Note:
The designation of geographical entities in this report, and the presentation of the material, do not imply the expression of any opinion whatsoever on the part of the African Chiroptera Project, managing editors, or other collaborating individuals or organisations concerning the legal status of any country, territory, or area, or of its authorities, or concerning the delimitation of its frontiers or boundaries. Furthermore, the views expressed in this report do not necessarily reflect those of any of the collaborating organisations.

This is a print report from the data contained in the 2019 version of the African Chiroptera Database. The resulting views and outputs are based solely on the data contained within the tables in this database.

Funding Organizations:

The organizations shown below have contributed funds to support projects that assist with the production and refinement of the African Chiroptera Report 2019.

Table of Contents:

Introduction 1
Taxa profiles 11
ORDER CHIROPTERA Blumenbach, 1779 11
†Family AEGYPTONYCTERIDAE Simmons, Seiffert and Gunnell, 2016 22
†Genus ***Aegyptonycteris*** Simmons, Seiffert and Gunnell, 2016 22
†***Aegyptonycteris knightae*** Simmons, Seiffert and Gunnell, 2016 22
†Family NECROMANTIDAE Sigé, 2011 23
†Genus ***Necromantis*** Weithofer, 1887 23
†***Necromantis fragmentum*** (Ravel, 2016) 23
SUBORDER PTEROPODIFORMI Van Cakenberghe, Kearney and Seamark, 2007 24
INFRAORDER PTEROPODIFORMACEI Van Cakenberghe, Kearney and Seamark, 2007 25
Superfamily PTEROPODOIDEA Gray, 1821 25
Family PTEROPODIDAE Gray, 1821 25
Subfamily Eidolinae Almeida, Giannini and Simmons, 2016 29
Genus ***Eidolon*** Rafinesque, 1815 29
Eidolon dupreanum (Schegel, 1867) 30
Eidolon helvum (Kerr, 1792) 33
Eidolon helvum helvum (Kerr, 1792) 47
†Subfamily Propottininae Butler, 1984 48
†Genus ***Propotto*** Simpson, 1967 48
†***Propotto leakeyi*** Simpson, 1967 49
Subfamily Pteropodinae Gray, 1821 49
Genus ***Pteropus*** Brisson, 1762 50
Pteropus aldabrensis True, 1893 52
Pteropus livingstonii Gray, 1866 54
Pteropus niger (Kerr, 1792) 57
Pteropus rodricensis Dobson, 1878 60
Pteropus rufus E. Geoffroy St.-Hilaire, 1803 63
Pteropus seychellensis A. Milne-Edwards, 1877 68
Pteropus subniger (Kerr, 1792) 71
Pteropus voeltzkowi Matschie, 1909 73
Subfamily Rousettinae Andersen, 1912 74
Genus ***Casinycteris*** Thomas, 1910 75
Casinycteris argynnis Thomas, 1910 75
Casinycteris campomaanensis Hassanin, 2014 77
Casinycteris ophiodon (Pohle, 1943) 77
Genus ***Epomophorus*** Bennett, 1836 78
Epomophorus angolensis Gray, 1870 80
Epomophorus anselli Bergmans and Van Strien, 2004 81
Epomophorus crypturus Peters, 1852 82
Epomophorus dobsonii Bocage, 1889 84
Epomophorus gambianus (Ogilby, 1835) 86
Epomophorus gambianus gambianus (Ogilby, 1835) 89
Epomophorus gambianus pousarguesi Trouessart, 1904 91
Epomophorus grandis (Sanborn, 1950) 91
Epomophorus labiatus (Temminck, 1837) 92
Epomophorus minimus Claessen & De Vree, 1991 95
Epomophorus minor Dobson, 1880 97
Epomophorus wahlbergi (Sundevall, 1846) 98
Genus ***Epomops*** Gray, 1866 105
Epomops buettikoferi (Matschie, 1899) 106
Epomops franqueti (Tomes, 1860) 107
Genus ***Hypsignathus*** H. Allen, 1862 111
Hypsignathus monstrosus H. Allen, 1862 111
Genus ***Megaloglossus*** Pagenstecher, 1885 116
Megaloglossus azagnyi Nesi, Kadjo and Hassanin, 2012 116
Megaloglossus woermanni Pagenstecher, 1885 118
Genus ***Micropteropus*** Matschie, 1899 120
Micropteropus intermedius Hayman, 1963 120
Micropteropus pusillus (Peters, 1868) 121
Genus ***Myonycteris*** Matschie, 1899 124
Myonycteris angolensis (Bocage, 1898) 125
Myonycteris angolensis angolensis (Bocage, 1898) 128
Myonycteris angolensis goliath (Bergmans, 1997) 128
Myonycteris angolensis petraea (Bergmans, 1997) 129

Myonycteris angolensis ruwenzorii (Eisentraut, 1965) 130
Myonycteris angolensis smithii (Thomas, 1908) 130
Myonycteris brachycephala (Bocage, 1889) 131
Myonycteris leptodon K. Andersen, 1908 132
Myonycteris relicta Bergmans, 1980 133
Myonycteris torquata (Dobson, 1878) 134
Myonycteris torquata torquata (Dobson, 1878) 137
Myonycteris torquata wroughtoni K. Andersen, 1908 137
Genus ***Nanonycteris*** Matschie, 1899 138
Nanonycteris veldkampii (Jentink, 1888) 138
Genus ***Plerotes*** K. Andersen, 1910 140
Plerotes anchietae (Seabra, 1900) 140
Genus ***Rousettus*** Gray, 1821 142
Rousettus aegyptiacus (E. Geoffroy St.-Hilaire, 1810) 144
Rousettus madagascariensis G. Grandidier, 1929 163
Rousettus obliviosus Kock, 1978 167
Genus ***Scotonycteris*** Matschie, 1894 170
Scotonycteris bergmansi Hassanin, Khouider, Gembu, Goodman, Kadjo, Nesi, Pourrut, Nakouné, and Bonillo, 2015 171
Scotonycteris bergmansi bergmansi Hassanin, Khouider, Gembu, Goodman, Kadjo, Nesi, Pourrut, Nakouné, and Bonillo, 2015 171
Scotonycteris bergmansi congoensis Hassanin, Khouider, Gembu, Goodman, Kadjo, Nesi, Pourrut, Nakouné, and Bonillo, 2015 172
Scotonycteris occidentalis Hayman, 1947 172
Scotonycteris zenkeri Matschie, 1894 173
Genus ***Stenonycteris*** Gray, 1870 174
Stenonycteris lanosus (Thomas, 1906) 174
INFRAORDER RHINOLOPHIFORMACEI Van Cakenberghe, Kearney and Seamark, 2007 176
Superfamily RHINOLOPHOIDEA J. E. Gray, 1825 177
Family HIPPOSIDERIDAE Lydekker, 1891 177
Genus ***Asellia*** Gray, 1838 180
Asellia italosomalica de Beaux, 1931 180
Asellia patrizii de Beaux, 1931 180
Asellia tridens (E. Geoffroy St.-Hilaire, 1813) 181
Genus ***Doryrhina*** Peters, 1871 185
Doryrhina cyclops (Temminck, 1853) 185
Genus ***Hipposideros*** Gray, 1831 188
†***Hipposideros africanum*** Ravel, 2016 191
†***Hipposideros amenhotepos*** Gunnell, Winkler, Miller, Head, El-Barkooky, Gawad, Sanders, and Gingerich, 2015 191
†***Hipposideros kaumbului*** Wesselman, 1984 192
†***Hipposideros vetus*** (Lavocat, 1961) 192
Hipposideros abae J.A. Allen, 1917 192
Hipposideros beatus (K. Andersen, 1906) 194
Hipposideros caffer (Sundevall, 1846) 195
Hipposideros camerunensis Eisentraut, 1956 201
Hipposideros cf. centralis Andersen, 1906 203
Hipposideros curtus G.M. Allen, 1921 203
Hipposideros fuliginosus (Temminck, 1853) 204
Hipposideros jonesi Hayman, 1947 206
Hipposideros lamottei Brosset, 1985 207
Hipposideros marisae Aellen, 1954 208
Hipposideros megalotis (Heuglin, 1861) 209
Hipposideros ruber (Noack, 1893) 210
Hipposideros tephrus (Cabrera, 1906) 214
Genus ***Macronycteris*** Gray, 1866 216
†***Macronycteris besaoka*** (Samonds, 2007) 216
Macronycteris commersoni (E. Geoffroy St.-Hilaire, 1813) 217
Macronycteris cryptovalorona (Goodman, Schoeman, Rakotoarivelo and Willows-Munro, 2016) 220
Macronycteris gigas (Wagner, 1845) 221
Macronycteris vittatus (Peters, 1852) 224
†Genus ***Palaeophyllophora*** Revilliod, 1917 227
†***Palaeophyllophora tunisiensis*** (Ravel, 2016) 227
Family MEGADERMATIDAE H. Allen, 1864 228
Genus ***Cardioderma*** Peters, 1873 228
†***Cardioderma leakeyi*** Gunnell, Butler, Greenwood and Simmons, 2015 229

Cardioderma cor (Peters, 1872) 229
Genus ***Lavia*** Gray, 1838 231
Lavia frons (E. Geoffroy St.-Hilaire, 1810) 232
Genus ***Megaderma*** E. Geoffroy St.-Hilaire, 1810 234
†***Megaderma gaillardi*** (Trouessart, 1898) 234
†***Megaderma gigas*** (Lavocat, 1961) 235
†***Megaderma jaegeri*** Sigé, 1976 235
†Genus ***Saharaderma*** Gunnell, Simons and Seiffert, 2008 235
†***Saharaderma pseudovampyrus*** Gunnell, Simons and Seiffert, 2008 235
Family RHINOLOPHIDAE Gray, 1825 236
Genus ***Rhinolophus*** Lacépède, 1799 237
†***Rhinolophus maghrebensis*** Gunnell, Eiting, and Geraads, 2011 242
†***Rhinolophus mellali*** Lavocat, 1961 242
Rhinolophus adami Aellen and Brosset, 1968 242
Rhinolophus alcyone Temminck, 1853 243
Rhinolophus blasii Peters, 1867 245
Rhinolophus capensis Lichtenstein, 1823 249
Rhinolophus clivosus Cretzschmar, 1828 252
Rhinolophus cohenae Taylor, Stoffberg, Monadjem, Schoeman, Bayliss and Cotterill, 2012 258
Rhinolophus damarensis Roberts, 1946 259
Rhinolophus darlingi K. Andersen, 1905 260
Rhinolophus deckenii Peters, 1868 263
Rhinolophus denti Thomas, 1904 264
Rhinolophus eloquens K. Andersen, 1905 267
Rhinolophus euryale Blasius, 1853 269
Rhinolophus ferrumequinum (Schreber, 1774) 273
Rhinolophus fumigatus Rüppell, 1842 279
Rhinolophus gorongosae Taylor, MacDonald, Goodman, Kearney, Cotterill, Stoffberg, Monadjem, Schoeman, Guyton, Naskrecki and Richards, 2018 283
Rhinolophus guineensis Eisentraut, 1960 283
Rhinolophus hildebrandtii Peters, 1878 285
Rhinolophus hilli Aellen, 1973 288
Rhinolophus hillorum Koopman, 1989 288
Rhinolophus hipposideros (Bechstein, 1800) 290
Rhinolophus horaceki Benda and Vallo, 2012 294
Rhinolophus kahuzi Fahr and Kerbis Peterhans, 2013 294
Rhinolophus landeri Martin, 1838 295
Rhinolophus lobatus Peters, 1852 297
Rhinolophus mabuensis Taylor, Stoffberg, Monadjem, Schoeman, Bayliss and Cotterill, 2012 299
Rhinolophus maclaudi Pousargues, 1898 299
Rhinolophus maendeleo Kock, Csorba and Howell, 2000 301
Rhinolophus mehelyi Matschie, 1901 302
Rhinolophus mossambicus Taylor, Stoffberg, Monadjem, Schoeman, Bayliss and Cotterill, 2012 306
Rhinolophus rhodesiae Roberts, 1946 307
Rhinolophus ruwenzorii J. Eric Hill, 1942 307
Rhinolophus sakejiensis Cotterill, 2002 309
Rhinolophus silvestris Aellen, 1959 309
Rhinolophus simulator K. Andersen, 1904 311
Rhinolophus smithersi Taylor, Stoffberg, Monadjem, Schoeman, Bayliss and Cotterill, 2012 314
Rhinolophus swinnyi Gough, 1908 315
Rhinolophus willardi Kerbis Peterhans and Fahr, 2013 317
Rhinolophus ziama Fahr, Vierhaus, Hutterer and Kock, 2002 318
Family RHINONYCTERIDAE J. E. Gray, 1866 319
†Genus ***Brachipposideros*** Sigé, 1968 320
†Genus ***Brevipalatus*** Hand and Archer, 2005 320
Genus ***Cloeotis*** Thomas, 1901 320
Cloeotis percivali Thomas, 1901 320
Genus ***Paratriaenops*** Benda and Vallo, 2009 323
Paratriaenops auritus (G. Grandidier, 1912) 323
Paratriaenops furculus (Trouessart, 1907) 325
Paratriaenops pauliani (Goodman and Ranivo, 2008) 327
Genus ***Triaenops*** Dobson, 1871 328
†***Triaenops goodmani*** Samonds, 2007 329

Triaenops afer Peters, 1877 329
Triaenops menamena Goodman and Ranivo, 2009 330
Superfamily RHINOPOMATOIDEA Dobson, 1872 333
Family RHINOPOMATIDAE Dobson, 1872 334
†Genus ***Qarunycteris*** Gunnell, Simons and Seiffert, 2008 335
†***Qarunycteris moerisae*** Gunnell, Simons and Seiffert, 2008 335
Genus ***Rhinopoma*** E. Geoffroy St.-Hilaire, 1818 336
Rhinopoma cystops Thomas, 1903 336
Rhinopoma macinnesi Hayman, 1937 340
Rhinopoma microphyllum (Brünnich, 1782) 341
†Family TANZANYCTERIDIDAE Gunnell, Jacobs, Herendeen, Head, Kowalski, Msuya, Mizambwa, Harrison, Habersetzer and Storch, 2003 344
†Genus ***Tanzanycteris*** Gunnell, Jacobs, Herendeen, Head, Kowalski, Msuya, Mizambwa, Harrison, Habersetzer and Storch, 2003 344
†***Tanzanycteris mannardi*** Gunnell, Jacobs, Herendeen, Head, Kowalski, Msuya, Mizambwa, Harrison, Habersetzer and Storch, 2003 345
SUBORDER VESPERTILIONIFORMI Van Cakenberghe, Kearney and Seamark, 2007 346
INFRAORDER NOCTILIONIFORMACEI Van Cakenberghe, Kearney and Seamark, 2007 347
Superfamily NOCTILIONOIDEA Gray, 1821 347
Family MYZOPODIDAE Thomas, 1904 348
Genus ***Myzopoda*** Milne-Edwards and A. Grandidier, 1878 348
†***Myzopoda africana*** Gunnell, Butler, Greenwood and Simmons, 2015 349
Myzopoda aurita Milne-Edwards and A. Grandidier, 1878 349
Myzopoda schliemanni Goodman, Rakotondraparany and Kofoky, 2007 351
†Genus ***Phasmatonycteris*** Gunnell, Simmons and Seiffert, 2014 352
†***Phasmatonycteris butleri*** Gunnell, Simmons and Seiffert, 2014 353
†***Phasmatonycteris phiomensis*** Gunnell, Simmons and Seiffert, 2014 353
INFRAORDER NYCTERIFORMACEI Van Cakenberghe, Kearney and Seamark, 2007 353
Superfamily NYCTEROIDEA Van der Hoeven, 1855 354
Family EMBALLONURIDAE Gervais, 1855 354
Genus ***Coleura*** Peters, 1867 355
†***Coleura muthokai*** Wesselman, 1984 355
Coleura afra (Peters, 1852) 356
Coleura kibomalandy Goodman, Puechmaille, Friedli-Weyeneth, Gerlach, Ruedi, Schoeman, Stanley and Teeling, 2012 359
Coleura seychellensis Peters, 1868 361
†Genus ***Dhofarella*** Sigé, Thomas, Sen, Gheerbrant, Roger, and Al-Sulaimani, 1985 363
†***Dhofarella sigei*** Gunnell, Simons and Seiffert, 2008 363
†***Dhofarella thaleri*** Sigé et al., 1994 364
Genus ***Paremballonura*** Goodman, Puechmaille, Friedli-Weyeneth, Gerlach, Ruedi, Schoeman, Stanley and Teeling, 2012 364
Paremballonura atrata (Peters, 1874) 364
Paremballonura tiavato (Goodman, Cardiff, Ranivo, Russell, and Yoder, 2006) 366
†Genus ***Pseudovespertiliavus*** Ravel, 2016 367
†***Pseudovespertiliavus parva*** Ravel, 2016 368
Subfamily Taphozoinae Jerdon, 1867 368
Genus ***Saccolaimus*** Temminck, 1838 368
†***Saccolaimus abitus*** (Wesselman, 1984) 369
Saccolaimus peli (Temminck, 1853) 369
Genus ***Taphozous*** E. Geoffroy St.-Hilaire, 1818 370
†***Taphozous incognita*** (Butler & Hopwood, 1957) 371
Taphozous hamiltoni Thomas, 1920 372
Taphozous hildegardeae Thomas, 1909 372
Taphozous mauritianus E. Geoffroy St.-Hilaire, 1818 374
Taphozous nudiventris Cretzschmar, 1830 377
Taphozous perforatus E. Geoffroy St.-Hilaire, 1818 381
Taphozous perforatus perforatus E. Geoffroy St.-Hilaire, 1818 383
Taphozous perforatus sudani Thomas, 1915 384
†Genus ***Vespertiliavus*** Schlosser, 1887 384
†***Vespertiliavus aenigma*** (Ravel, 2016) 384
†***Vespertiliavus kasserinensis*** (Ravel, 2016) 384
Family NYCTERIDAE Van der Hoeven, 1855 385
†Genus ***Khoufechia*** Ravel, 2016 386
†***Khoufechia gunnelli*** Ravel, 2016 386
Genus ***Nycteris*** G. Cuvier and E. Geoffroy, 1795 386
Nycteris arge Thomas, 1903 387
Nycteris aurita (K. Andersen, 1912) 389

Nycteris cf. parisii De Beaux, 1924 390
Nycteris gambiensis (K. Andersen, 1912) 390
Nycteris grandis Peters, 1865 392
Nycteris hispida (Schreber, 1774) 394
Nycteris intermedia Aellen, 1959 398
Nycteris macrotis Dobson, 1876 399
Nycteris madagascariensis G. Grandidier, 1937 402
Nycteris major (K. Andersen, 1912) 403
Nycteris nana (K. Andersen, 1912) 404
Nycteris parisii (de Beaux, 1924) 406
Nycteris thebaica E. Geoffroy St.-Hilaire, 1818 407
Nycteris vinsoni Dalquest, 1965 416
Nycteris woodi K. Andersen, 1914 417
INFRAORDER VESPERTILIONIFORMACEI Van Cakenberghe, Kearney and Seamark, 2007 418
Superfamily MOLOSSOIDEA Gervais, 1856 419
Family MOLOSSIDAE Gervais, 1856 419
Subfamily Molossinae Gervais, 1856 421
Genus ***Chaerephon*** Dobson, 1874 421
Chaerephon aloysiisabaudiae (Festa, 1907) 424
Chaerephon ansorgei (Thomas, 1913) 425
Chaerephon atsinanana Goodman, Buccas, Naidoo, Ratrimomanarivo, Taylor and Lamb, 2010 427
Chaerephon bemmeleni (Jentink, 1879) 428
Chaerephon bivittatus (Heuglin, 1861) 430
Chaerephon chapini J.A. Allen, 1917 431
Chaerephon gallagheri (Harrison, 1975) 433
Chaerephon jobimena Goodman and Cardiff, 2004 434
Chaerephon leucogaster (A. Grandidier, 1869) 436
Chaerephon major (Trouessart, 1897) 438
Chaerephon nigeriae Thomas, 1913 439
Chaerephon nigeriae nigeriae Thomas, 1913 441
Chaerephon nigeriae spillmanni (Monard, 1933) 442
Chaerephon pumilus (Cretzschmar, 1826) 442
Chaerephon pusillus (Miller, 1902) 453
Chaerephon russatus J.A. Allen, 1917 455
Chaerephon tomensis (Juste and Ibáñez, 1993) 456
Genus ***Mops*** Lesson, 1842 457
†***Mops rusingae*** (Arroyo-Cabrales, Gregorin, Schlitter and Walker, 2002) 458
Subgenus *Mops (Mops)* Lesson, 1842 458
Mops (Mops) condylurus (A. Smith, 1833) 458
Mops (Mops) congicus J.A. Allen, 1917 465
Mops (Mops) demonstrator (Thomas, 1903) 465
Mops (Mops) leucostigma (G.M. Allen, 1918) 467
Mops (Mops) midas (Sundevall, 1843) 469
Mops (Mops) midas miarensis (A. Grandidier, 1869) 472
Mops (Mops) midas midas (Sundevall, 1843) 472
Mops (Mops) niangarae J.A. Allen, 1917 473
Mops (Mops) niveiventer Cabrera and Ruxton, 1926 474
Mops (Mops) trevori J.A. Allen, 1917 475
Subgenus *Mops (Xiphonycteris)* Dollman, 1911 476
Mops (Xiphonycteris) bakarii Stanley, 2009 477
Mops (Xiphonycteris) brachypterus (Peters, 1852) 478
Mops (Xiphonycteris) nanulus J.A. Allen, 1917 480
Mops (Xiphonycteris) petersoni (El Rayah, 1981) 481
Mops (Xiphonycteris) spurrelli (Dollman, 1911) 483
Mops (Xiphonycteris) thersites (Thomas, 1903) 484
Genus ***Mormopterus*** Peters, 1865 486
Mormopterus acetabulosus (Hermann, 1804) 487
Mormopterus acetabulosus acetabulosus (Hermann, 1804) 489
Mormopterus acetabulosus natalensis (A. Smith, 1847) 489
Mormopterus francoismoutoui Goodman, Jansen Van Vuuren, Ratrimomanarivo, Probst, Bowie, 2008 490
Mormopterus jugularis (Peters, 1865) 493
Genus ***Myopterus*** E. Geoffroy St.-Hilaire, 1818 495
Myopterus daubentonii Desmarest, 1820 495
Myopterus whitleyi (Scharff, 1900) 496
Genus ***Otomops*** Thomas, 1913 497

Otomops harrisoni Ralph, Richards, Taylor, Napier and Lamb, 2015....498
Otomops madagascariensis Dorst, 1953....500
Otomops martiensseni (Matschie, 1897)....502
Otomops martiensseni icarus Chubb, 1917....505
Otomops martiensseni martiensseni (Matschie, 1897)....505
Genus ***Platymops*** Thomas, 1906....506
Platymops setiger (Peters, 1878)....506
Platymops setiger macmillani Thomas, 1906....507
Platymops setiger setiger (Peters, 1878)....508
Genus ***Sauromys*** Roberts, 1917....508
Sauromys petrophilus (Roberts, 1917)....509
Sauromys petrophilus erongensis (Roberts, 1946)....511
Sauromys petrophilus haagneri (Roberts, 1917)....512
Sauromys petrophilus petrophilus (Roberts, 1917)....512
Sauromys petrophilus umbratus (Shortridge & Carter, 1938)....513
Genus ***Tadarida*** Rafinesque, 1814....513
†***Tadarida engesseri*** Rachl, 1983....514
Tadarida aegyptiaca (E. Geoffroy St.-Hilaire, 1818)....514
Tadarida aegyptiaca aegyptiaca (E. Geoffroy St.-Hilaire, 1818)....518
Tadarida aegyptiaca bocagei (Seabra, 1900)....518
Tadarida fulminans (Thomas, 1903)....519
Tadarida lobata (Thomas, 1891)....521
Tadarida teniotis (Rafinesque, 1814)....522
Tadarida ventralis (Heuglin, 1861)....527
Superfamily VESPERTILIONOIDEA Gray, 1821....528
Family CISTUGONIDAE Lack, Roehrs, Stanley, Ruedi and Van den Bussche, 2010....529
Genus ***Cistugo*** Thomas, 1912....529
Cistugo lesueuri Roberts, 1919....530
Cistugo seabrae Thomas, 1912....532
†Family INDETERMINATE....534
†Genus ***Chambinycteris*** Ravel, 2016....534
†***Chambinycteris pusilli*** Ravel, 2016....534
†Genus ***Drakonycteris*** Ravel, 2016....534
†***Drakonycteris glibzegdouensis*** Ravel, 2016....534
Family MINIOPTERIDAE Dobson, 1875....534
Genus ***Miniopterus*** Bonaparte, 1837....535
†***Miniopterus horaceki*** Gunnell, Eiting, and Geraads, 2011....538
Miniopterus aelleni Goodman, Maminirina, Weyeneth, Bradman, Christidis, Ruedi and Appleton, 2009....538
Miniopterus africanus Sanborn, 1936....540
Miniopterus ambohitrensis Goodman, Ramasindrazana, Naughton and Appleton, 2015....541
Miniopterus brachytragos Goodman, Maminirina, Bradman, Christidis and Appleton, 2009....542
Miniopterus egeri Goodman, Ramasindrazana, Maminirina, Schoeman, and Appleton, 2011....544
Miniopterus fraterculus Thomas and Schwann, 1906....545
Miniopterus gleni Peterson, Eger and Mitchell, 1995....547
Miniopterus griffithsi Goodman, Maminirina, Bradman, Christidis and Appleton, 2009....549
Miniopterus griveaudi Harrison, 1959....550
Miniopterus inflatus Thomas, 1903....552
Miniopterus inflatus inflatus Thomas, 1903....555
Miniopterus inflatus rufus Sanborn, 1936....555
Miniopterus maghrebensis Puechmaille, Allegrini, Benda, Bilgin, Ibañez and Juste, 2014....555
Miniopterus mahafaliensis Goodman, Bradman, Christides and Appleton, 2009....557
Miniopterus majori Thomas, 1906....560
Miniopterus manavi Thomas, 1906....562
Miniopterus minor Peters, 1867....564
Miniopterus mossambicus Monadjem, Goodman, Stanley and Appleton, 2013....566
Miniopterus natalensis (A. Smith, 1833)....567
Miniopterus newtoni Bocage, 1889....573
Miniopterus petersoni Goodman, Bradman, Maminirina, Ryan, Christidis & Appleton, 2008....574
Miniopterus schreibersii (Kuhl, 1817)....575

Miniopterus sororculus Goodman, Ryan, Maminirina, Fahr, Christidis and Appleton, 2007 580
Miniopterus villiersi Aellen, 1956 582
†Family PHILISIDAE Sigé, 1985 583
†Genus ***Dizzya*** Sigé, 1991 583
†***Dizzya exsultans*** Sigé, 1991 584
†Genus ***Philisis*** Sigé, 1985 584
†***Philisis sphingis*** Sigé, 1985 584
†Genus ***Witwatia*** Gunnell, Simons and Seiffert, 2008 584
†***Witwatia eremicus*** Gunnell, Simons and Seiffert, 2008 585
†***Witwatia schlosseri*** Gunnell, Simons and Seiffert, 2008 585
†***Witwatia sigei*** Ravel, Marivaux, Tabuce, Bel Haj Ali, Essid, and Vianey-Liaud, 2012 585
Family VESPERTILIONIDAE Gray, 1821 586
Subfamily Kerivoulinae Miller, 1907 589
†Genus ***Chamtwaria*** Butler, 1984 589
†***Chamtwaria pickfordi*** Butler, 1984 589
Genus ***Kerivoula*** Gray, 1842 589
Kerivoula africana Dobson, 1878 591
Kerivoula argentata Tomes, 1861 591
Kerivoula cuprosa Thomas, 1912 593
Kerivoula eriophora (Heuglin, 1877) 594
Kerivoula lanosa (A. Smith, 1847) 595
Kerivoula phalaena Thomas, 1912 597
Kerivoula smithii Thomas, 1880 598
Subfamily Myotinae Tate, 1942 599
†Genus ***Khonsunycteris*** Gunnell, Simons and Seiffert, 2008 600
†***Khonsunycteris aegypticus*** Gunnell, Simons and Seiffert, 2008 600
Genus ***Myotis*** Kaup, 1829 600
†***Myotis darelbeidensis*** Gunnell, Eiting, and Geraads, 2011 606
Myotis anjouanensis (Dorst, 1960) 607
Myotis bocagii (Peters, 1870) 607
Myotis bocagii bocagii (Peters, 1870) 610
Myotis bocagii cupreolus Thomas, 1904 610
Myotis capaccinii (Bonaparte, 1837) 610
Myotis dieteri M. Happold, 2005 614
Myotis emarginatus (E. Geoffroy St.-Hilaire, 1806) 615
Myotis goudoti (A. Smith, 1834) 617
Myotis morrisi Hill, 1971 620
Myotis mystacinus (Kuhl, 1817) 621
Myotis punicus Felten, 1977 623
Myotis scotti Thomas, 1927 628
Myotis tricolor (Temminck, 1832) 628
Myotis welwitschii (Gray, 1866) 631
Myotis zenatius Ibáñez, Juste, Salicini, Puechmaille and Ruedi, 2019 634
Subfamily Scotophilinae Van Cakenberghe and Seamark, 2008 636
†Genus ***Scotophilisis*** Horácek, Fejfar and Hulva, 2006 636
†***Scotophilisis libycus*** Horácek, Fejfar and Hulva, 2006 636
Genus ***Scotophilus*** Leach, 1821 636
Scotophilus altilis G.M. Allen, 1914 638
Scotophilus andrewreborii Brooks and Bickham, 2014 639
Scotophilus borbonicus (E. Geoffroy St.-Hilaire, 1803) 640
Scotophilus dinganii (A. Smith, 1833) 641
Scotophilus ejetai Brooks and Bickham, 2014 645
Scotophilus leucogaster (Cretzschmar, 1826) 646
Scotophilus livingstonii Brooks and Bickham, 2014 649
Scotophilus marovaza Goodman, Ratrimomanarivo and Randrianandrianina, 2006 649
Scotophilus nigrita (Schreber, 1774) 651
Scotophilus nigritellus de Winton, 1899 653
Scotophilus nucella Robbins, 1983 654
Scotophilus nux Thomas, 1904 655
Scotophilus robustus A. Milne-Edwards, 1881 657
Scotophilus tandrefana Goodman, Jenkins and Ratrimomanarivo, 2005 659
Scotophilus trujilloi Brooks and Bickham, 2014 660
Scotophilus viridis (Peters, 1852) 660
Scotophilus "incertae-sedis" 662
†Genus ***Vampyravus*** Schlosser, 1910 662
†***Vampyravus orientalis*** Schlosser, 1910 663

Subfamily Vespertilioninae Gray, 1821 663
Genus ***Barbastella*** Gray, 1821 666
Barbastella barbastellus (Schreber, 1774) 666
Barbastella leucomelas (Cretzschmar, 1826) 668
Genus ***Eptesicus*** Rafinesque, 1820 670
Eptesicus bottae (Peters, 1869) 672
Eptesicus floweri (de Winton, 1901) 675
Eptesicus hottentotus (A. Smith, 1833) 676
Eptesicus isabellinus (Temminck, 1840) 681
Eptesicus platyops (Thomas, 1901) 685
Genus ***Glauconycteris*** Dobson, 1875 686
Glauconycteris alboguttata J.A. Allen, 1917 687
Glauconycteris argentata (Dobson, 1875) 688
Glauconycteris atra Hassanin, Colombo, Gembu, Merle, Tu, Görföl, Musaba Akawa, Csorba, Kearney, Monadjem and Ing, 2017 689
Glauconycteris beatrix Thomas, 1901 690
Glauconycteris cf. beatrix Hassanin, Colombo, Gembu, Merle, Tu, Görföl, Musaba Akawa, Csorba, Kearney, Monadjem and Ing, 2017 691
Glauconycteris cf. humeralis Hassanin, Colombo, Gembu, Merle, Tu, Görföl, Musaba Akawa, Csorba, Kearney, Monadjem and Ing, 2017 692
Glauconycteris curryae Eger and Schlitter, 2001 692
Glauconycteris egeria Thomas, 1913 693
Glauconycteris gleni Peterson and Smith, 1973 694
Glauconycteris humeralis J.A. Allen, 1917 695
Glauconycteris kenyacola Peterson, 1982 696
Glauconycteris machadoi Hayman, 1963 697
Glauconycteris poensis (Gray, 1842) 698
Glauconycteris superba Hayman, 1939 699
Glauconycteris variegata (Tomes, 1861) 701
Genus ***Hypsugo*** Kolenati, 1856 704
Hypsugo anchietae (Seabra, 1900) 704
Hypsugo ariel (Thomas, 1904) 706
Hypsugo bemainty Goodman, Rakotondramanana, Ramasindrazana, Kearney, Monadjem, Schoeman, Taylor, Naughton and Appleton, 2015 708
Hypsugo cf. eisentrauti Hill, 1968 708
Hypsugo crassulus (Thomas, 1904) 709
Hypsugo eisentrauti (Hill, 1968) 711
Hypsugo musciculus (Thomas, 1913) 712
Hypsugo savii (Bonaparte, 1837) 713
Genus ***Laephotis*** Thomas, 1901 717
Laephotis angolensis Monard, 1935 719
Laephotis botswanae Setzer, 1971 721
Laephotis namibensis Setzer, 1971 725
Laephotis wintoni Thomas, 1901 728
Genus ***Mimetillus*** Thomas, 1904 731
Mimetillus moloneyi (Thomas, 1891) 732
Mimetillus thomasi Hinton, 1920 733
Genus ***Neoromicia*** Roberts, 1926 734
Neoromicia aff. guineensis Bocage, 1889 735
Neoromicia brunnea (Thomas, 1880) 736
Neoromicia capensis (A. Smith, 1829) 738
Neoromicia guineensis (Bocage, 1889) 744
Neoromicia helios (Heller, 1912) 746
Neoromicia humbloti (A. Milne-Edwards, 1881) 747
Neoromicia isabella Decher, Hutterer and Monadjem, 2016 748
Neoromicia malagasyensis (Peterson, Eger and Mitchell, 1995) 749
Neoromicia matroka (Thomas and Schwann, 1905) 750
Neoromicia nana (Peters, 1852) 751
Neoromicia rendalli (Thomas, 1889) 759
Neoromicia robertsi Goodman, Taylor, Ratrimomanarivo and Hoofer, 2012 762
Neoromicia roseveari Monadjem, Richards, Taylor and Stoffberg, 2013 763
Neoromicia somalica (Thomas, 1901) 764
Neoromicia stanleyi Goodman, Kearney, Ratsimbazafy and Hassanin, 2017 767
Neoromicia tenuipinnis (Peters, 1872) 769
Neoromicia zuluensis (Roberts, 1924) 772
Neoromicia "incertae-sedis" 775
Genus ***Nyctalus*** Bowdich, 1825 776

Nyctalus azoreum (Thomas, 1901).....776
Nyctalus lasiopterus (Schreber, 1780).....778
Nyctalus leisleri (Kuhl, 1817).....781
Genus ***Nycticeinops*** Hill & Harrison, 1987 784
†***Nycticeinops serengetiensis*** Gunnell, Butler, Greenwood and Simmons, 2015 785
Nycticeinops schlieffenii (Peters, 1859).....785
Nycticeinops "incertae-sedis".....788
Genus ***Otonycteris*** Peters, 1859 788
Otonycteris hemprichii Peters, 1859 789
Genus ***Pipistrellus*** Kaup, 1829.....793
Pipistrellus aero Heller, 1912 796
Pipistrellus grandidieri (Dobson, 1876).....797
Pipistrellus hanaki Hulva and Benda, 2004 799
Pipistrellus hesperidus (Temminck, 1840) 801
Pipistrellus hesperidus broomi Roberts, 1948 804
Pipistrellus hesperidus hesperidus (Temminck, 1840) 805
Pipistrellus hesperidus subtilis (Sundevall, 1846).....805
Pipistrellus inexspectatus Aellen, 1959 806
Pipistrellus kuhlii (Kuhl, 1817) 807
Pipistrellus maderensis (Dobson, 1878).....814
Pipistrellus nanulus Thomas, 1904.....816
Pipistrellus permixtus Aellen, 1957 817
Pipistrellus pipistrellus (Schreber, 1774) 818
Pipistrellus pygmaeus (Leach, 1825) 822
Pipistrellus raceyi Bates, Ratrimomanarivo, Harrison and Goodman, 2006 823
Pipistrellus rueppellii (Fischer, 1829) 825
Pipistrellus rueppellii fuscipes Thomas, 1913.....828
Pipistrellus rueppellii pulcher (Dobson, 1875) 829
Pipistrellus rueppellii rueppellii (J. B. Fischer, 1829) 829
Pipistrellus rueppellii senegalensis Dorst, 1960 830
Pipistrellus rueppellii vernayi Roberts, 1932.....831
Pipistrellus rusticus (Tomes, 1861).....831
****Pipistrellus*** sp. aff. ****kuhlii*** Kuhl, 1817 834
Pipistrellus "incertae-sedis".....834
Genus ***Plecotus*** E. Geoffroy St.-Hilaire, 1818.....835
Plecotus balensis Kruskop & Lavrenchenko, 2000 835
Plecotus christii Gray, 1838 837
Plecotus gaisleri Benda, Kiefer, Hanak & Veith, 2004.....839
Plecotus teneriffae Barrett-Hamilton, 1907 840
Genus ***Scotoecus*** Thomas, 1901 841
†***Scotoecus olduvensis*** Gunnell, Butler, Greenwood and Simmons, 2015.....842
Scotoecus albigula Thomas, 1909.....842
Scotoecus albofuscus (Thomas, 1890) 843
Scotoecus hindei Thomas, 1901.....845
Scotoecus hirundo (de Winton, 1899).....846

Introduction

The purpose of the African Chiroptera Report is to collate published information on, and collate specimen records of, African bats. The advent of the internet provides an opportunity for large amounts of information to be easily and economically updated and accessible, which is particularly important for taxonomic information. The electronic, web-based nature of the information is intended to allow information on African bats to be corrected/updated more frequently than a printed format allows, and to be available to users in an affordable form that can be manipulated to their specific requirements. It is hoped this tool will facilitate research and conservation planning, and possibly stimulate interactions across different areas of research. The report is generated from data collated in the African Chiroptera Database and will hopefully grow and develop with the addition of new and corrected information.

The incorporation of information other than taxonomic (see the various section headings in the description of the layout below), is still patchy in its execution across the taxa. Information that may answer specific requirements of a user, i.e. more information about the voucher specimens, or specimen collectors, has been drawn from across the database and is presented in separate appendices. Published identification keys for African bat species, have, where necessary, been updated to include current names, and are presented in appendix 5. In appendix 6 images of type specimens are included as they become available.

TAXONOMY

In 2006 an African Chiroptera Taxonomic Advisory Committee (ACTAC) was established to guide the development of this resource. This Committee has made valuable contributions regarding the incorporation of suggested changes/corrections, in particular in relation to the taxonomy, into this report. The report is currently most comprehensive in the presentation of information on all known synonyms, for presently accepted taxa of African bat species. Having a high Chiroptera diversity, there are currently 18 families (incl. 4 extinct and one indeterminate), 81 genera (23 extinct) and 379 species (48 extinct) recognized as occurring (or having occurred) in Africa. An overview of the number of genera and species per family occurring in Africa is shown in Figure 1. Usually the number of species is larger than the number of genera, but there is one exception: in the Megadermatidae, three genera and two species are mentioned. The reason for this is that only extant taxa are included, and although *Megaderma gigas* is an extinct species, the genus itself still has representatives in Asia. The graph further shows that the Vespertilionidae contain the largest number of both genera and species, followed by the Molossidae and Pteropodidae in number of species, and by the Pteropodidae and Molossidae in number of genera.

The synonym information is still largely based on work by Meester *et al.* (1986), Koopman (1993a), and Simmons (2005). The work of Simmons (2005) is still generally followed in the report for the status of lower taxonomic groups, and we are especially indebted to this publication.

The report also aims to incorporate information on the whereabouts of type specimens, name combinations, and spelling variations and errors/lapsus calami in names.

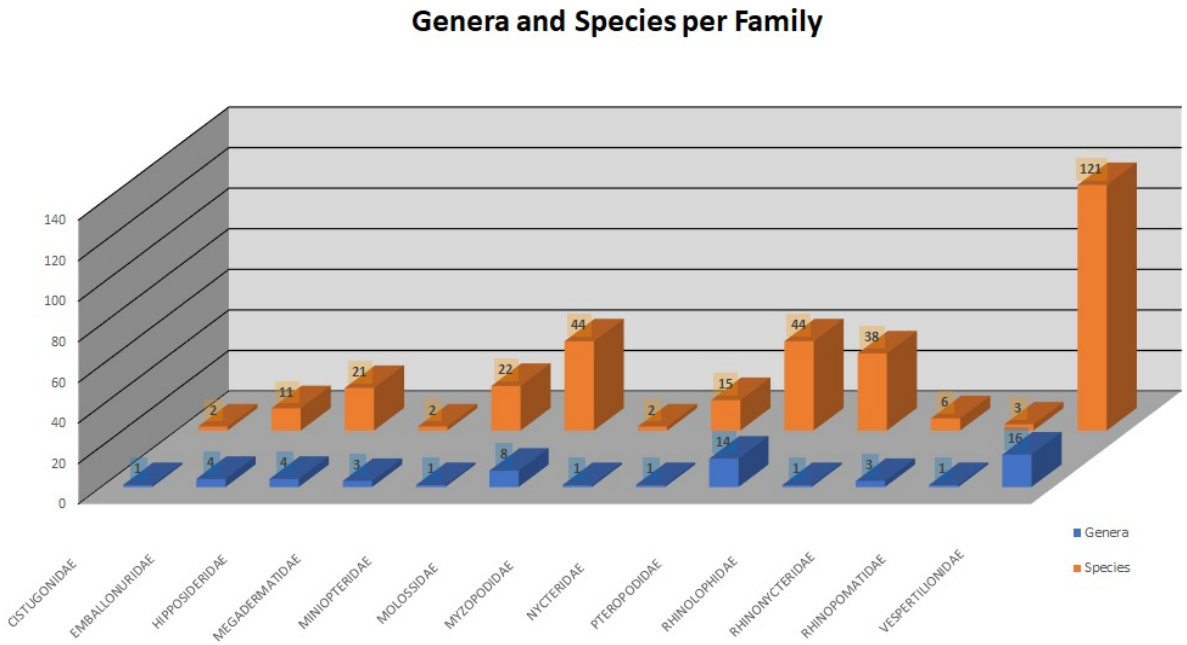

Figure 1. Overview of the number of extant genera and species per family occurring in Africa (Modified after Srinivasulu et al., 2010: 1008).

NEW TAXONOMIC CHANGES SINCE THE 2018 REPORT

Definitions of terms for taxonomic changes:

New taxon - a recently described taxon or a taxon that was for some reason omitted from the previous report.
Revised status – re-establishment of the taxon name.
Removed - a taxon which was previously recognized as occurring within Africa, but has been shown to not exist, for various reasons.
†extinct

New Status	Status change	2018 Status	Reason
Hipposideridae Lydekker, 1891			
†*Macronycteris besaoka* (Samonds, 2007)	Revised status	*Hipposideros besaoka*	Goodman *et al.* (2016: 435) found that the mandibula and lower teeth of *besaoka* are more robust than those of other Madagascan "*Hipposideros*" [=*Macronycteris*], but were in doubt about its generic assignment to either of these genera. More recent investigation by Rakotoarivelo et al. (2019: 14) assigned the species to *Macronycteris*.
Miniopteridae Dobson, 1875			
Miniopterus villiersi Aellen, 1956	Revised status	*Miniopterus schreibersii villiersi*	*Villiersi* was generally considered to be a synonym or a subspecies of either *M. inflatus, M. schreibersii* or *M. natalensis*, but several authors suggested it to be a separate species, which is gaining support as

New Status	Status change	2018 Status	Reason
			detailed genetic analyses indicate the presence of multiple taxa in West Africa.
Vespertilionidae Gray, 1821			
Myotis zenatius Ibáñez, Juste, Salicini, Puechmaille and Ruedi, 2019	New taxon		At the beginning of the year, two publications appeared dealing with the northwest African representatives of "*Myotis nattereri*" (Çoraman *et al.*, 2019 and Juste *et al.*, 2019), and leading to different conclusions. The former authors consider it a separate subspecies, whereas the latter consider it a separate species. Furthermore, there were also some issues with the validity of the description by Çoraman *et al.* (2019), which led us to tentatively use the name proposed by Juste *et al.* (2019) until this issue is solved.
Scotophilus altilis G.M. Allen, 1914	Revised status		Vallo et al. (2019: 148) found a 10 % difference in cyt-*b* between *Scotophilus leucogaster* and a series of specimens from southwestern Ethiopia and southern South Sudan. These latter specimens agreed with the description of *S. altilis* by Allen (1914). These differences were supported by differences in size and in two nuclear markers, which are different enough to consider it a separate species.
Pipistrellus grandidieri (Dobson, 1876)	Revised status	*Neoromicia flavescens* (Seabra, 1900)	Most authors since Thorn *et al*. (2007) consider *flavescens* to be a synonym of *grandidieri*, although the content of the latter taxon is still not fixed (e.g. Decher *et al.* (2016: 273) report *N.* cf. *grandidieri* specimens from Guinea, and Schaer *et al.* (2013a: 17416) and Rosskopf *et al*. (2018: 31, suppl.) as *P*. aff. *grandidieri* from West Africa). Based on the

New Status	Status change	2018 Status	Reason
			above, we tentatively consider *flavescens* as synonym of *grandidieri* pending further investigation.

GEOGRAPHIC SCOPE

This report covers the geographic area of the African continent and adjacent regions, including, Madagascar, and other surrounding islands in the Indian and Atlantic oceans (Figure 3). This and previous issues of the report have focused attention mainly on capturing information from the African continent and the associated islands. The taxa from the Arabian Peninsula are included as far as these are shared with the African continent.

SPECIES RICHNESS AND ESTIMATES

Figure 2 shows the number of families, genera and species occurring in the various African countries. The most diverse country in number of genera and species is The Democratic Republic of the Congo, followed by Kenya, Cameroon and Tanzania (all over 100 species) (see Figure 3 and 4).

Species lists per country together with voucher specimens (evidence) can be located in Appendix 2e.

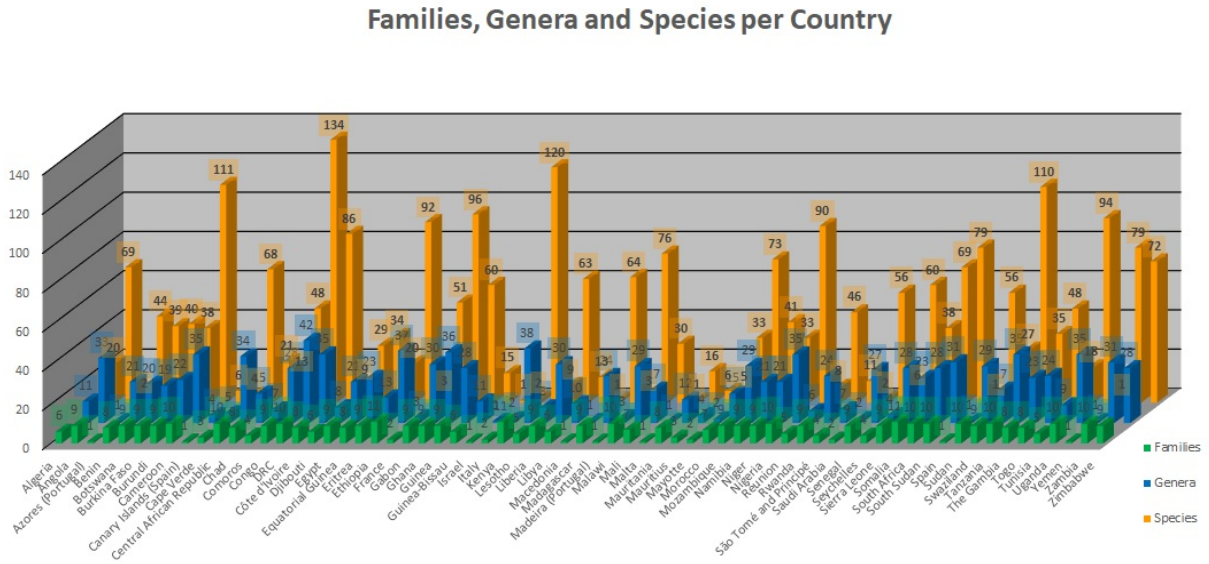

Figure 2. Overview of the number of extant families, genera and species occurring in the various countries in Africa (Modified after Srinivasulu et al., 2010: 1008).

Species richness maps for individual countries showing all known records have been mapped at a quarter degree level (0.25) (Appendix 2h).

Examination of the estimated spatial extent of collection coverage (Figure 4) indicates large areas where there is urgent need for surveys. Within southern Africa – southeastern Angola is in desperate need of preliminary survey work, as well as smaller areas in northern Mozambique, Botswana southwestern Zambia and Northern Cape Province of South Africa. In East Africa - Tanzania and Somalia should be prioritized and in Central Africa - The Democratic Republic of the Congo.

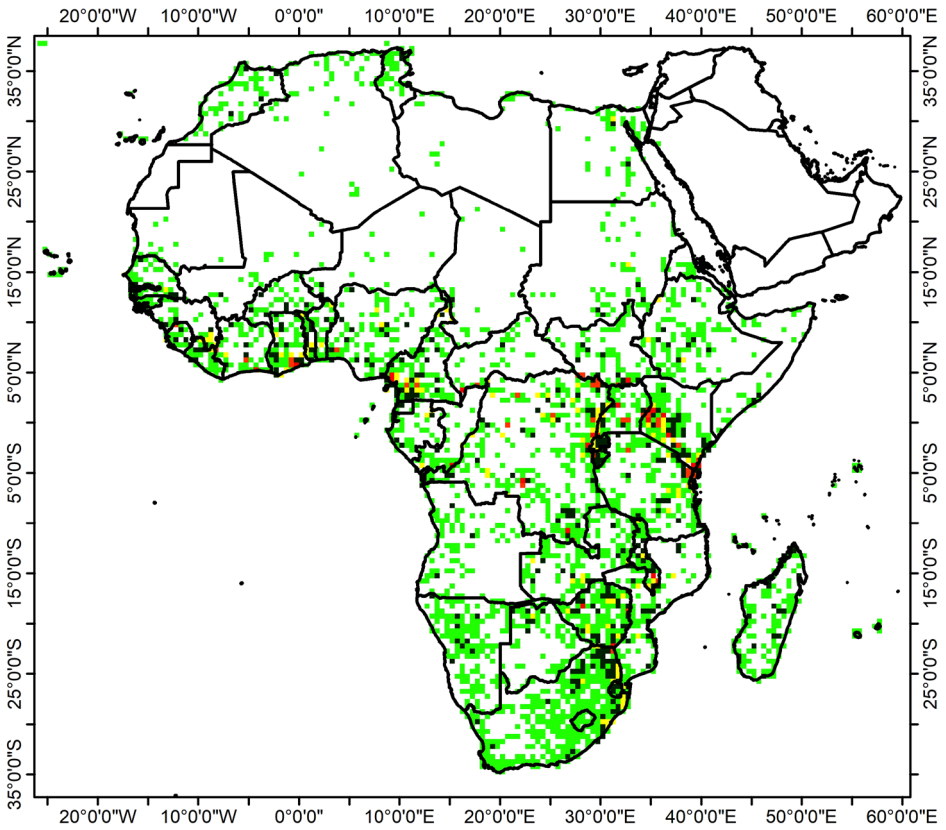

Figure 3. African bat species richness map, calculated in half degree grid (0.5) size from the specimen data in the African Chiroptera Database 2019. Light green = 1- 8 species; dark green / black = 9 – 17 species; yellow = 18 - 25 species; orange = 26 - 34 species; red= 35 - 59 species.

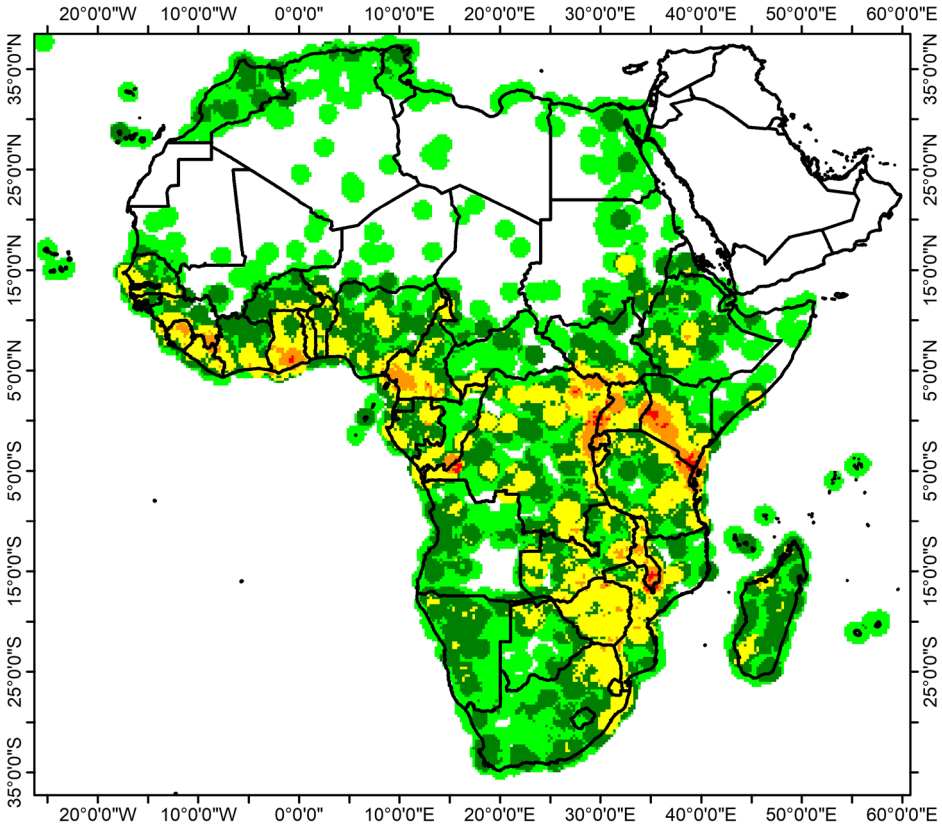

Figure 4. African bat species richness estimator (Chao 2) was used to calculate in quarter degree (0.25) grid size the specimen data in the African Chiroptera Database 2019, using DIVA-GIS 7.4.0.1 (http://www.diva-gis.org) with a nearest neighbor set at 2. Light green = 1 – 10; dark green / black = 11 – 30; yellow = 31 – 65; orange = 66 – 100; red = 101 – 191.

All light green areas in species richness maps should be viewed with some caution as these only represent 1 - 10 species. These areas most likely indicate bat records collected as part of larger mammal fieldwork or were collected opportunistically. Therefore, areas that are light green require surveys that will focus attention of the bat species found at these sites.

For Sub-Saharan Africa, Monadjem and Schoeman (2013: 104) indicate that the highest species richness is recorded in the Albertine Rift, the northern shores of Lake Victoria in East Africa, and the Upper Guinean forest zone of West Africa. Furthermore, eastern South Africa, southern Mozambique, Zimbabwe, Malawi, coastal Kenya and Tanzania, the Ethiopian rift valley, the Congo basin north of the Congo River and the humid Guinean woodlands north of the rainforest in West Africa have a high species richness. The poorest species richness, they found (not unexpectely) in the arid zones of south-western Southern Africa, the entire Sahel zone of North Africa, and the Horn of Africa. But the latter might still be the result of (large) collections in various museums, which are still unreported (as was already indicated by Schlitter and Delany, 1985: 47).

SPECIMENS

At the time the 2019 report was generated the African Chiroptera Database contained 131,890 specimen records of which 114,625 specimens had co-ordinates. This indicates that 87 % of the available records could be plotted.

The species distribution maps created in this report probably indicate biases in relation to the collections from which data has currently been obtained. In previous issues of the ACR, it was estimated that about 100,000 to 150,000 specimen records were available for African Chiroptera in collections around the world. This is now believed to be a serious underestimate of potentially available specimens (many European, African and Asian museum collections have not been captured as yet). We currently suspect that a more realistic number of records is possibly between 150,000 – 250,000. Using these revised estimates, we assume that between 52 – 87 % of available records have been captured in the ACD, for 2019.

LAYOUT OF ACCOUNTS

The taxa are presented in alphabetical order, top down (Order, Suborder, Infraorder…etc.).

In the synonyms list, an asterisk (*) in front of the year indicates that the synonym represents the original name for the taxon. This also reveals instances where it is not necessarily the oldest name that has taken precedence. The use of colours denotes the following: red - first name used; blue - name currently in use; green - valid synonyms; black - name combinations, spelling variations and errors/lapsus calami. A question mark (?) in the position of the year indicates that the first use of a particular name combination has not yet been determined.

Information relating to the following section headings, or citations to relevant publications, may also be presented in an account, if information relating to these sections has been published or communicated (e.g. "*pers. comm.*" or "unpublished report"), and has been entered in the database. Sections marked as "unknown" indicate that literature data explicitly mention that this information is "not known" (contrary to not having found any information on the topic).

Taxonomy:
Provides a brief history of previous studies in systematics, giving a summary of different conclusions arising from different methodologies and the resulting taxonomic debates. Much of this information has been taken from Simmons (2005).

Common names:
Common names used, in a variety of different languages, and found in various sources: e.g. Afrikaans (Roberts, 1951),Chinese (Musila *et al.*, 2018a), Czech (Benda, 2010), Dutch (Dietz, 2017), English (Roberts, 1951; Wilson and Cole, 2000), French (http://www.planet-mammiferes.org; Stéphane Aulagnier, *pers. comm.*), German (Rudi Hasslauer, *pers. comm.*), Greek, Albanian and Macedonian (Papadatou *et al.*, 2011), Italian: (Lanza *et al.*, 2015), Maltese (http://www.geocities.com/RainForest/3096/bats.html), Spanish (UNEP-WCMC, 2003; Fa, 1991), Arabian and Hebrew (Ferguson, 2002), Tamil (Kamalakannan and Nameer, 2019). Lina (2017) provided an overview of common names of Europan bats in every possible European language. As a large number of these bats also occur in (northern) Africa, these vernacular names are included too.

Etymology of name:
Information about the origin/meaning of the name.

Similar species:
Information about other taxa, with which there has been a recorded mistake in identification.

Palaeontological / archaeological records:
Any records identified from palaeontological or archaeological sites.

Conservation status:
This section is split into two categories: Global - provides information on past and present Red data assessments of the global populations of a species and; Regional - provides information on past and present Red data assessments of regional or country specific assessments of a species.

General distribution:
Distribution of the taxa in Africa, and extra-limital to Africa. Much of this information also comes from Simmons (2005). Additional records are indicated by a reference to their source.

Biogeography:
Information about the evolutionary processes that have driven speciation of the taxa and also its possible historical distributions in association with sister taxa.

Geographic variation:
Any known variation within a taxon across its distribution.

General description of external morphology:
Information about the outward appearance that may distinguish a taxon.

General description of cranial and dental morphology:
Information about the skull, mandible and teeth that may be distinguishing characters of a taxon.

Detailed morphology:
More detailed description of some structure of a taxon, i.e. for the baculum, tragus, hyoid, or wingshape.

Functional morphology:
Information on any work that has related morphological structure to function.

Sexual dimorphism:
Any known variation within a taxon between males and females.

Echolocation:
Information about the echolocation call of a taxon.

Molecular biology:
Information in this section is currently divided into three categories for information on DNA, Karyotype, and Protein/allozyme. The following abbreviations are used in the description of the karyotype: **2n -** diploid number, **FN -** fundamental number of autosomal chromosome arms, **BA -** total number of biarmed autosomal chromosomes, **X -** female sex chromosome, and **Y -** male sex chromosome.

Habitat:
Information about the environment in which a taxon has been recorded.

Behaviour:
Information about the timing and actions of a taxon.

Roost:
Indicates where a taxon settles during the day and at night.

Migration:
Any records of period movement from one geographic area to another.

Feeding/diet:
Records of behaviour in relation to feeding, and what is eaten.

Predators:
Records of other species know to eat the taxon in question.

Population:
Information in this section is separated into two categories: structure - in relation to any organization between individuals, and density - in relation to the number of individuals.

Lifespan:
Records relating to how long individuals of a taxon are known to live for.

Reproduction and ontogeny:
Information relating to the biology associated with producing further members of a species, and the growth/development over the course of a lifespan.

Mating:
Information relating to the behaviour associated with producing further members of a species.

Post-natal development:
Information relating to changes that occur after birth.

Parasites:

Information relating to both ectoparasites (parasites living outside the body), and endoparasites (parasites living within the body).

Viruses:
Any known viruses carried by a taxon. The taxonomy followed is that by the ICTV (International Committee on Taxonomy of Viruses - http://www.ictvonline.org/index.asp).

Utilization/significance:
Information about how a taxon may be used or viewed by people.

Distribution map:
The species distribution maps should still be viewed with some caution, since these are based on voucher specimen records currently included in the African Chiroptera Database. Hence, the actual distribution of the taxon might be more extensive than indicated on the maps, and the voucher specimen classification/identification may not be accurate. On the other hand, it might also be possible that the actual distribution is more restricted than indicated on the maps. This might be due to the inclusion of historical data, which indicate localities where the animals might have occurred a 100 (or less) years ago, when the habitat was favorable for the animals, but which currently is no longer the case (e.g. increased desertification, destruction of rain forest…). Additionally, it needs to be pointed out that due to variety of reasons not all voucher specimen localities have been plotted, i.e. no X, Y co-ordinates could be found, or these co-ordinates fall outside the country where this locality is supposed to be located. Voucher specimen localities that were not plotted are, however, indicated in the Appendices dealing with voucher specimens. Similarly the position of the point within a country does not necessarily confirm its presence at that spot on the map, as data has currently only been screened to fall within its associated country of representation. Appendix 2g contains a larger version of the maps displayed in the taxa accounts.

Distribution based on voucher specimens:
This is a calculated paragraph, where information is derived from information in the African Chiroptera Database, and provides a list of countries from which there are voucher specimens. A note of caution in viewing this data is that it is based on voucher specimen information currently in the African Chiroptera Database, hence there may be voucher specimen records that have not yet been included in the database, and voucher specimen classification/identification may not be accurate. Again, if you have any knowledge of omissions or errors in relation to voucher specimens, please send this information to the managing editors of the database (ACD@africanbats.org) for inclusion in the next revision.

An additional, calculated query indicates through the use of colour in the country name, the period of time when voucher specimens were last collected from a country. Green indicates that voucher specimens have been collected within the past 20 years, blue within the past 20-50 years, orange within the past 50-100 years, and red if the last voucher specimens were collected more than 100 years ago. Country names in black represent countries for which voucher specimens currently have no associated date of collection. The purpose of this ranking is to assist researchers and conservation planners to focus attention on species and areas where further collecting needs to be done to ascertain data on current presence in an area.

REFERENCES
In the references section of the report, the author names are colour coded to indicate in which part of the report the reference was mentioned: blue indicates that the reference is used in the main report, green that it is found in the appendices, and red is used for references occurring in both the main report and the appendices. References without colour code have not been used in the main report nor in the appendices, but are included to provide an overview of all publications pertaining to African bats.

GIS AND ESRI SHAPEFILES
GIS shapefile have been release with this 2019 report that contain all the spatial information to date on the bats in Africa. This is the raw information that was used to create the various maps as well as associated information that is used in the calculation of the various appendicies.

Download data: www.africanbats.org/Documents/ACR/2019/ACR_2019_data.zip.

Shapefile has been created using geographic projection. Caution must be used when interpreting the information as the X and Y co-ordinates have been calculated using various co-ordinate systems (e.g. DDMMSS, DDMM.SS or center of Quarter Degree), this level of precision varies and therefore the points also contain this level of error.

FUTURE OF THE REPORT

The current managing editors felt this project may have a better chance of being a successful tool for some time into the future, by encouraging contributions of data and information from interested individuals and organizations. It is hoped the African Chiroptera Report will continue to grow and develop with many more contributions of new and corrected information, i.e. verification of specimens, and specimen voucher records to the database from interested individuals and organizations. Not assigning individual names to authorship/editorship of the report has also been an intentional decision, to try and develop "ownership" of the project among all individuals and organizations who contribute to the database. It is envisaged that each release of the report, being built on the foundation of the previous report, will retain the information of whom and in what capacity they contributed to the project in a particular cycle.

Future funding is being sought for the continued support and development of the African Chiroptera Project and the development of additional tools and resources. Some of the tools and resources being explored are contracting in of additional technical skills to develop web access, GIS integration for spatial queries and information dissemination. The saying goes 'Garbage in garbage out', the African Chiroptera Project will continue to refine, verify and interrogate information contained in the database. This will be achieved through the development of teams who will verify and check all information contained in the database – verification of identifications, spatial accuracy of collection sites, and the entering in of recent and historical information from published sources.

Any mistakes, misrepresentation of data, or omitted publications can be reported to the managing editors of the database (ACD@africanbats.org). This will allow corrections and updates to be made in the next report (2020).

Taxa profiles

ORDER CHIROPTERA Blumenbach, 1779

330BC. *DERMAPTERA* Aristotle. - Comments: ca. 330 B.C. Non-Linnean but noted here for the sake of interest.

1767. *Vespertiliones* Pallas, Vespertiliones in genre. pp. 1–35, in Spicilegia Zoologica quibus novae imprimis et obscurae animalium species iconibus, descriptionibus atque commentariis illustrantur. Tomus 1. Fascicle Tertius. G. A. Lange, Berolini, Germany., 3. - Comments: Jackson and Groves (2015: 227) consider this as a synonym of Chiroptera. Originally, the name was proposed without rank, and included the genus *Vespertilio* Linnaeus, 1758.

*1779. *CHIROPTERA* Blumenbach, Handbuch der Naturgeschichte, 58. - Etymology: Neuter plural scientific Latin substantive made up of the Greek substantives, respectively feminine and neuter "*χείρ*" (kheír) [genitive "*χειρός*" (kheirós)] meaning "hand" and "*πτερόν*" (pterón) meaning "wing", or combined: "with the hand serving as a wing" or "with the hand changed into a wing" (see Lanza *et al.*, 2015: 13). - ZooBank: 06148AD8-596C-45A5-8756-74BCF5758557. (Current Combination)

1806. *Chiropteren* Duméril, Zoologie Analytique, 5, 11. - Comments: Jackson and Groves (2015: 227) indicate that Duméril introduced this "family" name to include the genera: *Galeopithecus* Pallas, 1780 [Order Dermoptera]; *Pteropus* Brisson, 1762; *Noctilio* Linnaeus, 1766; *Vespertilio* Linnaeus, 1758; *Rhinolophen* [= *Rhinolophus* Lacépède, 1799]; and *Phyllostomen* [= *Phyllostomus* Lacépède, 1799].

1815. *Chiropteria* Rafinesque, Analyse de la Nature., 51, 54. - Comments: Jackson and Groves (2015: 227) indicate that the name originally included the families Galeopia Rafinesque, 1815 [= Galeopithecidae Gray, 1821] and *Vespertilia* Rafinesque, 1815 [= Vespertilionidae J. Gray, 1821], and is an unjustified emendation of Chiroptera Blumenbach, 1779. (Emendation)

1816. *Cheiroptères* G. Cuvier, xxx, 121. - Comments: Originally proposed as family name and included the genera *Vespertilio* Linnaeus, 1758; *Pteropus* Brisson, 1762; *Cephalotes* É. Geoffroy, 1810 [= *Nyctimene* Borkhausen, 1797]; *Dysopes* Illiger, 1811: 122 [= *Molossus* É. Geoffroy, 1805]; *Noctilio* Linnaeus, 1766; *Phyllostoma* G. Cuvier, 1800 [= *Phyllostomus* Lacépède, 1799]; Les Megadermes [= *Megaderma* É. Geoffroy, 1810]; *Rhinolophus* Lacépède, 1799; *Nycteris* É. Geoffroy & G. Cuvier, 1795; *Thaphozous* [= *Taphozous* É. Geoffroy, 1818]; and *Plecotus* É. Geoffroy, 1818 (see Jackson and Groves, 2015: 227).

1821. *CHEIROPTERA* Gray, 299. - Comments: Proposed as a class, and originally included the orders Fructivorae J. Gray, 1821)[= Pteropodidae J. Gray, 1821] and Insectivorae J. Gray, 1821 [= Yangochiroptera Koopman, 1985 part] (see Jackson and Groves, 2015: 227). Synonymized with Chiroptera by McKenna and Bell (1997: 295).

1822. *CHEIROPTERA* Fleming, The Philosophy of Zoology, xxxii, 175. - Comments: Originally proposed as order and included the genera *Galeopithecus* Pallas, 1780 [Order Dermoptera (Illiger, 1811)]; *Pteropus* Brisson, 1762; *Cephalotes* É. Geoffroy, 1810b [= *Nyctimene* Borkhausen, 1797]; *Noctilio* Linnaeus, 1766; *Phyllostoma* G. Cuvier, 1800 [= *Phyllostomus* Lacépède, 1799]; *Molossus* É. Geoffroy, 1805; *Stenoderma* É. Geoffroy, 1818; *Rhinopoma* É. Geoffroy, 1818; *Rhinolophus* Lacépède, 1799; *Nycteris* É. Geoffroy and G. Cuvier, 1795; *Megaderma* É. Geoffroy, 1810; *Thaphozus* [sic = *Thaphozous*] Bowdich, 1821 [= *Taphozous* É. Geoffroy, 1818; *Vespertilio* Linnaeus, 1758; and *Plecotus* É. Geoffroy, 1818 (see Jackson and Groves, 2015: 227) . Synonymized with Chiroptera by McKenna and Bell (1997: 295).

