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Fahr, 2004h; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
There appear to be no major threats to this species as a whole (Fahr, 2008r; IUCN, 2009).

CONSERVATION ACTIONS:
Fahr (2008r) [in IUCN (2009)] reports that *Pipistrellus nanulus* has been reported from the Mole National Park in Ghana (Grubb *et al.*, 1998). No direct conservation measures are currently needed for this widespread and seemingly adaptable species as a whole.

GENERAL DISTRIBUTION:
Pipistrellus nanulus is widespread in West and Central Africa, with an apparently disjunct population in East Africa. It ranges from Senegal eastwards, through most West African countries to Cameroon, from here it has been recorded from Equatorial Guinea (including the island of Bioko) and Gabon. In the east of the species range it has been recorded from eastern Democratic Republic of the Congo, Uganda and western Kenya (north of Lake Victoria).

Kruskop *et al.* (2016: 64) report two specimens from Ethiopia, which look very similar to *P. nanulus* from other parts of Africa, and although they do not mention any "cf." or "aff." as they do for other species, they hint that the identification need further confirmation.

Native: Benin (Capo-Chichi *et al.*, 2004: 163); Burkina Faso (Kangoyé *et al.*, 2015a: 621);

Cameroon; Central African Republic; Congo (Bates *et al.*, 2013: 329 - 1st authenticated record); Congo (The Democratic Republic of the) (Monadjem *et al.*, 2010d: 572); Côte d'Ivoire; Equatorial Guinea (Bioko); Ethiopia (Kruskop *et al.*, 2016: 64); Gabon; Ghana (Decher and Fahr, 2007: 18); Guinea (Decher *et al.*, 2016: 274); Kenya; Liberia; Nigeria; Senegal; Sierra Leone; Uganda.

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Tragus: Monadjem *et al.* (2013c: 204) line drawing of tragi of specimen DNSM 13234 from Mount Nimba, Liberia.

DETAILED MORPHOLOGY:
Baculum - Hill and Harrison (1987). *P. nanulus* and *H. c. bellieri* were much longer in total length than any of the *Neoromicia* species examined by Monadjem *et al.* (2013c). The shaft tip has a bifurcated structure with one projection that was slightly more distended than the other baculum shaft in both species was moderately ventrally curved, ending in a fluted base that was broader in *P. nanulus* (0.71 - 0.82 mm) than in *H. c. bellieri* (0.38 - 0.41 mm), a broad projection was clearly visible midway down the ventral surface of the shaft in *P. nanulus* (Monadjem *et al.*, 2013c: 197). Line drawing of dorsal and ventral bacula of specimen DNSM 13230 from Mount Nimba, Liberia are shown in Monadjem *et al.* (2013c: 204).

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:

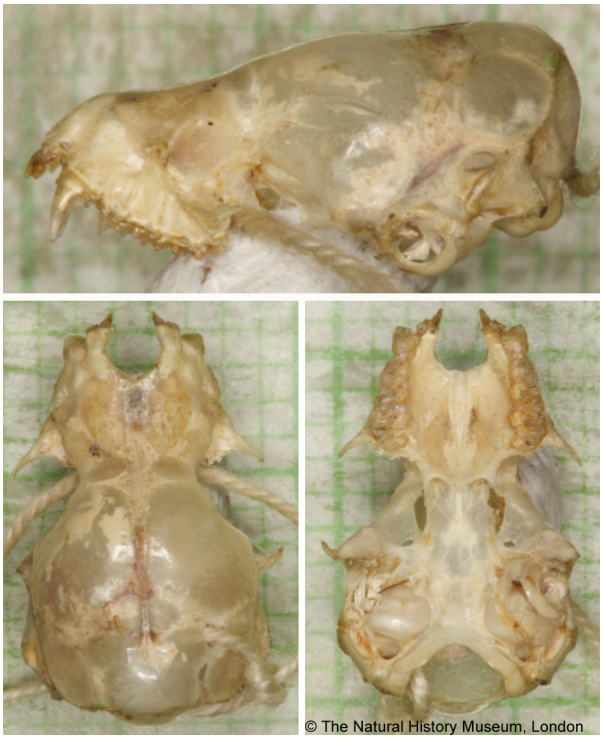

Figure 350. Clockwise from top lateral, ventral and dorsal skull images of BMNH 1904.2.8.8, holotype of *Pipistrellus nanulus* Thomas, 1904.

ECHOLOCATION:
Manga Mongombe (2012: 79) reported a FM/QCF call type for 1 calls from Maroua (Cameroon) and F_{max}: 65.5 kHz, F_{min}: 45.6 kHz, F_{mean}: 51.3 kHz, F_{knee}: 49.2 kHZ, F_{char}: 45.8 kHz, and duration: 2.89 msec.

HABITAT:
The specimens recorded by Monadjem *et al.* (2016y: 371) from the Mount Nimba area were found in lowland forest habitats (420 - 480 m).

POPULATION:
Structure and Density - This species is relatively common (Fahr, 2008r; IUCN, 2009).
Trend - 2008 - Unknown (Fahr, Fahr, 2008r; IUCN, 2009).

VIRUSES:
Coronaviridae - Coronaviruses
SARS-CoV - During Febuary 2008 in Ghana, Pfefferle *et al.* (2009) tested negative one fecal sample for coronavirus (CoV) RNA.

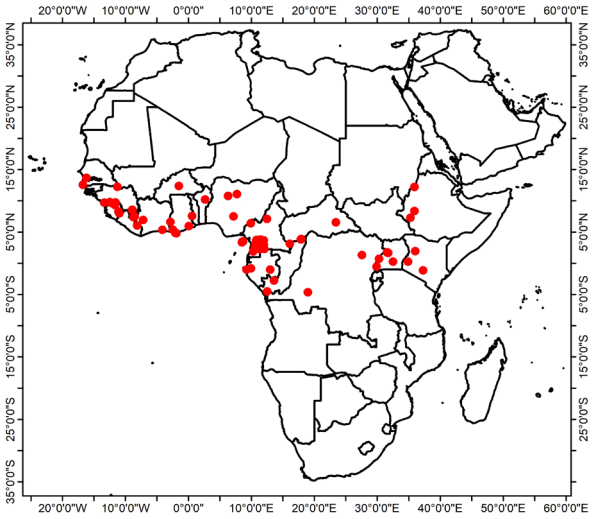

Figure 351. Distribution of *Pipistrellus nanulus*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Benin, Burkina Faso, Cameroon, Central African Republic, Congo, Congo (Democratic Republic of the), Côte d'Ivoire, Equatorial Guinea, Ethiopia, Gabon, Ghana, Guinea, Kenya, Liberia, Mali, Nigeria, Senegal, Sierra Leone, The Gambia, Togo, Uganda.

Pipistrellus permixtus Aellen, 1957

*1957. *Pipistrellus (Pipistrellus) permixtus* Aellen, Rev. suisse Zool., 64 (6): 200. Type locality: Tanzania: Dar-es-Salaam [06 48 S 39 18 E] [Goto Description]. Holotype: MZS 12c: ad ♀, skull and alcoholic. Collected by: Hürstel; collection date: 1905.
1966. *[Pipistrellus] permixtus:* Koopman, The Puku, 4: 159. (Name Combination, Current Combination)
1982. *Pipistrellus permixtus:* Seal and Makey, ISIS Mammalian Taxonomic Director, ???. (Name Combination)

TAXONOMY:
This is a very illusive species. It is only known from the type specimen, which shows more affiliation to the European *P. nathusii* than to any of the African species. Since the type specimen was collected in Dar-es-Salaam, a port, it can not be excluded that this animal was transported by ship from Europe to Africa.

COMMON NAMES:
Czech: netopýr tanganjický. English: Dar-es-Salaam Pipistrelle Bat, Dar-es-salaam Pipistrelle, Tanzania Pipistrelle. French: Pipistrelle de Tanzanie. German: Verwechselte Zwergfledermaus, Verwechselte Pipistrelle.

CONSERVATION STATUS:
Global - Listed as Data Deficient (DD ver 3.1 (2001)) in view of the absence of recent information on its extent of occurrence, ecological requirements, threats and conservation status (Jacobs *et al.*, 2008v; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) (Jacobs *et al.*, 2008v; IUCN, 2009). 2004 - DD ver 3.1 (2001) (Jacobs *et al.*, 2004ac; IUCN, 2004). 1996 - DD (Baillie and Groombridge, 1996).

MAJOR THREATS:
The threats to this species are poorly known. However, it may be confined to dry coastal forest habitat, which is significantly threatened by conversion to agricultural use and extraction of firewood and timber (Jacobs *et al.*, 2008v; IUCN, 2009).

CONSERVATION ACTIONS:
Jacobs *et al.* (2008v) [in IUCN (2009)] report that there appear to be no direct conservation measures in place for this species, and it is not known if the species is present within any protected areas. Additional studies are needed into the distribution, abundance, breeding biology and general ecology of this species. There is a need to conserve remaining areas of dry coastal forest in much of East Africa.

GENERAL DISTRIBUTION:
Pipistrellus permixtus is known only from a single specimen collected close to Dar es Salaam in Tanzania.

Native: Tanzania.

POPULATION:
Structure and Density - No information available on the abundance of this bat (Jacobs *et al.*, 2008v; IUCN, 2009).
Trend - 2008 - Unknown (Jacobs *et al.*, 2008v; IUCN, 2009).

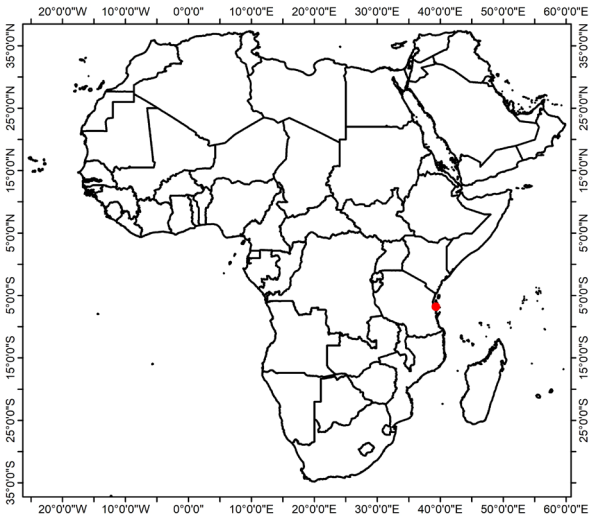

Figure 352. Distribution of *Pipistrellus permixtus*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Tanzania.

Pipistrellus pipistrellus (Schreber, 1774)

*1774. *Vespertilio pipistrellus* Schreber, Die Säugethiere in Abbildungen nach der Natur mit Beschreibungen, 1 (7): pl. 54 + 1 (9): 167. Publication date: 1774. Type locality: France: "France". Neotype: BMNH 1997.81: ad ♂. Collection date: October 1996. Designated by Anonymus (2003: 85). Locality of neotype: France: Normandy: Beauvais cathedral.

TAXONOMY:
Does not contain *pygmaeus* Leach, 1821. Genetic studies (e.g. Benda *et al.*, 2004b) provided evidence for a North-African lineage, possibly identified as a subspecies. Evin *et al.* (2011: 2096) also show that the shape of the skull of the Moroccon specimens differs from that of specimens from continental Europe and Corsica, and to a lesser extent, from the Middle East. Boston *et al.* (2014: 268) found *P. pipistrellus* to form a monophyletic group, but with a split between *P. pipistrellus* s. stricto and a possible paraphyletic group in Morocco, Algeria, Tunisia, Malta, Sicily, Corsica and Italy. Hulva *et al.* (2004; 2010) called this latter group "*P. pipistrellus* SW" and Puechmaille *et al.* (2012) suggest this group might represent a new species.

COMMON NAMES:
Albanian: Pipistrel i zakonshëm. Arabian: Khaffash. Armenian: Ցգnւկ փnքրաչnչիկ. Azerbaijani: Cı rtdan şə bpə rə. Basque: Pipistrelo arrunt, Saguzar. Belarusian: Нетапыр-карлік. Russian: Нетопырь-карлик [= Netopyr karlik]. Serbian: Обични сл[ij]епи

мишић [= Obič ni sl[ij]epi miš ić]. Scottish Gaelic: Ialtag fheasgarach. Slovak: Več ernica hvízdavá, Več ernica malá. Slovenian: Mali netopir. Swedish: Sydpipistrell, Pipistrell. Turkish: Cüce Yarasa. Ukrainian: Нетопир карлик, Нетопир малий. Welsh: Ystlum-lleiaf cyffredin.

CONSERVATION STATUS:
Global - The species is widespread and abundant, and there is no evidence of current significant population decline. Consequently, it is assessed as Least Concern (LC ver 3.1 (2001)) (Hutson *et al.*, 2008l; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Hutson *et al.*, 2008l; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Aulagnier and Benda, 2004a; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
In parts of the range there is deliberate persecution as people do not want thousands of bats roosting in their buildings. As a high proportion of colonies are found in buildings, the species may be particularly vulnerable to other anthropogenic factors, such as disturbance, timber treatment and building renovation (Battersby, 2005; Hutson *et al.*, 2008l; IUCN, 2009).

Sherwin *et al.* (2012: 174) indicate that the aerial hawking feeding style and the long-distance dispersal are the most important risk factors related to climatic change.

CONSERVATION ACTIONS:
Hutson *et al.* (2008l) [in IUCN (2009)] report that it is protected under national law in most range states. It is also protected under international law through the Bonn Convention (Eurobats) and Bern Convention in parts of its range where these apply, and is included in Annex IV of the EU Habitats and Species Directive. It occurs in many protected areas. No specific conservation actions are known.
Adoption of bat-friendly practices in the construction and maintenance of buildings is a proposed action.

GENERAL DISTRIBUTION:
Pipistrellus pipistrellus is a widespread western Palaearctic species with a range extending from the British Isles through southern Scandinavia, much of Europe (including all the Mediterranean countries, but with the exception of northern Fennoscandia) to the Volga and Caucasus; and through parts of north-western Africa (mountainous areas of Morocco, Algeria and Tunisia, also in Cyrenaica in Libya) and south-west Asia to central and eastern Asia (China, India, Myanmar). Its detailed distribution, as distinct from that of the recently-differentiated *P. pygmaeus*, is still to be established. It occurs from sea level to 2,000 m.

A dubious record from Taiwan by Kishida (1924) is rejected by Lin *et al.* (2002: 509). A record from Myanmar by Bates and Harrison (1997: 167) is rejected by Bates *et al.*, 2005: 220).

Native: Afghanistan; Albania; Algeria; Andorra; Armenia; Austria; Azerbaijan; Belarus; Belgium; Bosnia and Herzegovina; Bulgaria; China; Croatia; Cyprus (Benda *et al.*, 2007: 71); Czech Republic; Denmark; Estonia; Finland; France [Corse]; Georgia; Germany; Gibraltar; Greece [East Aegean Is., Kriti]; Holy Seat [Vatican City State]; Hungary; India (Jammu-Kashmir); Iran, Islamic Republic of; Ireland; Israel; Italy (Sardegna, Sicilia); Jordan (Benda *et al.*, 2010b: 185), Kazakhstan; Latvia; Lebanon (Horácek *et al.*, 2008: 59); Libyan Arab Jamahiriya; Liechtenstein; Lithuania; Luxembourg; Macedonia, the former Yugoslav Republic of; Malta; Moldova (Bondarenko, 2007: 23); Monaco; Montenegro; Morocco (Benda *et al.*, 2010a: 157; El Ibrahimi and Rguibi Idrissi, 2015: 361); Myanmar; Netherlands; Norway; Pakistan; Poland; Portugal; Romania; Russian Federation; San Marino; Serbia; Slovakia; Slovenia; Spain [Baleares]; Sweden; Switzerland; Taiwan, Province of China; Tunisia (Dalhoumi *et al.*, 2016b: 867); Turkey; Ukraine (Tyshchenko *et al.*, 2005: 181); United Kingdom.

DETAILED MORPHOLOGY:
Baculum - Hill and Harrison (1987).

Madej *et al.* (2012: 478) studied the skin structure and hair morphology of different body parts and found a number of areas with thin skin (wing and tail membrane) and other areas with thick skin (head and dorsum, abdomen, footpad). They also found that the density of the hairs was higher on the head than in the dorsal and ventral body parts. These differences might play a role for ectoparasites when choosing their preferred body region.

ECHOLOCATION:
The data for 47 animals from Greece are the following: F_{start}: 78.9 ± 15.79 kHz, F_{end}: 47.5 ± 1.43 kHz, F_{peak}: 48.6 ± 1.46 kHz, bandwidth: 6.5 ± 1.31 kHz, duration 5.7 ± 1.53 msec and interpulse interval: 94.9 ± 29.90 msec (Papadatou *et al.*, 2008b: 132).
Benda *et al.* (2010a: 163) report for 50 Moroccan specimens a starting frequency of 53.3 ± 4.6 (45.6 - 62.7) kHz, a maximum energy frequency of 47.9 ± 2.9 (42.9 - 51.8) kHz, an end frequency of 46.3 ± 3.0 (40.0 - 50.7) kHz, with a duration of 7.4 ± 1.7

(5.2 - 12.4) msec, and an inter-pulse interval of 123.9 ± 46.2 (73.4 - 250.1) msec.
Data presented by Walters *et al.* (2012: suppl.) for 47 calls by bats from France, Switzerland and the UK include: duration: 6.02 ± 2.10 msec, F_{max}: 58.06 ± 10.34 kHz, F_{min}: 44.77 ± 1.92 kHz, bandwidth: 13.29 ± 9.25 kHz, F_{peak}: 45.75 ± 2.03 kHz.

In Jordan, Benda *et al.* (2010b: 204) recorded the following parameters for 70 calls: F_{start}: 69.3 ± 14.8 (53.1 - 110.0) kHz, F_{end}: 48.4 ± 0.9 (46.8 - 50.5) kHz, F_{peak}: 51.2 ± 2.0 (48.2 - 57.9) kHz, duration: 5.7 ± 1.5 (2.8 - 8.0) msec, and Interpulse interval: 81.7 ± 22.2 (49.0 - 169.0) msec. For 54 Iranian calls, Benda *et al.* (2012a: 182) report: F_{start}: 57.1 ± 4.2 (50.2 - 60.8) kHz, F_{end}: 46.6 ± 2.2 (42.6 - 50.8) kHz, F_{peak}: 48.6 ± 2.4 (44.1 - 54.0) kHz, duration: 6.8 ± 1.5 (3.4 - 10.4) msec, and interpulse interval: 100.5 ± 26.5 (62.3 - 162.7) msec.

Götze *et al.* (2013: 61) indicate that frequency shifts ocurring when *P. pipistrellus* specimens are flying together, are not linked with jamming avoidance, but with a switch from search calls to shorter approach calls, which have higher frequencies. The other bats are perceived as moving targets, hence the switch to the approach call.

In Morocco, Disca *et al.* (2014: 226) reported for "*Pipistrellus* cf. *pipistrellus*" a FM-QFC type of call with the following parameters: F_{start}: 75.5 ± 12.8 kHz, F_{end}: 47.7 ± 2.3 kHz, F_{peak}: 50.4 ± 2.4 kHz, $F_{QFC\text{-}peak}$: 49.9 ± 2.5 kHz, bandwidth: 27.8 ± 12.3 kHz, duration: 6.4 ± 1.1 msec.

Molecular Biology:
DNA - See Benda *et al.* (2004b), Hulva *et al.* (2004), Mayer *et al.* (2007), García-Mudarra *et al.* (2009).

Karyotype - Rushton (1970: 465) mentioned a diploid number (2*n*) of 42. Arslan and Zima (2014: 12) report 2*n* = 42-44, FNa = 48-50, FN = 52-54, a medium-sized (sub)metacentric X, and a dot-like acrocentric Y. The autosomal component contains three large metacentric, one small metacentric and 16/17 acrocentric pairs. However, they can not exclude that some of the "aberrant" sets might represent *P. pygmaeus*.

Diet:
Benda *et al.* (2012a: 425 - 427) indicate that in Europe, *P. pipistrellus* mainly feeds on small swarming nematoceran Diptera, followed by Lepidoptera, Heteroptera and Hymenoptera. In the Middle East, the diet seems to be more variable and is dominated by smaller Coleoptera, Formicoidea, Heteroptera, smaller Lepidoptera, Ephemeroptera, Plecoptera, and Blattodea. In Iran, the most important food items are: Nematocera, Hymenoptera (Formicoidea), and Auchenorrhyncha.

Population:
Structure and Density - A widespread and abundant species, one of the most common bats in many parts of its range. Summer maternity colonies generally number 25 - 50 individuals, although colonies of as many as 200 have been recorded. In winter, it tends to occur singly or in small groups, although some very large groups have been recorded (e.g., up to 45,000 in caves in Romania and Slovakia) (Seamark, 2006d). Significant declines have been recorded in some European countries (e.g. Britain), although in Britain at least the trend may now have stabilised (Battersby, 2005). In Serbia, in the urban areas, *P. pipistrellus* has become less common due to displacement by *P. kuhlii* (M. Paunovic *pers. comm.*, 2007 in Hutson *et al.*, 2008l). The same is also reported from the Russian Federation.
Trend - 2008 - Stable (Hutson *et al.*, 2008l; IUCN, 2009).

Activity and Behaviour:
Referring to amongst others Barlow and Jones (1997a,1997b), Smotherman *et al.* (2016: 537) describe the song-like structure for this species as simple syllable type in a basic motif. Singing occurs while flying.

Reproduction and Ontogeny:
Ginther (1967: 580) mentioned that the embryo is more frequently located in the right uterine horn, whereas the Corpus luteum is about 50 % in the left ovary.
At birth, the young weights about 23.7 % of its mother's body mass (1.4 g versus 5.9 g), and its forearm length is about 35.6 % of that of its mother (11.4 versus 32.0 mm) (see Kurta and Kunz, 1987: 83).

Parasites:
In Europe, Genov *et al.* (1992) reported the following Nematodes: *Molinostrongylus vespertilionis* Morosov and Spassky, 1961 (of which *P. pipistrellus* is the type host) and *M. alatus* (Ortlepp, 1932).

Benda *et al.* (2010b: 278) found the following ectoparasites on Jordanian *Pipistrellus pipistrellus*: Ticks: Argasidae: *Argas vespertilionis* (Latreille, 1802); mites (Macronyssidae): *Macronyssus* sp., *Steatonyssus periblepharus* Kolenati, 1858, *Parasteatonyssus hoogstraali* Keegan, 1956; bugs: Cimicidae: *Cacodmus vicinus* Keegan, 1956; bat flies: Nycteribiidae: *Basilia daganiae* Keegan, 1956; and fleas:

Ischnopsyllidae sp. The latter might possibly belong to *Ischnopsyllus octactenus* (Kolenati, 1856), *I. dolosus* Dampf, 1912 or *I. consimilis* (Wahlgren, 1904) which were previously reported from *P. pipistrellus* from Turkey and Lebanon.

From Iran, Benda *et al.* (2012a: 428) reported the following ectoparasites: Ticks: Argasidae: *Argas vespertilionis* (Latreille, 1802), Ixodidae: *Dermacentor marginatus* (Sulzer, 1776), *Ixodes redikorzevi* Olenev, 1927; mites: Macronyssidae: *Steatonyssus* sp., Trombiculidae: *Schoutedenichia chilmirica* Kudrâšova, 1975; fleas: Ischnopsyllidae: *Ischnopsyllus octactenus* (Kolenati, 1856), Pulicidae: *Xenopsylla nuttalli* Ioff, 1930. From Azerbaijan, they mention another bat flea: *Ischnopsyllus dolosus* Dampf, 1912.

From Algeria, Bendjeddou *et al.* (2013: 325) reported the following parasites: *Cimex pipistrelli* Jenyns, 1839 (Hemiptera: Cimicidae) and *Ischnopsyllus octactenus* (Kolenati, 1856) (Siphonaptera: Ischnopsyllidae). Bendjeddou *et al.* (2017: 15) mentioned the following Heteroptera: *Cimex pipistrelli* Jenyns, 1839, *Cimex lectularius* Linnaeus, 1758 and *Cacodmus vicinus* Horváth, 1934.

Beaucournu and Noblet (1985: 636) refer to Hurka (1982) in plotting a record of *Basalia mediterranea* Hurka, 1970, parasiting on *P. pipistrellus*.

VIRUSES:

Adenoviridae

Mastadenovirus

Reported from Germany by Kohl and Kurth (2014: 3111).

Bornaviridae

An unclassified genus belonging to this family was reported by Kohl and Kurth (2014: 3111) from France.

Coronaviridae

None of five Kenyan bats tested by Tao *et al.* (2017: Suppl.) tested positive for CoV.

Betacoronavirus

This virus was reported from the Netherlands by Kohl and Kurth (2014: 3112).

Herpesviridae

Betaherpesvirus and *Gammaherpesvirus*

These viruses were reported by Kohl and Kurth (2014: 3113) from Germany.

Orthomyxoviridae

Despite sampling and testing of 44 individuals of this species, no evidence of influenza A-like viruses (*Orthomyxoviridae*) were obtained (Fereidouni *et al.*, 2015).

Paramyxoviridae

An unassigned virus was reported from Germany by Kohl and Kurth (2014: 3113).

Reoviridae

Orthoreovirus

Kohl and Kurth (2014: 3113) reported this virus from Germany.

Rhabdoviridae

"Various European bat lyssaviridae" were reported from various European countries by Kohl and Kurth (2014: 3114).

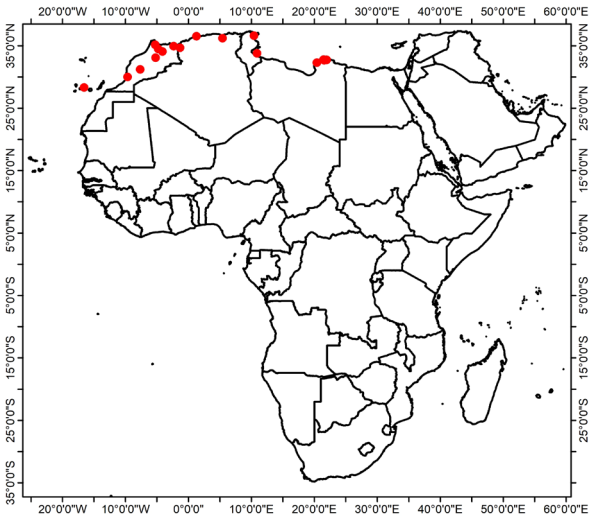

Figure 353. Distribution of *Pipistrellus pipistrellus*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:

"Africa", Algeria, Canary Islands (Spain), Egypt, France, Libya, Morocco, Tunisia.

Pipistrellus pygmaeus (Leach, 1825)

*1825. *Vespertilio Pygmæus* Leach, Zool. Journ., 1: 560. Type locality: United Kingdom: Chew valley. - Comments: Type locality: The original type locality was "England, Devonshire, near forest of Dartmoor, Spitchweek". The Neotype was collected in NE Somerset, Bath, Chew valley.

1999. *Pipistrellus pygmaeus:* Jones and Barratt, Bull. Zool. Nomencl., 56 (3): 182. Publication date: September 1999. (Name Combination, Current Spelling)

TAXONOMY:
One of the most outspoken examples of cryptic species is formed by the "*Pipistrellus pipistrellus / pygmaeus*" species complex. Originally, both taxa were considered to represent one single species, but with the growing use of bat detectors, it became clear that two forms were present. In a first stage, these were called the "45 kHz phonic type" and the "55 kHz phonic type". Jones and van Parijs (1993) and Barratt *et al.* (1995) proved that two separate species were involved: *Pipistrellus pygmaeus* and *Pipistrellus pipistrellus*.

Based on López-Baucells *et al.* (2012), Disca *et al.* (2014: 211) include *P. pygmaeus* as a member of the Moroccan bat fauna, but they indicate that more prove (e.g. photos, detailed descriptions, echolocation data, …) would be welcome.

Herdina *et al.* (2014: 157) indicate that *P. pipistrellus* and *P. pygmaeus* specimens can be discriminated by measuring the projected length, height, and width of the baculum. Other morphological discrimination traits commonly used are "wing vein" pattern and shape and color of the penis, but these have not been validated on sets of genetically identified specimens.

COMMON NAMES:
Albanian: Pipistrel xhuxh. Armenian: Գաջաճ փոքրաչղջիկ. Azerbaijani: Kiçik şəbpərə. Basque: Pipistrelo mediterraneo. Belarusian: Нетапыр-пігмей. Bosnian: Patuljasti šišmiš. Breton: Pipistrell gorr. Bulgarian: Малко кафяво прилепче. Castilian: Murciélago pigmeo, Murciélago de Cabrera. Catalan: Pipistrel·la nana. Croatian: Močvarni patuljasti šišmiš. Czech: Netopýr nejmenší, Nedopír kařelný. Danish: Dværgflagermus. Dutch: Kleine dwergvleermuis. English: Midge Bat, Soprano Pipistrelle, Pygmy pipistrelle bat, 55 kHz pipistrelle, Mediterranean Lesser pipistrelle. Estonian: Pügmee-nahkhiir. Finnish: Kääpiölepakko. French: Pipistrelle soprane, Pipistrelle pygmée, le vespertilion pygmée. Frisian: Lytse dwerchflearmûs. Galician: Morcego anano. Georgian: პაწია ღამორი. Latvian: Pigmejsikspārnis. Lithuanian: Šikšniukas mažylis. Luxembourgish: Méckefliedermaus. Macedonian: Џуџест лилјак, Kafeav Dzudzest Liljak. Maltese: Pipistrell Żgħir. Montenegrin: Patuljasti slijepi mišić. Norwegian: Dvergflaggermus. Polish: Karlik drobny. Portuguese: Morcego-pigmeu. Rhaeto-Romance: Pipistrel pigmeic, Pipistrel muschin. Romanian: Liliacul pigmeu. Russian: Нетопырь малый (пигмей), Малый нетопырь [=Malyj Neopyr]. Serbian: Патуљасти сл[ij]епи мишић [= Patuljasti sl[ij]epi mišić]. Scottish Gaelic: Ialtag shopranach. Slovak: Večernica Leachova. Slovenian: Drobni netopir. Liliacul-pitic mediteranean. Swedish: Dvärgpipistrell, Dvärgfladdermus. Turkish: Akdeniz Cüce Yarasası. Ukrainian: Нетопир пігмей. Welsh: Ystlum-lleiaf soprano.

GENERAL DISTRIBUTION:
Great Britain, Ireland, Germany, Switzerland, Czech Republic, Slovakia, Denmark, Sweden, Estonia, Latvia, Belarus, Portugal, Spain, Greece, Cyprus, Slovenia, Croatia, Albania, Serbia, Bosnia-Herzogovina, Montenegro, Romania, Bulgaria, Moldova, Georgia [Turkey, Belgium, Holland], Azerbaijan; Morocco; Iran; possibly Lebanon.

López-Baucells *et al.* (2012: 43) reported this species from the northern African Spanish enclave Ceuta, which is the first report of this species on the African continent.

VIRUSES:
Coronaviridae
Alphacoronavirus
Kohl and Kurth (2014: 3112) report this virus from German bats.

Orthomyxoviridae
Despite sampling and testing of 132 individuals of this species, no evidence of influenza A-like viruses (*Orthomyxoviridae*) were obtained (Fereidouni *et al.*, 2015).

Pipistrellus raceyi Bates, Ratrimomanarivo, Harrison and Goodman, 2006

*2006. *Pipistrellus raceyi* Bates, Ratrimomanarivo, Harrison and Goodman, Acta Chiropt., 8 (2): 301. Type locality: Madagascar: Fianarantsoa province: Kianjavato [21 22.84 S 44 40.49 E, 75 m] [Goto Description]. Holotype: FMNH 185567: ad ♂, skull and alcoholic. Collected by: Fania H. Ratrimomanarivo and E. Rakotonandrasana; collection date: 22 May 2005; original number: RHF 1281. - Etymology: In honour of Prof. Paul A. Racey, Regius professor of natural history, University of Aberdeen, UK, in recognition of his longstanding commitment to the study and conservation of bats worldwide and in particular to his on-

going programme of capacity building and bat research in Madagascar (see Bates *et al.*, 2006: 305). (Current Combination)

TAXONOMY:
See Bates *et al.* (2006).

COMMON NAMES:
English: Racey's Pipistrelle Bat. French: Pipistrelle de Racey. German: Raceys Zwergfledermaus, Raceys Pipistrelle.

CONSERVATION STATUS:
Global - This species is listed as Data Deficient (DD ver 3.1 (2001)) because although preliminary evidence suggests that it is widely distributed in lowland areas of parts of eastern and western Madagascar and it exists in a range of vegetation types, there are insufficient data on its habitat requirements and major threats (Jenkins *et al.*, 2008j; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) (Jenkins *et al.*, 2008j; IUCN, 2009).

MAJOR THREATS:
No major threats are documented, but forest degradation may conceivably reduce availability of suitable foraging and roosting habitat in the west where this species presumably roosts in trees and appears to be associated with forest habitats (Jenkins *et al.*, 2008j; IUCN, 2009).

CONSERVATION ACTIONS:
Jenkins *et al.* (2008j) [in IUCN (2009)] report that even though this species roosts synanthropically in the east and may therefore be expected to be relatively common given the abundance of suitable roosting sites, it is only known from four locations across Madagascar despite the large survey effort on Malagasy bats in recent years. Of the four known localities, all receive some form of active forest management and it is expected that deforestation at these sites has been and will be less than for non-protected forest. Further studies of this species are needed to investigate why it appears to be forest-dependent in the west but not in the east of its range.

GENERAL DISTRIBUTION:
Pipistrellus raceyi is an endemic species to Madagascar that is currently known from four localities (Bates *et al.*, 2006), two in the west (Mikea forest and Kirindy CFPF) and two in the east (Kianjavato and Tampolo forests), all below 80 m elevation (from 16 - 70 m asl.).

Native: Madagascar (Bates *et al.*, 2006).

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
See Bates *et al.* (2006).

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:
See Bates *et al.* (2006).

DETAILED MORPHOLOGY:
Baculum - Unknown
For a description of the crania, teeth, ears and tragus see Bates *et al.* (2006).

MOLECULAR BIOLOGY:
DNA, Karyotype, Protein / allozyme - Unknown.

HABITAT:
See Bates *et al.* (2006).

ROOST:
Synanthropic structures and vegetation for the typical roosting sites for this species on Madagascar according to Wilkinson *et al.* (2012: 160).

DIET:
Rakotondramanana *et al.* (2015: 77) reported the following volume percentages of food items: Coleoptera: 27.8 ± 20.00; Hymenoptera: 12.5 ± 17.15; Lepidoptera: 26.1 ± 23.05; Trichoptera: 1.9 ± 4.80; Isoptera: 30.0 ± 40.71; Homoptera: 1.5 ± 3.31; Arachnida: 0.1 ± 0.24. Expressed as frequency percentages, the values are: Coleoptera: 78.9 ± 29.48; Hymenoptera: 47.8 ± 41.81; Lepidoptera: 65.6 ± 44.35; Trichoptera: 10.0 ± 23.01; Isoptera: 37.8 ± 48.94; Homoptera: 12.2 ± 27.56; Arachnida: 1.7 ± 4.71. Based on the faeces of three animals, Rasoanoro *et al.* (2015: 64) found the following volume percentages: Aranea: 6.8 ± 1.47, Coleoptera: 32.5 ± 1.36, Diptera: 28.9 ± 4.15, Homoptera: 11.7 ± 2.18, Hymenoptera: 3.9 ± 2.20, and Lepidoptera: 16.3 ± 1.95.

POPULATION:
Structure and density - This recently described species is currently known only from 15 specimens (Bates *et al.*, 2006); however, with further survey work, it may be shown to more common (Jenkins *et al.*, 2008j; IUCN, 2009).
Trend - 2008 - Unknown (Jenkins *et al.*, 2008j; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
See Bates *et al.* (2006).

VIRUSES:
Paramyxoviridae
Wilkinson *et al.* (2012: 160) tested 1 individuals from the Madagascar using RT-PCR specific for *Respirovirus*/*Morbillivirus*/*Henipahvirus* (RMH) and *Paramyxovirinae* (PMV) and found 0 positive results for viral nucleic acids.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Madagascar.