1866. *Nycterides* Haeckel, Generelle Morphologie der Organismen., 2: clx. - Comments: *Nomen oblitum*. Jackson and Groves (2015: 227) indicated that this name was proposed as suborder for the "families" Gymnorrhina [= Gymnorhina Giebel, 1855] [= Yangochiroptera Koopman, 1985 part] (including the genera *Vespertilio, Dysopes, Noctilio*) and Histiorrhina [= Histiorhina Van der Hoeven, 1855] [= Rhinolophidae J. Gray, 1825] (including the genera *Rhinolophus, Megaderma, Phyllostoma*). McKenna and Bell (1997: 301) synonymized the name with Chiroptera.

1872. *ANIMALIVORA* Gill, Smiths. Misc. Coll., 11 (1): 16. - Comments: Proposed as a suborder, which originally included the following families: Desmodidae Bonaparte, 1845,

Phyllostomidae J. Gray, 1825, Mormopidae [= Mormoopidae de Saussure, 1860], Rhinolophidae J. Gray, 1825, Megadermidae Gill, 1872 [= Megadermatidae H. Allen, 1864], Vespertilionidae J. Gray, 1821, Molossidae Gervais, 1855 and Noctilionidae J. Gray, 1821 (see Jackson and Groves, 2015: 228). Generally synonymized with the Microchiroptera.

1875. *MICROCHIROPTERA* Dobson, Ann. Mag. nat. Hist., ser. 4, 16 (95): 346. - Comments: Originally included the families Rhinolophidae J. Gray, 1825, Nycteridae Van der Hoeven, 1855, Vespertilionidae J. Gray, 1821, Emballonuridae Gervais, 1855, and Phyllostomidae J. Gray, 1825 (Jackson and Groves (2015: 228). - Etymology: From neuter plural scientific Latin substantive made up of the Greek adjective "*μικρός*" (mikrós) meaning "small" and chiroptera, in opposition to Megachiroptera ("big Chiroptera") (see Lanza *et al.*, 2015: 18).

1883. *Chiropteri* de Rochebrune, Act. Soc. Linn. Bordeaux, 37: 87. - Comments: Unjustified emendation of Chiroptera Blumenbach, 1779. Originally included the families Pteropidae [= Pteropodidae J. Gray, 1821], Megadermidae Gill, 1872 [= Megadermatidae H. Allen, 1864], Nycteridae Van der Hoeven, 1855, Rhinolophidae J. Gray, 1825, Phyllorhinidae de Rochebrune, 1883 [= Hipposideridae Flower & Lydekker, 1891], Taphozoidae Jerdon, 1867 [= Emballonuridae Gervais, 1855b], Molossidae Gervais, 1855, and Vespertilionidae J. Gray, 1821 (see Jackson and Groves, 2015: 228). (Emendation)

1889. *Ptética* Ameghino, Actas Acad. Nac. Cien. Rep. Arg. Cór., 6: xxi, 44, 348. - Comments: Proposed as "Grand Seccion" and included the orders Prochiroptera Ameghino, 1889 and Chiroptera Blumenbach (see Jackson and Groves, 2015: 228). McKenna and Bell (1997: 295) synonymized the name with Chiroptera. Pre-occupied by *Ptetica* Saussure, 1884 (Orthoptera: Acrididae).

1985. *Yinochiroptera* Koopman, Bat Res. News, 25 (3/4): 26 (for 1984). - Comments: Proposed as infraorder and originally included the superfamilies Emballonuroidea Gervais, 1855 and Rhinolophoidea J. Gray, 1825 (Jackson and Groves, 2015: 228).

1994. *Chiropteriformes* Kinman, The Kinman System., 37. - Comments: Proposed as order. McKenna and Bell (1997: 295) synonymized this name with Chiroptera (Jackson and Groves, 2015: 228).

2014. *Vespertilioniformes* Zagorodniuk, Proc. Theriol. School, 12: 8.

TAXONOMY:

Higher classification of the Chiroptera follows Alonso-Zarazaga (2005), Eick *et al.* (2005), Hutcheon and Kirsch (2006), and Teeling *et al.* (2005).

The chiropteran monophyly/diphyly debate that raged over the last decade or so has been quelled by recent molecular studies (Stanhope *et al.*, 1992; Van Den Bussche *et al.*, 1998; Allard *et al.*, 1999; Miyamoto *et al.*, 2000; Murphy *et al.*, 2001a, 2001b; Liu *et al.*, 2001; Butler *et al.*, 2010; Amador *et al.*, 2016) that have unequivocally demonstrated bat monophyly, and thereby dispelled the "flying primate" hypothesis (e.g. Pettigrew, 1986). Molecular analyses reject any close relationship among bats, flying lemurs and tree shrews (once grouped in the cohort Archonta), and instead support a sister-taxon relationship between Chiroptera and Eulipotyphla (Murphy *et al.*, 2001a, 2001b), which together are the sister-group of the Fereuungulata clade (Nikaido *et al.*, 2001, Van Valen, 1979, Feijoo and Parada, 2017: 79), in the supercohort Laurasiatheria (also represented by carnivores, pangolins, cetartiodactyls and perissodactyls) (Murphy *et al.*, 2001a, 2001b; Madsen *et al.*, 2001; Eizirik *et al.*, 2001; Scalley *et al.*, 2001; Nikaido *et al.*, 2001; Springer *et al.*, 2001; Nery *et al.*, 2012; Tsagkogeorga *et al.*, 2013; Foley *et al.*, 2016). On of the most recent reviews (Chen *et al.*, 2017: 1998) suggests a close relationship between Chiroptera and Perissodactyla. The relationship between these two is mentioned as "plausible" by Esselstyn *et al.* (2017: 2308). However, based on neural findings on 38 mammalian species and 82 characters, Dell *et al.* (2010: 177) still suggest a diphyletic origin of Chiroptera with Megachiropterans being a sister-group of the primates.

Jackson and Groves (2015) present the following higher order subdivision for the Chiroptera:

Class Mammalia Linnaeus, 1758
Subclass Theria Parker and Haswell, 1897
Superlegion Trenchnotheria McKenna, 1975
Legion Yangotheria Chow and Rich, 1982
Sublegion Cladotheria McKenna, 1975
Infralegion Zatheria McKenna, 1975
Infraclass Tribosphenida McKenna, 1975
Supercohort Placentalia Bonaparte, 1838
Cohort Laurasiatheria Waddell et al., 1999
Subcohort Scrotifera Waddell et al., 1999
Order Chiroptera Blumenbach, 1779

They also provide an impressive historical overview of the content and synonyms of these divisions.

Studies using molecular techniques to investigate higher level relationships within Chiroptera have challenged the monophyly of Microchiroptera, as supported by morphological characters associated with laryngeal echolocation (see list of references in Simmons, 1994), and altered the traditional subordinal division of bats as Megachiroptera and Microchiroptera. Recent analyses of nuclear and mtDNA gene sequences (Teeling *et al.*, 2000; Springer *et al.*, 2001; Van Den Bussche *et al.*, 2002; Teeling *et al.*, 2002; 2003; Hoofer *et al.*, 2003; Hutcheon and Kirsch, 2004b; Teeling *et al.*, 2005; Eick *et al.*, 2005; Teeling *et al.*, 2000; Hahn and Nakhleh, 2015; Khwanmunee *et al.*, 2015; Amador *et al.*, 2016; Feijoo and Parada, 2017; Hawkins *et al.*, 2019) now strongly support an alliance of megachiropterans and rhinolophoids (excluding Nycteridae) in one suborder, and all other microbats and nycteriids in the other suborder. Although these independent studies identified similar subordinal groups, Teeling *et al.* (2002; 2003; 2005), Springer *et al.* (2001), Amrine-Madsen *et al.* (2003) and Tsagkogeorga *et al.* (2013: 2263) named the two rearranged Chiropteran suborders as: “Yinpterochiroptera” (including Pteropodidae, Rhinolophidae - includes Hipposideridae, Megadermatidae, Craseonycteridae and Rhinopomatidae) [Springer *et al.*, 2001, also include Nycteridae in the Yinpterochiroptera] and “Yangochiroptera” (including Emballonuridae, Nycteridae, Noctilionidae, Mormoopidae, Phyllostomidae, Natalidae, Furipteridae, Thyropteridae, Myzopodidae, Vespertilionidae, Mysctacinidae, and Molossidae), whereas Hutcheon and Kirsch (2004b; 2006) and Eick *et al.* (2005: 1876), following the Principal of Typification (International Code of Zoological Nomenclature, 1999), named the two Chiropteran suborders as: "Pteropodiformes" (including the Pteropodidae, Rhinolophidae, Hipposideridae, Megadermatidae, and Rhinopomatidae) and "Vespertilioniformes" (including Emballonuridae, Nycteridae, Noctilionidae, Mormoopidae, Phyllostomidae, Natalidae, Furipteridae, Thyropteridae, Myzopodidae, Vespertilionidae, Mystacinidae, Miniopteridae and Molossidae). These studies showing microbat paraphyly indicate that the complex suite of morphological innovations for nasal emission of laryngeal echolocation pulses found in rhinolophoid bats either evolved independently at least twice, or once with the subsequent loss in Pteropodidae (Simmons and Geisler, 1998; Springer *et al.*, 2001). This also has implications for the evolution of flight, where many features of flight and ventilation are either directly related or functionally correlated with echolocation (Teeling *et al.*, 2000). Hence, morphological characters previously suggested as synapomorphies of microchiropterans (e.g. features of the inner ear and post-cranial skeleton) have probably also evolved independently, together with the evolution of laryngeal echolocation (Teeling *et al.*, 2000).

Based on transcriptome RNA-seq data, Lei and Dong (2016: 1) estimate the split between Yinpterochiroptera and Yangochiroptera at around 63 MYA.

Teeling *et al.* (2000: 190) suggest two additional considerations that support the hypothesis that rhinolophids and megabats are more closely related: First, a sister-group relationship between these two rather than between megabats and all other chiropterans, reduces the duration of the implied ghost lineage for megabats from the early Eocene to the late Eocene. Second, both groups have distributions that are restricted to the Old World.

The subdivision into suborders "Pteropodiformes" and "Vespertilioniformes" is also supported by cytogentic data (Volleth *et al.*, 2011: 518), as the order of sub-segments in the HSA 4 homologous segment differs between members of both suborders.

Contrary to an earlier suggestion that included Furipteridae, Natalidae, Thyropteridae, and Myzopodidae in the Rhinolophoidea clade (Simmons and Geisler, 1998), the recent molecular studies have confirmed an expanded superfamily, Noctilionoidea, which includes the families Noctilionidae, Furipteridae, Phyllostomidae, Mormoopidae, Mystacinidae, and Thyropteridae (Teeling *et al.*, 2002; Hoofer *et al.*, 2003; Van Den Bussche and Hoofer, 2004b; Teeling *et al.*, 2005; Eick *et al.*, 2005). However, placement of some families is still controversial, since the results of Teeling *et al.*, 2005) showed good support for the basal position of Myzopodidae within Noctilionoidae, while those of (Hoofer *et al.* (2003) did not placed Myzopoda within the Noctilionoidae, but rather in a basal position to all other “yangochiropterans”; Emballonuridae (OR EMBALLONUROIDEA?), Vespertilionoidea, Noctilionoidea. While Eick *et al.* (2005) also indicated Myzopodidae to be basal to the Vespertilionoidea, Noctilionoidea and Emballonuroidea (see figure 1 in Eick *et al.*, 2005: 1874), their finding apparently had no significant nodal support and alternative topologies could not be rejected by the data (Eick *et al.*, 2005).

The other superfamilies recognised by the molecular studies are the Rhinolophoidea (including the families Rhinolophidae, Megadermatidae, Craseonycteridae, and Rhinopomatidae), Emballonuroidea (including the

families Emballonuridae and Nycteridae), and Vespertilionoidea (including the families Vespertilionidae, Molossidae, Natalidae, and Miniopteridae) (Eick *et al.*, 2005; Teeling *et al.*, 2005 [although no miniopterids were included in this study], Springer *et al.*, 2001; Hoofer *et al.*, 2003 [although no miniopterids were included in this study]). Springer *et al.* (2001) also recognised the superfamily Pteropodoidea.

Both Eick *et al.* (2005) and Teeling *et al.* (2005) also found similar sister taxa groups between the families, with Furipteridae and Noctilionidae (probably what was meant by Noctilionoidae in Eick *et al.* (2005)), and Nycteridae and Emballonuridae being sister taxa.

Many families can be diagnosed by unique morphological apomorphies and/or combinations of plesiomorphic and apomorphic features that strongly suggest monophyly (Miller, 1897; 1907; Hill, 1974a; Van Valen, 1979; Koopman, 1984b; 1994; Griffiths and Smith, 1991; Corbet and Hill, 1992; Griffiths *et al.*, 1992; Griffiths, 1994). The principal exception is Vespertilionidae, a diverse group that comprises between five and eight subfamilies in different classifications: Kerivoulinae, Miniopterinae, Murininae, Tomopeatinae, Vespertilioninae, Nyctophilinae (included within Vespertilioninae by Koopman (1994) and Volleth and Heller (1994)), Antrozoinae (named as a subfamily by Miller (1897) but subsequently included either within Nyctophilinae (e.g. Hill and Smith, 1984) or Vespertilioninae (e.g. Koopman, 1993a; 1994), and Myotinae (usually included as a tribe within Vespertilioninae (Koopman, 1994) but here raised to subfamily rank following the suggestion of Volleth and Heller (1994). The molecular work of Hoofer and Van Den Bussche (2003) suggested four subfamilies in the family Vespertilionidae: Vespertilioninae, Myotinae, Kerivoulinae and Murininae, with the subfamily Miniopterinae being elevated to family level, Miniopteridae. However, the intron results of Eick *et al.* (2005) were not able to reject or support alternative hypotheses that Miniopteridae was the sister taxa of Molossidae, and not the sister taxa of Vespertilionidae.

Based on upper molar morphology, Fracasso *et al.* (2011: 422) propose the following tree structure: The Icaronycteridae is positioned at the base, followed by three clades: Yinochiroptera, Noctilionoidea, Yangochiroptera. Within the Yinochiroptera, the Emballonuridae form the basal node, followed by Rhinopomatidae, Nycteridae, Megadermatidae, Rhinolophidae, and Hipposideridae. The Yangochiroptera have a basic split-up between the Nataloidea (including the Myzopodidae [at the base], Thyropteridae, and Furipteridae) and the group formed by the Antrozoinae, Mystacinidae, Molossidae (including Molossinae and Tomopeatinae), and Vespertilionidae (as a poorly supported monophyletic group, including Myotinae, Miniopterinae, Kerivoulinae, and Murininae).

If the suggestion to follow the format proposed for standardization of nomenclature of higher taxa by Alonso-Zarazaga (2005) is accepted for renaming of the suborders, then the suggested typified name for the order would be, VESPERTILIONIFORMES, from the oldest generic name of Vespertilio Linnaeus 1758.

Zagorodniuk (2014: 8) uses an alternative hierarchy, which starts with the Superorder Chiroptera, which contains the order Vespertilioniformes (Chiroptera auct.), which itself contains two suborders: Vespertilionimorpha (Yangochiroptera) and Pteropodimorpha (Yingochiroptera).

Known Chiroptera families:
† **Aegyptonycteridae** Simmons, Seiffert and Gunnell, 2016
† **Necromantidae** Sigé, 2011
† **Philisidae** Sigé, 1985
† Icaronycteridae Jepsen, 1966
† Archaeonycteridae Revilliod, 1917
† Onychonycteridae Simmons, Seymour, Habersetzer and Gunnell, 2008
† Palaeochiropterygidae Revilliod, 1917
† Hassianycteridae Habersetzer and Storch, 1987
† Mixopterygidae Maitre, 2008
† **Tanzanycteridida**e Gunnell, Jacobs, Herendeen, Head, Kowalski, Msuya, Mizambwa, Harrison, Habersetzer and Storch, 2003
Pteropodidae Gray, 1821
Hipposideridae Lydekker, 1891
Megadermatidae H. Allen, 1864
Rhinolophidae Gray, 1825
Rhinonycteridae J. E. Gray, 1866
Craseonycteridae Hill, 1974
Rhinopomatidae Dobson, 1872
Emballonuridae Gervais, 1855
Nycteridae Van der Hoeven, 1855
Myzopodidae Thomas, 1904
Mystacinidae Dobson, 1875
Phyllostomidae Gray, 1825
Mormoopidae Saussure, 1860
Noctilionidae Gray, 1821
Furipteridae Gray, 1866
Thyropteridae Miller, 1907
Natalidae Gray, 1866
Molossidae Gervais, 1856
Cistugonidae Lack, Roehrs, Stanley, Ruedi and Van den Bussche, 2010
Miniopteridae Dobson, 1875
Vespertilionidae Gray, 1821

Worldwide, six of the extant families (Pteropodidae, Rhinolophidae, Hipposideridae, Phyllostomatidae, Molossidae and Vespertilionidae) contain about 75 % of all species (see Shi and Rabosky, 2015: 1529).

COMMON NAMES:
Arabian: Bouchaara, Boujlida. Czech: letouni či netopýři, letaunové, ptákossavci, upírové, letouni lysoblaní. Dutch: Vleermuizen. English: Bats. French: Chauves-souris. German: Fledermäuse. Somalian: Fidmer, Fidmair, Auo-rnèr, Kibille, Kibillei, Kibil, Fid Mer, Sodan silli, Sod silli (see Lanza *et al.*, 2015: 13). Spanish (Castillian): Murcielagos. Swahili: Popo. Tanoboase (Ghana): ampane (singular), mmpane (plural) (see Ohemeng *et al.*, 2017: 184). Twi (Ghana): apan (singular), mmpan (plural).

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
The paleontological record of the Chiroptera in Africa, as in the world, is generally incomplete (Butler, 1978).

The first bats appeared somewhere in the Mid- to Late Cretaceous (about 88.7 million years ago), and the diversification began at about 74.9 to 63 MYA (Bininda-Emonds *et al.*, 2007: 509; Lovegrove, 2011: 152). However, dos Reis *et al.* (2012: 3494) situate the origin of the Chiroptera at 59.1 MYA, hence: after the Cretaceous-Paleogene event. Yu *et al.* (2014: 2204) suggest that the Chiroptera have an Asian origin and that there was rapid adaptive radiation from the emergence of crown bats until the Early Eocene Climatic Optimum. This was followed by a decreased diversification between 49 and 35 MYA, and another period of high diversification between 35 and 25 MYA.

Gunnell *et al.* (2017: 18) indicate that the earliest known bat fossiles came from Europe, India, North Africa and Australia (around 53 - 54 MYA), but they all represent archaic bat groups that have no clear phylogenetic connections with modern taxa. Modern familes of bats began to appear in the late early to middle Eocene of Europe and North Africa. They also pointed out (p. 1) that only 13 placental mammal genera first occurred in the middle to late Paleogene, of which six represented bats, including some extant genera belonging to both Yangochiroptera and Yinpterochiroptera.

The rapid diversification at the Paleocene-Eocene thermal maxiumum might have been the result of the large increase in insect abundance during that period (Eriksson, 2014: 175).

Springer *et al.* (2011: 2493) mention that the oldest bat fossils are from the Early Eocene of North America, and that further Early Eocene bats are also known from Europe, Africa and Australia. Most researchers seem to agree that bats originated in Laurasia, but some see Gondwana as the cradle for the Chiroptera. Teeling *et al.* (2005) [in Springer *et al.* (2011: 2493)] suggested North America or Laurasia as the ancestral area for bats, and Asia, Europe or Laurasia as the ancestral area for both Pteropodiformi (Yinpterochiroptera) and Vespertilioniformi (Yangochiroptera).

The oldest fossil bat described from Africa is: *Vampyravus* (= *Provampyrus*) *orientalis*, from the Oligocene of the Fayum (Egypt). However, in their abstract on an upper molar and two fragments of lower molars from El Kohol (Algeria), Ravel *et al.* (2010: 149) mention these belong to a member of the "Eochiroptera" (sensu Van Valen, 1979), dating back to the Early Eocene. Ravel *et al.* (2016: 359) indicate that these "Eochiroptera" cover six families (Onychonycteridae Simmons, Seymour, Habersetzer and Gunnell, 2008, Icaronycteridae Jepsen, 1966, Archaeonycteridae Revilliod, 1917, Hassianycteridae Habersetzer and Storch, 1987, Palaeochiropterygidae Revilliod, 1917, and Tanzanycteridae Gunnell, Jacobs, Herendeen, Head, Kowalski, Msuya, Mizambwa, Harrison, Habersetzer and Storch, 2003), none of which are related to the current day families. The oldest of the current day families start to appear in the lower Eocene of Africa, whereas on the other continents they only appeared in the middle Eocene (and even in the upper Eocene of Australia). This points to the great importance of Africa during the first phase of the development of modern bats (Ravel *et al.*, 2016: 359).

Hildebrand *et al.* (2010: 268, 281) recorded unknown bat species from the Kumali and Koka sites in southern Ethiopia.

CONSERVATION STATUS:
Worldwide, Amori *et al.* (2013: 98) state that 177 out of 1,116 bat species reported by Wilson and Reeder (2005) or 15.39 % have an IUCN status of CR, E, or VU.

MAJOR THREATS:
Sherwin *et al.* (2012: 173) [referring to Ciechanowski *et al.*, 2007] indicate that aerial-hawking species are probably more sensitive to climatic changes as they are dependent of a food supply that is extremely variable in time as well as in space. This is less the case for species foraging above water surfaces, as they rely on stable and spatially concentrated food resources. "Water

Stress" will become an important climatic change risk factor for species living in arid regions, as they depend on permanent water resources close to roosts (see Adams and Hayes, 2008 [in Sherwin *et al.* (2012: 173)]).

For southern Africa, Pio *et al.* (2014: 1543) predict that high concentrations of phylogenetic diversity (PD) will contract considerably by 2080, but that climate change will not result in higher nor lower PD losses, on average, compared to random extinction simulations. They also indicated (p. 1546) that the Kalahari will become very barren in terms of future surviving bat PD.

For the Mediterranean area, Maiorano *et al.* (2011: Table S2) predict that none of the presently occurring species will be extinct by the end of the century, but up to five of the Vespertilionid species might encounter a projected range loss of over 80 %. Between two and fifteen species will probably see a loss between 50 and 80 %, which will also be the case for four of the Rhinolophid species. Between four and eleven of the Vespertilionid species will encounter a loss of between 30 and 50 % of their range, which will also be the case for up to two of the Rhinolophid species. All bat families will contain species which will have a range loss of up to 30 %. One of the Hipposiderid species, one or both of the Rhinopomatid species, and one or two of the Vespertilionid species, however, will gain from the changing.

O'Shea *et al.* (2016) reviewed multiple mortality events in bats and identifed nineteen events for Africa: Intentional killing (n = 11), Biotic (n = 5), Accidental (n = 1), Wind Turbines (n = 1), Viral or bacterial disease (n = 1).

Some bat populations are killed to prevent them spreading viral diseases. However; Plowright *et al.* (2016: 16) mention that "culling bats may decrease spillover risk if transmission of the virus increases as population size increases (SIR [susceptible-infectious-recovered] dynamics), whereas culling may increase spillover risk if pulses are driven by viral reactivation after stress (SILI [susceptible-infectious-latent-infectious] dynamics)."

BIOGEOGRAPHY:
Maas *et al.* (2015: 1086) indicate that the Afrotropics (roughly Africa south of the Sahara) is certainly not the most specious zoogeographical region (the Neotropics has 100 species more), but it has with 211 out of 237 species the highest percentage of endemics (89 %), versus 75 % in the second region (Neotropics).

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Lucati and López-Baucells (2016: 117) provided a summary of chromatic disorders reported in bats and found that this character is underreported for Africa: Albinism (All-white hairs, pale skin and red eyes) is reported from five localities on the African continent and one in Réunion and Piedbaldism (All-white fur/skin patches, eyes always normally coloured) from two on the continent. Other disorders, such as Melanism (Increase in black or brown pigmentation on the whole body), Partial melanism (Increase in black or brown pigmentation on a part of the body), Leucism (All-white or whitish hairs, pale skin, eyes always normally coloured.) and Hypomelanism (Beige, golden, yellowish or reddish fur and skin, eyes always normally coloured) weren't reported from Africa at all.

Delmore *et al.* (2018: 127) studied the pigmentation of the tissues surrounding the testes and suggest that scrotal melanin may protect mature sperm from UV damage, and from oxidative damage in species with male sperm storage.

DETAILED MORPHOLOGY:
Bahlman *et al.* (2016: 118) provide a schematic overview of the wing joints and musculature of the various bat families.

FUNCTIONAL MORPHOLOGY:
Adams and Carter (2017) studied the climbing and walking locomotion of a number of Pteropodids and Vespertilionids and found fundamental differences. The Pteropodids had a far greater ability to climb in a head-up posture than the Vespertilionids, whereas the situation was quite the inverse when walking on the ground was compared. The Pteropodids behaved much more like other arboreal mammals (e.g. two-toed sloths - *Choloepus hoffmanni* Peters, 1858).

ECHOLOCATION:
Fenton (1994: 28) states "Echolocation profoundly affects the biology of bats, their behaviour and ecology and may have been central to their evolution".

MOLECULAR BIOLOGY:
The following statement has been made by Dell *et al.* (2013: 65): "So DNA sequence results in bats may have to be accepted with caution in view of the possibility that DNA is perhaps as susceptible to convergent evolution as morphological systems.", indicating that the results of these state-of-the-art techniques need to be interpreted with caution.

Dool *et al.* (2016a: 196) furthermore suggest: "We caution against the indiscriminate use of mtDNA in phylogenetic studies and advocate for pilot studies to select nuclear introns. The selection of marker type and number is a crucial step that is best based on critical examination of preliminary or previously published data. Based on our findings and previous publications, we recommend the following markers to recover phylogenetic relationships between recently diverged taxa (< 20 My) in bats and other mammals: ACOX2, COPS7A, BGN, ROGDI and STAT5A."

HABITAT:
Reardon and Schoeman (2017: 273) investigated the taxonomic and functional diversity of the assemblage structure of insectivorous bat communities along the Mount Nimba elevational gradient in view of rising global temperatures. They found that there was a taxonomic shift along the gradient, but that functionally, the assemblage remained largely intact.

In their study on the bat fauna of the southern African arid region, Monadjem *et al.* (2017a: 5) found that at a regional scale, landscape features might be more relevant for bats living in arid regions, as oposed to aridity gradients. They also found that open air foragers are restricted in the southern African arid region, although they could not determine the factor behind this. Furthermore, they were unable to determine the ecosystem services provided by bats in arid environment (as opposed to limiting pest insects in agro-ecosystems).

DIET:
Many bats feed on pest insects, e.g. stink bugs. Taylor *et al.* (2017a: 376) indicated that the percentage of Hemiptera in the diet of bats (at Levubu, RSA) varied between 6-20 % in *Nycteris thebaica* to 50 % in *Pipistrellus hesperidus*. They also calculated (p. 378) that the South African madacamia industry (covering about 25,000 ha) avoided a yearly cost between 56.81 and 138.91 USD/hectare as a result of this.

PREDATORS:
Black *et al.* (1979: 19) reported that the prey of a bat hawk (*Macheiramphus alcinus* Bonaparte, 1850) observed in Zambia most likely consisted of *Cloeotis percivali, Rhinolophus simulator, Hipposideros caffer*, and *Nycteris thebaica*.

Mikula *et al.* (2016: Supplemental data) mention the following birds preying on unspecified bats: Frances's sparrowhawk (*Accipiter francesiae* Smith, 1834), Rufous-breasted sparrowhawk (*Accipiter rufiventris* Smith, 1830), Ovambo sparrowhawk (*Accipiter ovampensis* Gurney, 1875) [on large bat], Tawny eagle (*Aquila rapax* (Temminck, 1828)), Mountain buzzard (*Buteo oreophilus* Hartert and Neumann, 1914), African marsh harrier (*Circus ranivorus* Daudin, 1800), Sooty falcon (*Falco concolor* Temminck, 1825) [on insectivorous bats], African hobby (*Falco cuvierii* Smith, 1830), Dickinson's kestrel (*Falco dickinsoni* Sclater, 1864) [on small insectivorous bat], Taita falcon (*Falco fasciinucha* Reichenow & Neumann, 1895); Lilac-breasted roller (*Coracias caudata* Linnaeus, 1766) [on insectivorous bat], Brown-hooded kingfisher (*Halcyon albiventris* (Scopoli, 1786)) [on insectivorous bat], Woodland kingfisher (*Halcyon senegalensis* (Linnaeus, 1766)), Southern grey shrike (*Lanius meridionalis* (Temminck, 1820)), Gabar goshawk (*Micronisus gabar* (Daudin, 1800)), Green wood hoopoe (*Phoeniculus purpureus* (J.F. Miller, 1784)), Long-tailed hawk (*Urotriorchis macrourus* (Hartlaub, 1855)).

Tapanes *et al.* (2016: 405, 406) indicate that several primates prey on bats: *Pan paniscus* Schwarz, 1929 (Bonobo); *Papio anubis* (Lesson, 1827) (olive baboon, Anubis baboon); *Perodicticus potto* (Statius Müller, 1766) (Potto); *Cercopithecus mitis* Wolf, 1822 (Blue monkey) and a *C. mitis* x *C. ascanius* hybrid. These observations suggest an alternative pathway for bat-*Cercopithecus* disease transmission that has implications for zoonotic disease transmission to humans. Of the 13 bat predations they observed, three were on Pteropodidae and one on Molossidae. In four addional events, the bats were small (13 - 18 cm body length) and one large (ca. 50 cm wingspan).

ACTIVITY AND BEHAVIOUR:
Schoeman (2015: 122, 125) classified South African insectivorous bats in three functional urban groups (based on wing and echolocation characteristics and foraging and/or roosting characteristics):

1) **urban avoiders** - slow-flying bats that typically hunt prey in forests or dense vegetation and have specific roosting requirements such as obligate cave roosters (e.g. *Nycteris thebaica, Rhinolophus simulator*);

2) **urban adapters** - bats that forage mainly along forest edges and adjacent open areas, and readily utilize favorable conditions provided by humans, for example, forage at wastewater treatment plants and/or roost in man-made structures or plants in gardens (e.g. *Miniopterus natalensis, Neoromicia capensis, Neoromicia nana, Pipistrellus hesperidus/Hypsugo anchietai, Taphozous mauritianus*).

3) **urban exploiters** - fast-flying, open-air bats often recorded in urbanized landscapes that depend to a certain degree on urban resources such as houses that provide suitable roosting sites and can sustain large bat colonies (e.g. *Chaerephon pumilus, Mops condylurus, Otomops martiensseni, Scotophilus dinganii, Tadarida aegyptiaca*).

PARASITES:

HEMOSPORIDIA:

Perkins and Schaer (2016: 776) provide an overview of the malaria parasites of bats, which include nine genera, of which the most important ones are: *Hepatocystis, Polychromophilus, Nycteria*, and *Plasmodium* (the others are: *Bioccala*, Biguetiella*, Sprattiella*, Johnsprentia**, and *Dionisia* - *: not in Africa).

Killick-Kendrick (1973: 647) mentions *Plasmodium* (*Vinckea*) *voltaicum* Van Der Kaay, 1964 from a non-specified bat. Makanga *et al.* (2017: Suppl.) refers to an *Anopheles marshalli* infected with *Polychromophilus melanipherus*, which it could only have received from sucking blood of a bat.

Rudoler *et al.* (2018: 392) found four species of *Plasmodium* in pools of blood from various Ugandan bats: *P. berghei* Vincke and Lips, 1948 , *P. falciparum* Welch, 1897, *P. yoelii* Landau, Michel and Adam, 1868 and *P. chabaudi* Landau, 1965.

TREMATODA

Richard (1966: 416) described *Acanthatrium (Acaisthatrium) houini* from an unidentified bat from Ranomafana (Madagascar).

HEMIPTERA

Cimicidae: *Loxaspis miranda* Rothschild 1912 from Gogrial, Sudan, but no host given (Haeselbarth *et al.*, 1966: 10). *Cacodmus ignotus* Rothschild 1912 described from a single female without locality data, and a subsequent collection is reported from Uganda (Haeselbarth *et al.*, 1966: 10). In the British Museum there are also specimens of *Cacodmus sparsilis* Rothschild 1914 from Pietermaritzbrug, South Africa, without host records (Haeselbarth *et al.*, 1966: 10). *Aphrania barys* Jordan and Rothschild 1912 described from Maseru, Lesotho, host is not known (Haeselbarth *et al.*, 1966: 11). *Aphrania recta* Ferris and Usinger 1957 described from Mutir, Uganda, and another record from Mabal, Congo, but hosts unknown (Haeselbarth *et al.*, 1966: 11-12). *Leptocimex boueti* (Brumpt 1910) has been recorded from a few places in Guinea, the northern Gold Coast, Upper Volta, Dahomey and the former French Sudan, where it was found biting humans, the hosts are bats but no definite species (Haeselbarth *et al.*, 1966: 13). *Stricticimex antennatus* Ferris and Usinger 1957, found in the Cape Province, South Africa in caves at Bredasdorp and Three Sister's Rocks, the host-bat not recorded (Haeselbarth *et al.*, 1966: 14). *Strictimex brevispinosus* Usinger 1959, found in a cave near Lake Victoria, Urundi associated with unidentified bat (Haeselbarth *et al.*, 1966: 14). *Strictimex intermedius* Ferris and Usinger 1959, was recorded from a cave near Mombasa, Kenya, the host not recorded (Haeselbarth *et al.*, 1966: 14). *Stricticimex transverses* Ferris and Usinger 1957 was originally described from an unknown bat from Bloemfontein, South Africa (Haeselbarth *et al.*, 1966: 14).

Polyctenidae: *Eoctenes intermedius* (Speiser 1904) found on an unidentified bat in the Sudan (Haeselbarth *et al.*, 1966: 16). *Androctenes horvathi* Jordan 1912 described form an unidentified bat in Somalia (Haeselbarth *et al.*, 1966: 17).

DIPTERA

Streblidae: *Raymondia huberi* Frauenfeld 1856 from unidentified bat in the Rukwa Valley, Tanzania (Haeselbarth *et al.*, 1966: 102). *Raymondia setosa* Jobling 1930 collected from a "broad-eared bat" at Aden (Haeselbarth *et al.*, 1966: 104). *Raymondiodes leleupi* Jobling 1954 described form a poorly identified bat (*Hipposideros caffer* or *Miniopterus* sp.) from Thysville, Congo (Haeselbarth *et al.*, 1966: 104). Shapiro *et al.* (2016: 255) indicates that Kessel (1925: 24) mentions *Raymondia lobulata* Speiser, 1900 "off *Megaderma lyra* from Ceylon, from bats in Madras and British Somaliland".

Nycteribiidae: *Nycteribia hoogstraali* Theodor 1957 from the Congo and Tanzania host unidentified (Haeselbarth *et al.*, 1966: 109). *Basilia meridionalis* Theodor 1956 host and exact locality not recorded from South Africa (Haeselbarth *et al.*, 1966: 111). *Basilia bouvieri* (Falcoz, 1924) originally described without exact locality (West Africa) or host (Haeselbarth *et al.*, 1966: 111). *Basilia glabra* Theodor 1957 from Aruwimi province in the Congo, but no host is given (Haeselbarth *et al.*, 1966: 112). *Dipseliopoda arcuata* Theodor 1955, collected from an unknown bat at Addis Ababa, Ethiopia (Haeselbarth *et al.*, 1966: 115).

When studying the Nycteribiid abundance on fruit bats and insectivorous bats, Luguterah and Lawer (2015: 4) found that fruit bats were much more infested than insectivorous bats. This could be the result of fruit bats being poorer in nitrogen, which leads to a lack of protein, which in turn inhibits the proper functioning of the immune system. Another explanation might be that insectivorous bats

capture their prey on the wing and as such minimize contact with contaminated surfaces.

Szentivanyi *et al.* (2017: 182) found that bat fly species showed a higher diversity towards the equator, and also that bat species assigned to the IUCN LC category hosted a larger number of bat fly specimens than bats assigned to the VU category.

SIPHONAPTERA
Pulicidae: *Echidnophaga aethiops* Jordan and Rothschild 1906 host recorded as unidentified Chiroptera and locality not mentioned (Haeselbarth *et al.*, 1966: 135).
Ischnopsyllidae: *Dampfia grahami equatoris* Smit 1954 found on a 'small insectivorous bat' in the Kivu district of the Congo (Haeselbarth *et al.*, 1966: 187).

ARACHNIDA
Argasidae: Morel and Mouchet (1965: 492) report the presence of *Carios vespertilionis* Latreille, 1796 and *Carios boueti* Roubaud and Colas-Belcour 1933 on non-specified bats in Cameroun.

ACARI
Trombiculidae: Stekolnikov (2018a: 33) reported *Schoengastiella vattierae* (Taufflieb, 1964) from unidentified bats from the Central African Republic. He also indicated (p. 116) that *Trisetica aethiopica* (Hirst, 1926) was described from a non specified bat, and that he found (p. 157) *Microtrombicula machadoi* Taufflieb, 1965.

VIRUSES:
Luis *et al.* (2013, 2015) and O'Shea *et al.* (2014: 741) indicate that bats are more likely to be infected with more zoonotic viruses per host species than were rodents, and therefore adding weight to the suggestion that bats might in some way be unique as sources of emerging zoonoses. Luis *et al.* (2015) found that gregarious bats are more likely to share more viruses and regionally migrating bats are important for spreading viruses through the "viral sharing network". O'Shea *et al.* (2014: 742) also indicate that body temperatures of flying bats are elevated (in the range of typical fever temperatures), and they suggest that these daily high temperatures might arm bats against some pathogens during the early stages of infection. This hypothesis, however, was rejected by Schountz *et al.* (2017: 2) as fever response to a virus infection is much more complex than simply raising the body temperature. These authors also point to the "allways on" IFN (interferon) system and the immunoglobulin repertoires of bats.

Reusken and Heyman (2013: 99) [referring to Weiss *et al.* (2012b)] indicate that bats might be the primordial reservoir for the majority of viruses pathogenic to humans. Brierley *et al.* (2016: "5") report that - based on viral richness alone - the risk of bat-human virus sharing showed prominent hotspots in Central/South America, sub-Saharan Africa, and parts of Southeast Asia. Yinda *et al.* (2019) analysed the gut virome of Cameroonians and found a genetic relatedness between orthoreovirus, picobirnavirus and smacovirus found in humans and those of bats and/or other animals.

The accounts below represent only viruses where the host (e.g. bat) is unknown. For further information see taxa accounts where the virus is associated with a particular taxon. Also see Chen *et al.* (2014: 1) for an online database on bat-associated viruses. Furthermore, Moratelli and Calisher (2015: suppl. Table II) provide an overview of bat host genera and their associated virus genera, and Young and Olival (2016: suppl. Table S2) provide details on species level for both bat hosts and viruses.

Astroviridae
From a study on 962 bats (*Hipposideros* cf. *ruber, Hipposideros gigas, Coleura afra, Miniopterus inflatus*, and *Rousettus aegyptiacus*) from Gabon, Rougeron *et al.* (2016: 386) found that bat astroviruses form a group that is genetically distinct from astroviruses infecting other mammals (including humans). These viruses also showed an important genetic diversity and low host restriction in bat species.

Bunyaviridae
Hantavirus
Gu *et al.* (2014: 1904) argue that primordial hantaviruses may have emerged in an early common ancestor for all bats as bat species hosting these viruses belong to both currently accepted suborders of the Chiroptera (Pteropodiformi [Hipposideridae + Rhinolophidae] and Vespertilioniformi [Nycteridae + Vespertilionidae]). This led Yanagihara *et al.* (2014: 9) to suggest that primordial hantaviruses may have infected an early common ancestor of bats. Yanagihara *et al.* (2014: 9) also indicate that the five known bat hantaviruses are among the most genetically diverse described to date.

Coronaviridae - Coronaviruses
Severe Acute Respiratory Syndrome-associated coronavirus (SARS-CoV or hu-SARS-CoV) - Balboni *et al.* (2012: 8) indicate that SARS-like CoVs have possibly originated in Africa as the viruses themselves has been found in several species of the genera *Hipposideros* and *Chaerephon*, and antibodies against SARS-CoV antigens have been found in *Hypsignathus,*

Lyssonycteris, Miniopterus, Mops, Myonycteris, Rhinolophus and *Rousettus* species.

Specifically for Coronaviruses worldwide, Anthony *et al.* (2017b: 7) found that a large number of bat host species were not infected by these viruses, but they also remarked that none of these species were sampled extensively. They found that all species with sample sizes >110 individuals were positive for one or more CoVs, suggesting that CoVs may be detected in some of the negative species if sampling effort were increased. They also calculated (p. 9) that with 154 host individuals, an average of one CoV would be detected, and with 397 individuals, up to five CoVs would be detected. As they did not find any bat species with more than five viral sequence clusters, sampling 397 bats should capture all of the CoVs in a specific bat species.

Filoviridae - Filo viruses

Han *et al.* (2016) reported on traits that discriminate host and non-host (=filovirus-positive) bat species, and they provide a list of bat species most likely to be filovirus-positive on the basis of intrinsic trait similarity with known filovirus-positive bats (See also Sylla *et al.*, 2015).

In their study, Schuh *et al.* (2017c) point to the accumulating number of links between filovirus hemorrhagic fever (FHF) index cases and prior exposure to environments inhabited by bats.

Marburgvirus

Peterson and Holder, 2012: 1831) analyzed fifteen Marburg virus sequences from bats, and found no indication from the topology of the tree or the branch lengths that the bat-derived filoviruses represent a population distinct from viruses collected from human outbreaks. They suggest that bat sequences do not form a monophyletic group, nor are they associated with long or “deep” branches in the tree. This situation could indicate that the bats are the reservoir population, or that high gene flow exists between virus populations in bats and those in some other taxon (see Towner *et al.*, 2009). Given the short sequence lengths obtained from bat filovirus (about 302 nucleotides of the VP35 gene for most samples), it is also possible that Peterson and Holder, 2012: 1831) lacked the power to detect subtle evidence for population structuring. Thus, firm conclusions about gene flow between the "bat" filovirus populations and the true source of human infections will require more data.

Ebola virus

Most papers related to Ebola (e.g. Alexander *et al.*, 2015) do not provide any details on the bat species involved ("fruit bats", "possibly fruit bats") or refer to the "usual suspects" (*Myonycteris torquata, Hypsignathus monstrosus, Eidolon helvum*". Murray (2015: 802) indicates that the transmission of Ebola virus from bats to humans must be uncommon because the potential reservoir of Ebola virus is huge. Buceta and Johnson (2017) provide a model of the Ebola zoonotic dynamics suggesting a bidirectional coupling between the available resources and the dynamics of the bat population, and indicating that environmental pressure is the main driving force for bats' migration. Based on the fact that the human sero-positive zone is wider than the distribution area of *M. torquata, H. monstrosus* and *E. franqueti*, Formella and Gatherer (2016: 3125) suggest that *E. helvum*, which has a wider distribution, may be involved. They also point out that some (early) Ebola outbreaks, which lie beyond the distribution range of the fruit bats, may have been overlooked.

An extensive survey of Ebola viruses in 4,022 bats from Guinea, Cameroon and the DRC by De Nys *et al.* (2018) showed antibodies in *Mops* sp., *Eidolon helvum*, *Epomophorus* sp., *Hypsignathus monstrosus, Lissonycteris angolensis, Micropteropus pusillus* and *Rousettus aegyptiacus*. No antibodies were found in *Hipposideros* sp., *Miniopterus* sp., *Chaerephon* sp., *Nycteris* sp., *Rhinolophus* sp., *Glauconycteris* sp., *Kerivoula* sp., *Myotis bocagii*, *Neoromicia* sp., *Scotophilus* sp., *Epomops* sp., *Megaloglossus woermanni*, *Myonycteris torquata* or *Scotonycteris zenkeri*.

A phylogenetic analysis, combined with phylogeographical data led Hassanin *et al.* (2016: 518) to conclude that only three bat species are able to disperse directly ZEBOV (Zaire Ebola) from the Congo Basin to Upper Guinea: *E. helvum, H. monstrosus*, and *R. aegyptiacus*.

de La Vega *et al.* (2015: 6) [referring to Biek *et al.* (2006)] indicate that the L gene of bat-derived EBOV showed that it could have recently experienced a genetic bottleneck-type event. Biek *et al.* (2006) proposed a number of scenario's, of which the first suggests that the bat population (around 1999 when the most recent common ancestor to all currently known Ebola viruses existed) decreased significantly, causing a reduction in the viral population size. A second scenario suggested that infected bats could have introduced EBOV in the region near Congo and Gabon circa 1999, and a final scenario is that the the fruit bat species identified by Leroy *et al.* (2005) is not the primary reservoir, and that EBOV was possibly introduced by another (bat) species.

Analysing the outbreak data and the distribution area of the various bat species, made Pigott *et al.*

(2016: 2) select four species of bats as explaining more of the variation than the rest: *Hypsignathus monstrosus, Epomops franqueti* (from both of which Ebolavirus RNA has been isolated), *Otomops martiensseni* and *Epomophorus labiatus* (both identified through trait-based machine learning approaches as being similar to species already reporting filoviral infection, as suggested by Han *et al.* (2016)).

However, Leendertz (2016: 1) finds it questionable whether these viruses are circulating regularly in bat populations as both fruit and insectivorous bats have a long lifespan and can fly over large distances, which means that seropositive specimens could be sampled for a long period of time and at large distances from the place where they could have been exposed to the Ebolavirus. Furthermore, the various types of Ebola seem to be linked with different river basins, which do not form barriers for fruit bats. She furthermore suggests to look at insects (e.g. mayflies) as possible vectors. Additionally, Spengler *et al.* (2016: 958) point out that EBOV has yet to be isolated in nature from any bat species (or non-human primates). Furthermore, EFSA AHAW Panel (EFSA Panel on Animal Health and W (2017: 6) remark that natural shedding of the virus has not been reported and that the suspected links between bats and human outbreaks have not been confirmed and further research is necessary to confirm or identify reservoir species. A similar conclusion is drawn by Holmes *et al.* (2016: 198), who indicate that it is likely that other host species exist, which may have a major bearing on epidemiological dynamics.

Gale (2017: 1678) argues that although previous studies failed to detect the presence of EBOV in arthropods, these studies might not have included the correct arthropod species: "This is because filoviruses are not 'arboviruses' in the sense that arboviruses are transmitted in a defined cycle which alternates between the vertebrate host and the arthropod vector. Instead, filovirus transmission pathways appear to be more random in terms of host species. Indeed, if these arthropod species were the reservoir for EBOV, then EBOV would be an arbovirus with a vertebrate host defined by the host preference of the arthropod." If an arthropod is the intermediate host, then an insectivorous bat would rather be the host than any of the Pteropodids. Gale (2017: 1678) also indicates that the higher body temperature of the bat (40°C in *Mops condylurus*, compared to that of an arthropod, which is the ambient temperature) would activate the virus reproduction in the bat, and hence, its increased probablity to infect humans. However, the bats will still need to ingest a large quantity of the virus to start off with, but this could happen during an ephemeral mass emergence of mayflies.

Li *et al.* (2016: 127) also pointed out that as large quantities of bat meat are consumed every year, the virus must be very rare in its reservoir, otherwise more frequent outbreaks of the virus would be observed, which led them to the suggestion that strict restrictions on bushmeat are not recommended for local citizens.

Leendertz *et al.* (2015: 22) suggest that bats are intermediate hosts, which are occasionally exposed via another intermediate host or unknown reservoir and that viral emergence might be more related to environmental factors and other hosts than bats themselves. See also Caron *et al.* (2018: 5) who discuss a number of hypothetical transmission pathways between a maintenance host of EBOV and bats: Air-borne, vector-borne, food-borne (insects or fruits), water-borne, direct and environmental.

Dick and Dittmar (2014: 150) indicate that nycteribiid and streblid bat flies are known to infest the above mentioned fruit bats. These flies readily move from bat to bat, feeding on multiple individuals during the course of days and weeks. Possibly, the flies can uptake viral pathogens, which might remain viable within bat flies. If this is the case, host-specific flies can transfer such viruses among host bats within a population.

Babayan *et al.* (2018: 578) worked out a model that analyses virus genomes and links these to probable reservoir hosts. For the four Ebolavirues, the model showed greater support for Pteropodiformi as reservoir than Vespertilioniformi, but Bundibugyo and Tai Forest ebolaviruses had equal or stronger support for primate reservoirs.

Analysing the literature data, Ponce *et al.* (2019: 3133) pointed out that for only three of the 23 outbreaks (13.0 %) the source animal was confirmed in a laboratory. Of the suspected source animals, 10 were primates and six bats (with three fruit bats and three insectivorous bats).

On 24 January 2019, a series of newspaper articles was published, where several scientists from EcoHealth Alliance were quoted (Simon J. Anthony, Jonathan Epstein) stating that in a mouth swab one Liberian *Miniopterus inflatus* (out of 150 tested) RNA material of the Zaire Ebolavirus was found. Epstein, however, pointed out that if the bat was a natural host for the virus, it would have been found in more than one bat. He also pointed out that the bat could have become infected by another bat species living in the same habitat.

Fabian Leendertz (veterinary epidemiologist at the Robert Koch Institute - not involved in the study) indicated that the virus itself wasn't isolated but only about one-fifth of its genome (Grady, 2019; Kupferschmidt, 2019; Su, 2019).

Rhabdoviridae
Lyssavirus - Rabies related viruses
Munang'andu *et al.* (2011: 23) summarize rabies status in Zambia for the period 1985-2004, where only one single case is reported from an unidentified bat. See Adedeji *et al.* (2010) for an overview of the history, and epidemiology of rabies and rabies-like viruses.

DUV - In 2007 a bat flew against the face of a Dutch woman in Tsavo West National Park in Kenya. She noticed two superficial bleeding wounds. Twenty-three days after the incidence she presented herself with symptoms in a hospital in the Netherlands and died of rabies. The virus was identified as Duvenhage virus (Van Thiel *et al.*, 2009).

UTILISATION:
Kamins *et al.* (2011b: S102) report that in southeastern Ghana nearly one half of the population may eat bats, although bats do not appear in other studies on wildlife meat markets.

ANTHROPOPHILOUS:
Willett (1988) discusses the use of bat symbols in West African art.

ZOOBANK:

†Family AEGYPTONYCTERIDAE Simmons, Seiffert and Gunnell, 2016

*2016. *Aegyptonycteridae* Simmons, Seiffert and Gunnell, Am. Mus. Novit., 3857: 4, 8. Publication date: 9 May 2016. - Comments: Type genus *Aegyptonycteris* Simmons, Seiffert and Gunnell 2016.

TAXONOMY:
The supra-familial relationships for this family are yet unknown.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
These fossil bats have a late Eocene (Priabonian, ca. 37 Mya) age.

†Genus *Aegyptonycteris* Simmons, Seiffert and Gunnell, 2016

*2016. *Aegyptonycteris* Simmons, Seiffert and Gunnell, Am. Mus. Novit., 3857: 6, 8. Publication date: 9 May 2016. - Etymology: From *Aegyptus*, Latinized Greek for "Egypt," and nycteris, Greek for "bat." The genus name refers to the country in which this new taxon was discovered (Simmons *et al.*, 2016: 8).

†*Aegyptonycteris knightae* Simmons, Seiffert and Gunnell, 2016

*2016. *Aegyptonycteris knightae* Simmons, Seiffert and Gunnell, Am. Mus. Novit., 3857: 6 8, figs 3 - 5. Publication date: 9 May 2016. Type locality: Egypt: Western Desert: Fayum Depression, Birket Qarun Formation: Fayum Quarry BQ-2: 23 m level [Goto Description]. Holotype: CGM 83740: Collected by: ?: Collector Unknown. Presented/Donated by: ?: Collector Unknown. Fragment of right maxilla with M2 and M3 (see: Simmons *et al.*, 2016: 8). - Etymology: Named in honour of Mary Knight, Managing Editor of the American Museum of Natural History Scientific Publications, in recognition of the enormous contributions she has made to dissemination of the results of scientific research over the years, as well as her lifelong devotion to the people and culture of Egypt (Simmons *et al.*, 2016: 8).

COMMON NAMES:
Dutch: Knight's Egyptische vleermuis. English: Knight's Egyptian bat

†Family NECROMANTIDAE Sigé, 2011

*2011. *Necromantidae* Sigé, Bull. Soc. Hist. Nat. Toulouse, 147: xxx.. - Comments: Type genus †*Necromantis* Weithofer, 1887.

†Genus ***Necromantis*** Weithofer, 1887

1888. *Necromanter* Lydekker, Zool. Rec., London, 71 - 56 [for 1887].
*1888. *Necromantis* Weithofer, Sber. Akad. Wiss. Wien, math. naturw. Kl., 96 (1) 5: 353 (for 1887).
1903. *Necronycteris* Palmer, Science, N.S. 17: 873.. Publication date: 29 May 1903.

†***Necromantis fragmentum*** (Ravel, 2016)

*2016. *?Necromantis fragmentum* Ravel, in: Ravel et al., Geodiversitas, 38 (3): 356, 363, figs 4, 5. Publication date: 30 September 2016. Type locality: Tunisia: Kassérine province: Djebel Chambi National Park: Chambi [35 14 03 N 08 45 29 E, 630 m] [Goto Description]. - Etymology: From the Latin "fragmentum" meaning fragment or debris, referring to the fragmented character of the material attributed to this species (see Ravel *et al.*, 2016: 364).

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS: Late lower Eocene to early middle Eocene.
Timeframe:

SUBORDER PTEROPODIFORMI Van Cakenberghe, Kearney and Seamark, 2007

1821. *FRUCTIVORAE* Gray, London Med. Repos., 15 (1): 299. - Comments: Proposed as order and originally included the families Pteropidae J. Gray, 1821 and Cephalotidae J. Gray, 1821, both currently representing Pteropodidae J. Gray, 1821. Jackson and Groves (2015: 230) included it as synonym of the Pteropodidae.

1855. *FRUGIVORA* Giebel, Die Säugethiere …, xii, 991. - Comments: Originally included the genera *Hypoderma* É. Geoffroy, 1828 [= *Dobsonia* Palmer, 1898]; *Harpyia* Illiger, 1811 [= *Nyctimene* Borkhausen, 1797]; *Macroglossus* F. Cuvier, 1824 [1821-1825]; and *Pteropus* Brisson, 1762 (see Jackson and Groves, 2015: 229). McKenna and Bell (1997: 295) synonymized it with Megachiroptera.

1866. *Pterocynes* Haeckel, Generelle Morphologie der Organismen., 2: clx. - Comments: *Nomen oblitum*. Proposed as suborder and originally included the "families" Pteropodida (including the genera *Pteropus* and *Macroylossus*) and Hypodermida (including the genus *Hypoderma*) Jackson and Groves, 2015: 229). McKenna and Bell (1997: 295) synonymized it with Megachiroptera.

1875. *MEGACHIROPTERA* Dobson, Ann. Mag. nat. Hist., ser. 4, 16 (95): 346. - Comments: Originally included the groups Pteropi (containing the genera *Pteropus* Brisson, 1762; *Cynopterus* F. Cuvier, 1824 [1821-1825]; *Cynonycteris* Peters, 1852 [= *Rousettus* J. Gray, 1821]; *Harpyia* Illiger, 1811 [= *Nyctimene* Borkhausen, 1797]; *Epomophorus* E. Bennett, 1836; and *Cephalotes* É. Geoffroy, 1810 [= *Nyctimene* Borkhausen, 1797]) and Macroglossi (containing the genera *Macroglossus* F. Cuvier, 1824 [1821-1825]; *Eonycteris* Dobson, 1873; and *Notopteris* J. Gray, 1859) (see Jackson and Groves, 2015: 228). - Etymology: From the neuter plural scientific Latin substantive made up of the Greek adjective "*μέγα*" (mega) "big" and chiroptera, i.e. "big Chiroptera", in opposition to Microchiroprera ("small chiroptera") (see Lanza *et al.*, 2015: 18).

2001. *YINPTEROCHIROPTERA* Springer, Teeling, Madsen, Stanhope, and De Jong, Proc. Natl. Acad. Sci. USA, 98 (11): 6423. - Comments: In part.

2004. *PTEROPODIFORMES* Hutcheon and Kirsch, J. mamm. Evolut., 11 (1): 44. - Comments: Originally included the families Pteropodidae J. Gray, 1821, Hipposideridae Flower & Lydekker, 1891, Rhinolophidae J. Gray, 1825, Megadermatidae H. Allen, 1864, and Craseonycteridae Hill, 1974 (see Jackson and Groves, 2015: 229)..

*2007. *PTEROPODIFORMI* Van Cakenberghe, Kearney and Seamark, African Chiroptera Report. Publication date: July 2007. - Comments: The name of the suborder is based on *Pteropus* Brisson, 1762 (type of Pteropodidae Gray, 1821). (Current Combination)

2014. *Pteropodimorpha* Zagorodniuk, Proc. Theriol. School, 12: 8.

TAXONOMY:
The suborder name follows the typified name used by Hutcheon and Kirsch (2004b, 2006), but with the ending changed to follow the format proposed for standardization of nomenclature of higher taxa by Alonso-Zarazaga (2005). '-formes' indicates ordinal level, while ending '-formi' indicates subordinal level.

Ao *et al.* (2007: 257) provide the first cytogenetic signature rearrangement that supports the grouping of Pteropodidae and Rhinolophoidea in a common clade (i.e. Pteropodiformes or Yinpterochiroptera).

In their phylogenetic study on *Bartonella*, McKee *et al.* (2016: 390) estimated the posterior state transition rate for *gltA* sequences in this bacterium and found a very high median rate between the superfamilies Pteropoidea and Rhinolophoidea (2.77) and between the families Pteropodidae and Rhinolophidae (2.32).

Based on transcriptome RNA-seq data, Lei and Dong (2016: 2) estimated the split between Rhinophoidea and Pteropoidae at about 60 MYA.

Currently two Infraorders are recognized within the suborder PTEROPODIFORMI from Africa: **PTEROPODIFORMACEI** Van Cakenberghe, Kearney and Seamark, 2007 and **RHINOLOPHIFORMACEI** Van Cakenberghe, Kearney and Seamark, 2007.

COMMON NAMES:
Czech: kaloňotvaří.

DETAILED MORPHOLOGY:
The echolocating bats belonging to the Pteropodiformi can be distinguished from the

Vespertilioniformi by the presence of a pectoral ring. This bony structure is formed by the fusion of the top bone of the breast bone (manubrium), the first two ribs and the last cervical and first two thoracic vertebrae (Jacobs (2016: 66-67).

MOLECULAR BIOLOGY:
Volleth (2010: 308) reports the detection of two cytogenetic characters serving as synapomorphies for Pteropodiformi (i.e. Rhinolophoidea plus Pteropodidae), and indicates that the cytogenetic basis is a small paracentric inversion hardly detectable with banding techniques, but clearly detectable with FISH (fluorescence in-situ hybridization) techniques.

VIRUSES:
Osborne *et al.* (2011: 8) indicate that "Yinpterochiroptera" [=Pteropodiformi] is the only suborder in which Betacoronaviruses are found, but they indicate that their conclusion might be biased as they only examined a subset of species of the New World, where no representatives of this suborder are occurring.

INFRAORDER PTEROPODIFORMACEI Van Cakenberghe, Kearney and Seamark, 2007

*2007. *PTEROPODIFORMACEI* Van Cakenberghe, Kearney and Seamark, African Chiroptera Report. Publication date: July 2007. - Comments: The name of the Infraorder is based on *Pteropus* Brisson, 1762 (type of Pteropodidae Gray, 1821). (Current Combination)

TAXONOMY:
Currently only a single superfamily is recognised within the infraorder PTEROPODIFORMACEI: **PTEROPODOIDEA** Gray, 1821.

Superfamily PTEROPODOIDEA Gray, 1821

*1821. *PTEROPODOIDEA* Gray, London Med. Repos., 15 (1): 229. - Comments: The name of the superfamily is based on *Pteropus* Brisson, 1762 (type of Pteropodidae Gray, 1821), and originally included the genera *Pteropus* Brisson, 1762; and *Rousettus* J. Gray, 1821. (Current Combination)
2008. *Pteropoidea* Serra-Cobo, López-Roig, Bayer, Amengual and Guasch, Ratpenats. Ciència i mite., 31.

TAXONOMY:
Known families of the superfamily PTEROPODOIDEA: **PTEROPODIDAE** Gray, 1821.

COMMON NAMES:
Czech: kaloňovci, kaloni.

Family PTEROPODIDAE Gray, 1821

1821. *Cephalotidæ* Gray, London Med. Repos., 15 (1): 299. - Comments: Type genus: *Cephalotes* É. Geoffroy, 1810b [= *Nyctimene* Borkhausen, 1797].
*1821. *Pteropidæ* Gray, London Med. Repos., 15 (1): 299. Publication date: 1 April 1821. - Comments: Jackson and Groves (2015: 230) explains that the stem of the Greek *pous* (=foot) is *pod-*, so the stem of the latinised *Pteropus* is 'pteropod-', leading to the corrected name Pteropodidae introduced by Bonaparte (1837-41: 112).
1825. *Pteropina* Gray, Ann. Philos., 10 (5): 338. Publication date: November 1825. - Comments: Proposed as tribe and originally included the genera *Pteropus* Brisson, 1762; *Cynopterus* F. Cuvier, 1824 [1821-1825]; *Macroglossum* [sic = *Macroglossus*] F. Cuvier, 1824 [1821-1825]; *Cephalotis* [sic = *Cephalotes*] É. Geoffroy, 1810b [= *Nyctimene* Borkhausen, 1797]; and *Harpyia* Illiger, 1811 [= *Nyctimene* Borkhausen, 1797] (see Jackson and Groves, 2015: 230). McKenna and Bell (1997: 295) synonymized it with Pteropodidae. Jackson and Groves (2015: 236) also mention it in the synonymy of the subfamily Pteropodinae.

1838. *PTEROPODIDAE* Bonaparte, Syn. Vert. Syst., in Nuovi Ann. Sci. Nat., Bologna, 2: 111. - Comments: Type genus: *Pteropus* Brisson, 1762. (Alternate Spelling)

1842. *Harpyidae* C. H. Smith, An introduction to the Mammalia, 15: 115. - Comments: Type genus: *Harpyia* Illiger, 1811 [=*Nyctimene* Borkhausen, 1797). Originally included the genera *Pteropus* Brisson, 1762; *Pachysoma* I. Geoffroy, 1828 [= *Cynopterus* F. Cuvier, 1824 [1821-1825]; *Macroglossus* F. Cuvier, 1824 [1821-1825]; *Harpyia* Illiger, 1811 [= *Nyctimene* Borkhausen, 1797]; and *Cephalotes* É. Geoffroy, 1810 [= *Nyctimene* Borkhausen, 1797] (see Jackson and Groves, 2015: 230). Simmons (2005: 313) synonymized this name with Pteropodidae.

1866. *Hypodermida* Haeckel, Generelle Morphologie der Organismen., clx. - Comments: Originally included the genus *Hypoderma* É. Geoffroy, 1828 [= *Dobsonia* Palmer, 1898] (see Jackson and Groves, 2015: 230). McKenna and Bell (1997: 295) synonymized it with Pteropodidae.

1866. *Pteropi* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, 1865: 256. - Comments: Proposed as family name and originally included the genera *Pteropus* Brisson, 1762; *Cynonycteris* Peters, 1852 [= *Rousettus* J. Gray, 1821]; *Pterocyon* Peters, 1861 [= *Eidolon* Rafinesque, 1815]; *Cynopterus* F. Cuvier, 1824 [1821-1825]: 248; *Megaerops* Peters, 1865; *Epomophorus* E. Bennett, 1836; *Macroglossus* F. Cuvier, 1824 [1821-1825]; *Harpyia* Illiger, 1811 [= *Nyctimene* Borkhausen, 1797]; *Cephalotes* É. Geoffroy, 1810b [= *Nyctimene* Borkhausen, 1797]; and *Notopteris* J. Gray, 1859.

1866. *Pteropodida* Haeckel, Generelle Morphologie der Organismen., clx. - Comments: Originally included the genera *Pteropus* Brisson, 1762; and *Macroglossus* F. Cuvier, 1824 [1821-1825] (see Jackson and Groves, 2015: 230). McKenna and Bell (1997: 295) synonymized it with Pteropodidae.

1893. *Pteropi* Winge, Samling af Afhandlinger. E Museo Lundii, 2 (1): 53. - Comments: Proposed as tribe(?) and originally included the genera *Cynonycteris* Peters, 1852b: 25 [= *Rousettus* J. Gray, 1821]; *Pteropus* Brisson, 1762; *Pteralopex* Thomas, 1888; *Epomophorus* Bennett, 1836; *Cephalotes* É. Geoffroy, 1810 [= *Nyctimene* Borkhausen, 1797]; *Cynopterus* F. Cuvier, 1824 [1821-1825]; and *Harpyia* Illiger, 1811 [= *Nyctimene* Borkhausen, 1797] (see Jackson and Groves, 2015: 231).

TAXONOMY:

The taxonomy of the Pteropodidae follows that of Bergmans (1988, 1989, 1991, 1994, 1997) and Simmons (2005: 313 - 350).

Corbet and Hill (1992: 55) refer to Handley (1980) for a discussion on the correct formation of the family name.

Between two and six subfamilies of Pteropodidae have been recognized (Simmons, 2005: 313) including: Cynopterinae K. Andersen, 1912, Epomophorinae K. Andersen, 1912, Harpionycterinae Miller, 1907, Nyctimeninae Miller, 1907, Macroglossinae Gray, 1866, Rousettinae Andersen, 1912, and Pteropodinae Grey, 1821 (Bergmans, 1997; Corbet and Hill, 1980, 1991, 1992; Hill and Smith, 1984; Koopman, 1993a, 1994; McKenna and Bell, 1997).

Recent phylogenetic studies agree that Macroglossinae and Pteropodine *sensu* (Koopman, 1993a, 1994; McKenna and Bell, 1997) are not monophyletic (Álvarez *et al.*, 1999; Giannini and Simmons, 2003; Hollar and Springer, 1997; Hood, 1989; Juste B. *et al.*, 1997; Kirsch *et al.*, 1995; Romagnoli and Springer, 2000; Springer *et al.*, 1995). Monophyly of cynopterines and empomophorines has also been questioned (Álvarez *et al.*, 1999; Hollar and Springer, 1997; Kirsch *et al.*, 1995; Romagnoli and Springer, 2000). Phylogenetic studies based on DNA hybridization and DNA sequences have found support for a large clade of endemic African taxa including genera previously placed in several different subfamilies/tribes based on traditional taxonomic groupings (Álvarez *et al.*, 1999; Giannini and Simmons, 2003; Hollar and Springer, 1997; Kirsch *et al.*, 1995; Romagnoli and Springer, 2000). Relationships among pteropodid genera are not yet fully resolved, however, and questions remain concerning the position of *Nyctimene*; *Paranyctimene*, *Eidolon*, and several SE Asian endemic genera (Simmons, 2005) . Based on a phylogenetic study of newly generated sequences of four nuclear loci, Almeida *et al.* (2011b: 86) found a basal split of Pteropodidae into 7 (maybe 8) main clades, but the relationships between them are not well resolved. The analyses performed by Almeida *et al.* (2011a: 7) revealed six principal clades and one independent lineage (for *Eidolon*). Some of their principal clades agree with previously proposed subfamilies: Cynopterinae, Harpyionycterinae, and Nyctimeninae. The other clades agree with Macroglossini, Epomophorinae + Rousettini, and Pteropodini + *Melonycteris*.

Almeida *et al.* (2016: 73) recognize four main African clades: *Eidolon*, Scotonycterini (including the genera *Casinycteris* and *Scotonycteris*), African *Rousettus* (with three species) and the previously identified 'endemic African clade' (with nine genera: (*Stenonycteris, Plerotes, Myonycteris, Megaloglossus, Hypsignathus, Nanonycteris, Epomops, Epomophorus*, and *Micropteropus*), and suggest that a new classification on subfamilial and tribal levels is probably needed.

Simmons (2005: 313) suggests the relationships among the pteropodid genera are not yet fully resolved, and no subfamilial or tribal groups were recognized pending a thorough reevaluation of pteropodid classification.

Almeida *et al.* (2016: 83) provide the following classification: Harpyionycterinae (including the genera *Dobsonia, Aproteles, Boneia, Harpyionycteris*, Rousettinae (including the tribes Rousettini (*Rousettus*), Eonycterini (*Eonycteris*), Scotonycterini (*Scotonycteris, Casinycteris*), Epomophorini (*Epomophorus, Epomops, Hypsignathus, Nanonycteris, Micropteropus*), Stenonycterini (*Stenonycteris*), Myonycterini (*Myonycteris* (incl. *Lissonycteris*), *Megaloglossus*), and Plerotini (*Plerotes*)), and Eidolinae (*Eidolon*).

Hassanin *et al.* (2016: 521) indicate that two subfamiles occur in Africa: Pteropodinae (with one genus: *Eidolon*) and Rousettinae. The latter subfamily is subdivided in three tribes: Scotonycterini (*Scotonycteris* and *Casinycteris*), Rousettini (*Rousettus*), and Epomophorini, which is further divided in four subtribes: Epomophorina (*Epomophorus, Epomops, Hypsignathus, Micropteropus*, and *Nanonycteris*), Myonycterina (*Myonycteris* and *Megaloglossus*), Plerotina (*Plerotes*), and Stenonycterina (*Stenonycteris*). They also estimate that the three tribes diversified about 7 - 8 Mya. They also indicate (p. 524) that this family has its origin in Southeast Asia, which is supported by: **1)** More than half of the species (94) are found in this region, **2)** The highest species density is found on the islands of Sumatra, Borneo and Sulawesi, **3)** the oldest fossil of fruit bats has been described in the Late Eocene/Early Oligocene of Thailand, and **4)** The molecular analyses indicate that all African species have a derived position with respect to their congeners from Asia and Oceania.