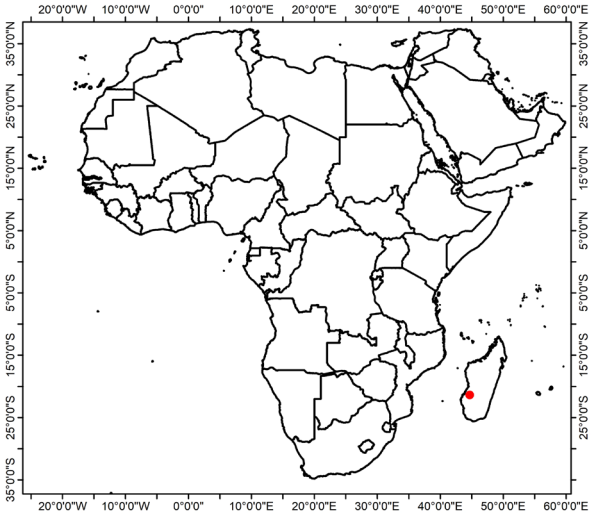

Figure 354. Distribution of *Pipistrellus raceyi*

Pipistrellus rueppellii (Fischer, 1829)

1826. *Vespertilio temminckii* Cretzschmar, in: Rüppell, Atlas Reise Nördlichen Afrika, Zoologie Säugethiere, 1: 17: pl. 6. Type locality: Sudan: Northern province: Dongola [19 10 N 30 27 E] [Goto Description]. Lectotype: SMF 4308: ad ♂, skin only. Collected by: Wilhem Peter Edward Simon Rüppell; collection date: 1824. Old catalog: II.N.11.b: see Mertens (1925: 22). - Comments: Preoccupied by *temmincki* Horsfield, 1824 (a *Scotophilus*): see Allen (1939a: 95), Meester *et al.* (1986: 51), Simmons (2005). The publication date of Cretzschmar's work is sometimes indicated as "1826" (as mentioned on the title page), but also as "1827", "1828", "1830-1831".

*1829. *Vespertilio Rüppelii* J.B. Fischer, Synopsis Mamm, 109. Publication date: 1829. Type locality: Sudan: Northern province: Dongola [19 10 N 30 27 E]. - Comments: Mertens (1925: 22) mentions that the specimen designated as lectotype for *temminckii* is also the lectotype for *rüppellii*. - Etymology: The type (*Vespertilio temminckii*) was described in Rüppell's (1827) *Atlas zu der Reise im Nordlichen Afrika* and renamed by Fischer (1829) after Rüppell (*V. rüppellii*) (see Taylor, 2005).

1838. *Scotophilus Temminckii:* Gray, Mag. Zool. Bot., Edinburgh, 2 (12): 497.

1855. *V[espertilio] rüppelli:* Giebel, Die Säugethiere, 945. (Name Combination)

1855. *Vespertilio (Vesperugo) Rüppellii:* Wagner, in: Schreber, Die Säugethiere in Abbildungen nach der Natur mit Beschreibungen, Suppl. 5: 745. (Name Combination)

1860. *Panugo rüppelii:* Kolenati, Monographie der Europäischen Chiroptern, 10. (Name Combination, Alternate Spelling)

1868. *Vespertilio (Alobus) Temminckii:* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, 707 (for 1867).

1877. *V[esperugo] Temminckii:* Heuglin, Reise in Nordost Afrika, 2: 32.

1877. *Vesperugo Rüppellii:* Heuglin, Reise in Nordost Afrika, 2: 32. (Name Combination)

1878. *Vesperugo (Vesperugo) temminckii:* Dobson, Catalogue of the Chiroptera of the collection of the British Museum, 233.

1880. *Vesperugo temminckii:* Dobson, Report on accessions to our knowledge of the chiroptera during the past two years (1878 - 1880), 186.

1891. *Vesperugo temmincki:* Noack, Jb. Hamb. Wiss. Anst., 9: 140.

1901. *Pipistrellus Temminckii:* Thomas, Ann. Mag. nat. Hist., ser. 7, 8 (46): 274.

1902. *Pipistrellus rueppelli:* Anderson and de Winton, Zoology of Egypt: Mammalia, 127. (Name Combination)

1917. *Scotozous rüppelii:* J.A. Allen, Bull. Am. Mus. Nat. Hist., 37 (18): 409. (Name Combination)

1918. *Pipistrellus rüppelii:* Hollister, Bull. U.S. natl. Mus., 99: 93. (Alternate Spelling)

1919. *P[ipistrellus] rüppelli:* Thomas, J. Bomb. nat. Hist. Soc., 26: 747. (Alternate Spelling)

1920. *Pipistrellus rüppelli:* Schwarz, Fledermäuse aus West- und Zentralafrika, ???. (Alternate Spelling)

1925. *Pipistrellus rüppellii:* Mertens, Senckenb. biol., 7 (1/2): 22. (Alternate Spelling)

1925. *V[espertilio] Rüppellii:* Mertens, Senckenb. biol., 7 (1/2): 22. (Name Combination)

1928. *Scotozous rüppellii:* Gyldenstolpe, Ark. Zool. Stockholm, 20A (4): 71. (Alternate Spelling)
1935. *Scotozous trüppellii:* Monard, Arq. Mus. Bocage, 6: 31. - Comments: Lapsus (see Kock, 1969a: 174; Meester *et al.*, 1986: 51). (Lapsus)
1938. *[Scotozous] rüppeli:* Frechkop, Exploration du Parc National Albert, 52. (Lapsus, Alternate Spelling)
1953. *Pipistrellus (Scotozous) rueppelli:* Ellerman, Morrison-Scott and Hayman, Southern African mammals 1758 to 1951, 78. (Name Combination)
1956. *Pipistrellus ruppelli:* Harrison, Proc. zool. Soc. Lond., 127: ???. (Alternate Spelling)
1957. *[Pipistrellus] rueppeli:* Aellen, Rev. suisse Zool., 64 (6): 204. (Lapsus)
1962. *Scotozous rüppelli:* Wassif, Proc. zool. Soc. Lond., 811. (Alternate Spelling)
1964. *Scotozous temmincki:* Lehmann, in: Niethammer, Alexander Koenigs Reisen am Nil, 72.
1969. *Vespertilio temmincki:* Kock, Abh. Senckenberg. naturforsch. Ges., 521: 174. (Alternate Spelling)
1980. *Pipistrellus rueppellii:* Swanepoel, Smithers and Rautenbach, Ann. Transv. Mus., 32 (7): 171. (Name Combination, Current Combination)
1981. *Pipistrellus (Pipistrellus) rueppellii:* Hill and Harrison, Bull. Br. Mus. (nat. Hist.) Zool., 52 (7): 281. (Name Combination)
1983. *Pipistrellus (Scotozous) rueppellii:* Smithers, Mammals Southern African subreg, 97. (Name Combination)
1985. *Pipistrellus ruepellii:* Rautenbach, Fenton and Braack, Koedoe, 28: 74. (Lapsus)
1986. *Pipistrellus (Vansonia) rueppellii:* Meester, Rautenbach, Dippenaar and Baker, Transv. Mus. Monogr., 5: 50. (Name Combination)
1990. *Pipistrellus ruppellii:* Yom-Tov, Cohen and Wollberg, Mammalia, 54 (2): 281. (Name Combination)
1995. *P[ipistrellus (?Hypsugo)] rueppelli:* Pavlinov, Borissenko, Kruskop and Jahonton, Arch. Zool. Mus., Moscow State Univ., 133: 107. (Name Combination)
1995. *P[ipistrellus (Pipistrellus)] ruepelli:* Nowak, Walker's Bats of the World, 94. (Lapsus)
1996. *Eptesicus rueppellii:* Kityo and Kerbis, J. East Afr. Nat. Hist., 85: 53. (Name Combination)
? *Pipistrellus rueppellii vernayi:* (Name Combination)
? *Scotozous rueppellii:* (Name Combination)
? *Vesperugo hesperida:*

TAXONOMY:

Figure 355. *Pipistrellus rueppellii* (ECJS-126/2009) caught in the Okanango, Botswana.

Renaming of *V. temminckii* Cretzschmar, 1826 (see Allen, 1939a: 95). Mentioned in the subgenus *Vansonia* by Koopman (1994: 116). Mentioned in the subgenus *Hypsugo* inc. sedis by Pavlinov *et al.* (1995: 107).

Meester *et al.* (1986) state that Ellerman *et al.* (1953: 79) do not recognize *Vansonia*, and instead place *Pipistrellus rueppellii* in the subgenus *Scotozous*, as do later authors (Rosevear, 1965; Hayman and Hill, 1971: 41; Smithers, 1983). Corbet and Hill (1980: 68), however, retain *Scotozous* as a full genus for the Indian *S. dormeri* Dobson, 1875, and both J.E. Hill (in litt.) and K.F. Koopman (in litt.) agree that it is incorrect to use this name for *rueppellii*. *Vansonia* is therefore the prior subgeneric name for this species. Benda *et al.* (2014c: 81; 2016: 322) place *rueppellii* in the genus *Vansonia*.

Helbig *et al.* (2010: 168) suggest that *rueppellii* needs to be transferred to a genus that needs to be newly created or resurrected from the current synonymy. Also Koubínová *et al.* (2013: 8) found evidence in the cyt *b* gene to support the transfer of *rueppellii* to a distinct genus, but they indicate that further investigations on material from the type countries of *P. rueppellii* [=Sudan] and the type locality of *P. vernayi* (the type species of *Vansonia* [Maun, Ngamiland, Botswana] are needed to confirm the relationship with *Vansonia*.

The original name was spelled as *Rüppelii*, so the present spelling should probably be *rueppelii*. However, this spelling was only found one single time in all of the literature data: as a misspelling in Koopman (1975). There are a number of earlier authors which use *rueppelli* (e.g. Anderson and de

Winton, 1902). Older literature data are: Wagner (1855) as *Vespertilio (Vesperugo) rüppelli*, Kolenati (1860) as *Panugo rüppelii*, and Heuglin (1877) as *Vesperugo rüppellii*. So the earliest record we were able to find was Wagner (1855), who already used the double "ll" (and double "ii"), but still used "ü", as did Heuglin (1877). Only Kolenati (1860) used a single "l". So if we consider Wagner to be the first reviewer, the name should be spelled as "*rueppellii*" with double "ll" and double "ii" and with "ue" since diacritics are no longer allowed in scientific names.

COMMON NAMES:
Afrikaans: Rüppell se vlermuis, Rüppell-vlermuis. Arabian: Khaffash. Chinese: 吕氏伏翼. Czech: netopýr Rüppellův, netopýr dvoubarvý. Dutch: Rüppells dwergvleermuis. English: Rüppell's Bat, Ruppell's Pipistrelle, Rüppel's Pipistrelle Bat, Rüppel's Pipistrelle. French: Pipistrelle de Rueppel, Pipistrelle de Rüppell. German: Rüppells Zwergfledermaus, Rüppells Pipistrelle, Dongola-Dämmerungsfledermaus. Hebrew: Atalfon Rippel. Italian: Pipistrèllo di Rüppell.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Butler and Greenwood (1965) found in the early Pleistocene at Olduvai material which they refered to as "cf *Pipistrellus* (*Scotozous*) *rueppelli* (Fischer)" (see Butler, 1978).

CONSERVATION STATUS:
Global - A widespread species with no known major threats, hence is assessed as Least Concern (LC ver 3.1 (2001)) (Jacobs *et al.*, 2008a; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Jacobs *et al.*, 2008a; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Jacobs *et al.*, 2004ag; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - LC ver 3.1 (2001) (Monadjem *et al.*, 2016q). 2004 - considered a vagrant not assessed, only one locality in SA (Augrabies Falls) (Friedmann and Daly, 2004). 1986 - Indeterminate (Smithers, 1986).

MAJOR THREATS:
Use of pesticides against locusts is a threat (Jacobs *et al.*, 2008a; IUCN, 2009).

CONSERVATION ACTIONS:
Jacobs *et al.* (2008a) [in IUCN (2009)] report that no specific measures are known. A study on the impacts of pesticides is required, especially ways in which the impact might be minimised.

GENERAL DISTRIBUTION:
Pipistrellus rueppellii has been recorded throughout Africa, with scattered records from southwest Asia. North African records include a disjunct distribution being recorded from a small part of eastern Morocco into western Algeria, Tunisia, a single record from eastern Libya (on the border with Egypt; Benda *et al.*, 2004a) and then in a broad strip in Egypt including all of the Nile River valley and delta and extending to the Red Sea (but not in the south) and the westernmost part of the Sinai. West African records are from the Senegal coast and the Senegal/Mauritania border. The largest contiguous range consists of a strip stretching from northern Sudan down to northern Zimbabwe, which at its widest point ranges from western Zambia to western Mozambique. Occurs up to 1,100 m in Morocco.

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 477,914 km^2.

Bates *et al.* (2013: 339) reject the occurrence of *P. rueppellii* in the Republic of Congo as Malbrant and Maclatchy (1949) only suggested that it 'likely' occurs in that country.

Native: Algeria; Angola (Crawford-Cabral, 1989; Monadjem *et al.*, 2010d: 572); Benin; Botswana (Archer, 1977; Monadjem *et al.*, 2010d: 572); Burkina Faso; Burundi; Cameroon; Central African Republic (Benda *et al.*, 2004a: 91); Chad; Congo (The Democratic Republic of the) (Hayman *et al.*, 1966; Monadjem *et al.*, 2010d: 572); Egypt (Sinai); Equatorial Guinea; Ethiopia; Gabon; Gambia; Ghana; Guinea; Guinea-Bissau; Iraq; Israel; Kenya; Liberia; Libyan Arab Jamahiriya (Benda *et al.*, 2004a: 91); Malawi (Ansell and Dowsett, 1988: 40; Happold *et al.*, 1988; Monadjem *et al.*, 2010d: 572); Mali; Mauritania (Padial and Ibáñez, 2005: 240); Morocco (Benda *et al.*, 2004d; 2010a; El Ibrahimi and Rguibi Idrissi, 2015: 362); Mozambique; Namibia (Monadjem *et al.*, 2010d: 572); Nigeria (Benda *et al.*, 2004a: 91); Rwanda; Senegal; Sierra Leone; Somalia; South Africa (Monadjem *et al.*, 2010d: 572); Sudan; Tanzania (including Unguja [O'Brien, 2011: 290]); Togo; Tunisia; Uganda (Kityo and Kerbis, 1996: 62); Yemen; Zambia (Monadjem *et al.*, 2010d: 572); Zimbabwe (Monadjem *et al.*, 2010d: 572).

Presence uncertain: Kuwait.

DETAILED MORPHOLOGY:
Baculum - Hill and Harrison (1987) and Kearney *et al.* (2002).

ECHOLOCATION:
See Jacobs (1996), Taylor (1999b) and Taylor *et al.* (2005).

Disca *et al.* (2014: 226) indicate that the type of call is FM-QFC. They also provide two different sets of parameters: A - long) F_{start}: 93.0 ± 8.9 kHz, F_{end}: 51.7 ± 0.7 kHz, F_{peak}: 53.6 ± 1.3 kHz, bandwidth: 41.3 ± 8.6 kHz, duration: 6.1 ± 1.2 msec; B - short) F_{start}: 68.2 ± 6.1 kHz, F_{end}: 52.8 ± 1.7 kHz, F_{peak}: 55.8 ± 2.0 kHz, bandwidth: 15.4 ± 6.7 kHz, duration: 2.4 ± 0.5 msec. The "B" type has not been reported from *Pipistrellus* before, and the peak frequencies of both type differ from those observed in Kenya (37.3 ± 0.8 kHz) and Zimbabwe (45 kHz).

84 calls from Israeli bats were reported by Hackett *et al.* (2016: 223): F_{start}: 62.24 ± 3.75 (55.5 - 72.0) kHz, F_{end}: 51.94 ± 0.88 (50.0 - 54.7) kHz, F_{peak}: 52.19 ± 0.97 (50.0 - 55.0) kHz, pulse duration: 4.22 ± 0.39 msec.

MOLECULAR BIOLOGY:
DNA - See Mayer *et al.* (2007).
Karyotype - Rautenbach *et al.* (1993) reported 2*n* = 36, FN = 54, BA = 20, a submetacentric X chromosome, and an acrocentric Y chromosome, for specimens from South Africa.
Protein / allozyme. - Based on the analysis of eight mitochondrial and nuclear genes, Koubínová (2013: 7) found that *P. rueppellii* was basal to the whole *Pipistrellus* / *Nyctalus* clade, and possibly might be placed in a genus of its own.

HABITAT:
In southern Africa, this species occurs primarily in Savanna (82 %) and Afromontane (11 %) habitats (Cooper-Bohannon *et al.*, 2016: Table S2).

DIET:
Benda *et al.* (2014c: 86) analyzed the content of the digestive tract of the single specimen they captured and found it contained 50 % by the volume of brachyceran Diptera, 30% of Lepidoptera and 20% of nematoceran Diptera.

PREDATORS:
Mikula *et al.* (2016: Supplemental data) mention the Bat hawk (*Macheiramphus alcinus* Bonaparte, 1850) as diurnal avian predator.

POPULATION:
Structure and Density - Unknown, because it is primarily known only from mist net captures (Jacobs *et al.*, 2008a; IUCN, 2009).
Trend - 2008 - Unknown (Jacobs *et al.*, 2008a; IUCN, 2009).

PARASITES:
SIPHONAPTERA:
Ischnopsyllidae: (*Ischnopsyllus emminus* Jordan and Rothschild, 1921 was reported from Malawi by Beaucournu and Kock (1996).

IXOIDIDA:
Hornok *et al.* (2017b: 3) collected a larva of *Argas vespertilionis* (Latreille, 1796) from a *P.* cf. *rueppellii* from South Horr, Kenya. Hornok *et al.* (2019: 2) probably refer to the same bat and tick and mentioned that the tick itself was infected by *Rickettsia* sp. Bacteria.

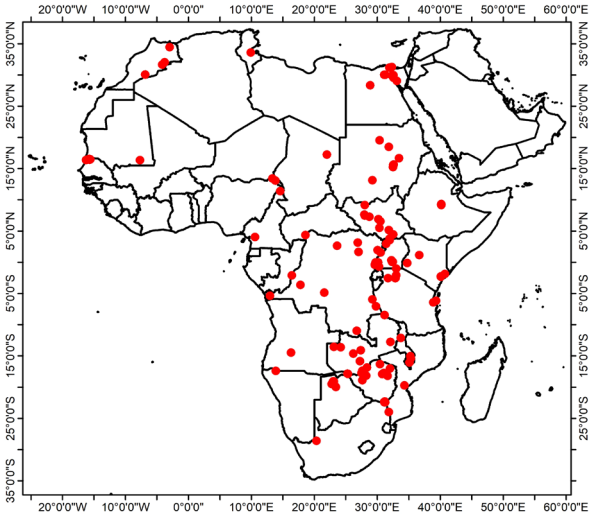

Figure 356. Distribution of *Pipistrellus rueppellii*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Angola, Botswana, Cameroon, Central African Republic, Chad, Congo (Democratic Republic of the), Egypt, Ethiopia, Kenya, Malawi, Mauritania, Morocco, Mozambique, Namibia, Nigeria, Senegal, South Africa, South Sudan, Sudan, Tanzania, Togo, Tunisia, Uganda, Zambia, Zimbabwe.