Currently recognized genera of Pteropodidae: *Acerodon* Jourdan, 1837, *Aethalops*, Thomas, 1923, *Alionycteris* Kock, 1969, *Aproteles* Menzies, 1977, *Balionycteris* Matschie, 1899, ***Casinycteris*** Thomas, 1910, *Chironax* K. Andersen, 1912, *Cynopterus* F. Cuvier, 1824, *Desmalopex* Miller, 1907, *Dobsonia* Palmer, 1898, *Dyacopterus* K. Andersen, 1912, ***Eidolon*** Rafinesque, 1815, *Eonycteris* Dobson, 1873, ***Epomophorus*** Bennett, 1836, ***Epomops*** Gray, 1870, *Haplonycteris* Lawrence, 1939, *Harpyionycteris* Thomas, 1896, ***Hypsignathus*** H. Allen, 1861, *Latidens* Thonglongya, 1972, *Macroglossus* F. Cuvier, 1824, *Megaerops* Peters, 1865, ***Megaloglossus*** Pagenstecher, 1885, *Melonycteris* Dobson, 1877, ***Micropteropus*** Matschie, 1899, *Mirimiti* Helgen, 2005, ***Myonycteris*** Matschie, 1899, ***Nanonycteris*** Matschie, 1899, *Neopteryx* Hayman, 1946, *Notopteris* Gray, 1859, *Nyctimene* Borkhausen, 1797, *Otopteropus* Kock, 1969, *Paranyctimene* Tate, 1942, *Penthetor* K. Andersen, 1912, ***Plerotes*** K. Andersen, 1910,† Propotto Simpson, 1967, *Ptenochirus* Peters, 1861, *Pteralopex* Thomas, 1888, ***Pteropus*** Brisson, 1762, ***Rousettus*** Gray, 1821, ***Scotonycteris*** Matschie, 1894, *Sphaerias* Miller, 1906, *Stenonycteris* Gray, 1870, *Stylocteniu*m Matschie, 1899, ***Syconycteris*** Matschie, 1899, *Thoopterus* Matschie, 1899.

COMMON NAMES:
Czech: kaloňovití, upírové, létací psi, bejložraví netopýři, létací lišky. Dutch: Grote fruitvleermuizen, Vliegende honden. English: Old World Fruit bats. Finnish: Hedelmälepakot. French: Prétopodidés. German: Flughunde, Flederhunde. Italian: Pteropòdidi; Pteròpidi. Norwegian: Flyvende hunder, kalong. Russian: Крылановые. Vietnamese: Họ dơi qụa.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Gunnell and Simmons (2013: 63) indicate that fossil records for Pteropodid bats are extremely poor. There are hardly any records older than Late Pleistocene-Holocene, although molecular data suggest that Pteropodids diverged from other bats no later than in the Early Eocene (ca. 50 million years ago). They suggest that this is probably due to the fact that most of the Pteropodid fossils are concidered to be from Primates rather than from bats.

The family's stem and crown ages were reported by Shi and Rabosky (2015: 1537) to be respectively 56.6 and 40.2 mya.

Foley *et al.* (2014: 320) indicate that the Rhinolophoidea and Pteropodidae diverged approximately 59 Ma.

DETAILED MORPHOLOGY:
Dentition - See Adeniyi *et al.* (2010).
Tongue - Morphological studies on the tongue structure of Old World fruit bats suggest that these bats are highly adapted to fruit and nectar diets and are able to change between a fruit and nectar

diet when their preferred food is not available (Morrison, 1980; Birt *et al.*, 1997). Old World fruit bat species possess filiform papillae at the tip of the tongue, which is thought to increase the surface area for nectar collection (Birt *et al.*, 1997). Filiform papillae increase the gripping of food on the tongue surface, thus efficiently moving food toward the pharynx (Birt *et al.*, 1997). Bats feeding on fruit also have a large tongue surface area, but generally lack tongue tip filiform papillae, and possess tridentate papillae (Birt *et al.*, 1997). Tridentate papillae are thought to be valuable when piercing through the skin of soft fruits (Birt *et al.*, 1997). Morrison (1980) suggested that fruit bats have a widened tongue and consequently larger tongue surface area that is used to squeeze fruit against the hard upper palate, thus releasing fruit juices.
See also Adeniyi *et al.* (2010).

SEXUAL DIMORPHISM:
Dobson (1873: 251) suggests that the hairs of the male's epaulettes of the Epomophori are long due to glandular excretions, similar to beard of male *Taphozous melanopogon*. The different colour, however, can (probably) not be explained by this.

ECHOLOCATION:
Although the use of clicking sounds as means of echolocation by *Rousettus aegyptiacus* has become well accepted over the past few years, Boonman *et al.* (2013a: 23) showed that this type of clicks were also produced by representatives of other genera they investigated: (*Eonycteris, Cynopterus* and *Macroglossus*, which convinced Boonman *et al.* (2013a) that the use of echolocation is more widely distributed than previously believed.

Boonman *et al.* (2014: 2962) provided evidence that suggests that all Old World fruit bats can produce clicks with their wings, resulting in a rudimentary echolocation system.

MOLECULAR BIOLOGY:
Jiao *et al.* (2018: 4477) found that the bitter taste receptor genes (*Tas2rs*) in the Old World fruit bats underwent a massive loss (-11 genes out of the ancestral 27) in their common ancestor, but the remaining ones underwent subsequent diversification leading to an average number of genes in the present day species (e.g. 23 in *Eidolon helvum* and 31 in *Rousettus aegyptiacus*).

DIET:
In their study on figs as resources for tropical frugivorous vertebrates, Gautier-Hion and Michaloud (1989: 1826) concluded that these fruits are occurring in such distant patches, that only large frugivorous bats can use them as staple food.

Pettersson *et al.* (2004: 166) state that African pteropodid bats apparently feed more commonly from nectar sources visually observable from above the canopy (as compared with pollinating species from the New World). They also suggest that the absence of sulphur compounts in the floral scent of West African *C. pentandra* (as opposed to South-America) is the result of the different selective regimes of the pollinating bats.

Djossa *et al.* (2015: 286) found that the baobab tree (*Adansonia digitate* L.) needs pollinators (= fruit bats) to reach its optimal pollination success. They also concluded that the involvement of fruit bats is beneficial as they travel over long distances, which may help conserve the genetic diversity of this plant species, especially keeping in mind that the baobab tree is a multipurpose socioeconomically relevant plant for Sub-Saharan African rural communities.

PREDATORS:
Mikula *et al.* (2016: Supplemental data) report the following birds predating on "Pteropodidae": Chestnut-flanked sparrowhawk (*Accipiter castanilius* Bonaparte, 1853), Little sparrowhawk (*Accipiter minullus* (Daudin, 1800)), Bat hawk (*Macheiramphus alcinus* Bonaparte, 1850), African harrier-hawk (*Polyboroides typus* Smith, 1829), Crowned eagle (*Stephanoaetus coronatus* (Linnaeus, 1766)).

PARASITES:
Fain (1994: 1279) indicated that the Pteropodidae are hosts for two or three genera of Myobiidae: *Binuncus* (with subgenus *Probinuncus*) including 19 species of which 18 occur on Pteropodinae only, and one on Macroglossinae. The second genus is *Pteropimyobia* with five species of which 3 live on Macroglossinae and two on Nyctimeninae. The third genus - *Ugandobia* - contains nine species occuring on Emballonuridae and one species each occurring on Hipposideridae (*U. euthrix*) and on Pteropodinae (*U. balionycteris*). However, he believes that these two latter species were reported from the wrong host species due to "contamination of museum jars". Fain (1994: 1280) also mentions that the Myobiidae found on Megachiroptera are more evolved than those found on the Microchiroptera, indicating that the Myobiidae have probably originated on a primitive genus of the Microchiroptera and subsequently have passed to the Megachiroptera. He also reported this as peculiar since mites belonging to the Mesostigmata and Sarcoptidae are more primitive on Megachiroptera than on Microchiroptera.

HEMIPTERA
Cimicidae: Haeselbarth *et al.* (1966: 8) recorded *Afrocimex leleupi* Schouteden 1951 from fruit-bats in the "Grotte de Kakontwe" and "Grotte Dufrenne", Katanga, DRC.

DIPTERA
Streblidae: *Ascodipteron semirasum* Maa 1965 from a fruit bat in Kenya (Haeselbarth *et al.*, 1966: 106).

VIRUSES:
Nesi *et al.* (2012: 126) suggest that the high nucleotide distance between Ebola virus Côte d'Ivoire and Ebola virus Zaire can be correlated with the Plio/Pleistocene divergence between their putative reservoir host species, i.e., *Myonycteris leptodon* and *Myonycteris torquata*, respectively.

Akani *et al.* (2015: 614 - 615) state "... the first Ebola outbreak in Guinea in 2014 occurred in a site where there was recent deforestation due to the planting of massive oil palm plantations (Wallace *et al.*, 2014), exactly as it also occurred in the Democratic Republic of Congo in 2007 (see Leroy *et al.*, 2009). Therefore, it is likely that there is a direct noncasual link between oil palm plantations, fruit bats and Ebola outbreaks (Wallace *et al.*, 2014). Fruit bats may shift from using rainforest to utilizing oil palm plantations as foraging grounds once the forests became disturbed, especially where plantations are adjacent to rainforest patches. The intensified use of oil palm plantations by fruit bats may be due to the high food resource available due to the palm fruits"
[**Note** (26 July 2015): As far as the editors are aware, no proof has yet been provided that fruit bats are indeed the culprits.]

Subfamily Eidolinae Almeida, Giannini and Simmons, 2016

*2016. *Eidolinae* Almeida, Giannini and Simmons, Acta Chiropt., 18 (1): 83, 84. Publication date: June 2016 [Goto Description].

TAXONOMY:
This subfamily was created by Almeida *et al.* (2016: 84) to distinguish monophyletic groups within the Pteropodidae.

Currently recognized genera of Eidolinae: *Eidolon* Rafinesque, 1815.

Genus ***Eidolon*** Rafinesque, 1815

*1815. *Eidolon* Rafinesque, Analyse de la Nature, 45. - Comments: Type species: *Pteropus stamineus* E. Geoffroy Saint-Hilaire, 1803 (= *Vespertilio vampyrus helvus* Kerr, 1792). - Etymology: From the Greek "*ειδωλον*", meaning "image" or "phantom", evidently in allusion to its movements (see Palmer, 1904: 252; DeFrees and Wilson, 1988: 4). (Current Combination)

1862. *Pterocyon* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, 1861: 423. - Comments: Type species: *Pterocyon paleaceus* Peters, 1861 (=*Vespertilio vampyrus helvus* Kerr, 1792). - Etymology: From the Greek "*πτερόν*", meaning wing and "*κύων*", meaning dog (see Palmer, 1904: 595).

1881. *Leiponyx* Jentink, Notes Leyden Mus., 3 (15): 60. Publication date: April 1881 [Goto Description]. - Comments: Type species: *Leiponyx büttikoferi* Jentink, 1881 (=*Vespertilio vampyrus helvus* Kerr, 1792). - Etymology: From the Greek "*λείπω*", meaning to leave or to be wanting and "*ονυξ*", meaning claw, referring to the absence of a claw on the index finger (see Palmer, 1904: 367).

1882. *Liponyx* Forbes, Zoological Record, 18 Mamm.: 13 (for 1881). - Comments: Emendation of *Leiponyx* Jentink, 1881. Preoccupied by *Liponyx* Vieillot, 1816; a bird (see Andersen, 1912b: 2; Meester *et al.*, 1986: 27). (Emendation)

TAXONOMY:
Revised by Bergmans (1991). See Simmons (2005: 320).

Almeida *et al.* (2011a: 11) suggest that *Eidolon* should be included in a subfamily of its own.

Known species of *Eidolon*: ***dupreanum*** (Pollen, 1866); ***helvum*** (Kerr, 1792).

COMMON NAMES:
Czech: plaví kaloni. English: Straw-coloured Fruit-bats, Eidolon fruit bats. French: Roussettes des palmiers. German: Palmenflughunde. Italian: Èidoli, Ptèropi fantasrna.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Shi *et al.* (2014: 285) refer to Howell and Coppens (1974), who reported the only fossil record for *Eidolon* from the Pliocene (ca. 3 mya) of Ethiopia. They also indicate (p. 279) that the two taxa (*helvum* and *dupreanum*) diverged in the mid-to-late Miocene. Almeida *et al.* (2016: 85) place the origin of the genus in the Miocene or Oligocene.

VIRUSES:
Flaviviridae
Luis *et al.* (2013: suppl.) mention the following Flaviviridae from "*Eidolon*": Entebbe bat virus, Uganda S virus, Usutu virus, West Nile virus, Yellow fever virus, and Zika virus.

Togaviridae
Alphavirus - (Luis *et al.*, 2013: suppl.) mention "from *Eidolon*".
Chikungunya virus - (Luis *et al.*, 2013: suppl.) mention "from *Eidolon*".

Eidolon dupreanum (Schegel, 1867)

*1867. *Pteropus dupréanus* Schlegel, in: Schlegen and Pollen, Proc. zool. Soc. Lond., 1866, III: 419. Publication date: April 1867. Type locality: Madagascar: Nossi Bé island [ca. 13 20 S 48 15 E] [Goto Description]. - Comments: Andersen (1912b: 8) mentions two cotypes in the Leyden Museum collected by Fr. Pollen and C.C. van Dam (see Schlegel, 1867: 419).
2014. *Eidolon duprenum:* Gunnell, Simmons and Seiffert, PLoS ONE, 9 (2): e86712: 3. Publication date: 4 February 2014. (Lapsus)
? *Eidolon dupreanum:* (Name Combination, Current Combination)
? *Eidolon helvum dupreanum:* (Name Combination)

TAXONOMY:
Koopman (1993a: 140) mentioned Schlegel, 1867 as author, but Allen (1939a: 54), Peterson *et al.* (1995: 22) and Russ *et al.* (2001) mention Pollen, 1866, in Schlegel and Pollen, Proc. Zool. Soc. Lond., 1866: 419. Meester *et al.* (1986: 28), DeFrees and Wilson (1988: 1) mention Schlegel and Pollen, 1867 as authors, but in the references of the latter only Schlegel is mentioned as author. Reviewed by Bergmans (1991) and Peterson *et al.* (1995). See Simmons (2005: 321 and comments under *E. helvum* pg. 321).

COMMON NAMES:
Czech: kaloň malgašský. English: Madagascan Straw-coloured Fruit-bat, Madagascan Fruit Bat, Malagasy Straw-colored Fruit Bat. French: Roussette des palmiers malgache, Roussette malgache couleur paille, Roussette jaune de Madagascar. German: Madagaskar-Palmenflughund. Malagasy: Angavo.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Samonds (2007: 43) found samples in deposits dated at 10,000 yrs old or younger from within the Anjohibe cave, Madagascar. Gunnell *et al.* (2014: 3) also refer to Goodman and Jungers (2013), who report material from the Andrahomana cave.

CONSERVATION STATUS:
Global - This species is listed as Vulnerable (VU A2ad ver 3.1 (2001)) because it is estimated to have undergone a decline exceeding 30% over the past 20 years mainly from extreme pressure from hunting, causing it to abandon roosts, with known examples of local extirpation of roosts sites (Andriafidison *et al.*, 2008b; IUCN, 2009).

Assessment History -
2008 - VU A2ad ver 3.1 (2001) (Andriafidison *et al.*, 2008b; IUCN, 2009). 1996 - LR/lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
This species is subject to harvesting for bushmeat across its range and hunting occurs both at roosting and foraging sites (Jenkins and Racey, 2008). It is classed as a game species under Malagasy law and although it can only be legally hunted between the first of May and the first of September (Anonymus, 2007b: 6; Durbin, 2007; Randrianandrianina *et al.*, 2010: 412), this legislation is widely ignored and the bats are hunted throughout the year. Its roosts tend to be well protected from bushfires and it is able to survive in landscapes with severely depleted natural food supplies as long as alternative plants are available (Ratrimomanarivo, 2007). Hunting is therefore the main threat and was reported to account for a 30% desertion rate from 60 roosts (MacKinnon *et al.*, 2003). Although hunters report that deserted roosts are recolonized after a few years, there are several confirmed examples

where this species has been extirpated at roost sites (MacKinnon *et al.*, 2003).

Randrianandrianina *et al.* (2010: 413) observed that at least 14 *E. dupreanum* specimens were captured each night at fruiting voandelaka tree (*Molinaea* sp.).

Cardiff and Jenkins (2016: 99) indicate that fires are used to expel *E. dupreanum* from their rocky roost sites.

CONSERVATION ACTIONS:
Andriafidison *et al.* (2008b) [in IUCN (2009)] report this species is known from a number of protected areas (Goodman *et al.*, 2005a) including, Parc National d'Isalo, Parc National de Namoroka, Réserve Spéciale d'Ankarana and Réserve Spéciale de Cape Sainte Marie; however, hunting has been reported from within Réserve Spéciale d'Ankarana (Cardiff, 2006). Fernández-Llamazares *et al.* (2018: 273), similarly, reported hunting in and outside the Tsimanampetsotsa National Park, even in sacred caves. Roosts that are located in inaccessible rock outcrops pose significant challenges to hunters are relatively protected. Cave roosts are probably subject to highest hunting pressure and conservation measures should be focused at these sites (Andriafidison *et al.*, 2008b; IUCN, 2009).

Additional research is needed on natural history and in particular roosting ecology and movements (Andriafidison *et al.*, 2008b; IUCN, 2009).

GENERAL DISTRIBUTION:
Eidolon dupreanum is endemic to the island of Madagascar where it is widespread, albeit with a patchy distribution (MacKinnon *et al.*, 2003). It is found both along the coast and on the central high plateau and areas from where there are no records probably reflect inadequate survey coverage rather than a genuine absence. There are some areas within its range where the lack of crevices means there are no roosting opportunities (Goodman *et al.*, 2005a).

Native: Madagascar.

DETAILED MORPHOLOGY:
Baculum:
Rakotondramanana and Goodman (2017: 52) describe the baculum as a large flat structure, with the distal tip having a serrated or tooth-like structure that is wider than the proximal base; length: 6.59 ± 0.225 (6.41 - 6.84) mm, width: 4.21 ± 0.671 (3.48 - 4.80) mm.

ECHOLOCATION:
Schoeman and Goodman (2012) identified three distinct call types: social calls 1, social calls 2 and echo clicks. Bats produce the echo clicks while flying towards the entrance of the cave, while the other two calls were emitted at roost sites and near the cave entrance. Based on the preliminary results, Schoeman and Goodman (2012) suggest that the social calls 1 and 2 were employed for social communication, whilst echo clicks may have been used in a sensory context, potentially as incipient echolocation to navigate in the dark cave.

HABITAT:
Eidolon dupreanum has a patchy distribution which includes humid, dry deciduous and spiny forest is probably related to the availability of suitable roost sites and is rare or absent from a number of forests without rocky outcrops (Goodman *et al.*, 2005a; Jenkins *et al.*, 2007b; Schmid and Alonso, 2007). It continues to survive in highly modified landscapes with very little native vegetation remaining (Ratrimomanarivo, 2007), but appears to use native forest vegetation for food in preference to introduced plants (Picot *et al.*, 2007).

Dammhahn and Goodman (2013: 108) indicate that mid- to upper-canopy in forest and trees growing in open areas form the foraging habitat of this species.

HABITS:
Baum (1995: 337) reported that fruit bats (probably *E. dupreanum*) intensively visited *Adansonia suarezensis* trees in the forest at Beantely in the hour after dark, but also during the remainder of the night at a much lower frequency. Peak rates were about 14 visits per tree per hour (or ca. 0.5 visits / flower / hr), each lasting between 20 and 30 seconds. During each of the tree stopovers, up to nine flowers were visited.
While exiting roost, individuals flew within 50–100 cm of the ceiling, often settling and perching every 5–10 m along their flight patch and displacing in a leapfrog manner towards the cave entrance (Schoeman and Goodman, 2012).

ROOST:
It is known to roost in tree foliage, but is more usually found in rock fissures and caves (MacKinnon *et al.*, 2003). Its roost sites are usually very high and located in cliffs and rock faces (Jenkins and Racey, 2008). In the Réserve Spéciale d'Ankarana, it used caves that were high and long with a good buffering capacity for temperature and humidity (Cardiff, 2006).
See habits for roosting behaviour.

MIGRATION:
MacKinnon *et al.* (2003) suggested that *E. dupreanum* might be migratory because of regular variation in the occupancy and abundance of roosts.

DIET:
In a study, during three months (February, July and December), at four sites on the central Malagasy highlands, Ratrimomanarivo (2007) found the seeds of 13 plant species. Picot *et al.* (2007) reported that *E. dupreanum* ate mainly fruits (65%), although *Eucalyptus* spp. flowers were also consumed. Thirty plant species (14 identified and 16 unidentified), including six introduced species were utilized in the corridor of rainforest between Ranomafana and Andringitra National Parks, south-eastern Madagascar (Picot *et al.*, 2007). *Polyscias* spp. fruit (seeds) were the most frequently recorded plant in 70 % of the faecal samples (Picot *et al.*, 2007). Fruit is the main dietary component, but it also eats leaves and other plant parts (Picot, 2005; Picot *et al.*, 2007). Through the ingestion of pollen and small seeds, a significant ecological role is inferred (Picot, 2005; Ratrimomanarivo, 2007). *E. dupreanum* may be an important pollinator of threatened baobab trees (Baum, 1995).

Baum (1995: 339) mentions that *E. dupreanum* is believed to be one of the major pollinators of endemic baobabs *Adansonia grandidieri* and *Adansonia suarezensis* of Madagascar.

Picot *et al.* (2007) suggest that the alimentary tract is one intrinsic factor that influences seed dispersal, as they found a maximum seed size of 7 mm and mean size of 3.2 mm for *E. dupreanum* and the ecological services provided by this species appear to be limited by the dimensions of its intestinal tract.

Jenkins *et al.* (2007b: 213) [referring to Rakotonirainy (2001)] mention these bats visit fruiting trees of *Ficus soroceoides, F. pyrifolia*, and *F. guatteriifolia*.

Based on stable isotope analyses, Reuter *et al.* (2016) found that *Pteropus rufus*, *Eidolon dupreanum* and *Rousettus madagascariensis* have broadly overlapping diets, although there are differences between *P. rufus* and *E. dupreanum*. Furthermore, they found that the diet shifted when these two species occurred sympatrically.

POPULATION:
Structure and Density - The population size and local abundance of this species are not well known. Estimates of colony size are difficult to obtain because the bats are hidden during the day, but is usually in the range of between 10 and 500, with a median of 200 individuals (MacKinnon *et al.*, 2003). The maximum colony size of 1,400 is from Réserve Spéciale d'Ankarana (S. G. Cardiff unpubl. [in Andriafidison *et al.* (2008b)]).

Given the estimated adult survival, Brook *et al.* (2019: 165) found that the population of *E. dupreanum* will only be able to persist if the field-based fecundity estimates were replaced by higher values reported in the literature for related species.

Trend - 2008 - Decreasing (Andriafidison *et al.*, 2008b; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
Kaudern (1914: 11 - 12) reported that he was unable to shoot any pregnant female or females with young during his travels on Madagascar, which took place in the dry season (May to September), so he assumed they had their reproductive season in Spring or Summer.

PARASITES:
Brook *et al.* (2015: 4) found *E. dupreanum* to be the host of *Cyclopodia dubia* (Westwood, 1835) (Nycteribiidae) and *Thaumapsylla* sp. fleas. In the bat flies (and the bats), DNA of a new *Bartonella* was found. The bat flies were also reported by Wilkinson *et al.* (2016) and Ramasindrazana *et al.* (2017: Suppl). Szentiványi *et al.* (2019: Suppl.) indicated that thes bat flies were also carrying Enterobacteriales and *Wolbachia* sp. bacteria.

VIRUSES:
Reynes *et al.* (2011: 3) were able to isolate Ife virus from *E. dupreanum*.

Coronaviridae - Coronaviruses
BtCoVMAH051F/E. dupreanum/2011 - In Madagascar, identified in faecal material (Razanajatovo *et al.*, 2015).

Herpesviridae
Alphaherpesvirinae
Simplexvirus
Alphaherpesvirus CS730G - In Madagascar 2006, isolated in Vero cells from throat swabs (Razafindratsimandresy *et al.*, 2009).

Paramyxoviridae
Henipavirus
Nipah (NiV) - In Madagascar during 2003 - 2004, Iehlé *et al.* (2007) found Nipah virus with an infection rate of 19.2%. Kuzmin *et al.* (2011a: 5) suggest that their exposure to NiV might be the result of contact with infected *Pteropus rufus* specimens.

Hendra (HeV) - In Madagascar during 2003 - 2004, Iehlé *et al.* (2007) found Hendra virus with an infection rate of 19.2%.
Tioman (TiV) - In Madagascar during 2003 - 2004, this virus was not detected (Iehlé *et al.*, 2007).

Rhabdoviridae – Rabies like viruses
Lyssavirus - Rabies related viruses
Andriamandimby *et al.* (2013: 3) reported that 17 bats testes positive for the detection of antibodies agains Lagos Bat Virus (LBV) in two areas close to Antananarivo. Five of these also tested positive against European Bat Lyssavirus type 1 (EBLV-1).

UTILISATION:
E. dupreanum is hunted for meat in many parts of Madagascar (Ranivo, 2001; MacKinnon *et al.*, 2003). Hunting is undertaken by specialists (due to the roosting high in cliffs) who either access the roosts with wooden ladders (Jenkins and Racey, 2008) or light fires directly underneath the roosts and net or swat flying bats as they emerge (Ranivo, 2001). Alternatively, a hunter is lowered on a rope and hits the bats with a stick (Jenkins and Racey, 2008). Jenkins and Racey (2008) also indicate that guns and slingshots are used.
In the rainforests between PN de Ranomafana and PN d'Andringitra, a number of accounts of bat hunting were collected from villages (Picot, 2005). Although familiar with the location of the bat roosts, the local people rarely hunted or consumed the bats. Professional hunters visited a few times a year and occasionally offered bat meat to the village but most of the animals were taken to larger towns and sold for $ 0.4 US to restaurants and hotels. In this area oil residue from cooked bats is used as medicine for whooping cough (Jenkins and Racey, 2008). Further north in the highlands, Ranivo (2001) investigated the hunting of *E. dupreanum* at roost sites near Ambositra, Antsirabe and Ankazobe, where villages reported purchasing one and four times per year.
Pteropus rufus and *Eidolon dupreanum* appear to be the only species sold in restaurants, where they are either served individually, complete with head and wings, jointed, or are diced up into small pieces and accompanied by rice (Jenkins and Racey, 2008).
Ranivo (2001) found that hunting caused the bats to abandon traditional roost sites and local people noted declines in hunting returns.

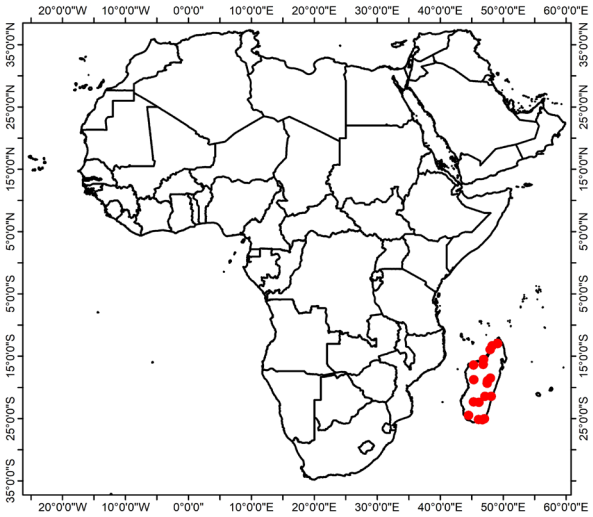

Figure 5. Distribution of *Eidolon dupreanum*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Madagascar.

Eidolon helvum (Kerr, 1792)

*1792. *Vespertilio vampyrus helvus* Kerr, in: Linnaeus, Animal Kingdom, 1 (1): xvii, 91. Publication date: February 1792. Type locality: Senegal: "Senegal". - Comments: Type locality fixed by Andersen (1907a: 504); see Meester *et al.* (1986: 28), DeFrees and Wilson (1988: 1), Harrison and Bates (1991). Andersen (1912b: viii) indicates that the type was once in the Museum Leverianum, but is probably no longer in existence. - Etymology: From the Latin "helvus" (=dun-coloured), referring to the straw colour on their shoulders; the back, rump and hind limbs are normally various shades of brown (see DeFrees and Wilson, 1988: 4; Taylor, 2005). Lanza *et al.* (2015: 27) translate "helvus" to "dull-yellow".
1862. *Xantharpyia stramineus:* Gerrard, Catalogue of the bones of Mammalia in the collection of the British Museum, 58. (Name Combination)
1866. *Xantharpyia leucomelas* Heuglin, in: Heuglin and Fitzinger, Sber. k. Akad. Wiss. Wien, math. naturw. Kl., 54: sect. 1, pt. 10, p. 544. Type locality: Sudan: Kordofan: Bahr-el-Azrak: Bahr-el-Abiad: Sennaar. - Comments: Originally "Upper Nile lands", but subsequently fixed to Senaar by Koopman (1975): see Meester *et al.* (1986: 28), DeFrees and Wilson (1988: 1).
1867. *Cynonycteris straminea:* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, 866. - Comments: see Pousargues (1896: 257). (Name Combination)
1895. *Cynonicteris straminea:* Bocage, J. Sci. mat. phys. nat., ser. 2, 4 (8): 4. Publication date: December 1895. (Name Combination, Lapsus)

1906. *R[oussettus (Xantharpyia)] stramineus:* Johnston, Liberia, Volume II: 690. (Name Combination, Lapsus)
1920. *Rousettus stramineus:* Haagner, South African mammals, 23. (Name Combination)
2015. *Pterocyon palaeaceus:* Lanza, Funaioli and Riccucci, The bats of Somalia and neighbouring areas, 27. (Lapsus)
2019. *Eidolon hevlum:* Debata, Panda and Palita, Biodivers. Conserv., 28 (8-9 SI): 2386. Publication date: 13 February 2019. (Lapsus)
? *Eidolon helvum:* (Name Combination, Current Combination)

TAXONOMY:
Includes *sabaeum* see Hayman and Hill (1971), Bergmans (1991), Harrison and Bates (1991), Simmons (2005: 321). Does not include *dupreanum*; see Bergmans (1991), Peterson *et al.* (1995) and Simmons (2005: 321), but also see Hayman and Hill (1971) who treated *dupreanum* Schlegel, 1866, from Madagascar and *sabaeum* Andersen, 1907, from Arabia as subspecies of *E. helvum* (Meester *et al.*, 1986).
African forms reviewed in part by Juste *et al.* (2000); Palearctic forms reviewed by Horácek *et al.* (2000). The taxonomic status of populations in the Anr Mountains of Niger is unclear (Simmons (2005: 321).

E. dupreanum is here retained as a separate species and *sabaeum* is considered an extralimital subspecies of *E. helvum* not occuring in Africa.

Juste *et al.* (2000) found that the population from Annobón is significantly smaller than the continental forms (and the specimens from the other islands in the Gulf of Guinea) and created a new subspecies for these: *Eidolon helvum annobonensis*.

Currently recognized subspecies of *Eidolon helvum*:
E. h. helvum (Kerr, 1792) - Afrotropics.
E. h. annobonensis Juste et al. 2000 - islands off Gulf of Guinea.
E. h. sabaeum K. Andersen, 1907 - Oriental.

COMMON NAMES:
Afrikaans: Geel vrugtevlermuis. Chinese: 黄毛果蝠. Czech: kaloň plavý, upír bledý, kaloň palmový, kaloň úzkokřídlý. English: African Straw-coloured Fruit-bat, Straw-colored Fruit Bat, Straw-coloured Flying Fox, Pale Xantharpy, Yellow-haired fruit bat. French: Roussette jaune, Roussette des palmiers africaine, Roussette paillée, chauve-souris paillée. German: Afrikanischer Palmenflughund, Palmenflughund, Afrikanischer strohfarbener Flughund. Italian: Èidolo paglierìno, Ptèropo fantàsma paglierìno. Kinande (DRC): Mulima. Portuguese: Morcego frugivoro gigante. Spanish (Castillian): Zorra Voladora Amarilla. Tanoboase (Ghana): ampane ankasa.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Hildebrand *et al.* (2010: 268) recorded this species from the Kumali site in southern Ethiopia.

CONSERVATION STATUS:
Global - Listed as Near Threatened (NT ver 3.1 (2001)) because this species is in significant decline (but at a rate of less than 30% over three generations (approximately fifteen years)) because it is being seriously over-harvested for food and medicine, making the species close to qualifying for Vulnerable, Under criterion A2d (Mickleburgh *et al.*, 2008dc; IUCN, 2009).

The subspecies *E. h. sabaeum* (Andersen, 1907) is known only from Yemen and Saudi Arabia and is possibly threatened (see Bergmans, 1999).

Assessment History -
2008 - NT ver 3.1 (2001) (Mickleburgh *et al.*, 2008dc; IUCN, 2009). 2004 - LC (Mickleburgh *et al.*, 2004bh; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - LC ver 3.1 (2001) (Monadjem *et al.*, 2016e). 2004 - considered a vagrant not assessed, doesn't breed in SA (Friedmann and Daly, 2004).

MAJOR THREATS:
In general there are no major threats to this widespread and adaptable species. It is, however, locally threatened in parts of its range by severe deforestation, and more generally across West and Central Africa by hunting for food and medicinal use. It is the most heavily harvested bat for bushmeat in West and Central Africa, and one of the most frequently consumed mammals in this region (P. Racey *pers comm.* in Mickleburgh *et al.* (2008dc)). Large pre-migration colonies are considered particularly vulnerable to any threats. In some areas it is considered to be a pest species and roosting locations may be restricted by cutting down trees. Trees are also cut down in order to catch bats for the market (P. Racey *pers comm.* [in Mickleburgh *et al.* (2008dc)]). Kamins *et al.* (2010: 190) report that 41 hunters, they interviewed, killed about 35,000 bats in one year in southeastern Ghana. 95 meat vendors indicated that they sold

over 100,000 bats as food in one year. These bats were captured in an area up to 200 km away from the markets where they were sold. Kamins *et al.* (2011a: 3000) update these figures, based on interviews with 551 Ghanaians, to a minimum 128,000 bats being sold yearly, up to 400 km away from the markets. MacDonald *et al.* (2011: Suppl. Table 1) indicate that, in rural markets in Cameroon and Nigeria, fresh bats were sold at 2.96 US$, or about 10.6 US$/kg, and smoked bats at 1.63 US$ or 5.82 US$/kg. In Côte d'Ivoire, Niamien *et al.* (2015a: 233) found that poachers only ate 5 % of their catch themselves, the rest was sold for 0.6 US$ per animal, leading to a daily revenu of 15 US$. They estimated that some 30,600 were killed each month, but luckily for the bats, they made some major calculation errors.

On São Tomé, these bats are extensively harvested for household consumption (see Carvalho *et al.*, 2015: 1). Hayman and Peel (2016: 132) indicate that the smaller island populations [from São Tomé, Príncipe and Annobón] may more likely suffer from additive mortality in response to harvesting than populations from the nearby Bioko as these latter can still mix freely with the continental populations.

Musaba Akawa *et al.* (2017) followed the sale of *E. helvum* at a market in Kisangani (DRC) for one year and found that most of the bats were sold during one of the wet seasons (September-October), but low during the second wet season (March-April). They also found that while hunting was allowed from December through July, only 47 % of the total number of bats were sold during that period; 53 % was sold during the period that the hunt was closed.

Anonymus (2004f: 51) indicates that their colonies are unwelcome in towns and cities through fruit feeding, defoliation of roost trees, defecation on (commercial) buildings.

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008dc) [in IUCN (2009)] report that there are no known direct conservation measures in place, but in view of the species extensive range it seems probable it is present in some protected areas during migration. There is a need to identify and protect important roosting sites, and a better understanding of the migratory patterns of this species would be beneficial to any conservation activities. The highest priority is to limit the harvesting of this species to sustainable levels.

GENERAL DISTRIBUTION:
Eidolon helvum is broadly distributed across the lowland rainforest and savanna zones of Africa from Senegal in the west, through to South Africa in the south and Ethiopia in the east (possibly ranging into Djibouti and southern Eritrea). It is also present on the extreme southwest Arabian Peninsula, where it has been recorded from Yemen and Saudi Arabia (Harrison and Bates, 1991). Populations of this bat occur on several offshore islands including the Gulf of Guinea islands (Peel *et al.*, 2013a: 296) and Zanzibar, Pemba and Mafia (off Tanzania) (Bergmans, 1991; Simmons, 2005; O'Brien, 2011: 285). It has also been recorded at sea, 250 km from the nearest land (Anonymus, 2004f: 50). There is a possibly disjunct population in the Air Mountains of Niger. Distribution at northern and southern extremes of the range is patchy and erratic. It is also sparse or absent in large areas of the Horn of Africa, central East Africa, and elsewhere (Bergmans, 1991). *Eidolon helvum* is a migratory species in parts of its range; populations migrate from the West African forest north into the savanna zone during the major wet season. It ranges from sea level to around 2,000 m asl (Ruwenzori Mountains). In South Africa, its distribution is mostly affected by precipitation seasonality (Babiker Salata, 2012: 49).

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 1,091,925 km^2.

It has also been reported from the Cape Verde Islands (Jiménez and Hazevoet, 2010: 116).

Native: Angola (Crawford-Cabral, 1989; Lopes and Crawford-Cabral, 1992; Bergmans, 1991; Monadjem *et al.*, 2010d: 551); Benin (Capo-Chichi *et al.*, 2004: 161); Botswana; Burkina Faso (Kangoyé *et al.*, 2015a: 605); Burundi; Cape Verde Islands (Jiménez and Hazevoet, 2010: 116); Cameroon; Central African Republic; Chad; Congo (Bates *et al.*, 2013: 333); Congo (The Democratic Republic of the) (Schouteden, 1944; Dowsett *et al.*, 1991: 259; Monadjem *et al.*, 2010d: 551); Côte d'Ivoire (Henry *et al.*, 2004: 24); Equatorial Guinea; Ethiopia; Gabon; Gambia (Kock *et al.*, 2002: 78); Ghana; Guinea (Fahr and Ebigbo, 2003: 128; Decher *et al.*, 2016: 259); Guinea-Bissau (Bocage, 1892b; Veiga-Ferreira, 1948; Bergmans, 1991; Corbet, 1984: 30) ; Kenya; Lesotho; Liberia (Fahr, 2007a: 103); Malawi (Happold *et al.*, 1988; Ansell and Dowsett, 1988: 28; Bergmans, 1991; Monadjem *et al.*, 2010d: 551); Mali (Meinig, 2000: 104); Mauritania; Mozambique (Smithers and Lobão Tello, 1976; Cotterill, 2001e: 54; Monadjem *et al.*, 2010d: 551); Namibia (Bergmans, 1991; Monadjem *et al.*, 2010d: 551); Niger (Bergmans, 1991 in Cotterill, 2001e, 2001e: 55); Nigeria; Rwanda; Sao Tomé and Principe (Rainho *et al.*, 2010a: 24); Saudi Arabia; Senegal; Sierra Leone;

South Africa (Monadjem *et al.*, 2010d: 551); Sudan; Swaziland; Tanzania; Togo; Uganda (Kityo and Kerbis, 1996: 58); Yemen; Zambia (Ansell, 1974; Cotterill, 2001e: 54; Monadjem *et al.*, 2010d: 551); Zimbabwe (Monadjem *et al.*, 2010d: 551). Presence uncertain: Djibouti; Eritrea.

GEOGRAPHIC VARIATION:
Peel *et al.* (2010b: 245) indicate that the non-migratory populations on the islands in the Gulf of Guinea (São Tomé and Príncipe, and Bioko and Annobón) show evidence of genetic differentiation from the continental (migratory) populations. They also indicate that two or three colonisation events to the islands have taken place.

Juste *et al.* (2000) found that the population from Annobón is significantly smaller than the continental forms (and the specimens from the other islands in the Gulf of Guinea) and created a new subspecies for these: *Eidolon helvum annobonensis*.

DENTAL FORMULA:
Popa *et al.* (2016: 847) described the replacement of the deciduous (milk) teeth by the permanent ones. The dentition consists of: Upper deciduous dentition: incisors i^1, i^2; canines c^1; premolars pm^1, pm^2, pm^3. Lower deciduous dentition: incisors i_1, i_2; canines c_1; premolars pm_1, pm_2, pm_3. Upper permanent dentition: incisors I^1, I^2; canines C^1; premolars PM^2, PM^3; molars M^1, M^2. Lower permanent dentition: incisors I_1, I_2; canines C_1; premolars PM_2, PM_3; molars M_1, M_2, M_3.

DETAILED MORPHOLOGY:
Baculum:
Rakotondramanana and Goodman (2017: 54) refer to Nwoha *et al.* (2000: 154), who found that the baculum in juvenile bats consists of two small paddlestone pieces located longitudinally close to each other at the distal third of the penis. In adult bats, the baculum consists of a large distal portion and a narrow proximal portion.

The average brain mass for this species is 4.30 g [n = 2, Chawana *et al.* (2013: 160)].

Huggel (1959) studied the blood pressure in the wings of *E. helvum* from Côte d'Ivoire. The normal pressure varied between 23 and 30 cm H_2O. This pressure was the same for the two types of bloodvessels that are present in the wing (contracting or non-contracting). If there is some blocking, the pressure can double very quickly, and in one case it even trippled.

Nwoha (2000: 291) examined the pelvis of this bat and found sexual dimorphism both in the shape and size of these bones as well as in its development. In males, the ossification of the interpubic ligament already start in the juvenile stage, whereas in females this only begins with puberty.

Odukoya *et al.* (2009b: 175) investigated the biochemical differences in the two uterine limbs during pregnancy and found that the uterine limbs actively utilized different metabolic pathways according to the functions they subserve during pregnancy.

Adeniyi *et al.* (2012: 118) compared the lateral geniculate bodies (LGB) of *E. helvum* with those of *Rattus norvegicus* and *Manis tricuspis* and found some differences, which they attributed to the feeding habits, lifestyle as well as the nature of their habitat.

The morphometrics of the reproductive tract of male bats were examined by Danmaigoro *et al.* (2014a), whereas Danmaigoro *et al.* (2014b) examined the histology and the histometric anatomy.

Abedi-Lartey *et al.* (2016: 18) found that the average gut passage time for small seeds was 116 ± 112 minutes (4 - 1,143 min). The dispersal distances for the small and large seeds were longer in rural areas than in urban areas, and for large seeds and small seeds in urban areas, they were also longer in the dry season than in the wet season. For small seeds in rural areas, they found that the distances were longer in the wet season than in the dry season.

FUNCTIONAL MORPHOLOGY:
Church and Warren (1968) indicate that wing membranes of *Eidolon helvum* are composed of long, prominent strands of elastin with collagen stretched in between, and that 2 x 2 cm holes in wings heal in 24 days.
Referring to Riskin *et al.* (2010), O'Mara *et al.* (2016: 10) mention that the wing camber of *E. helvum* shows more variation than in non-migrating flying foxes. O'Mara *et al.* (2019a: 1) found that wingbeat frequency has the strongest positive relationship with ODBA (overall dynamic body acceleration) and that there is small, negative correlation between ODBA and airspeed. ODBA is also decreased with increasing tailwind.

Igado *et al.* (2015: 283) studied the tongue, hard palate and buccal cavity of this bat. They found that the overal distribution of lingual papillae was the same for both sexes, but the weight and the length of the tongue was higher in females (although the difference was not significant). Also the number of ridges on the hard palate showed a

sexual dimorphism (see also the sexual dimorphism section).

The eyes of *E. helvum* contain approximately 280,000 retinal ganglion cells. The minimum angle of resolution was approximately 0.122° (ca. 4 mm at 1 m distance).

Based on an histological investigation, Mainoya and Howell (1979: 162) suggest that the neck skin patch in *E. helvum* - consisting of long and coarse hairs, and extending from the ventral surface of the neck to the shoulder area - plays a role in scent emission.

SEXUAL DIMORPHISM:
In Nigeria, Igado *et al.* (2015: 285) examined the heads of 30 adult males and females and found the males to have larger values for overal weight, weight of the head, thickness of the tongue (at the torus), width of the tongue (at the root), width of the hard palate (at the commissures of the mouth), and width of the hard palate (at the anterior region and at the posterior half). Additionally, the number of palatine ridges was higher in males (♂♂: 8.33 ± 0.577; ♀♀: 7.667 ± 0.577). The width of the tongue at the apex was similar in both species, and the width of the tongue at the torus was significantly larger in females. In a previous study, Igado *et al.* (2012: 172) already found that males had higher values for most of the craniofacial and neurometric parameters they examined. The only parameter where females had higher values was the width of the left external nares (♀♀: 5.08 ± 0.55 mm; ♂♂: 5.0 ± 0.39 mm).

MOLECULAR BIOLOGY:
DNA - Peel *et al.* (2010a) developed twenty microsatellite loci, from 142 individuals sampled from nine populations across Africa.

Teeling *et al.* (2017: 32) mention the estimated genome size for *E. helvum* to be 2.03 C, and the assembly size 1.44 Gb.

Karyotype - Mattey (1962) and Rushton (1970: 460) reported 2*n* = 34.

Protein / allozyme - Unknown.

The phosphate and oxygene binding capacity of the bat's haemoglobin was studied by Fodeke (2017).

HABITAT:
This adaptable species has been recorded from a very wide range of habitats. It is commonly found in moist and dry tropical rain forest, including evergreen forest habitats in the form of coastal (including mangrove) and riverine forest, through moist and dry savanna and mosaics of these and similar habitat types. Populations can persist in modified habitats and the species is often recorded in urban areas, such as wooded city parks (Mickleburgh *et al.*, 2008dc).

ROOST:
Roosting trees often become defoliated due to the large number of bats inhabiting them and are therefore only used on a relatively limited temporal scale (Kunz, 1996: 42). The extent of the damage caused by the bats at the Awolowo University Campus, Ile-Ife, Nigeria, was studied by Ayoade *et al.* (2012: 405), who reported that premature defoliation, loss of branches and hence reduction in canopy foliage of the host trees led to the decline in the ability of the trees to provide many environmental and social services that contribute to the quality of life in cities and to serve as effective wind barrier.

Ayensu (1974: 716) mentions that Ghanese *E. helvum* roosting in the palms do not feed on the fruits of the same palm tree, but fly to another palm to feed. In Accra, the bats roost in large mahogany and neem trees at the 37 Military Hospital, the Department of Parks and Gardens and the 37 Military Barracks (Ohemeng *et al.* (2018: 3). Lawson *et al.* (2018: 110) also found them roosting in huge silk cotton trees (*Ceiba pentandra*).

In Côte d'Ivoire, Niamien *et al.* (2017a: 70) found that *E. helvum* prefers to roost in *Hevea brasiliensis* Müll. Arg. (Pará rubber tree - Euphorbiaceae) and *Mangifera indica* L. (Mango - Anacardiaceae) trees.

For western Kenya - the only colony site in Kenya - Webala *et al.* (2012: 3) suggested that tree density was an important factor in roosting-camp selection for *E. helvum*, and the removal of roost trees could have serious ramifications on their conservation in the region. This is especially important as colonies of *E. helvum* are rarely found in protected areas, but rather within human habitation. Webala *et al.* (2014: 85) found that, besides the density of the trees, also the number of branches on a tree was an important factor when selecting a roost site.

Peel *et al.* (2017: 77) provided information on distribution, migration patterns, roost size, age and seks composition of 29 *E. helvum* roosts from nine countries across tropical Africa. They indicate (p. 89) that roosts in urban areas are in zones where hunting is discouraged due to their human usage: hospital grounds, embassies, botanical gardens, hotels, palace gardens, zoos, and military, private or corporate compounds. These zones are usually

locations where sufficient numbers of large, tall trees are present.

MIGRATION:
Cosson *et al.* (1996: 370) reported that *E. helvum* is not a year-round inhabitant of Mauritania, and is likely a migrant species. Lelant and Chenaval (2011d: 14) reported an impressive cloud consisting of thousands of animals in Nouakchott on 9 November 2010.
Hayman *et al.* (2010) who radio tracked an individual (EBOV-seropositive, see viruses below), showed typical migratory movements in this region of West Africa.
The drivers, routes and patterns of migration are unknown (Peel *et al.*, 2010a). It is unclear whether *E. helvum* has a panmictic population structure across a continous distribution that shifts according to seasonal resource availability, or whether a finer substructure and specific migration routes exist (Peel *et al.*, 2010a).

Daïnou *et al.* (2010) report that the distribution of *Milicia excelsa* (Moracea) is largely determined by the migration behaviour of the species main seed disperser *E. helvum*.

Based on stable hydrogen isotopes in the fur of 88 examined museum specimens from Sub-Saharan Africa, Ossa *et al.* (2012: 1) report that 22 % had migrated at least 250 km, with a mean distance of 860 km, and a maximum of over 2,000 km (for seven specimens).
For Zambia, Richter (2004: 70) suggests that trees of the genera *Uapaca* and *Syzygium* may be key in timing this species' migration, although she also indicates that the exact migratory cues for the species are unknown.

Isotopic data captured by Ossa Gómez (2012: 22) suggest that *E. helvum* has a core distribution around the Gulf of Guinea, with migration towards the north (Mauritania, Niger) during the months of May to September and towards the south (Tanzania, Zimbabwe, Zambia) during the months of October and December.

Pakula *et al.* (2017: 2) report on a Straw-coloured fruit bat that was observed on a ship sailing along the coast of West Africa, indicating that these bats can be transported over long distances.

DIET:
Doutre and Sarrat (1973: 280) indicated that in West Africa, *E. helvum* has an outspoken preference for (over)ripe local fruits such as mangos, guavas, figs and bananas. They never saw them eat green fruits.

Ayensu (1974) reports on *E. helvum* visiting the following plants when foraging: *Parkia clappertonia* (Dawadawa), *Ceiba pentandra* (Silk-Cotton tree or Kapop tree), *Adansonia digitata* (Baobab), *Anacardium occidentale* (Cashew tree), *Ficus umbellata* (Fig tree), *Psidium guajava* (Guava tree), *Carica papaya* (Papaya or pawpaw), and *Azadirachta indica* (Neem tree).

Daïnou *et al.* (2010) mention that *E. helvum* feeds on the fruits of the Iroko trees (*Milicia excelsa*) in Cameroon, and suggest that the migratory behaviour of *E. helvum* is the primary mechanisim (seed dispersal) for the distribution of *Milicia excelsa* (Moraceae).

In Accra (Ghana), Dechmann *et al.* (2010: 121) found that seven tracked bats mainly fed on introduced and/or cultivated fruits (primarily neem - *Azadirachta indica*, but also on papaya, mango, oil palm and banana). Only two animals ate wild figs. They also found that the core foraging area was only 3.9 ha (2.2 - 4.9 ha) and included only a few food trees. This area was on average 18.6 ± 11.8 km (max: 37 km) from their roost.
Fahr *et al.* (2015: 1) found that *E. helvum* primarily fed on fruits of introduced trees during the wet season low population numbers, whereas nectar and pollen of native trees made up the major part of their diet during the dry season when population numbers peak.

O'Brien (2011: 264) mentions that *Syzygium* is a staple food for mainland African *E. helvum*, but also refers to DeFrees and Wilson (1988: 4), who indicate that they are also fond of *Ceiba pentandra*.

Investigations by Kankam and Oduro (2011: 22) in the Bia Biosphere Reserve in Ghana showed that *Antiaris toxicaria* [bark cloth tree, antiaris, false iroko, false mvule or upas tree] fruits processed by *E. helvum* still had some fruit pulp around them, and resulted in a far less degree of germination than seeds, which were processed by monkeys and were cleared of fuit pulp.

In Congo, Kipalu (2009: 16) observed *E. helvum* visiting and/or consuming fruits of the African custard-apple (*Annona senegalensis*), Borassus palm (*Borassus aethiopum*), Heart Fruit (*Hymenocardia acida*), African peach (*Nauclea diderichii*), African corkwood tree (*Musanga cecropioides*), and (*Caloncoba welwitschii*)

Lavin *et al.* (2009: 336) report on the prevention of ISD (Iron Storage Disease of hemochromatosis) in captive *E. helvum* specimens, which can result in organ damage and possibly fatalities. The animals might succumb due to the extremely low iron

concentrations in the wild diet as compared with the diet they have in captivity.

In Abidjan, Côte d'Ivoire, Niamien *et al.* (2009: 235) reported the following fruits to be present in the bat's droppings: Anacardiaceae: *Mangifera indica* L. (Mango); Arecaceae: *Elaeis guineensis* Jacq. (African oil palm); Caricaceae: *Carica papaya* L. (Papaya); Mimosaceae: *Parkia biglobosa* (Jacq.) R.Br. ex G.Don (African locust bean) [flowers]; Moraceae: *Ficus benjamina* L. (Weeping fig, Benjamin fig), *Ficus exasperata* Vahl (Sandpaper tree, forest sandpaper fig, white fig, or sandpaper leaf tree), *Ficus lutea* Vahl (giant-leaved fig, Lagos rubbertree), *Ficus polita* Vahl (Heart-leaved fig), *Ficus* spp., *Ficus sur* Forssk (Cape fig, broom cluster fig), *Ficus umbellata* Vahl; Myrtaceae: *Psidium guajava* L. (common guava, yellow guava, lemon guava) as well as leaves of *Araucaria excelsa* (Norfolk Island Pine, Star Pine - Araucariaceae). Niamien *et al.* (2017b: 187) added the fruits of *Eugenia jambos* L. (Rose apple, Malabar plum) and *Eugenia malaccensis* L (Malay apple) (Myrtaceaea) and leaves of *Platycerium* sp. (Polypodiaceae).

In western Kenya, Webala *et al.* (2012: 12) reported that *E. helvum* helped to disperse seeds of over 32 plant species belonging to 17 families: Anacardiaceae: *Mangifera indica* (Mango); Apocynaceae: *Saba comorensis* (Bungo fruit); Canellaceae: *Warburgia ugandensis* (Uganda greenheart); Caricaceae: *Carica papaya* (Papaya); Cucurbitaceae: *Momordica foetida*; Flacourtiaceae: *Flacourtia indica* (Madagascar plum, batoka plum, flacourtia, governor's plum, Indian plum); Guttiferae: *Garcinia buchananii* (Granite Mangosteen); Lauraceae: *Persea americana* (Avocado); Malvaceae *Ceiba pentandra* (Kapok); Meliaceae: *Melia azedarach* (white cedar); Moraceae: *Ficus amadiensis*, *Ficus asperifolia*, *Ficus lutea* (Giant-leaved Fig), *Ficus natalensis* (Natal Fig), *Ficus ovalifolia*, *Ficus ovata*, *Ficus sur* (Cape Fig), *Ficus sycomorus* (Sycamore Fig), *Ficus thonningii* (Strangler Fig, Common Wild Fig, Bark-cloth Fig), *Ficus vallis-choudae*, *Morus alba* (White Mulberry); Myrtaceae: *Psidium guajava* (Apple or common guava), *Syzygium cordatum* (Water berry), *Syzygium guineense* (Water berry); Fabaceae: *Crotolaria lanchnocarpoides*; Rosaceae: *Eriobotrya japonica* (Loquat), *Rubus apetalus*; Rubiaceae: *Vangueria apiculata* (Mutugundo Fruit); Rutaceae: *Teclea nobilis* (Small fruited Teclea), *Teclea trichocarpa* (Furry-fruited Teclea), *Toddalia asiatica* (Orange climber).
Webala *et al.* (2014: 90) removed *Ceiba pentandra* from the above list and added *Allophylus ferrugineus* (Sapindaceae).

Makau (2016: xii) found it to be the most effective disperser of guava seeds in western Kenya.

Seltzer *et al.* (2013: table S2) provides an overview of the plant species found beneath bat feeding roosts. For *E. helvum* these include *Elaeis guineensis* Jacq. (African Oil palm - Arecaceae), *Magnistipula butayei* De Wild (Chrysobalanaceae), *Parinari excelsa* Sabine (Guinea Plum - Chrysobalanaceae), *Antiaris toxicaria* Lesch. (upas tree - Moraceae), *Ficus natalensis* Hochst (Natal Fig - Moraceae), *Milicia excelsa* (Welw.) C. C. Berg (African Iroko - Moraceae), *Psidium guajava* L. (apple guava - Myrtaceae), *Syzygium guineense* (Willd.) D.C. ("water-berry", Snake bean tree - Myrtaceae) and *Maesopsis eminii* Engl. (Umbrella tree - Rhamnaceae).

Corlett (2017: 13) (referring to Abedi-Lartey *et al.*, 2016) reports that gut passage times for small seeds in caged bats had a median of 72 min and a maximum of 19 h. Combined with the long commutes these bats undertake, this results in a potential dispersal distance of 10 to 100 km. However, they also indicate that the estimated median dispersal distances (for larger seeds) is about 50 m. van Toor *et al.* (2019: R238) found that the bats dispersed seeds over distances of up to 95 km, with averages ranging from 12.6 to 21.4 km, depending on colony and season. For the colony in Accra (Ghana), they calculated that during the dry season the 152,000 bats accounted for 338,000 dispersal events during a single night and produced an average seed rain of 26.2 dispersal events per km^2. During the wet season, when only 4,000 bats are present, there are only 5,500 dispersal events per night.

PREDATORS:
Mikula *et al.* (2016: 162) report that the Amur falcon (*Falco amurensis* Radde, 1863) and the Eurasian hobby (*Falco subbuteo* Linnaeus, 1758) were observed chasing *Eidolon helvum* bats in Kasanka forest, Zambia. Furthermore (supplemental data), they mention the following avian predators: Steppe eagle (*Aquila nipalensis* (Hodgson, 1833)), African hawk eagle (*Aquila spilogaster* (Bonaparte, 1850)), Common buzzard (*Buteo buteo* (Linnaeus, 1758)), Greater spotted eagle (*Clanga clanga* (Pallas, 1811)), Lesser spotted eagle (*Clanga pomarina* (Brehm, 1831)), Lanner falcon (*Falco biarmicus* Temminck, 1825) [with "*Eidolon* sp" from countries on the African continent as prey], Palm-nut vulture (*Gypohierax angolensis* (Gmelin, 1788)), White-backed vulture (*Gyps africanus* Salvadori, 1865), African fish eagle (*Haliaeetus vocifer* (Daudin, 1800)), Ayres's hawk-eagle (*Hieraaetus ayresii* Gurney, 1862), Bat hawk (*Macheiramphus alcinus* Bonaparte, 1850),

Black kite (*Milvus migrans* (Boddaert, 1783)), Martial eagle (*Polemaetus bellicosus* (Daudin, 1800)), Crowned eagle (*Stephanoaetus coronatus* (Linnaeus, 1766)), Pied crow (*Corvus albus* Statius Muller, 1776).

POPULATION:
Structure and Density - In general this is a common species forming large colonies of thousands to even millions of individual. Hayman *et al.* (2011b: 1; 2012c: 1393) report on a colony of up to one million individuals being present in Accra, Ghana for approximately 6 months during the dry season, and Sørensen and Halberg (2001: 213) report 1.5 million fruit bats leaving the roost at sunset in the Kasanga National Park, Zambia. Racey (2004a: 2) indicates that the number bats at the same locality peak near the end of November to about 8 million (representing a total mass of 3,000 metric tons in one hectare of forest and consuming nearly 6,000 tons of fruit each night), after which they begin to fall rapidly. Within colonies they form tight clusters of up to 100 animals, although in particularly large colonies this clustering may not be so obvious. Colonies may show extreme roost-site fidelity. During migration this species disperses into small groups. There is evidence of a widespread decline (P. Racey *pers. comm.* in Mickleburgh *et al.*, 2008dc). A well-known colony in Kampala (Uganda) declined in numbers over a forty-year period from ca. 250,000 animals to 40,000 in 2007 (Monadjem *et al.*, 2010d). A trend which continued over the following years (Akite, 2009: 28-29).

Based on emergence data for one roost on Principe (10,500 - 14,200 bats), Dallimer *et al.* (2006: 50) estimated a population density between 82 and 111 bats/km^2 for the entire island.
On Annobón, Peel *et al.* (2012: 3) reported colony sized of up to 1,500 animals.
Wood *et al.* (2012: 2885) indicate that while colonies in West Africa can be very large, these in East Africa appear to be smaller and more fragmented, and also seem to be less migratory.

Magloire *et al.* (2017: 890) reported on a colony from Abidjan (Côte d'Ivoire) counting on average 180,000 bats. They found that the colony size increased from August to November (from 200,000 to 300,000), stabilized from November to February and decreased from March to July (to 12,000). These fluctuations were linked to food diversity and abundance.

For their study on the distribution of Ebola viruses, Fiorillo *et al.* (2018: 8) estimated the density of a *E. helvum* colony to be about 180 bats/km^2.

Trend - 2008 - Decreasing (Mickleburgh *et al.*, 2008dc; IUCN, 2009). 2004 - Decreasing (Mickleburgh *et al.*, 2004bh; IUCN, 2004).

LIFESPAN:
Hayman *et al.* (2012c: 1399) examined the tooth cementum annuli, and found three old specimens with an estimated age range from 13 to 15 years. They found that adult bats had a survival probability of about 0.83, whereas this was 0.43 for juveniles.

Szekely *et al.* (2015: Suppl.) reports a maximum longevity of 21.8 years.

Hayman and Peel (2016:134) calculated that the mean life expectancy estimates across the colonies they studied to be ranging from 2.3 to 6.8 years, and that individuals may live up to 30 years of age.

Peel *et al.* (2017: 85) report on regional differences in the livespan of *E. helvum*: Tanzania (Dar es Salaam: mean 6.4 yrs, max 15 yrs, n = 53 adults; Morogoro: 4.5, 8, 24), Ghana (6.0, 14, 76), Bioko (2.4, 6, 16), Príncipé (4.2, 10, 23), and São Tomé (4.8, 13, 57).

ACTIVITY AND BEHAVIOUR:
In Nigeria, *E. helvum* was reported to fly at least 24 km each night and often stopped at a number of locations between leaving the roost and arriving at the foraging site (Okon, 1974). Richter and Cumming (2006) reported flights of over 15 km for *E. helvum* in Kasanka National Park, Zambia. Richter and Cumming (2008: 172) reported that bats foraged as far as 59 km away from their roost. During their migration, one animal travelled 370 km in one night, but on average they travelled 29 km/day. The largest distance travelled by one bat, reported in that study, is 2,518 km in 149 days.

Sapir *et al.* (2014: 1) found that, in Ghana, *E. helvum* modified its flight in response to the wind vector (e.g. they decreased their airspeed in response to tailwinds so that their groundspeed remained nearly constant).

In Ghana too, Fahr *et al.* (2015: 1) found that *E. helvum* foraged locally during the wet season population low (ca. 4,000 animals traveling between 3.5 and 36.7 km) in urban areas with low tree cover. During the dry season population peak, some 150,000 individuals travelled between 24.1 and 87.9 km.

Carpenter (1986: 90) and McGuire and Guglielmo (2009: 1291) reported that the respiratory quotient for this species indicates that fat provided 77 - 92 % of the fuel during flight, and a decline in

respiratory quotient during long flights may prove that fat is indeed the only fuel source following initial carbohydrate use. Carpenter (1986: 93) also indicates that at airspeeds of 5.5 to 6.5 m/s the heart beats at a frequency of 576 - 601 beats per minute, and at airspeeds between 5.5 and 7.0 m/s, these bats take 295 to 316 breadths per minute. From flight corridor tests, Riskin *et al.* (2012: 2946) determined the average flight speed to be 4.24 ± 0.91 m/s.

In captive groups, Carter and Leffer (2015: 3) found that 6 males spent 0.52 % of their awake time with social grooming. A group consisting of six females and two castrated males did not perform any social grooming at all.

REPRODUCTION AND ONTOGENY:
For Uganda, Mutere (1967, 1968) reported pregnancies between October and February and births occurring between February and March.

For Congo, Bergmans (1979a: 165) reported two pregnant females on 6 December 1972.

Krutzsch (2000: 109) reports that various authors found that *E. helvum* has a monoestrous reproduction cycle.

Simbauni and Bernard (2001: 63) indicate that the reproductive cycle of *E. helvum* is characterized by a three-month period of delayed implantation (see also Badwaik and Rasweiler, 2000: 228; Racey and Entwistle, 2000: 383) and that the pregnancy may last for 10 months. At birth, the young has about 18.4 % of the mother's body mass (48.6 g versus 263.5 g; see Kurta and Kunz, 1987: 82).

Peel *et al.* (2013b: 7) indicate that *E. helvum* is panmictic across its continental African range, meaning that all individuals from over the entire range are potential partners. They found no indication that gene flow was more likely to occur among neighbouring populations than among distant populations (> 4,500 km). They conclude that *E. helvum*, therefore, has the largest reported panmictic unit of any mammal.

Szekely *et al.* (2015: Suppl.) report a gestation period of 275 days, and indicate that weaning occurs after 65 days. At birth the young weighs 50 g and after gestation its weight has increased to 135 g.

In their overview, Peel *et al.* (2017: 82) report the estimated start of births in different countries: Annobón (mid-September), Malawi (mid-November), Principé (November-December), Tanzania (mid-December), São Tomé and Ghana (February-March), Uganda (March-April), Bioko (mid-April). They also indicate (p. 83) that females are reproductively active between the ages of 2 and 14 years.

PARASITES:
BACTERIA
Gram-negative bacterium - Pinus and Müller (1980) and Sara (2002: 41) reported *Citrobacter freudii*, *Escherichia coli*, *Klebsiella oxytoca*, and *Klebsiella pneumoniae*.
Nowak *et al.* (2017: 6) tested three bats from the Republic of Congo of which two tested positive for *E. coli*.

Gram-positive bacterium - Akobi *et al.* (2012: 1) found that 500 faecal samples of bats at the university of Ife-Ife, Nigeria were colonized by 107 isolates of *Staphylococcus aureus* strains with genotypic characteristics that are rarely found in humans. Held *et al.* (2016: 118) refer to a report from Nigeria, indicating that *E. helvum* can be colonized by *S. schweitzeri*.

Spirochaetales - Reviewed in McCoy (1974), who listed *Borrelia* sp. Ogawa *et al.* (2015a: 143) report on the presence of at least two other spirochaete bacteria: *Leptospira borgpetersenii* and *L. kirschneri* in *E. helvum* which migrated from the Democratic Republic of the Congo to Zambia.

Bartonellae - Bacteria
Bartonella - Kosoy *et al.* (2010: 1877) and Bai and Kosoy (2012: 58) reported a prelevence of *Bartonella* spp. In *E. helvum* from Kenya of 23/88 (26.1%) cultured from blood samples. The level of *gltA* sequence identified between 16 *Bartonella* genotypes, but varied greatly, eight genotypes (sequence variants) were clustered around 4 clades (Kosoy *et al.*, 2010: 1878). Three novel *Bartonella* species have been isolated from *E. helvum* (Kosoy, 2010: 719). See also Kosoy (2010: 719) for further information.
Morse *et al.* (2012: 1719) refer to Billeter *et al.* (2012) for *Bartonella* sp. found in the bat fly *Cyclopodia greefi*, parasiting on *E. helvum* in Ghana. Billeter *et al.* (2012: 325) collected batflies (*Cyclopodia greefi greefi*) from *E. helvum* specimens from Ghana (see also Morse *et al.*, 2012), Bioko, and Annobón. Of these bat flies, 56.5 % (Ghana) to over 71 % (Bioko, Annobón) were carriers of *Bartonella* bacteria. Genetically, 65.9 % of the *Bartonella* sequences were identical or similar to sequences obtained in other studies (e.g. Kosoy *et al.*, 2010). One sequence was very similar to one obtained from a *E. helvum* specimen collected in Kenya (Billeter *et al.*, 2012: 326 - 327). Kamani *et al.* (2014: 628) tested 79 *E. helvum* specimens from Nigeria and found at least 44 testing positive for *Bartonella* DNA.

79 isolates studied by Bai *et al.* (2015: 7) revealed five genogroups (*E1* to *E5*) for *ribC*. An additional lineage (*Ew*) did not contain a fragment for *ribC*.

Mannerings *et al.* (2016: 923) report that the following *Bartonella* species were already isolated from *E. helvum* bats: *B. henselae, B. quintana, B. clarridgeiae, B. vinsonii vinsonii, B. elizabethae*, and *Bartonella* strain E1–105.

Olatimehin *et al.* (2018: 3) found *Staphylococcus aureus*, *Staphylococcus schweitzeri* and *Staphylococcus argenteus* in feacal samples from bats at the Obafemi Awolowo University, Ile-Ife, Nigeria.

HAEMOSPORIDIA
Boundenga *et al.* (2018: 10581) reported 1 out of six examined *E. helvum* to be infected by *Hepatocystis* (16.67%).
In a study performed in Ibadan (Nigeria), Li *et al.* (2019: 21) found six out of 109 *E. helvum* specimens (5.5%) infected with *Cryptosporidum* sp. and 16 (14.7%) infected by *Enterocytozoon bieneusi*; none were infected by *Giardia duodenalis*.

ACARI
Laelapidae: Taufflieb (1962: 112) indicated that *Chelanyssus aethiopious* Hirst, 1921 was found once on a female *Eidolon helvum*, but this was never confirmed by subsequent findings. He considered this one time occurrence as accidental.
Sarcoptidae: *Nycteridocoptes pteropodi* Rodhain and Gedoelst, 1923 was reported by Fain (1958: 236) from *E. helvum* specimens from Astrida (=Butare), Rwanda.
Spinturnicidae: Taufflieb (1962: 112) reported *Meristaspis kenyaensis* Radford, 1947.

HEMIPTERA
Cimicidae: Haeselbarth *et al.* (1966: 8) recorded *Afrocimex constrictus* Ferris & Usinger, 1957 associated with *E. helvum* near Ruiru, Kenya.

DIPTERA
Nycteribiidae: *Penicillidia fulvida* (Bigot, 1885) (see Haeselbarth *et al.*, 1966: 114). *Eucampsipoda africanum* Theodor, 1955, widely distributed over the Ethiopian region and recorded from localities in Senegal to the Sudan and southwards to the Cape (Haeselbarth *et al.*, 1966: 115). *Dipseliopoda setosa* Theodor, 1955 from Kenya and Tanzania (Haeselbarth *et al.*, 1966: 116). *C. greeffi* was originally described by Karsch (1884) from an *E. helvum* specimen from São Tomé, and the adjacent islet of Rojas (see Urich *et al.*, 1922: 471). Urich *et al.* (1922) furthermore mentioned additional specimens from this bat fly, reported by Rodhain and Bequaert from *E. helvum* specimens from Leopoldville [= Kinshasa], DRC. *Cyclopodia greeffi* are found in a belt across central Africa, between lat. 10° south and north, while in West Africa it occurs further north up to lat. 20° (Haeselbarth *et al.*, 1966: 117). Billeter *et al.* (2012: 325) collected bat flies (*Cyclopodia greefi greefi*) from *E. helvum* specimens from Ghana (see also Morse *et al.*, 2012), Bioko, and Annobón (see above for bacteria results from this study). Szentiványi *et al.* (2019: Suppl.) indicated that these bat flies were also carrying the arthropod *Eupelmus urichi* (on São Tomé) and *Bartonella* bacteria (in Ghana).