Pipistrellus rueppellii fuscipes Thomas, 1913

*1913. *Pipistrellus fuscipes* Thomas, Ann. Mag. nat. Hist., ser. 8, 11 (63): 315. Publication date: 1 March 1913. Type locality: Uganda: Entebbe, 60 mi (90 km) W [00 04 N 32 20 E, 3 700 ft] [Goto Description]. Holotype: BMNH 1906.7.1.5: ad ♂, skin and cranium only (no mandibula). Collected by: R.E. Dent and The Ruwenzori Expedition; collection date: 29 November 1905; original number: 1. See Thomas (1913b: 315).

1939. *Pipistrellus rüppellii fuscipes:* G.M. Allen, Bull. Mus. comp. Zool., 83: 96. (Name Combination)
1951. *Pipistrellus (Scotozous) ruppellii fuscipes:* Swynnerton and Hayman, J. East Afr. Nat. Hist. Soc., 20 (6-7) (90): 293 (for 1950). (Name Combination)
1960. *Pipistrellus ruppelli fuscipes:* Harrison, J. East Afr. Nat. Hist. Soc., 23 (7)(104): 294. Publication date: December 1860. (Name Combination, Alternate Spelling)
1966. *Pipistrellus (Scotozous) rüppelli fuscipes:* Hayman, Misonne and Verheyen, Ann. Kon. Mus. Mid. Afr., Zool. Wetensch., (8) 154: 55. (Name Combination)
1975. *P[ipistrellus] r[ueppelli] fuscipes:* Koopman, Bull. Am. Mus. Nat. Hist., 154 (4): 404. (Name Combination)
1984. *Pipistrellus (Scotozous) rueppelli fuscipes:* Anciaux de Faveaux, Ann. Kon. Mus. Mid. Afr., Zool. Wetensch.. (Name Combination)
1994. *P[ipistrellus (Vansonia)] r[ueppelli] fuscipes:* Koopman, in: Niethammer, Schliemann and Starck, Handbook of Zoology, volume II (Mammalia) Chiroptera, (60) 116. (Name Combination)
? *Pipistrellus (Vansonia) rueppellii fuscipes:* (Name Combination)
? *Pipistrellus rueppellii fuscipes:* (Name Combination, Current Combination)

GENERAL DISTRIBUTION:
Ethiopia to northern Angola.

Pipistrellus rueppellii pulcher (Dobson, 1875)

*1875. *Vesperugo pulcher* Dobson, Proc. zool. Soc. Lond., 1875, III: 471. Publication date: October 1875. Type locality: Tanzania: Zanzibar [ca. 06 10 S 39 12 E] [Goto Description]. Holotype: BMNH 1868.12.22.3: ad ♂, alcoholic (skull not removed). Presented/Donated by: Dr. Kirk.
1878. *Vesperugo (Vesperugo) pulcher:* Dobson, Catalogue of the Chiroptera of the collection of the British Museum, 233. (Name Combination)
1902. *P[ipistrellus] pulcher:* Anderson and de Winton, Zoology of Egypt: Mammalia, 129. (Name Combination)
1910. *Pipistrellus pulcher:* Thomas and Wroughton, Trans. Linn. Soc. Lond., 19 (5) (63): 489. (Name Combination)
1984. *Pipistrellus (Scotozous) rueppelli pulcher:* Anciaux de Faveaux, Ann. Kon. Mus. Mid. Afr., Zool. Wetensch.. (Name Combination)
1994. *P[ipistrellus (Vansonia)] r[ueppelli] pulcher:* Koopman, in: Niethammer, Schliemann and Starck, Handbook of Zoology, volume II (Mammalia) Chiroptera, (60) 116. (Name Combination)
? *Pipistrellus rueppellii pulcher:* (Name Combination, Current Combination)

GENERAL DISTRIBUTION:
Northeastern Tanzania and Zanzibar.

Pipistrellus rueppellii rueppellii (J. B. Fischer, 1829)

1827. *Vespertilio temminckii* Cretzschmar, in: Rüppell, Atlas Reise Nördlichen Afrika, Zoologie Säugethiere, 1: 17: pl. 6. Type locality: Sudan: Northern province: Dongola [19 10 N 30 27 E]. Lectotype: SMF 4308: ad ♂, skin only. Collected by: Wilhem Peter Edward Simon Rüppell; collection date: 1824. Old catalog: II.N.11.b: see Mertens (1925: 22). - Comments: Preoccupied by *temmincki* Horsfield, 1824 (a *Scotophilus*): see Allen (1939a: 95), Meester *et al.* (1986: 51), Simmons (2005). The publication date of Cretzschmar's work is sometimes indicated as "1826" (as mentioned on the title page), but also as "1827", "1828", "1830-1831".
*1829. *Vespertilio ruppellii* J.B. Fischer, Synopsis Mamm, 109. Publication date: 1829. Type locality: Sudan: Northern province: Dongola [19 10 N 30 27 E].
1866. *Vesperugo hypoleucus* Heuglin and Fitzinger, Sber. k. Akad. Wiss. Wien, math. naturw. Kl., 54 (1) 10: 546. Publication date: 1866. Type locality: Sudan: between Kéréri, Halfaye & Surerát on the Nile: Sennaar, near Khartoum, [ca. 15 35 N 33 38 E] [Goto Description].

Holotype: NMW 24574: ad, skin and skull. Collection date: August 1853. - Comments: Meester *et al.* (1986: 51) assigned it to Fitzinger only.

1866. *Vesperugo sennaariensis* Heuglin and Fitzinger, Sber. k. Akad. Wiss. Wien, math. naturw. Kl., 54 (1) 10: 546. Publication date: 1866. Type locality: Sudan: Khartoum [15 40 N 32 35 E, 380 m] [Goto Description]. - Comments: Nomen nudum (see Allen, 1939a: 95; Meester *et al.*, 1986: 51).

1877. *Vesperugo senarensis* Heuglin, Reise in Nordost Afrika, 2: 32. Publication date: 1877 [Goto Description]. - Comments: Nomen nudum (see Allen, 1939a: 95; Meester *et al.*, 1986: 51).

1939. *Pipistrellus rüppellii rüppellii:* G.M. Allen, Bull. Mus. comp. Zool., 83: 95. (Name Combination)

1955. *Pipistrellus ruppelli ruppelli:* Sanborn and Hoogstraal, J. Egypt. Publ. Health Ass., 30 (4): xxx.

1958. *Pipistrellus (Scotozous) rueppelli rueppeli:* Anciaux de Faveaux, Bull. IFAN, (A) 20 (1): 273. (Name Combination, Alternate Spelling)

1962. *Pipistrellus ruppelii ruppelii:* Heyneman and Macy, J. Egypt. Publ. Health Ass., 37 (4): 123. (Alternate Spelling)

1964. *Scotozous r[üppelli] rüppelli:* Niethammer, Alexander Koenigs Reisen am Nil, 72. (Name Combination)

1966. *Pipistrellus (Scotozous) rüppelli rüppelli:* Ellerman and Morrison-Scott, Checklist of Palaearctic and Indian Mammals 1758 to 1946. (Second Edition), 172. (Name Combination)

1974. *Pipistrellus rueppelli rueppelli:* Largen, Kock and Yalden, Mon. Zool. ital., (N.S.) 16 (Suppl. 5): 222, 245.

1978. *Pipistrellus rüppelli rüppelli:* Madkour, Zool. Anz., 201 (5/6): 387. (Alternate Spelling)

1983. *P[ipistrellus (Vansonia)] r[ueppellii] rueppellii:* Smithers, Mammals Southern African subreg, 97. (Name Combination)

1984. *Pipistrellus rueppellii rueppellii:* Rautenbach, Schlitter and Braack, Koedoe, 27: ???. (Name Combination, Current Combination)

1988. *Pipistrellus (Pipistrellus) rueppellii rueppellii:* Ansell and Dowsett, Mammals of Malawi, 39. (Name Combination)

1994. *P[ipistrellus (Vansonia)] r[ueppelli] rueppelli:* Koopman, in: Niethammer, Schliemann and Starck, Handbook of Zoology, volume II (Mammalia) Chiroptera, (60) 116. (Alternate Spelling)

MAJOR THREATS:
Sherwin *et al.* (2012: 174) consider water stress and the aerial hawking feeding style to be risk factors related with climatic change.

GENERAL DISTRIBUTION:
Egypt to Nigeria and Central Sudan.

Pipistrellus rueppellii senegalensis Dorst, 1960

*1960. *Pipistrellus Rüppelli senegalensis* Dorst, Bull. Mus. natn. Hist. nat., Paris, sér. 2, 31: 473 (for 1959). Type locality: Senegal: Richard Toll [16 48 N 15 42 W] [Goto Description]. Holotype: MNHN ZM-MO-1960-81: ad ♀, skull and alcoholic. Collected by: Francis Roux; collection date: September 1958.

? *Pipistrellus rueppellii senegalensis:* (Current Combination, Current Spelling)

GENERAL DISTRIBUTION:
Algeria to Senegal.

Pipistrellus rueppellii vernayi Roberts, 1932

*1932. *Pipistrellus vernayi* Roberts, Ann. Transv. Mus., 15 (1): 16. Publication date: 1 October 1932. Type locality: Botswana: Ngamiland: Maun [19 59 S 23 25 E] [Goto Description]. Holotype: TM 6546: ad ♂. Collected by: The Vernay-Lang Kalahari Expedition 1930; collection date: 29 May 1930; original number: 648.
1933. *Pipistrellus leucomelas* Monard, Bull. Soc. Neuchât. Sci. nat., 57: 47 (for 1932?). Publication date: 1933. Type locality: Angola: South-Central Angola: Vila da Ponte [14 25 S 16 15 E].
1939. *Pipistrellus rüppellii vernayi:* G.M. Allen, Bull. Mus. comp. Zool., 83: 96. (Name Combination, Current Combination)
1946. *[Vansonia] vernayi:* Roberts, Ann. Transv. Mus., 20 (4): 304. (Name Combination)
1951. *Vansonia vernayi:* Roberts, Mammals of South Africa, 82. (Name Combination)
1953. *Pipistrellus (Scotozous) rueppelli vernayi:* Ellerman, Morrison-Scott and Hayman, Southern African mammals 1758 to 1951, 78. (Name Combination)
1978. *Pipistrellus rueppelli vernayi:* Ansell, Mammals of Zambia, 24. (Name Combination)
1983. *P[ipistrellus (Scotozous)] r[ueppellii] vernayi:* Smithers, Mammals Southern African subreg, 97. (Name Combination)
1984. *Pipistrellus (Scotozous) rueppelli leucomelas:* Anciaux de Faveaux, Ann. Kon. Mus. Mid. Afr., Zool. Wetensch., 244: 49.
1986. *Pipistrellus (Vansonia) rueppellii vernayi:* Meester, Rautenbach, Dippenaar and Baker, Transv. Mus. Monogr., 5: 51. (Name Combination)
1994. *P[ipistrellus (Vansonia)] r[ueppelli] leucomelas:* Koopman, in: Niethammer, Schliemann and Starck, Handbook of Zoology, volume II (Mammalia) Chiroptera, (60) 116.
? *Pipistrellus (Vansonia) rueppellii leucomelas:*
? *Pipistrellus rueppellii leucomelas:*
? *Pipistrellus rueppellii vernayi:* (Current Spelling)

TAXONOMY:
If *vernayi* and *leucomelas* indeed represent the same form, then it might become important to check the actual publication date of *leucomelas*. This name was published in the 1932 issue of the "Bulletin de la Société Neuchâteloise de Sciences Naturelles", but the issue seemed to have appeared in 1933. Otherwise, this name might have priority over *Pipistrellus vernayi* which was published on 1 October 1932.

At present, we synonymize both names and consider *vernayi* to be the oldest name.

Kock (1969a: 174) points out that *leucomelas* might be a homonym of *Vespertilio leucomela* Cretzschmar, 1830.

GENERAL DISTRIBUTION:
Malawi to Transvaal and Southern Angola.

Pipistrellus rusticus (Tomes, 1861)

*1861. *Scotophilus rusticus* Tomes, Proc. zool. Soc. Lond., 1861, I: 31, 35. Publication date: May 1861. Type locality: Namibia: Ovamboland: Olifants Vlei [18 00 S 17 30 E] [Goto Description]. Lectotype: BMNH 1907.1.1.419: ad ♀, skin and skull. Collected by: 1 Anderson; original number: 176a. Paralectotype: BMNH 1907.1.1.420: ad, skin and skull. Collected by: 1 Anderson; collection date: November 1899; original number: 176b. - Etymology: Lanza *et al.* (2015: 441) mention "The masculine Latin adjective *rùsticus* actually means "rural, country" i. e. farmland-loving. Tomes (1861b: 35) apparently used this adjective erroneously instead of the masculine Latin adjective *robiginosus* "rusty", referring to the fur dorsal colour of the species: 'On the upper surface it is dark brown at the roots, with the terminal half light cinnamon-brown […].' ".
1913. *Pipistrellus rusticus:* Roberts, Ann. Transv. Mus., 4: 67. (Name Combination, Current Combination)

1923. *Pipistrellus marrensis* Thomas and Hinton, Proc. zool. Soc. Lond., 1923, II: 249. Publication date: 6 July 1923. Type locality: Sudan: foothills S Jebel Marra: Darfur [12 54 N 24 21 E, 4 000 ft] [Goto Description]. Holotype: BMNH 1923.1.1.15: ad ♂. Collected by: Captain/Rear-Admiral Hubert Lynes and Willoughby P. Lowe; collection date: 3 April 1924; original number: 633.
1934. *Eptesicops rusticus:* Shortridge, Mammals of South West Africa, 60. (Name Combination)
1953. *Pipistrellus (Pipistrellus) rusticus:* Ellerman, Morrison-Scott and Hayman, Southern African mammals 1758 to 1951, 78. (Name Combination)

TAXONOMY:

Figure 357. A male *Pipistrellus rusticus* (TM 48130) caught at Makalali-GR, Limpopo, South Africa.

See Simmons (2005).

COMMON NAMES:

Afrikaans: Roeskleurvlermuis. Chinese: 锈色伏翼. Czech: netopýr damarský. English: Rusty Bat, Rusty Pipistrelle Bat, Rusty Pipistrelle. French: Pipistrelle rustique, Pipistrelle rouille. German: Rostfarbene Zwergfledermaus, Rostfarbene Pipistrelle. Italian: Pipistrèllo rugginóso.

ETYMOLOGY OF COMMON NAME:

The colloquial name refers to the rusty colour of their fur (Taylor, 2005).

CONSERVATION STATUS:

Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Jacobs *et al.*, 2008am; IUCN, 2009).

Assessment History -

2008 - LC ver 3.1 (2001) (Jacobs *et al.*, 2008am; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Jacobs *et al.*, 2004ao; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - LC ver 3.1 (2001) (Monadjem *et al.*, 2016r). 2004 - NT ver 3.1 (2001) (Friedmann and Daly, 2004). 1986 - Indeterminate (Smithers, 1986).

MAJOR THREATS:

There appear to be no major threats to this species as a whole (Jacobs *et al.*, 2008am; IUCN, 2009).

CONSERVATION ACTIONS:

Jacobs *et al.* (2008am) [in IUCN (2009)] report that this species has been recorded from Mole National Park in Ghana (Grubb *et al.*, 1998). No direct conservation measures are currently needed for this species as a whole.

GENERAL DISTRIBUTION:

Pipistrellus rusticus has been widely, but patchily, recorded throughout much of sub-Saharan Africa. It is distributed from Senegal and The Gambia in the west, with easternmost records from Ethiopia close to the Somalia border area. It is found as far south as northern South Africa (where its distribution is mostly affected by precipitation seasonality; Babiker Salata (2012: 49)) and central Namibia. Other than records from southern Chad and northern Central African Republic, the species has not been recorded in Central Africa.

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 842,481 km^2.

Fahr (2007a: 105) assigns the Liberian *rusticus* specimens tentatively to *hesperidus*.

Native: Angola (Taylor *et al.*, 2018b: 60); Botswana (Archer, 1977; Monadjem *et al.*, 2010d: 572); Burkina Faso (Kangoyé *et al.*, 2015a: 621); Central African Republic (Kock *et al.*, 2002: 87); Chad; Ethiopia; Gambia (Kock *et al.*, 2002: 87); Ghana; Kenya; Malawi (Ansell and Dowsett, 1988: 40; Happold *et al.*, 1988; Monadjem *et al.*, 2010d: 572); Mozambique; Namibia (Monadjem *et al.*, 2010d: 572); Nigeria; Senegal; South Africa (Monadjem *et al.*, 2010d: 572); Sudan (Kock *et al.*, 2002: 87); Tanzania (Kock *et al.*, 2002: 87); Uganda; Zambia (Ansell, 1969; Ansell, 1973; Monadjem *et al.*, 2010d: 572); Zimbabwe (Monadjem *et al.*, 2010d: 572).

DETAILED MORPHOLOGY:
Baculum - Hill and Harrison (1987) and Kearney *et al.* (2002).

ECHOLOCATION:
In Waterberg, South Africa, Taylor *et al.* (2013b: 17) recorded the following parameters for 1 call: F_{max}: 62.1 kHz, F_{min}: 55.3 kHz, F_{knee}: 57.6 kHz, F_{char}: 55.4 kHz, duration: 3.1 msec. 19 calls recorded at Mapungubwe National Park (RSA) by Parker and Bernard (2018: 57) had the following features: F_{char}: 55.20 ± 0.92 kHz, F_{max}: 64.41 ± 3.75 kHz, F_{min}: 54.00 ± 1.05 kHz, F_{knee}: 57.68 ± 1.34 kHz, duration: 4.70 ± 1.59 msec, and 6.11 ± 3.12 calls/sec.

MOLECULAR BIOLOGY:
DNA - Unknown.
Karyotype - Both Rautenbach *et al.* (1993) and Kearney *et al.* (2002) reported 2*n* = 42, FN = 50, BA = 10, and an acrocentric Y chromosome, for specimens from South Africa. However, while Rautenbach *et al.* (1993) reported a submetacentric X chromosome, Kearney *et al.* (2002) reported a metacentric X chromosome. GTG banding identified that *P. hesperidus* and *P. rusticus* share the same Robertsonian fusion of chromosomes 11/12 (Kearney *et al.*, 2002).
Protein / allozyme - Unknown.