SIPHONAPTERA
Ischnopsyllidae: *Thaumapsylla breviceps* Rothschild, 1907, described from Kenya and the DRC (Haeselbarth *et al.*, 1966: 186). *Thaumapsylla dina* Jordan, 1937 from the mountains of the Ruwenzori, Congo and Kenya (Haeselbarth *et al.*, 1966: 186). *Lagaropsylla consularis* Smit, 1957, traditional host being molossid bats, but it has also been recorded from this taxon (Haeselbarth *et al.*, 1966: 190).
Teinocoptidae: *Teinocoptes eidoloni* Fain, 1959 was reported by Fain (1967: 367) from *E. helvum* from Astrida (=Butare), Rwanda.

VIRUSES:
In their country-wide survey of Kenyan bats, Waruhiu *et al.* (2017) found the following viruses in *Eidolon helvum*: Adenoviruses, Astroviruses, Coronaviruses, Flaviviruses, Paramyxoviruses and Polyomavirus.

Willoughby *et al.* (2017: Suppl.) report the following viruses: Bundibugyo ebolavirus, Bunyamwera orthobunyavirus, Entebbe bat virus, Hendra henipavirus, Ife virus, Influenza A virus, Lagos bat lyssavirus, Mokola lyssavirus, Nipah henipavirus, Ntaya virus, Sudan ebolavirus, Tai forest ebolavirus, Usutu virus, West Caucasian bat lyssavirus, West Nile virus, Yellow fever virus, Zaire ebolavirus, Zika virus.

Yinda *et al.* (2016: 6) identified 5 divergent novel bat RVA strains from faeces collected in Cameroon. Four of these were genetically similar to each other and the last one was related to the Kenyan bat strain. They did not notice any diarrhea or other obvious signs of sickness in the bats.

Peel (2018: 1) estimated that maternally-derived immunity to Lagos bat virus and African henipavirus has a mean duration of about six months, which is much less than the acquired immunity for these viruses: 12 and 4 years respectively.

Yinda *et al.* (2018: 2) pooled 87 fecal samples of *Eidolon helvum* and *Epomophorus gambianus* from Cameroon into 25 groups. One group containing fecal samples of *E. gambianus* only yielded mainly phage viral reads, leading them to conclude that all the eukaryotic viral reads they encountered were from *E. helvum*. The viruses they found belonged to the following families: Alphaflexiviridae, Astroviridae, Baculoviridae, Caliciviridae, Caulimoviridae, Circoviridae, Coronaviridae, Dicistroviridae, Geminiviridae, Hepeviridae, Herpesviridae, Iflaviridae, Marnaviridae, Nodaviridae, Other Picornavirales, Papillomaviridae, Partitiviridae, Parvoviridae, Picobirnaviridae, Picornaviridae, Polydnaviridae, Reoviridae, Retroviridae, Secoviridae, Tombusviridae, Totiviridae, Tymoviridae, Unclassified eukaryotic virus, and Virgaviridae. Most of the identified partitiviruses and densoviruses constitute putative novel genera in their respective families.

In bats from Saudi Arabia, Mishra *et al.* (2019: 5) found evidence for the following viruses: Bat astrovirus, Bat papilloma virus, Bat Coronavirus, Bat polyomavirus, Me Hepe-Astro virus, Parechovirus, Rotavirus, Sapovirus, Teschovirus,

Adenoviridae
Sequences of *Eidolon helvum* adenovirus 1 attributed to the genus *Mastadenovirus* were found by Baker *et al.* (2013a: 98) in samples from bats from Ghana.
Conrardy *et al.* (2014) tested 9 bats from Kenya, none of which tested positive.
Ogawa *et al.* (2017: 2) isolated a new adenovirus from Zambian bats: *E. helvum* adenovirus 06-106 - EhAdV 06-106, which they also tentatively called: *Bat mastadenovirus H*.

Caliciviridae
Sapovirus (SaV)
From Cameroonian bats, Yinda *et al.* (2017a: 2) identified the complete genome of six highly divergent SaVs and one partial SaV, which probably represent two novel genogroups, that are only distantly related to any other known SaVs.

Coronaviridae - Coronaviruses
SARS-CoV - Müller *et al.* (2007b) tested between 1986 and 1999, six individuals for antibody to SARS-CoV in sera from Bandundu Province, DRC, none were found to be positive. In February 2008, Pfefferle *et al.* (2009) tested 212 fecal samples from bats from Ghana and all were negative for coronavirus (CoV) RNA. Tong *et al.* (2009) found 6/10 bats collected in 2006 positive for coronavirus RNA in Kenya (Kenya bat coronavirus BtKY20, Kenya bat coronavirus BtKY23, Kenya bat coronavirus BtKY24). 21 % (38 out of 181) of the Kenyan bats tested by Tao *et al.* (2017: 3) were positive for coronaviruses. In Nigeria during June 2008, Quan *et al.* (2010) screened the gastrointestinal tissue for the presence of coronaviruses by PCRs, none tested positive.
Anthony *et al.* (2017b: Suppl.) mention beta-coronaviruses Eidolon_bat_CoV and Kenya_CoV_BtKY56.
Leopardi *et al.* (2016: 575) report on the first occurrence of CoV outside of Kenya: Nigeria.

Filoviridae - Filoviruses
Olival and Hayman (2014: 1770) found that *E. helvum* has a high seroprevalence of antibodies against several RNA viruses, but not filoviruses, especially when compared to other species in the same locations. They suggest that the migratory lifestyle of this species might prevent filovirus cirulation. Peterson *et al.* (2007: 1547) indicate that the geographic distribution of *E. helvum* covers the entire distribution range of both Ebola and Marburg viruses. Hayman (2015: 6) points to the single, highly synchronous birth pulse per year, which prevents persistence of the virus in *E. helvum*.

Ebolavirus
Hayman *et al.* (2010) tested the blood of 262 individuals from Ghana for Ebola virus using indirect flurescent tests for antibodies against EBOV subtype Zaire [= ZEBOV], one positive was found in a pregnant female. The positive reactivity for EBOV was confirmed using western blot against a recombinant nucleocapsid protein of EBOV-Zaire (Hayman *et al.*, 2010).
Funk and Piot (2014: 2) erroneously refer to Gire *et al.* (2014), who should have claimed that the 2014 Ebola outbreak in West Africa probably originated from a child infected by a straw-coloured fruit bat. However, as indicated by Jakob Fahr in the discussion following this paper, Gire *et al* (2014) never mention bats. The reference was then changed to Baize *et al.* (2014), but that paper (p. 1424) only refers to the "usual suspects": *Hypsignatus monstrosus, Epomops franqueti* and *Myonycteris torquata*. To date, there is no proof that the West African Ebola outbreak is directly related to bats.
In Zambia, Ogawa *et al.* (2015b: "1") found some serum samples that showed distinct specificity for Reston ebolavirus, which has thus far been found only in Asia.
Studying *E. helvum* genes, Ng *et al.* (2015: 2) found that the *NCP1* gene, which encodes a protein that mammals need in order to move cholesterol within their cells, also turns out to be a receptor that the filoviruses must bind to before they can infect the cells.

Marburgvirus
Towner *et al.* (2007) tested 35 individuals from Gabon for Marburg virus RNA by conventional and real-time RT-PCR and 33 individuals for anti-Marburg virus IgG antibodies by ELISA; no positives were found. Hayman *et al.* (2010) tested the blood of 262 individuals from Ghana for Marburg virus using indirect flurescent tests for antibodies against MARV subtype Leiden, no positives were found.

Flaviviridae
Flavivirus - In Uganda, Kading *et al.* (2018: 3) found neutralizing antibodies against West Nile virus (WNV) and non-specific Flaviviruses.
Malmlov *et al.* (2019: 3) refer to Simpson *et al.* (1968) who experimentally inoculated three *E. helvum* specimens with Zika virus, of which two became viremic and seroconverted.

Pegivirus (BPgv) - 0 out of 8 bats from Cameroon, 1 out of 17 from the Democratic Republic of the Congo, 0 out of 11 from Kenya and 1 out of 50 animals from Nigeria examined by Quan *et al.* (2013: Table S5) were infected by clade H type *Pegivirus* (overal 2.3 %). For the same bats examined, they also found 1, 0, 1, and 5 specimens infected by clade K type *Pegivirus*.

Herpesviridae
Alphaherpesvirinae
Simplexvirus
Dak An Y 7 – (3 isolates) Cameroon, 1971, isolated from pooled organs (Razafindratsimandresy *et al.*, 2009).

Betaherpesvirinae
Eidolon helvum herpesvirus 1 and 3 - Baker *et al.* (2013a: 96) identified 539 sequences related to herpesviruses, primarily from throat samples: 366 belonging to *betaherpesvirinae*.

Gammaherpesvirinae
Eidolon helvum herpesvirus 2 - Baker *et al.* (2013a: 96) identified 539 sequences related to herpesviruses, primarily from throat samples: 171 to *gammaherpesvirinae*.

Nairoviridae
Orthonairovirus
Of the 167 specimens from Ghana tested by Müller *et al.* (2016: 3), 1 was positive for Crimean Congo hemorrhagic fever virus (CCHFV)

Orthomyxoviridae
Freidl *et al.* (2015) conducted serological studies on 100 *E. helvum* serum samples collected in Ghana in 2009/10. About 30% of the screened animals showed serological evidence to avian influenza subtype H9. According to Brunotte *et al.* (2016: 117), this suggests that bats can be naturally infected with classical IAV, although they did not find any evidence to support this hypothesis.

Papillomaviridae (PV)
Baker *et al.* (2013a: 97) found 408 sequences belonging to multiple papillomaviruses, of which two represented new forms.
García-Pérez *et al.* (2013: 51) cloned and sequenced the complete genome of a novel PV, EhelPV1, isolated from hair bulbs from a captive straw-colored fruit bat.
Mengual-Chuliá *et al.* (2012) reported on PV sequences from hair follicles of captive bats.

Paramyxoviridae - Paramyxoviruses
Nine individuals from Kenya were tested for paramyxoviruses by Conrardy *et al.* (2014). All nine were negative for paramyxovirus RNA.
Paramyxovirinae
Henipavirus
Hayman *et al.* (2008b) detected antibodies to both Nipah (NiV - 39 %) and Hendra (HeV - 22 %) [both members of the genus *Henipavirus* (see Hayman *et al.* (2011b: 1)] in bats collected in Ghana in 2007. Peel *et al.* (2012: 2) found antibodies against these viruses in bats on Annobón.
Drexler *et al.* (2009) detected henipavirus RNA and three novel viruses were identified. Drexler *et al.* (2012a: Suppl. Table 1) indicated that 42 out of 722 (5.8 %) bats collected in Ghana, the Central African Republic and Gabon tested positive for *Henipavirus*. 4.0 % (29) tested positive for *Rubulavirus* and 1.8 % (13) for *Pneumovirus*.
Pernet *et al.* (2014: 3) screened 44 Cameroonian bat serum samples for anti-NiV cross-neutralizing activity and found 21 (ca. 48 %) testing positive.
Baker *et al.* (2012: 1348) describe two new Rubulaviruses: Achimota virus 1 (AchPV1) and Achimota virus 2 (AchPV2). They developed specific serological assays for these two viruses and found evidence of infection by both in *E. helvum* across sub-Saharan Africa and on islands in the Gulf of Guinea.
Baker *et al.* (2011b: 855) indicate that a co-evolutionary relationship might exist between Chiroptera and *Paramyxoviridae*, based on an analysis of urine samples of *E. helvum* from Accra, Ghana.
Weiss *et al.* (2012a: suppl. 1) report on *Paramyxovirinae* sequences obtained from liver and urine samples from bats collected near Brazzaville (Republic of Congo), organs of one individual presented with two diverse paramyxovirus sequences.
From Zambia, Muleya *et al.* (2013: 611) report five new paramyxoviruses closely related to the genus *Henipavirus* and two related to the unclassified Bat

paramyxoviruses from Ghana and Congo Brazzaville.
With the use of a seroneutralization assay, Pernet *et al.* (2014) found cross-neutralizing antibodies to Nipah virus in 48 % of sampled *E. helvum* bats collected in Cameroon.
Mbu'u *et al.* (2019: "1") mention the presence of Ghanaian bat henipavirus (designated Ghana virus - GhV) in Ghana.

Rubulavirus
Achimota virus: Baker *et al.* (2012) describes two new paramyxoviruses isolated from *E. helvum*: Achimota virus 1 (AchPV1) and Achimota virus 2 (AchPV2).
Several rubulaviruses and rubula-related viruses were reported in several *E. helvum* individuals sampled from several African countries (Drexler *et al.*, 2012). Some of these sequences proved to be closely-related to human mumps virus and simian virus 5.

Kohl *et al.* (2018: 11) indicate that a number of yet unknown rubulaviruses might be present in these bats.

Pneumovirinae
Pneumovirus
Several individuals sampled in Ghana tested positive for a pneumovirus closely related to pneumonia virus of mice, and grouped in a sister clade to human respiratory syncytial virus.

Parvoviridae
Canuti *et al.* (2011: 3) report a new virus (Eidolon-helvum-bat-Parvovirus-1 [Eh-BtPV-1]) from bats captured in Kumasi, Ghana. Baker *et al.* (2013a: 100) found 10 sequences, belonging to both the mammalian-infecting Parvovirinae (related to the genera *Erythrovirus* and *Betaparvovirus*) and the invertebrate-infecting Densovirinae.

Peribunyaviridae
Orthobunyavirus
Fagre and Kading (2019: 4) report that Bunyamwera virus (BUNV) was isolated from this bat or that molecular and serologic evidence of it was found.

Picornaviridae
Eidolon-helvum-Picornavirus-1 contigs related to the genus *Kobuvirus* from 6 urine samples and one contig from a lung sample, and related to the genus *Enterovirus*, were reported by Baker *et al.* (2013a: 100).

In the faeces of Cameroonian bats, Yinda *et al.* (2017b: 3) identified 11 new picorna-like viruses of which some might represent new families [*] within the order Picornavirales: bat sapelovirus, bat kunsagivirus and bat crohivirus, bat iflavirus [Iflaviridae], bat posalivirus [Posa-like virus; *], bat fisalivirus [Fisa-like virus; *], bat cripavirus [Dicistroviridae], bat felisavirus [fesa-like virus; *], bat dicibavirus [bat dicistrovirus; *] and bat badiciviruses 1 and 2 [anagram from bat dicistrovirus; *].

Polyomaviridae
Baker *et al.* (2013a: 100) assembled a sequence from a throat sample. Eckerle *et al.* (2014: 4) mention the presence of several, unassigned viruses of this family. Conrardy *et al.* (2014: 259) reported that one of the nine specimens tested in the Vihiga district (Kenya) tested positive for *Polyomavirus*. Tao *et al.* (2012) identified two novel species termed *Eidolon* PyV1 and 2, from Kenya in 2006.

Poxviridae
38 contigs related to *Molluscum contagiosum* [MC]), a human contagion were reported by Baker *et al.* (2013a: 99). Baker and Murcia (2014: 1567) indicate that the bats do not show any clinical signs.

Reoviridae - Rotaviruses
Rotavirus
Esona *et al.* (2010: 1844) reported genetic characterization of a bat rotavirus (Bat/KE4852/07) detected in the feces of *E. helvum*, which is a novel *Rotavirus A* species. This isolate contained a VP4 gene that probably originated from a human rotavirus, an NSP4 gene of likely human or animal rotavirus origin, and otherwise a unique genetic background requiring establishment of new genotypes for at least 7 genes (Esona *et al.*, 2010: 1845).
Sasaki *et al.* (2018: 104) compared genome segments of RVA from bats from Cameroon and Zambia and found these to be 97 to 99 % identical, suggesting that *E. helvum* is capable of dissimating RVA across long distances.

Orbivirus
Ife virus - In Nigeria 1971, the virus was isolated from the salivary glands, brain and blood (Kemp *et al.*, 1988). Also reported by de Jong *et al.* (2011: 11). Fagre *et al.* (2019: 2) indicated that this virus was also found in bats from Cameroon and the Central African Republic.

Retroviridae
Baker *et al.* (2013a: 100) reported on 292 sequences related to retroviridae, that were recovered from lung samples.

Rhabdoviridae
No rhabdoviruses were detected from 9 *E. helvum* bats sampled in Kenya Conrardy *et al.* (2014).

Lyssavirus - Rabies related viruses
2006 in Nigeria, Dzikwi *et al.* (2010: 269) tested 223 brains by direct fluorescent antibody (DFA) and mouse inoculation test (MIT) which tested negative for lyssavirus antigens. In Nigeria during June 2008, Quan *et al.* (2010) did not detect any lyssavirus-specific antigens from the brains by use of direct fluroescent antibody testing.

Lagos bat virus (LBV) - Isolated in Nigeria (Boulger and Porterfield, 1958: 424 [1st detection]; Shope *et al.*, 1970; Kemp, 1975: 616; Hayman *et al.*, 2011a: 88; Fisher *et al.*, 2018: 242) and Senegal (Institute Pasteur, 1985; Hayman *et al.*, 2011a: 88). Antibodies detected in Ghana (Hayman *et al.*, 2008a); Kenya (Kuzmin *et al.*, 2008a; Kuzmin *et al.*, 2011b: 1467; Nadin-Davis *et al.*, 2011: 238), Annobón (Peel *et al.*, 2012: 3). In 2006, 105 individuals from Nigeria were serum tested by a modified rapid fluorescent focus inhibition test (RFFIT), where 24 tested positive (22.86 %) for neutralizing antibodies (Dzikwi *et al.*, 2010: 269).
Hayman *et al.* (2010), who found an individual which tested positive for EBOV, also tested positive for LBV, but no antibodies against Mokola (MOKV).
Restif *et al.* (2012: 1091) report on how emerging infectious disease research can be undertaken when little prior knowledge exists, based on the occurrence of LBV in a population of *E. helvum* in Accra, Ghana.
Freuling *et al.* (2015: 44) point out that Lagos bat viruses belong to two phylogenetic lineages and that the presence of neutralizing antibodies might be missed if the test is performed with the most commonly used isolate.
Kalemba *et al.* (2017: 409) reported that out of 18 bats examined from the DRC, six tested positive for lyssavirus neutralizing antibodies (LBV).
Hayman *et al.* (2018: 1) constructed a model to determine how host traits (e.g. maternally-derived antibodies, seasonal birthing) and viral traits (e.g. incubation periods) interact to allow LBV viruses to persist within bat populations.

Mokola virus (MOKV) - King *et al.* (1990 168) found monoclonal antibodies for MOKV in bats from Nigeria and Senegal.
In 2006, 105 individuals from Nigeria were serum tested by a modified rapid fluorescent focus inhibition test (RFFIT), where 2 tested positive (1.9 %) for neutralizing antibodies (Dzikwi *et al.*, 2010: 269).

Shimoni bat virus (SHIBV) - Kuzmin *et al.* (2011b: 1467) found 2 individuals testing seropositive on 9 animals tested between 2009 and 2010 in Kenya.
Kalemba *et al.* (2017: 409) found four out of 19 bats examined from the DRC tested positive for SHIBV neutralizing antibodies.

Horton *et al.* (2014: Table S1) tested 8 Kenyan *E. helvum* specimens, but failed to find neutralising antibodies to IKOV (Ikoma lyssavirus).

Kumasi Rhabdovirus (KRV) - This new virus was detected by Binger *et al.* (2015: 4588) in the spleen and sera of *E. helvum* specimens from Kumasi in Ghana.

By means of Capture-Mark-Recapture (CMR) procedures, Hayman *et al.* (2012b: 2163) found that survival probabilities for lyssavirus seronegative and seropositive *Eidolon helvum* in Ghana were not significantly different.
King *et al.* (1990: 168) reported monoclonal antibodies for Duvenhage and Denmark bat virus from bats from Nigeria and Senegal.

???:
Kemp (1975: 616 - 617) also mentions IbAn 67204 being isolated on 9 April 1971 from this species in Nigeria, and Herpes (YV6) virus in April 1971 and Dakar YV 177 in May 1971, both latter in specimens from Cameroon.

In their overview table, Maganga *et al.* (2014a: 8) report the following viruses were found on *E. helvum*: Lagos bat virus (LBV), Mokola virus, West Caucasian (WC) virus, Zaire Ebola virus (ZEBOV), Ife virus (Orbivirus), Hendra virus, Nipah virus (NPHV), Rubulavirus, Coronavirus, Rotavirus related, Simplexvirus, Parvovirus.

Peel *et al.* (2016) examined 2,827 bats from 9 countries over 8 years and focused on four viruses: Lagos bat virus (LBV), African henipaviruses, Achimota virus 1 (AchPV1) and Achimota virus 2 (AchPV2).

The genomic mining study by Cui and Wang (2015: 5793) revealed bornaviral elements built in the genome of *E. helvum*

UTILISATION:
In Ghana *E. helvum* is a food source (Hayman *et al.*, 2008a). *Eidolon helvum* is the most heavily harvested bat for bushmeat in West and Central Africa, and this is believed to be a major factor in reported population declines (P. Racey *pers. comm.* in Mickleburgh *et al.*, 2008dc). Kamins *et al.* (2014) investigated the sociological characteristics of communities who interact with bats (specifically *E. helvum* in Ghana) to assess their attitudes and perceptions regarding bats and disease. Ohemeng *et al.* (2017: 184) indicated that local (Ghanese) people prefered eating *E.*

helvum over other bat species, because of their delicious taste.

In Benin, Dougnon *et al.* (2012: 85 - 86) found an average carcass weight of 89.27 ± 11.41 g (about 43 % of the body mass). The quality of the meat was evaluated (for 100g meat): Total mineral matter: 13.2 g, Lipids: 23.11 g, Protein: 56.8 g, Calcium: 55 mg, Sodium: 39 mg, Phosphore: 83 mg and Potassium: 75 mg, making it more fatty than *E. gambianus* meat (Lipids: 13.36 g). The authors suggest that the higher fat content is a result of the longer foraging distance covered by *E. helvum*.

See also threats section for additional information on utilization.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Angola, Benin, Burkina Faso, Burundi, Cameroon, Central African Republic, Chad, Congo, Congo (Democratic Republic of the), Côte d'Ivoire, Equatorial Guinea, Ethiopia, Gabon, Ghana, Guinea, Guinea-Bissau, Kenya, Liberia, Madagascar, Malawi, Mauritania, Mozambique, Namibia, Niger, Nigeria, Rwanda, São Tomé and Principé, Senegal, Sierra Leone, South Africa, South Sudan, Sudan, Tanzania, The Gambia, Togo, Uganda, Zambia, Zimbabwe.

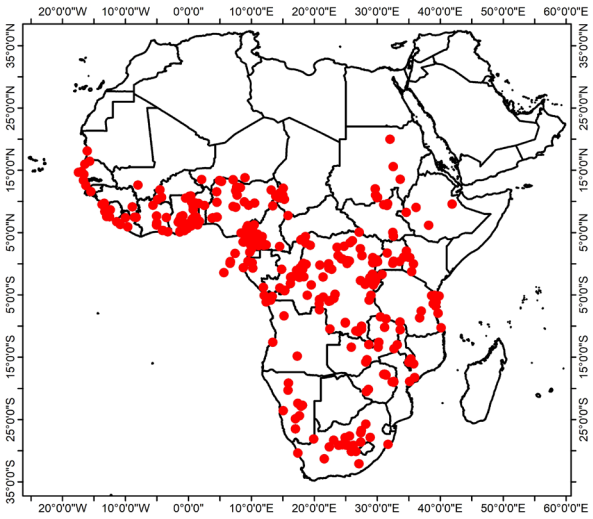

Figure 6. Distribution of *Eidolon helvum*

Eidolon helvum helvum (Kerr, 1792)

*1792. *Vespertilio vampyrus helvus* Kerr, in: Linnaeus, Animal Kingdom, 1 (1): xvii, 91. Publication date: February 1792. Type locality: Senegal: "Senegal". - Comments: Type locality fixed by Andersen (1907a: 504); see Meester *et al.* (1986: 28), DeFrees and Wilson (1988: 1), Harrison and Bates (1991). Andersen (1912b: viii) indicates that the type was once in the Museum Leverianum, but is probably no longer in existence. - Etymology: From the Latin "helvus" (=dun-coloured), referring to the straw colour on their shoulders; the back, rump and hind limbs are normally various shades of brown (see DeFrees and Wilson, 1988: 4; Taylor, 2005). Lanza *et al.* (2015: 27) translate "helvus" to "dull-yellow".

1803. *Pteropus stramineus* E. Geoffroy Saint-Hilaire, Catalogue des Mammifères du Muséum national d'Histoire naturelle, Paris, 48. Type locality: Sudan: Sennaar [15 35 N 33 38 E, 425 m] [Goto Description]. - Comments: Harrison (1964a: 44) refers to Sherborn to indicate that the 1803 paper has never been published. The next available date for this name is 1810: Ann. Mus. Nat. Hist., Paris, 15: 95.
Andersen (1912b: 12) mentions that the description in Geoffroy's 1813 paper was based on three specimens in the Paris Museum (nos 92 and 93 from an unknown locality, presented by Professor Fourcroy, and no 94 "de la collection du Stathouder") but these could not be traced by him. The description in the 1810 paper was based on two specimens, one believed to be from Timor (Péron and Lesueur), and the other without details (and possibly one of the cotypes of the 1803 description). Andersen (1912b: 12) also pointed out that "The 'Cat. Mamm. Mus. Nation. d'Hist. Nat.' (1803) was suppressed by Geoffroy himself, and the name *Pteropus stramineus* is therefore usually dated from his well-known paper in Ann. Mus. d'Hist. Nat. XV. (1810)."
Originally, the type locality was not specified, but it was subsequently fixed as Senaar by Koopman (1975: 357): see Meester *et al.* (1986: 28), DeFrees and Wilson (1988: 1).
Harrison (1964a: 44) indicates that the type locality has been fixed by Temminck (1837b, Mon. Mamm. 2: 84), and Andersen (1912b: 12) mentions that the original type locality was "Timor" (based on the 1810 description), but that Temminck already corrected this to "Africa".

1809. *Vespertilio caninus var. b* Goldfuss, Vergl. Naturbeschr., Säugethiere, 98. - Comments: Preoccupied by *V. caninus* Blumenbach, 1797: see Meester *et al.* (1986: 28).

1815. *Pteropus flavus* Illiger, Abh. Ak. Berlin, 90, 98. - Comments: *Nomen nudum* (see Andersen, 1912b: 809).

1862. *Pterocyon paleaceus* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, 1861: 423. Type locality: Sudan: Sennaar [15 35 N 33 38 E, 425 m]. - Comments: Type locality originally as "Africa", but restricted to Senaar by Matschie (1899b: 62): see Meester *et al.* (1986: 28), DeFrees and Wilson (1988: 1).

1862. *Pteropus mollipilosus* H. Allen, Proc. Acad. nat. Sci. Philad., 13 (11): 159 (for 1861). Type locality: Gabon: "Gabon" [Goto Description]. - Comments: Originally mentioned as "Western Africa" by Allen (1861: 160), but restricted to Gabon (see Andersen, 1912b: 12). The type specimen was collected by Mr. Duchaillu, and is presumably in the Philadelphia Museum (see Andersen, 1912b: 12).

1865. *Pteropus palmarum* Heuglin, Leopoldina (Halle), 5 (3 & 4): 34. Publication date: June 1865. Type locality: Sudan: Sennaar [15 35 N 33 38 E, 425 m]. - Comments: Type locality originally as "Middle and Upper White Nile and between Senaar and Fazogli along the Blue Nile", but subsequently fixed as Senaar by Koopman (1975: 360): see Meester *et al.* (1986: 28), DeFrees and Wilson (1988: 1). Andersen (1912b: 12) mentions that the type is probably no longer in existence.

1866. *Xantharpyia leucomelas* Fitzinger, in: Heuglin and Fitzinger, Sber. k. Akad. Wiss. Wien, math. naturw. Kl., 54 (1) 10: 544. Type locality: Sudan: Kordofan province: Bahr-el-Azrak, Bahr-el-Abiad: Sennaar [15 35 N 33 38 E, 425 m]. - Comments: Type locality originally as "Upper Nile lands", but subsequently fixed to Senaar by Koopman (1975): see Meester *et al.* (1986: 28), DeFrees and Wilson (1988: 1). Andersen (1912b: 13) mentions that the specimen on which Fitzinger based himself is probably in the Munich Museum, and that a specimen belonging to the same series as the type is in the BM (1847.5.27.28; ad ♀; SK; purchased Parreys, from Sennaar).

1881. *Leiponyx büttikoferi* Jentink, Notes Leyden Mus., 3: 59, 60. Publication date: April 1881. Type locality: Liberia: St. Paul's river: Millsburg [06 33 N 10 38 W] [Goto Description]. - Comments: Type in RMNH.

1906. *R[oussettus (Xantharpyia)] buettikoferi:* Johnston, Liberia, Volume II: 690. - Comments: Bakwo Fils (2012: 690 - footnote) indicates that this name refers to the "very doubtfull *Leiponyx buettikoferi*" from Jentink. (Name Combination, Lapsus)

1906. *Roussettus buttikoferi:* Johnston, Liberia, Volume II: 690 - footnote. (Name Combination)

1953. *Pterocyon palaeceus:* Ellerman, Morrison-Scott and Hayman, Southern African mammals 1758 to 1951, 44. - Comments: Lapsus: see Meester *et al.* (1986: 28). (Lapsus)

1975. *Pterocyon palaceus:* Koopman, Bull. Am. Mus. Nat. Hist., 154 (4): 357. - Comments: Lapsus: see Meester *et al.* (1986: 28). (Lapsus)

2000. *Eidolon helvum annobonensis* Juste, Ibáñez and Machordom, Biol. J. Linn. Soc., 71: 373. Type locality: Equatorial Guinea: Annobón Island [01 24 N 05 38 E].

? *Eidolon helvum helvum:* (Current Combination)

GENERAL DISTRIBUTION:
See species, with the exception of SW Arabia.

†Subfamily Propottininae Butler, 1984

*1984. *Propottininae* Butler, Palaeovert., 14 (3): 118, 175. Publication date: 15 November 1984 [Goto Description]. - Comments: Recognized as a subfamily. (Current Combination)

TAXONOMY:
Currently recognized genera of Propottininae: *Propotto* Butler 1984.

†Genus ***Propotto*** Simpson, 1967

*1967. *Propotto* Simpson, Bull. Mus. comp. Zool., 136: 50 [Goto Description]. - Etymology: Meant to imply an antecedent but not necessarily ancestral relative of the potto. Although the valid generic name of the potto too is probably *Perodicticus*, *Potto* has also been used. The valid specific name of the potto is probably *Perodicticus potto* although several other names are also in use (Simpson, 1967). (Current Combination)

TAXONOMY:
Simpson (1967) originally described this as a new genus of primates, within the Lorisiforms. Walker (1969) reexamining the type, noted that it was not a Lorisiform, but rather a fruit bat.

Butler (1984: 178) believed it to be unlikely that *Propotto* is ancestral to any of the living Pteropodid genera.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
If *Archaeopteropus*, from the Oligocene of Italy, is removed from the Megachiroptera following Russell and Sigé (1970), *Propotto* becomes the oldest known member of the suborder (Butler, 1978).

†***Propotto leakeyi*** Simpson, 1967

*1967. *Propotto leakeyi* Simpson, Bull. Mus. comp. Zool., 136: 50 [Goto Description]. - Etymology: Named for Dr. Louis Seymour Bazett Leakey, "in gratitude and admiration" (Simpson, 1967). (Current Combination)

TAXONOMY:
Simpson (1967) originally described this as a new species of primate, within the Lorisiforms. Walker (1969) reexamining the type, noted that it was not a primate, but rather a fruit bat.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Early Miocene, Songhor (Simpson, 1967; Walker, 1969), probably Rusinga (Butler, 1978).

Subfamily Pteropodinae Gray, 1821

*1821. *Pteropodinae* Gray, London Med. Repos., 15: 299. (Current Combination)
1831. *Pteropodina* Bonaparte. - Comments: Introduced as tribe in the Vespertilionidae. Recognized as subtribe by Koopman and Jones (1970: 23) (see Jackson and Groves (2015: 236).
1835. *Pteropodae* Bonaparte, Iconogr. Fauna Ital. (Fascicolo 14 under *Dysopes cestonii*, second of four unnumbered pages). - Comments: Introduced as family (see Jackson and Groves, 2015: 236).
1866. *Epomophorina* Gray, Proc. zool. Soc. Lond., 1866, I (v): 65. Publication date: May 1866. - Comments: Not included in Simmons (2005) since it was not proposed as family name, but as a subdivision within the Pteropodidae (Simmons, pers. comm.).
1891. *Pteropodinae:* Flower and Lydekker, Mammals Living and Extinct, 650. - Comments: Proposed as subfamily. Originally included the genera *Epomophorus* E. Bennett, 1836; *Pteropus* Brisson, 1762; *Xantharpyia* J. Gray, 1843 [= *Rousettus* J. Gray, 1821]; *Boneia* Jentink, 1879 [= *Rousettus* J. Gray, 1821]; *Cynopterus* F. Cuvier, 1824 [1821-1825]; *Harpyia* Illiger, 1811 [= *Nyctimene* Borkhausen, 1797]; *Cephalotes* É. Geoffroy, 1810 [= *Nyctimene* Borkhausen, 1797]; *Pteralopex* Thomas, 1888 (see Jackson and Groves, 2015: 236).
1897. *Pteropinae* Trouessart, Cat. Mamm. Viv. Foss., 1: v, 77. - Comments: Bergmans (1997: 64) assigned it to Gray, 1821. Jackson and Groves (2015: 236) assigned it to Trouessart, 1897, but also mention a misspelling by Simpson (1945).
1912. *Cynopterinae* K. Andersen, Cat. Chiroptera Brit. Mus. Publication date: 23 March 1912. - Comments: Bergmans (1997: 69) considers this a valid subfamily in which he includes the genera *Cynopterus, Ptenochirus, Megaerops, Dyacopterus, Balionycteris, Chironax, Thoopterus, Sphaerias, Aethalops, Penthetor, Latidens, Alionycteris, Otopteropus, Haplonycteris*.
1970. *Cynopterini* Koopman and J.K. Jones Jr., Classification of Bats. - Comments: Not included in Simmons (2005) since it was not proposed as family name, but as a subdivision within the Pteropodidae (Simmons, pers. comm.).

TAXONOMY:
Currently recognized genera of Pteropodinae: *Acerodon* Jourdan, 1837, *Desmalopex* Miller, 1907, *Macroglossus* F. Cuvier, 1824, *Melonycteris* Dobson, 1877, *Mirimiri* Helgen, 2005, *Neopteryx* Hayman, 1946, *Notopteris* Gray, 1859, *Pteralopex* Thomas, 1888, ***Pteropus*** Brisson, 1762,

Styloctenium Matschie, 1899, *Syconycteris* Matschie, 1899.

Genus ***Pteropus*** Brisson, 1762

*1762. *Pteropus* Brisson, Regnum Animale, 2nd ed: 13, 53 [Goto Description]. - Comments: Type species: *Vespertilio vampirus niger* Kerr, 1792. Allen (1939a: 59), Corbet and Hill (1992: 57), and Simmons (2005) mention Brisson, 1762 [Règne Animal, ed. 2, pp. 13, 153] as author. This name was long time considered to be "not available" (see Hopwood, 1947). However, Opinion 1894 (ICZN, 1998: 64) ruled that the name (and authorship) is available.

Not *Pteropus* Thunberg, 1815 (Insecta, Phasmatodea, Phylliidae - leaf insects); not *Pteropus* Jennings, 1828 (Aves, Gruiformes, Heliornithidae); not *Pteropus* Canestrini and Fanzago, 1878 (Arachnida, Mesostigmata, Spinturnicidae) (see Jackson and Groves, 2015: 238). - Etymology: From the Greek "*πτερόπους*", meaning wing-footed, referring to the wing membrane which arises from the side of the back and the back of the second toe (see Palmer, 1904: 596; Jones and Kunz, 2000: 5). (Current Combination)

1799. *Spectrum* Lacépède, Tabl. Div. Subd. Orders Genres Mammifères, 15. - Comments: Type species: *Vespertilio vampirus* Linnaeus, 1758 (according to Miller and Wilson, 1997: 1; Jackson and Groves (2015: 238) or *Vespertilio vampirus niger* Kerr, 1792 (according to Andersen, 1912b: 61). Preoccupied by *Spectrum* Scopoli, 1777 [Lepidoptera, Sphingidae] (see Allen, 1939a: 59; Corbet and Hill, 1992: 57; Pavlinov *et al.*, 1995: 62; Miller and Wilson, 1997: 1; Jones and Kunz, 2000: 1). Not *Spectrum* Stoll, 1787 (Insecta, Orthoptera, Phasmatidae) (see Jackson and Groves (2015: 238). - Etymology: From the Latin "*spectrum*", meaning apparition or specter (see Palmer, 1904: 638).

1866. *Eunycteris* Gray, Proc. zool. Soc. Lond., 1866, I (v): 64. Publication date: May 1866. - Comments: Type species: *Pteropus phaiops* Temminck, 1837 (=*Pteropus melanopogon* Peters, 1867).

1870. *Pselaphon* Gray, Catalogue of Monkeys, Lemurs and Fruit-eating bats in the collection of the British Museum London, 110. - Comments: Type species: *Pteropus pselaphon* Layard, 1829, by monotypy. Not *Pselaphus* [= *Pselaphon*] Herbst, 1792 (Insecta, Coleoptera, Psephalidae) (Jackson and Groves, 2015: 238). - Etymology: From the Greek "*ψηλαφάω*", meaning to grope about (see Palmer, 1904: 588).

1899. *Sericonycteris* Matschie, Die Fledermäuse des Berliner Museums für Naturkunde. 1. Lieferung. Die Megachiroptera des Berliner Museums für Naturkunde, 6, 30. - Comments: Type species: *Pteropus rubricollis* E. Geoffroy Saint-Hilaire, 1810 (= *Pteropus subniger* Kerr, 1792), by original designation (according to Miller and Wilson, 1997: 1) or subsequent designation (Palmer, 1904: 629; according to Jackson and Groves, 2015: 238). Originally described as a subgenus of *Pteropus*. Matschie dated his introduction on 14 May 1899. - Etymology: From the Greek "*σηρικόν*", meaning silk and "*νυκτερίς*", meaning bat (see Palmer, 1904: 627).

1907. *Desmaplex* Miller, Bull. U.S. natl. Mus., 57: vii, 60. Publication date: 29 June 1907. - Comments: Type species: *Pteropus leucopterus* Temminck, 1853, by original designation (see Jackson and Groves, 2015: 238).

2011. *Pterocarpus* Mishra, Rout and Panda, Afr. J. Pharm. Pharmacol., 5 (1): 6. Publication date: January 2011. - Comments: Not of Jacquin, 1763, which is a pantropical genus of trees in the family Fabaceae (see http://en.wikipedia.org/wiki/Pterocarpus). (Lapsus)

TAXONOMY:

See Bergmans (1991) and Simmons (2005: 334). The International Commission on Zoological Nomenclature ruled in favor of rejecting Brisson (1762), but conserved several of the generic names including *Pteropus* (Opinion 1894; ICZN, 1998). Formerly included *arquatus* and *leucotis* which were transferred to *Acerodon* by Musser et al. (1982a).

O'Brien *et al.* (2009) examined the western Indian Ocean member of the genus *Pteropus*, based on three mitochondrial genes – cytochrome *b*, 12S rRNA, and a portion of the control region. The combined data set indicates the lack of reciprocal monophyly in western Indian Ocean *Pteropus*. With the expetion of *P. livingstonii* and *P. voeltzkowi*, the other regional taxa demonstrate little genetic differentiation. The resulting poytomy indicates rapid and presumably recent divergence. Almeida *et al.* (2014: 83) studied the cytochrome *b* and the 12S rRNA mitochondrial genes sequences for all *Pteropus* species and some additional sequences of the nuclear RAG1, vWF, and

BRCA1 genes for a subsample of taxa. Their conclusions were that the genus as a whole is monophyletic (originating in the Miocene), but also that the monophyly of the traditional species-groups could not be substantiated. They subdivided the genus in 13 species groups, where *livingstonii* and *voeltzkowi* are the only members of the "*livingstonii*" group. *aldabrensis, niger, rodricensis, rufus*, and *seychellensis* are part of the "*vampyrus*" group, whereas the extinct *subniger* could not be tested and is tentatively placed in an "*incertae sedis*" group.

Known species of *Pteropus*: *admiralitatum* Thomas, 1894 – Solomon Isls; Admiralty Isls, New Britain, and Tabar Isl (Bismarck Arch.) (Simmons, 2005: 334); ***aldabrensis*** True, 1893; *alecto* Temminck, 1837 – Sulawesi, Saleyer Isl, Lombok, Bawean Isl, Kangean Isls, Sumba Isl, and Savu Isl (Indonesia); north and east Australia; south New Guinea (Simmons, 2005: 335); *allenorum* Helgen, Helgen and Wilson, 2009; *anetianus* Gray, 1870 – Vanuatu including Banks Isls (Simmons, 2005: 335); *argentatus* Gray, 1844; *aruensis* Peters, 1867 – Aru Isls (Indonesia) (Simmons, 2005: 335); *banakrisi* Richards and Hall, 2002 – Moa Isl (Australia) (Simmons, 2005: 335); *brunneus* Dobson, 1878 – Percy Isl., Queensland (Australia) (Simmons, 2005: 335); *caniceps* Gray, 1870 – Halmahera (Indonesia) (Simmons, 2005: 335); *capistratus* Peters, 1876 – Bismarch Arch. (Papua New Guinea) (Simmons, 2005: 336); *chrysoproctus* Temminck, 1837 – Ambon, Buru, Seram, and small islands east of Seram (Indonesia) (Simmons, 2005: 336); *cognatus* K. Andersen, 1908 – Makira and Uki Ni Masi Isls (Solomon Isls) (Simmons, 2005: 336); *conspicillatus* Gould, 1850 – north Moluccas (Indonesia), New Guinea and West Papuan Isls (Raja Ampat Isl, off northwest coast of New Guinea), northeast Queensland (Australia) (Simmons, 2005: 336); *coxi* Helgen, Helgen and Wilson, 2009; *dasymallus* Temminck, 1825 – Taiwan, Ryuku Isls, and extreme southern Kyushu (Japan), Batan, Dalupiri, and Fuga Isls (Philippines) (Simmons, 2005: 337); *faunulus* Miller, 1902 – Nicobar Isls (India) (Simmons, 2005: 337); *fundatus* Felten and Kock, 1972 – Banks Isls (Vanuatu) (Simmons, 2005: 337); *giganteus* (Brünnich, 1782) – Maldive Isls, India (incl. Andama Isl), Sri Lanka, Pakistan, Bangladesh, Nepal, Burma (Simmons, 2005: 337); *gilliardorum* Van Deusen, 1969 – New Britain and New Island (Bismarck Arch., Papua New Guinea) (Simmons, 2005: 337); *griseus* (E. Geoffroy, 1810) – Timor, Samao Isl, Dyampea Isl, Bonerato Isl, Saleyer Isl, Paternoster Isls, Pelang Isl, Sulawesi, and Banda Isls (Indonesia) (Simmons, 2005: 337); *howensis* Troughton, 1931 – Ontong Java Isl (Solomon Isls) (Simmons, 2005: 338); *hypomelanus* Temminck, 1853 – Andaman and Maldive Isls, New Guinea through Indonesia to Vietnam and Thailand, and adjacent islands, Philippines (Simmons, 2005: 338); *insularis* Hombron and Jacquinot, 1842 – Truk Isls (Micronesia) (Simmons, 2005: 338); *intermedius* K. Andersen, 1908 – southern Burma and western Thailand (Simmons, 2005: 338); *keyensis* Peters, 1867 – Kai Isls (Indonesia) (Simmons, 2005: 339); *leucopterus* Temminck, 1853 – Luzon, Catanduanes, and Dinagat Isls (Philippines) (Simmons, 2005: 339); ***livingstonii*** Gray, 1866; *lombocensis* Dobson, 1878 – Lombok, Sumbawa, Komodo, Flores, Lembata, Pantar, Alor and Timor Isls (Indonesia) (Simmons, 2005: 339); *loochoensis* Gray, 1870 – Okinawa Isl, Ryûkyû Isls (Japan) (Simmons, 2005: 339); *lylei* K. Andersen, 1908 – Thailand, Vietnam, Cambodia (Simmons, 2005: 339); *macrotis* Peters, 1867 – New Guinea, Aru Isls (Indonesia), Boigu Isl (Australia) (Simmons, 2005: 340); *mahaganus* Sanborn, 1931 – Bougainville Isl (Papua New Guinea), Ysabel Isl and Choiseul Isl (Solomon Isls) (Simmons, 2005: 340); *mariannus* Desmarest, 1822; *melanopogon* Peters, 1867 – Amboina, Buru, Seram, Banda Isls, Yamdena (= Timor Laut), and adjacent islands (Indonesia) (Simmons, 2005: 340); *melanotus* Blyth, 1863 – Nicobar and Andaman Isls (India), Engano Isl and Nias Isl (Indonesia), Christmas Isl. (Simmons, 2005: 340); *molossinus* Temminck, 1853 – Pohnpei (= Ponape) and possibly Mortlock Isls (Caroline Isls, Micronesia) (Simmons, 2005: 341); *neohibernicus* Peters, 1876 – Bismarck Arch. and Admiralty Isls (Papua New Guinea), New Guinea, Misool and Gebi Isls, Gag Isl (Simmons, 2005: 341); ***niger*** (Kerr, 1792); *nitendiensis* Sanborn, 1930 – Nendö and Tömotu Neo (in the Santa Cruz Isls, Solomon Isls) (Simmons, 2005: 341); *ocularis* Peters, 1867 – Seram and Buru (Indonesia) (Simmons, 2005: 341); *ornatus* Gray, 1870 – New Caledonia and Loyalty Isls (Simmons, 2005: 342); *pelagicus* Kittlitz, 1836; *pelewensis* K. Andersen, 1908 – Pelew Isls (Micronesia) (Simmons, 2005: 342); *personatus* Temminck, 1825 – North Molucca Isls (Halmahera and Obi Isl groups), and Gag (Simmons, 2005: 342); *pilosus* K. Andersen, 1908 – Pelew Isls (Micronesia) (Simmons, 2005: 342); *pohlei* Stein, 1933 – Yapen, Biak-Spiori, Numfoor, and Rani Isls (off northwestern New Guinea) (Simmons, 2005: 342); *poliocephalus* Temminck, 1825 – Eastern Australia, from southern Queensland to Victoria (Simmons, 2005: 342); *pselaphon* Lay, 1829 – Bonin and Volcano Isls (Japan) (Simmons, 2005: 342); *pumilus* Miller, 1911 – Philippines (except Palawan region), Talaud Isls (Indonesia) (Simmons, 2005: 343); *rayneri* Gray, 1870 – Bougainville and Buka Isls (Papua New Guinea), Solomon Isls (Simmons, 2005: 343); *rennelli* Troughton, 1929 – Rennell Isl (Solomon Isls) (Simmons, 2005: 343); ***rodricensis***

Dobson, 1878; ***rufus*** E. Geoffroy, 1803; *samoensis* Peale, 1848 – Fiji Isls, Samoan Isls (Simmons, 2005: 344); *scapulatus* Peters, 1862 – Australia, southern New Guinea, accidental on New Zealand (Simmons, 2005: 344); ***seychellensis*** Milne-Edwards, 1877; *speciosus* K. Andersen, 1908 – Philippines, Besar and Mata Siri (Java Sea), Talaud Isls (Simmons, 2005: 344); ***subniger*** (Kerr, 1792); *temminckii* Peters, 1867 – Buru, Ambon, Seram (Indonesia), nearby small islands, perhaps Timor Isl (Indonesia) (Simmons, 2005: 345); *tokudae* Tate, 1934 – Guam (Mariana Isls, USA) (Simmons, 2005: 345); *tonganus* Quoy and Gaimard, 1830 – Karkar Isl (off northeastern New Guinea) and Rennell Isl (Solomon Isls), south to New Caledonia, east to Cook Isls (Simmons, 2005: 345); *tuberculatus* Peters, 1869 – Vanikoro Isl (Santa Cruz Isls, Solomon Isls) (Simmons, 2005: 345); *ualanus* Peters, 1883 – Kosrae (Micronesia) (Simmons, 2005: 345); *vampyrus* (Linnaeus, 1758) – Vietnam, Burum, Malay Peninsula, Borneo, Philippines, Sumatra, Java, and Lesser Sunda Isls, adjacent small islands including Anak Krakatau (Simmons, 2005: 346); *vetulus* Jouan, 1863 – New Caledonia (Simmons, 2005: 346); ***voeltzkowi*** Matschie, 1909; *woodfordi* Thomas, 1888 – New Georgia group, Russell and Florida Isls, Guadalcanal, Malaita (Solomon Isls) (Simmons, 2005: 346); *yapensis* K. Andersen, 1908 – Yap Isls (Simmons, 2005: 346).

COMMON NAMES:
Czech: praví kaloni, upírové. Dutch: Kalongs. English: Flying-foxes, Flying Foxes. French: Renards volants, Roussettes géantes. German: Flugfüchse.

GENERAL DISTRIBUTION:
McNab (2009: 156) indicates that *Pteropus* "is primarily an island taxon, with 55 species (of the 57 species or 96.5 %) having some or all of their distribution on islands". Furthermore, McNab (2009: 158) states that the distributional pattern of *Pteropus* on islands is extremely variable, with some species being limited to small islands (e.g. *P. voeltzkowi* on Pemba, *P. livingstonii* on Anjouan and perhaps on Mohéli in the Comoros, *P. rodricensis* on Rodrigues, and *P. niger* on Mauritius, and other (Asian) species on islands that are hundreds or even thousands of kilometers apart.

BIOGEOGRAPHY:
Kingdon (1989) suggested that *Pteropus* doesn't occur in central parts of the continent since it might depend on seawater as source of salts. This is rejected by McNab and Armstrong (2001: 710) as this would not explain why there are no representatives of this genus in the African coastal areas.

Pteropus aldabrensis True, 1893

*1893. *Pteropus aldabrensis* True, Proc. U.S. Natl. Mus., 16 (948): 533. Publication date: 14 July 1893. Type locality: Seychelles: Aldabra Island. Syntype: USNM 20984: ♂, skin and skull. Collected by: Dr. William Louis Abbott; collection date: 26 September 1892. Presented/Donated by: ?: Collector Unknown. Syntype: USNM 20985: ♂, skin and skull. Collected by: Dr. William Louis Abbott; collection date: 1892. Presented/Donated by: ?: Collector Unknown. - Comments: USNM 20984/36053 + 20985/36054: "cotypes" (syntypes); ad ♂♂, SS; coll. W.L. Abbott, 26 September 1892 and 5 October 1892: see Poole and Schantz (1942: 139), who also indicate "No type is specified in the original description, but these two specimens are mentioned by number and are therefore regarded as cotypes." Catalogued 30 June 1893: see Lyon and Osgood (1909: 256). Fisher and Ludwig (2015: 52) mention that *Proc. U.S. Natl. Mus.* **16**: 1, (published on 14 July 1893) was a "Preprint" of *Proc. U.S. Natl. Mus.* **16**: 533, which was published on 21 October 1893. (Current Combination)

1971. *Pteropus seychellensis aldabrensis:* Hill, Phil. Trans. Roy. Soc. Lond., B 260: 574. (Name Combination)

? *[Pteropus seychellensis] aldabrabensis:* Honacki, Kinman and Koeppl, Mammal species of the world: A taxonomic and geographic reference., 124. - Comments: Honacki *et al.* (1982: 124) mention "*aldabrabensis*" in the list of included taxa, and mention "*P. aldabrensis* (sic)." in the list with ISIS numbers. Bergmans (1991: 154) states it isn't clear to him why Honacki *et al.* (1982) changed the spelling. (Emendation)

TAXONOMY:
Bergmans (1991) showed that *P. aldabrensis* differs strongly from *P. seychellensis*, a view followed by Simmons (2005: 334).

O'Brien *et al.* (2009) suggested that *P. aldabrensis*, *P. rufus*, *P. niger* and *P. seychellensis* (including *comorensis*) should be considered

geographical forms of a single species *P. giganteus* (Brünnich, 1782) from the Indian subcontinent, Maldives and Andaman archipelagos.

O'Brien (2011: 261) indicates that the last complete innundation of the Alabra atoll occurred some 125,000 years ago, and that the diversification of *Pteropus* in the area is therefore of recent age.

Almeida *et al.* (2014: 83) places this in the '*vampyrus*' group.

COMMON NAMES:
Czech: kaloň aldabránský. English: Aldabra Flying Fox, Aldabra Flying-fox. French: Renard volant d'Aldabra. German: Aldabra-Flugfuchs. Spanish (Castillian): Zorro volador de Aldabra.

CONSERVATION STATUS:
Global - Listed as Vulnerable (VU D2 ver 3.1 (2001)) because it is known from only a single location (the Aldabra Atoll), and it is plausible that this restricted range species could be threatened by tropical cyclones, similar stochastic events or a rising sea level (Mickleburgh *et al.*, 2008dh; IUCN, 2009).

Critically endangered - C2a(ii): see Jones *et al.* (2009b: 506). Conenna *et al.* (2017: Suppl.) mention its status as Vulnerable (VU).

Assessment History -
2008 - VU D2 ver 3.1 (2001) (Mickleburgh *et al.*, 2008dh; IUCN, 2009). 2004 - CR C2a(i) ver 3.1 (2001) (Mickleburgh *et al.*, 2004cv; IUCN, 2004).

CITES - Appendix II.

MAJOR THREATS:
The population is probably stable with no declines reported. However, because of the restricted nature of the species range it is considered to be especially vulnerable to threats such as tropical cyclones and rises in sea level (60% of the atoll is at or below 1 m asl.) (Mickleburgh *et al.*, 1992; Hutson, 2004a; Justin Gerlach *pers. comm.,* 2008; Mickleburgh *et al.*, 2008dh; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008dh) [in IUCN (2009)] report that although the species is not directly protected (Tony Hutson *pers. comm.,* 2008), the Aldabra Atoll is a highly protected UNESCO World Heritage site and a Special Reserve under the Seychelles National Parks and Nature Conservancy Act (Mickleburgh *et al.*, 1992; Hutson, 2004a: 128). There is a distinct need for additional research into the total population number of this restricted range species and to monitor any changes in abundance (Hutson, 2004a: 128).

GENERAL DISTRIBUTION:
Pteropus aldabrensis is endemic to the Aldabra Atoll (approximately 150 km^2) in the Seychelles. Bats have been recorded from all main islands and have been observed flying between islands of the atoll (Hutson, 2004a; von Brandis, 2004).

Native: Seychelles [Aldabra].

BIOGEOGRAPHY:
See O'Brien *et al.* (2009) for further details.

MOLECULAR BIOLOGY:
DNA - See O'Brien *et al.* (2009) and Almeida *et al.* (2014).
Karyotype - Unknown.
Protein / allozyme - Unknown.

ROOST:
Racey and Nicoll (1984) [in O'Brien (2011: 262)] indicate that *P. aldabrensis* roosts in coconut palms, figs and *Sideroxylon inerme*.

DIET:
Hutson (2004a: 127) mentions that fruits of the following plants are eaten: *Ficus lutea, F. rubra* (as *F. avi-avi*) and *F. reflexa, Calophyllum inophyllum, Terminalia catappa, Mystroxylon aethiopicum*, and also flowers of *Cocos nucifera* and *Agave sisalana*. Roberts and Seabrook (1989) [in Courts (1998: 188)] report that *P. seychellensis aldabrensis* licked coccoids (*Icerya seychellarum*) from the leaves of infested *Ficus* trees, probably to supplement their diets.

POPULATION:
Structure and Density - The population is reported to consist of only a few hundred animals (Cheke and Dahl, 1981; Carroll, 1985). Hutson (2004a) notes that no major colonies were located in 1968, with the largest roosting group on the small lagoon islet of Iles Michel that was probably well under 100 animals. Hutson (2004a) suggests that the total population was fewer than 250 animals in 1968, although he considered that the majority of the population may be present on the relatively little explored Middle Island (= Malabar Island) 26 km^2 in size. von Brandis (2004) reports that large groups of these bats have been recorded in Casuarina trees, with the largest group of more than 100 animals reported at the eastern end of Middle Island (=Malabar Island) in 1995. Conrad Savy (*pers. comm.,* 2008) indicates that the bats were commonly seen in good numbers during 2001 (Mickleburgh *et al.*, 2008dh; IUCN, 2009).

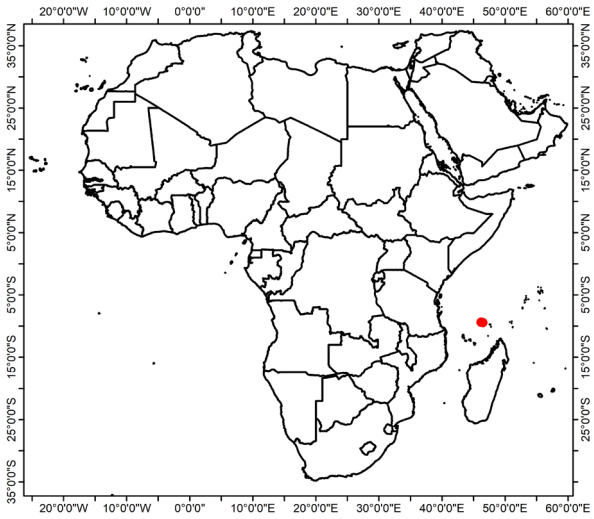

Figure 7. Distribution of Pteropus aldabrensis

DISTRIBUTION BASED ON VOUCHER SPECIMENS: Seychelles.

Pteropus livingstonii Gray, 1866

*1866. *Pteropus livingstonii* Gray, Proc. zool. Soc. Lond., 1866, I: 66. Publication date: May 1866. Type locality: Comoros: Anjouan Island. Holotype: BMNH 1863.12.11.2: ad, skin and skull. Collected by: Dr. Livingstone. Presented/Donated by: Earl Russell. See Andersen (1912b: 250). (Current Combination)

1971. *Pteropus livingstonei:* Hayman and Hill, Mammals of Africa: Chiroptera, 10. (Lapsus)

TAXONOMY:
See Bergmans (1991), Simmons (2005: 339) and Smith and Leslie (2006: 1).

P. livingstonii together with *P. voeltzkowi* form the most distinct and ancient lineage of the western Indian Ocean *Pteropus* spp. (O'Brien *et al.*, 2009). The phylogenetic analyses performed by Chan *et al.* (2011: 7) suggest that both are sister species. This is supported by Almeida *et al.* (2014), who places this in the '*livingstoni*' group.

COMMON NAMES:
Czech: kaloň komorský. Dutch: Zwarte Komorenkalong, Schoudervlekkalong. English: Comoro Black Flying Fox, Comoro Flying Fox, Black Flying- fox, Livingstone's Flying Fox, Comores Flying Fox. French: Renard volant des Comores, Renard volant noir, la roussette de Livingstone. German: Livingstones Flugfuchs. Spanish (Castillian): Zorro Volador De Livingston.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
No fossils are known (Smith and Leslie, 2006: 2).

CONSERVATION STATUS:
Global - Listed as Endangered (EN A2c; B1ab(iii) ver 3.1 (2001)) because of a serious population decline, estimated to be more than 50% over the next ten years, inferred from ongoing habitat loss and degradation, and because its extent of occurrence is less than 5,000 km^2, all individuals are in fewer than five locations, and there is continuing decline in the extent and quality of its habitat (Mickleburgh *et al.*, 2008t; IUCN, 2009). Daniel *et al.* (2016: 742) recategorized the species to "Critically Endangered".

Assessment History -
2008 - EN A2c; B1ab(iii) ver 3.1 (2001) (Mickleburgh *et al.*, 2008t; IUCN, 2009). 2004 - CR A4c ver 3.1 (2001) (Mickleburgh *et al.*, 2004p; IUCN, 2004). 2002 - CR A1c+2cd, B1+2c, C2a (Mickleburgh *et al.*, 2002a: 22). 1998 - EN A1c+2cd, B1+2c, C2a (Trewhella *et al.*, 1998: 32). 1996 - CR (Baillie and Groombridge, 1996). 1994 - EN (Groombridge, 1994). 1993 - EN (World Conservation Monitoring Centre, 1993). 1990 - EN (IUCN, 1990). 1988 - EN (IUCN Conservation Monitoring Centre, 1988).

CITES -
Appendix II, see Smith and Leslie (2006: 4) for discussion.

MAJOR THREATS:
The species is threatened by the continuing degradation of its forest habitat by conversion of land to agricultural use, especially the use of lowland areas for export crops (such as cloves). In degraded forest the species is outcompeted by the bat *Pteropus seychellensis* (Mickleburgh *et al.*, 2002a). Tree felling has additionally destroyed a number of roosts (Trewhella *et al.*, 2005). There is also increased disturbance because of human population growth, however, the species is not

hunted for food (Trewhella *et al.*, 2005). The small remaining population is additionally potentially threatened in its restricted range by the effects of tropical cyclones (Mickleburgh *et al.*, 2008t; IUCN, 2009). Since Anonymus (2000: 30) points out that this species generally roosts and feeds in native trees, the destruction of these forests can have a devastating effect, especially since *P. livingstonii* uses different tree species for food during different seasons.

Sagot and Chaverri (2015: 1670) mention roost loss or disturbance, and habitat degradation or loss as major threats for this species. Daniel *et al.* (2016: 743) indicate that the estimated forest loss between 2000 and 2010 was 9.3 % per annum.

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008t) [in IUCN (2009)] report that a species action plan developed by the NGO Action Comoros is being implemented for this species (Sewall *et al.*, 2003). A national environmental education programme has been implemented to raise awareness of this species (Trewhella *et al.*, 2005). National legislation to protect this species is being developed (Trewhella *et al.*, 2005) and work has begun to establish a forest reserve for this bat on Moheli and on evaluating a site for a reserve on Anjouan (Trewhella *et al.*, 2005). Sewall (2004: 10) suggests that the protection of specific "bat trees" can already provide a short-term solution.

Since 1992, there is an active captive-breeding programme underway for this species initiated by the Durrell Wildlife Conservation Trust and the Bristol Zoo, where 35 animals are housed, of which 21 were born in captivity (Anonymus, 2000: 31). At the Jersey Wildlife Preservation Trust (JWPT), 6 bats (5 ♂♂ and 1 ♀) were imported from the Comores in 1992, and a second group with the same composition was imported in 1993, followed by an additional ♀ in 1995 (Carroll and Feistner, 1996: 334).

Based on a study of mitochondrial and microsatellite markers, Ibouroi *et al.* (2018a: 1425) conclude that - for conservation purposes - the *S. livingstonii* populations from Anjouan and Mohéli should be considered as two separate management units, and that the focus should be targeted on the Anjouan population.

GENERAL DISTRIBUTION:
Pteropus livingstonii is endemic to two of the four Comoro Islands: Anjouan (formerly Johanna) and Moheli (Trewhella *et al.*, 2001; Smith and Leslie, 2006: 1). On Anjouan, the species avoids lower parts of the island below 300 to 1100 m asl, and on Moheli between 150 to 700 m asl.

Native: Comoros (Cheke and Dahl, 1981; Clark *et al.*, 1997; Trewhella *et al.*, 2001; Smith and Leslie, 2006: 1; Goodman *et al.*, 2010c: 124).

GEOGRAPHIC VARIATION:
See Smith and Leslie (2006: 1).

General description of exernal morphology:
See Smith and Leslie (2006: 1).

DETAILED MORPHOLOGY:
Baculum - Unknown

For a description of the cranium, teeth, ear and tragus, and wingshape and aspect ratio see Smith and Leslie (2006: 1-2).

Dickson *et al.* (2016: 963) and Killick *et al.* (2017: 1077) studied cardiomyopathies on a group of captive bats, where dilated cardiomyopathy may be a major cause of death (Drane *et al.*, 2017: 89).

SEXUAL DIMORPHISM:
It is not clear if sexual dimorphism occurs in *P. livingstonii* due to insufficient numbers of adult females have been difficult to collect in the wild (Clark *et al.*, 1997; Trewhella *et al.*, 2005; Young *et al.*, 1993; Smith and Leslie, 2006: 2).

ECHOLOCATION:
Not known to echolocate.

MOLECULAR BIOLOGY:
DNA - See O'Brien *et al.* (2009) and Almeida *et al.* (2014).
Karyotype - Unknown.
Protein / allozyme - Unknown.

HABITAT:
Ibouroi *et al.* (2018b: 2395) reported that the species' habitat is restricted to steep, high-elevation slopes of the Comoro's remaining natural forests.

HABITS:
See Smith and Leslie (2006).

Based on wing morphology, Lindhe Norberg *et al.* (2000) classified *P. livingstonii* as a soaring species.

ROOST:
See Smith and Leslie (2006). Anonymus (2000: 30) indicates that *P. livingstonii* roosts in tall trees in the rain forest, at medium altitude. These nesting trees are, in general, local species. Trewhella *et al.* (2001) indicate that day-roost sites are also shared with *P. s. comorensis*. Daniel *et al.* (2016: 747) indicate that only four tree species

were used as roost on Mohéli [M] and 12 on Anjouan [A]: *Ficus exasperata* Vahl (sandpaper tree, forest sandpaper fig, white fig, or sandpaper leaf tree) [M+A], *Gyrostipula comoriensis* J.-F. Leroy [A], *Gambeya* spp. [A], *Ficus lutea* Vahl (giant-leaved fig or Lagos rubbertree) [A], *Nuxia pseudodentata* Gilg [A], *Albizia lebbeck* (L.) Benth. (lebbeck, lebbek tree, flea tree, frywood, koko and woman's tongue tree) [M], *Ocotea comoriensis* Kosterm. [A], *Weinmannia comoriensis* Tul. [A], *Brachylaena ramiflora* (DC.) Humbert [A], *Ficus pirifolia* Lamk. [A], *Terminalia catappa* L. (country-almond, Indian-almond, Malabar-almond, sea-almond, tropical-almond or false kamani) [M], *Antidesma hildebrandtii* Pax & K. Hoffm. [A], *Albizia glaberrima* (Schumach. & Thonn.) [A], *Khaya comorensis* (Comorian mahogany) [M], *Cryptocarya* spp. [A].

Ibouroi *et al.* (2018b: Suppl.) reported the following roost trees being used on the Comoro Islands: Asteraceae: *Brachylaena ramiflora*; Combretaceae: *Terminalia catappa*; Cunoniaceae: *Weinmannia comorensis*; Gentianaceae: *Anthocleista grandiflora*; Lauraceae: *Ocotea comorensis*; Leeaceae: *Leea guineensis*; Loganiaceae: *Nuxia pseudodenta*; Meliaceae: *Khaya comorensis*; Mimosaceae: *Albizia glaberrima, Albizia lebbeck*; Moraceae : *Ficus antandronarum, Ficus lutea, Ficus pirifolia*; Myrtaceae: *Eugenia comorensis*; Sapotaceae: *Gambeya boiviniana*.

Granek (2000a: 29 - 30) determined the following roost site characteristics:
1) between 500 and 1,100 m in elevation,
2) steeply sloped land,
3) some native forest cover was present,
4) presence of water in the same valley,
5) presence of an east- or south-facing slope
6) the valley was protected by mountains on three sides, forming a 'bowl' (protecting them from the wind and the mid-day sun),
7) presence of the following tree species: *Gambeya* sp. and *Nuxia pseudodentata*.
However, Granek (2002: 95) indicates that there was no significant association between the bat roosts and characteristics 1, 2 and 3.

MIGRATION:
Intra-island movement among roosts is likely, but inter-island movement is unknown (Smith and Leslie, 2006: 3).

DIET:
See Smith and Leslie (2006: 3). Kock and Nader (1984: 30 - 31) and Sewall (2004:10) point out that this species almost completely feeds on native trees, and changes tree species according to the season. One of its favourite foods is the fruit of a giant-leaved fig tree (*Ficus lutea*) (Sewall, 2004: 9 - 10). Young *et al.* (1993) [in Carroll and Feistner (1996: 330)] indicate that *R. obliviosus* and *P. livingstonii* were captured at the same kapok and fig feeding sites on Anjouan, which would suggest that their feeding niches might overlap. However, they also indicate that there might be a vertical separation between the two species.
Nectar and fruits of the Moraceae family form an important part of the diet, while pollen is not important Cotterill (1995).

Trewhella *et al.* (2001: 141) reported the following food items (with known items in bold and suspected items in plain text): Aphloiaceae: *Aphloia theaeformis* [= *Aphloia theiformis* (Vahl) Benn.]; Asteraceae: ***Brachylaena ramiflora*** (DC.) Humbert; Clusiaceae: *Rheedia anjouanensis* H. Perrier [= *Garcinia anjouanensis* (H. Perrier) P.W. Sweeney & Z.S. Rogers; Cunoniaceae: *Weinmannia comorensis* Tul.; Gentianaceae: *Anthocleista grandiflora* L. (forest fever tree); Lauraceae: *Ocotea comorensis* ?; Malvaceae: ***Ceiba pentandra*** (L.) Gaertn. (kapok tree); Monimiaceae: ***Tambourissa comorensis*** Lorence; Moraceae: *Artocarpus altilis* (Parkinson) Fosberg (breadfruit), *Artocarpus heterophyllus* Lam. (jackfruit or jack tree), ***Ficus lutea*** Vahl (giant-leaved fig), ***Ficus pirifolia*** ?; Myrtaceae: *Eugenia jambos* L. [= *Syzygium jambos* L. (Alston)] (rose apple); Oxalidaceae: *Averrhoa bilimbi* L. (bilimbi, cucumber tree or tree sorrel); Sapotaceae: ***Gambeya*** sp.; Stilbaceae: *Nuxia pseudodentata* Gilg, 1895.

Courts (1998: 189) reports that captive animals catch and eat insects flying by.

Bell *et al.* (2019: 250) indicate that dominant male bats (in a captive colony) defend small feeding territories within the colony, and are therefore often more sedentary, which might result in these animals being heavier and running a higher risk of cardiomyopathy.

PREDATORS:
See Smith and Leslie (2006).

POPULATION:
Structure and Density - In 2002 there were estimated to be 1,200 bats in 20 roosts, many of which have been recently located as a result of the implementation of a national environmental education programme (Trewhella *et al.*, 2005). Sewall (2009: 3) indicates that the population might count 1,200 - 1,500 animals. Prior to the national environmental education programme there were estimated to be fewer than 200 bats.

During an extensive survey in 2011 - 2012, Daniel *et al.* (2016: 742) estimated the population size to be about 1,260 animals, distributed over 21 roosts on Anjouan and Mohéli.

Ibouroi *et al.* (2018b: 2408) observed 1,243 bats divided over 19 locations, with colony sizes ranging from 3 to 349 individuals (average: 65).

Also see Smith and Leslie, 2006: 1).
Trend - 2008 - Decreasing (Mickleburgh *et al.*, 2008t; IUCN, 2009).

LIFESPAN:
Szekely *et al.* (2015: Suppl.) report a maximum longevity of 15 years.

ACTIVITY AND BEHAVIOUR:
See Smith and Leslie (2006: 1).

Trewhella *et al.* (2001: 135) indicate that *P. livingstonii* is more diurnally active than the sympatric *P. seychellensis comorensis*, and is the dominant species during their encounters.

REPRODUCTION AND ONTOGENY:
See Smith and Leslie (2006: 2).

Szekely *et al.* (2015: Suppl.) mention a gestation period of 152 days. At birth, the young weights 137 g (adult weight: 696.5 g).

MATING:
See Smith and Leslie (2006).

Riccucci (2011: 141) reports on same sex sexual behaviour in captive held *P. livingstonii*.

PARASITES:
Fountain *et al.* (2019: 268) examined the captive population at the Jersey Zoo and found them to be infected by the following *Staphylococcus* species (in descending order): *S. xylosus, S. aureus, S. saprophyticus, S. nepalensis, S. simulans, S. sciuri, S. kloosii, S. simiae, S. hominis, S. epidermidis, S. succinus, S. warneri, S. lentus, S. lugdunensis, S. cohnii, S. haemolyticus, S. equorum, S. capitis*.

UTILISATION:
Is not hunted for food (Trewhella *et al.*, 2005).

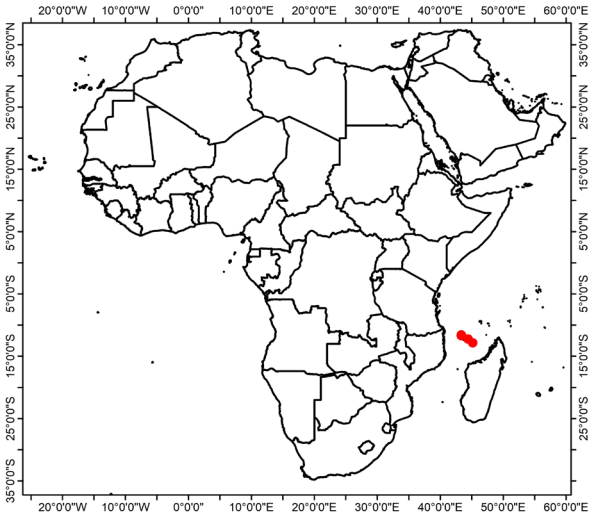

Figure 8. Distribution of *Pteropus livingstonii*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Comoros, Mayotte.

Pteropus niger (Kerr, 1792)

*1792. *Vespertilio vampirus niger* Kerr, in: Linnaeus, Animal Kingdom, 1 (1): xvii, 90. Publication date: February 1792. Type locality: Réunion: "Réunion island". - Comments: Andersen (1912b: viii) mentions that the type was once in the ancient Royal Cabinet in Paris, but is probably no longer in existence.

1797. *Vespertilio caninus* Blumenbach, Handb. Naturg, 5 ed.: 73. - Comments: Pavlinov *et al.* (1995) consider *caninus* to be a synonym of *vampyrus*, but Andersen (1912b: 220) indicates this is a synonym of *niger* Kerr, 1792. The name was originally proposed as a replacement for *V. vampyrus* L., but this includes *vampyrus*, *rufus* and *niger*. Andersen also indicates that Goldfuss' plate of "*V. caninus*" Blumenbach (1809), is a copy of Schreber's plate xiv, which is *Pteropus niger*.

1803. *Pteropus fuscus* E. Geoffroy Saint-Hilaire, Catalogue des Mammifères du Muséum national d'Histoire naturelle, Paris, 46. Type locality: Réunion: Réunion and Madagascar [Goto Description]. - Comments: Andersen (1912b: 220) mentions that Geoffroy based himself on three specimens "viz., two mounted specimens (wings expanded), sent from Réunion by de la Nux (nos. 86 and 87), and a third 'envoyé de Madagascar, par le citoyen Macé, naturaliste' (no. 88)". Andersen also indicates that specimen 88 (from Madagascar) was probably obtained from a dealer. He was also unable to find any of these specimens.

1804. *V[espertilio] mauritianus* Hermann, Obs. Zool. , 19. Publication date: 31 August 1804. Type locality: Mauritius: "Mauritius" [Goto Description].

1808. *Pteropus rufus:* Tiedemann, Zool, 1808: 535. Type locality: Madagascar: "Madagascar". - Comments: Not of E. Geoffroy Saint-Hilaire, 1803, but see).
1810. *Pteropus vulgaris*E. Geoffroy Saint-Hilaire, Ann. Mus. Hist. nat. Paris, 15: 92. Type locality: Réunion: Réunion and Madagascar: Restricted to Réunion by Andersen (1912b: 221), due to the type locality for *Pteropus fuscus* is Réunion. Holotype: MNHN A.1.C.18 - 745H - 154: ad ♂, mounted skin (skull not removed). - Comments: A redescription and renaming of *Pteropus fuscus* Geoffroy, 1803 (see Andersen, 1912b: 221).
1870. *Spectrum vulgare* Gray, Catalogue of Monkeys, Lemurs and Fruit-eating bats in the collection of the British Museum London, 100. Type locality: : Mauritius, Réunion, ? Madagascar [Goto Description].
1895. *Pteropus pteropus* Merriam, Science, N.S. 1 (14): 376. Publication date: 5 April 1895. Type locality: Réunion: Réunion and Madagascar. - Comments: Combination introduced into literature by Merriam on the mistaken supposition that Brisson's nomenclature was binomial (see Andersen, 1912b: 223).
? *Pteropus niger:* (Name Combination, Current Combination)

TAXONOMY:
See Bergmans (1991) and Simmons (2005: 341).

O'Brien *et al.* (2009) suggested that *P. aldabrensis*, *P. rufus*, *P. niger* and *P. seychellensis* (including *comorensis*) should be considered geographical forms of a single species *P. giganteus* (Brünnich, 1782) from the Indian subcontinent, Maldives and Andaman archipelagos.

Almeida *et al.* (2014: 85) place *P. niger* in the "*vampyrus*" group.

COMMON NAMES:
Czech: kaloň mauricijský. English: Greater Mascarene Flying Fox, Mascarene Flying-fox, Mauritian Flying Fox. French: Renard volant de l'île de Mascarene, Renard volant de Maurice, Renard volant des Mascaraignes, Roussette noire, grande Roussette des Mascareignes. German: Grosser Maskarenen-Flugfuchs. Spanish (Castillian): Zorro volador negro de Mauricio.

CONSERVATION STATUS:
Global - Listed as Endangered (EN B1ab(iii,v) ver 3.1 (2001)) because its extent of occurrence is less than 5,000 km^2 (Mauritius is 1,860 km^2), its entire range is restricted to only one island (and possibly one other island), and there is continuing decline in the extent and quality of its habitat, as well as the number of mature individuals due to hunting pressure, and culling of the species (Jenkins *et al.*, 2008k; IUCN, 2009).

Conenna *et al.* (2017: Suppl.) mention its status as Vulnerable (VU), but Anthony *et al.* (2018: 12075) indicated that the culling ot the bats in 2015-2016 resulted in upgrading the status to "Endangered" by the IUCN in 2018.

Assessment History - 2008 - EN B1ab(iii,v) ver 3.1 (2001) (Jenkins *et al.*, 2008k; IUCN, 2009). 1996 - VU A1d+2cd ver 2.3 (1994) (Baillie and Groombridge, 1996). 1994 - VU A1d+2cd ver 2.3 (1994) (Groombridge, 1994). 1993 - VU (World Conservation Monitoring Centre, 1993). 1990 - VU (IUCN, 1990). 1988 - VU. 1986 - Rare (IUCN Conservation Monitoring Centre, 1986). 1981 - VU: A1d+2cd. Extinct on Réunion Island (see Cheke and Dahl, 1981).

CITES - Appendix II

MAJOR THREATS:
Like other *Pteropus* species in the region, this species is threatened by cyclones, the removal of feeding and roosting trees, and persecution/hunting by people (Carroll and Feistner, 1996). Up until recently populations of this species were considered healthy because of the lack of any severe cyclones, and active protection (Nyhagen, 2004). In October 2006 the government endorsed a culling programme for 2,000 bats because of their perceived role in inflicting serious economic damage on lychees. This is obviously in conflict with the fact that the species is protected under the Wildlife and National Parks Act 1993. Only six bats were officially culled, despite illegal hunting parties being known to kill up to a few hundred bats in one night. The law is currently being revised and it is unknown whether further culling will be supported, although most likely it will be (Jenkins *et al.*, 2008k; IUCN, 2009).
Anthony *et al.* (2018: 12075) reported that in November-December 2015 30,938 bats were culled and in December 2016 yet another 7,380 bats. Florens and Baider (2018: 60) furthermore reported that 12,500 bats were planned to be culled in 2018.

Olival (2015: 6) reviews why culling is not an effective means to mitigate conflicts between fruit

growers and bats, nor to reduce the likelihood of zoonotic disease risk.

Florens (2015: 1325; 2016: 33) indicated that the official population estimates are between 90,000 and 1,000,000 bats. The government set a cull target of 20 %, which resulted in the death of 20,000 bats. However, as the real number of bats accounted for about 50,000 animals, this meant that about half of the population was eradicated.

CONSERVATION ACTIONS:
Jenkins *et al.* (2008k) [in IUCN (2009)] report that *P. niger* became a protected species in 1993 on Mauritius (Nyhagen *et al.*, 2005) and is reported to occur in protected areas, including the Black River Gorges National Park (Nyhagen, 2004), nature reserves and mountain reserves. There is a clear need to assess the population size, population dynamics, response to cyclones, assess relative fruit predation, roosting habitat requirements and impact of culling on this species and effectiveness of netting trees to prevent foraging. Oleksy *et al.* (2018: "5") also suggest to harvest the fruits at an earlier stage to reduce their attractiveness to bats as bats prefer to eat fruits that are to ripe to be sold. Additionally, they found that 10% of the lychee losses and up to 50% (or more) of the mango losses could be attributed to natural falling of fruit, which could also be reduced by early harvesting. Their study also indicated (p."6") that netting of trees could reduce damage caused by bats 12 to 23 fold.

GENERAL DISTRIBUTION:
Historically, *Pteropus niger* is distributed within the Mascarene Islands (Reunion Island, Mauritius Island, subfossil on Rodriquez Island). Since becoming extirpated from La Réunion in the early eighteenth century, this species has been restricted to the western Indian Ocean island of Mauritius. In 2007 a small colony of *P. niger* (up to 6 individuals) was located on La Réunion, though a few individuals have been observed on previous occasions over the past decade, most likely blown over from Mauritius by annual cyclones. Breeding within this small population on La Réunion is suspected but not confirmed.
Caceres (2010: 9) mentions that the orginal population disappeared from La Réunion between 1772 and 1801.

Native: Mauritius; Réunion.

BIOGEOGRAPHY:
See O'Brien *et al.* (2009) for further details.

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
The adult's weight is on average 456.3 g (see Szekely *et al.*, 2015: Suppl.), but Oleksy *et al.* (2019: 5) reported an average weight of 617 (± 76) g for females and 630 (± 96) g for males.

MOLECULAR BIOLOGY:
DNA - See O'Brien *et al.* (2009).
Karyotype - Unknown.
Protein / allozyme - Unknown.

HABITS:
P. niger is primarily nocturnal, but Nyhagen *et al.* (2005: 492) observed some specimens foraging during the day.

Using solar-powered GSM-tracking, Oleksy *et al.* (2019: 5) found that on average males traveled 9.38 km each night and females 6.06 km. The maximum distance traveled during one night was 92.92 km for a male and 79.19 km for a female. They also found that home ranges of males averaged 74,633 ha, whereas these for females only covered 31,072 ha. The core foraging areas averaged 2,222 ha for males, 1,364 ha for females.

ROOST:
On La Réunion, Caceres (2010: 14) reported that Yellow jade orchid tree (*Michelia champaca,* Chinese fan palm (*Livistona chinensis*), Longan (*Dimocarpus longan*), soft bollygum (*Litsea glutinosa*) and Wampee (*Clausena lansium*) are used as roosting trees. These roost trees can be used for several years, although during the year several roosts on different places of the island can be used.

DIET:
Nyhagen *et al.* (2005: 493) reported that on Mauritius, *P. niger* ate 22 plant species, 20 of which were visited for fruit, two for floral resources and one for leaves (of *Diospyros tessellaria* both fruits and flowers were eaten). Nyhagen (2004: 120) described the characteristics, which fruit eaten by *P. niger* posses: easily accessible (95 %), medium size (47 %), medium size seed (68 %), vivid colours (53 %), sweet smell (58 %), sweet flavour (74 %), and not juicy, i.e. low water content (58 %). Four of the plant species (*Artocarpus heterophyllus, Diospyros tessellaria, Mangifera indica* and *Mimusops petiolaris*) possess five of these seven characteristics. Nyhagen (2004: 122) also mentions that this bat is the only native vertebrate to feed on fruits of *Labourdonnaisia glauca*.

Seltzer *et al.* (2013: table S2) provide an overview of the plant species found beneath bat feeding roosts. For *P. niger* these include *Psidium guajava* L. (apple guava - Myrtaceae) and *Syzygium jambos* L. (Alston) (Malabar Plum - Myrtaceae).

Florens *et al.* (2017: 89) provided the following list of fruits eaten by *P. niger*: Aphoiaceae: *Aphloia theiformis* (Vahl) Benn.; Apocynaecae: *Tabernaemontana persicariifolia* Jacq.; Araliaceae: *Polyscias maraisiana* (Marais) Lowry & G.M. Plunkett (Ox tree); Arecaceae: *Dictyosperma album* (Bory) H. Wendl. & Drude ex-Scheff. (princess palm, hurricane palm), *Hyophorbe lagenicaulis* (L.H. Bailey) H.E. Moore (bottle palm, palmiste gargoulette), *Latania loddigesii* Martius (Latanier de l'île Ronde, Latanier de Maurice); Burseraceae: *Protium obtusifolium* (Lam.) Marchand; Calophyllaceae: *Calophyllum tacamahaca* Willd., 1811; Celastraceae: *Cassine orientalis* (Jacq.) Kuntze (bois d'olive); Chrysobalanaceae: *Grangeria borbonica* Lam., 1789; Combretaceae: *Terminalia bentzoe* (L.) L. f.; Ebenaceae: *Diospyros egrettarum* I. Richardson, *Diospyros tessellaria* Poir. (black ebony, Mauritian ebony), *Diospyros melanida* Poir.; Elaeocarpaceae: *Elaeocarpus integrifolius* Lam.; Lecythidaceae: *Foetidia mauritiana* Lam.; Loganiaceae: *Geniostoma borbonicum* (Lam.) Spreng.; Melastomataceae: *Warneckea trinervis* (DC.) Jacq.-Fél.; Moraceae: *Ficus reflexa* Thunb., *Ficus rubra* Vahl, 1805, *Ficus mauritiana* Lam.; Myrtaceae: *Eugenia alletiana* Baider & V. Florens, *Eugenia elliptica* Lam., 1789, *Eugenia pollicina* J. Guého & A.J. Scott, *Eugenia lucida* Lam., *Eugenia tinifolia* Lam., *Syzygium glomeratum* (Lam.) DC., *Syzygium populifolium* (Baker) J. Guého & A.J. Scott, 1980; Pandanaceae: *Pandanus eydouxia* Balf. f., *Pandanus utilis* Bory; Pittosporaceae: *Pittosporum senacia* Putt.; Rubiaceae: *Pyrostria borbonica* (J.F. Gmelin) Razafim. & B. Bremer; Salicaceae: *Ludia mauritiana* J.F. Gmelin, 1791; Sapindaceae: *Stadmania oppositifolia* Lam.; Sapotaceae: *Labourdonnaisia calophylloides* Bojer (Bois de natte à petites feuilles), *Labourdonnaisia glauca* Bojer (Bois de natte à grandes feuilles), *Labourdonnaisia revoluta* Bojer, *Mimusops maxima* (Poir.) R.E. Vaughan (Grand natte), *Mimusops petiolaris* Dubard, 1915 (macaque, makak, bois makak), *Sideroxylon boutonianum* A. DC, *Sideroxylon cinereum* Lam., *Sideroxylon puberulum* C. DC. (Manglier rouge), *Sideroxylon grandiflorum* A. DC. (tambalacoque, dodo tree).

POPULATION:
Structure and Density - The present population on Mauritius appears to be stable; 14 roosting sites were reported by Nyhagen (2004), but Robin, 2007) identified 57 roosts. This latter study only looked at 24 of the 57 roosts and calculated a minimum population size of 12,000 - 16,000. It can therefore be assumed that the minimum island wide population is over 25,000 (V. Tatayah *pers. comm.* [in Jenkins *et al.* (2008k) in IUCN, 2009]). Anthony *et al.* (2018: 12074) referred to a survey held in October 2016, which yielded a population estimate of about 62,000 individuals.
Trend - 2008 - Decreasing (Jenkins *et al.*, 2008k; IUCN, 2009).

LIFESPAN:
Szekely *et al.* (2015: Suppl.) report a maximum longevity of 19.4 years.

PARASITES:
Hirst (1923: 980) mentions that the mite *Ancystropus mulleri* Kolenati was collected from *P. vulgaris* [= *P. niger*].

VIRUSES:
Rhabdoviridae
Of the 36 bats from Mauritius tested by Mélade *et al.* (2016a: 6) against *Lagos bat lyssavirus* and *Duvenhage lyssavirus*, two and 13 respectively, displayed a sero reaction. Also one out of 21 specimens tested for *European bat lyssavirus 1* showed this reaction.

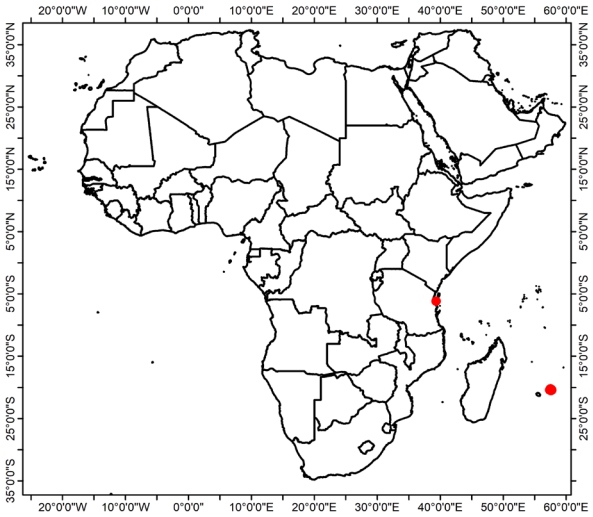

Figure 9. Distribution of *Pteropus niger*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Madagascar, Mauritius, Réunion, Tanzania.

Pteropus rodricensis Dobson, 1878

*1878. *Pteropus rodricensis* Dobson, Catalogue of the Chiroptera of the collection of the British Museum, xxxvii, 20, 36, pl. 3, fig. 3. Publication date: June 1878. Type locality: "Africa": Mascarene Islands: Rodrigues Island [Goto Description]. Holotype: BMNH 1876.3.11.1: ad ♂, skull and alcoholic. Collected by: J. Gulliver. Presented/Donated by: The Royal

Society. See Andersen (1912b: 275). Paratype: SMF 44785: juv ♀, skull and alcoholic. Collected by: J. Gulliver. Presented/Donated by: ?: Collector Unknown. (Current Combination)

1907. *Pteropus mascarinus* Mason, Ann. Mag. nat. Hist., ser. 7, 20 (117): 221. Publication date: 1 September 1907. Type locality: Mauritius: 15 mi (=22 km) NE Mauritius: Round island (La Ronde) [Goto Description]. Holotype: BMNH 1925.8.10.1:.

TAXONOMY:
See Bergmans (1991) and Simmons (2005: 343).

Almeida *et al.* (2014: 85) place *P. rodricensis* in the "*vampyrus*" group.

COMMON NAMES:
Czech: kaloň rodrigueský, kaloň zlatý. Dutch: Rodriguez vliegende hond. English: Rodriguez Flying Fox, Rodrigues Flying Fox. French: Renard volant de Rodrigues, Renard Volant de l'île de Rodriguez. German: Rodriguez-Flughund, Rodrigues-Flugfuchs. Spanish (Castillian): Zorro volador de la isla Rodrigues.

CONSERVATION STATUS:
Global - Listed as Critically Endangered (CR B1ab(iii)c(iv) ver 3.1 (2001)) because the global population is restricted to a single location (the island of Rodrigues), and has a extent of occurrence is less than 100 km^2, and undergoes extreme fluctuations due to tropical cyclones. Cyclones have devastating long term effect on the number of bats (sometimes causing significant mortality) and remaining areas of the species vulnerable forest habitat (Mickleburgh *et al.*, 2008u; IUCN, 2009).

Assessment History -
2008 - CR B1ab(iii)c(iv) ver 3.1 (2001) (Mickleburgh *et al.*, 2008u; IUCN, 2009). 2004 - CR B1ac(iv) ver 3.1 (2001) (Mickleburgh *et al.*, 2004q; IUCN, 2004). 2002 - CR: B1+3d (Mickleburgh *et al.*, 2002a: 22), extinct on Round Island. 1996 - CR (Baillie and Groombridge, 1996). 1994 - EN (Groombridge, 1994). 1993 - EN (World Conservation Monitoring Centre, 1993). 1990 - EN (IUCN, 1990). 1988 - EN (IUCN Conservation Monitoring Centre, 1988). 1986 - EN (IUCN Conservation Monitoring Centre, 1986).

U.S. ESA - Endangered.
CITES - Appendix II.

MAJOR THREATS:
Deforestation has been a serious threat to the species, especially where mature fruit trees and important roost trees were felled. Because of the deforestation of this forest buffer, any remaining patches of forest (and their roosting bats), are now much more susceptible to tropical cyclones. These cyclones can cause significant fluctuations in bat population size and, along with shortage of food and dehydration, are now the major current threat to the species (Powell and Wehnelt, 2003). In the past the species was also hunted for food, however, this is now rare (Trewhella *et al.*, 2005; Mickleburgh *et al.*, 2008u; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008u) [in IUCN (2009)] report a successful captive breeding programme for this species was initiated by the Durrell Wildlife Conservation Trust, with breeding populations of this bat now maintained at 28 zoos around the world (Powell and Wehnelt, 2003). In 1995, the International Studbook contained 542 individuals distributed over 18 institutions (Carroll and Feistner, 1996: 334).

In-situ conservation efforts have concentrated on restoration of the natural habitat, watershed protection and awareness raising among the local people through environmental education programmes (Powell and Wehnelt, 2003; Trewhella *et al.*, 2005).

GENERAL DISTRIBUTION:
Pteropus rodricensis is confined to the western Indian Ocean island of Rodrigues (Mauritius). It was historically present on the island of Mauritius and Round Island (Mauritius), but is now extinct on these islands. It appears to range up to around 200 m asl.

Native: Mauritius [Mauritius (main island) - Regionally Extinct, Rodrigues].

DETAILED MORPHOLOGY:
Baculum - Unknown

Gardner *et al.* (2007: 196) studied the heart of several *P. rodricensis* specimens kept in captivity, and found it to have a normal cardiac silhouette, comparable to domestic small mammals.

Carter and Adams (2013: 33) postulated that tracheal and primary bronchi calcification will occur in echolocating *Artibeus jamaicensis* but not in non-echolocating *Syconycteris australis* and *Pteropus rodricensis*. The calcification would be needed to counteract the compressive forces executed by the flight muscles on the respiratory tract, as there is a sychronisation between wing-

beat and respiration, and the latter is linked with the production of echolocation calls. However, to their surprise, they found that the tracheae and primary bronchi of *P. rodricensis* were also heavily calcified.

MOLECULAR BIOLOGY:
O'Brien and Hayden (2004: 144) report that, notwithstanding the reduction of the population to less than 70 individuals in the 1970's, the species has still retained some genetic diversity.

DIET:
Courts (1998: 189) reports that captive animals catch insects flying by, and that these were readily eaten. The bats also ate mealworms (*Tenebrio molitor*) and waxmoth larvae (*Galeria mellonella*).
Blood glucose - Heard and Whittier (1997) found blood glucose concentrations within the normal mammalian range.

POPULATION:
Structure and Density - Until around 1916, the species was reported to be abundant on Rodrigues, and even in 1955 large numbers (about 500) still roosted in tamarinds (Mickleburgh *et al.*, 2002a). In 1965 there were fewer bats, but the species was still common. There was a marked decline in the 1970's, and following Cyclone Celine II in 1979, the population was reduced to around 70 bats. By 1980 the population had recovered to between 200 and 250 animals (Carroll and Mace, 1988), and at the end of February 1990, the population was estimated to be greater than 1,000 bats (Mickleburgh *et al.*, 2002a). Recently the population had recovered to around 5,076 bats (Powell and Wehnelt, 2003). However, the impact of cyclone Kalunde in March 2003 appears to have reduced the population to around 4,000 animals (Anonymus, 2006), although Caceres (2010: 19) reports that the current population is estimated at about 5,500 individuals.
Trend - 2008 - Increasing (Mickleburgh *et al.*, 2008u; IUCN, 2009).

LIFESPAN:
Szekely *et al.* (2015: Suppl.) report a maximum longevity of 28 years.

ACTIVITY AND BEHAVIOUR:
For a selection of sounds, check http://macaulaylibrary.org/search?taxon=Pteropus rodricensis&taxon_id=11036948&taxon_rank_id=67&tab=audio

Riccucci (2016: 94) observed several different behaviours: "play chase" by immature bats flying to one location and rapidly leaving; "play wrestle", which involves close belly contact between individuals, with restrained biting on the neck. He also noticed that pairs or groups of bats (mostly females) wrestle together in long play sessions.

REPRODUCTION AND ONTOGENY:
Kunz *et al.* (1994: 691) report on allomaternal care, or epimeletic (care-giving) behaviour, exhibited by one female toward another, before, during. and after giving birth.

Szekely *et al.* (2015: Suppl.) report a gestation period of 198 days. The young then weights 45 g (adult: 350 g).

MATING:
McCracken and Wilkinson (2000: 339) refer to Carroll and Mace (1988), who indicated that *P. rodricensis* forms harem groups consisting of one male and up to eight females.

Riccucci (2011 141) suggests that male-male mounting behaviour is a way to assert dominance.

PARASITES:
BACTERIA
Gram-positive bacterium - Heard *et al.* (1979) recorded the following gram-positive bacteria from *Pteropus rodricensis* - *Actinomycetis*, *Bacillus* spp., *Corynebacterium* spp., *Enterococcis* spp., *Lactobacillus* spp., *Staphylococcus aureus*, *Staphylococcus* spp., *Streptococcus* spp. hemolytic, *Streptococcus* sp Group D and *Streptococcus* sp.
Gram-negative bacterium - Heard *et al.* (1979) recorded *Bacteroides* spp., *Escherichia coli*, *Klebsiella oxytoca*, *Klebsiella pneumonia*, *Morganella morganii*, *Proteus mirabilis*, and *Proteus* spp. Helmick *et al.* (2004: 88) reported a *Pasteurella* from one captive bat.

Fungi
Heard *et al.* (1979) recorded an unspecified yeast.

UTILISATION:
In the past the species was also hunted for food, however, this is now rare (Trewhella *et al.*, 2005).

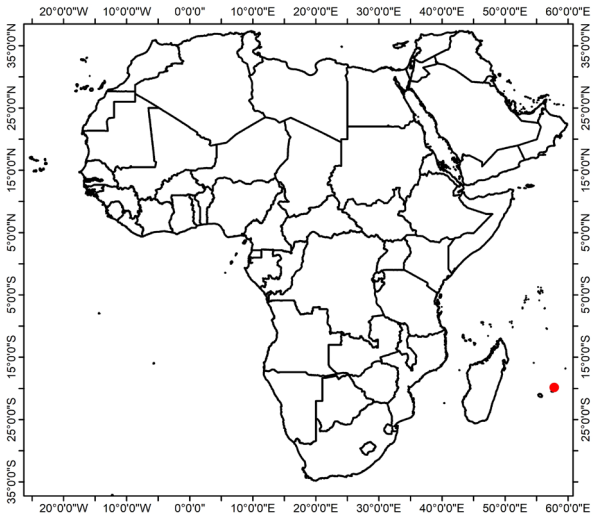

Figure 10. Distribution of *Pteropus rodricensis*

DISTRIBUTION BASED ON VOUCHER SPECIMENS: Mauritius.

Pteropus rufus E. Geoffroy St.-Hilaire, 1803

*1803. *Pteropus rufus* E. Geoffroy Saint-Hilaire, Catalogue des Mammifères du Muséum national d'Histoire naturelle, Paris, 47. Type locality: Madagascar: North and Central Madagascar [Goto Description]. - Comments: Type locality originally "Madagascar", restricted to North and Central Madagascar by Andersen (1908b: 367) (See Peterson *et al.*, 1995: 14). Andersen (1912b: viii) indicates that the type was once in the Paris Museum, but is probably no longer in existence. On page 206, he also mentioned that the specimen was sent by "le citoyen Macé, naturaliste" (nr 90 of Geoffroy's catalog). (Current Combination)

1810. *Pteropus Edwardsii* E. Geoffroy Saint-Hilaire, Ann. Mus. Hist. nat. Paris, 15: 92. Type locality: Madagascar: "Madagascar". - Comments: Renaming of *P. rufus* E. Geoffroy Saint-Hilaire, 1803 (see Andersen, 1906c: 206; Allen, 1939a: 60). Mentioned as *edwardii* by Smith (1833: 52) and as *edwarsi* by Koopman (1993a). Description is based on the same specimen as *Pteropus rufus* Geoffroy, 1803.

1816. *Pteropus madagascariensis* Oken, Lehrbuch Naturgeschichte, Jena, 3 (2): 936. Type locality: Madagascar: "Madagascar". - Comments: Renaming of *P. edwardsii* E. Geoffroy Saint-Hilaire, 1810 (see Andersen, 1912b: 207; Allen, 1939a: 60).

1825. *Pteropus phaiops* Temminck, Monogr. Mamm, 1: 178. Type locality: Madagascar: "Madagascar". - Comments: Syntypes: RMNH Jentink Cat. Syst., p. 146 [under *Pt. edwardsi*] c (skull not removed), d (skull removed); Cat. Ost., p. 259, c.

1838. *Pteropus phæops* Oken, Allg. Naturgesch, 7 (2): 990. Type locality: Madagascar.

1908. *Pteropus rufus princeps* K. Andersen, Ann. Mag. nat. Hist., ser. 8, 2 (10): 367. Publication date: 1 October 1908. Type locality: Madagascar: Tuléar province: Fort Dauphin [25 02 S 47 00 E] [Goto Description]. Holotype: BMNH 1891.11.30.10: ad ♂, skull and alcoholic. Collected by: M. Cloisel. See Andersen (1912b: 14), Peterson *et al.* (1995: 14).

? *Pteropus rufus rufus:* (Name Combination)

TAXONOMY:
See Bergmans (1991) and Simmons (2005: 343 - 344). Commonly cited from "E. Geoffroy, 1803. Cat. Mamm. Mus. Nat. Hist. Nat. Paris, p. 47", but this work was never published, which would make this a *nomen nudum*. However, Opinion 2005 (Case 3022) fixed the authorship and date of this name to E. Geoffroy St.-Hilaire (1803) by (see Anonymus, 2002b: 154).

O'Brien *et al.* (2009) suggested that *P. aldabrensis*, *P. rufus*, *P. niger* and *P. seychellensis* (including *comorensis*) should be considered geographical forms of a single species *P. giganteus* (Brünnich, 1782) from the Indian subcontinent, Maldives and Andaman archipelagos.

Almeida *et al.* (2014: 85) place *P. rufus* in the "*vampyrus*" group.

COMMON NAMES:
Czech: kaloň madagaskarský, upír černolící. English: Madagascan Flying Fox, Madagascan Flying-fox, Red Flying Fox, Madagascar Fruit Bat, Madagascar Flying Fox. French: Renard volant de Madagascar, Renard volant roux, Roussette rougeâtre, Renard volant malgache. German:

Madagaskar-Flugfuchs. Malagasy: Fanihy. Spanish (Castillian): Zorro volador de Madagascar.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Gunnell *et al.* (2014: 3) refer to Goodman and Junkers (2013), who report on fossil material from the Andrahomana cave in Madagascar.

CONSERVATION STATUS:
Global - This species is listed as Vulnerable (VU A2acd ver 3.1 (2001)) based on the loss of over 30% of its population over the last 20 years. This can be attributed to the increased level of hunting particularly with the introduction of shotguns and continued loss of its preferred roosting habitats (Andriafidison *et al.*, 2008a; IUCN, 2009).

Assessment History -
2008 - VU A2acd ver 3.1 (2001) (Andriafidison *et al.*, 2008a; IUCN, 2009). 2004 - VU A2b+3d ver 3.1 (2001) (Participants of CBSG CAMP Madagascar Mammal Worksh, 2004; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996). 1993 - LR/lc (World Conservation Monitoring Centre, 1993).

CITES - Appendix II.

MAJOR THREATS:
There are numerous threats to this species. It is listed as a game species under Malagasy law and can be legally hunted between the first of May and the first of September (Anonymus, 2007b: 6; Durbin, 2007; Randrianandrianina *et al.*, 2010: 412). Only the few roosts that are located in protected areas therefore receive some protection (Racey *et al.*, 2009). *Pteropus rufus* is hunted for food across Madagascar (MacKinnon *et al.*, 2003; Rakotondravony, 2006; Rakotonandrasana and Goodman, 2007; Racey *et al.*, 2009; Randrianandrianina *et al.*, 2010) where it is an important subsistence food, but also of commercial importance. Although quantitative data on the supply of *P. rufus* for food and the impact of this harvest on colonies/populations is lacking, there is some evidence that the offtake is locally unsustainable (Racey *et al.*, 2009). Hunting occurs at roost sites and where the bats forage, especially when they feed on trees in villages (Jenkins and Racey, 2008). There is evidence that *P. rufus* from Ile Sainte Marie is hunted commercially and frozen shipments are sent to the mainland port of Toamasina (Rakotonandrasana and Goodman, 2007). The conversion of the forest used by roosting bats into agriculture is another threat to *P. rufus* and results in the permanent loss of suitable trees which in many cases have been used for decades. *Pteropus rufus* feeds on a number of cultivated fruits that have a high economic value in rural Madagascar and is often subjected to persecution.

Randrianandrianina *et al.* (2010: 413) observed that a minimum of five *P. rufus* specimens were caught each night, when they were feeding on kapok (*Ceiba pentandra*) nectar in July. For one roost in Andranomena, Oleksy *et al.* (2015b: 4) reported that six hunters camped for three nights per week for approximately eight months per year and captured about 20 bats per night.

Oleksy *et al.* (2015b: 4) and Cardiff and Jenkins (2016: 97) mention that roost sites are also threatened by fire and agricultural expansion. These roost sites are particularly vulnerable as they are located in large trees located in forest fragments in savanna or scrub habitats.

CONSERVATION ACTIONS:
Andriafidison *et al.* (2008a) [in IUCN (2009)] report that it is listed on CITES Appendix II and is a game species under Malagasy law (Durbin, 2007) but neither of these provide any practical in situ conservation measures (Racey *et al.*, 2009). There are a few roosts in protected areas, notably Parc National Kirindy-Mité, Parc National de Masoala, Parc National de Mananara-nord (MacKinnon *et al.*, 2003) and Berenty Private Reserve (Long, 2002), but many of the existing parks and reserves appear to be without roosting colonies (e.g. Goodman, 1996; 1999; Alonso *et al.*, 2002; Goodman *et al.*, 2005a; Schmid and Alonso, 2005). The ongoing process to triple the surface of protected areas in Madagascar is providing an unprecedented opportunity to include traditional roosts in the new conservation sites. There is also significant scope for local institutions to conserve roosts and this is already occurring in some parts of Madagascar where the bats use sacred forests (Jenkins *et al.*, 2007b) or where communities have created social contracts to protect the bats (Jenkins *et al.*, 2007a).

GENERAL DISTRIBUTION:
Pteropus rufus is endemic to Madagascar. It is one of the most widespread bat species on the island and appears to only be absent from the highly populated central highlands (MacKinnon *et al.*, 2003). The highest density of roost sites is in coastal regions, especially from Morombe in the south-west to Antsiranana in the north (MacKinnon *et al.*, 2003). It has also been recorded from the islands of Nosy Be, Nosy Komba, and Ile Sainte-Marie (Rakotonandrasana and Goodman, 2007: 6).

Native: Madagascar (Bollen and Van Elsacker, 2002; MacKinnon *et al.*, 2003; Simmons, 2005:

344; Rakotonandrasana and Goodman, 2007: 6; Long and Racey, 2007; Jenkins and Racey, 2008).

BIOGEOGRAPHY:
See O'Brien *et al.* (2009) for further details.

DETAILED MORPHOLOGY:
Baculum:
Rakotondramanana and Goodman (2017: 54) described the baculum having a distal tip forming an arch-shaped structure and a basal portion which is lobed with a distinct central prolongation; length: 3.22, 3.86 mm, width: 3.53, 4.15 mm. In subadults, the bones are notably reduced in length and width.

MOLECULAR BIOLOGY:
DNA - See O'Brien *et al.* (2009).

Karyotype - 2n = 38 and FN = 68, containing 11 pairs of metacentrics, 6 submetacentrics, 1 pair of acrocentrics; X: large submetacentric, Y: small acrocentric (see Richards *et al.*, 2016d: 187, 189).

Protein / allozyme - Unknown.

HABITAT:
MacKinnon *et al.* (2003) failed to locate any roost sites within the endemic spiny forests of south-west Madagascar. Long and Racey (2007) did not find any evidence to show that *P. rufus* uses the endemic plants of the spiny forest in the Mandrare region of Madagascar.
Jenkins *et al.* (2007b: 212) indicate that *P. rufus* is generally found in forest fragments or linear patches of vegetation along water.

HABITS:
Jenkins and Racey (2008) indicate that day roosts and night feeding areas are often spatially distinct, and are over 40 km apart.

ROOST:
P. rufus roost in foliage (Jenkins and Racey, 2008).

In their 2005 survey, Jenkins *et al.* (2007b: 213) have found six roosting sites, with colony sizes ranging from 40 to over 1,000 animals. Three of these were protected by local taboes or ancestral traditions.

Ravelomanantsoa *et al.* (2019: 110) indicate that *P. rufus* uses large trees (e.g. *Cocos nucifera* - Arecaceae) as roost.

DIET:
Bollen and Van Elsacker (2002: 37) found that *P. rufus* at Ste. Luce, ate the fruits of 40 endemic species, and that typically one seed species was found in a dropping. Oleksy and Jones (2013: 113) reported that 110 plant species were found in its diet, of which 59 (55 %) were endemic. However, Long (2002) and Long and Racey (2007) found *P. rufus* at Berenty in south-east Madagascar to have a narrow dietary breadth, consisting of only 14 plant species. The single most important food source for *Petropus rufus* in south-east Madagascar, is the pollen of *Agave sisalana* a commercial introduced species, while they also eat other locally cultivated and introduced fruits (*Mangifera indica*, *Psidium* cf. *cattleianum*, *Sclerocarya caffra*, *Cordia sinensis* and *Hylocereus* sp.) and native and endemic forest species (*Tamarindus indica* (leaves), *Celtis philippensis*, *Ficus megapoda*, *F. grevei*, *F. pachyclada* and *Grewia* sp.) (Long, 2002; Long and Racey, 2007). Jenkins *et al.* (2007b: 212) indicate that the most important food plants include *Ficus guatteriifolia*, *Syzigium* sp., *Terminalia fatrea*, *Uapaca thouarsii* and *U. littoralis*.
Raheriarisena (2005: 255) mentions that this species' diet is composed of fruits (59.0 - 65.1%), flowers (17.3 - 35.0%), and leaves (6.0 - 18.0%), but also that the percentages of these elements vary with the seasonal variations of plant phenology and the species' activity, especially its reproduction status.

Bollen *et al.* (2004a: 603) found that *P. rufus* preferred to consume multi-seeded fruits.

Bollen (2007: 140) lists the following food plants consumed by *P. rufus*: Annonaceae: *Polyalthia madagascariensis* Cavaco & Keraudren, 1957; Araliaceae: *Polyscias* sp.; Areceae: *Dypsis nodifera* Mart., 1849, *Dypsis prestoniana* Beentje, 1995; Bignoniaceae: *Ophiocolea delphinensis* H. Perrier, 1938; Canellaceae: *Cinnamosma madagascariensis* var. *namoronensis* H. Perrier, 1948; Combretaceae: *Terminalia fatraea* (Poir.) DC., 1828; Ericaceae: *Vaccinium emirnense* Hook, 1837; Euphorbiaceae: *Uapaca ferruginea* Baillon, 1858, *Uapaca littoralis* Denis, 1927, *Uapaca thouarsii* Baillon, 1858; Flacourtiaceae: *Ludia antanosarum* Capuron & Sleumer, 1972, *Scolopia orientalis* Sleumer, 1972; Grossulariaceae: *Brexia* sp.; Lauraceae: *Beilschmiedia madagascariensis* (Baillon) Kostermans, 1952, *Ocotea* sp.; Liliaceae: *Dracaena reflexa* var. *nervosa* H. Perrier, 1936; Loganiaceae: *Anthocleista longifolia* (Lam.) Boiteau, 1973, *Anthocleista madagascariensis*, Baker, 1882, *Bakerella ambongoensis* Balle, 1964, *Bakerella* sp.; Monimiaceae: *Tambourissa purpurea* (Tul.) A. DC, 1868; Moraceae: *Ficus baroni* Baker, 1883, *Ficus guatteriifolia* Baker, 1890, *Ficus pyrifolia* Burm. f., 1768; Myrtaceae: *Syzygium* sp.2; Rubiaceae: *Canthium variistipula* (Arènes ex Cavaco), *Ixora* sp., *Mapouria*

aegialodes Bremekamp, 1963, *Mapouria* sp., *Hyperacanthus mandenensis* Rakotonas. & A.P. Davis, 2004, *Tricalysia* cf. *cryptocalyx* Baker, 1882, *Vepris elliotii* (Radlk.) I. Verdoorn, 1926; Sapotaceae: *Sideroxylon beguei* var. *saboureani*, *Sarcolaena multiflora* Thouars, 1805.

Ravelomanantsoa *et al.* (2019: 110) reported that fruits of *Ziziphus jujuba* Mill.(Jujube, Red dade, chinese dade - Rhamnaceae) are consumed.

Oleksy *et al.* (2015a: 678) followed 15 radio-tracked animals (nine ♂♂ and six ♀♀ females) between July and September 2012 and found that females had larger home ranges and core foraging areas, which might be explained by the higher energy requirements of the females during the gestation period. The bats showed a strong preference for overgrown sisal (*Agave sisalana*) plantations, and also ate large quantities of figs (*Ficus grevei*).

Oleksy *et al.* (2017: 1) found seeds of *Ficus polita*, *F. grevei* and *F. lutea* in bat faeces. They found that the seeds that passed through the bat's digestive track had an increased germination success.

Based on stable isotope analyses, Reuter *et al.* (2016) found that *Pteropus rufus*, *Eidolon dupreanum* and *Rousettus madagascariensis* have broadly overlapping diets, although there are differences between *P. rufus* and *E. dupreanum*. Furthermore, they found that the diet shifted when these two species occurred sympatrically.

Raharimihaja *et al.* (2016: 9512) tested a number of methods to deter *P. rufus* from feeding on commercial fruits (*Litchi chinensis*). They found that an organic product made from dried blood and vegetable oil (Plantskydd®) with a taste and odour aimed at deterring mammal feeding, gave the best results.

PREDATORS:
Mikula *et al.* (2016: Supplemental data) mention the Madagascar harrier-hawk (*Polyboroides radiates* (Scopoli, 1786)) as diurnal avian predator.

POPULATION:
Structure and Density - Roosts are conspicuous and noisy but the bats are often tightly clustered making abundance estimates at the larger sites difficult. MacKinnon *et al.* (2003) reported that colony size ranged from 10 to 5,000 animals with a median of 400. They found that nationally 17.5% of 154 roosts had been abandoned in the last ten years and desertion rates were much higher (70%) in the central highlands. The estimated national population size in 2000 was 300,000 (MacKinnon *et al.*, 2003). In December 2005, Rahaingodrahety *et al.* (2008) recorded colony sizes of 900 at Berenty Private Reserve, 412 at Amborabao and 54 at Sainte Luce.

Based on tooth-derived estimated of adult survival, Brook *et al.* (2019: 165) showed that even with a perfect juvenile annual survival (100 %) stable population trajectories for *P. rufus* are not possible.

Trend - 2008 -Decreasing (Andriafidison *et al.*, 2008a; IUCN, 2009).

ACTIVITY AND BEHAVIOUR:
For a selection of sounds, check http://macaulaylibrary.org/search?taxon=Pteropus rufus&taxon_id=11067862&taxon_rank_id=67&tab=audio

REPRODUCTION AND ONTOGENY:
Kaudern (1914: 11 - 12) reported that he was unable to shoot any pregnant female or females with young during his travels on Madagascar, which took place in the dry season (May to September), so he assumed they had their reproductive season in Spring or Summer [as *P. edwardsi*].
Rand (1935) [in Fox *et al.* (2009: 272)] found two large foetuses in each of the three female specimens that were available to him.

PARASITES:
BACTERIA
Gram-positive bacterium - Reviewed in McCoy (1974), who listed *Enterococcus* spp. and *Staphylococcus* spp.
Gram-negative bacterium - Mayoux *et al.* (1971: 29) and McCoy (1974) listed *Citrobacter* sp., *Enterobacter* sp., *Escherichia coli*, *Salmonella typhi*, *S. typhimurium*, *Salmonella* spp., and *Shigella flexneri*.

Gomard *et al.* (2016: 5) added *Leptospira* to this list (see also Dietrich *et al.*, 2018a: 3).

PROTOZOA
Ranaivoson *et al.* (2019: 1) were the first to report *Babesia* sp. (order Piroplasmida; family Babesiidae), an erythrocythic protozoan) from Madagascan bats (and the first Pteropodid infection). They examined 203 *P. rufus*, of which nine (all males) were positive for babesial infection, whereas none of the 203 bats carried any ectoparasites.

VIRUSES:
Coulanges *et al.* (1974) [in Fontenille *et al.* (1989: 239)] found antibodies against West-Nile virus in 11.4 % of the 94 bats from the Anjiro region they examined.

Coronaviridae - Coronaviruses
Thirteen novel strains of betacoronaviruses were identified in Madagascar in 2010 (Razanajatovo *et al.*, 2015).

Paramyxoviridae
3 out of 20 Madagascan specimens tested by Mélade *et al.* (2016b: 4) were positive for paramyxoviruses.
Henipavirus
Nipah (NiV) - In Madagascar during 2003 - 2004, Iehlé *et al.* (2007) found an overall contamination of 2.3%.
Hendra (HeV) - In Madagascar during 2003 - 2004, Iehlé *et al.* (2007) found an overall contamination of 2.3%.
Tioman (TiV) - In Madagascar during 2003 - 2004, Iehlé *et al.* (2007) found an overall contamination of 2.3%.

Rhabdoviridae – Rabies like viruses
Lyssavirus - Rabies related viruses
Andriamandimby *et al.* (2013: 3) reported on one *P. rufus* from Madagascar, which tested positive to antibodies for European Bat Lyssavirus type 1 (EBLV-1). Of the 11 bats tested by Mélade *et al.* (2016a: 6) for *Duvenhage lyssavirus*, five showed a positive reaction.

UTILISATION:
Pteropus rufus being the largest bat is the main source of bat bushmeat in Madagascar (Jenkins and Racey, 2008). In many regions nets are erected inside or on the periphery of roosts to intercept flying bats (Jenkins *et al.*, 2007b; Jenkins and Racey, 2008). In southern Madagascar *P. rufus* is netted when it feeds on sisal (*Agave sisalana*) plants at night and at least some of the bats are sold locally (Rahaingodrahety, 2007). Firearms (shotguns) are also used to hunt *P. rufus* in many areas (Jenkins and Racey, 2008). In eastern Madagascar individual trees with roosting bats are felled by hunters who club the fallen animals with sticks (MacKinnon *et al.*, 2003).
Pteropus rufus is hunted in the Daraina area in northeastern Madagascar (Rakotondravony, 2006) where roosts of over 1,000 individuals have been reported from littoral forest (Jenkins and Racey, 2008). Although the people living around the forests refrain from eating the bats, the colonies are reportedly subject to frequent hunting by local immigrants (Rakotondravony, 2006). In Makira, *P. rufus* is eaten widely by local communities and at $1.5 US/kg was the most expensive meat (Golden, 2005). In the Mahavavy-Kinkony area of western Madagascar, regular hunting at a *P. rufus* roost was reported by Rakotoarivelo and Randrianandrianina (2007); hunting teams of up to eight men visited the roost on a regular basis and caught up to 100 bats on each occasion. These were sold around villages and to local restaurants for $0.5 US each. On Nosy Boraha, *P. rufus* is regularly exploited from at least one roost and is served seasonally in restaurants in the main town on the island (Rakotonandrasana and Goodman, 2007). One hunter also reported that frozen shipments of *P. rufus* are sent to the mainland port of Toamasina (Rakotonandrasana and Goodman, 2007). At a small restaurant near Mahajanga in 2000, at least 30 *P. rufus* were reportedly sold daily, although it is not clear whether this figure is monthly average estimate or reflects a seasonal peak in availability (Racey *et al.*, 2009). In the sisal plantations surrounding Berenty Private Reserve, hunters can expect to catch 8 - 12 individuals per week between September and May and 25 - 30 between June and August, where they are sold discretely in villages around the reserve for $ 0.7 - 1.0 US (Rahaingodrahety, 2007) therefore a single hunter could catch between 164 and 192 bats per year.
Pteropus rufus and *Eidolon dupreanum* appear to be the only species sold in restaurants, where they are either served individually, complete with head and wings, jointed, or are diced up into small pieces and accompanied by rice (Jenkins and Racey, 2008).
Rakotondravony (2006) considered hunting of *P. rufus* a minor threat in northern Madagascar, while Golden (2005) reported large annual harvests in the Makira forest and Maroantsetra were unsustainable.
See also Goodman *et al.* (2008d).
Golden and Comaroff (2015: 5) indicate that flying foxes and other fruit bats (including *P. rufus*) are frequently the subject of food taboos, which they link to the fact that these bats are carriers of virulent zoonotic diseases.

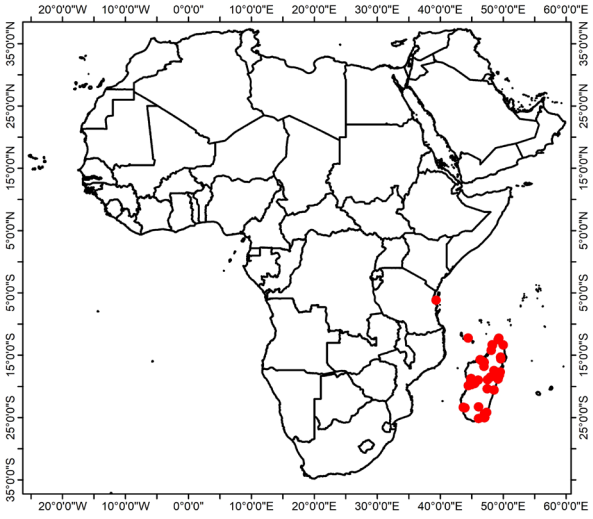

Figure 11. Distribution of *Pteropus rufus*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Comoros, Madagascar, Tanzania.

Pteropus seychellensis A. Milne-Edwards, 1877

*1877. *Pteropus seychellensis* A. Milne-Edwards, Bull. Sci. Soc. Philom. Paris, sér. 7, 2: 221. Type locality: Seychelles: Mahe Island. Lectotype: MNHN ZM-MO-1878-1110 - 35A-157: ad ♂, mounted skin and skull. Collected by: M. Lantz. Paralectotype: MNHN ZM-MO-1878-1106: Collected by: M. Lantz. Rode (1941: 230): nr 157b. Paralectotype: MNHN ZM-MO-1878-1107 - 35B: ♂, mounted skin (skull not removed). Collected by: M. Lantz. Rode (1941: 230): nr 157a. Paralectotype: MNHN ZM-MO-1878-1108: Collected by: M. Lantz. Rode (1941: 230): nr 157c. Paralectotype: MNHN ZM-MO-1878-1109 - 35C: Collected by: M. Lantz. Rode (1941: 230): nr 157d. Paralectotype: MNHN ZM-MO-1878-1111: Collected by: M. Lantz. Paralectotype: MNHN ZM-MO-1878-1112: Collected by: M. Lantz. - Comments: Bergmans (1991: 151) indicated that the lectotype (MNHN CG 1878-1110), as well as most of the other specimens on which Milne-Edwards based his description, were in fact collected by Lantz on Marianne Island, and not on Mahé Island. (Current Combination)

1880. *Pteropus comorensis* Wallace, Island Life, 400. Type locality: Comoros: "Comoro Islands". - Comments: Allen (1939a: 60) and Simmons (2005) mention J.M. Nicoll, 1908 as author, since the original description by Wallace (1880) is actually a nomen nudum.

1908. *Pteropus comorensis* Nicoll, Three voyages of a naturalist being an account of many little-known islands in three oceans visited by the "Valhalla" R.Y.S. - Witherby & Co. London, 87. Type locality: Mayotte: Buzi Island [0 - 600 ft] [Goto Description]. Paratype: SMF 44784: ♂, skull and alcoholic. Collected by: Michael John Nicoll; collection date: 1906. Presented/Donated by: ?: Collector Unknown. Syntype: BMNH 1906.6.3.14: ad ♂, skin and skull. Collected by: Michael John Nicoll; collection date: 2 March 1906. Presented/Donated by: Earl of Crawford. Syntype: BMNH 1906.6.3.15: ad ♂, skin and skull. Collected by: Michael John Nicoll; collection date: 2 March 1906. Presented/Donated by: Earl of Crawford. Syntype: BMNH 1906.6.3.16: ad ♂, skin and skull. Collected by: Michael John Nicoll; collection date: 25 February 1906. Presented/Donated by: Earl of Crawford. - Comments: Nicoll (1908: 88) mentions that the bats were shot in the evening when returning to the ship, and before (p. 87) he mentioned that every evening the bats were flying from the little island (= "Buzi Island") to the main island (= Mayotte).

? *Pteropus seychellensis comorensis:* (Name Combination)

? *Pteropus seychellensis seychellensis:* (Name Combination)

TAXONOMY:
Hill (1971a: 574) included *aldabrensis*, but we follow Bergmans (1991) and Simmons (2005: 344) who considers this to be a separate species.

It seems probable that the two recognized subspecies *Pteropus seychellensis seychellensis* (from the Seychelles) and *Pteropus seychellensis comorensis* (from the Comoros Islands and Mafia Island) represent distinct taxa at the species level. In addition, the population of *Pteropus seychellensis comorensis* from Mafia island (Tanzania) might represent a species distinct from the populations of this bat recorded from the Comoros Islands (Mickleburgh *et al.*, 2008di; IUCN, 2009).

O'Brien *et al.* (2009) suggested that *P. aldabrensis*, *P. rufus*, *P. niger* and *P. seychellensis* (including *comorensis*) should be considered geographical forms of a single species *P. giganteus* (Brünnich, 1782) from the Indian subcontinent, Maldives and Andaman archipelagos. O'Brien *et al.* (2009) show that *P. s. seychellensis* is more closely related to *P. niger* from Mauritius, than to *P. s. comorensis*. Further, based on cytochrome *b* and 12S results, there appears to be no notable genetic differentiation in populations of *P. s. comorensis* from Grande Comore and Mayotte, suggesting genetic exchange.

Chan *et al.* (2011: 7) found that *P. s. comorensis* and *P. rufus* alleles differed by as few as two base-pairs. Based on this mitochondrial haplotype network, *P. s. seychellensis* was more closely related to *P. niger* and these two were more closely related to *P. rufus* than to *P. s. comorensis*.

Almeida *et al.* (2014: 85) place *P. seychellensis* in the "*vampyrus*" group.

COMMON NAMES:
Comorian: ndema, ndrema. Czech: kaloň seychelský. English: Seychelles Flying Fox, Seychelles Fruit Bat. French: Renard volant des Seychelles, Roussette des Seychelles. German: Seychellen-Flugfuchs. Spanish (Castillian): Zorro volador de las Seychelles.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008di; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2008di; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2004cs; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996). 1993 - LR/lc (World Conservation Monitoring Centre, 1993); VU [assessed as *P. s. aldabrensis*] (World Conservation Monitoring Centre, 1993). 1990 - VU [assessed as *P. s. aldabrensis*] (IUCN, 1990). 1988 - VU [assessed as *P. s. aldabrensis*] (IUCN Conservation Monitoring Centre, 1988).

CITES - Appendix II.

MAJOR THREATS:
Overall, there currently appear to be no major threats to the species. There is some limited hunting for food on a few islands in the species range (e.g. Mahé and Praslin in the Seychelles) however, this does not appear to be significantly impacting the population at present. Additional localised threats include mortality through collision with power lines, and possible persecution as a pest of fruit crops (Mickleburgh *et al.*, 2008di; IUCN, 2009). However, Sagot and Chaverri (2015: 1670) mention the following threats: Roost loss or disturbance, habitat degradation or loss, introduced predators.

Due to the numerous amount of bats around Mutsamudu (Anjouan, Coromo islands), Middleton and Hume (2010: 132) report that this bat is not a part of the people's diet.

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008di) [in IUCN (2009)] report that a large population (2,000 to 3,000 bats) of this species is present in the Morne Seychellois National Park on Mahé, Seychelles (Nicoll and Racey, 1981). There is a general need to continue monitoring activities for this species in order to detect any possible declines and to determine if there are any movements between populations. Studies are underway to better determine the taxonomic status of the population of bats from Mafia Island (*Pteropus seychellensis comorensis*) largely to understand if this population should be recognised at the species level distinct from *P. seychellensis*. The population of Mafia Island may be threatened, and an assessment of the situation on this island and of the possibilities for the species' protection there is highly desirable (Mickleburgh *et al.*, 2002a).

Based on their study of mitochondrial and microsatellite markers, Ibouroi *et al.* (2018a: 1425) conclude that the populations of *P. seychellensis* occurring on the Comoro Islands can be treated as one management unit for conservation purposes (contrary to what they found for *P. livingstonii*).

GENERAL DISTRIBUTION:
Pteropus seychellensis has been recorded from the Seychelles, the Union of the Comoro and Tanzania. In the Seychelles it is present on a number of islands including Mahé, Praslin, La Digue, and Silhouette. Gerlach (2004) mentions that it has recently been recorded roosting on several islands where its presence was previously unconfirmed. In the Comoros it is known from the islands of Anjouan, Grand Comore and Moheli. In Tanzania, it is restricted to Mafia island, possibly Zanzibar, although Simmons (2005) considers this record extremely dubious.

Ibouroi *et al.* (2018b: 2395) indicated that its distribution is negatively correlated to natural forest across the entire area on the Comoro Islands, but that its foraging areas were positively correlated with natural forests and high-elevation areas.

Cheke (2011: 59) argues this species (as *P. comorensis*) was introduced on Mafia island by Comorians, rather than having arrived on the island by itself, which he supports by indicating that the bat was not noticed (perhaps not present) until the 1930s, and that no bones were found in middens (p. 65).

Known across an elevational range on Grand Comore from sea level to 1,000 m, on Anjouan from sea level to 760 m, on Mohéli from sealevel to 500 m, and Mayotte from sea level to 250 m (Cheke and Dahl, 1981; Mickleburgh *et al.*, 1992; Trewhella *et al.*, 2001; Goodman *et al.*, 2010c: 123).

Native: Comoros (Goodman *et al.*, 2010c: 123 as *P. s. comorensis*); Mayotte; Seychelles; Tanzania.

BIOGEOGRAPHY:
See O'Brien *et al.* (2009) and Goodman *et al.* (2010c: 123) for further details.

MOLECULAR BIOLOGY:
DNA - See O'Brien *et al.* (2009).
Karyotype - Unknown.
Protein / allozyme - Unknown.

HABITAT:
Goodman *et al.* (2010c: 123) indicate that *P. s. comorensis* is adapted to the anthropgenic transformation of the former natural habitats of the different islands, including the widespread plantations of fruit trees. They occur in a variety of habitats from urban settings, agricultural zones, to remnant forest patches.

HABITS:
See Cheke and Dahl (1981); Trewhella *et al.* (1995); Trewhella *et al.* (2001) and Louette (2004).

Gerlach (2003: 79) reports on *P. seychellensis* specimens flying low over the sea surface, and dipping their belly fur in the water. He postulates that this is possibly a strategy to remove parasites. The risk of falling in sea was minimised as the bats only dipped in exceptionally calm weather.

Based on wing morphology, Lindhe Norberg *et al.* (2000) classified this species (as *P. seychellensis comorensis*) as "non-soaring".

ROOST:
Racey and Nicoll (1984) [in O'Brien (2011: 262)] indicate that *P. seychellensis* roosts in tall trees (*Casuarina* or *Albizzia*).

Ibouroi *et al.* (2018b: Suppl.) reported the following roost trees being used by *P.seychellensis comorensis* on the Comoro Islands: Anacardiaceae: *Mangifera indica, Brachylaena ramiflora*; Bombacaceae: *Adansonia digitata, Ceiba pentandra*; Caesalpiniaceae: *Tamarindus indica*; Combretaceae: *Terminalia catappa*; Fabaceae: *Pterocarpus indicus*; Lauraceae: *Ocotea comorensis*; Leeaceae: *Leea guineensis*; Loganiaceae: *Nuxia pseudodenta*; Mimosaceae: *Albizia glaberrima, Albizia lebbeck*; Moraceae: *Artocarpus heterophyllus, Ficus antandronarum, Ficus lutea, Ficus pirifolia*; Myrtaceae: *Eucalyptus* sp., *Eugenia jambolana*; Sapindaceae: *Litchi chinensis*.

DIET:
Pteropus seychellensis eats 27 species of plant, including 17 fruits (Racey and Nicoll, 1984).

Trewhella *et al.* (2001: 141) reported the following food items (with known items in bold and suspected in plain text): Anacardiaceae: *Anacardium occidentale* L. (cashew), ***Mangifera indica*** L. (mango); Annonaceae: *Annona muricata* L. (soursop), *Annona reticulata* L. (custard apple), *Annona squamosa* L. (sugar apple or sweetops); Aphloiaceae: *Aphloia theaeformis* [= *Aphloia theiformis* (Vahl) Benn.]; Arecaceae: *Cocos nucifera* L. (coconut tree); Cannabaceae: *Trema orientalis* (L.) Blume (charcoal-tree, Indian charcoal-tree,pigeon wood or Oriental trema); Caricaceae: ***Carica papaya*** L. (papaya); Combretaceae: ***Terminalia catappa*** L. (Indian-almond); Fabaceae: ***Erythrina*** sp. (coral trees); Gentianaceae: *Anthocleista grandiflora* L. (forest fever tree); Lamiaceae: ***Vitex*** sp. (chaste tree); Loganiaceae: *Strychnos spinosa* Lam. (Natal orange, spiny orange or green monkey orange); Malvaceae: ***Adansonia digitata*** L. (baobab), ***Adansonia madagascariensis*** Baill. (baobab), ***Ceiba pentandra*** (L.) Gaertn. (kapok tree); Monimiaceae: *Tambourissa anjouanensis*, *Tambourissa leptophylla* (Tul.) A. DC., *Tambourissa mohelienses* Lorence, *Tambourissa paradoxa* Perkins; Moraceae: *Artocarpus altilis* (Parkinson) Fosberg (breadfruit), *Artocarpus heterophyllus* Lam. (jackfruit or jack tree), ***Ficus*** sp.; Musaceae: *Musa sapientum* L. (banana or plantane); Myrtaceae: *Eugenia jambos* L. [= *Syzygium jambos* L. (Alston)] (rose apple), *Psidium cattleyanum* Sabine (Cattley guava, strawberry guava or cherry guava), *Psidium guajava* L. (common guava), ***Syzygium cuminii*** (L.) Skeels (Java plum); Oxalidaceae: *Averrhoa bilimbi* L. (bilimbi, cucumber tree or tree sorrel); Rubiaceae: *Psychotria* aff. *aledjoensis* De Wild. [= *Psychotria mannii* Hiern, 1877]; Rutaceae: *Citrus* x *aurantifolia* (Christm.) Swingle (key lime), *Citrus* x *aurantium* L. (bitter orange, seville orange, sour orange, bigarade orange, or marmalade orange), *Citrus reticulata* Blanco, 1837 (mandarine orange), *Citrus* x *sinensis* (L.) Osbeck (orange).

POPULATION:
Structure - O'Brien *et al.* (2009), based on cytochrome *b* and 12S results, indicated that there appeared to be no notable genetic differentiation in populations of *P. s. comorensis* from Grande Comore and Mayotte, suggesting genetic exchange.

Density - This species is widespread throughout the Seychelles, with some colonies consisting of up to 300 individuals. It is very common in villages and towns (Goodman, 2007). The population was estimated to be around 10,000 individuals on the Seychelles in 1979, and was believed to be close to this level in 2004 although adequate censuses have not been completed for all islands (Gerlach, 2004).

On the Comoro Islands, Ibouroi *et al.* (2018b: 2406) observed 11,898 bats at 59 different sites,

with colony sizes varying between 11 and 742 individuals (average: 184).

Trend - 2008 - Stable (Mickleburgh *et al.*, 2008di; IUCN, 2009).

ACTIVITY AND BEHAVIOUR:
Riccucci (2016: 93) reported on play behaviour on Praslin Island, which included play-fighting, tussle, and play-chasing. He indicated that this behaviour was not limited to young bats, but saw this also among adults.

Trewhella *et al.* (2001: 135) indicate that the sympatric *P. livingstonii* is more diurnally active (leaving their roosts at 11 a.m.) than *P. seychellensis comorensis* (leaving its roosts not before 3 p.m.), and is the dominant species during their encounters.

REPRODUCTION AND ONTOGENY:
See Trewhella *et al.* (1995) and Reinhardt and Jacobs (2006).

MATING:
McCracken and Wilkinson (2000: 339) indicate that Cheke and Dahl (1981) reported that *P. seychellensis* forms harem groups.

PARASITES:
BACTERIA
Dietrich *et al.* (2018a: 3) reported the presence of bacteria of the genus *Leptospira*.

VIRUSES:
Astroviridae
Hoarau *et al.* (2018: 1) tested 21 bats from the Comoros, but none of them tested positive for this group of viruses.

Rhabdoviridae
Four of 40 tested bats from Mayé showed a seroreaction against *Lagos bat lyssavirus* (LBV) (Mélade *et al.*, 2016a: 6). Six against *Duvenhage lyssavirus* (DUVV), and one out of 17 tested, against *European bat lyssavirus 1* (EBL-1). For the 19 specimens tested from Mayotte, two were positive for LBV and one for DUVV.

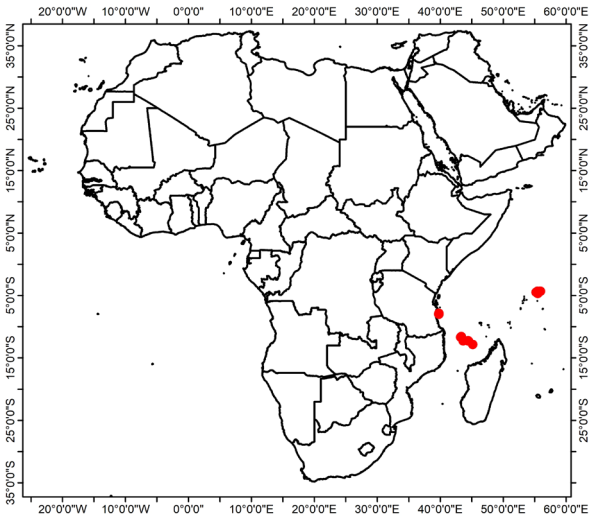

Figure 12. Distribution of *Pteropus seychellensis*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Comoros, Mayotte, Seychelles, Tanzania.

Pteropus subniger (Kerr, 1792)

*1792. *Vespertilio vampyrus subniger* Kerr, in: Linnaeus, Animal Kingdom, 1 (1): xvii, 91. Publication date: February 1792. Type locality: Réunion: "Réunion island". - Comments: Andersen (1912b: viii) mentions that the type was originally in the Cabinet Réaumur, but is probably no longer in existence.

1802. *Spectrum rubidum* Daudin, in: Buffon, Histoire Naturelle des Quadrupèdes, Didot ed, 14: 188. Type locality: Mauritius: Reunion. - Comments: Type locality fixed by Andersen (1912b: 169) since the name was proposed for Buffon's Rougette, which was based on a specimen sent by de la Nux from Reunion. The year of publication might not be correct (see Allen, 1939a: 61).

1803. *Pteropus fuscus:* Desmarest, Nouveau Dictionnaire d'Histoire Naturelle, 19: 544. Type locality: Réunion: "Réunion Island". - Comments: Not of E. Geoffroy Saint-Hillaire, 1803, see Allen (1939a: 61).