HABITAT:
In southern Africa, *P. rusticus* occurs in Savanna habitats (84 %; Cooper-Bohannon *et al.*, 2016: Table S2).

POPULATION:
Structure and Density - This species is locally common (Jacobs *et al.*, 2008am; IUCN, 2009).
Trend - 2008 - Unknown (Jacobs *et al.*, 2008am; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
P. rusticus displays a clear disassociation between male and female gamete production (van der Merwe and Mostert, 2005: 45). Spermatogenesis occurs during summer, and by late autumn the testes have regressed and the caudae epididymidis are full of stored spermatozoa (van der Merwe and Rautenbach, 1990). Mating is initiated in autumn, and spermatozoa from these inseminations are stored throughout the winter in the uteri of females (van der Merwe and Rautenbach, 1990; van der Merwe, 1994). Ovulation occurs late in winter to early spring and the released ova are fertilized by the spermatozoa stored within the female (van der Merwe and Mostert, 2005: 45).

van der Merwe and Rautenbach (1990: 538) found that 1 to 5 embryos might be present, but a maximum of two become implanted. The other embryos (up to morula stage) are resorbed (p. 540).

P. rusticus are seasonally monoestrous breeders and normally give birth to twins during the middle of November (van der Merwe and Rautenbach, 1990: 539; van der Merwe, 1994). However, occasional singletons have been recorded by van der Merwe and Rautenbach (1990). The uterus is bicornuate and a single foetus is carried in each of the uterine horns (van der Merwe and Rautenbach, 1990). *P. rusticus* is unique, in that although implantation is superficial, the amnion is formed by means of cavitation (van der Merwe, 1994). According to van der Merwe and Rautenbach (1990), embryonic development seems to be retarded just after implantation.
van der Merwe and Mostert (2005) investigated the reproductive pattern of female *P. rusticus* in South Africa by means of a histological examination of the ovarian follicles as well as early embryonic development. Female *P. rusticus* are seasonal monestrous breeders, initiating copulation in mid-autumn (April), storing sperm until the time of ovulation in late winter (August), and giving birth to twins in late spring (November). The period April until mid-August was characterized by sperm storage and increased follicular development. During mid-August the females ovulate and excess sperm were discarded. Females released between three and five ova, while a maximum of two embryos implanted successfully. Only a single embryo implanted per uterine horn. Embryo movement through the Fallopian tubes appeared to be a rapid process. Redundant embryos were resorbed before implantation. The period from the end of August until mid-November was marked by Pregnancy. Females invariably carried twins (one foetus in each uterine horn). Large-scale follicle

atresion, and very low levels of follicle development, chatacterized the period end of August until March. High incidences of polyovular follicles were recorded for all months of the year. No obvious form of reproductive asymmetry was recorded in *P. rusticus* (van der Merwe and Mostert, 2005).

Monadjem *et al.* (2010d) [in Weier *et al.* (2018: Suppl.)] mentioned births taking place in November.

MATING:
For Northern Transvaal (RSA), van der Merwe and Rautenbach (1990: 538) indicate that copulation was initiated during April, and ovluation and fertilization takes place in the second half of August.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Botswana, Burkina Faso, Cameroon, Central African Republic, Egypt, Ethiopia, Ghana, Kenya, Madagascar, Malawi, Mozambique, Namibia, Niger, Nigeria, Senegal, Somalia, South Africa, South Sudan, Sudan, The Gambia, Uganda, Zambia, Zimbabwe.

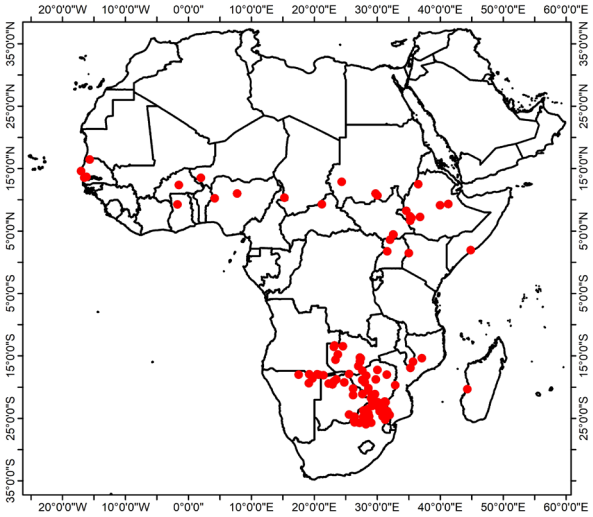

Figure 358. Distribution of *Pipistrellus rusticus*

Pipistrellus sp. aff. ***kuhlii*** Kuhl, 1817

*2001. *Pipistrellus cf kuhlii* Volleth, Bronner, Göpfert, Heller, von Helversen and Yong, Chromosome Res., 9 (1): 26. (Current Combination)

TAXONOMY:
Volleth *et al.* (2001: 25) report a *Pipistrellus kuhlii*-like species from Madagascar, which they separated from the European *Pipistrellus* based on a different diploid chromosome number. This form might possibly be conspecific with *Pipistrellus hesperidus* Temminck, 1840, since Bates *et al.* (2006: 299) mention *P. hesperidus* from Madagascar.

Pipistrellus "incertae-sedis"

1858. *Nannugo Kolenatii* Müller, Lotos (Prag), 8: 75, figs 1 - 4. Type locality: Egypt: "Egypt" [Goto Description].
1862. *Vespertilio (Nannugo) Kolenatii:* Koch, Nass. Naturw. Jahrb., 18: 397.
2013. *Pipistrellus cf. hesperidus:* Koubínová *et al.*, Front. Zool., 10: 1-48. - Comments: Koubínová *et al.* (2013: 7) found found differences in dipoloid chromosome number and/or in chromosome morphology between the populations from Senegal and other regions in Africa. (Name Combination)

TAXONOMY:
Müller (1858: 75) called *Nannugo Kolenati* one of the smallest Nord African bat species. Its German name "Die weissgesäumte Buschfledermaus" indicates that a white edge on the wing membrane was present.
Koch (1862: 397) considers this form a relative of *Nannugo marginatus*, which in turn is a synonym of *P. kuhlii*. Except for these two publications, no other references to this form were found.
The description does not enable us to assign this name to either *Pipistrellus kuhlii* Kuhl, 1817 or *Pipistrellus deserti* Thomas, 1902. In the latter case this name might be a senior synonym, provided *aegyptius* Fischer, 1829 is to be ignored. However, this name clearly does qualify for the status of "*nomen oblitum*", and should, therefore, probably be ignored.

Genus ***Plecotus*** E. Geoffroy St.-Hilaire, 1818

1816. *Macrotus* Leach, Cat. Mamm. Birds B.M, p 5. - Comments: Type species: *Macrotus europaeus* Leach, 1816 [= *Vespertilio auritus* Linnaeus, 1758]. Preoccupied by *Macropus* Gray, 1842, *Nomen nudum* by Pavlinov *et al.* (1995: 103).. - Etymology: From the Greek "*μακρός*", meaning large and "*ούς*" or "*ώτός*", meaning ear, referring to very large ears (see Palmer, 1904: 395).

*1818. *Plecotus* E. Geoffroy Saint-Hilaire, Description des Mammifères qui se trouve en Egypte, 2: 112, pl. 2, No 3. Publication date: 1818. - Comments: Type species: *Vespertilio auritus* Linnaeus, 1758. - Etymology: From the Greek "*pleko*" meaning folded or twisted and "*otis*" meaning ear (see Jones, 1977a: 3; Álvarez-Castañeda and Álvarez Solórzano, 1996: 43). Gardner (2005: 184) considers this to be masculine (*Plec* = twisted + *ot* = ear(ed) + *us* (Latin second declension ending)). (Current Combination)

1829. *Plecautus:* F. Cuvier. - Comments: Lapsus: see Cabrera (1914). (Lapsus)

? *Plecotus sp.:*

TAXONOMY:
A key to the genus was published by Jones (1977a: 1). Mediterranean and Atlantic islands forms reviewed by Juste *et al.* (2004a).

Benda *et al.* (2006) indicated that Benda *et al.* (2004c) and Spitzenberger *et al.* (2006) performed combined genetic and morphological analyses of Mediterranean plecotine bats with very similar results but with a slightly different interpretation. The difference is in the taxonomic evalutation of the *kolombatovici* clade of the *austriacus* group (in the sense of Juste *et al.* (2004a). This clade consists of a mosaic of morphotypes with a relatively very shallow genetic divergence. Benda *et al.* (2004c) coidentified this group with one species *P. teneriffae*, containg three to four more or less distinct forms living in allopatry (*teneriffae*, *kolombatovici*, *gaisleri*, and a possible fourth form in the Maghreb, but preliminary included into *gaisleri*). Spitzenberger *et al.* (2006) distinguished two species in the clade, the monotypic *P. teneriffae* and *P. kolombatovici* with three forms, *kolombatovici*, *gaisleri*, and the unnamed Maghrebian form. A third possible interpretation, considering three species within the clade (which well confirm with the morphological evidence) was recently suggested by Mayer *et al.* (2007). Since all three analyses used almost the same types of character sets, their interpretations are alternatives arising from almost identical results. Thus, contrary to Benda *et al.* (2006) who suggest to follow the 'intermediate' designation *P.* (*teneriffae*) *gaisleri* for the populations of the Maghreb and Cyrenaica, the IUCN evaluated *P. kolombatovici* including these North African populations.

Known species of the genus *Plecotus*: *alpinus* Kiefer and Veith, 2002 – France, Liechtenstein, Switzerland, Austria, Croatia, Greece (Simmons, 2005: 482); *auritus* (Linnaeus, 1758) – Norway, Ireland and Spain to Sakhalin Isl (Russia), Korea, Japan, northern China, Nepal, India (Simmons, 2005: 482); *austriacus* (J. Fischer, 1829) – England and Spain to Mongolia and western China (Simmons, 2005: 482); ***balensis*** Kruskop and Lavrenchenko, 2000; ***christii*** Gray, 1838; *kolombatovici* Dulic, 1980 – Croatia and nearby islands in the Adriatic Sea (Simmons, 2005: 483); ***gaisleri*** Benda, Kiefer, Hanak and Veith, 2004; *sardus* Mucedda, Kiefer, Pidinchedda and Veith, 2002; *taivanus* Yoshiyuki, 1991 – Taiwan (Simmons, 2005: 483); ***teneriffae*** Barrett-Hamilton, 1907.

COMMON NAMES:
Czech: praví ušani (ušanové, srostlouchové, pletušanové, vrásničové. English: Long-eared bats, Old World Big-eared Bats, Big-eared Bats, Old World Long-eared Bats. French: Oreillards, Chauves-souris à grandes oreilles. German: Langohrfledermäuse, Langohren.

GENERAL DISTRIBUTION:
Dorst and de Naurois (1966: 292) report on *Plecotus austriacus* specimens collected on the Cape Verdian islands of Maio and Santiago.

Plecotus balensis Kruskop & Lavrenchenko, 2000

*2000. *Plecotus balensis* Kruskop and Lavrenchenko, Myotis, 38: 6, figs 1, 5, 6, 7. Publication date: December 2000. Type locality: Ethiopia: Southern Ethiopia, Bale Mountains National Park: Harenna Forest [06 45 N 39 44 E, 2 760 m] [Goto Description]. Holotype: ZMMU S-164904: ad ♂, skin and skull. Collected by: Sergey V. Kruskop; collection date: 29 December 1995. - Etymology: In reference to the Bale mountains, the area from where

the type specimen originated (see Kruskop and Lavrenchenko, 2000: 8). (Current Combination)

TAXONOMY:
See Simmons (2005).

COMMON NAMES:
Czech: ušan habešský. English: Bale Big-eared Bat, Bale Long-eared Bat, Ethiopian Big-eared Bat, Ethiopian Long-eared Bat. French: Oreillard d'Ethiopie. German: Bale-Langohr.

CONSERVATION STATUS:
Global - Listed as Data Deficient (DD ver 3.1 (2001)) in view of the absence of sufficient information on its extent of occurrence, natural history, threats and conservation status. The species has only been recently described, and there remains very little information on the distribution of the species. While it is currently known from fewer than five locations, it seems plausible that the species ranges more widely than this and does not therefore qualify for Vulnerable B2ab(iii) (Lavrenchenko *et al.*, 2008; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) (Lavrenchenko *et al.*, 2008; IUCN, 2009). 2004 - VU D2 ver 3.1 (2001) (Lavrenchenko *et al.*, 2004a; IUCN, 2004).

MAJOR THREATS:
This species is threatened by the rapid destruction of montane forest, presumably through extraction of timber and firewood, and the conversion of land to agricultural use (Lavrenchenko *et al.*, 2008; IUCN, 2009).

CONSERVATION ACTIONS:
Lavrenchenko *et al.* (2008) [in IUCN (2009)] report that this species has been recorded within the Bale Mountains National Park. Additional management of the area is needed to prevent further deforestation of the Harenna Forest. There is a need for further field surveys to better determine the range of this species.

GENERAL DISTRIBUTION:
Plecotus balensis is endemic to the Ethiopian highlands were it is currently known only with certainty from the upper belts of the Harenna Forest in the Bale Mountains National Park and from Abune Yosef (Kruskop and Lavrenchenko, 2000; Juste *et al.*, 2004a; Benda *et al.*, 2004c). There is an early record from "Shoa" (= Shewa), which probably came from the uplands north or northwest of Addis Ababa (Kruskop and Lavrenchenko, 2000). It is possible that the species occurs in similar areas of montane forest, but it has not been recorded during surveys in either the Beletta Forest or the Sheko Forest (Kruskop and Lavrenchenko, 2000). The species is found at elevations of 2,500 to 3,000 m asl.

There are a number of poorly documented museum specimens that may have come from additional sites within Ethiopia, or possibly from adjacent Eritrea (although this may refer to a specimen of *Plecotus christii*) (Kruskop and Lavrenchenko, 2000).

Benda *et al.* (2011b: 44) tentatively assign *Plecotus* specimens from Yemen to this taxon as *Plecotus* cf. *balensis*.

Native: Ethiopia (Kruskop and Lavrenchenko, 2000; Juste *et al.*, 2004a; Benda *et al.*, 2004c).
Presence uncertain: Eritrea (Kruskop and Lavrenchenko, 2000).

DETAILED MORPHOLOGY:
Baculum - See Kruskop and Lavrenchenko (2000), Benda *et al.* (2004c).

MOLECULAR BIOLOGY:
DNA - See Benda *et al.* (2004c), Juste *et al.* (2004c).
Karyotype - Unknown.
Protein / allozyme - Unknown.

POPULATION:
Structure and Density - Kruskop and Lavrenchenko (2000) mention that this bat appears to be relatively common within its limited distribution.
Trend - 2008 - Unknown (Lavrenchenko *et al.*, 2008; IUCN, 2009).

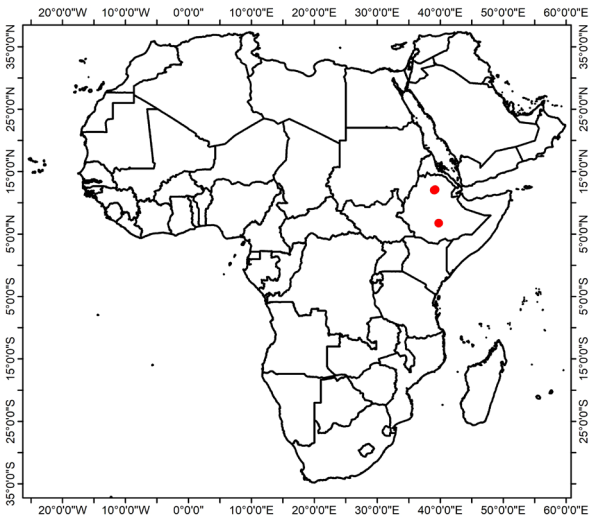

Figure 359. Distribution of *Plecotus balensis*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Ethiopia.

Plecotus christii Gray, 1838

1829. *Vespertilio auritus ß aegyptius* J.B. Fischer, Synopsis Mamm, 117. Publication date: 1829. - Comments: Junior homonym of *Vespertilio pipistrellus var aegyptius*: see Qumsiyeh (1985: 65). Allen (1939a: 96) mentioned this form to be based on the description by E. Geoffroy, 1818: Description de l'Egypte, 2: 119.

*1838. *Plecotus christii* Gray, Mag. Zool. Bot., Edinburgh, 2 (12): 495. Publication date: 1 February 1838. Type locality: Egypt: southern Egypt: Nile valley between Qena and Aswan. Lectotype: BMNH 1866.a: skin only. Collected by: Major (Dr.) Turnbell Christie. Presented/Donated by: ?: Collector Unknown. Skin in poor condition. Sometimes also mentioned as "BMNH GMC M66a". - Comments: Type locality originally North Africa, but restricted by Qumsiyeh (1985: 65, 67) to southern Egypt, Nile valley between Qena and Aswan. Between 16° 10' N, 32° 43' E and 24° 05' N, 32° 53' E: see Benda *et al.* (2008f: 70). - Etymology: In honour of Dr. Turnbull Christie, the collector of the type specimen (see Gray, 1838: 495).

1866. *Plecotus æthiopicus* Heuglin, in: Fitzinger and Heuglin, Sber. k. Akad. Wiss. Wien, math. naturw. Kl., 54 (1) 10: 546. Publication date: 1866. Type locality: Sudan: Bahr-el-Abiad [ca. 14 00 N 33 00 E]. - Comments: Nomen nudum. Mentioned by Allen (1939a: 96) as a synonym of *Plecotus auritus aegyptiacus* Geoffroy.

1878. *Plecotus ægyptiacus* Dobson, Catalogue of the Chiroptera of the collection of the British Museum, p. 178. Publication date: June 1878. Type locality: Egypt. Topotype: MCZ 32976: ♂, alcoholic (skull not removed). Collected by: Dr. John Anderson. Presented/Donated by: ?: Collector Unknown. - Comments: Allen (1939a: 96) mentioned "I. Geoffroy, Mag. de Zool., 2: cl. 1, p. 2 of description of pl. 2-3, 1832, who repeats characters given by E. Geoffroy, in Description de l'Egypte, 2: 119, 1818. Egypt". Kock (1969a: 179) also mentions "I. Geoffr.", buf refers to Fitzinger (in Heuglin and Fitzinger, 1866: 545) as first reference, who reported it from Egypt, Abyssinia and Shoa. Pavlinov *et al.* (1995) mentioned Dobson, 1878 as author.

1911. *Plecotus christiei:* Thomas, Proc. zool. Soc. Lond., 1911, I: 160. - Comments: Unjustified emendation (Benda *et al.*, 2006). (Emendation)

1964. *Plecotus austriacus christiei:* - Comments: Unjustified emendation (see Thomas, 1911; Benda *et al.*, 2006). (Name Combination, Lapsus)

2002. *Plecotus cristiei:* Kiefer and Veith, Myotis, 39: 12. (Lapsus)

2008. *Plecotus christii petraeus* Benda, in: Benda, Dietz, Andreas, Hotový, Lucan, Maltby, Meakin, Truscott and Vallo, Acta Soc. Zool. Bohem., 72: 1, 71, fig. 68. Type locality: Egypt: Sinai: Janub Sina Governate: Wadi Feiran: western edge of Feiran Oasis [28 43 N 33 37 E, 595 m]. Holotype: NMP 90496: ad ♂, skull and alcoholic. Collected by: Michal Andreas, Petr Benda, Josef Hotový and Radek K. Lucan; collection date: 8 September 2005; original number: pb2858. See Benda in Mlíkovský *et al.* (2011: 138). Paratype: BMNH 1903.12.8.5: ad ♀, skull and alcoholic. Collected by: Dr. John Anderson. Tor [= El Tur], Sinai [Egypt]. Paratype: NMP 90497: sad ♀, skull and alcoholic. Collected by: Michal Andreas, Petr Benda, Josef Hotový and Radek K. Lucan; collection date: 9 September 2005; original number: pb2859. El Milga, Sinai, Egypt. See Benda in Mlíkovský *et al.* (2011: 138). Paratype: NMP 90499: ad ♂, skull and alcoholic. Collected by: Michal Andreas, Petr Benda, Josef Hotový and Radek K. Lucan; collection date: 10 September 2005; original number: pb2861. Feiran, Sinai, Egypt. See Benda in Mlíkovský *et al.* (2011: 138). Paratype: NMP 90518: ad ♀, skull and alcoholic. Collected by: Michal Andreas, Petr Benda, Josef Hotový and Radek K. Lucan; collection date: 10 September 2005; original number: pb2880. El Tur, Hammam Musa, Sinai, Egypt. See Benda in Mlíkovský *et al.* (2011: 138). Paratype: NMP 90519: ad ♂, skull and alcoholic. Collected by: Michal Andreas, Petr Benda, Josef Hotový and Radek K. Lucan; collection date: 10 September 2005; original number: pb2881. El Tur, Hammam Musa, Sinai, Egypt. See Benda in Mlíkovský *et al.* (2011: 138). Paratype: NMP 90523: ad ♂, skull and alcoholic. Collected by: Michal Andreas, Petr Benda, Josef Hotový and Radek K. Lucan; collection date: 15 September 2005; original number: pb2885. Ain Hudra, Sinai, Egypt. See Benda in Mlíkovský *et al.* (2011: 138). Paratype: NMP 90533: ad ♀, skull and alcoholic. Collected by: Michal Andreas, Petr Benda, Josef Hotový and Radek K. Lucan; collection date: 18

September 2005; original number: pb2895. Ain Sudr, Sinai. See Benda in Mlíkovský *et al.* (2011: 138). Paratype: TAU M.7160: ad ♂, skin and skull. Collection date: 01 December 1977. Hashiba [= Umm Khisheib], Sinai [Egypt]. See Benda *et al.* (2008f: 71).

? *Plecotus auritus aegyptiacus:*

? *Plecotus austriacus christei:* (Lapsus)

? *Plecotus austriacus christii:* (Name Combination)

TAXONOMY:
Generally considered to be a subspecies of *austriacus*, but see Benda *et al.* (2004c: 23), who raised it to species rank.

Since *Plecotus austriacus* is a strictly European species (Juste *et al.*, 2004a; Mayer *et al.*, 2007). Therefore, this species is removed from the list of African species. All of the African records of *P. austriacus* in fact belong to *P. christii*, *P.* (*teneriffae*) *gaisleri* or to *P. balensis*.

COMMON NAMES:
Arabian: Khaffash. Czech: ušan egyptský. Dutch: Egyptische grootoorvleermuis. English: Christie's Long-eared Bat. French: Oreillard d'Egypte. German: Christis Graues Langohr. Hebrew: Oznan.

CONSERVATION STATUS:
Global - Probably a small population, suitable habitat might be fragmented, but needs more research to be properly assessed (Aulagnier and Benda, 2008; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) (Aulagnier and Benda, 2008; IUCN, 2009). 2006 - DD ver 3.1 (2001) (Aulagnier and Benda, 2004b; IUCN, 2006). 2004 - DD ver 3.1 (2001) [assessed as *Plecotus christiei*] (Aulagnier and Benda, 2004b; IUCN, 2004).

MAJOR THREATS:
Affected by human disturbance (Aulagnier and Benda, 2008; IUCN, 2009).

CONSERVATION ACTIONS:
Aulagnier and Benda (2008) [in IUCN (2009)] report that no conservation measures are in place. Further research on population is needed in order to make an assessment.

GENERAL DISTRIBUTION:
Plecotus christii is known only from a few localities in NE Africa, including eastern Libya (S. Aulagnier *pers. comm.*, 2007 in Aulagnier and Benda, 2008 [in IUCN, 2009]), Egypt including Sinai and Sudan. Benda *et al.* (2004c: 26) restricted its confirmed distribution to the north-eastern African desert region, Mayer *et al.* (2007) suggested its occurrence also in the Jordan desert.

A specimen from Eritrea may belong to this species or to *P. balensis* (Kruskop and Lavrenchenko, 2000).

Native: Egypt [Sinai] (Horácek *et al.*, 2000: 135); Libyan Arab Jamahiriya (Horácek *et al.*, 2000: 135); Sudan (Horácek *et al.*, 2000: 135).
Presence uncertain: Eritrea.

DETAILED MORPHOLOGY:
Baculum - See Benda *et al.* (2004c).

ECHOLOCATION:
In Jordan, Benda *et al.* (2010b: 204) recorded the following parameters for 42 calls: Start frequency: 44.2 ± 2.8 (34.5 - 49.0) kHz, End frequency: 25.0 ± 1.0 (22.6 - 26.7) kHz, Peak frequency: 30.5 ± 1.7 (28.6 - 34.2) kHz, Pulse duration: 2.3 ± 0.5 (1.4 - 3.5) msec, and Inter-pulse duration: 57.6 ± 18.9 (18.0 - 89.0) msec.

Hackett *et al.* (2016: 223) reported on 25 calls from Israel: Pulse duration: 3.05 ± 0.98 msec, F_{start}: 37.22 ± 3.43 kHz, F_{end}: 23.85 ± 2.45 kHz, F_{peak}: 28.47 ± 2.74 kHz.

MOLECULAR BIOLOGY:
DNA - See Benda *et al.* (2004c), Juste *et al.* (2004c), Spitzenberger *et al.* (2006, Mayer *et al.* (2007).
Karyotype - Unknown.
Protein / allozyme - Unknown.

POPULATION:
Structure and Density - Probably very small population, only scattered and isolated records (Aulagnier and Benda, 2008; IUCN, 2009).
Trend - 2008 - Unknown (Aulagnier and Benda, 2008; IUCN, 2009).

ACTIVITY AND BEHAVIOUR:
Korine *et al.* (2015: 5) indicate that the activity of *P. christii* could be underestimated because of the whispering nature of their echolocation calls.

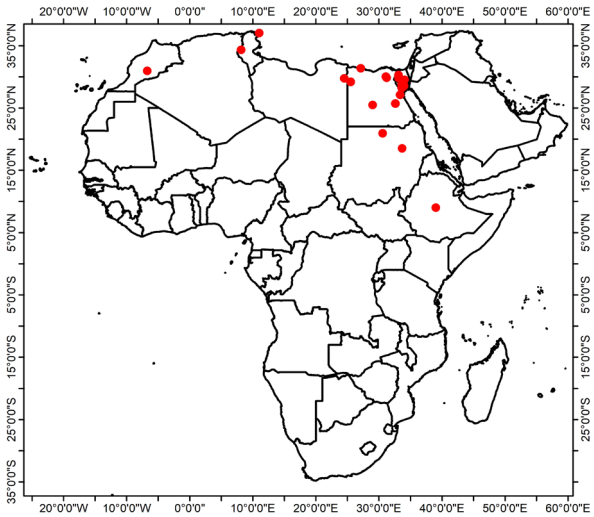

Figure 360. Distribution of *Plecotus christii*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Egypt, Ethiopia, Libya, Morocco, Sudan, Tunisia.

Plecotus gaisleri Benda, Kiefer, Hanak & Veith, 2004

*2004. *Plecotus teneriffae gaisleri* Benda, Kiefer, Hanák and Veith, Folia Zool., 53 (Monogr. 1): 28. Type locality: Libya: Cyrenaica: Al Jabal Al Akhdar district: 8 km SW Massah,: Wadi al Kuf (Jabal Akhdar Mts) [32 42 N 21 35 E, ca. 330 m] [Goto Description]. Holotype: NMP 49911: ad ♀, skull and alcoholic. Collected by: Petr Benda, Vladimir Hanák, Michal Andreas, Antonin Reiter and Marcel Uhrin; collection date: 20 May 2002. Paratypes: 4 MM + 2 FF; see Benda *et al.* (2004c: 29). Paratype: NMP 49905: ad ♂, skull and alcoholic. Collected by: Michal Andreas, Petr Benda, Vladimir Hanák, Antonin Reiter and Marcel Uhrin; collection date: 20 May 2002; original number: pb2153. See Benda *et al.* (2004c: 29), Benda in Mlíkovský *et al.* (2011: 137). Paratype: NMP 49906: ad ♂, skull and alcoholic. Collected by: Petr Benda, Vladimir Hanák, Michal Andreas, Antonin Reiter and Marcel Uhrin; collection date: 20 May 2002; original number: pb2154. See Benda *et al.* (2004c: 29), Benda in Mlíkovský *et al.* (2011: 137). Paratype: NMP 49907: ad ♂, skull and alcoholic. Collected by: Petr Benda, Vladimir Hanák, Michal Andreas, Antonin Reiter and Marcel Uhrin; collection date: 20 May 2002; original number: pb2155. See Benda *et al.* (2004c: 29), Benda in Mlíkovský *et al.* (2011: 137). Paratype: NMP 49908: ad ♂, alcoholic (skull not removed). Collected by: Petr Benda, Vladimir Hanák, Michal Andreas, Antonin Reiter and Marcel Uhrin; collection date: 20 May 2002; original number: pb2156. See Benda *et al.* (2004c: 29), Benda in Mlíkovský *et al.* (2011: 137). Paratype: NMP 49909: ad ♀, alcoholic (skull not removed). Collected by: Petr Benda, Vladimir Hanák, Michal Andreas, Antonin Reiter and Marcel Uhrin; collection date: 20 May 2002; original number: pb2157. See Benda *et al.* (2004c: 29), Benda in Mlíkovský *et al.* (2011: 137). Paratype: NMP 49910: ad ♀, alcoholic (skull not removed). Collected by: Petr Benda, Vladimir Hanák, Michal Andreas, Antonin Reiter and Marcel Uhrin; collection date: 20 May 2002; original number: pb2158. See Benda *et al.* (2004c: 29), Benda in Mlíkovský *et al.* (2011: 137). - Comments: Considered a valid species by Mayer *et al.* (2007: Additional file 1) based on mitochondrial DNA analyses. - Etymology: In honour of professor Jiri Gaisler (Brno, Czech Republic) who significantly contributed to the knowledge of the North Afrian bat fauna (see Benda *et al.*, 2004c: 29).

2006. *P. kolombatovici gaisleri:* Spitzenberger, Strelkov, Winkler and Haring, Zool. Scr., 35 (3): 221. (Name Combination)

? *Plecotus gaisleri:* (Name Combination, Current Combination)

TAXONOMY:
See under *Plecotus* above. Formerly considered as *P. auritus* or *P. austriacus*, for details see Benda *et al.* (2004c). Spitzenberger *et al.* (2006) include it in *P. kolombatovici*.
See Mayer *et al.* (2007) and Mayer *et al.* (2007: Additional material).

COMMON NAMES:
Czech: ušan berberský. Dutch: Gaislers grootoorvleermuis. English: Gaisler's Long-eared Bat. French: Oreillard du Gaisler. German: Gaislers Langohrfledermaus. Italian: Orecchione di Gaisler.

CONSERVATION STATUS:
Global - VU (Baillie and Groombridge, 1996); DD ver 3.1 (2001) (IUCN, 2004; Juste *et al.*, 2004a) as *P. teneriffae*.

GENERAL DISTRIBUTION:
Northern Cyrenaica (Libya); north-west Africa [Maghreb: Morocco (Benda *et al.*, 2010a: 158; El Ibrahimi and Rguibi Idrissi, 2015: 364 [as "*Plecotus teneriffae = (P. austriacus, P. gaisleri)*"]), Algeria, Tunisia (Dalhoumi *et al.*, 2014: 53; 2016b: 867); Pantelleria island (Italy) and Malta.

ECHOLOCATION:
Benda *et al.* (2010a: 163) are the first to provide echolocation data for this species, based on 58 Moroccan specimens. They report a F_{start}: 41.7 ± 1.7 (37.2 - 44.5) kHz, F_{max}: 31.9 ± 2.0 (28.3 - 37.0) kHz, F_{end}: 21.7 ± 2.3 (16.1 - 26.5), with a duration of 1.4 ± 0.3 (0.9 - 1.9) ms, and an inter-pulse interval of 40.9 ± 23.5 (12.9 - 95.7) ms.

Also from Morocco, Disca *et al.* (2014: 226) report the following: call type FM multi H, F_{start}: 51.4 ± 1.1 kHz, F_{end}: 22.0 ± 0.7 kHz, $F_{max\ all\ harmonics}$: 29.7 ± 1.0 kHz, bandwidth: 29.3 ± 1.0 kHz, duration: 2.6 ± 0.2 msec.

ROOST:
Benda *et al.* (2014c: 103) found a roost (probably the remainder of a maternity colony) in deep holes and crevices of the ceiling of an ancient ruin covered by carob trees. Further specimens were also recovered from ruins, indicating that *P. gaisleri* is probably a petrophilous species, which seems to select its roosts solely in underground spaces rather open to daylight and in rock fissures

DIET:
Benda *et al.* (2014c: 108) examined eight sample sets of the diet and found large amounts of moths (Lepidoptera), most with wingspans between 30 and 35 mm. From other areas in Libya, orthopterans (Ensifera) or cockroaches (Blattoidea) formed the major part of the diet.

REPRODUCTION AND ONTOGENY:
Two pregnant females, both with one foetus, were collected in the central part of Wadi Al Kuf (Libya) on 19 May, whereas lactating females were found between 9 May and 4 August (Benda *et al.*, 2014c: 105).

PARASITES:
Benda *et al.* (2014c: 109) reported one egg with praelarvae of a mite belonging to the superorder Acariformes.

From Algeria, Bendjeddou *et al.* (2017: 15) reported the following ectoparasites: Nycteribiidae: *Nycteribia (Nycteribia) latreillii* (Leach, 1817) and Arachnida: *Spinturnix myoti* (Kolenati, 1856) and *Argas vespertilionis* (Latreille, 1802).

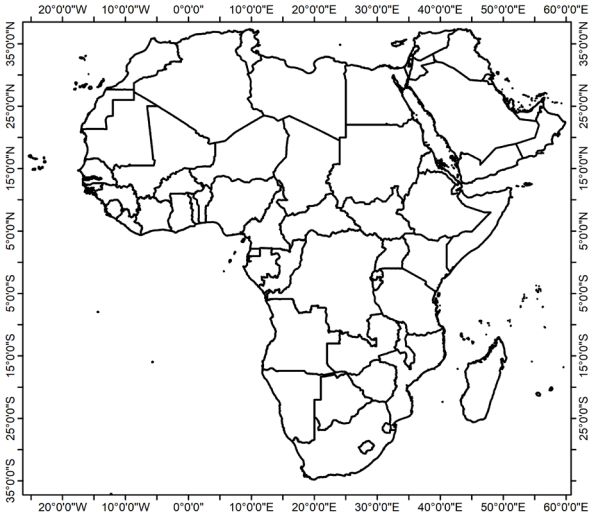

Figure 361. Distribution of *Plecotus gaisleri*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Morocco.

Plecotus teneriffae Barrett-Hamilton, 1907

*1907. *Plecotus teneriffae* Barrett-Hamilton, Ann. Mag. nat. Hist., ser. 7, 20 (120): 520. Publication date: 1 December 1907. Type locality: Canary Islands (Spain): Tenerife island: Orotava [28 23 N 16 31 W] [Goto Description]. Holotype: BMNH 1887.4.18.1: skin only. Collected by: Ramon Gomez; collection date: 3 April 1887. See Benda *et al.* (2004c: 39). - Comments: Barrett-Hamilton (1907: 520) mentions that the type specimen has no skull. - Etymology: Refering to the island where the type specimen was collected. (Current Combination)

? *Plecotus austriacus:*

TAXONOMY:
Synonymized with *P. austriacus* by Corbet (1978); but see Ibañez and Fernández (1985b). Genetic studies clearly show that *teneriffae* is more closely related with *kolombatovici*, while Pestano *et al.*

(2003a: 306) suggested the North African to be the closest relative.

COMMON NAMES:
Albanian: Lakuriq nate veshgjatë i Teneriffae-ve. Armenian: Կանարյան կամ Տենեռիֆյան ականջեղ. Azerbaijani: Kanar palazqulağı. Basque: Belarrihandi kanariar. Belarusian: Вушан канарскі. Turkish: Kanaryarlar Uzunkulaklı Yarasası. Ukrainian: Вухань канарський. Welsh: Ystlum hirglust yr Ynysoedd Dedwydd.

CONSERVATION STATUS:
Global - VU (Baillie and Groombridge, 1996); DD ver 3.1 (2001) (IUCN, 2004; Juste *et al.*, 2004a).

MAJOR THREATS:
Sagot and Chaverri (2015: 1670) mention roost loss or disturbance, and habitat degradation or loss as major threats for this species.

GENERAL DISTRIBUTION:
(Tenerife, La Palma, El Hiero) Canary Isls (Spain) (Benda *et al.*, 2004c: 28).

DETAILED MORPHOLOGY:
Baculum - See Ibañez and Fernández (1985b), Benda *et al.* (2004c).