1803. *Pteropus ruber* E. Geoffroy Saint-Hilaire, Catalogue des Mammifères du Muséum national d'Histoire naturelle, Paris, 48. Type locality: Mauritius: Réunion [Goto Description]. - Comments: Originally "Madagascar", but corrected to Réunion by Andersen (1912b: 169). Andersen also indicates that the type specimen is not in the Paris Museum.

1810. *Pteropus rubricollis* E. Geoffroy Saint-Hilaire, Ann. Mus. Hist. nat. Paris, 15: 93. Type locality: Réunion: "Réunion Island". - Comments: One specimen sent by Mr. de la Nux: see Geoffroy Saint-Hilaire (1810a: 94). Andersen (1912b: 169) indicates that this is the

same specimen as used by Brisson (1756) for his description of "*Pteropus collo rubro*" and by Buffon (1763) for his "*Rougette*".

1814. *Pteropus torquatus* G. Fischer, Zoognosia, 3: 553. - Comments: This is a renaming and redescription of Brisson's "*Pt. collo rubro*" (see Andersen, 1912b: 169).

1815. *Pteropus collaris* Illiger, Abh. K. Preuss. Akad. Wiss. Berlin, 78, 84. Type locality: Mauritius: Réunion: Type locality originally "E. African Islands", but restricted to Réunion by Andersen (1912b: 169). - Comments: "According to Andersen (1912b: 169), it looks like the publication was part of series dated 1804-1811, but actually appeared in 1815 in the section on E. African Islands." Simmons (*pers. comm.*).

1837. *Pteropus vulgaris* Temminck, Monogr. Mamm, 2: 74, pl. 38.

? *Pteropus subniger:* (Name Combination, Current Combination)

TAXONOMY:
See Bergmans (1991) and Simmons (2005: 344).

Almeida *et al.* (2014: 83) indicate that *P. subniger* could not be tested, but tentatively placed in an "*incertae sedis*" group.

COMMON NAMES:
Czech: kaloň maskarénský, upír obecný, upír červenokrký, kaloň obojkový. English: Dark Flying Fox, Lesser Mascarene Flying Fox, Lesser Mascarene Flying-fox. French: Petit Renard volant de Mascareignes, Roussette foncée, Rougette, Petit renard volant de Mascarene, Roussette à collet rouge. German: Kleiner Maskarenen-Flugfuchs. Spanish (Castillian): Zorro volador oscuro de Mauricio.

CONSERVATION STATUS:
Global - The last authentic record of this species on Mauritius was in 1859, but it is believed to have died out between 1864 and 1873. On Réunion, no new records appeared after 1862 and it seems probable that it became extinct in the 1860s (Mickleburgh *et al.*, 2008de; IUCN, 2009).

Assessment History -
2008 - EX ver 3.1 (2001) (Mickleburgh *et al.*, 2008de; IUCN, 2009). 2004 - EX ver 3.1 (2001) (Mickleburgh *et al.*, 2004cu; IUCN, 2004). 1996 - Ex (Baillie and Groombridge, 1996). 1994 - Ex (Groombridge, 1994). 1993 - Ex (World Conservation Monitoring Centre, 1993). 1990 - Ex (IUCN. 1990). 1988 - Ex (IUCN Conservation Monitoring Centre, 1988). 1981 - probably extinct (Cheke and Dahl, 1981).

CITES - Appendix II.

MAJOR THREATS:
Both deforestation and local hunting are thought to have contributed to the extinction of this species. It was thought to have lived in hollow trees (Mickleburgh *et al.*, 2008de; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008de) [in IUCN (2009)] report that this is no longer applicable.

GENERAL DISTRIBUTION:
Pteropus subniger was previously known from the Mascarenes Islands (Mauritius and Réunion). It was restricted to elevations of between 1,200 and 1,600 m asl.

O'Brien (2011: 286) reports it from the Tanzanian island of Mafia.

Regionally extinct: Mauritius; Réunion.

POPULATION:
Structure and Density - This species is now extinct. It is believed to have become extinct on Mauritius between 1864 and 1873. It is likely to have disappeared from Réunion in the 1860s. It may have lasted a little longer but is now certain to be extinct. In the 1730s it was common enough to consider for the bat oil trade (Mickleburgh *et al.*, 2008de; IUCN, 2009).

UTILISATION:
Caceres (2010: 9) indicates that in the 1730s its population (on La Réunion) was large enough to trade its fat.

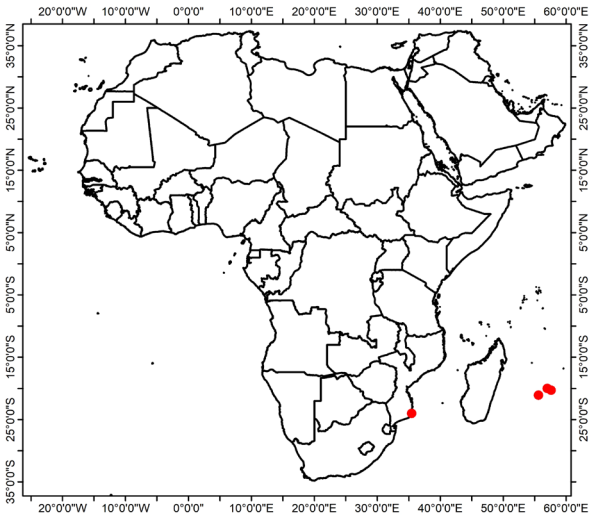

Figure 13. Distribution of *Pteropus subniger*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Mauritius, Mozambique, Réunion.

Pteropus voeltzkowi Matschie, 1909

*1909. *Pteropus (Spectrum) voeltzkowi* Matschie, Sber. Ges. naturf. Freunde Berlin, 486. Publication date: October 1909. Type locality: Tanzania: Pemba Island: Fufuni [ca. 07 31 S 38 25 E]. Holotype: ZMB 88677: ad ♂, skin and skull. Collected by: Prof. Dr. Alfred Voeltzkow; collection date: 13 March 1903. Paratype: ZMB ad ♀. See Turni and Kock (2008). Paratype: ZMB 88678: ad ♀. Collected by: Prof. Dr. Alfred Voeltzkow; collection date: 13 March 1903. See Turni and Kock (2008). Paratype: ZMB 88679: ad ♀. Collected by: Prof. Dr. Alfred Voeltzkow; collection date: 12 March 1903. See Turni and Kock (2008). Paratype: ZMB 88680: ad ♀. Collected by: Prof. Dr. Alfred Voeltzkow; collection date: 13 March 1903. See Turni and Kock (2008). Paratype: ZMB 88681: ad ♀. Collected by: Prof. Dr. Alfred Voeltzkow; collection date: 13 March 1903. See Turni and Kock (2008).
2010. *P[teropus] voletzkowi:* Goodman, Weyeneth, Ibrahim, Saïd and Ruedi, Acta Chiropt., 12 (1): 133. (Lapsus)
? *Pteropus voeltzkowi:* (Name Combination, Current Combination)

TAXONOMY:
See Bergmans (1991) and Simmons (2005: 346).

P. voeltzkowi together with *P. livingstonii* form the most distinct and ancient lineage of the western Indian Ocean *Pteropus* spp. (O'Brien *et al.*, 2009). The phylogenetic analyses performed by Chan *et al.* (2011: 7) suggest that both are sister species. This is supported by Almeida *et al.* (2014: 85), who place this species in the "*livingstonii*" group.

COMMON NAMES:
Czech: kaloň pembánský, kaloň pembský. Dutch: Pemba vliegende hond. English: Pemba Flying-fox, Pemba Flying Fox. French: Renard volant de Pemba. German: Pemba-Flugfuchs. Spanish (Castillian): Zorro volador de Voeltzkow.

CONSERVATION STATUS:
Global - Listed as Vulnerable (VU D2 ver 3.1 (2001)) because it is known from only a single location (Pemba Island), where ongoing active conservation activities have significantly reduced the plausibility of future declines of this species (Mickleburgh *et al.*, 2008df; IUCN, 2009).

Assessment History -
2008 - VU D2 ver 3.1 (2001) (Mickleburgh *et al.*, 2008df; IUCN, 2009). 2004 - VU D2 ver 3.1 (2001) (Mickleburgh *et al.*, 2004cw; IUCN, 2004). 2002 - CR C2a (Mickleburgh *et al.*, 2002a: 22). 1996 - CR (Baillie and Groombridge, 1996). 1994 - EN (Groombridge, 1994). 1993 - EN (World Conservation Monitoring Centre, 1993). 1990 - EN (IUCN, 1990). 1988 - VU (IUCN Conservation Monitoring Centre, 1988).

CITES - Appendix II.

MAJOR THREATS:
Much of the natural forest habitat of this bat has been cleared or severely fragmented. The species has been hunted for food with the use of shotguns replacing traditional methods, resulting in an unsustainable use (Entwistle and Corp, 1997a). As of 2005, hunting had been reduced but not stopped on Pemba (Trewhella *et al.*, 2005). An additional threat is posed by the collision of bats with overhead electric cables (Mickleburgh *et al.*, 2008df; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008df) [in IUCN (2009)] report that ongoing awareness raising on the importance and uniqueness of the endemic fruit bat, and the need for sustainable hunting, has been undertaken through environmental education programmes (Trewhella *et al.*, 2005; Juma, 2007). Income for the local community is being generated through bat related ecotourism activities (Juma, 2007). It has been reported from the recently gazetted Ngezi-Vumawimbi Nature Forest Reserve and Msitu Kuu Forest (Pakenham, 1984; Juma, 2007). Illegal logging and the invasive umbrella tree (*Maesopsis eminii*), that degrades the habitat of this bat, are being controlled within the Nature Forest Reserve (Juma, 2007).

A captive breeding program was set up in 1994, starting with 18 specimens, of which 12 were housed in the Phoenix Zoo (USA), but only 4 ♂♂ and 1 ♀ survived, and Carroll and Feistner (1996: 334) were not yet able to provide information about the program's success.

GENERAL DISTRIBUTION:
Pteropus voeltzkowi is endemic to the island of Pemba in Tanzania, where it occurs at elevations from sea level to 45 m asl.

Native: Tanzania.

MOLECULAR BIOLOGY:
DNA - See O'Brien *et al.* (2009).
Karyotype - Unknown.
Protein / allozyme - Unknown.

ROOST:
Entwistle and Corp (1997a: 137) reported roosts to be found in primary forest (n = 5), secondary forest (overgrown clove plantations) (n = 6), traditional graveyards (n = 4), mangroves (n = 1), and isolated trees (n = 3).
The tree species included: *Uapaca guineensis, Mangifera indica, Ficus natalensis, Ficus lutea, Syzygium jambolanum, Terminalia catappa, Adansonia digitata, Antiaris toxicaria, Erythrophleum suaveolens, Afzelia quanzensis, Parinari curatellifolia*, and *Blighia unijugata*.

DIET:
Seltzer *et al.* (2013: table S2) provide an overview of the plant species found beneath bat feeding roosts. For *P. voeltzkowi* this includes *Ficus sur* Forssk. (Broom cluster fig - Moraceae).

Entwistle and Corp (1997b: 357) analysed faecal pellets, ejecta and dropped fruits, as well as information obtained from villagers and students, and provided the following overview of the bat's diet: *Mangifera indica* L. (mango - Anacardiaceae [fruit]), *Artocarpus altilis* (Parkinson) Fosberg (breadfruit - Moraceae [fruit]), *Ficus* spp. (figs - Moraceae [fruit]), *Carica papaya* L. (papaya - Caricaceae [fruit]), *Ceiba pentandra* (L.) Gaertn. (kapok - Malvaceae [flowers/pollen]), *Anacardium occidentale* L. (cashew apple - Anacardiaceae [fruit]), *Musa spp.* (banana or plantain - Musaceae [fruit and flowers/pollen]), *Psidium guajava* L. (guava - Myrtaceae [fruit]), *Terminalia catappa* L. ('kungu' or Indian-almond - Combretaceae [fruit]), *Parinari curatellaefolia* Planch. ex Benth. (mupundu or mobola plum - Chrysobalanaceae), *Cocus nucifera* L. (coconut - Arecaceae [leaves]), *Eugenia aromatica* (L.) Baill. [= *Syzygium aromaticum* (L.) Merrill & Perry (clove - Myrtaceae [fruit]), *Calophyllum inophyllum* L. (Alexandrian laurel - Callophyllaceae), *Syzygium jambolanum* Lam. [= *Syzygium cumini*] (L.) Skeels. (jambolana or Java plum - Myrtaceae [flowers/pollen]). They also indicated (p. 359) that cultivated species are prominently present in the diet during the months of June and July.

POPULATION:
Structure and Density - In the early 1990s the population of this species appears to have been reduced to a few hundred animals at most (Mickleburgh *et al.*, 1992). Entwistle and Corp (1997a) reported that in 1997, 94% of the population was restricted to 10 roosts (of 41 in total) with a total estimate of 4,600 to 5,500 individuals. Entwistle (2001: 356) reported that more recent local participation in survey work had helped to give a more accurate population estimate of ca. 6,900 bats (Trewhella *et al.*, 2005). The population of bats has continued to increase and by the end of 2006 there were ca. 19,000 animals (Juma, 2007).
Trend - 2008 - Increasing (Mickleburgh *et al.*, 2008df; IUCN, 2009).

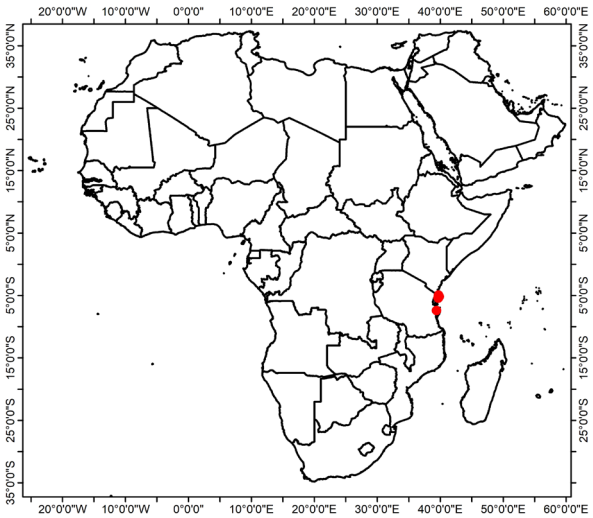

Figure 14. Distribution of *Pteropus voeltzkowi*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Tanzania.

Subfamily Rousettinae Andersen, 1912

1912. *Epomophorinae* K. Andersen, Cat. Chiroptera Brit. Mus. Publication date: 23 March 1912. - Comments: Considered as a valid subfamily by Bergmans (1997: 69) who includes the tribes Epomophorini Gray, 1866 (*Epomophorus, Micropteropus, Hypsignathus, Epomops, Nanonycteris*), Myonycterini Lawrence and Novick, 1963 (*Myonycteris, Lissonycteris, Megaloglossus*), Scotonycterini Bergmans, 1997 [new tribe] (*Scotonycteris, Casinycteris*), Plerotini Bergmans, 1997 [new tribe] (*Plerotes*)? However, Almeida *et al.* (2016: 83) included the Epomophorine genera in the Rousettinae.

1912. *Rousettinae* K. Andersen, Cat. Chiroptera Brit. Mus. Publication date: 23 March 1912. - Comments: Bergmans (1997: 69) recognizes the Rousettinae as a separate subfamily in which he included the tribes Rousettini Andersen, 1912 (*Rousettus, Eonycteris, Eidolon*)

and Dobsoniini Andersen, 1912 (*Dobsonia, Aproteles*). Almeida *et al.* (2016: 83), however, provided an entirely different arrangement.

1970. *Rousettina* Koopman and J.K. Jones Jr., Classification of Bats. - Comments: Not included in Simmons (2005) since it was not proposed as family name, but as a subdivision within the Pteropodidiae (Simmons, pers. comm.).

TAXONOMY:
The subfamily was already recognized by Bergmans (1997: 69) and confirmed by the phylogenetic study by Almeida *et al.* (2016: 83), although their content differs. Bergmans (1997: 69) considered the Epomophorinae to be a valid separate subfamily, whereas Almeida *et al.* (2016: 83) included them in the Rousettinae.

Currently recognized tribes and genera of Rousettinae: Rousettini (***Rousettus*** Gray, 1821), Eonycterini (*Eonycteris* Dobson, 1873), Scotonycterini (***Casinycteris*** Thomas, 1910, ***Scotonycteris*** Matschie, 1894), Epomophorini (***Epomophorus*** Bennett, 1836, ***Epomops*** Gray, 1870, ***Hypsignathus*** H. Allen, 1861, ***Micropteropus*** Matschie, 1899, ***Nanonycteris*** Matschie, 1899), Stenonycterini (***Stenonycteris*** Gray, 1870), Myonycterini (***Lissonycteris*** K. Andersen, 1912, ***Megaloglossus*** Pagenstecher, 1885, ***Myonycteris*** Matschie, 1899), Plerotini (***Plerotes*** K. Andersen, 1910).

Genus ***Casinycteris*** Thomas, 1910

*1910. *Casinycteris* Thomas, Ann. Mag. nat. Hist., ser. 8, 6 (31): 111. Publication date: 1 July 1910 [Goto Description]. - Comments: Type species: *Casinycteris argynnis* Thomas, 1910. (Current Combination)

TAXONOMY:
Revised by Bergmans (1991).

Included in the Scotonycterini tribe by Bergmans (1997: 69) and Almeida *et al.* (2016: 83), which was considered part of the Epomophorinae by the former and of the Rousettinae by the latter.

Known species of *Casinycteris*: ***argynnis*** Thomas, 1910; ***campomaanensis*** Hassanin 2014; ***ophiodon*** (Pohle 1943).

COMMON NAMES:
Czech: krátkonebí kaloni. English: Short-palate Fruit-bats, Short-palated Fruit-bats. French: Casinyctère. German: Kurzgaumen-Flughunde.

Casinycteris argynnis Thomas, 1910

*1910. *Casinycteris argynnis* Thomas, Ann. Mag. nat. Hist., ser. 8, 6 (31): 111. Publication date: 1 July 1910. Type locality: Cameroon: Ja River: Bitye [03 13 N 12 22 E, 2 000 ft] [Goto Description]. Holotype: BMNH 1911.5.5.1: ad ♀, skin and skull. Collected by: George Latimer Bates Esq. Collection date: 19 November 1909; original number: 502. (Current Combination)

1943. *[Scotonycteris] argynnis:* Pohle, Sber. Ges. naturf. Freunde Berlin, 86 (for 1942). (Name Combination)

TAXONOMY:
See Bergmans (1991) and Simmons (2005: 315 - 316).

COMMON NAMES:
Czech: kaloň krátkonebý. English: Golden Short-palate Fruit-bat, Yellow-winged Short-palate Fruit-bat, Thomas's Short-palate Fruit-bat, Short-palated Fruit Bat, Golden Short-palated Fruit Bat. French: Casinyctère dorée, Roussette à petit palais, Chauve-souris frugivore à palais court, Casinyctère. German: Goldener Kurzgaumen-Flughund.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008c; IUCN, 2009).

Assessment History -

2008 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2008c; IUCN, 2009). 2004 -NT ver 3.1 (2001) (Mickleburgh *et al.*, 2004k; IUCN, 2004). 1996 - LR/nt (Baillie and Groombridge, 1996).

MAJOR THREATS:
Mickleburgh *et al.* (1992) indicate that there is little information on the threats to this species, but that it may be threatened by deforestation. It is possible that this species eats cultivated fruits, and consequently might be persecuted as a crop pest (Mickleburgh *et al.*, 2008c; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008c) [in IUCN (2009)] report that there appear to be no direct conservation measures in place, and it is not known if the species is present within any protected areas. Mickleburgh *et al.* (1992) recommend that surveys are needed to assess the conservation status of this species, to determine if it is present in protected areas, and to learn more about the food plants and general natural history of this species.

GENERAL DISTRIBUTION:
This lowland species is distributed in Central Africa. It has been recorded from southern Cameroon, the Central African Republic and the Democratic Republic of the Congo.

Native: Cameroon; Central African Republic; Congo (The Democratic Republic of the) (Bergmans, 1991; Lunde *et al.*, 2001: 537; Monadjem *et al.*, 2010d: 550); Equatorial Guinea; Gabon (Drexler *et al.*, 2012a: Suppl. Table S1).
Presence uncertain: Congo.

DETAILED MORPHOLOGY:
Chawana *et al.* (2013: 160) report an average brain mass of 0.83 g (n = 2).

FUNCTIONAL MORPHOLOGY:
The eye of this bat contains about 130,000 retinal ganglion cells (Coimbra *et al.*, 2016: 191). The minimum angle of resolution was about 0.227° (ca. 8 mm at 1 m distance).

HABITAT:
This species is generally associated with lowland tropical moist forest, swamp forest, a mosaic of these two forest habitats, and a mosaic of swamp forest and secondary grassland (Bergmans, 1991).

ROOST:
It is a solitary rooster, with one specimen collected in the dense foliage of a bush Nowak (1999).

DIET:
Gembu Tungaluna (2012: 91 - 93) followed the consumption of fruits by this species year-round in the DRC and reported the following: First heavy rain season (September - November): *Uapaca guineensis* Müll.Arg., 1864 (Sugar plum, red cedar, false mahogany, rikio) (31%), *Ficus leprieuri* Miq., 1867 (19%), *Ficus wildemanniana* Warb. (14%), *Pseudospondia microcarpa* Engl. (10%), *Musanga cecropioides* R. Br. & Tedlie (African corkwood tree, umbrella tree) (8%), *Myrianthus arboreus* P. Beauvois, 1805 (giant yellow mulberry, bush pineapple, corkwood) (8%), *Spondias cytherea* Sonnerat, 1782 (Ambarella, otaheite apple, great hog plum) (2%), *Dacryoides edulis* H.J. Lam (safou, African pear, bush pear, Nsafu, bush butter tree, butterfruit) (2%), *Carica papaya* L. (papaya) (2%).
First mild rain season (December - February): *Ficus leprieuri* (42%), *Musanga cecropioides* (27%), *Myrianthus arboreus* (11%), *Spondias cytherea* (5%), *Uapaca guineensis* (5%), *Ficus vallis-choudae* Delile (5%), *Ficus wildemanniana* (5%).
Second heavy rain season (March - May): *Ficus wildemanniana* (62%), *Ficus leprieuri* (25%), *Pseudospondias microcarpa* (A. Rich.) Engl. (13%).
"Dry" season (June - August): *Ficus leprieuri* (100%).

PREDATORS:
Blanding's Tree Snake (*Toxicodryas blandingii*) was found in a mist net eating a traped *C. argynnis* in the Democratic Republic of the Congo (Nagy *et al.*, 2011).

POPULATION:
Structure and Density - It is locally not uncommon, with many specimens (~20) caught in mist nets from a locality in the eastern Democratic Republic of the Congo (Mickleburgh *et al.*, 2008c; IUCN, 2009).
Trend - 2008 - Unknown (Mickleburgh *et al.*, 2008c; IUCN, 2009). 2004 - Unknown (Mickleburgh *et al.*, 2004k; IUCN, 2004).

REPRODUCTION AND ONTOGENY:
The female gives birth to a single young (Hayssen *et al.*, 1993).

VIRUSES:
Coronaviridae - Coronaviruses
SARS-CoV - Müller *et al.* (2007b) tested between 1986 and 1999, three individuals for antibody to SARS-CoV in sera from Bandundu Province, DRC, none were found to be positive (0/3).

Filoviridae - Filo viruses

Marburgvirus - Towner *et al.* (2007) tested 2 individuals from Gabon using real-time RT-PCR and conventional and nested RT-PCR; neither were found to be positive for Marburg virus specific RNA.

Drexler *et al.* (2012a: Suppl. Table S1) indicated that none of the 21 specimens they examined from Gabon tested positive for *Respirovirus, Henipavirus, Morbillivirus, Rubulavirus* or *Pneumovirus*.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Cameroon, Central African Republic, Congo (Democratic Republic of the).

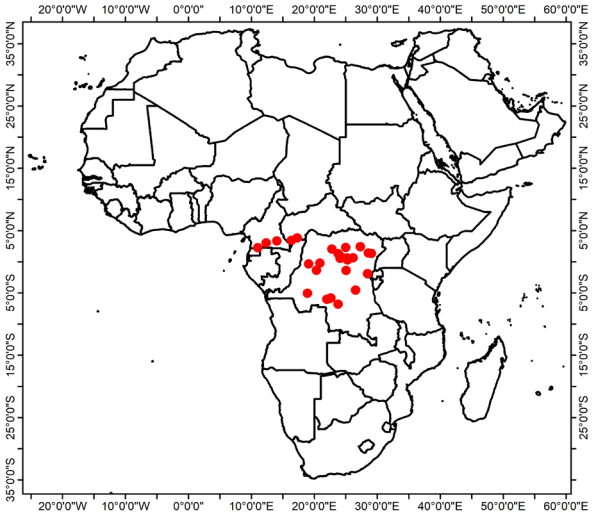

Figure 15. Distribution of *Casinycteris argynnis*

Casinycteris campomaanensis Hassanin, 2014

*2014. *Casinycteris campomaanensis* Hassanin, C. R. Biologies, 337 (2): 134, 137, figs 1B, 3, 4. Publication date: 5 February 2014. Type locality: Cameroon: South Region: Campo-Ma'an area: Nkoélon-Mvini [02 23.831 N 10 02.691 E, 117 m] [Goto Description]. Holotype: MNHN ZM-2011-637: ad ♀, skull and alcoholic. Collected by: Alexandre Hassanin; collection date: 21 November 2007; original number: C07-41. Presented/Donated by: ?: Collector Unknown. - Etymology: The specific epithet refers to the Campo-Ma'an area, where the holotype was collected (see Hassanin, 2014: 137). (Current Combination)

COMMON NAMES:
English: Campo-Ma'an fruit bat. French: Casinyctère de Campo-Ma'an. German: Campomaan-Flughund.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Cameroon.

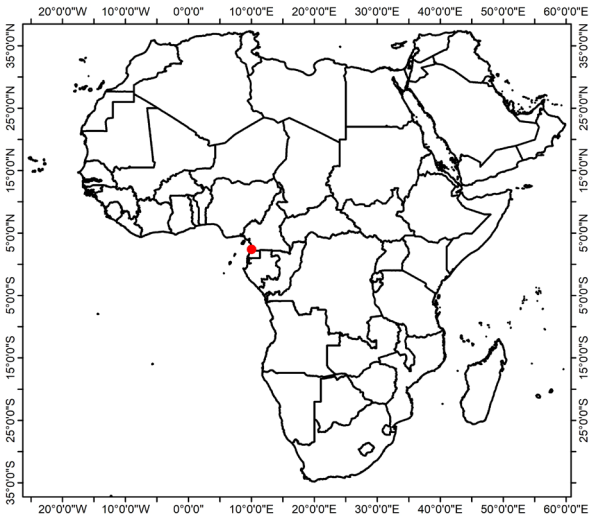

Figure 16. Distribution of *Casinycteris campomaanensis*

Casinycteris ophiodon (Pohle, 1943)

*1943. *Scotonycteris ophiodon* Pohle, Sber. Ges. naturf. Freunde Berlin, 78, figs 1 -2 (for 1942). Type locality: Cameroon: Kribi, Bez: Bipindi [03 06 N 10 30 E] [Goto Description]. Holotype: ZMB 50001: sad ♀, skull only. Collected by: Georg August Zenker; collection date: May 1899. See Turni and Kock (2008: 21). Pohle (1943: 78) mentioned that the skull was removed from the alcoholic specimen. - Etymology: From "*ophiodon*" meaning snake-toothed.

1946. *Scotonycteris ophiodon cansdalei* Hayman, Ann. Mag. nat. Hist., ser. 11, 12 (95): 766 (for 1945). Publication date: 19 September 1946. Type locality: Ghana: Central province: Oda district: Oda [05 55 N 00 56 W] [Goto Description]. Holotype: BMNH 1946.229: ad ♀, skin and skull. Collected by: George Soper Cansdale; collection date: 24 December 1945;

original number: 420. - Etymology: In honour of Mr. George Soper Cansdale, the collector of the type specimen (see Hayman, 1946: 770).

2014. *Casinycteris ophiodon:* Hassanin, C. R. Biologies, 337 (2): 141. Publication date: 5 February 2014. (Current Combination)

TAXONOMY:
See Simmons (2005: 349).

COMMON NAMES:
Czech: kaloň hadozubý. English: Snake-toothed Harlequin Fruit-bat, Pohle's Harlequin Fruit-bat, Snake-toothed Tear-drop Fruit-bat, Pohle's Tear-drop Fruit-bat, Pohle's Fruit Bat. French: Scotonyctère à dents de serpent, Roussette de Pohle. German: Schlangenzähniger Harlekin-Flughund, Pohles Harlekin-Flughund, Poehle's Traenenflughund.

CONSERVATION STATUS:
Global - Listed as Vulnerable (VU A2c ver 3.1 (2001)) because it is suspected that a population decline, estimated to be more than 30% would be met over the next 10 years or three generations, inferred from the susceptibility of the specialist species to habitat degradation (Mickleburgh *et al.*, 2008db; IUCN, 2009).

Assessment History -
2008 - VU A2c ver 3.1 (2001) (Mickleburgh *et al.*, 2008db; IUCN, 2009). 2004 - EN A4c ver 3.1 (2001) (Mickleburgh *et al.*, 2004co; IUCN, 2004). 1996 - LR/nt (Baillie and Groombridge, 1996).

MAJOR THREATS:
This species is highly impacted by deforestation, and through forest fragmentation and degradation. Threats presumably include logging and mining activities, and the conversion of land to agricultural use (Mickleburgh *et al.*, 2008db; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008db) [in IUCN (2009)] report that this species has been recorded from the Mount Nimba World Heritage Site (Guinea, Liberia and Côte d'Ivoire) and from Tai National Park (Côte d'Ivoire). There is a need to maintain areas of suitable primary forest throughout much of West Africa, especially in areas where this seemingly rare bat has been recorded. Further field surveys are needed to locate any additional populations of this species.

GENERAL DISTRIBUTION:
Scotonycteris ophiodon is known only from a relatively few scattered records in West Africa and Central Africa. It has been recorded from Liberia, Côte d'Ivoire, Ghana, Cameroon and Congo. It seems to be known from 16 localities only, and has not been recorded from a number of areas where intensive netting has taken place. The species has been recorded at elevations from 120 m (Oda, Ghana) to 1,200 m asl (Mount Nimba).

Native: Cameroon; Congo; Côte d'Ivoire (Henry *et al.*, 2004: 24); Ghana; Liberia.

MOLECULAR BIOLOGY:
DNA - Unknown.
Karyotype - Haiduk *et al.*, 1980; 1981: 226) reported $2n$ = 34, FN = 62, BA = 32, a subtelocentric X chromosome and an acrocentric Y chromosome for specimens from Cameroon.
Protein / allozyme - Unknown.

POPULATION:
Structure and Density - This appears to be a naturally rare species (Mickleburgh *et al.*, 2008db; IUCN, 2009).
Trend - Decreasing (Mickleburgh *et al.*, 2008db; IUCN, 2009).

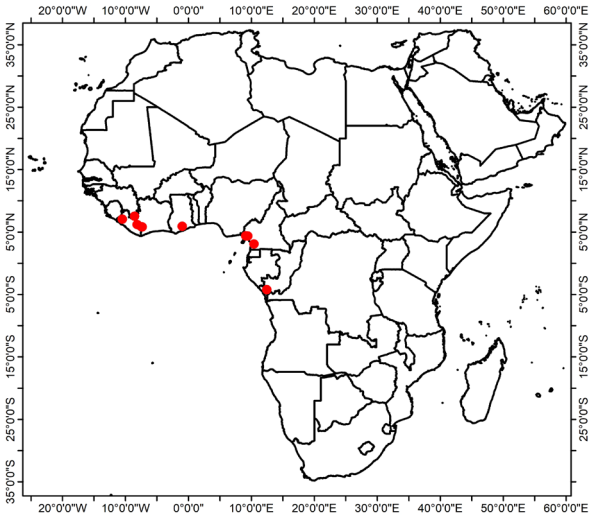

Figure 17. Distribution of *Casinycteris ophiodon*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Cameroon, Congo, Côte d'Ivoire, Ghana, Liberia.

Genus ***Epomophorus*** Bennett, 1836

1835. *Pteropus:* Ogilby, Proc. zool. Soc. Lond., 1835, III (xxxi): 100. Publication date: 9 October 1835. - Comments: Preoccupied by *Pteropus* Brisson, 1762.

*1836. *Epomophorus* Bennett, Proc. zool. Soc. Lond., 1835, III (xxxiv): 149. Publication date: 12 February 1836. - Comments: Type species: *Pteropus whitei* var. *epomophorus* Bennett, 1836 (= *Pteropus gambianus* Ogilby, 1835). - Etymology: From the Greek "*ἐπί*", meaning upon, "*ωμος*", meaning shoulder, and "*φόρος*", meaning bearing, refering to the conspicuous tufts of hair on the shoulders of the males (see Palmer, 1904: 268; Boulay and Robbins, 1989: 4). (Current Combination)

1853. *Pachysoma* Temminck, Esq. zool. Côte de Guiné, 64. - Comments: Preoccupied by *Pachysoma* MacLeay, 1821, a genus of Coleoptera: see Boulay and Robbins (1989: 1). Not *Pachysoma* I. Geoffroy Saint-Hilaire, 1828. Andersen (1912b: 514) indicates that *Pachysoma* Temminck includes both *Epomophorus* and *Cynopterus*.

1975. *Epomorphus:* Höhne, Loose and Seeliger, Ann. Microbiol. (Inst. Pasteur), 126 A: 503. (Lapsus)

1978. *Epomophevus:* Arata and Johnson, in: Pattijn, Ebola Virus Haemorrhagic Fever, 135. (Lapsus)

2014. *Epimorphosis:* Walldorf and Mehlhorn, Parasitology Research Monographs, 5 - Springer Verlag - Berlin Heidelberg: 13.. (Lapsus)

2016. *Epomorphorus:* Pancer, Gut and Litwinska, Post. Mikrobiol., 55 (2): 208. (Lapsus)

2017. *Epomophorous:* Waruhiu, Ommeh, Obanda, Agwanda, Gakuya, Ge, Yang, Wu, Zohaib, Hu and Shi, Virol. Sin., 32 (2): 5. Publication date: 6 April 2017. (Lapsus)

? *Epomophorus sp.:*

Taxonomy:

Revised by Bergmans (1988), who transferred *Micropteropus grandis* to this genus. A key to this genus is presented in Boulay and Robbins (1989) and Claessen and De Vree (1991). See Simmons (2005: 322).

Almeida *et al.* (2016: 83) found *Epomophorus* to be paraphyletic not only because they transferred *dobsonii* from the genus *Epomops*, but also because *Micropteropus pusillus* seems highly related. However, they suggest further investigation of rapidly evolving nuclear loci and additional species of both genera to decide whether *Micropteropus* and *Epomophorus* are synonyms.

Included in the Epomophorinii tribe by Bergmans (1997: 69) and Almeida *et al.* (2016: 83), which was considered part of the Epomophorinae by the former and of the Rousettinae by the latter.

Known species of *Epomophorus*: ***angolensis*** Gray, 1870; ***anselli*** Bergmans and Van Strien, 2004; ***crypturus*** Peters, 1852; ***dobsonii*** Bocage, 1889; ***gambianus*** (Ogilby, 1835); ***grandis*** (Sanborn, 1950); ***labiatus*** (Temminck, 1837); ***minimus*** Claessen and De Vree, 1991; ***minor*** Dobson, 1880; ***wahlbergi*** (Sundevall, 1846).

Common Names:

Czech: výložkoví kaloni. English: Epauletted Fruit-bats. French: Epomophores, Chauves-souris à épaulettes. German: Epaulettenflughund, Epaulettenflughunde. Italian: Epomòfori. Kiluba (DRC): Mulima.

General description of external morphology:

Fenton (1992: 49) suggests that the white ear spots present disruptive patterns, which contribute to the cryptic appearance of these bats when resting in foliage.

Detailed morphology:

The region of the shoulder pouches was morphologically, anatomically and histologically investigated by Püscher (1972), who found special muscles to move the dermal pouch, but no special cutaneous glands.

Predators:

Steyn (1964: 257) reported an Epauletted Fruit Bat of 6 inches being eaten by a small Python of 2 feet 7 inches.

Mikula *et al.* (2016: Supplemental data) mention *Epomophorus* sp. to be preyed upon by African goshawk (*Accipiter tachiro* (Daudin, 1800)) [possibly either *E. crypturus* or *E. wahlbergi*], Bat hawk (*Macheiramphus alcinus* Bonaparte, 1850).

Parasites:

BACTERIA

Bartonellae

Kamani *et al.* (2014: 628) tested 30 Nigerian *Epomophorus* sp., and found at least 16 of them testing positive for *Bartonella* DNA.

HAEMOSPORIDA

Perkins and Schaer (2016: Suppl.) mention the presence of *Hepatocystis epomophori* Rodhain, 1926 in *Epomophorus* sp. bats. Of the 138 South Sudanese *Epomophorus* sp. bats examined by Schaer *et al.* (2017: 2), 130 (94 %) were infected by *Hepatocystis*.

HEMIPTERA
Cimicidae: Haeselbarth *et al.* (1966: 8) recorded *Afrocimex constrictus* Ferris & Usinger 1957 associated with *Epomorphorus* sp. from Kiambu, near Nairobi, Kenya.

DIPTERA
Nycteribiidae: *Cyclopodia greeffi* Karsch 1884 found in a belt across central Africa, between lat. 10° south and north, while in West Africa it occurs further north up to lat. 20° (Haeselbarth *et al.*, 1966: 117).

VIRUSES:
Flaviviridae

Andral *et al.* (1968: 855) reported on the isolation of yellow fever virus in Ethiopia from either *Epomophorus anurus*, "*Epomophorus monstruosus*" or "*Epomophorus limbatus*".

Paramyxoviridae
Rubulavirus
Krüger *et al.* (2018: 318) state that broad geographic distribution of the genus *Epomophorus* in Sub-Saharan Africa makes it conceivable that Bat Mumpsvirus (batMuV) is widely dispersed in the region. This virus is closely related to the human Mumpsvirus of which in 2016 100,576 cases were reported in Africa, and which is serologically not distinguishable from the human virus.

Epomophorus angolensis Gray, 1870

*1870. *[Epomophorus macrocephalus] var. angolensis* Gray, Catalogue of Monkeys, Lemurs and Fruit-eating bats in the collection of the British Museum London, 125. Type locality: Angola: Benguela [12 34 S 13 24 E, 160 m] [Goto Description]. Holotype: BMNH 1864.1.9.4: juv ♂. Presented/Donated by: Mr. J.J. Monteiro Esq. - Etymology: Named from a specimen taken at Benguela, Angola (see Smithers, 1983: 56; Taylor, 2005).
? *Epomophorus angolensis:* (Name Combination, Current Combination)

TAXONOMY:
Member of the *gambianus* species group Simmons (2005: 322). See also Bergmans (1988).

COMMON NAMES:
Afrikaans: Angola-witkolvrugtevlermuis. Czech: kaloň angolský. English: Angolan Epauletted Fruit-bat, Angolan Epauletted Fruit Bat. French: Epomophore d'Angola, Roussette à épaulettes d'Angola. German: Angola-Epaulettenflughund.

CONSERVATION STATUS:
Global - Listed as Near Threatened because this species may be in significant decline (but presumably at a rate of less than 30% over ten years) because of the loss of riverine roosting and fruit trees (almost qualifies as threatened under criterion A2c) (Mickleburgh *et al.*, 2008d; IUCN, 2009). This is a precautionary listing, as it is possible that the species has a less restricted habitat, and as such should be listed as Least Concern (Mickleburgh *et al.*, 2008d; IUCN, 2009).

Assessment History -
2008 - NT ver 3.1 (2001) (Mickleburgh *et al.*, 2008d; IUCN, 2009). 2004 - NT ver 3.1 (2001) (Mickleburgh *et al.*, 2004b; IUCN, 2004). 1996 - LR/nt (Baillie and Groombridge, 1996). 1994 - Rare (Groombridge, 1994).

MAJOR THREATS:
This species is threatened by the removal of roost trees, often for use as fuel. Griffin (1998) indicates that the removal of riverine trees is a particular threat to species of *Epomophorus* in Namibia, with relatively little suitable habitat remaining; presumably this is similar problem in Angola. It may have been threatened by the availability of firearms during the long civil war in Angola, although this requires confirmation.

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008d) [in IUCN (2009)] report that there appear to be no direct conservation measures in place for this species (it has been recorded from Mupa National Park and Bikuar National Park in Angola). There is a need to conserve remaining areas of suitable roosting and feeding sites for this species, and for new field surveys to better determine the current conservation status of the species (Mickleburgh *et al.*, 2008d; IUCN, 2009).

GENERAL DISTRIBUTION:
Epomophorus angolensis is present in Angola and adjacent parts of northern Namibia. It is largely a lowland species, but may range into more montane areas. In Angola it is present west and south of the Mosaic of Guineo-Congolian lowland rain forest and secondary grassland (Bergmans, 1988). In eastern Angola the range seems to be halted by the extensive mosaic region of

Brachystegia bakerana thicket and edaphic grassland (Bergmans, 1988).

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 339,737 km^2.

Native: Angola (Bergmans, 1988; Crawford-Cabral, 1989; Monadjem *et al.*, 2010d: 551; Taylor *et al.*, 2018b: 60); Namibia (Monadjem *et al.*, 2010d: 551).

HABITAT:
Bergmans (1988; 1999) reports that the species is present in wetter Zambezian miombo woodland, north Zambezian woodland; *Colophospermum mopane* woodland and scrub woodland. Skinner and Chimimba (2005) suggest that the species may be largely confined to riverine forest and other evergreen forest with fruit-bearing trees.

HABITS:
Shortridge (1934) reported on animals hanging singly from bare branches of large Acacia trees near the Cunene River, however, loose colonies of up to 200 have also been found.

POPULATION:
Structure and Density - The abundance of this species is poorly known, with very little recent information (Mickleburgh *et al.*, 2008d; IUCN, 2009).
Trend - 2008 - Decreasing (Mickleburgh *et al.*, 2008d; IUCN, 2009).

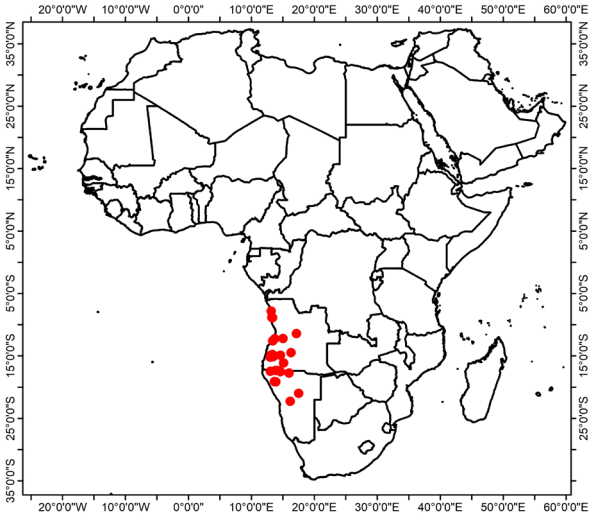

Figure 18. Distribution of *Epomophorus angolensis*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Angola, Namibia.

Epomophorus anselli Bergmans and Van Strien, 2004

*2004. *Epomophorus anselli* Bergmans and Van Strien, Acta Chiropt., 6 (2): 258. Type locality: Malawi: Kasungu National Park: Lisanthu [13 00 S 33 10 E, 1 000 m]. Holotype: ZMA MAM.21693b: ad ♂, skull and alcoholic. Collected by: Hugo Jachmann; collection date: 19 March 1982; original number: #25. See Bergmans and Van Strien (2004: 258 - 259). Paratype: ZMA MAM.26105: sad ♀, skin and skull. Collected by: Nico[laas] Jan Van Strien; collection date: 19 May 1988; original number: #162. Locality: Lifupa Camp - 13.05 S 3005E, 1050 m; see Bergmans and Van Strien (2004: 258 - 259). - Comments: Publication date: The volume is for "September 2004", but the paper has been accepted on 16 October 2004. - Etymology: In honour of Mr. William Frank Harding Ansell for his important contributions to the mammalogy of Malawi and other African countries (see Bergmans and Van Strien, 2004: 262). (Current Combination)

TAXONOMY:
See Bergmans and Van Strien (2004).

COMMON NAMES:
Czech: kaloň Ansellův. French: Epomophore d'Ansell. German: Ansells Epaulettenflughund.

CONSERVATION STATUS:
Global - Listed as Data Deficient (DD ver 3.1 (2001)) since it has only recently been described, and there is still very little information on its extent of occurrence, status, threats and ecological requirements (Bergmans and van Strien, 2008; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) (Bergmans and van Strien, 2008; IUCN, 2009).

MAJOR THREATS:
Bergmans and Van Strien (2004) note that they "have no reason to believe that the species is in any danger but at the same time the available data are few and between 43 and 16 years old".

CONSERVATION ACTIONS:
Bergmans and van Strien (2008) [in IUCN (2009)] reported that this species has been recorded from the Kasungu National Park in Malawi, and further field surveys are needed to better understand the

distribution range, threats and conservation status of this species .

GENERAL DISTRIBUTION:
Epomophorus anselli is currently only known from Malawi, where it has been collected in the Kasungu National Park (collected in 1982 and 1988) and (most probably) the Karonga area (collected in 1961) (Bergmans and Van Strien, 2004).

Native: Malawi (Bergmans and Van Strien, 2004; Monadjem *et al.*, 2010d: 551).

HABITAT:
Bergmans and Van Strien (2004) record that 'the type specimen was mist netted in Miombo woodland at an elevation of 1,000 m, over a stream between two water berry trees, *Syzygium cordatum* Hochst., in fruit (Bergmans and Jachmann, 1983).' Furthermore, they state that 'the vegetation of Lifupa Camp, the locality where the female paratype was collected (exact elevation unknown, but between 1,000 and 1,100 m) is Miombo woodland with *Brachystegia* and *Julbernardia* (Bergmans and Jachmann, 1983)'.

POPULATION:
Structure and Density - It is only known from a few specimens (Bergmans and van Strien, 2008; IUCN, 2009).
Trend- 2008- Unknown (Bergmans and van Strien, 2008; IUCN, 2009).

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Congo (Democratic Republic of the), Malawi.

Epomophorus crypturus Peters, 1852

*1852. *Epomophorus crypturus* Peters, Naturwissenschaftliche Reise nach Mossambique, Zoologie, Säugethiere, 26, pl. 5, pl. 13, fig. 1 - 6. Type locality: Mozambique: Lower Zambezi River: Tete [16 10 S 33 35 E, 230 m] [Goto Description]. Lectotype: ZMB 10080: ad ♀, skull and alcoholic. Collected by: Prof. Wilhelm Carl Hartwig Peters; collection date: between 1843 and 1847. Lectotype designated by Andersen (1912b: 537); formerly ZMB 553; see Turni and Kock (2008). Paralectotype: ZMB 10018: ♀, skull and alcoholic. Collected by: Prof. Wilhelm Carl Hartwig Peters; collection date: between 1843 and 1847. See Andersen (1912b) and Turni and Kock (2008: 8). Paralectotype: ZMB 10019: ♀, skull and alcoholic. Collected by: Prof. Wilhelm Carl Hartwig Peters; collection date: between 1843 and 1847. See Andersen (1912b) and Turni and Kock (2008: 8). Paralectotype: ZMB 10020: ♂, skull and alcoholic. Collected by: Prof. Wilhelm Carl Hartwig Peters; collection date: between 1843 and 1847. See Andersen (1912b) and Turni and Kock (2008: 8). Paralectotype: ZMB 10078: skull only. Collected by: Prof. Wilhelm Carl Hartwig Peters; collection date: between 1843 and 1847. See Andersen (1912b) and Turni and Kock (2008: 8). Paralectotype: ZMB 10081: skull and alcoholic. Collected by: Prof. Wilhelm Carl Hartwig Peters; collection date: between 1843 and 1847. Formerly ZMB 355. See Andersen (1912b) and Turni and Kock (2008: 8). Andersen (1912b: 537) also mentions that most of the paratypes are immature specimens, and that Peters' adult male is in fact an immature.
1855. *Pt[eropus] crypturus:* Giebel, Die Säugethiere., 1002. (Name Combination)
1960. *Epomophorus gambianus parvus* Ansell, Rev. Zool. Bot. afr., 61: 160. Type locality: Zambia: Zambezi district: Chingi [13 01 S 22 44 E]. Holotype: BMNH 1959.610: ad ♂. - Comments: Type locality originally Balovale [=Zambezi] district, restricted to Chingi by Ansell (1978: 17).
1986. *Epomophorus crypturus parvus:* Meester, Rautenbach, Dippenaar and Baker, Transv. Mus. Monogr., 5: 27. (Name Combination)
1988. *Epomophorus gambianus crypturus:* Bergmans, Beaufortia, 38 (5): ???. (Name Combination)
? *Epomophorus angolensis:* - Comments: Not of Gray, 1870.

? *Epomophorus crypturus crypturus:* (Name Combination)
? *Epomophorus gambianus:* - Comments: Not of Ogilby, 1835.

TAXONOMY:
Bronner *et al.* (2003) state that *Epomophorous crypturus* was previously afforded full species status (Corbet and Hill, 1980; Swanepoel *et al.*, 1980; Koopman, 1982; Meester *et al.*, 1986; Claessen and De Vree, 1990, 1991; 2005).

Meester *et al.* (1986) states that Koopman (1966) considers the possibility that the extralimital *E. anurus* Heuglin, 1864, may be conspecific with *crypturus*. This would extend the range of *crypturus* to Uganda, Rwanda, southern Sudan, Ethiopia, Eritrea and westwards to Nigeria. However, Kock (1969a) and Koopman (1975) regard *anurus* instead as a synonym of the extralimital *E. labiatus* (Temminck, 1837), while Hayman and Hill (1971) retain it as a separate species, so that a close relationship with *crypturus* does not seem to be indicated. Further uncertainty surrounds the status of *E. gambianus parvus*. Ansell (1978), while treating *parvus* as a subspecies of *gambianus*, expresses doubt whether *parvus* can be distinguished at species level from *crypturus*, and suggests that *crypturus* and *gambianus* are conspecific, with *parvus* as an intermediate subspecies or a stage in a cline running between them. Koopman (1982) retains *gambianus* as a separate species, but includes *parvus* in *crypturus*, without specifying whether or not he regards it as subspecifically distinct. While acknowledging that this problem remains to be solved we shall provisionally treat *parvus* as a taxon of *crypturus*.

COMMON NAMES:
Afrikaans: Peters se witkolvrugtevlermuis, Peters-witkolvrugtevlermuis, Klein Vrugtevlermuis. Czech: kaloň mosambický. English: Peters's Epauletted Fruit Bat, Smaller Epauletted fruit bat. French: Epomophore de Peters, Roussette à épaulettes de Peters. German: Peters' Epaulettenflughund. Nyanja (Malawi): Mleme. Portuguese: Morcego frugivoro de Peters.

ETYMOLOGY OF COMMON NAME:
In honour of Wilhelm Carl Hartwig Peters who, in 1852, published a monumental work on zoological material collected mainly in the Tete District of Mozambique (Smithers, 1983: 58).

SIMILAR SPECIES:
Taylor and Monadjem (2008: 24) provided data which enabled them to separate *E. crypturus* from *E. wahlbergi*. In the first species, the maxillary width is always smaller than in the latter (♂♂: < 14 mm; ♀♀: < 13 mm).

CONSERVATION STATUS:
Global assessment- Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, it occurs in a number of protected areas, has a tolerance of a degree of habitat modification, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008e; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) assessed as *E. crypturus* (Mickleburgh *et al.*, 2008e; IUCN, 2009). 2004 - LC ver 3.1 (2001) assessed as *E. crypturus* (Mickleburgh *et al.*, 2004c; IUCN, 2004).

Regional -
South Africa: 2016 - LC ver 3.1 (2001) (Monadjem *et al.*, 2016x). 2004 - DD ver 3.1 (2001) (Friedmann and Daly, 2004).

MAJOR THREATS:
There appear to be no major threats to this species as a whole. Some populations may be impacted by general persecution as crop pests (Mickleburgh *et al.*, 2008e; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008e) [in IUCN (2009)] state that this species has been recorded from many protected areas, and no direct conservation measures are needed for this widespread and adaptable species as a whole.

GENERAL DISTRIBUTION:
E. crypturus is a widespread southern African species distributed from southern parts of the Democratic Republic of the Congo and southern Tanzania, to the eastern coastline of South Africa. It ranges from eastern Angola and northern Botswana to the southeastern African coastline. It has been recorded at elevations of up to 2,185 m asl, although it has mostly been collected between 500 and 1,500 m asl (Mickleburgh *et al.*, 2008e; IUCN, 2009). For South Africa, Babiker Salata (2012: 49) found that its distribution is stongly associated with the mean temperature of the coldest quarter.

Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 1,213,597 km^2.

Native: Angola (Bergmans, 1988; Monadjem *et al.*, 2010d: 551); Botswana (Bergmans, 1988;

Monadjem *et al.*, 2010d: 551); Congo (The Democratic Republic of the) (Schouteden, 1944; Hayman *et al.*, 1966; Monadjem *et al.*, 2010d: 551); Malawi (Happold *et al.*, 1988; Bergmans, 1988; Happold and Happold, 1997b: 813; Monadjem *et al.*, 2010d: 551); Mozambique (Smithers and Lobão Tello, 1976; Bergmans, 1988; Monadjem *et al.*, 2010d: 551; 2010c: 376); Namibia (Monadjem *et al.*, 2010d: 552); South Africa (Monadjem *et al.*, 2010d: 552); Swaziland (Monadjem *et al.*, 2010d: 552); Tanzania; Zambia (Ansell, 1978; Monadjem *et al.*, 2010d: 552); Zimbabwe (Monadjem *et al.*, 2010d).

MOLECULAR BIOLOGY:
DNA - Unknown.
Karyotype - In Zimbabwe, Peterson and Nagorsen (1975: 4) recorded the following: 2*n* = 35 for a male, and 2*n* = 36 for a female (XO/XX; see also Nesi *et al.*, 2011: 552).

HABITAT:
This species is generally associated with dry savanna and riverine forest with fruit bearing trees (Mickleburgh *et al.*, 2008e).

ROOST:
Colonies often roost under the canopy of trees, in thick foliage (Mickleburgh *et al.*, 2008e).

MIGRATION:
Populations exhibit considerable movements in search of food, and may come into towns and feed on crops and fruit trees (Mickleburgh *et al.*, 2008e).

DIET:
Bonaccorso *et al.* (2014: 41) studied the foraging movements of *E. crypturus* in the Kruger National Park (RSA) in relation to the distribution of sycamore figs *Ficus sycomorus*. They also performed germination trials on 20 intact seeds that had passed through the gastro-entero tract of the bats and found 100 % germination. They also found (p. 48) that during a very dry period, the bats flew between 4 and 14 km from their roosting site to fruiting *F. sycomorus*. In normal circumstances, they only flew 400 - 2,000 m. The bats visited up to four fig trees per night.

POPULATION:
Structure and Density - It is a quite common species, sometimes forming loose colonies of hundreds of bats (Mickleburgh *et al.*, 2008e; IUCN, 2009).

Trend - 2008 - Unknown (Mickleburgh *et al.*, 2008e; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
In the Kruger Park, Pienaar (1964: 8) reported single young attached to their mothers in December and January.

MATING:
McCracken and Wilkinson (2000: 349) suggest that *E. crypturus* uses nocturnal display sites where females visit males for mating. Males call from roosts in trees that are spaced about 50 m apart along rivers.

At Shingwedzi (Kruger National Park), Adams and Snode (2015: 4) found the following values for the male mating calls: mean fundamental frequency: 15.71 ± 0.07 kHz (first harmonic), only in one case followed by multiple harmonics at 16, 48, 64, 96, and 112 kHz.

VIRUSES:
Coronaviridae - Coronaviruses
SARS-CoV: Müller *et al.* (2007b) tested between 1986 and 1999, for antibody to SARS-CoV in sera in four individuals from Limpopo Province, none tested positive (0/4) and six individuals from Mpumalanga Province, South Africa, none tested positive (0/6).

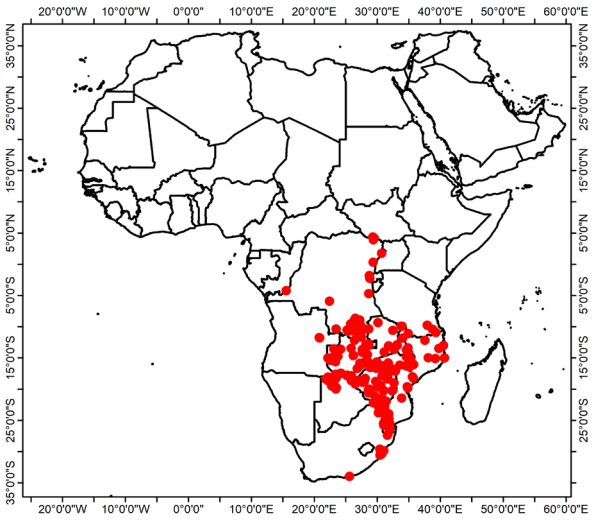

Figure 20. Distribution of *Epomophorus crypturus*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Angola, Botswana, Central African Republic, Congo (Democratic Republic of the), Malawi, Mozambique, Namibia, South Africa, Swaziland, Tanzania, Zambia, Zimbabwe.

Epomophorus dobsonii Bocage, 1889

*1889. *Epomophorus Dobsonii* Bocage, J. Sci. mat. phys. nat., ser. 2, 1 (1): 1, Fig 1. Publication date: March 1889. Type locality: Angola: Benguela district: Quindumbo [Goto

Description]. Neotype: AMNH 88068: ♂, skin and skull. Collected by: the Phipps-Bradley Expedition; collection date: 27 February 1933; original number: 902. At Chitau, 4930 ft. Designated by Bergmans (1989) (see AMNH website). - Comments: Andersen (1912b: 501) mentions that the original type was an adult male in the Lisbon museum. Frequently mentioned as *dobsoni*. - Etymology: Named after George Edward Dobson who, among his many other papers on bats, published a Catalogue of the Chiroptera in the collection of the British Museum in 1878 (see Taylor, 2005).

1899. *Epomophorus (Epomops) dobsoni:* Matschie, Die Fledermäuse des Berliner Museums für Naturkunde. 1. Lieferung. Die Megachiroptera des Berliner Museums für Naturkunde, 57. (Name Combination)

1912. *Epomops dobsoni:* K. Andersen, Catalogue of the Chiroptera in the British Museum. Second Edition. Volume I: Megachiroptera: viii, lvi, 500. (Name Combination, Lapsus)

1939. *Epomops dobsonii:* G.M. Allen, Bull. Mus. comp. Zool., 83: 57. Publication date: February 1939. (Name Combination)

2016. *E. dobosonii:* Calderon, Guzman, Salazar-Bravo, Figueiredo, Mattar and Arrieta, Manter, Suppl. 6: 7. Publication date: 30 September 2016. (Lapsus)

? *Epomophorus dobsoni:* (Alternate Spelling)

TAXONOMY:
See Bergmans (1979b; 1989) and Simmons (2005: 323).

The phylogenetic analyses by Almeida *et al.* (2016: 83) suggest that *dobsonii* is closely related to *Epomophorus wahlbergi* and they transfered the species to the latter genus.

COMMON NAMES:
Afrikaans: Dobson se vrugtevlermuis, Dobson-vrugtevlermuis. Czech: kaloň Dobsonův. English: Dobson's Fruit Bat, Dobson's Epauletted Fruit Bat, Dobson's Epauletted Bat, Singing Fruit Bat. French: Epomophore de Dobson, Roussette de Dobson. German: Dobsons Epaulettenflughund.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008bx; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2008bx; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2004cj; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
There appear to be no major threats to this species (Mickleburgh *et al.*, 2008bx; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008bx) [in IUCN (2009)] report that it has been recorded from Kasungu National Park in Malawi and from Parc National de l'Upemba in the Democratic Republic of the Congo. There is a need for additional studies into the natural history of this species and into any possible future threats to the species (Mickleburgh *et al.*, 1992).

GENERAL DISTRIBUTION:
Epomophorus dobsonii is distributed in East Africa, Central Africa and southern Africa. It has been recorded from Angola, Namibia, Zambia, southern Democratic Republic of the Congo, Malawi and Mozambique, being found as far north as Tanzania and possibly Rwanda. It has been recorded at elevations of up to 1,500 m asl (in Malawi) and at 1,890 m asl at Kibwele, Tanzania.

For southern Africa (south of 8° S), Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 503,585 km^2.

Native: Angola (Crawford-Cabral, 1989; Bergmans, 1989; Monadjem *et al.*, 2010d: 553; Taylor *et al.*, 2018b: 60); Botswana (Monadjem *et al.*, 2010d: 554); Congo (The Democratic Republic of the) (Hayman *et al.*, 1966; Monadjem *et al.*, 2010d: 554); Malawi (Bergmans, 1989; Monadjem *et al.*, 2010d: 554); Mozambique; Namibia; Tanzania; Zambia (Ansell, 1973; Bergmans, 1989; Monadjem *et al.*, 2010d: 554); Zimbabwe.
Presence uncertain: Namibia (see Cotterill, 2004a: 260); Rwanda.

POPULATION:
Structure and Density - It does not appear to be an especially rare species in Malawi. There is little information on the abundance of the species over the rest of its range, but it is presumed to be reasonably common (Mickleburgh *et al.*, 2008bx; IUCN, 2009).
Trend - 2008 - Stable (Mickleburgh *et al.*, 2008bx; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
Hill (1941) [in Fox *et al.* (2009: 272) reported that "*E. dobsoni*" gave birth to two young, but Fox *et al.* (2009: 272) indicate that this statement was based on translated field notes, and it is not clear whether they refer to twins or to two birthing seasons each year.

VIRUSES:
Rhabdoviridae
Lyssavirus - Rabies related viruses
de Jong *et al.* (2011: 9) and Willoughby *et al.* (2017: Suppl.) report Lagos Bat Virus from *E. dobsonii*.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Angola, Botswana, Congo (Democratic Republic of the), Malawi, Rwanda, Tanzania, Zambia, Zimbabwe.

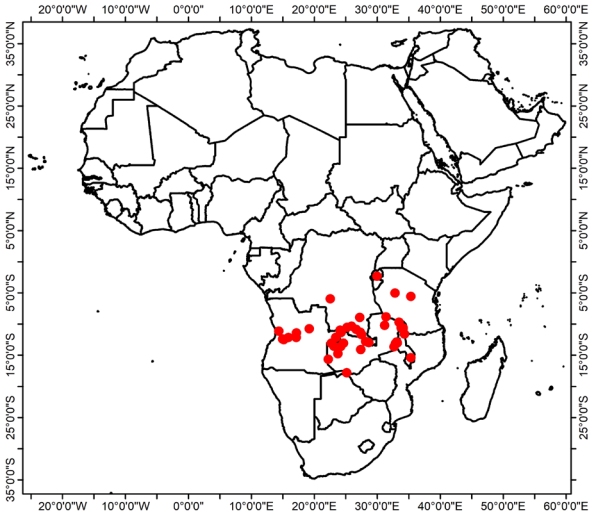

Figure 21. Distribution of *Epomophorus dobsonii*

Epomophorus gambianus (Ogilby, 1835)

*1835. *Pteropus Gambianus* Ogilby, Proc. zool. Soc. Lond., 1835, III (xxxi): 100. Publication date: 9 October 1835. Type locality: The Gambia: Banjul [Goto Description]. Holotype: BMNH 1907.1.1.233: ad ♀, skin and skull. Collected by: Dr. Percy Rendall. Formerly in Tomes collection. Paratype: BMNH 1874.a-c: 2 sad FF, 1 imm F, skin and skull. Collected by Liet. Rendall. Paratype: BMNH 1874.a = 124b: imm ♀. Presented/Donated by: ?: Collector Unknown. Paratype: BMNH 1874.b = 124c: ad ♀. Collected by: Dr. Percy Rendall. Presented/Donated by: ?: Collector Unknown. Paratype: BMNH 1874.c = 124d: imm ♀. Presented/Donated by: ?: Collector Unknown. Paratype: BMNH 1907.1.1.231: sad ♀, skin and skull. Collected by: Dr. Percy Rendall. Formerly in Tomes collection. - Comments: Type locality restricted by Kock *et al.* (2002: 80). - Etymology: Named as the species was described from a specimen from Gambia in West Africa (see Taylor, 2005).

1898. *Epomophorus guineensis* Bocage, J. Sci. mat. phys. nat., ser. 2, 5 (19): 136, fig. 3. Publication date: June 1898. Type locality: Guinea-Bissau: Bolama [11 35 N 15 30 W] [Goto Description]. - Comments: Andersen (1912b: 541) mentions the type specimen as being a mounted ad ?, skull extracted, coll. Sr. Damasceno da Costa, and in the Lisbon Museum.

2017. *Epomorphus giambianus:* Banyard and Fooks, Microbiol. Aust., 38 (1): 18. Publication date: March 2017. (Lapsus)

2019. *E[pomophorus] gambiansus:* Mbu'u, Mbacham, Gontao, Kamdem, Nlôga, Groschup, Wade, Fischer and Balkema-Buschmann, Vector-Borne Zoon. Dis., xxx: "6". Publication date: 13 April 2019. (Lapsus)

? *Epomophorus gambianus:* (Name Combination, Current Combination)

TAXONOMY:
See Boulay and Robbins (1989), Claessen and De Vree (1990) and Simmons (2005: 322).

Two subspecies are currently recognized: *E. g. gambianus* (Ogilby, 1835) and *E. g. pousarguesi* Trouessart, 1904.

COMMON NAMES:
Afrikaans: Gambiaanse witkolvrugtevlermuis. Czech: kaloň výložkový, kaloň větší. English: Gambian Epauletted Fruit bat, Gambian Epauleted Bat. French: Epomophore de Gambie, Chauve-souris à épaulettes de Gambie. German: Gambia Epaulettenflughund. Tanoboase (Ghana): sreso ampane [="original or normal bat'], ampane kronfo ["thief or criminal bat"] (see Ohemeng *et al.*, 2017: 184).

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001) assessed as full species in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008f; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2008f; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2004l; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
There are no major threats to this species as a whole. In parts of its range it is locally threatened by overhunting for food and habitat loss through logging and conversion of land to agricultural use (Mickleburgh *et al.*, 2008f; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008f) [in IUCN (2009)] state that the species has a wide range, and is presumably present in many protected areas.

GENERAL DISTRIBUTION:
Senegal, Gambia over Guinea (Fahr and Ebigbo, 2003: 128), Mali (Meinig, 2000: 104), Benin (Capo-Chichi *et al.*, 2004: 161), Cameroon (Bakwo Fils *et al.*, 2014: 3), Central African Republic (Morvan *et al.*, 1999: 1195) to W Ethiopia, south to South Sudan.

Simmons (2005: 322) includes Malawi and Botswana, these records may be associated with *crypturus* and need to be verified.

E. g. gambianus - west Africa.
E. g. pousarguesi - east Africa.

Native: Benin (Capo-Chichi *et al.*, 2004: 161), Burkina Faso (Kangoyé *et al.*, 2015a: 605), Cameroon (Bakwo Fils *et al.*, 2014: 3), Central African Republic (Morvan *et al.*, 1999: 1195), Chad, Congo (Democratic Republic of the), Côte d'Ivoire, Ethiopia, Gabon, Ghana, Guinea (Fahr and Ebigbo, 2003: 128; Decher *et al.*, 2016: 261), Guinea-Bissau (Bocage, 1889a:2; Seabra, 1898b; Monard, 1939; Veiga-Ferreira, 1948; Bergmans, 1988; Lopes and Crawford-Cabral, 1992; Rainho and Ranco, 2001: 22), Liberia, Mali (Meinig, 2000: 104), Niger, Nigeria, Senegal, Sierra Leone, South Sudan, Sudan, The Gambia, Togo.

SEXUAL DIMORPHISM:
Dobson (1873: 247) quotes Tomes' description of the male as: "The conspicuous shoulder-tufts of *E. macrocephalus* are here very fully developed. They consist of a very slight warty excrescence clothed with fur, which differs from that which surrounds it only in being of a dirty white colour."

MOLECULAR BIOLOGY:
Riesle-Sbarbaro *et al.* (2016: 447) reported on the complete mitochondrial genome of this species, which consists of 16,702 bases.

Riesle-Sbarbaro *et al.* (2018: "13") examined mitochondrial and nuclear DNA and found that connectivity and free mixing occurred between the colonies sampled over most of its distribution area. Their data lso indicated that male dispersal occurs more often and/or over longer distances than females. The Ethiopian colonies seem to form an exception as the genetic differences indicate that they apparently diverged about 1.6 Mya from the bats from the more western part of the distribution area. Also the populations from southern Ghana (Accra and Ve-Golokwati) show some genetic differentiation. Riesle-Sbarbaro *et al.* (2018: "14") suggest that the geographical barriers (e.g. mountains and water bodies such as rivers and lakes) and other environmental developments (e.g., urbanization of megacities) are the likely drivers for the regional divergences.

HABITAT:
This species is present in a variety of tropical moist and dry forest, savanna, bushland and mosaic habitats, and has additionally been reported from mangroves and swamp forests (Mickleburgh *et al.*, 2008f). It is able to persist in areas of partially degraded forest.

HABITS:
Anonymus (2002a: 103) mentions that in some areas of Benin, *E. gambianus* might be causing large trees to die, as they swarm in large numbers on a restricted surface.

ROOST:
Roosting usually takes place as individuals or small groups in dense vegetation (Happold, 1987). *E. gambianus* forms roosting colonies in crowns of trees, containing a few to 50 - 100 individuals (Kunz, 1996: 44). Ayensu (1974: 716) indicates that in Ghana, *Azadirachta indica* or the Neem tree is a favorite roosting haven. Lawson *et al.* (2018: 110) found them also roosting in mango (*Mangifera* sp.) and fig (*Ficus* sp.) trees around schools, churches, market places and people's homes.