MOLECULAR BIOLOGY:
DNA - See Pestano *et al.* (2003a), Benda *et al.* (2004c), Juste *et al.* (2004a), Spitzenberger *et al.* (2006), Mayer *et al.* (2007).
Karyotype - Unknown.
Protein / allozyme - Unknown.

PARASITES:
Estrada-Peña and Sanchez (1988: 309) described the mite *Steatonyssus (Steatonyssus) teidae* from a *P. teneriffae* specimen from La Caldera, Tenerife, Canary Islands.

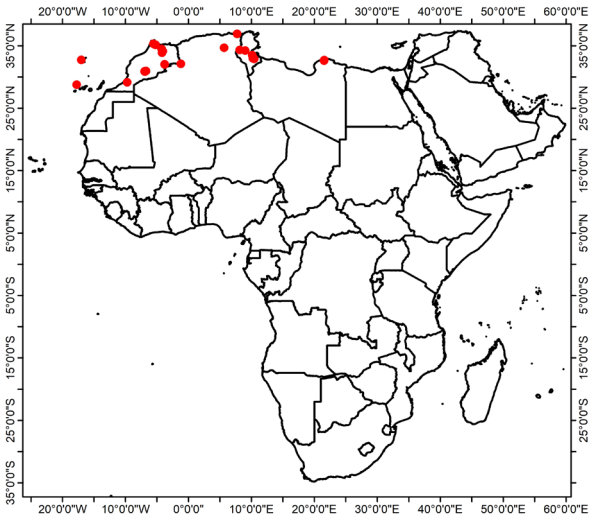

Figure 362. Distribution of *Plecotus teneriffae*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Algeria, Canary Islands (Spain), Libya, Madeira (Portugal), Malta, Morocco, Tunisia.

Genus ***Scotoecus*** Thomas, 1901

*1901. *Scotœcus* Thomas, Ann. Mag. nat. Hist., ser. 7, 7 (39): 263. Publication date: 1 March 1901 [Goto Description]. - Comments: Type species: *Scotophilus albofuscus* Thomas, 1890. - Etymology: From the Greek "*σκόοτος*", meaning darkness and "*όικέω*", meaning to dwell (see Palmer, 1904: 627).
1917. *Scotæcus:* Thomas, Ann. Mag. nat. Hist., ser. 8, 19 (111): 280. (Lapsus)
? *Scotoecus:* (Current Spelling)

TAXONOMY:
Scotoecus has been treated as a subgenus of *Nycticeius* (Ellerman *et al.*, 1953; Hayman and Hill, 1971), but more often as a full genus (Allen, 1939a; Rosevear, 1965; Kock, 1969a; Hill, 1974b; Koopman, 1975, 1978; Corbet and Hill, 1980; Swanepoel *et al.*, 1980; Honacki *et al.*, 1982). Of the two (Honacki *et al.*, 1982) or three (Corbet and Hill, 1980) recognized African species only *albofuscus* occurs in Southern Africa, having been recorded from a single locality in Mozambique.

Bronner *et al.* (2003) report the light-winged lesser house bat (*Scotoecus albofuscus*) in South Africa. This represents a significant extension in the known ranges of both species and testifies to the need for more intensive field surveys targeting poorly known taxa. Cotterill (2001d) also recorded *Scotoecus albigula* and *S. hindei* from Zinave, Mozambique, based on the re-identification of two museum specimens originally assigned to *Scotophilus viridis*. Compared with the light-winged *albofuscus*, species identification of the dark-winged taxa of *Scotoecus* (*albigula, hindei, hirundo, falabae*) is more complicated. Indeed, Koopman (1993a) included all these taxa in *S. hirundo*. A study of cranial variation involving a small sample of Malawian specimens (Taylor and van der Merwe (1998) revealed that *hindei, hirundo* and *albigula* are distinguishable on morphometric grounds, with *albigula* and *hindei* apparently having larger canines and cheekteeth (as well as larger skulls) than *hirundo*, while *albigula* and *hindei* differ from each other in skull proportions. However, we provisionally retain these within *S. hirundo*, pending a broader study of the dark-winged forms including a larger sample of specimens from across the range.

Known species of the genus *Scotoecus*: ***albigula*** Thomas, 1909; ***albofuscus*** (Thomas, 1890); ***hindei*** Thomas, 1901; ***hirundo*** (de Winton, 1899); ***†olduvensis*** Gunnell, Butler, Greenwood and Simmons, 2015; *pallidus* (Dobson, 1876) – Pakistan, northern India (Simmons, 2005: 465).

COMMON NAMES:
Czech: vlaštovčí netopýři. English: Lesser House Bats, House Bats. French: Scotoèques, Chauves-souris des maisons. German: Kleine Hausfledermäuse. Italian: Scotoèchi.

GENERAL DISTRIBUTION:
Monadjem *et al.*, 2010d could not distinguish between *S. hindei* and *S. albigula* therefore they were combined for the distribution being recorded from Angola; Congo (Democratic Republic of the); Malawi; Mozambique; Zambia.

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Patterson and Webala (2012: 43) indicate that male *Scotoecus* can easily be distinguished from any other Vespertlionid by th large size of its penis.

VIRUSES:
Coronaviridae
None of the 24 *Scotoecus* specimens tested by Tao *et al.* (2017: Suppl.) in Kenya were positive for CoV.

Alphacoronavirus
Tong *et al.* (2009) identified coronavirus RNA from the fecal material of *Scotoecus* spp.

†***Scotoecus olduvensis*** Gunnell, Butler, Greenwood and Simmons, 2015

*2015. *Scotoecus olduvensis* Gunnell, Butler, Greenwood and Simmons, Am. Mus. Novit., 3846: 1, 10, figs 6B, 7. Publication date: 16 December 2015. Type locality: Tanzania: Arusha province: Olduvai Gorge: Bed I, FLK NI, Layer 3. [Goto Description]. - Etymology: Named for Olduvai Gorge, Tanzania (Gunnell *et al.*, 2015a: 10).

SIMILAR SPECIES:
The teeth of *S. olduvensis* are on average 12 % larger than those of its congeners (Gunnell *et al.*, 2015a: 10)..

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Timeframe: Pleistocene.

Scotoecus albigula Thomas, 1909

*1909. *Scotœcus albigula* Thomas, Ann. Mag. nat. Hist., ser. 8, 4 (24): 544. Publication date: 1 December 1909. Type locality: Kenya: Mount Elgon: Kirui [04 43 S 39 13 E, 6 000 ft] [Goto Description]. Holotype: BMNH ad ♂. Collected by: Robin Kemp; collection date: 5 September 1909; original number: 200. Formerly Rudd Collection. - Comments: Type locality coordinates mentioned as 00 50 N 34 40 E by Thorn *et al.* (2009: 58). - Etymology:

From the feminine Latin adjective *àlba*, meaning "white" and the feminine Latin substantive *gùla*, meaning "throat", referring to the colour of the throat fur (see Lanza *et al.*, 2015: 460).

2010. *Scotoecus hindei/albigula:* Monadjem, Taylor, Cotterill and Schoeman, Bats of Southern and Central Africa. A biogeographic and taxonomic synthesis. Wits University Press, Johannesburg, 510.

? *Nycticeius (Scotoecus) hirundo albigula:* (Name Combination)

? *Scotoecus albigula:* (Current Combination, Current Spelling)

? *Scotoecus hindei albigula:* (Name Combination)

? *Scotoecus hirundo albigula:* (Name Combination)

TAXONOMY:
Considered a subspecies of *hindei* by Hill (1974b: 182), and Thorn and Kerbis Peterhans (2009: 58). Included in *hirundo* by Koopman (1993a: 226), but considered a valid species by Ansell and Dowsett (1988: 44), Simmons (2005).

COMMON NAMES:
Czech: netopýr bělohrdlý. English: White-throated Lesser House Bat, White-bellied Lesser House Bat. French: Scotoèque à gorge blanche. German: Weisskehl-Hausfledermaus. Italian: Scotoèco golabiànca.

CONSERVATION STATUS:
Global - *Scotoecus albigula* was included in *Scotoecus hirundo* by Jacobs *et al.* (2008af) in IUCN (2009) for the global assessment. Although this species is known mainly from isolated records from a large area, it is listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Jacobs *et al.*, 2008af; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) [assessed as part of *Scotoecus hirundo*] (Jacobs *et al.*, 2008af; IUCN, 2009). 2004 - DD ver 3.1 (2001) (Jacobs and Cotterill, 2004c; IUCN, 2004).

MAJOR THREATS:
While the threats to this species are not well known, it is presumed not to have any major threats in view of the species wide distribution in habitats that are not rapidly declining throughout much of its recorded range (Jacobs *et al.*, 2008af; IUCN, 2009).

CONSERVATION ACTIONS:
Jacobs *et al.* (2008af) [in IUCN (2009)] report that further studies are needed into the natural history and possible threats to this poorly known species.

GENERAL DISTRIBUTION:
Native: Angola; Kenya; Malawi; Mozambique (Monadjem *et al.*, 2010c: 384 as *S. hindei/albigula*); Somalia; Uganda; Zambia.

DETAILED MORPHOLOGY:
Baculum - Hill and Harrison (1987).

ECHOLOCATION:
See Taylor *et al.* (2005).

POPULATION:
Structure and Density - It is very rarely recorded, and there is little information is available on the population abundance or size of this species (Jacobs *et al.*, 2008af; IUCN, 2009).
Trend - 2008 - Unknown (Jacobs *et al.*, 2008af; IUCN, 2009).

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Angola, Kenya, Malawi, Mozambique, Somalia, Tanzania, Uganda, Zambia.

Scotoecus albofuscus (Thomas, 1890)

*1890. *Scotophilus albofuscus* Thomas, Ann. Mus. civ. Stor. nat. Genova, ser. 2a, (O.S. 29) 9: 84. Publication date: 3 February 1890. Type locality: The Gambia: Bathurst [=Banjul] [13

28 N 16 39 W] [Goto Description]. Holotype: BMNH 1889.12.12.2: ad ♂, alcoholic (skull not removed). Collected by: Dr. Percy Rendall.

1917. *Scotoecus woodi* Thomas, Ann. Mag. nat. Hist., ser. 8, 19 (111): 280. Publication date: 1 March 1917. Type locality: Malawi: Shiré valley: Chiromo [16 32 S 35 09 E, 200 ft] [Goto Description]. Holotype: BMNH 1917.2.1.1: ad ♂. Collected by: Rodney Carrington Wood Esq. Collection date: 2 October 1916; original number: 173. Presented/Donated by: Rodney Carrington Wood Esq.

? *Scotoecus albofuscus albofuscus:* (Name Combination)

? *Scotoecus albofuscus woodi:* (Name Combination)

? *Scotoecus albofuscus:* (Name Combination, Current Combination)

TAXONOMY:
See Simmons (2005).

COMMON NAMES:
Afrikaans: Thomas se vlermuis, Thomas-vlermuis. Chinese: 淡翼宽吻蝠. Czech: netopýr gambiánský. English: Thomas' House Bat, Light-winged Lesser House Bat, Thomas's Lesser House Bat. French: Scotoèque à ailes pâles, Scotophile du crépuscule, Chauve-souris de Thomas. German: Weißflügel-Hausfledermaus. Portuguese: Morcego pequeno das casas.

CONSERVATION STATUS:
Global - Listed as Data Deficient (DD ver 3.1 (2001)) in view of the absence of sufficient information on its extent of occurrence, natural history, threats and conservation status (Jacobs, 2008l; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) (Jacobs, 2008l; IUCN, 2009). 2004 - DD ver 3.1 (2001) (Jacobs, 2004h; IUCN, 2004). 1996 - LR/nt (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - NT D2 ver 3.1 (2001) (Richards *et al.*, 2016f). 2004 - VU D2 ver 3.1 (2001) (Friedmann and Daly, 2004).

MAJOR THREATS:
The threats to this species are not known (Jacobs, 2008l; IUCN, 2009).

CONSERVATION ACTIONS:
Jacobs (2008l) [in IUCN (2009)] reports that there appear to be no direct conservation measures in place. It has been recorded from Zinave National Park on the Save River in Mozambique, and presumably is present in additional protected areas. Further studies are needed into the distribution, natural history and possible threats to this widespread but seemingly very poorly known species.

GENERAL DISTRIBUTION:
Scotoecus albofuscus has been widely, but patchily recorded over much of West Africa and East Africa, with some records from Central Africa. It ranges from The Gambia and Senegal in the west, through West Africa to eastern Nigeria, it is then distributed from northern Uganda and southern Kenya, through Tanzania, southeastern Democratic Republic of the Congo, southern Malawi, Mozambique and southeastern South Africa. The range is poorly known and the species might be more widespread.

Native: Benin (Capo-Chichi *et al.*, 2004: 163); Burkina Faso (Kangoyé *et al.*, 2012: 6026; 2015a: 626); Congo (The Democratic Republic of the) (Hayman *et al.*, 1966; Monadjem *et al.*, 2010d: 573); Côte d'Ivoire; Gambia; Ghana; Kenya; Malawi (Happold and Happold, 1997b: 819; Cotterill, 2001d; Monadjem *et al.*, 2010d: 573); Mozambique (Cotterill, 2001d; Monadjem *et al.*, 2010d: 573); Nigeria; Senegal; Sierra Leone; South Africa (Kearney and Taylor, 1997: 53; Monadjem *et al.*, 2010d: 573); Sudan; Tanzania; Uganda (Kityo and Kerbis, 1996: 62); Zambia (Monadjem *et al.*, 2010d: 573).

DETAILED MORPHOLOGY:
Baculum - Hill and Harrison (1987).

POPULATION:
Structure and Density - Little information is available on the population abundance or size of this species (Jacobs, 2008l; IUCN, 2009).
Trend - 2008 - Unknown (Jacobs, 2008l; IUCN, 2009).

? *Scotoecus hindei:* (Current Combination, Current Spelling)

? *Scotoecus hirundo hindei:* (Name Combination)

TAXONOMY:

Figure 365. *Scotoecus hindei* (ECJS-36/2008), from Lafupa camp, Zambia.

Included in *hirundo* by Kock (1969a: 192), Koopman (1993a: 226), but considered a valid species by Ansell and Dowsett (1988: 44), Simmons (2005).

COMMON NAMES:
Czech: netopýr Hindeův. English: Hinde's Lesser House Bat. French: Scotoèque de Hinde. German: Hindes Hausfledermaus. Italian: Scotoèco di Hìnde.

CONSERVATION STATUS:
Global - *Scotoecus hindei* was included in *Scotoecus hirundo* by Jacobs *et al.* (2008af) in IUCN (2009) for assessment. Although this species is known mainly from isolated records from a large area, it is listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Jacobs *et al.*, 2008af; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) [assessed as part of *Scotoecus hirundo*] (Jacobs *et al.*, 2008af; IUCN, 2009). 2004 - DD ver 3.1 (2001) (Jacobs *et al.*, 2004q; IUCN, 2004).

MAJOR THREATS:
While the threats to this species are not well known, it is presumed not to have any major threats in view of the species wide distribution in habitats that are not rapidly declining throughout much of its recorded range (Jacobs *et al.*, 2008af; IUCN, 2009).

CONSERVATION ACTIONS:
Jacobs *et al.* (2008af) [in IUCN (2009)] report that further studies are needed into the natural history and possible threats to this poorly known species.

GENERAL DISTRIBUTION:
Native: Cameroon; Congo, Democratic Republic of the; Ethiopia (Lavrenchenko *et al.*, 2004b: 141); Kenya; Malawi; Mozambique (Monadjem *et al.*, 2010c: 384 as *S. hindei/albigula*); Nigeria; Somalia; Sudan; Tanzania; Zambia.

DETAILED MORPHOLOGY:
Baculum - Hill and Harrison (1987).

ECHOLOCATION:
See Taylor *et al.* (2005).

MOLECULAR BIOLOGY:
DNA - Unknown.
Karyotype - Nagorsen *et al.* (1976) reported 2*n* = 30, FN = 50, BA = 22, a subtelocentric X chromosome and a submetacentric Y chromosome.
Protein / allozyme - Unknown.

POPULATION:
Structure and Density - It is very rarely recorded, and there is little information available on the population abundance or size of this species (Jacobs *et al.*, 2008af; IUCN, 2009).
Trend - 2008 - Unknown (Jacobs *et al.*, 2008af; IUCN, 2009).

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Cameroon, Congo (Democratic Republic of the), Ethiopia, Kenya, Malawi, Mozambique, Nigeria, South Sudan, Tanzania, Uganda, Zambia.

Scotoecus hirundo (de Winton, 1899)

*1899. *Scotophilus hirundo* de Winton, Ann. Mag. nat. Hist., ser. 7, 4 (23): 355. Publication date: 1 November 1899. Type locality: Ghana: Gambaga [10 32 N 00 26 W] [Goto Description]. Holotype: BMNH 1899.6.15.8:. - Etymology: From the feminine Latin noun, in apposition, *hirùndo*, meaning "swallow", referring to the species' appearance (see Lanza *et al.*, 2015: 471).

1923. *Scotoecus artinii* de Beaux, Atti Soc. ital. Sci. nat., 62: 98. Publication date: July 1923. Type locality: Kenya: Northern Guaso Nyiro: Archer's Post [00 39 N 37 41 E, 2 000 ft] [Goto Description]. Holotype: [Unknown] ♀, skin and skull. Collected by: L. Franchetti and L. Tonker; collection date: 26 December 1919; original number: N1443. 2 paratypes: see De Beaux (1923: 98). - Etymology: In honour of prof. E. Artini, director of the Museo Civico di Storia Naturale di Milano (see De Beaux, 1923: 98).

2013. *Scotoecus cf. hirundo:* Koubínová *et al.*, Front. Zool., 10: 1-48. - Comments: Koubínová *et al.* (2013: 7) showed that the karyotype from Senegal (2n=30, FN=50, aFN=46) had a reduced number of arms than reported previously from the Ivory Coast (2n=30, FN=54, Fna=50 Volleth *et al.* (2006)), and suggested that this may represent a distinct species. Further investigations are needed to compare other related species of *Scotecus*, as both the cytogenetics only compared the specimens from Sengal with that of Ivory Coast. (Name Combination)

? *Scotoecus hirundo artinii:* (Name Combination)

? *Scotoecus hirundo:* (Name Combination, Current Combination)

TAXONOMY:
Koopman (1993a: 226) included *hindei*; see Hayman and Hill (1971: 36) and Robbins (1980: 84); but see also Hill (1974b).

COMMON NAMES:
Chinese: 暗翼宽吻蝠. Czech: netopýr vlaštovčí. English: Dark-winged Lesser House Bat, Swallow Lesser House Bat. French: Scotoèque hirundine, Scotophile à ailes noires. German: Schwarzflügel-Hausfledermaus. Italian: Scotoèco róndine.

CONSERVATION STATUS:
Global - Although this species is known mainly from isolated records from a large area, it is listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Jacobs *et al.*, 2008af; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) [includes *S. albigula* and *S. hindei*] (Jacobs *et al.*, 2008af; IUCN, 2009). 2004 - DD ver 3.1 (2001) (Jacobs, 2004g; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
While the threats to this species are not well known, it is presumed not to have any major threats in view of the species wide distribution in habitats that are not rapidly declining throughout much of its recorded range (Jacobs *et al.*, 2008af; IUCN, 2009).

CONSERVATION ACTIONS:
Jacobs *et al.* (2008af) [in IUCN (2009)] report that further studies are needed into the natural history and possible threats to this poorly known species.

GENERAL DISTRIBUTION:
For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 555,102 km^2.

Native: Benin (Capo-Chichi *et al.*, 2004: 163); Burkina Faso (Kangoyé *et al.*, 2012: 6026; 2015a: 626); Cameroon; Côte d'Ivoire (Volleth *et al.*, 2006); Ethiopia; Ghana; Guinea-Bissau (: 59); Senegal; Tanzania; Uganda (Kityo and Kerbis, 1996: 63).

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:
Scott *et al.* (2012: 2943) report that the mandibular symphysis is completely fused in this species.

DETAILED MORPHOLOGY:
Baculum - Hill and Harrison (1987).

ECHOLOCATION:
Two FM/QCF calls from Maroua (Cameroon) were reported by Manga Mongombe (2012: 79) having the following parameters: F_{max}: 58.4 (57.2 - 59.6) kHz, F_{min}: 54.5 (54.2 - 54.8) kHz, F_{mean}: 56.6 (55.9 - 57.2) kHz, F_{knee}: 58.2 (57.2 - 59.2) kHZ, F_{char}: 54.7 (54.5 - 54.8) kHz, and duration: 0.87 (0.82 - 0.91) msec.

MOLECULAR BIOLOGY:
DNA - See Hoofer and Van Den Bussche (2003) from Tanzania.

Karyotype - Volleth *et al.* (2006) reported 2*n* = 30, FN = 50, BA = 22, and a subtelocentric X chromosome for a female from Ivory Coast.

Koubínová *et al.* (2013: 3) report the following karyotype for 1 ♂ from Senegal: 2*n* = 30, Fna = 46, FN = 50, X = metacentric, and Y = dot-like (probably acrocentric). They also found that the Senegalese specimen differed for 1.6 % in its *rag2* gene when compared with a specimen from Tanzania, which is more than in other non-cryptic species. As such they assign their specimen to *S.* cf. *hirundo*.

Protein / allozyme - Unknown.

HABITAT:
In southern Africa, this species inhabits Savanna habitats (84 %; Cooper-Bohannon *et al.*, 2016: Table S2).

POPULATION:
Structure and Density - It is very rarely recorded, and there is little information is available on the population abundance or size of this species (Jacobs *et al.*, 2008af; IUCN, 2009).
Trend - 2008 - Unknown (Jacobs *et al.*, 2008af; IUCN, 2009).

Glossary

The following abbreviations have been used:

a.	adjective
Art.,	Arts. Article, Articles of the Code
e.g.	for example (Latin: *exempli gratia*)
DD	Data Deficient
EN	Endangered
EX	Extinct
EW	Extinct in the wild
CR	Critically Endangered
ICZN	International Commission of Zoological Nomencleature
i.e.	that is (Latin: *id est*)
LC	Least Concern
n.	noun
neut.	Neuter
NE	Not Evaluated
NT	Near Threatened
pl.	plural
q.v.	
RE	Regionally Extinct
sing.	Singular
v.	verb
VU	Vulnerable

The glossary follows the definitions from:
International Commission on Zoological Nomenclature. (1999). *International Code of Zoological Nomenclature.* 4th edition. The International Trust for Zoological Nomenclature, London.
IUCN. (2001). *IUCN Red List Categories and Criteria: Version 3.1.* IUCN Species Survival Commission. IUCN, Gland, Switzerland and Cambridge, UK. ii + 30 pp.
IUCN. (2003). *Guidelines for Application of IUCN Red List Criteria at Regional Levels: Version 3.0.* IUCN Species Survival Commission. IUCN, Gland, Switzerland and Cambridge, UK. ii + 26 pp.

lapsus calami (*sing.* and *pl.*), *n.* A Latin term meaning "slip (or slips) of the pen", i.e. an error (or errors) made by an author in writing a text, such as a misspelling of a name; contrasted with copyist's or printer's errors [Art. 32.5.1].

***nomen dubium* (*pl. nomina dubia*)** *n.* A Latin term meaning "a name of unknown or doubtful application."

***nomen novum* (*pl. nomina nova*)** *n.* A Latin term equivalent to new replacement name.

***nomen nudum* (*pl. nomina nuda*)** *n.* A Latin term referring to a name that, if published before 1931, fails to conform to Article 12; or, if published after 1930, fails to conform to Article 13. A *nomen nudum* is not an available name, and therefore the same name may be made available later for the same or a different concept; in such a case it would take authorship and date [Arts. 50, 21] from that act of establishment, not from any earlier publication as a *nomen nudum*.

***nomen oblitum* (*pl. nomina oblita*)** *n.* A Latin term (meaning forgotten name) applied after 1 January 2000 to a name, unused since 1899, which as a result of an action taken under Article 23.9.2 does not take precedence over a younger synonym or homonym in prevailing usage; the younger name which takes precedence over the *nomen oblitum* may be called a *nomen protectum (q.v.)*. The term *nomen oblitum* was also applied to a disused senior synonym rejected between 6 November 1961 and 1 January 1973 under Article 23b of the Code editions then in force (see Article 23.12.2). *Nomina oblita* remain available names; see Articles 23.9 and 23.12 for conditions controlling their use as valid names.

nomen protectum *n.* A Latin term (meaning protected name) applied to a name which has been given precedence over its unused senior synonym or senior homonym relegated to the status of *nomen oblitum* (*q.v.*, and see Article 23.9.2).

***Sensu lato* (*s. lat.* or *s.l.*)** A Latin term meaning "in the wide sense". Contrast with *sensu stricto (s. str.)*.

***Sensu stricto* (*s. str.* or *s.s.*)** A Latin term meaning "in the strict sense". Often used in conjunction with a name when referring to the nominal taxon in the narrow sense of its subordinate nominotypical taxon (contrast with *sensu lato (s. lat.)*.

sensu A Latin term meaning "in the sense of". Often used to refer to the usage of a name by a (cited) author in a sense different from that of the original author or some other previous author. See also auctorum.

***species inquirenda* (*pl. species inquirendae*)** *n.* A Latin term meaning a species of doubtful identity needing further investigation.

allotype *n.* See under type.

Articles *n.* The mandatory provisions of the ICZN

available name A scientific name applied to an animal taxon that is not excluded under Article 1.3 and that conforms to the provisions of Articles 10 to 20.

Code *n.* (1) An abbreviation of the title International Code of Zoological Nomenclature

conserved name A name otherwise unavailable or invalid that the Commission, by the use of its plenary power, has enabled to be used as a valid name by removal of the known obstacles to such use (see conserve).

cotype *n.* See under type.

Critically Endangered (CR) A taxon is Critically Endangered when the best available evidence indicates that it meets any of the criteria A to E for Critically Endangered (see Section V), and it is therefore considered to be facing an extremely high risk in the wild.

Data Deficient (DD) A taxon is Data Deficient when there is inadequate information to make a direct, or indirect, assessment of its risk of extinction based on its distribution and/or population status. A taxon in this category may be well studied, and its biology well known, but appropriate data on abundance and/or distribution are lacking. Data Deficient is therefore not a category of threat. Listing of taxa in this category indicates that more information is required and acknowledges the possibility that future research will show that threatened classification is appropriate. It is important to make positive use of whatever data are available. In many cases great care should be exercised in choosing between DD and a threatened status. If the range of a taxon is suspected to be relatively circumscribed, and a considerable period of time has elapsed since the last record of the taxon, threatened status may well be justified.

Date of publication *n.* Of a work (and of a contained name and nomenclatural act): the date on which copies of the work become available by purchase or free distribution. If the actual date is not known, the date to be adopted is regulated by the provisions of Article 21.2-7.

description *n.* A statement in words of taxonomic characters of a specimen or a taxon [Arts. 12,13].

original description The description of a nominal taxon when it is established.

Endangered (EN) A taxon is Endangered when the best available evidence indicates that it meets any of the criteria A to E for Endangered (see Section V), and it is therefore considered to be facing a very high risk of extinction in the wild.

extant *a.* (1) Of a taxon: having living representatives. (2) Of specimen: still in existence.

Extinct (EX) *a.* Of a taxon: having no living representatives. IUCN - A taxon is Extinct when there is no reasonable doubt that the last individual has died. A taxon is presumed Extinct when exhaustive surveys in known and/or expected habitat, at appropriate times (diurnal, seasonal, annual) throughout its historic range have failed to record an individual. Surveys should be over a time frame appropriate to the taxon's life cycle and life form (IUCN 2001).

Extinct in the Wild (EW) *a.* A taxon is extinct in the Wild when it is known only to survive in captivity or as a naturalized population (or populations) well outside the past range. A taxon is presumed Extinct in the Wild when exhaustive surveys in known and/or expected habitat, at appropriate times (diurnal, seasonal, annual), throughout its historic range have failed to record an individual. Surveys should be over a time frame appropriate to a taxons' life cycle and life form.

homonym *n.* (1) In the family group: each of two or more available names having the same spelling, or differing only in suffix, and denoting different nominal taxa. (2) In the genus group: each of two or more names having the same spelling, and denoting different nominal taxa. (3) In the species group: each of two or more available specific or subspecific names having the same spelling, or spellings, or spellings deemed under Article 58 to be the same, and established for different nominal taxa, and either originally (primary homonymy) or subsequently (secondary homonymy) combined with the same generic name [Art. 53.3].

homonymy *n.* (1) The relationship between homonyms. (2) The state of being homonymous.

junior homonym Of two homonyms: the latter established, or in the case of simultaneous establishment to one not given precedence under Article 24.

Least Concern (LC) A taxon is Least Concern when it has been evaluated against the criteria and does not qualify for Critically Endangered, Endangered, Vulnerable or Near Threatened. Widespread and abundant taxa are included in this category.

monotypy *n.* The situation arising (1) when an author establishes a nominal genus or subgenus for what he or she considers to be a single taxonomic species and denotes that species by an available name (the nominal species so named is the type-species by monotypy) [Art. 68.3]; or (2) when an author bases a nominal species-group taxon on a single specimen but does not explicitly designates it as holotype (holotype by monotypy; see Article 73.1.2).

multiple original spelling See under spelling.

Near Threatened (NT) A taxon is Near Threatened when it has been evaluated against the criteria but does not qualify for Critically Endangered, Endangered or Vulnerable now, but is close to qualifying for or is likely to qualify for a threatened category in the near future.

new replacement name (*nomen novum*) A name established expressly to replace an already established name. A nominal taxon denoted by a new replacement name (*nomen novum*) has the same name-bearing type as the nominal taxon denoted by the replaced name [Arts. 67.8, 72.7]. See emendation, substitute name.

Not Evaluated (NE) A taxon is Not Evaluated when it is has not yet been evaluated against the criteria.

primary homonym Each of two or more identical specific or subspecific names established for different nominal taxa and originally combined with the same generic name [Art. 57.2]. For variant spellings deemed to be identical see Article 58.

Regionally Extinct (RE) Category for a taxon when there is no reasonable doubt that the last individual potentially capable of reproduction within the region has died or has disappeared from the wild in the region, or when, if it is a former visiting taxon, the last individual has died or disappeared in the wild from the region. The setting of any time limit for listing under RE is left to the discretion of the regional Red List authority, but should not normally pre-date 1500 AD.

rejected name (1) A name which, under the provisions of the Code, cannot be used as a valid name and which is set aside in favour of another name. (2) A name which, as a matter of taxonomic judgment, is either treated as a junior subjective synonym (*q.v.*) of a name used as valid or is believed not to be applicable to the taxon under consideration.

senior homonym Of two homonyms: the first established, or in the case of simultaneous establishment the one given precedence under Article 24.

species (*sing.* and *pl.*) *n.* (1) The rank next below the genus group; the basic rank of zoological classification. (2) A taxon at the rank of species.

species group *n.* In the zoological classification, the lowest-ranking group of taxa the names of which are regulated by the Code. The species group includes all taxa at the ranks of species and subspecies [Art. 45.1].

specimen *n.* An example of an animal, or a fossil or work of an animal, or of a part of these. See Article 72.5 for the kinds of specimen eligible to be name-bearing types of nominal species-group nominal taxa.

spelling

subsequent monotypy The situation arising when a nominal genus or subgenus was established before 1931 without any included nominal species, and when only a single taxonomic species denoted by an available name was first subsequently referred to it [Art. 69.3].

suppression, *n.* (suppress, *v.*) A ruling by the Commission, using its plenary power, (1) that a work is to be deemed, for nomenclature purposes, as unpublished, or that names and acts in it are not available; or (2) that an available name is never to be used as valid because (a) it is available only for the purpose of homonymy ("partial suppression") or (b) it is not available for the purposes of priority and homonymy ("total suppression"; but a totally suppressed species-group name may still denote the type species of a nominal genus or subgenus [Art. 81.2.1]); or (3) that an available name is only to be used as valid under stated conditions (e.g. when not considered a synonym of a particular later name) ("conditional suppression").

synonym *n.* Each of two or more names of the same rank used to denote the same taxonomic taxon.

junior synonym Of two synonyms: the later established, or in the case of simultaneous establishment that not given precedence under Article 24. See also Article 23.9.

objective synonym Each of two or more synonyms that denote nominal taxa with the same name-bearing type, or (in the cases of family-group and genus-group taxa) that denote nominal taxa with name-bearing types whose own names are themselves objectively synonymous.

senior synonym Of two synonyms: the earlier established, or in the case of simultaneous establishment that given precedence under Article 24. See also Article 23.9.

subjective synonym Each of two or more names whose synonymy is only a matter of individual opinion. i.e. it is not objective. See also Article 61.3.1.

synonymy *n.* (1) The relationship between synonyms. (2) A list of synonyms.

syntype *n.* See under type.

taxon, (*pl.* taxa) *n.* A taxonomic unit, whether named or not: i.e. a population, or group of populations of organisms which are usually inferred to be phylogenetically related and which have characters in common which differentiate (*q.v.*) the unit (*e.g.* a geographic population, a genus, a family, an order) from other such units. A taxon encompasses all included taxa of lower rank (*q.v.*) and individual organisms. The Code fully regulates the names of taxa only between and including the ranks of superfamily and subspecies. (2) A species or infraspecific entity whose extinction risk is being assessed.

taxonomic information

taxonomy, *n.* (taxonomic, *a.*) The theory and practice of classifying organisms. See taxonomic information, taxonomic taxon.

topotype See under type.

type *n.* A term used alone, or forming part of a compound term, to denote a particular kind of specimen or taxon.

allotype A term, not regulated by the Code, for a designated specimen of opposite sex to the holotype [Recommendation 72A].

cotype A term not recognized by the Code, formerly used for either syntype or paratype, but that should not now be used in zoological nomenclature [Recommendation 73E].

genotype A term not recognized by the Code, formerly used for type species, but that should not now be used in zoological nomenclature [Recommendation 67A].

holotype The single specimen designated or otherwise fixed as the name-bearing type of a nominal species or subspecies when the nominal taxon is established.

lectotype A syntype designated as the single name-bearing type specimen subsequent to the establishment of a nominal species or subspecies [Art. 74].

name-bearing type The type genus, type species, holotype, lectotype, series of syntypes (which together constitute the name-bearing type) or neotype that provides the objective standard of reference whereby the application of the name of a nominal taxon can be determined.

neotype The single specimen designated as the name-bearing of a nominal species or subspecies when there is a need to define the nominal taxon objectively and no name-bearing type is believed to be extant. If stability and universality are threatened, because an existing name-bearing type is either taxonomically inadequate or not in accord with the prevailing usage of a name, the Commission may use its plenary power to set aside that type and designate a neotype.

paralectotype Each specimen of a former syntype series remaining after the designation of a lectotype [Art. 721.3, Recommendation 74F].

paratype Each specimen of a type series other than the holotype [Recommendation 73D].

syntype Each specimen of a type series (*q.v.*) from which neither a holotype nor lectotype has been designated [Arts. 72.1.2, 73.2, 74]. The syntypes collectively constitute the name-bearing type.

topotype, *n.* (topotypic, *a.*) A term, not regulated by the Code, for a specimen originating from the type locality of the species or subspecies to which it is thought to belong, whether or not the specimen is part of the type series.

type genus *n.* The nominal genus that is the name-bearing type of a nominal family-group taxon.

type host *n.* The host species with which the name-bearing type of a nominal species or subspecies was associated [Recommendation 76A.1].

type locality *n.* The geographical place of capture, collection, or observation of the name-bearing type of a nominal species or subspecies [Art. 76.1, Recommendation 76A].

type series *n.* The series of specimens, defined in Articles 72.4 and 73.2, on which the original author bases a new nominal species-group taxon. In the absence of a holotype designation, any such specimen is eligible for subsequent designation as the name-bearing type (lectotype); pending lectotype designation, all the specimens of the type series are syntypes and collectively they constitute the name-bearing type. Excluded from the type series are any specimens that the original author expressly excludes or refers to as distinct variants, or doubtfully includes in the taxon.

type species *n.* The nominal species that is the name-bearing type of a nominal genus or subgenus.

type specimen A term used in previous editions of the Code for a holotype, lectotype or neotype, or for any syntype; also used generally for any specimen of the type series (*q.v.*).

Vagrant A taxon that is currently found only occasionally within the boundaries of a region.

Visitor (also, visiting taxon) A taxon that does not reproduce within a region but regularly occurs within its boundaries either now or during some period of the last century. Regions have several options on how to decide the boundaries between visitors and vagrants, e.g., using a preset percentage of the global population found in the region or predictability of occurrence.

Vulnerable (VU) A taxon is Vulnerable when the best available evidence indicates that it meets any of the criteria A to E for Vulnerable (see Section V), and it is therefore considered to be facing a high risk of extinction in the wild.