MIGRATION:
Isotopic data collected by Omatsu *et al.* (2008: 21 - 22) suggest that *E. gambianus* has an East-West migratory behaviour inside its distribution range, which is even more pronounced than the migration displayed by *Eidolon helvum*. Six specimens that were captured in February in Mali were most probably originating from some 3,000 km to the east.

DIET:
Ayensu (1974) reports that in West Africa, *E. gambianus* visits *Parkia clappertoniana*

(Dawadawa), *Ceiba pentandra* (Silk-Cotton tree or Kapop tree), *Mangifera indica* (Mango tree), *Anacardium occidentale* (Cashew tree), *Psidium guajava* (Guava tree), *Carica papaya* (Papaya or pawpaw), and *Azadirachta indica* (Neem tree) when foraging. Bachirou *et al.* (2011: 2) indicate that *E. gambianus* is the most important seed disperser for the Neem tree in Cameroon.

Kangoyé *et al.* (2010: 291) show a picture of *E. gambianus* pollinating *Ceiba pentandra* flowers, and also indicate that this species was found transporting Shea fruits (*Vitellaria paradoxa*) or figs (*Ficus* sp.), whereas others were found in cashew fields (*Anacardium occidentale*).

Seltzer *et al.* (2013: table S2) provide an overview of the plant species found beneath bat feeding roosts. For *E. gambianus* these include *Rauvolfia caffra* Sond. (Quinine Tree - Apocynaceae) and *Psidium guajava* L. (Apple guava - Myrtaceae).

Based on faecal pellets and ejecta, Amponsah-Mensah *et al.* (2019: 5687) found the following fruits (FR) and flowers (FL) in the diet of bats from Ghana: Anacardiaceae: *Anacardium occidentale* L. (Cashew) FR), *Mangifera indica* L. (Mango - FR), *Spondias mombin* L. (Yellow mombin - FR); Annonaceae: *Annona muricata* L. (Soursop - FR), *Polyalthia longifolia* Sonn. (Indian mast tree, false ashoka - FR); Bignoniaceae: *Spathodea campanulata* P. Beauv. (African tulip tree - FL); Bombacaceae: *Bombax buonopozense* P. Beauv. (Gold Coast bombax, Red-flowered silk-cotton - FL), *Ceiba pentandra* (L.) Gaertn. (Kapok, Silk Cotton - FL); Caricaceae: *Carica papaya* L. (Papaya, Pawpaw - FR); Combretaceae: *Terminalia catappa* L. (Indian almond - FR); Cucurbitaceae: *Melothria* sp. (Mouse melon - FR); Fabaceae: *Daniellia oliveri* (Rolfe) Hutch. & Dalziel (African copaiba balsam - FL), *Parkia biglobosa* (Jacq.) R.Br. ex G.Don (African locust bean - FL); Gentianaceae: *Anthocleista vogelii* Planch. (Cabbage tree - FR, FL); Malvaceae: *Adansonia digitata* L. (Baobab - FL), *Sterculia rhinopetala* K. Schum. (Brown sterculia, Red sterculia - FR); Meliaceae: *Azadirachta indica* A.Juss (Neem - FR, FL); Moraceae: *Antiaris toxicaria* Lesch. (False iroko, Antiaris - FR), *Ficus* spp. (five species Figs - FR), *Milicia excelsa* (Welw.) C.C. Berg (Iroko, Odum - FR); Musaceae: *Musa* sp. (Banana - FR, FL); Myrtaceae: *Psidium guajava* L. (Guava - FR), *Syzygium* sp. (woodland waterberry - FR); Solanaceae: *Solanum* sp. (Potato tree - FR); Verbenaceae: *Vitex doniana* Sweet (Black plum - FR). *Ficus* sp. was present in over a third of all the samples and were eaten in all months. Other fruits that played a vital role, and were prefered over other available fruits, include *Vitex doniana* and *Anthocleista vogelii*. The main reason was probably the higher protein content of these fruits. They were also highly available in the period of late pregnancy (March and September) and parturition (April/May and October/November) (p. 5689). Amponsah-Mensah *et al.* (2019: 5690) could not confirm whether *E. gambianus* were actively eating pollen, nectar, or both, even when they observed bats visiting flowering trees and being covered in pollen.

PREDATORS:
Mikula *et al.* (2016: Supplemental data) mention the Bat hawk (*Macheiramphus alcinus* Bonaparte, 1850) as diurnal avian predator, as well as the Pied crow (*Corvus albus* Statius Muller, 1776). Ayivor *et al.* (2017: 6) indicate that the latter targets young, just weaned *E. gambianus*.

POPULATION:
Structure and Density - Animals are often found in loose colonies of up to 100 bats (Mickleburgh *et al.*, 2008f).
Trend - 2008 - Unknown (Mickleburgh *et al.*, 2008f; IUCN, 2009).

LIFESPAN:
Szekely *et al.* (2015: Suppl.) report a maximum longevity of 7.8 years.

REPRODUCTION AND ONTOGENY:
Szekely *et al.* (2015: Suppl.) report that the gestation period lasts for 150 days, and that the young's weight at birth is 10 g (the adult weights 80 g).

MATING:
Nesi *et al.* (2011: 552) indicate that the male's courting call has a frequency of 1,750 Hz.

PARASITES:
BACTERIA
Höhne *et al.* (1975: 505) found *Listeria monocytogenes* bacteria in one out of two *E. gambianus* specimens from Lomé, Togo.

HAEMOSPORIDA
Schaer *et al.* (2013a: 17416) report the presence of hemosporidian parasites of the genus *Hepatocystis* in one investigated bat. Miltgen *et al.* (1977: 595) pointed out that the first reports of gametocytes from this parasite were made by the Léger(s) from Niger in 1914.

VIRUSES:
Willoughby *et al.* (2017: Suppl.) report the following viruses: Lagos bat lyssavirus, Nipah henipavirus, Reston ebolavirus, Zaire ebolavirus.

Filoviridae - Filoviruses
Ebolavirus

Hayman *et al.* (2012d: 1208) examined 37 bats from the Greater Accra region, Ghana, and found 14 to be positive for EBOV antibodies.

Paramyxoviridae
Paramyxoviruses
Hayman *et al.* (2008a: 926; 2008b: 2) detected antibodies to Nipah virus in one bat collected in Ghana in 2007.
Drexler *et al.* (2012a: Suppl. Table S1) found three bats out of 54 (5.4 %) testing positive for *Henipavirus* in the Democratic Republic of the Congo and Ghana.

Rhabdoviridae
Lyssavirus - Rabies related viruses
2006 in Nigeria, Dzikwi *et al.* (2010: 269) tested 12 brains by direct fluorescent antibody (DFA) and mouse inoculation test (MIT) which tested negative for lyssavirus antigens.
Lagos bat virus (LBV): Hayman *et al.* (2008a) detected antibodies in Ghana. In 2006, 12 individuals from Nigeria were serum tested by a modified rapid fluorescent focus inhibition test (RFFIT), where 3 tested positive (25%) for neutralizing anitibodies (Dzikwi *et al.*, 2010: 269).
Mokola virus (MOKV): In 2006, 12 individuals from Nigeria were serum tested by a modified rapid fluorescent focus inhibition test (RFFIT), none tested positive for neutralizing anitibodies (Dzikwi *et al.*, 2010: 269).

In their overview table, Maganga *et al.* (2014a: 8) reported that the following viruses were already found in *E. gambianus*: Lagos bat virus (LBV), Nipah virus (NPHV), Zaire Ebola virus (ZEBOV), Reston Ebola virus.

UTILISATION:
In some localities in Benin, specimens of this species are eated, but always in small numbers (Anonymus, 2002a: 102). Dougnon *et al.* (2012: 85) reported that the carcasses have an average weight of 40.52 ± 5.08 g (about 43 % of the body mass). They also evaluated the quality of the meat (for 100 g): total mineral matter: 14.1 g, lipids: 13.36 g, protein: 58.4 g, Calcium: 44 mg, Sodium: 48 mg, Phosphore: 80 mg and Potassium: 88 mg.

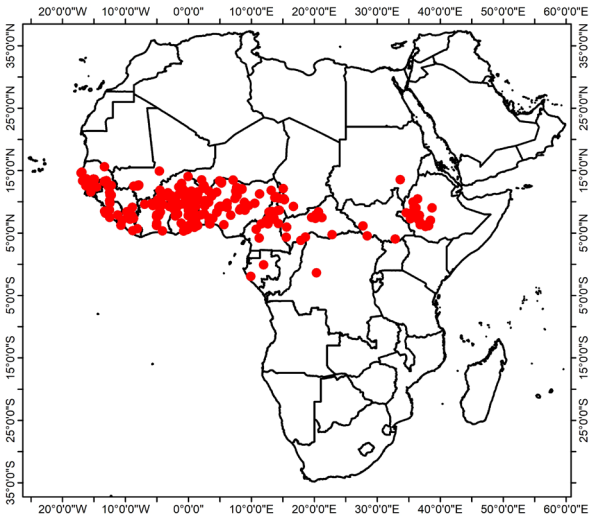

Figure 22. Distribution of *Epomophorus gambianus*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Benin, Burkina Faso, Cameroon, Central African Republic, Chad, Congo (Democratic Republic of the), Côte d'Ivoire, Ethiopia, Gabon, Ghana, Guinea, Guinea-Bissau, Liberia, Mali, Niger, Nigeria, Senegal, Sierra Leone, South Sudan, Sudan, Tanzania, The Gambia, Togo, Zambia, Zimbabwe.

Epomophorus gambianus gambianus (Ogilby, 1835)

*1835. *Pteropus Gambianus* Ogilby, Proc. zool. Soc. Lond., 1835, III (xxxi): 100. Publication date: 9 October 1835. Type locality: The Gambia: Banjul [Goto Description]. Holotype: BMNH 1907.1.1.233: ad ♀, skin and skull. Collected by: Dr. Percy Rendall. Formerly in Tomes collection. Paratype: BMNH 1874.a-c: 2 sad FF, 1 imm F, skin and skull. Collected by Liet. Rendall. Paratype: BMNH 1874.a = 124b: imm ♀. Presented/Donated by: ?: Collector Unknown. Paratype: BMNH 1874.b = 124c: ad ♀. Collected by: Dr. Percy Rendall. Presented/Donated by: ?: Collector Unknown. Paratype: BMNH 1874.c = 124d: imm ♀. Presented/Donated by: ?: Collector Unknown. Paratype: BMNH 1907.1.1.231: sad ♀, skin and skull. Collected by: Dr. Percy Rendall. Formerly in Tomes collection. - Comments: Type locality restricted by Kock *et al.* (2002: 80). - Etymology: Named as the species was described from a specimen from Gambia in West Africa (see Taylor, 2005).
1835. *Pteropus macrocephalus* Ogilby, Proc. zool. Soc. Lond., 1835, III (xxxi): 101. Publication date: 9 October 1835. Type locality: The Gambia: "Gambia" [Goto Description]. - Comments: collected by Rendall.
1835. *Pteropus megacephalus* Swainson, Natural History and Classification of Quadrupeds, 91, 92, 356, figs 31, 154. Type locality: The Gambia. - Comments: Type locality originally as West Africa, but Andersen (1912b: 539) mentions "Gambia" as type locality.
1836. *Pteropus epomophorus* Bennett, Proc. zool. Soc. Lond., 1835, III (xxxiv): 149. Publication date: 12 February 1836. Type locality: The Gambia: "Gambia". Holotype: BMNH

1907.1.1.232: ad ♂, skin only. Collected by: Dr. Percy Rendall. (Type for both *epomophorus* and *whitei*). Ex Tomes collection: see Andersen (1912b: 542). Holotype: NRM [unknown]: ad ♀, alcoholic (skull not removed). Collected by: Bror Yngve Sjöstedt; collection date: 4 May 1905. Kilimandjaro-Meru Expedition. See Lönnberg (1908b: 7) and Andersen (1912b: 810).

1836. *Pteropus Whitei* Bennett, Trans. Linn. Soc. Lond., 2 (1): 37, pl. 6, pl. 7. Publication date: 2 October 1836. Type locality: The Gambia: "Gambia" [Goto Description]. Holotype: BMNH 1907.1.1.232: ad ♂, skin only. Collected by: Dr. Percy Rendall. (Type for both *epomophorus* and *whitei*). Ex Tomes collection: see Andersen (1912b: 542).

1838. *Epomophorus whitii:* Gray, Mag. Zool. Bot., Edinburgh, 2 (12): 504. Publication date: 1 February 1838. - Comments: Also incorrect subsequent spelling, see Boulay and Robbins (1989: 1). (Name Combination)

1898. *Epomophorus guineensis* Bocage, J. Sci. mat. phys. nat., ser. 2, 5 (19): 136, fig. 3. Publication date: June 1898. Type locality: Guinea-Bissau: Bolama [11 35 N 15 30 W] [Goto Description]. - Comments: Andersen (1912b: 541) mentions the type specimen as being a mounted ad ?, skull extracted, coll. Sr. Damasceno da Costa, and in the Lisbon Museum.

1899. *Ep[omophorus (Epomophorus)] zechi* Matschie, Die Fledermäuse des Berliner Museums für Naturkunde. 1. Lieferung. Die Megachiroptera des Berliner Museums für Naturkunde, 46, pl 10, fig. 3 a-c. Type locality: Benin: Togoland: Kunjuruma [Goto Description]. Lectotype: ZMB 10170/17171: ad ♂, skin and skull. Collected by: Baumann; collection date: 1894. Lectotype designated by Andersen (1912b: 541); see Turni and Kock (2008) [skin: ZMB 10170 - skull: ZMB 17171]. Paralectotype: ZMB 10009: ad ♂, skin and skull. Collected by: Baumann; collection date: 1894. Kunjuruma. Paralectotype: ZMB 10011: juv ♂, skull only. Collected by: Bloess. Gross-Popo. Paralectotype: ZMB 10065: ad ♀, skull and alcoholic. Collected by: Anton Reichenow. Accra, Ghana. Paralectotype: ZMB 3413: ad ♂, skull and alcoholic. Lagos, Nigeria, acquired from Salmin. Paralectotype: ZMB 356: ad ♂, skin and skull. Collection date: 1855. West Africa acquired from Salmin. Paralectotype: ZMB 3654: ad ♂, skull and alcoholic. Collected by: Unger. Accra, Ghana. Paralectotype: ZMB 4784: ad ♂, skull and alcoholic. Collected by: Anton Reichenow. Accra, Ghana. - Comments: Kunjuruma is the location from lectotype: see Allen (1939a: 56). Boulay and Robbins (1989: 1) mention "Accra, Goldkuste [=Ghana], Gross-Popo, Misahoho in Togoland, Lagos [Nigeria], restricted to Kunjuruma, Togoland [=Benin] by Andersen (1912b)". Turni and Kock (2008: 10) mention "Matschie (1899b: 46) gave the locality of the specimens collected by Baumann as 'Misahöhe, Togoland' (= Missahoe, Togo); however, according to the entry book the locality is Kunjuruma." Preface by Matschie is dated 14 May 1899.

1950. *Epomophorus reii* Aellen, Rev. suisse Zool., 57 (3): 559. Type locality: Cameroon: Rei Bouba [ca. 08 37 N 14 09 E] [Goto Description]. Holotype: MHNC 32-8-970: ad ♀. Collected by: MSS Cameroun; collection date: 13 September 1947. Presented/Donated by: ?: Collector Unknown. Paratype: MHNC 32-8-969: imm ♀. Collected by: MSS Cameroun; collection date: 13 September 1947. Presented/Donated by: ?: Collector Unknown. - Comments: in part?.

? *Epomophorus anurus:* - Comments: Not of Heuglin, 1864.

? *Epomophorus gambianus gambianus:* (Name Combination, Current Combination)

? *Epomophorus sp.:*

TAXONOMY:
Simmons (2005:322) does not include *crypturus*.

GENERAL DISTRIBUTION:
This subspecies ranges from Senegal in the west, through much of West Africa and parts of Central Africa. It is typically a lowland species occurring below 500 m asl.

Native: Benin; Burkina Faso; Cameroon; Central African Republic; Chad; Congo (The Democratic Republic of the); Côte d'Ivoire; Gambia; Ghana; Guinea; Guinea-Bissau (Bocage, 1889a:2; Seabra, 1898b; Monard, 1939; Veiga-Ferreira, 1948; Bergmans, 1988; Lopes and Crawford-Cabral, 1992; Rainho and Ranco, 2001: 22); Liberia; Mali; Nigeria; Senegal; Sierra Leone; Togo.

Epomophorus gambianus pousarguesi Trouessart, 1904

*1904. *Epomophorus pousarguesi* Trouessart, Catalogus Mammalium tam viventium quam fossilium, supplement, 55. Type locality: Central African Republic: Grande Brousse between Yabanda and Mpoko. Holotype: MNHN ZM-MO-1892-1020: Collected by: Jean Dybowski; collection date: 1-11 December 1891. Bergmans (1978a: 682, 683) mentions two different numbers for this specimen. In the table on pag 682, he mentions 1899-1020 and on page 683 he mentions 1892-1020. - Comments: Boulay and Robbins (1989: 1) mention "Africa Occ.-Centrali, a fl. Chari (Inter Yabanda et Mpoko), reg. Lac. Chad. Central African Republic as type locality; restricted to 'along the track between Mpoko (near Makorou) and Yabanda' by Bergmans (1978b)". The type locality is sometimes given as "Eastern Congo, Shari region". Description based on *E. macrocephalus* Pousargues (not Ogilby) see Allen (1939a: 56).
? *Epomophorus gambianus pousarguesi:* (Name Combination, Current Combination)
? *Epomophorus gambianus:* - Comments: Not of Ogilby, 1835.

TAXONOMY:
Recognized as a subspecies (Simmons, 2005: 322).

GENERAL DISTRIBUTION:
In Ethiopia populations may be found up to 2,000 m asl.

Native: Ethiopia, South Sudan, Sudan.

Epomophorus grandis (Sanborn, 1950)

*1950. *Micropteropus grandis* Sanborn, Publ. Cult. Comp. Diamantes Angola, Lisboa, 10: 55, figs 2 - 3. Publication date: 29 November 1950. Type locality: Angola: Lunda: Dundo [07 22 S 20 50 E]. Holotype: FMNH 66433: ad ♀, skull and alcoholic. Collected by: A. de Barros Machados; collection date: September 1948; original number: 2015.
1988. *Epomophorus grandis:* Bergmans, Beaufortia, 38 (5): ???. (Name Combination, Current Combination)

TAXONOMY:
Transferred from *Micropteropus* to *Epomophorus* by Bergmans (1988). See Simmons (2005: 322).

COMMON NAMES:
Czech: kaloň Sanbornův. English: Sanborn's Epauletted Fruit-bat, Lesser Angolan Epauletted Fruit Bat. French: Epomophore de Sanborn, Petit Epomophore frugivore d'Angola. German: Sanborns Epaulettenflughund.

CONSERVATION STATUS:
Global - Listed as Data Deficient (DD ver 3.1 (2001)) in view of the absence of recent information on its extent of occurrence, ecological requirements, threats and conservation status (Mickleburgh *et al.*, 2008h; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) (Mickleburgh *et al.*, 2008h; IUCN, 2009). 2004 - DD ver 3.1 (2001) (Mickleburgh *et al.*, 2004e; IUCN, 2004). 2000 - DD (Hilton-Taylor, 2000). 1996 - EN (Baillie and Groombridge, 1996). 1994 - Rare (Groombridge, 1994).

MAJOR THREATS:
The threats to this species are not known. There is deforestation taking place in parts of the species range. However, it is not known how adaptable this species is to habitat modification (Mickleburgh *et al.*, 2008h; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008h) [in IUCN (2009)] report that it is not known if the species is present in any protected areas, and the area where it occurs has been inaccessible for many years, further studies are needed into the distribution, natural history and possible threats to this species.

GENERAL DISTRIBUTION:
Epomophorus grandis is a poorly known as it has only been recorded at the type locality of Dundo in northeast Angola (Sanborn, 1950), and from Pointe Noire on the coast of Congo (Bergmans, 1988).

Native: Angola (Bergmans, 1988; Sanborn, 1950; Monadjem *et al.*, 2010d: 552); Congo (Bergmans, 1988; Monadjem *et al.*, 2010d: 552; Bates *et al.*, 2013: 333).

HABITAT:
Although the natural history of this species is poorly known, it seems to be primarily a savanna species that may range into tropical moist forest (Mickleburgh *et al.*, 2008h; IUCN, 2009).

POPULATION:
Structure and Density - It is only known from a few specimens (Mickleburgh *et al.*, 2008h; IUCN, 2009).
Trend - 2008 - Unknown (Mickleburgh *et al.*, 2008h; IUCN, 2009).

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Angola, Congo.

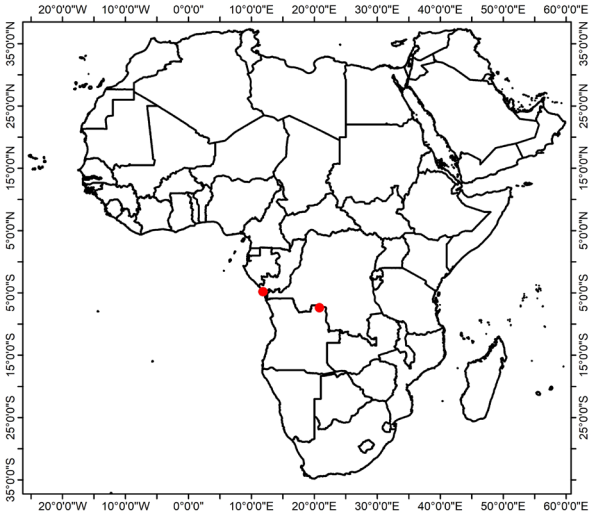

Figure 23. Distribution of *Epomophorus grandis*

Epomophorus labiatus (Temminck, 1837)

*1837. *Pteropus labiatus* Temminck, Monogr. Mamm, 2: 83, pl. 39, figs 1 - 3. Type locality: Sudan: Blue Nile province: Sennaar [15 35 N 33 38 E, 425 m] [Goto Description]. Lectotype: RMNH MAM.27342: juv ♀. Collected by: Dr. Paolo Emilio Botta. See Kock (1969a: 18). - Comments: Type locality originally given as "Abyssinia"; see Horácek *et al.* (2000: 96). Andersen (1912b: 530) mentions that Temminck (1835) had two specimens, one obtained in London without any indication about the country of origin, and a second from Paris, originating from the collections of M. Botta, the latter is the only one presently in the RMNH. - Etymology: From the Latin "*labiatus*" for lipped.

1842. *Pteropus Schoënsis* Rüppell, Mus. Senckenberg., 3 (2): 131. Type locality: Ethiopia: Shoa province: Shoa province [ca. 09 00 N 39 00 E] [Goto Description]. Holotype: SMF 4370: juv ♂, skin and skull. Collected by: Wilhem Peter Edward Simon Rüppell; collection date: 1841. Old catalog II.A.13a; see Kock (1969a: 18); Mertens (1925: 20) mentions it as a juv ♀. - Comments: Andersen (1912b: 531) already mentioned that the mounted specimen is of doubtfull sex.

1860. *Epomophorus labiatus:* Tomes, Proc. zool. Soc. Lond., 28: 55 - 56. (Name Combination, Current Combination)

1864. *Epomophorus anurus* Heuglin, Nov. Act. Acad. Cæs. Leop.-Carol., 31 (7): 12. Type locality: Sudan: Bahr-el-Ghazal province: Bongo [07 15 N 28 42 E]. Syntype: SMNS 1090: imm ♂, mounted skin and skull. Collected by: Martin Theodor von Heuglin; collection date: 1855. Dieterlen *et al.* (2013: 293) indicate that this specimen was collected in “Bellegas-Tal” [= Belegaz/Belghe], Abyssinia. Syntype: SMNS 1091: ad ♀, mounted skin and skull. Collected by: Martin Theodor von Heuglin; collection date: 1863/1864. Dieterlen *et al.* (2013: 293) indicate that this animal was collected in Bongo [= country of Bongo, southern part of the province of Bahr-el-Ghazal in the south of Sudan]. Syntype: SMNS 609/661: ad ♂, mounted skin and skull. Collected by: ?: Collector Unknown. Presented/Donated by: ?: Collector Unknown. Dieterlen *et al.* (2013: 293) mention the skull bears number 609, and that the mounted specimen has 661 as additional number. - Comments: Thorn *et al.* (2009: 20) mention 06 40 N 29 40 E. Type locality originally given as "Gebied zw. Wau am Djur River und dem Getti River im Westen", see Kock (1969a: 18). Two syntypes: SMNS 1090 (♂, imm) and SMNS 1091 (♀, ad).

1877. *Pteropus (Epomophorus) anurus:* Heuglin, Reise in Nordost Afrika, 2: 16 - 17. (Name Combination)

1877. *Pteropus (Epomophorus) labiatus:* Heuglin, Reise in Nordost Afrika, 2: 15 - 16. (Name Combination)

1877. *Pteropus (Epomophorus) schovanus:* Heuglin, Reise in Nordost Afrika, 2: 18. - Comments: Emendation of *schoënsis* (see Andersen, 1912b: 530; Allen, 1939a: 56; Kock, 1969a: 18). (Emendation)

1899. *Ep[omophorus (Epomophorus)] doriae* Matschie, Die Fledermäuse des Berliner Museums für Naturkunde. 1. Lieferung. Die Megachiroptera des Berliner Museums für Naturkunde,

54. Type locality: Eritrea: Bogos country [=Keren region] [ca. 15 45 N 38 20 E] [Goto Description]. Holotype: ZMB 10079: Collected by: Gerrard. Presented/Donated by: ?: Collector Unknown. Holotype: ZMB 5384/10079: ad ♀, skin and skull. Vendor Gerrard; see Kock (1969a: 18), and Turni and Kock (2008: 8) [skin: ZMB 5384 + skull: ZMB 10079].

1936. *Epomophorus labiatus minor:* G.M. Allen and Lawrence, Bull. Mus. comp. Zool., 79 (3): 45. - Comments: (Locality suggestive of *labiatus* rather than *Epomophorus minor* Dobson, 1880). (Name Combination)

1950. *Epomophorus reii* Aellen, Rev. suisse Zool., 57 (3): 559. Type locality: Cameroon: Rei Bouba [ca. 08 37 N 14 09 E] [Goto Description]. Holotype: MHNC 32-8-970: ad ♀. Collected by: MSS Cameroun; collection date: 13 September 1947. Presented/Donated by: ?: Collector Unknown. Paratype: MHNC 32-8-969: imm ♀. Collected by: MSS Cameroun; collection date: 13 September 1947. Presented/Donated by: ?: Collector Unknown. - Comments: in part?.

1960. *Epomophorus labiatus anurus:* Harrison, J. East Afr. Nat. Hist. Soc., 23 (7) (104): 287. Publication date: December 1960. (Name Combination)

? *Epomophorus cf. labiatus:*

TAXONOMY:
Includes *anurus* and *minor*; see Claessen and De Vree (1991), but see also Bergmans (1988) and Simmons (2005: 322 - 323). Middle Eastern forms reviewed by Horácek *et al.* (2000).

COMMON NAMES:
Azande (DRC): Ndima. Chinese: 小颈囊果蝠. Czech: kaloň sudánský. English: Little Epauletted Fruit-bat, Ethiopian Epauletted Fruit-bat, Ethiopian Epauletted Fruit Bat. French: Petit épomophore, Epomophore d'Ethiopie, Roussette labiée, Roussette labiaire. German: Temmincks Epaulettenflughund. Italian: Epomòforo labiàto. Kinande (DRC): Apopo.

CONSERVATION STATUS:
Global - Listed as Least Concern in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008l; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) [includes *E. minor* (Mickleburgh *et al.*, 2008l; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2004d; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
There appear to be no major threats to this species as a whole. Some populations may be threatened by overharvesting for subsistence food (Mickleburgh *et al.*, 2008l; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008l) [in IUCN (2009)] report that this species has been recorded from many protected areas. No direct conservation measures are currently needed for the species as a whole. Additional research is needed into the impact of possible overharvesting of animals on some populations.

GENERAL DISTRIBUTION:
Epomophorus labiatus is largely distributed in Central Africa and East Africa. It appears to range from northern Nigeria and Cameroon, into Chad, southern and central Sudan, Ethiopia and Eritrea, and from here south into eastern Democratic Republic of the Congo, Uganda, Rwanda and Burundi, Kenya and Tanzania (including the islands of Unguja [=Zanzibar] and Mafia [see O'Brien, 2011: 285]), being recorded as far south as Malawi, northern Mozambique and northern Zambia. There is one isolated record from coastal Congo, although the presence of the species in this country, and also in Chad and Nigeria, needs to be confirmed. It has been recorded from

lowland sites up to elevations of over 2,000 m asl (2,200 asl at Gondar, Ethiopia) (Mickleburgh *et al.*, 2008l; IUCN, 2009).

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 436,697 km^2.

Senegal records are probably erroneous (see Bergmans, 1988), although Capo-Chichi *et al.* (2004: 161) do refer to these records.

Native: Burundi; Cameroon; Congo (Bates *et al.*, 2013: 333); Congo (The Democratic Republic of the) (Bergmans, 1988; Monadjem *et al.*, 2010d: 552); Djibouti (Pearch *et al.*, 2001: 392); Eritrea (Yalden *et al.*, 1996); Ethiopia (Yalden *et al.*, 1996); Kenya (Aggundey and Schlitter, 1984; Malawi (Ansell, 1986; Bergmans, 1988; Happold *et al.*, 1988; Monadjem *et al.*, 2010d: 552); Mozambique (Monadjem *et al.*, 2010d: 552; Monadjem *et al.*, 2010c: 376); Rwanda (Baeten *et al.*, 1984); Saudi Arabia (Gaucher, 1992); Sudan (Koopman, 1975; Tanzania; Uganda (Kityo and Kerbis, 1996: 59); Yemen (Benda *et al.*, 2011b: 28); Zambia (Ansell, 1973; Bergmans, 1988; Monadjem *et al.*, 2010d: 552).
Presence uncertain: Chad; Congo; Nigeria.

SEXUAL DIMORPHISM:
Dobson (1873: 247) already indicated that Temminck noticed the absence of shoulder-tufts in the female.

MOLECULAR BIOLOGY:
Karyotype - Đulic and Mutere (1973b) recorded the diploid number as 2*n* = 36.

HABITAT:
This species is regularly recorded from woodland (including miombo woodland), savanna, bushland, arid or semi-desert grassland habitats and mosaics of these general habitat types. In East African coastal areas it has been recorded from mangroves (Mickleburgh *et al.*, 2008l).

HABITS:
It has been found resting together in small groups of about a dozen animals (Mickleburgh *et al.*, 2008l).

DIET:
Seltzer *et al.* (2013: table S2) provide an overview of the plant species found beneath bat feeding roosts. For *E. labiatus* this included *Ficus natalensis* Hochst (Natal Fig - Moraceae).

POPULATION:
Structure and Density - This is a common species (Mickleburgh *et al.*, 2008l; IUCN, 2009).

Trend - 2008 - Stable (Mickleburgh *et al.*, 2008l; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
Bergmans (1979a), Kingdon (1974), and Kulzer (1958) [in Krutzsch (2000: 110)] indicate that the male reproductive cycle of *E. labiatus* [as *E. anurus*] is apparently in synchrony with the one from the females as there occurs a biseasonal testicular hypertrophy in West Africa.

PARASITES:
Nycteribiidae: *Tripselia blainvillii* (Leach 1817) single record (Haeselbarth *et al.*, 1966: 113, host referred to as *E. anurus*).

Teinocoptidae: *Teinocoptes epomophori* Rodhain, 1923 was reported by Fain (1967: 367) from an *E. anurus* from Astrida (=Butare), Rwanda and from an *E. labiatus minor* from Bukavu, DRC.

VIRUSES:
Willoughby *et al.* (2017: Suppl.) report the following viruses: Entebbe bat virus and Shamonda orthobunyavirus. In Uganda, Kading *et al.* (2018: 3) found neutralizing antibodies against West Nile virus (WNV), Dengue 2 virus (DENV-2), non-specific Flaviviruses, Babanki virus (BBKV), and Rift Valley fever virus (RVFV).

Coronaviridae
28.6 % (10 out of 35) of the Kenyan *E. labiatus* tested positive for CoV in the study by Tao *et al.* (2017).

Flaviviridae
Pegivirus (BPgv) - 1 out of 3 bats from Kenya examined by Quan *et al.* (2013: Table S5) were infected by clade k type *Pegivirus*.

Drexler *et al.* (2012a: Suppl. Table S1) indicated that the single specimen they examined from the Democratic Republic of the Congo did not test positive for *Repirovirus, Henipavirus, Morbillivirus, Rubulavirus* or *Pneumovirus*.

UTILISATION:
Bobo and Ntumwel (2010: 232) report that, in the Korup area of Cameroon, "*E. anurus*" is being sold as a medicine on markets, since consuming it would render women fertile.

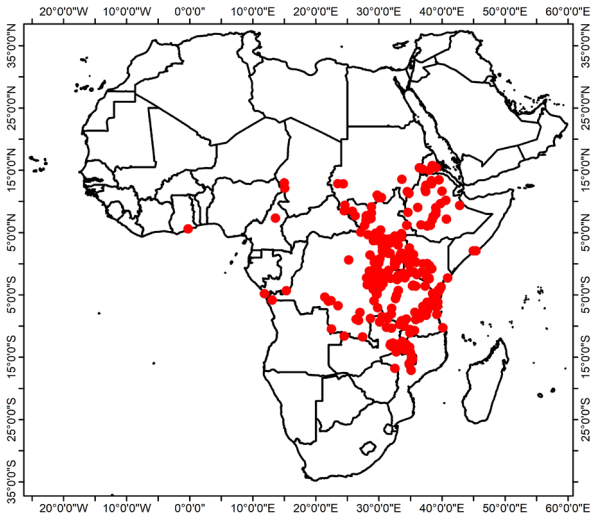

Figure 24. Distribution of *Epomophorus labiatus*

DISTRIBUTION BASED ON VOUCHER SPECIMENS: "Africa", Burundi, Cameroon, Chad, Congo, Congo (Democratic Republic of the), Djibouti, Eritrea, Ethiopia, Ghana, Kenya, Malawi, Mozambique, Rwanda, Somalia, South Africa, South Sudan, Sudan, Tanzania, Uganda, Zambia, Zimbabwe.

Epomophorus minimus Claessen & De Vree, 1991

1837. *Pteropus labiatus:* Temminck, Mon. Mammal., 2: 83 - 84. - Comments: Partim. One of the type specimens, an adult ♂, which later disappeared (Claessen and De Vree, 1991: 216). - Etymology: From the scientific Latin male adjective *labiàtus* meaning "lipped", referring to the expansible lower lip (see Lanza *et al.*, 2015: 36).
1861. *Epomophorus labiatus:* Tomes, Proc. zool. Soc. Lond., 29: 11. - Comments: Partim.
1899. *Ep[omophorus (Epomophorus)] schoensis:* Matschie, Die Fledermäuse des Berliner Museums für Naturkunde. 1. Lieferung. Die Megachiroptera des Berliner Museums für Naturkunde, 44, 53. - Comments: Partim. Not of Rüppell, 1842.
1930. *Epomophorus minor:* Zammarano, Le colonie Italiane, 146. - Comments: Not of Dobson, 1880.
1939. *Epomophorus labiatus minor:* G.M. Allen, Bull. Mus. comp. Zool., 83: 56. - Comments: Partim. Not of Dobson, 1880.
1971. *Epomophorus labiatus labiatus:* Hayman and Hill, Mammals of Africa: Chiroptera, 6 - 7. - Comments: Partim.
1984. *Epomophorus labiatus anurus:* Aggundey and Schlitter, Ann. Carnegie Mus., 53 (5): 124. - Comments: Animals from Katilo. Not of Heuglin, 1864.
*1991. *Epomophorus minimus* Claessen and De Vree, Senckenb. biol., 71: 216. Type locality: Ethiopia: Harar province: Shewa: Bahadu [10 05 N 40 37 E, 600 m]. Holotype: SMF 44238: ad ♀, skull and alcoholic. Collected by: M.J. Largen; collection date: 3 - 7 May 1971; original number: 16194. Full grown female with well developed nipples (see Claessen and De Vree (1991: 216). Paratype: SMF 44232: ad ♀, skull and alcoholic. Collected by: M.J. Largen; collection date: 3 - 7 May 1971. Presented/Donated by: ?: Collector Unknown. Paratype: SMF 44233: sad ♀, skull and alcoholic. Collected by: M.J. Largen; collection date: 3 May 1971. Presented/Donated by: ?: Collector Unknown. Paratype: SMF 44234: juv ♀, skull and alcoholic. Collected by: M.J. Largen; collection date: 3 May 1971. Presented/Donated by: ?: Collector Unknown. Paratype: SMF 44235: juv ♀, skull and alcoholic. Collected by: M.J. Largen; collection date: 3 May 1971. Presented/Donated by: ?: Collector Unknown. Paratype: SMF 44236: ad ♀, skull and alcoholic. Collected by: M.J. Largen; collection date: 3 - 7 May 1971. Presented/Donated by: ?: Collector Unknown. Paratype: SMF 44237: ad ♀, skull and alcoholic. Collected by: M.J. Largen; collection date: 3 - 7 May 1971. Presented/Donated by: ?: Collector Unknown. Paratype: SMF 44239: ad ♀, skull and alcoholic. Collected by: M.J. Largen; collection date: 3 - 7 May 1971. Presented/Donated by: ?: Collector Unknown. Paratype: SMF 44240: ad ♀, skull and alcoholic. Collected by: M.J. Largen; collection date: 3 - 7 May 1971. Presented/Donated by: ?: Collector Unknown. Paratype: SMF 44242: sad ♀, skull and alcoholic. Collected by: M.J. Largen; collection date: 3 - 7 May 2015. Presented/Donated by: ?: Collector Unknown. Paratype: SMF 44243: juv ♀, skull and alcoholic. Collected by: M.J. Largen; collection date: 5 May 1971. Presented/Donated by: ?: Collector Unknown. Paratype: SMF 44245: ad ♀, skull and alcoholic. Collected by: M.J. Largen; collection date: 3 - 7 May 1971. Presented/Donated by: ?: Collector Unknown. Paratype: SMF

44246: sad ♂, skull and alcoholic. Collected by: M.J. Largen; collection date: 3 May 1971. Presented/Donated by: ?: Collector Unknown. Paratype: SMF 44247: ad ♂, skull and alcoholic. Collected by: M.J. Largen; collection date: 3 - 7 May 1971. Presented/Donated by: ?: Collector Unknown. Paratype: SMF 44248: sad ♂, skull and alcoholic. Collected by: M.J. Largen; collection date: 3 May 1971. Presented/Donated by: ?: Collector Unknown. Paratype: SMF 44250: juv ♂, skull and alcoholic. Collected by: M.J. Largen; collection date: 3 May 1971. Presented/Donated by: ?: Collector Unknown. Paratype: SMF 44252: ad ♂, skull and alcoholic. Collected by: M.J. Largen; collection date: 3 - 7 May 1971. Presented/Donated by: ?: Collector Unknown. Paratype: SMF 44253: juv ♂, skull and alcoholic. Collected by: M.J. Largen; collection date: 3 May 1971. Presented/Donated by: ?: Collector Unknown. Paratype: SMF 44325: juv ♀, skull and alcoholic. Collected by: M.J. Largen; collection date: 3 May 1971. Presented/Donated by: ?: Collector Unknown. - Etymology: From the Latin superlative masculine adjective *mìnimus* meaning "least, smallest" referring to the relatively small size of the species (see Lanza *et al.*, 2015: 41). (Current Combination)

TAXONOMY:
Included in *E. minor* by Bergmans (1988). Recognized as a full species by Claessen and De Vree (1991); Simmons (2005: 323).

Based on multivariate analyses, Claessen and De Vree (1991) concluded that the type specimen of *Epomophorus minor* fitted within the variation displayed by *E. labiatus* and that this name should be considered a synonym of *E. labiatus*. Consequently, no valid name was available for the smallest form included in the genus *Epomophorus* at that time. For these specimens, they proposed the new name Epomophorus minimus. However, Brosset and Caubère (1960) provided a further analysis of the problem and rejected this view, and reinstated the name *minor*. The situation is currently still not completely resolved with both names being used by various authors. The systematics of the small-sized *Epomophorus* forms, therefore, still remains unclear and needs further investigation.

Member of the *gambianus* species group.

COMMON NAMES:
Chinese: 侏颈囊果蝠. Czech: kaloň habešský. English: Least Epauletted Fruit-bat, East African Epauletted Fruit-bat, East African Epauletted Fruit Bat. French: Petit Epomophore, Epomophore nain. German: Winziger Epaulettenflughund. Italian: Epomòforo mìnimo.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008j; IUCN, 2009).

Assessment History - 2008 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2008j; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2004j; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
There appear to be no major threats to this species. It is locally threatened in parts of its range by deforestation of its habitat for timber and firewood (Mickleburgh *et al.*, 2008j; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008j) [in IUCN (2009)] report that *E. minimus* it is not known if the species is present in any protected areas and further studies are needed into the distribution, natural history and possible threats to this species.

GENERAL DISTRIBUTION:
Epomophorus minimus is an East African species which is present in Uganda, northern Tanzania, Kenya, Ethiopia and Somalia.

Native: Ethiopia (Yalden *et al.*, 1996); Kenya (Aggundey and Schlitter, 1984; Somalia (Funaioli and Simonetta, 1966); Tanzania; Uganda (Kityo and Kerbis, 1996: 58).

HABITAT:
Recorded from dry and arid savanna habitats.

DIET:
It is possible that this species has a specialised diet to persist in its arid habitat (Mickleburgh *et al.*, 2008j).

POPULATION:
Structure and Density - It can be a common species (Mickleburgh *et al.*, 2008j; IUCN, 2009). Trend - 2008 - Stable (Mickleburgh *et al.*, 2008j; IUCN, 2009)

VIRUSES:
Drexler *et al.* (2012a: Suppl. Table S1) indicated that three out of six specimens they tested from the Democratic Republic of the Congo were positive for *Rubulavirus*.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Congo (Democratic Republic of the), Ethiopia, Kenya, Somalia, Tanzania, Uganda.

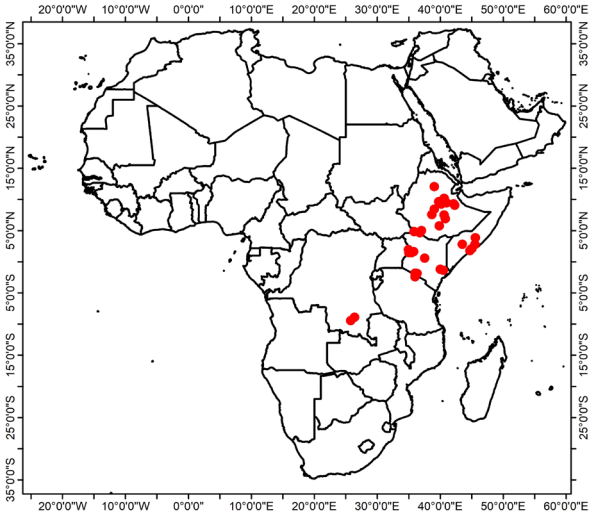

Figure 25. Distribution of *Epomophorus minimus*

Epomophorus minor Dobson, 1880

*1880. *Epomophorus minor* Dobson, Proc. zool. Soc. Lond., 1879, IV: 715. Publication date: April 1880. Type locality: Tanzania: Zanzibar [ca. 06 10 S 39 12 E]. Holotype: BMNH 1879.9.12.4: juv ♂, skull and alcoholic. Exchanged from Surgon-General G.E. Dobson see Turni and Kock (2008). Paratype: ZMB 5550: ad ♀, skull and alcoholic. Presented/Donated by: George Edward Dobson. See Turni and Kock (2008: 8). - Comments: Andersen (1912b: 532) furthermore mentions that paratypes were distributed by Dobson to various museums. Considered a valid species by Kock (1969a: 18 - 24), Koopman (1975: 363) and Ansell and Dowsett (1988: 27), but see Claessen and De Vree (1991). - Etymology: From the Latin "*minor*" (= smaller). (Current Combination)
1896. *Epomophorus pusillus:* Pousargues, Ann. Sci. Nat., (8) 3: 255.
? *Epomophorus anurus:* - Comments: Not of Heuglin, 1864.
? *Epomophorus labiatus anurus* - Comments: Not of Heuglin, 1864.
? *Epomophorus labiatus minor:* (Name Combination)
? *Epomophorus labiatus:* (Name Combination)
? *Epomophorus minor minor:* (Name Combination)

TAXONOMY:
Recognized as a full species by Simmons (2005: 323).

COMMON NAMES:
Czech: kaloň zanzibarský, kaloň menší. English: Minor Epauletted Fruit Bat. German: Zwerg-Epaulettenflughund. Yao: Lichinji (applied to all large bats).

CONSERVATION STATUS:
Global - Unknown.

GENERAL DISTRIBUTION:
Ethiopia, Somalia, Sudan, Kenya, Rwanda, SE Dem. Rep. Congo, Zambia, Tanzania, Zanzibar, Uganda, Malawi (Simmons, 2005: 323).

PARASITES:
Hirst (1923: 980) described a new mite species (*Ancystropus æthiopicus*) from an *E. minor* specimen from Zanzibar.

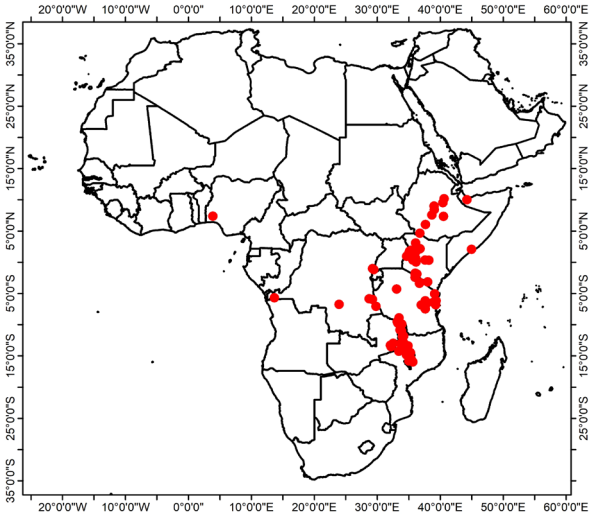

Figure 26. Distribution of *Epomophorus minor*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Congo (Democratic Republic of the), Ethiopia, Kenya, Malawi, Mozambique, Nigeria, Somalia, Sudan, Tanzania, Zambia.

Epomophorus wahlbergi (Sundevall, 1846)

1846. *Pteropus Haldemani* Hallowell, Proc. Acad. nat. Sci. Philad., 3 (3): 52. Publication date: prior to July 1846. Type locality: Liberia [Goto Description]. - Comments: Holotype; ad ♀, SA, in the collection of the Academy of Natural Sciences of Philadelphia, see Andersen (1912b: 524), who further mentions "'W. Africa,' obtained from 'Dr. Goheen, Physician to the American Colonization Society' (from this it might be supposed that the specimen came from Liberia; there can be little doubt, however, that it was obtained elsewhere in W. Africa; no form of *Epomophorus* with the palate-ridges of the *walhbergi* type is known to inhabit the Guinea coast west of the Cameroons)." Allen (1939a: 56) suggests that the specimen might possible have come from Liberia. Considered a valid species by Schutt and Simmons (1998: 27).

*1846. *Pteropus Wahlbergi* Sundevall, Öfvers. kongl. Sv. Vet.-Akad. Förhandl., 3 (4): 118. Type locality: South Africa: KwaZulu-Natal: Port Natal [=Durban], near [29 52 S 31 00 E] [Goto Description]. - Comments: Type locality originally: "Prope Port-Natal et in Caffraria interiore occisus" see Acharya (1992: 1). As to the publication date, Andersen (1912b: 526, footnote) mentions "Sundevall's paper was read before the Stockholm Academy on May 13th, 1846, and presumably published in the latter half of May or in June (the 'Öfversigt' appears to have been issued regularly for every month in which the Academy held a meeting). Hallowell's description of *Pt. haldemani* was passed by the Publication Committee on May 26th, 1846, and printed in the May-June issue of the Proceedings of the Philadelphia Academy, which cannot have come out before, in the earliest, in July, since it contains a report of a meeting held on June 30th. The balance of evidence would seem, therefore, to be in favour of the date priority of *Pt. wahlbergi*". Andersen (1912b: 527) also mentions "Type (by selection) in the Riksmuseum, Stockholm, a well-preserved mounted adult male, skull separate (nearly perfect), Tugela River, Natal, 27 Nov. 1843, J. Wahlberg coll., Reg. No. 1040.". - Etymology: Named after Johan August Wahlberg (1810 - 1856), explorer, hunter and outstanding collector of zoological material in Southern Africa. He was killed in 1856 by a wounded elephant near Savuti in northern Botswana (see Gyldenstolpe, 1933; Taylor, 2005, Lanza *et al.*, 2015: 48).

1870. *[Epomophorus macrocephalus] var. unicolor* Gray, Catalogue of Monkeys, Lemurs and Fruit-eating bats in the collection of the British Museum London, 125 [Goto Description].

1870. *Epomophorus macrocephalus var. unicolor* Gray, Catalogue of Monkeys, Lemurs and Fruit-eating bats in the collection of the British Museum London, 125. Type locality: Mozambique: Zambesi River: Shupanga [=Chupanga] [18 02 S 35 37 E]. Holotype: BMNH 1864.8.16.1: sad ♀, skin and skull. Collected by: Dr. Sir John Kirk; collection date: June.

1899. *Ep[omophorus (Epomophorus)] neumanni* Matschie, Die Fledermäuse des Berliner Museums für Naturkunde. 1. Lieferung. Die Megachiroptera des Berliner Museums für Naturkunde, 43, 50. Type locality: Kenya: Mombassa [04 03 S 39 40 E] [Goto Description]. Lectotype: ZMB 9967: ad ♂, skull and alcoholic. Collected by: Dr. Johann Maria Hildebrandt; collection date: about 1880. Lectotype designated by Andersen (1912b: 525); see Turni and Kock (2008). Paralectotype: ZMB 53873: ♀, skull and alcoholic. Collected by: Michael Rodgers Oldfield Thomas; collection date: 1898. Takaungu, Kenya. Paralectotype: ZMB 53897: ♀, skull and alcoholic. Collected by: Michael Rodgers Oldfield Thomas; collection date: 1898. Takaungu, Kenya. Paralectotype: ZMB 5428: ♀, skull and alcoholic. Collected by: Dr. Johann Maria Hildebrandt; collection date: ca. 1876. Mombassa. Paralectotype: ZMB 54367: ♂, skull and alcoholic. Collected by: Michael Rodgers Oldfield Thomas; collection date: 1898. Takaungu, Kenya. See Turni and Kock (2008: 9). Paralectotype: ZMB 5597: juv ♂, skull and alcoholic. Collected by: Fischer. Malini, Kenya. Paralectotype: ZMB 9968: juv ♀, skull and alcoholic. Collected by: Prof. Oscar Rudolph Neumann; collection date: January 1898. - Comments: Mombasa is the locality of the lectotype: see Allen (1939a: 57). Acharya (1992: 1) mentions "No type originally designated. Type locality restricted to "Mombassa, British East Africa (=Kenya) by Andersen (1912b: 524)". Matschie mentioned 14 May 1899 in his introduction.

1899. *Ep[omophorus (Epomophorus)] stuhlmanni* Matschie, Die Fledermäuse des Berliner Museums für Naturkunde. 1. Lieferung. Die Megachiroptera des Berliner Museums für Naturkunde, 50. Type locality: Tanzania: Usaramo: Vikindo [06 59 S 39 17 E, 120 m]

[Goto Description]. Lectotype: ZMB 9982/9983: ad ♂, skin and skull. Collected by: Dr. Franz Ludwig Stuhlmann; collection date: 11 January 1894. Lectotype designated by Andersen (1912b: 527); skull damaged [skin: ZMB 9983 + skull: ZMB 9982]. Paralectotype: ZMB 10000: ♀, skull and alcoholic. Collected by: Dr. Franz Ludwig Stuhlmann. Zanzibar. Paralectotype: ZMB 10001: ♀, skull and alcoholic. Collected by: Neumann. Zanzibar. Paralectotype: ZMB 10002: ♂, skull and alcoholic. Collected by: Neumann. Zanzibar. TAXONOMY:

Figure 27. *Epomophorus wahlbergi* from Durban, KwaZulu Natal, South Africa.

Reviewed by Acharya (1992). See Simmons (2005: 323).

COMMON NAMES:
Afrikaans: Wahlberg se vrugtevlermuis, Wahlberg-witkolvrugtevlermuis. Chinese: 韦氏颈囊果蝠. Czech: kaloň Wahlbergův. English: Wahlberg's Epauletted Fruit-bat, Wahlberg's Epauletted Fruit-bat. French: Epomophore frugivore de Wahlberg, Roussette à épaulettes de Wahlberg. German: Wahlbergs Epaulettenflughund. Italian: Epomòforo di Wàhlberg. Portuguese: Morcego frugivoro de Wahlberg. Spanish (Castillian): Zorra Voladora

SIMILAR SPECIES:
Taylor and Monadjem (2008: 24) provided data which enabled them to separate *E. wahlbergi* from *E. crypturus*. In the first species, the maxillary width is always larger than in the latter (♂♂: > 14 mm; ♀♀: > 13 mm).

Adams and Snode (2015) analysed the male mating calls of two groups of epauletted bats (*E. wahlbergi* and *E. crypturus*) in the Kruger National Park, and found differences in mean fundamental frequency, mean high frequency, mean low frequency, mean bandwidth, and mean call slope. They hypothesize that these differences may be used to avoid cross-mating between species.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008k; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2008k; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2004f; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - LC ver 3.1 (2001) (Schoeman *et al.*, 2016d). 2004 - LC ver 3.1 (2001) (Friedmann and Daly, 2004).

MAJOR THREATS:
There appear to be no major threats to this species as a whole (Mickleburgh *et al.*, 2008k; IUCN, 2009). However, MacEwan (2016: 3) reports on *E. walhbergi* fatalities as a result of encounters with wind turbine blades.

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008k) [in IUCN (2009)] report that it is present in many protected areas and no direct conservation measures are currently needed for this species as a whole.

GENERAL DISTRIBUTION:
Epomophorus wahlbergi is found in Central Africa, East Africa and southern Africa (it is broadly distributed across southern Africa). It has been recorded from Cameroon (Aellen, 1952), Equatorial Guinea (Rio Muni), Gabon, Congo and Angola in the west, through southern Democratic Republic of the Congo and Rwanda, being distributed in East Africa from Uganda, Kenya and southern Somalia in the north, through Tanzania (including the islands of Unguja [=Zanzibar], Pemba, and Mafia [see O'Brien, 2011: 285]), Zambia, Malawi and Mozambique into Zimbabwe, eastern and southern South Africa and Swaziland. There is a need to confirm the presence of this species in Cameroon and Equatorial Guinea. It ranges from sea level to around 2,000 m asl (Mickleburgh *et al.*, 2008k; IUCN, 2009).

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 1,327,859 km^2.

In South Africa, its distribution is strongly associated with annual precipitation (Babiker Salata, 2012: 49).

Liberian records are probably erroneous.

Native: Angola (Bergmans, 1988; Crawford-Cabral, 1989; Monadjem *et al.*, 2010d: 552); Botswana; Burundi; Congo (Bates *et al.*, 2013: 333); Congo (The Democratic Republic of the) (Schouteden, 1944; Hayman *et al.*, 1966; Dowsett *et al.*, 1991: 259; Monadjem *et al.*, 2010d: 552); Gabon; Kenya; Malawi (Happold *et al.*, 1988; Bergmans, 1988; Happold and Happold, 1997b: 815; Monadjem *et al.*, 2010d: 554); Mozambique (Smithers and Lobão Tello, 1976; Bergmans, 1988; Monadjem *et al.*, 2010d: 554; Monadjem *et al.*, 2010c: 376); Rwanda; Somalia; South Africa (Monadjem *et al.*, 2010d: 553); Swaziland (Monadjem *et al.*, 2010d: 553); Tanzania (Stanley and Goodman, 2011: 37); Uganda; Zambia (Ansell, 1978; Bergmans, 1988; Cotterill, 2002b: 6; Monadjem *et al.*, 2010d); Zimbabwe (Monadjem *et al.*, 2010d: 553).
Presence uncertain: Cameroon; Equatorial Guinea, Namibia (Cotterill, 2004a: 260).

DENTAL FORMULA:
At birth, the following dentition is present:

i $^{2}/_{2}$ c ^{1} / $_{1}$ p $^{1}/_{1}$ = 16

The adult dental formula is:

I $^{2}/_{2}$ C $^{1}/_{1}$ P $^{2}/_{3}$ M $^{1}/_{2}$ = 28 (Sowler, 1980: 113).

Sowler (1980: 113) also reports that the second deciduous premolars appear between the second and third week, making a total of 20 teeth. All of the permanent teeth are present between week 12 and 14.

DETAILED MORPHOLOGY:
Tongue - Mqokeli and Downs (2012b examined eight *E. wahlbergi* from Pietermaritzburg, South Africa where all studied had an elongated, muscular tongue of 4.4 ± 0.33 cm (mean ± SD) long and 1.1 ± 0.4 cm (mean ± SD) wide. The anterior tip of the tongue of each was narrower compared with the broader posterior part of the tongue. The anterior tip of the tongues was 0.2 ± 0.05 cm thick with a width of 0.7 ± 0.10 cm (mean ± SD). The mid-region of the tongues had a thickness of 0.6 ± 0.05 cm and a width of 1 ± 0.20 cm (mean ± SD). The posterior regions of the tongues were 0.7 ± 0.00 cm thick and 1.5 ± 0.10 cm wide. The dorsal surface of the tongues possessed two types of mechanical papillae, filiform and conical papillae, and two types of gustatory papillae, fungiform and circumvallate papillae, which varied in distribution. Filiform papillae were highly abundant and occurred on the entire surface of the tongue. These papillae were posteriorly directed, with the small filiform papillae situated at the anterior tip of the tongue. Larger filiform papillae were present as a band posterior to these in the anterior to mid-regions of the tongue. Small filiform papillae with fungiform papillae occurred on either side of the giant filiform papillae band. The posterior part of the *E. wahlbergi* tongue (behind the giant filiform papillae) had elongated basket-like filiform papillae. These had large projections and occupied most of the posterior region of the tongue. Fungiform papillae occurred among these filifor papillae. The elongated basket-like filiform papillae were symmetrically arranged with respect to the axis of the tongue. The filiform papillae transformed into conical papillae on the left and right side of the posterior base of the tongue and pointed inwards. Short conical papillae occurred on the midportion of the posterior region of the tongue. Fungiform papillae were scattered among the filiform papillae, except in areas of giant filiform and conical papillae. At the posterior end of the tongue occurred a triangular arrangement of three circumvallate papillae directed toward the pharynx surrounded by a deep groove.

Brain - Chawana *et al.* (2013: 160) indicate the average brain mass for 2 specimens was reported as 1.81 g.

Physiology - Minnaar *et al.* (2014b: 475) studied the evaporative water loss and indicate that they can not substantiate previous findings of 5 to 10 % of the gas exchanges being done over the wing membrane.

FUNCTIONAL MORPHOLOGY:
Makanya and Mortola (2007: 687) and Kovalyova (2014: 326) indicate that the body skin epidermis for this species thick (61 ± 3 µm, SEM), the stratum corneum alone taking a third of it (21 ± 3 µm). The wing membrane was 27.8 ± 3.1 µm thick, of which the epidermis took 9.8 ± 0.7 (9.1 - 10.5) µm, with a stratum corneum (horny layer) of 4.1 ± 0.3 (3.7 - 4.4) µm. Makanya and Mortola (2007: 687) conclude that the wing web has structural modifications that permit a substantial contribution to the total gas exchange.

Coimbra *et al.* (2016: 191) mention that the eye in this species contains about 200,000 retinal ganglion cells. The minimum angle of resolution was approximately 0.167° (ca. 5-6 mm at 1 m distance).

SEXUAL DIMORPHISM:
Adams and Snode (2013: 54) indicate that males are larger than females and have bulldog-like facial pouches that inflate during mate-calling.

MOLECULAR BIOLOGY:
DNA - Unknown
Karyotype - 2*n* = 36, FN = 68 (Đulic and Mutere, 1973b; Peterson and Nagorsen, 1975; Đulic and Mutere, 1977). Đulic and Mutere (1973b; 1977) reported BA = 34, whereas Peterson and Nagorsen (1975) reported BA = 36 as they included the X (no male studied).
Protein / allozyme - Unknown.

HABITAT:
Although *E. wahlbergi* was found in bushed *Acacia* steppe, Lönnberg (1912: 27) doesn't regard this species as a steppe mammal, since a forest of tall Acacias and other trees was nearby.

HABITS:
Wickler and Seibt (1976) suggest that male *E. wahlbergi*'s call out to space out other males, but also to attract females. Funakoshi *et al.* (1995: 504) indicate that their communication calls consist of several harmonics covering the 2 - 8 kHz range, with a duration of 200 - 300 msecs, which also contain a slight click at the beginning.

In a study at the University of KwaZulu-Natal, Downs *et al.* (2015: 7) found that in winter bats generally slept for longer periods of time, and more often than in summer, and that no bats were sleeping when the ambient temperature was above 35°C. During the winter season, the percentage of sleeping bats increased between 9 and 12 o'clock as T_a increased. In both seasons, more bats were sleeping with both eyes closed than with only one open. During the first hours after their nightly activity, sleep with both eyes closed was more often observed, but this diminished later on during the day, with one eye open sleep reaching its peak around 10h00.

ROOST:
Day roosts are often located in the dense foliage of riverine or gallery forests, but sometimes caves are used too. Three to six individuals roost in small groups, and roosts are switched every five or six days, sometimes only for a few metres (Kunz, 1996: 44).

Wickler and Seibt (1976) [in McCracken and Wilkinson (2000:350)] found that *E. wahlbergi* roosts in palm leaves or thatch roofs in mixed sex colonies, containing from three to over 100 animals, where the individuals are spaced at least 2.5 cm apart (except for female-young pairs).

In the Durban area, Taylor *et al.* (1999: 66) reported *E. wahlbergi* to roost along the undersurface midribs of royal palm (*Roystonia elata* (Kunth) O.F. Cook) leaves, and sometimes under eaves of double-storey houses or in recesses under a concrete road bridge.

The bats also regularly change their day roost (see Rollinson *et al.*, 2014: 173), e.g. to reduce the distance from the roost site to their feeding sites. During the winter they changed their roosting sites more often than during the summer (p. 179). These authors also reported that the roost temperatures are generally higher than the ambient temperature, and that roosts in man-made structures had usually a higher temperature than those in natural vegetation (e.g. in *Bougainvillea, Borassus, Trema orientalis*).

DIET:
Voigt *et al.* (2011: 355) found *E. wahlbergi* to be the second most important seed disperser for syringa fruits (*Melia azedarach*), which is an alian invasive tree species in KwaZulu Natal. Jordaan *et al.* (2011: 961) fed captive specimens with fruits of *Psidium guajava* L. (Myrtaceae) and *Melia azedarach* L. (Meliaceae) during the month of May, and with those of *Eriobotrya japonica* (Thunb.) Lindl. (Rosaceae) and *Morus alba* L. (Moraceae) during September. *Solanum mauritianum* Scopoli (Solanaceae) and *Cinnamomum camphora* (L.) J. Presl. (Lauraceae) fruits were also made available to the bats, but were not eaten by any of the individuals.

In Congo, Kipalu (2009: 16) reported *E. wahlbergi* visiting/consuming fruits of the Borassus palm (*Borassus aethiopum*), African peach (*Nauclea diderichii*), and Mango (*Mangifera indica*).

Seltzer *et al.* (2013: table S2) provided an overview of the plant species found beneath bat feeding roosts. For *E. wahlbergi* these include *Rauvolfia caffra* Sond. (Quinine Tree - Apocynaceae), *Ficus natalensis* Hochst (Natal Fig - Moraceae) and *Syzygium cordatum* Hochst. (water-berry tree - Myrtaceae).

Govender *et al.* (2016: 315) found that *E. wahlbergi* prefered ripe figs over green ones.

Wickler and Seibt (1976) [in Bonaccorso *et al.* (2014: 50)] reported *E. wahlbergi* feeding on leaves of *Balanites wilsonianea* (Balanitaceae) in East Africa. Bonaccorso *et al.* (2014: 50) indicated this might also be the case in the Kruger National Park. Based on data from captive feeding experiments Bonaccorso *et al.* (2014: 50) extrapolated that the Skukuza bat colony (133

animals in 2007) would have dispersed 3.2 million fig seeds per night.

Downs *et al.* (2011b: 148) indicate that *E. wahlbergi*'s body mass was significantly higher in winter than in summer, which is possibly not attributable to an increase in body fat, but rather to excessive eating as result in increased metabolic costs.

Rollinson *et al.* (2013: 340) found that in the urban environment of Pietermaritzburg, South Africa, the bats had a greater home range in winter than in spring, which was linked with the reduction of fruiting plant species. They also found (p. 343) that male home ranges were smaller than those of females (0.46 km^2 versus 0.78 km^2). Their mean foraging distance was 1.45 ± 0.2 km in winter and 0.88 ± 0.08 km in spring.

Namah *et al.* (2019: 2) expected *E. wahlbergi* to be the pollinator of sausage trees (*Kigelia africana* (Lam.) Benth.) in the Kruger Park (RSA), but could not find any proof of this. Nor could they confirm pollination by any other species of bat.

Coleman and Downs (2012: 431) investigated the effect of sugar type and concentration on *E. wahlbergi* and suggest that these bats do not appear to have a selective pressure on the sugar composition of the fruit they eat. Mqokeli and Downs (2014: 161) performed some tests with equicaloric solutions (15 % glucose or 15 % sucrose with 0, 2.58, 5.68, 7.23 g soy protein/kg H_2O). Volumetric intake of the respective glucose and sucrose solutions varied among individual bats, with total volumetric intake being highest for solutions with no protein. The authors concluded that this suggests *E. wahlbergi* has low protein dietary requirements, which may be a response to the low-protein fruit available in the wild. They do point out that the bats may supplement their diet by actively preying on insects, but this needs to be investigated.

Blood plasma glucose concentrations – *Epomophorus wahlbergi*'s blood plasma glucose concentration was lower (5.24 ± 0.38 mmol/l) at 18:00 before feeding and increased during/after feeding (8.19 ± 1.24 mmol/l) but bats appeared to regulate it within limits (Mqokeli and Downs, 2012a: 348). Glucose intake of *E. wahlbergi* is generally high irrespective of sugar concentration (Coleman and Downs, 2012; Downs *et al.*, 2011a). Mqokeli and Downs (2012a: 349) found that blood plasma glucose concentration differed significantly with time. The greatest individual variation in blood plasma glucose concentrations were recorded at 24:00 possibly because of varying feeding and digestion rates (Mqokeli and Downs, 2012a: 350). Mqokeli and Downs (2012a: 349) found that blood plasma glucose concentrations were generally higher than the upper limit of the normal mammalian blood plasma glucose range. Mqokeli and Downs (2012a) showed diet variations in blood plasma glucose concentrations with an increase in concentrations during or directly after feeding. Mqokeli and Downs (2012a: 349) found that the body masses differed significantly at the respective blood sampling times. The lowest mean body mass (± S.E) was at 18:00 (99.69 ± 5.55 g) while the highest mean body mass was at 24:00 (105.05 ± 5.75 g). There was a significant difference in body mass between the 12:00 and 18:00 sampling times, and between the 24:00 and 18:00 sampling times. At 24:00 all bats had fed on the fruit provided and at 06:00 little fruit remained. The increase in body mass at 24:00 was about 6 %.

Germination experiments performed with four *E. wahlbergi* specimens captured on Mount Kilimanjaro (Tanzania), and fed with fig fruit parts of *Ficus sur* trees resulted in an overal germination percentage of 49.3 % after 13 days (Helbig-Bonitz *et al.* (2013: 123).

PREDATORS:
Broadley (in Schätti, 1984: 340) reports that these bats were eaten by Gaboon vipers (*Bitis gabonica*) kept in captivity.
Mikula *et al.* (2016: Supplemental data) mention the following diurnal avian predators: Dickinson's kestrel (*Falco dickinsoni* Sclater, 1864), Wahlberg's eagle (*Hieraaetus wahlbergi* (Sundevall, 1851)), Crowned eagle (*Stephanoaetus coronatus* (Linnaeus, 1766)); Trumpeter hornbill (*Bycanistes bucinator* (Temminck, 1824)).

POPULATION:
Structure and Density - Common (Mickleburgh *et al.*, 2008k; IUCN, 2009).
Trend - 2008 - Stable (Mickleburgh *et al.*, 2008k; IUCN, 2009).

LIFESPAN:
Szekely *et al.* (2015: Suppl.) report a maximum longevity of 10.1 years.

REPRODUCTION AND ONTOGENY:
Close to the equator, this species has two birth periods in February-March and in October-December (Bergmans, 1979a; O'Shea and Vaughan, 1980), or an extended period from October to January (Wickler and Seibt, 1976; Bernard and Cumming, 1997). Further south in Malawi and Zambia this species has been described as 'aseasonally polyoestrus' with births from September to March (Happold and Happold,

1990b). In southern Africa, this species has been described as 'seasonally polyoestrus' (Taylor, 2005). Although Taylor (1998) reported that in the KwaZulu-Natal province of South Africa 'breeding occurs throughout the year with peaks in July and in the summer'. However, this statement was based on an unpublished dataset by C. Sapsford, and further details were not presented (Taylor, 2005) in [Skinner and Chimimba, 2005]). In Zimbabwe, gravid females have been recorded in June and December (Smithers and Wilson, 1979), suggesting an extended breeding season. By contrast, in Kruger National Park, South Africa, parturition has been recorded in November-December (Pienaar *et al.*, 1980). In Swaziland, subadults were present throughout the year with two peaks (January-May and August-October), while lactating females were only present between December and May (Monadjem and Reside, 2012: 322).
Lönnberg (1912: 47) mentioned that two of the three females captured on 20 March 1911 at the upper Luazomela River, Kenya were carrying young of approximately 6 cm. Stanley and Goodman (2011: 37) reported a pregnant female collected in the South Pare Mountains, Tanzania, on 20 July 1993.
One female, taken by Bergmans (1979a: 174) in Congo on 21-22 November was lactating, while three others, taken between 28 November and 13 December, were pregnant.

Szekely *et al.* (2015: Suppl.) report a gestation period of 165 days, and two litters per year.

MATING:
Wickler and Seibt (1976) [in Krutzsch (2000: 111)] indicate that male mating patterns also include courtship vocalizations (calling territories). Males also establish nocturnal display sites where females visit the males for mating (see McCracken and Wilkinson, 2000: 349). At Skukuza (Kruger National Park), Adams and Snode (2015: 4) found the following values for the male mating calls: mean fundamental frequency: 7.88 ± 0.11 kHz (first harmonic) followed by a second harmonic: 15.71 ± 0.23 kHz.

Adams and Snode (2013: 54) investigated the male-male competition for females during the mating season and found (p. 58) that the most dominant individuals were calling nearest to a ripe fig tree, and therefore more likely to be noticed by a foraging female. None of the males they observed were calling from nonfruiting sycamore fig trees.

Chaverri *et al.* (2018: 1942) point out the role of the retractile white shoulder tufts, which are erected during courtship by wing-flapping males. They also suggest that these movements may help spread pheromones.

PARASITES:
BACTERIA
One out of five bats tested by Dietrich *et al.* (2016b: 3) in Pafuri (RSA) tested positive for *Bartonella* bacteria, and one out of two bats from Rocktail Bay (RSA) tested positive for *Rickettsia*, as did one out of 80 tested from Umbilo (RSA).

gram-negative
Helmick *et al.* (2004: 88) reported a novel *Pasteurella*-like organism found in lung tissue of two captive Wahlberg's epauleted fruit bats, which were recently shipped, and died soon after release from a 30-day quarantine period.

HAEMOSPORIDA
Garnham (1948, 1950) [in Miltgen *et al.* (1977: 595)] described some liver schizonts and gametocytes, which he assigned to the genus *Hepatocystis*.

ACARI
Teinocoptidae: Fain (1967: 367) reported *Teinocoptes epomophori* Rodhain, 1923 from an *E. wahlbergi haldemani* specimen from Boma, DRC, and *Teinocoptes auricularis* from an *E. wahlbergi* from Zanzibar.
Trombiculidae: *Schoutedenichia (Schoutedenichia) cordiformis* Vercammen-Grandjean, 1958 was reported by Stekolnikov (2018a: 101), who also reported (p. 153) *Microtrombicula homopholis* (Lawrence, 1949).

VIRUSES:
Coronaviridae - Coronaviruses
SARS-CoV: Müller *et al.* (2007b) tested between 1986 to 1999, two individuals from Mpumalanga Province, South Africa for antibody to SARS-CoV in sera, none were found to be positive.
Four out of 63 (6.3 %) Kenyan bats tested by Tao *et al.* (2017: Suppl.) were positive for CoV.

Rhabdoviridae
Lyssavirus - Rabies related viruses
Lagos bat virus (LBV): Isolated from South Africa (Crick *et al.*, 1982: 211; King *et al.*, 1990: 169; Meredith and Standing, 1981; Swanepoel, 2004; Markotter *et al.*, 2006b; Hayman *et al.*, 2011a: 88; Nadin-Davis *et al.*, 2011: 238; Coertse *et al.*, 2011: 251; Willoughby *et al.*, 2017: Suppl.).
Mokola virus (MOKV): King *et al.* (1990: 168) found monoclonal antibodies for MOKV in bats from South Africa. They also reported antibodies for Duvenhage and Denmark bat virus.

Paramyxoviridae

Drexler *et al.* (2012a: Suppl. Table S1) indicated that none of the 4 specimens they examined from the Democratic Republic of the Congo tested positive for *Repirovirus, Henipavirus, Morbillivirus, Rubulavirus* or *Pneumovirus*.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Angola, Burundi, Cameroon, Congo, Congo (Democratic Republic of the), Equatorial Guinea, Ethiopia, Gabon, Ghana, Kenya, Malawi, Mozambique, Namibia, Rwanda, Somalia, South Africa, South Sudan, Swaziland, Tanzania, Uganda, Zambia, Zimbabwe.

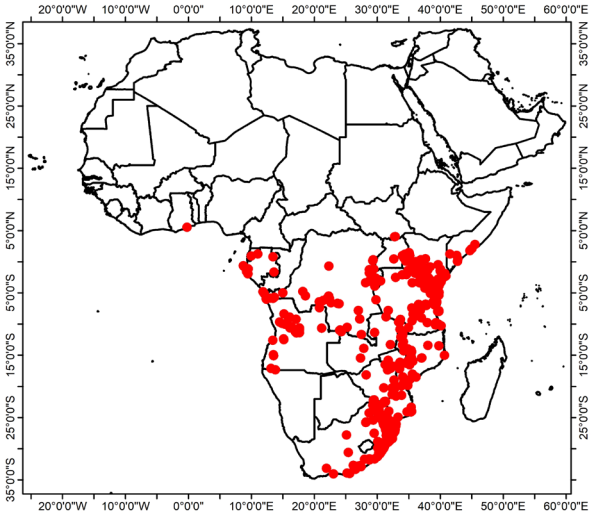

Figure 28. Distribution of *Epomophorus wahlbergi*

Genus ***Epomops*** Gray, 1866

*1870. *Epomops* Gray, Catalogue of Monkeys, Lemurs and Fruit-eating bats in the collection of the British Museum London, 126 [Goto Description]. - Comments: Type species: *Epomophorus franqueti* Tomes, 1860. - Etymology: Probably an abbreviation of *Epomophorus* and the Greek "*οψ*", meaning aspect, referring to its resemblance to that genus (see Palmer, 1904: 268). (Current Combination)
2007. *Epomop:* Lameed, Biodiversity, 8 (4): 8. (Lapsus)
2014. *Hepomops:* Nina, Acta Med. Port., 27 (5): 627. Publication date: Sep-Oct 2014.
2016. *Epomos:* Pancer, Gut and Litwinska, Post. Mikrobiol., 55 (2): 207.

TAXONOMY:
Reviewed by Bergmans (1989). See Simmons (2005: 323).

Andersen (1912b: 487), Grubb *et al.* (1998: 69) mention "Gray, 1866, Proc. Zool. Soc., Lond.: 65" as first publication in which the name *Epomops* was used.

The results of the phylogenetic analyses by Almeida *et al.* (2016: 82) showed that the genus *Epomops* is not monophyletic as a DNA fragment of *E. dobsonii* shows a close relationship with *Epomophorus wahlbergi*, which seems to support the similarities or transitional traits of *dobsonii* with *Epomophorus* reported by Bergmans (1989: 118).

Included in the Epomophorinii tribe by Bergmans (1997: 69) and Almeida *et al.* (2016: 83), which was considered part of the Epomophorinae by the former and of the Rousettinae by the latter.

Based on the analyses of mitochondrial and nuclear data, Hassanin *et al.* (2016: 525) suggest that the genus *Epomops* contains only one species, which can be divided into two subspecies: *E. franqueti franqueti* in Central Africa and *E. f. buettikoferi* in West Africa.

Known species of *Epomops*: ***buettikoferi*** (Matschie, 1899); ***franqueti*** (Tomes, 1860).

COMMON NAMES:
Czech: Grayovi kaloni. English: Clamorous Fruit-bats, Noisy Fruit-bats, Singing Fruit-bats, Epauletted bats, Epaulet bats, African Epauletted bats. French: Epomophores de l'ouest. German: Epaulettenflughunde.

MOLECULAR BIOLOGY:
The *Cytb* analyses performed by Hassanin *et al.* (2016: 525) revealed that bats from West Africa, identified as either *E. franqueti* or *E. buettikoferi*, share very similar or identical haplotypes, which are divergent from those sequenced for all individuals of *E. franqueti* collected in Central Africa.

PARASITES:
HAEMOSPORIDA
Perkins and Schaer (2016: Suppl.) mention the presence of *Hepatocystis epomophori* Rodhain, 1926 in *Epomops* sp. bats. Nine out of 10 (90 %) South Sudanese bats examined by Schaer *et al.* (2017: 2) were infected by *Hepatosystis* sp.

Epomops buettikoferi (Matschie, 1899)

*1899. *Ep[omophorus (Epomophorus)] büttikoferi* Matschie, Die Fledermäuse des Berliner Museums für Naturkunde. 1. Lieferung. Die Megachiroptera des Berliner Museums für Naturkunde, 43, 45. Type locality: Liberia: Junk river: Schieffelinsville [06 11 N 10 30 W] [Goto Description]. Holotype: RMNH ad ♂, mounted skin (skull missing). Collected by: F.X. Stampfli. - Comments: Matschie dated his introduction to 14 May 1899. - Etymology: In honour of J. Büttikofer, who collected animals in Liberia.
1972. *Epomophorus (Epomops) franqueti buettikoferi:* Püscher, Z. Säugetierk., 37 (3): 155. (Name Combination)

2013. *Epomops buettifoferi:* Seltzer, Ndangalasi and Cordeiro, Biotropica, 45 (4): table S2. Publication date: 22 February 2013. (Lapsus)
2016. *E[pomops] f[ranqueti] buettikoferi:* Hassanin, Nesi, Marin, Kadjo, Pourrut, Leroy, Gembu, Musaba Akawa, Ngoagouni, Nakouné, Ruedi, Tshikung, Pongembo Shongo and Bonillo, C. R. Biologies, 339 (11-12): 525. Publication date: 14 October 2016. (Name Combination)
? *Epomops buettikoferi:* (Name Combination, Current Combination)

TAXONOMY:
See Bergmans (1989) and Simmons (2005: 323).

COMMON NAMES:
Czech: kaloň Büttikoferův. English: Buettikofer's Clamorous Fruit-bat, Buettikofer's Epauletted Bat, Buettikofer's Epauletted Fruit Bat, Büttikofer's Fruit Bat. French: Epomophore de Büttikofer, Epomophore de Buettikofer, Roussette de Büttikofer, Roussette de Buettikofer. German: Büttikofers Epaulettenflughund.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, it occurs in a number of protected areas, has a tolerance of a degree of habitat modification, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008as; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2008as; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2004bg; IUCN, 2004). 1996 - VU (Baillie and Groombridge, 1996). 1994 - VU (Groombridge, 1994).

MAJOR THREATS:
It is possible that there are no major threats to this species. Populations might be threatened by deforestation in parts of the species range, however, the extent to which it depends on forest cover is unclear (Mickleburgh *et al.*, 2008as; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008as) [in IUCN (2009)] suggest that further studies are needed into the dependence of this species on forested areas.

This species has been recorded from a number of protected areas in West Africa (Mickleburgh *et al.*, 1992).

GENERAL DISTRIBUTION:
Epomops buettikoferi is a lowland West African species which ranges from Senegal and Guinea-Bissau in the west, to central Nigeria in the east. Bergmans (1975: 147) indicates it is restricted to the West African "moist forest" block.

Native: Cameroon (Bakwo, 2009: 12); Côte d'Ivoire (Henry *et al.*, 2004: 24); Ghana (Decher and Fahr, 2007: 10 - 11); Guinea (Denys *et al.*, 2013: 281; Decher *et al.*, 2016: 259); Guinea-Bissau (Rainho and Ranco, 2001: 26); Liberia (Monadjem and Fahr, 2007: 50); Nigeria; Senegal; Sierra Leone.

MOLECULAR BIOLOGY:
Denys *et al.* (2013: 281) determined the karyotype of four specimens from the Guinean Mount Nimba area and found 2*n* = 36 in females (34 autosomes and two X gonosomes), and 2n = 35 in males (X0 gonosomes); NFa = 68. X = submetacentric or medium-sized.

ROOST:
E. buettikoferi roosts alone or in small groups, near its feeding area (Kunz, 1996: 52).

DIET:
Seltzer *et al.* (2013: table S2) provide an overview of the plant species found beneath bat feeding roosts. For *E. buettikoferi* this included *Milicia excelsa* (Welw.) C. C. Berg (African Teak - Moraceae).

POPULATION:
Structure and Density - It appears to remain common in many areas, with the exception of Nigeria, but populations may be declining in areas of ongoing deforestation (Mickleburgh *et al.*, 2008as; IUCN, 2009).
Trend - 2008 - Decreasing (Mickleburgh *et al.*, 2008as; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
Krutzsch (2000: 93) mentions that males attain puberty at the age of eleven months.

Weber *et al.* (2019: 19) reported one pregnant female on 30 March and six lactating (24, 30, 31 March, 1, 7 April) in Sierre Leone.

MATING:
The male mating pattern in *E. buettikoferi* includes courtship vocalizations (calling territories) (see Krutzsch (2000: 111).

PARASITES:
HAEMOSPORIDA
Schaer *et al.* (2013a: 17416) report the presence of hemosporidian parasites of the genus *Hepatocystis* in seven out of 25 investigated bats.

VIRUSES:
Rhabdoviridae
Lyssavirus - Rabies related viruses
Lagos bat virus - Hayman *et al.* (2008a) detected antibodies in Ghana.

Drexler *et al.* (2012a: Suppl. Table S1) indicated that the single specimen they examined from Ghana did not test positive for *Repirovirus, Henipavirus, Morbillivirus, Rubulavirus* or *Pneumovirus*.

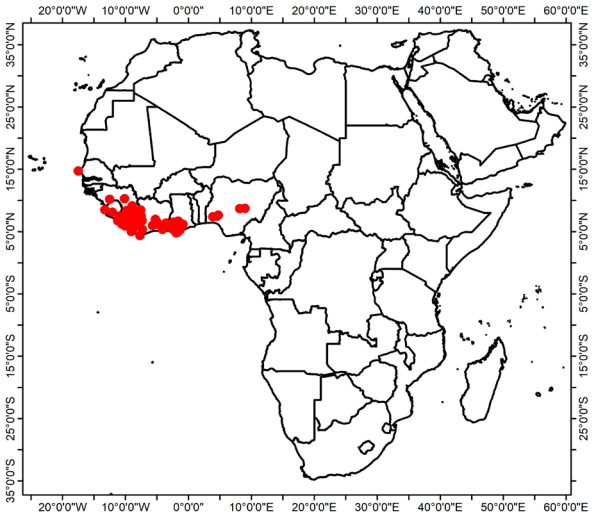

Figure 29. Distribution of *Epomops buettikoferi*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Côte d'Ivoire, Ghana, Guinea, Liberia, Nigeria, Senegal, Sierra Leone.

Epomops franqueti (Tomes, 1860)

*1860. *Epomophorus franqueti* Tomes, Proc. zool. Soc. Lond., 1860, I: 54, pl. 75. Publication date: February - May 1860. Type locality: Gabon: "Gabon" [Goto Description]. Holotype: MNHN A.107-776-C.52-1852-257: ad ♂, mounted skin and skull. Collected by: Franquet. Skull has number A6767; see Rode (1941: 233), who uses number 164.

1862. *Epomophorus comptus* H. Allen, Proc. Acad. nat. Sci. Philad., 13 (11): 158 (for 1861). Type locality: "Africa": West Africa [Goto Description]. - Comments: Andersen (1912b: 497) and Allen (1939a: 57) mentioned "=Gaboon" as type locality. Publication date: Volume 13 issue 11 covers the meetings of June-July 1861, but was probably only printed in 1862. Andersen (1912b: 498) mentions "as having been collected by Du Chaillu the specimen is no doubt from Gaboon." Type in Phildalphia Museum, unmounted skin, skull extracted, ♀.

1910. *Epomops franqueti strepitans* K. Andersen, Ann. Mag. nat. Hist., ser. 8, 5 (25): 106. Publication date: 1 January 1910. Type locality: Nigeria: 150 mi up the Niger: Asaba [06 11 N 06 43 E]. Holotype: BMNH 1895.5.3.7: ad ♂, skin and skull. Presented/Donated by: Dr. W.H. Cross. See Andersen (1912b: 497).

2017. *Epomops frangueti:* Dammann, Semin. Cell Dev. Biol., 70: 160. Publication date: 8 July 2017. (Lapsus)

? *Epomops franqueti franqueti:* (Name Combination)

? *Epomops franqueti:* (Name Combination, Current Combination)

TAXONOMY:
See Bergmans (1989) and Simmons (2005: 324).

COMMON NAMES:
Czech: kaloň Franquetův, kaloň plavý. English: Franquet's Clamorous Fruit-bat, Franquet's Fruit Bat, Franquet's Epauletted Fruit Bat, Singing Fruit Bat. French: Epomophore de Franquet, Chien volant à épaulettes du Congo, Roussette de Franquet. German: Franquets Epaulettenflughund, Franquet's Epaulettenflugfuchs.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008by; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2008by; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2004ci; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
There appear to be no major threats to this species as a whole (Mickleburgh *et al.*, 2008by; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008by) [in IUCN (2009)] report that *E. franqueti* is present in many protected areas. No direct conservation measures are currently needed for this adaptable species as a whole.

GENERAL DISTRIBUTION:
Epomops franqueti is a widespread species, which is present in much of West Africa and Central Africa, with some records from East Africa. It ranges from Côte d'Ivoire and Ghana in the west, to Cameroon, and then through Central Africa to southern Sudan, Rwanda and Uganda in the east. It has been recorded as far south as northern Angola, southern Democratic Republic of the Congo and northeastern Zambia.

The record (MNHN ZM-MO-1984-1165) from Madagascar is a possible misidentification/or incorrect locality information and needs verification.

Native: Angola (Bergmans, 1989; Monadjem *et al.*, 2010d: 554); Benin (Capo-Chichi *et al.*, 2004: 161); Cameroon; Central African Republic (Morvan *et al.*, 1999: 1195); Congo (King and Dallimer, 2010: 65; Bates *et al.*, 2013: 333); Congo (The Democratic Republic of the) (Hayman *et al.*, 1966; Dowsett *et al.*, 1991: 259; Van Cakenberghe *et al.*, 1999; Monadjem *et al.*, 2010d: 554); Côte d'Ivoire; Equatorial Guinea; Gabon; Ghana; Nigeria; Rwanda; Sudan; Tanzania; Togo; Uganda (Kityo and Kerbis, 1996: 59); Zambia (Ansell, 1978; Monadjem *et al.*, 2010d: 554).

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
From western Uganda, Monadjem *et al.* (2011: 30) reported the following data for 7 specimens: Fa: 93.51 ± 5.246 mm, mass: 114.7 ± 35.86 g, wing loading: 19.7 ± 3.81 N/m^2, aspect ratio: 5.4 ± 0.43.

DETAILED MORPHOLOGY:
Dobson (1881: 686) provides a detailed description of the pharynx, larynx, and hyoid bones.

Chawana *et al.* (2013: 160) report an average brain mass of 2.42 g (n = 2).

FUNCTIONAL MORPHOLOGY:
Coimbra *et al.* (2016: 191) found that the eye of *E. franqueti* has a bright yellow tapetum lucidum, which covers almost the entire extension of its dorsal hemisphere. There are about 200,000 retinal ganglion cells. The minimum angle of resolution was approximately 0.167° (ca. 5-6 mm at 1 m distance).

MOLECULAR BIOLOGY:
DNA - Unknown.

Karyotype - In Kenya, Peterson and Nagorsen (1975) recorded 2*n* = 36. Haiduk *et al.* (1980) reported 2*n* = 36, FN = 68, BA = 34, a subtelocentric X chromosome and a subtelocentric Y chromosome for specimens from Cameroon. Haiduk *et al.* (1981: 224) mention 2*n* = 36, FN = 66. Primus *et al.* (2006) reported a male without Y chromosome (2*n* = 35) from Gabon.

Protein / allozyme - Unknown.

Dammann (2017: 160) refers to Ifuta *et al.* (1988: 379), who found that levels of T_4 (plasma concentrations of thyroxine) were about 10 times lower in this bat than in other mammals. These low values might be stress related as several hours elapsed between the capture of the bats and taking blood samples. However, these low values were not found for T_3 (Plasma concentrations of triiodothyronine). Dammann (2017) suggests that

the low levels of T_4 might be related to the longevity in bats.

Ekeolu and Adebiyi (2018: 391) investigated blood parameters in 17 *E. franqueti* specimens from Nigeria and found no significant sex-related differences, except for erythrocyte osmotic fragility, which was significantly higher in female than in male bats at 0.1 % NaCl.

HABITAT:
This species is associated with lowland tropical moist forest, where it has been recorded in both primary and secondary habitat. Populations are also present in the mosaic habitats of tropical moist forest with woodland and grassland (Bergmans, 1989). It is an adaptable species that can be found in disturbed areas, seemingly being only absent from heavily degraded or urban areas.

HABITS:
Bradbury (1977) [in McCracken and Wilkinson (2000: 351)] found that females and juvenile animals were feeding near the territory of a calling male, which would suggest that additional resources could be available in that area.

ROOST:
The species roosts alone or in small groups, often close to water, in the dense leave cover of shrubs or trees (Brosset, 1966c; Jones, 1972; Kunz, 1996: 44).

DIET:
In Congo, Kipalu (2009: 16) reported *E. franqueti* visiting/consuming fruits of *Chlorophora excelsa* (African teak) and *Ficus mucuso*.

Gembu Tungaluna (2012: 95 - 97) reported the following fruits being eaten in the Kisangani area (DRC) in the various seasons: First heavy rain season (September - November): *Persea americana* Mill., 1786 (avocado) (24%), *Carica papaya* L. (papaya) (16%), *Spondias cytherea* Sonnerat, 1782 (Ambarella, otaheite apple, great hog plum) (14%), *Annonidium mannii* (Oliv.) Engl. & Diels (Junglesop) (11%), *Musanga cecropioides* R.Br. & Tedlie (African corkwood tree, umbrella tree) (8%), *Ficus leprieuri* Miq., 1867 (8%), *Myrianthus arboreus* P.Beauvois, 1805 (giant yellow mulberry, bush pineapple, corkwood) (5%), *Elaeis guineensis* Jacq. (African oil palm, macaw-fat) (3%), *Ficus wildemanniana* Warb. (3%), *Musa* sp. (3%).
First mild rain season (December - February): *Musanga cecropioides* (40%), *Elaeis guineensis* (20%), *Myrianthus arboreus* (13%), *Carica papaya* (13%), *Ficus wildemanniana* (7%), *Ficus vallis-choudae* Delile (7%).
Second heavy rain season (March - May): *Carica papaya* (23%), *Dacryoides edulis* H.J. Lam (safou, African pear, bush pear, Nsafu, bush butter tree, butterfruit) (15%), *Musanga cecropioides* (15%), *Myrianthus arboreus* (8%), *Elaeis guineensis* (8%), *Oncoba welwitschii* Oliv. (8%), *Ficus* sp3 (8%), *Musa* sp. (8%), *Ficus leprieuri* (7%).
"Dry" season (June - August): *Ficus wildemanniana* (100%).

POPULATION:
Structure and Density - This is a common species (Mickleburgh *et al.*, 2008by; IUCN, 2009).
Trend - 2008 - Stable (Mickleburgh *et al.*, 2008by; IUCN, 2009).

ACTIVITY AND BEHAVIOUR:
For a selection of sounds, check http://macaulaylibrary.org/search?taxon=Epomops_franqueti&taxon_id=11069435&taxon_rank_id=67&tab=audio

REPRODUCTION AND ONTOGENY:
From southern Sudan, Bates (1905: 72) reports on two females (probably of this species) carrying a half-grown young on 31 August and 1 September.

A male with probably active testes was caught on 2-3 November in Pointe Noire (Congo) by Bergmans (1979a: 171), and a lactating female with an embryo was captured in Brazzaville on 23 December. Furthermore, females with developed nipples were collected in March, May, November and December.

MATING:
Brosset (1966c) and Bradbury (1977) [in McCracken and Wilkinson (2000: 349)] indicate that males establish nocturnal display sites where females visit males for mating.

PARASITES:
BACTERIA
Gram-negative bacterium - Nowak *et al.* (2017: 6) tested three bats from the Republic of Congo of which two tested positive for *E. coli*.

HAEMOSPORIDA
Lutz *et al.* (2016: 9) examined 52 *E. franqueti* specimens from East Africa and found 35 of them infected with *Hepatocystis* sp. Perkins and Schaer (2016: Suppl.) refer to the presence of *Hepatocystis brosetti* Miltgen *et al.*, 1977 in Gabon, from where it was described by Miltgen *et al.* (1977: 589). Landau *et al.* (2012: 142) also mention it as type host for *Hepatocystis epomophori* (Rodhain, 1926). Boundenga *et al.* (2018: 10581) reported 21 out of 160 (13.12 %) bats from the Franceville (Gabon) area to be

infected by *Hepatocystis* sp. Surprisingly, Rosskopf *et al.* (2018: 31) were unable to find any *Hepatocystis* parasites in the 21 Gabonese bats they examined and they suggest that this might be linked with the fact their bats were collected during the dry season.

DIPTERA
Nycteribiidae: *Basila tenuispina* Theodor 1957 from Stanleyville, Congo (Democratic Republic of the) (Haeselbarth *et al.*, 1966: 111).

ACARI
Teinocoptidae: *Teinocoptes epomophori* Rodhain, 1923 was reported from an *E. franqueti* specimen from Stanleyville (=Kisangani), DRC by Fain (1967: 367).

VIRUSES:
Willoughby *et al.* (2017: Suppl.) report the following viruses: Marburg marburgvirus, Rift Valley fever phlebovirus, Shamonda orthobunyavirus, Zaire ebolavirus.

Coronaviridae - Coronaviruses
SARS-CoV - Müller *et al.* (2007b) tested between 1986 to 1999 five individuals from Bandundu Province, DRC for antibody to SARS-CoV in sera, none were found to be positive (0/5).
Anthony *et al.* (2017b: Suppl.) mention the beta-coronavirus Eidolon_bat_CoV.

Filoviridae - Filo viruses
Ebolavirus
Pourrut *et al.* (2007) found homogeneous ZEBOV [Zaire Ebolavirus] infection in the wild populations of *E. franqueti* in Gabon and the Democratic Republic of the Congo. Eight out of 117 bats had immunoglobulin G (IgG) specific for Ebola in Gabon during a test performed by Leroy *et al.* (2005: 575). 10 out of 27 bats were found to be positive for EBOV antibodies in the Greater Accra region, Ghana (Hayman *et al.*, 2012d: 1208).

Bausch and Schwarz (2014: 1) and Pigott *et al.* (2014: 9) indicate that *E. franqueti* is one of the leading candidates for introducing Ebola in Guinea (together with *Hypsignathus monstrosus* and *Myonycteris torquata*). However, no proof has been provided that this was indeed the case.

Marburgvirus
Towner *et al.* (2007) tested 296 individuals from Gabon for Marburg virus RNA by conventional and real-time RT-PCR and 47 individuals for anti-Marburg virus IgG antibodies by ELISA; no positives were found.

Flaviviridae
Flavivirus
Maganga *et al.* (2014a: 5) tested 128 bats from Congo, of which 2 tested positive.

Nairoviridae
Nairovirus
Of the 99 specimens from Gabon and Congo tested by Müller *et al.* (2016: 3), 7 were positive for Crimean Congo hemorrhagic fever virus (CCHFV).

Phenuiviridae
Phlebovirus
Fagre and Kading (2019: 4) report that Rift Valley fever virus (RVFV) was either isolated from this bat or that molecular evidence was found (see also de Jong *et al.* (2011: 11) and Luis *et al.* (2013: suppl.)).

Paramyxoviridae
Drexler *et al.* (2012a: Suppl. Table S1) indicated that none of the 100 specimens they examined from Gabon, Congo, Ghana and the Central African Republic tested positive for *Repirovirus, Henipavirus, Morbillivirus, Rubulavirus* or *Pneumovirus*.

In their overview table, Maganga *et al.* (2014a: 8) report that the following viruses were already found on *E. franqueti*: Zaire Ebola virus (ZEBOV), Reston Ebola virus, Marburg virus (MBGV), Flavivirus.

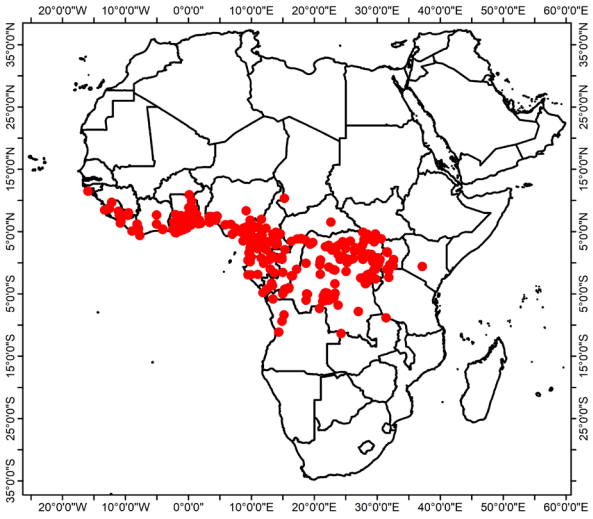

Figure 30. Distribution of *Epomops franqueti*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Angola, Benin, Cameroon, Central African Republic, Congo, Congo (Democratic Republic of the), Côte d'Ivoire, Equatorial Guinea, Gabon, Ghana, Guinea-Bissau, Kenya, Liberia, Nigeria, Rwanda, Sierra Leone, South Sudan, Tanzania, Togo, Uganda, Zambia.

Genus ***Hypsignathus*** H. Allen, 1862

*1862. *Hypsignathus* H. Allen, Proc. Acad. nat. Sci. Philad., 13 (11): 156 (for 1861). Publication date: 1862 [Goto Description]. - Comments: Type species: *Hypsignathus monstrosus* H. Allen, 1861. Publication date: Volume 13 issue 11 covers the meetings of June-July 1861, but was probably only printed in 1862. - Etymology: From the Greek "*υψι*", meaning on high or aloft and "*γνάθος*", meaning jaw, possibly referring to the 'deeply arched mouth' (see Palmer, 1904: 343). (Current Combination)

1862. *Sphyrocephalus* A. Murray, Proc. zool. Soc. Lond., 1862, I: 8. Publication date: June 1862 [Goto Description]. - Comments: Type species: *Sphyrocephalus labrosus* Murray,1862 (=*Hypsignathus monstrosus* H. Allen, 1861). Preoccupied by *Sphyrocephala* Westwood, 1848, a dipteran and *Sphyrocephalus* Schmarda, 1859, a turbellarian (see Palmer, 1904: 642; Langevin and Barclay, 1990: 1). Andersen (1912b: 501 - footnote) also mentions "Murray probably originally intended to name this genus *Zygænocephalus* in allusion to the Hammer-headed Sharks *Zygæna*, and had that name printed on the plate, but for some reason or other changed it in the text to *Sphyrocephalus*.". - Etymology: From the Greek "*σφύρα*", meaning hammer and "*κεφαλή*", meaning head (see Palmer, 1904: 642; Murray, 1862: 8).

1862. *Zygænocephalus* A. Murray, Proc. zool. Soc. Lond., 1862, I: pl. 1. Publication date: June 1862. - Comments: Type species: *Zygænocephalus labrosus* Murray,1862 (=*Hypsignathus monstrosus* H. Allen, 1861). This name was attached to the plate illustrating Murray's description of *Sphyrocephalus* and serves as a replacement for *Sphyrocephalus* Murray, 1862: see Langevin and Barclay (1990: 1). - Etymology: From the Greek "*ξύγαινα*", a hammer-headed shark and "*κεφαλή*", meaning head (see Palmer, 1904: 717).

? *Epomophorus (Hypsignathus):* (Name Combination)

? *Hypsygnathus:* (Lapsus)

TAXONOMY:
Revised by Bergmans (1989). See Simmons (2005: 324).

Included in the Epomophorinii tribe by Bergmans (1997: 69) and Almeida *et al.* (2016: 83), which was considered part of the Epomophorinae by the former and of the Rousettinae by the latter.

Known species of *Hypsignathus*: ***monstrosus*** H. Allen, 1861.

COMMON NAMES:
Czech: kladivohlaví kaloni. English: Hammer-headed bats. French: Hypsignates. German: Hammerkopf-Flughunde.

Hypsignathus monstrosus H. Allen, 1862

*1862. *H[ypsignathus] monstrosus*H. Allen, Proc. Acad. nat. Sci. Philad., 13 (11): 157 (for 1861). Publication date: 1862. Type locality: "Africa": Western Africa: possibly Gabon (see Andersen, 1912b: 506). [Goto Description]. - Comments: Type specimen collected by Mr. Du Chaillu (Murray, 1862: 8); Allen (1861: 158) mentions the name as Duchaillu. Andersen (1912b: 508) mentions the type specimen as being an adult ♂, SS, in the collection of the Philadelphia museum. Publication date: Volume 13 issue 11 covers the meetings of June-July 1861, but was probably only printed in 1862, as Murray (1862: 8) indicates that he received a copy of this publication on 19 February 1862. But we also found a reference to issue 23 of volume 13 (for the meeting of 26 November 1861) having been published on 31 December 1861, which might indicate that issue 11 might have been published in 1861. (Current Combination)

1862. *Sphyrocephalus labrosus* A. Murray, Proc. zool. Soc. Lond., 1862, I: 8. Publication date: June 1862. Type locality: Nigeria: Eastern region: Old Calabar river [ca. 04 56 N 08 22 E] [Goto Description]. Holotype: BMNH 1862.1.23.1[b]: ad ♂, skull and alcoholic. Collected by: Reverend William C. Thomson. Presented/Donated by: Mr. A. Murray Esq. - Comments: The publication contains 14 January 1862 as date, but see Duncan (1937) for the actual publication date.

1862. *Zygaenocephalus labrosus:* A. Murray, Proc. zool. Soc. Lond., 1862, I: pl. 1. Publication date: June 1862. (Name Combination)

1876. *Epomophorus macrocephalus* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, 474. Type locality: Gabon: Dongila. - Comments: Not of Ogilby (see Andersen, 1912b: 507).

? *Hypsygnathus monstrosus:* (Lapsus)

TAXONOMY:
See Langevin and Barclay (1990), Bergmans (1989) and Simmons (2005: 324).

COMMON NAMES:
Chinese: 锤头果蝠. Czech: kaloň kladivohlavý, kaloň štítohlavý. English: Hammer-headed bat, Hammer-headed Fruit Bat. French: Hypsignathe monstrueux, Chien volant à tête en marteau, chauve-souris à tête de marteau. German: Hammerkopf, Hammerkopf-Flughund. Kinande (DRC): Mulina. Spanish (Castillian): Cabeza Martillo. Tanoboase (Ghana): ahwenekron. Vai (Liberia): Tuña.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008az; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2008az; IUCN, 2009). 2004 - LC ver 3.1 (2001) (IUCN, 2004; Mickleburgh *et al.*, 2004bw). 1996 - LR/lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
This species is locally threatened by habitat destruction, particularly the loss of riverine forests. In parts of its range it is hunted for subsistence food (Mickleburgh *et al.*, 2008az; IUCN, 2009).

Duke (1934: 74) provided some suggestions on how to shoot this bat as this seemed to be the only way to get rid of its terrible noice.

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008az) [in IUCN (2009)] report that there appear to be no direct conservation measures in place. It has been recorded from Tai National Park (Côte d'Ivoire) and in view of its wide range, is presumably present in some other protected areas. Further studies are needed into the distribution of this species.

GENERAL DISTRIBUTION:
Hypsignathus monstrosus is widespread in West and Central Africa. It ranges from Guinea-Bissau in the west, to northwestern Angola in the south, and as far east as western Ethiopia and western Kenya (near Lake Victoria). It has been recorded to at least 1,800 m asl.

Native: Angola (Crawford-Cabral, 1989; Bergmans, 1989; Monadjem *et al.*, 2010d: 554); Benin; Burkina Faso (Kangoyé *et al.*, 2015a: 605); Cameroon; Central African Republic (Hayman *et al.*, 1966; Morvan *et al.*, 1999: 1195; Monadjem *et al.*, 2010d: 554); Congo (King and Dallimer, 2010: 65; Bates *et al.*, 2013: 333); Congo (The Democratic Republic of the) (Hayman *et al.*, 1966; Dowsett *et al.*, 1991: 259; Monadjem *et al.*, 2010d: 554); Côte d'Ivoire (Heim de Balsac, 1934b: 24); Equatorial Guinea; Ethiopia (Lavrenchenko *et al.*, 2004b: 131); Gabon; Ghana (Decher and Fahr, 2007: 11); Guinea (Denys *et al.*, 2013: 281); Guinea-Bissau (Rainho and Ranco, 2001: 21); Kenya; Liberia (Monadjem and Fahr, 2007: 50); Nigeria (Happold, 1987; Capo-Chichi *et al.*, 2004: 161); Sierra Leone (Grubb *et al.*, 1998); Sudan; Togo; Uganda (Kityo and Kerbis, 1996: 59).
Presence uncertain: Gambia.

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
The peculiar head of the males of this species, made Johnston (1906: 689) describe it as: "In these bats [Epomophori] the head is unusually

large and long; but it is so monstrous and hideous in the biggest of the sub-family - the hammer-headed bat, *Hypsignathus* - as to provoke the appropriate specific term of *monstrosus*. This animal is the creation of a nightmare imagination. It might be recommended to the designers of an instructive pantomime or Wagnerian opera." Duke (1934: 72) compares its head with the gargoyles of the Nôtre Dame, and described it as half hippo, half horse.

From western Uganda, Monadjem *et al.* (2011: 30) reported the following data: Fa: 115.7 mm, mass: 211 g, wing loading: 21.2 N/m^2, aspect ratio: 5.8.

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:
Eisenberg and Wilson (1978: 744) indicate that the cranial volume of *H. monstrosus* is slightly smaller than was expected from a regression line they calculated for all frugivorous bats. The lower score could be linked with the partially carnivorous diet of these bats as found by Van Deusen (1968).
Davies *et al.* (2013a: 4) provide an illustration of the bony labyrinth of *H. monstrosus*'s inner ear.

DETAILED MORPHOLOGY:
The average brain mass for two *H. monstrosus* specimens was found to be 3.81 g (Chawana *et al.*, 2013: 160).

FUNCTIONAL MORPHOLOGY:
The study of Coimbra *et al.* (2016: 191) found that the eye of *H. monstrosus* possesses a bright yellow tapetum lucidum, which covers almost the entire extension of its dorsal hemisphere. Its retinal area is about 200 mm^2 and contains about 3000,000 retinal ganglion cells. The minimum angle of resolution was approximately 0.122° (ca. 40 mm at 10 m distance).

Kawashima *et al.* (2017: 48) examined the postcranial skeleton of six *H. monstrosus* specimens and found that five had 15 thoracic vertebrae and one had 14; all had seven cervical, three lumbal and four sacral vertebrae.

MOLECULAR BIOLOGY:
DNA - Unknown.
Karyotype - Peterson and Nagorsen (1975) and Haiduk *et al.* (1980; 1981: 225) reported 2*n* = 36, FN = 68, BA = 34, a subtelocentric X chromosome and a subtelocentric Y chromosome for specimens from Kenya and Cameroon, respectively. 2*n* = 36 was also reported by Primus *et al.* (2006).
Protein / allozyme - Unknown.

ROOST:
During the day, *H. monstrosus* roosts in trees, in most cases as singles of either sex, but also in mixed sex groups of up to 17 individuals. Males typically roost at the periphery of larger groups (see Bradbury, 1977).

DIET:
Duke (1934: 72) indicates that *H. monstrosus* starts to feed soon after dark, and that it eats fruits of various kinds, especially guavas and certain kinds of wild figs. Gautier-Hion and Michaloud (1989: 1829) reported that 88 % of 133 oral swabs and fecal samples analysed from May to October in Makokou (Gabon) contained figs. They reported (p. 1831) that females forage at about 1 to 4 km from their roosts, whereas males travel up to 10 km, and also that figs only form 38 % of the females diet against 58 % in males.

Van Deusen (1968) [in Courts (1998: 190)] observed this bat attacking live chickens and scavenging the carcasses of small birds.

Seltzer *et al.* (2013: table S2) provided an overview of the plant species found beneath bat feeding roosts. For *H. monstrosus* this included *Milicia excelsa* (Welw.) C. C. Berg (African Teak - Moraceae).

From the Kisangani area (DRC), Gembu Tungaluna (2012: 99 - 100) reported the following fruits being eaten during the various seasons: First heavy rain season (September - November): *Persea americana* Mill., 1786 (avocado) (21%), *Annonidium mannii* (Oliv.) Engl. & Diels (Junglesop) (18%), *Carica papaya* L. (papaya) (14%), *Dacryoides edulis* H.J. Lam (safou, African pear, bush pear, Nsafu, bush butter tree, butterfruit) (14%), *Spondias cytherea* Sonnerat, 1782 (Ambarella, otaheite apple, great hog plum) (11%), *Uapaca guineensis* Müll.Arg., 1864 (Sugar plum, red cedar, false mahogany, rikio) (7%), *Myrianthus arboreus* P.Beauvois, 1805 (giant yellow mulberry, bush pineapple, corkwood) (4%), *Elaeis guineensis* Jacq. (African oil palm, macaw-fat) (4%), *Ficus wildemanniana* Warb. (4%), *Ficus leprieuri* Miq., 1867 (3%).
First mild dry season (December - February): *Myrianthus arboreus* (50%), *Musanga cecropioides* R.Br. & Tedlie (African corkwood tree, umbrella tree) (50%).
Second heavy rain season (March - May): *Musanga cecropioides* (75%), *Ficus leprieuri* (25%).
No data for the "Dry" season (June - August).

PREDATORS:
Neil (2017: 131) reported on a hammer-headed fruit bat being captured by a Long-tailed hawk, *Urotriorchis macrourus* (Hartlaub, 1855) in Gabon. The hawk left its wounded prey on the ground, after which the bat was able to escape.

POPULATION:
Structure and Density - It is a locally common species. Roosts can contain as many as 25 bats, but the average roost size is fewer than five animals (Mickleburgh *et al.*, 2008az; IUCN, 2009). Trend - 2008 - Unknown (Mickleburgh *et al.*, 2008az; IUCN, 2009).

ACTIVITY AND BEHAVIOUR:
Bradbury (1977) observed females hover in front of selected males before copulation.

Carpenter (1986: 90) and McGuire and Guglielmo (2009: 1291) reported that the respiratory quotient for this species indicates that fat provided 77 - 92 % of the fuel during flight, and a decline in respiratory quotient during long flights may prove that fat is indeed the only fuel source following initial carbohydrate use. Carpenter (1986: 93) also indicates that at airspeeds of 5.5 m/s the heart beats at a frequency of 620 beats per minute, whereas the respiration rate is 293 breadths per minute.

The courtship calls, which likely have a territorial function, consist of a simple syllable type in series (Bradbury, 1977 in Smotherman *et al.*, 2016: 538).

For a selection of sounds, check http://macaulaylibrary.org/search?taxon=Hypsignathus monstrosus&taxon_id=11075759&taxon_rank_id=67&tab=audio

REPRODUCTION AND ONTOGENY:
Tuttle and Stevenson (1982: 120, 121) indicate that females attain sexual maturity at 5 to 6 months of age, whereas males need 18 months. Kurta and Kunz (1987: 82) report that, at birth, the young weights about 16.2 % of the mother's body mass (38.0 g versus 234.0 g).

MATING:
Bradbury (1977) reported that *H. monstrosus* exhibit lek behaviour at their mating sites: Males form large choruses during the night that are visited by females, and they respond to the presence of females by increasing the repetition rate of their calls and by moving their wings. He also found that females favor larger males with bulbous muzzles and enormous hypertrophied larynxes, which are acting as resonating chambers. Male sites are spaced about 10 m apart, and individual males use the same site every night.

In Abidjan (Côte d'Ivoire), Niamien *et al.* (2015b: 230) found that *H. monstrosus* males prefered relatively low (5 - 10 m) *Terminalia catappa* L. trees (Indian almond - Combretaceae) for their leks. The individual trees were about 5 m apart. The males were present from August to October (small dry seaon to start of small wet season), and from February to May (end of large dry season to start of large wet season). In the other months no males were observed.

Bradbury (1977) [in Fasel *et al.* (2016: 2)] reported on uneven copulation rates, whereby harem males mate at a higher frequency than other males.

PARASITES:
BACTERIA
Gram-negative bacterium - Nowak *et al.* (2017: 6) tested two bats from the Republic of Congo, both of which were positive for *E. coli*.

HAEMOSPORIDA
Ayala *et al.* (1981: 21) examined blood smears from 142 *H. monstrosus* specimens from Gabon, and found 139 of them to be infected by hemosporidian parasites of the genus *Hepatocystis*. They also indicate that the bats probably became infected before the age of six months and that the infection rate varied according to sex, age and female reproductive status. Schaer *et al.* (2013a: 17416) report the same parasites in five out of 10 investigated bats. Perkins and Schaer (2016: Suppl.) mention *Hepatocystis carpenteri*, described by Miltgen *et al.* (1980), from Gabon and *H. epomophori* and *H.* sp. from various countries.
Hepatocystis sp. Infections were also reported by Boundenga *et al.* (2018: 10581) from bats from Gabon (1 out of 21 examined: 4.8%).

Hepatocystis gametocytes were reported from this bat for the first time in the DRC by Rodhain (1913), although he referred the bats erroneously to *Epomops franqueti franqueti* (see Miltgen *et al.*, 1977: 595).

Hepatocystis parasites were also found in the single *Hypsignathus* sp. from South Sudan examined by Schaer *et al.* (2017: 2).

ACARI
Fain (1967: 364) reported *H. monstrosus* from Epulu, DRC as new host for *Teincoptes auricularis* Fain, 1959 (Acari: Teinocoptidae). The parasites were found around the nipples of the host.

VIRUSES:
Willoughby *et al.* (2017: Suppl.) report the following viruses: Lagos bat lyssavirus, Marburg marburgvirus, Mokola lyssavirus, Nipah henipavirus, Reston ebolavirus, Zaire ebolavirus.

Nairoviridae

Orthonairovirus
Only one of the 101 specimens from Gabon and Congo tested by Müller *et al.* (2016: 3) was positive for Crimean Congo hemorrhagic fever virus (CCHFV).

Coronaviridae - Coronaviruses
SARS-CoV - Müller *et al.* (2007b) tested between 1986 and 1999, 11 individuals from Bandundu Province, DRC for antibody to SARS-CoV in sera, one was found to be positive (9.1 %).

Filoviridae - Filo viruses
Ebolavirus
Pourrut *et al.* (2007) found homogeneous ZEBOV [Zaire Ebolavirus] infection in the wild populations of *H. monstrosus* in Gabon and the Democratic Republic of the Congo. Hayman *et al.* (2010) tested the blood of 3 adult females from Ghana for Ebola virus using indirect flurescent tests for antibodies against EBOV subtype Zaire, none tested positive. However, Hayman *et al.* (2012d: 1208) found 7 out of 16 bats to be positive for EBOV antibodies in Ghana's Greater Accra region. Four out of 17 bats had immunoglobulin G (IgG) specific for Ebola in Gabon during a test performed by Leroy *et al.* (2005: 575).

Bausch and Schwarz (2014: 1) and Pigott *et al.* (2014: 8) indicate that *H. monstrosus* is one of the leading candidates for introducing Ebola in Guinea (together with *Epomops franqueti* and *Myonycteris torquata*). However, no proof has been provided that this was indeed the case.

Marburgvirus
Towner *et al.* (2007) tested 56 individuals from Gabon for Marburg virus RNA by conventional and real-time RT-PCR and 12 individuals for anti-Marburg virus IgG antibodies by ELISA; no positives were found. Hayman *et al.* (2010) tested the blood of 3 adult females from Ghana for Marburg virus using indirect flurescent tests for antibodies against MARV subtype Leiden, none tested positive.

Peterson *et al.* (2007: 1547) indicate that the geographic distribution of *H. monstrosus* covers the entire range of the Ebola virus, but not that of the Marburg virus.

Henipaviridae
Henipavirus
Krüger *et al.* (2013: 13889) demonstrated that the surface glycoproteins F and G of an African henipavirus (M74) induce syncytium formation in a kidney cell line derived from *H. monstrosus*.

Paramyxoviridae
Hayman *et al.* (2008b) detected antibodies Nipah virus in one bat collected in Ghana in 2007.
Drexler *et al.* (2012a: Suppl. Table S1) reported that 2 out of 4 specimens they examined from Gabon, Congo, Ghana and the Central African republic tested positive for *Henipavirus* and *Rubulavirus*.

In their overview table, Maganga *et al.* (2014a: 8) reported that the following viruses were already found on *H. monstrosus*: Zaire Ebola virus (ZEBOV), Reston Ebola virus, Marburg virus (MBGV), Coronavirus (SARS-CoV), Nipah virus (NPHV).

Bennett *et al.* (2018: 65) studied viruses in the blood of *H. monstrosus* from the Republic of Congo and found that four out of five viruses are phylogenetically and genomically allied with viruses of arthropods: a nodavirus ("hypsignathus nodavirus", provisionally genus *Hypnovirus*, family Nodaviridae), a dicistrovirus ("hypsignathus dicistrovirus", genus *Cripavirus*, family Dicistroviridae), and two distinct variants of the recently recognized tombus-like viruses ("Hypsignathus monstrosus tombus-like virus 1 and 2", family Tombusviridae). The fifth virus was a novel hepatitis B-like virus ("Hypsignathus monstrosus hepatitis B virus (HMHBV)", family Hepadnaviridae), which is of mammalian origin. They also suggest that the viruses from arthropod origin might have been accidentally ingested, as the insects they are associated with, are themselves parasites of fruits eaten by the bats.
(In a Corrigendum to their paper, the authors indicate that the characterization of their putative HBV sequences should be considered inconclusive as contamination of reagents might have occurred.)

UTILISATION:
Bobo and Ntumwel (2010: 232) report that in the Korup area of Cameroon the whole animal is used for medicinal purposes, as it would render women fertile when consumed.

ANTHROPOPHILOUS:
Jeffreys (1944: 73) [referring to Goddard (1925)] mentions "From Sierra Leone comes an account of the gruesome habits of the large fruit bat. 'One of the most uncanny superstitions is that of the 'Boman' in which anthropologists will recognise the vampire of European superstition. This creature is said to suck the blood of sleeping children until they die: it can turn into a stone or snake at will. The 'Boman' is in reality the hammer-headed bat (*Hypsignathus monstrosus*), the largest fruit bat found in Africa; its dull and monotonous cry at the time when fruit is ripening has struck terror into many a village, whose inhabitants will sally forth

from their houses and beat tins to drive it away, cursing its father and mother and all its ancestors the while."

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Angola, Burkina Faso, Cameroon, Central African Republic, Congo, Congo (Democratic Republic of the), Côte d'Ivoire, Equatorial Guinea, Ethiopia, Gabon, Ghana, Guinea, Kenya, Liberia, Nigeria, Sierra Leone, South Sudan, The Gambia, Togo, Uganda.

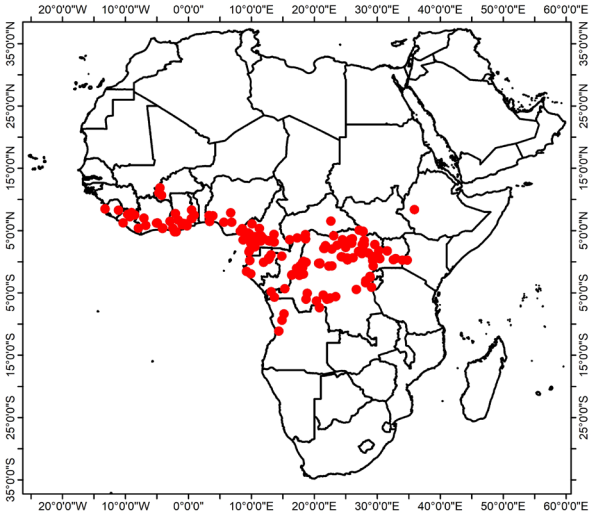

Figure 31. Distribution of *Hypsignathus monstrosus*

Genus ***Megaloglossus*** Pagenstecher, 1885

*1885. *Megaloglossus* Pagenstecher, Zool. Anz., 8 (193): 245. Publication date: 27 April 1885 [Goto Description]. - Comments: Type species: *Megaloglossus woermanni* Pagenstecher, 1885. - Etymology: From the Greek "*μέγας*" or "*μέγαλο*", meaning great or large and "*γλοσσα*", meaning tongue (see Palmer, 1904: 405). (Current Combination)

1891. *Trygenycteris* Lydekker, in: Flower and Lydekker, Mammals Living and Extinct, 655. - Comments: Type species: *Megaloglossus woermanni* Pagenstecher, 1885. Proposed to replace *Megaloglossus*, thought to be preoccupied by *Megaglossa* Rondani, 1865 (Diptera): see Allen (1939a: 63). - Etymology: From the Greek "*τρύγη*", meaning ripe fruit and "*νυκτερίς*", meaning bat (see Palmer, 1904: 696).

TAXONOMY:
Reviewed by Hill (1983).

Bergmans (1997: 69) suggests that *Megaloglossus* should be included in the tribe Myonycterini Lawrence & Novick, 1963 (together with the genera *Myonycteris* and *Lissonycteris*), within the subfamily Epomophorinae, and not within the Macroglossinae.

Included in the Myonycterini tribe by Bergmans (1997: 69) and Almeida *et al.* (2016: 83), which was considered part of the Epomophorinae by the former and of the Rousettinae by the latter.

Known species of *Megaloglossus*: ***azagnyi*** Nesi, Kadjo and Hassanin, 2012. ***woermanni*** Pagenstecher, 1885.

COMMON NAMES:

(Current Combination)

TAXONOMY:
Nesi *et al.* (2012) examined cytochrome *b* sequences and found West African *Megaloglossus* to be significantly different from Central African specimens.

COMMON NAMES:
German: Westlicher Woermanns Langzungen-Flughund.

GENERAL DISTRIBUTION:
This species occurs in Côte d'Ivoire, Liberia, and probably Guinea and Sierra Leone to Ghana and Togo.

In their study, Nesi *et al.* (2012) did not include specimens from the area between the Dahomey Gap and the Niger delta, but Herkt *et al.* (2017: Appendix S9) found their maps predicted moderately high habitat suitability for *M. azagnyi* in this area whereas suitability for *M. woermanni* was estimated to be very low. Therefore, they assigned the specimens from this area to *M. azagnyi*.

Native (mostly reported as *M. woermanni*): Benin; Côte d'Ivoire (Heim de Balsac, 1934b: 24); Ghana (Decher and Fahr, 2007: 12); Liberia (Monadjem *et al.*, 2016y: 364); Nigeria (West of the Niger Delta); Sierra Leone; Togo.

HABITAT:
In the Mount Nimba area, Happold (2013dh: 364) report this species to occur in old growth or secondary forest at relatively low altitudes (450 - 690 m) on both the Liberian and Guinean sides.

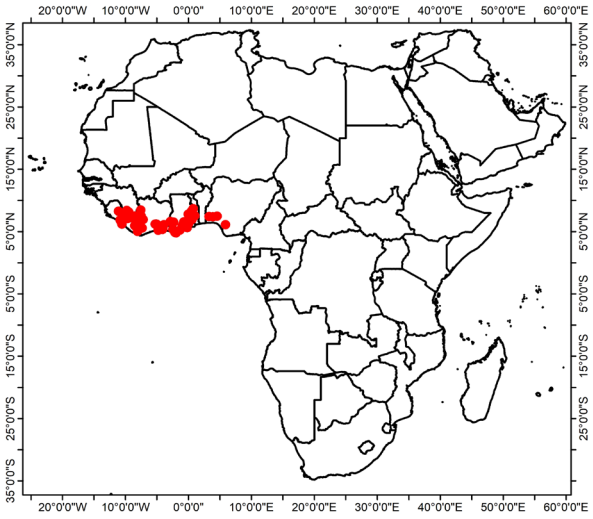

Figure 32. Distribution of *Megaloglossus azagnyi*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Côte d'Ivoire, Ghana, Liberia, Nigeria, Sierra Leone, Togo.

Megaloglossus woermanni Pagenstecher, 1885

*1885. *Megaloglossus woermanni* Pagenstecher, Zool. Anz., 8 (193): 245. Publication date: 27 April 1885. Type locality: Gabon: Ssibange farm [00 25 N 09 28 E] [Goto Description]. Holotype: ZMB 54589: ad ♀, mounted skin and skull. Collected by: H. Soyaux; collection date: 21 January 1885; original number: 9489. Bergmans (1997: 60, 63) mentions old number "9489", but this is a writing error in the file card; see Turni and Kock (2008). - Etymology: In honour of Mr. Adolf Woermann (see Pagenstecher, 1885c: 128). (Current Combination)

1966. *Megaloglossus woermanni prigoginei* Hayman, in: Hayman, Misonne and Verheyen, Ann. Kon. Mus. Mid. Afr., Zool. Wetensch., (8) 154: 26. Type locality: Congo (Democratic Republic of the): Kiliza [03 42 S 28 10 E, 1 370 m]. Holotype: RMCA 32577: ad ♂, skin and skull. Collected by: Dr. Alexandre Prigogine; collection date: 25 May 1964; original number: 1248. See Bergmans (1997: 60). Paratype: RMCA 20429: ♂. Collected by: Dr. Alexandre Prigogine; original number: 494. Presented/Donated by: ?: Collector Unknown. Paratype: RMCA 21586: Collected by: Schepens; original number: 6. Presented/Donated by: ?: Collector Unknown. Paratype: RMCA 32394: juv ♀. Collected by: Dr. Alexandre Prigogine; original number: 1226. Presented/Donated by: ?: Collector Unknown. Paratype: RMCA 32578: ♀. Collected by: Dr. Alexandre Prigogine; original number: 1249. Presented/Donated by: ?: Collector Unknown. Paratype: RMCA 32579: ♀. Collected by: Dr. Alexandre Prigogine; original number: 1250. Presented/Donated by: ?: Collector Unknown. Paratype: RMCA 32580: ♀. Collected by: Dr. Alexandre Prigogine; original number: 1251. Presented/Donated by: ?: Collector Unknown. Paratype: RMCA 32581: ♀. Collected by: Dr. Alexandre Prigogine; original number: 1252. Presented/Donated by: ?: Collector Unknown. Paratype: RMCA 32582: ♀. Collected by: Dr. Alexandre Prigogine; original number: 1253. Presented/Donated by: ?: Collector Unknown. Paratype: RMCA 32583: ♀. Collected by: Dr. Alexandre Prigogine; original number: 1254. Presented/Donated by: ?: Collector Unknown.

1993. *prigoginii:* Koopman, in: Wilson and Reeder, Mammal species of the World (2nd Edition): Chiroptera, 154. (Lapsus)

2003. *Megaloglossus woermani:* Giannini and Simmons, Cladistics, 19 (6): 508. (Lapsus)

? *Megaloglossus woermanni woermanni:* (Name Combination)

TAXONOMY:
See Bergmans and Van Bree (1972), Bergmans (1997) and Simmons (2005: 326 - 327).

COMMON NAMES:
Czech: kaloň dlouhojazyčný. English: Woermann's Long-tongued Fruit-bat, Woermann's Bat, Woermann's Fruit bat, Nectar Bat, African Long-tongued Bat. French: Macroglosse de Woermann, Mégaloglosse de Woermann. German: Woermann's Langzungen-Flughund, Afrikanischer Langzungen-Flughund. Spanish (Castillian): Murciélago de Lengua Larga.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008p; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2008p; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2004w; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
It is locally threatened by habitat loss and degradation, often resulting from conversion of land to agricultural use or the harvesting of timber and firewood (Mickleburgh *et al.*, 2008p; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008p) [in IUCN (2009)] report that there appear to be no direct conservation measures in place, however, in view of the species wide range it seems possible that it is present within some protected areas. Further studies are needed into the distribution and natural history of this species.

GENERAL DISTRIBUTION:
Megaloglossus woermanni was formerly considered to occur throughout much of West and Central Africa. However, Nesi *et al.* (2012) assigned the West African specimens to a separate species, restricting the distribution area to Cameroon and from here south and east into

Equatorial Guinea, Congo, Central African Republic, Democratic Republic of the Congo, Angola and western Uganda.

In their study, Nesi *et al.* (2012) did not include specimens from the area between the Dahomey Gap and the Niger delta, but Herkt *et al.* (2017: Appendix S9) found their maps predicted moderately high habitat suitability for *M. azagnyi* in this area whereas suitability for *M. woermanni* was estimated to be very low. Therefore, they assigned the specimens from this area to *M. azagnyi*.

Native: Angola (Crawford-Cabral, 1989; Bergmans, 1997; Monadjem *et al.*, 2010d: 554); Cameroon; Central African Republic (Morvan *et al.*, 1999: 1195); Congo (King and Dallimer, 2010: 65); Congo (The Democratic Republic of the) (Schouteden, 1944; Dowsett *et al.*, 1991: 259; Bergmans, 1997; Van Cakenberghe *et al.*, 1999; Monadjem *et al.*, 2010d: 554); Equatorial Guinea (Fahr and Ebigbo, 2003: 128); Gabon; Nigeria (East of the Niger delta); Uganda (Kityo and Kerbis, 1996: 58).

Presence uncertain: Bioko.

DETAILED MORPHOLOGY:
Chawana *et al.* (2013: 160) indicate that the average brain mass is 0.60 g (n = 2).

FUNCTIONAL MORPHOLOGY:
Coimbra *et al.* (2016: 191) mention that the retinal area covers about 40 - 50 mm^2. The eye contains about 90,000 retinal ganglion cells. The minimum angle of resolution was about 0.227° (ca. 8 mm at 1 m distance).

Kulzer and Storf (1980: 409) investigated the thermoregulatory response by measuring body temperature and rate of oxygen consumption. At high ambient temperatures, the bats increase their oxygen consumption and at low ambient temperatures, they enter a lethargic sleep.

MOLECULAR BIOLOGY:
DNA - Hollar and Springer (1997), Juste B. *et al.* (1999), Teeling *et al.* (2000), Colgan and da Costa (2002) and Cantrell *et al.* (2008).
Karyotype - Haiduk *et al.* (1980, 1981: 228) reported 2*n* = 34, FN = 62, BA = 30, a metacentric X chromosome and a metacentric Y chromosome for specimens from Cameroon. The same karyotype was reported by Primus *et al.* (2006) for specimens from Gabon.
Protein / allozyme - Unknown.

HABITAT:
Juste B. and Perez del Val (1995: 144) found *M. woermanni* to occur to 1,800 m altitude on Bioko Island, where it occurred more frequently in cultivated areas than in lowland rainforests.

HABITS:
Weber *et al.* (2009) found that spatial use was characterized by small home ranges and high site-fidelity, mean home range sizes (minimum convex polygon) were larger in females (139.0 and 146.8 ha) than in males (99.8 and 102.9 ha) in Lama Forest Reserve, southern Benin.

Kulzer and Storf (1980) [in Lovegrove (2011: 152)] indicate that *M. woermanni* uses daily torpor.

DIET:
Pettersson *et al.* (2004: 162) indicate that *M. woermanni* is the only nectar specialist in Africa, whereas there are 14 such specialists in Asia, Australia and Polynesia.

Weber *et al.* (2009) frequently observed *M. woermanni* visiting flowers of cultivated bananas.

In Cameroon, Grünmeier (1993: 35) reported the following pollen from the gut and faeces: *Anthocleista* sp. (Gentianaceae), *Mucuna flagellipes* Hook.f. (Fabaceae), *Kigelia africana* (Lam.) Benth. (Bignoniaceae), *Celtis* sp. (Cannabaceae), *Citrus* sp.(Rutaceae), Bombacaceae indet.

POPULATION:
Structure and Density - It is a locally abundant species (Mickleburgh *et al.*, 2008p; IUCN, 2009).
Trend - 2008 - Stable (Mickleburgh *et al.*, 2008p; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
Czekala and Benirschke (1974: 220) mention an adult female, collected in January 1973 by M. Eisentraut, containing two foetuses of different size, probably due to implantation occurring at two different times (p. 229).

Two females collected in Dimonika (Congo) on 10 March were pregnant with a large embryo (Bergmans, 1979a: 181).

VIRUSES:
Filoviridae - Filo viruses
Marburgvirus
Towner *et al.* (2007) tested 37 individuals from Gabon for Marburg virus RNA by conventional and real-time RT-PCR and 20 individuals for anti-Marburg virus IgG antibodies by ELISA; no positives were found.

Flaviviridae
Pegivirus (BPgV) - Quan *et al.* (2013: Table S5) reported 1 out of 3 examined specimens from the Democratic Republic of the Congo to be infected by clade H type *Pegivirus*.

Paramyxoviridae
Drexler *et al.* (2012a: Suppl. Table S1) reported that one of the 34 specimens they examined from Gabon, Congo, the Democratic Republic of the Congo, the Central African Republic, and Ghana tested positive for a *Rubulavirus* that was found to be closely related to human mumps virus.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Angola, Cameroon, Central African Republic, Congo, Congo (Democratic Republic of the), Equatorial Guinea, Gabon, Nigeria, Uganda.

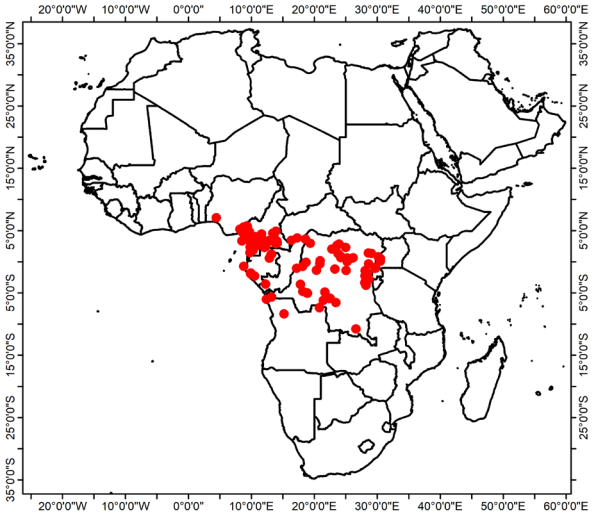

Figure 33. Distribution of *Megaloglossus woermanni*

Genus ***Micropteropus*** Matschie, 1899

*1899. *Micropteropus* Matschie, Die Fledermäuse des Berliner Museums für Naturkunde. 1. Lieferung. Die Megachiroptera des Berliner Museums für Naturkunde, 36, 57 [Goto Description]. - Comments: Type species: *Epomophorus pusillus* Peters, 1867. Described as subgenus of *Epomophorus* Bennett, 1836. Matschie dated his introduction on 14 May 1899. - Etymology: From the Greek "*μικρός*", meaning small and "Pteropus", meaning wing-footed (see Palmer, 1904: 423; Owen-Ashley and Wilson, 1998: 4). (Current Combination)
1978. *Micropterus:* Arata and Johnson, in: Pattijn, Ebola Virus Haemorrhagic Fever, 135. (Lapsus)
? *Epomophorus:* - Comments: Not of Bennett, 1836.

TAXONOMY:
Revised by Bergmans (1989), who transferred *grandis* from this genus to *Epomophorus*. See Simmons (2005: 327).

Included in the Epomophorinii tribe by Bergmans (1997: 69) and Almeida *et al.* (2016: 83), which was considered part of the Epomophorinae by the former and of the Rousettinae by the latter.

Known species of *Micropteropus*: ***intermedius*** Hayman, 1963; ***pusillus*** (Peters, 1868).

COMMON NAMES:
Czech: nigerijští kaloni. English: Lesser Fruit-bats, Dwarf epauletted fruit bats. French: Microptères. German: Kleine Epaulettenflughunde.

PARASITES:
BACTERIA
Bartonellae
Kamani *et al.* (2014: 628) tested 11 Nigerian "*Micropterus*" sp., and found at least 6 of them testing positive for *Bartonella* DNA.

HAEMOSPORIDA
31 of the 35 (89 %) South Sudanese *Micropteropus* specimens examined by Schaer *et al.* (2017: 2) was infected by *Hepatocystis*.

DIPTERA
Nycteribiidae:
Kamani *et al.* (2014: 628) reported the presence of *Cyclopodia greeffi* Karsch, 1884 on "*Micropterus*" bats from Nigeria.

Micropteropus intermedius Hayman, 1963

1889. *Epomophorus pusillus:* Noack, Zool. Jb. Syst., 4: 206. - Comments: Not of Peters, 1868. Partim. See Kock (1987b: 220).
1953. *Micropteropus grandis:* Ellerman, Morrison-Scott and Hayman, Southern African mammals 1758 to 1951, 49. - Comments: Not of Sanborn, 1950. In part. See Kock (1987b: 220).

1956. *Micropterus grandis:* Leleup, Ann. Kon. Mus. Mid. Afr., Zool. Wetensch., 46: 76. - Comments: Not of Sanborn, 1950. (Lapsus)
*1963. *Micropteropus intermedius* Hayman, Publ. Cult. Comp. Diamantes Angola, Lisboa, 66: 100, fig. 8. Type locality: Angola: Lunda: Dundo [07 22 S 20 50 E] [Goto Description]. Holotype: BMNH 1962.2073: ad ♀, skull and alcoholic. Collected by: Dr. A. de Barros Machado; collection date: June - July 1953. (Current Combination)
1969. *Micropteropus pusillus:* Kock, Abh. Senckenberg. naturforsch. Ges., 521: 24. - Comments: Not of Peters, 1868. In Part. See Kock (1987b: 220).
? *Micropterus (sic) intermedius:* (Name Combination, Lapsus)
? *Micropterus intermedius:* (Emendation)

TAXONOMY:
See Bergmans (1989) and Simmons (2005: 327).

COMMON NAMES:
Czech: kaloň Haymannův. English: Hayman's Lesser Fruit-bat, Hayman's Lesser Fruit Bat, Hayman's Dwarf Epauletted Fruit Bat, Hayman's Epauletted Fruit Bat. French: Microptère de Hayman, Roussette naine de Hayman. German: Haymans Kleiner Epaulettenflughund.

CONSERVATION STATUS:
Global -

Assessment History -
2008 - DD ver 3.1 (2001) (Mickleburgh *et al.*, 2008ba; IUCN, 2009). 2004 - DD ver 3.1 (2001) (Mickleburgh *et al.*, 2004t; IUCN, 2004). 2000 - DD (Hilton-Taylor, 2000). 1996 - VU (Baillie and Groombridge, 1996). 1994 - Rare (Groombridge, 1994).

MAJOR THREATS:
The threats to this species are not well known, but may include general habitat loss through ongoing deforestation (Mickleburgh *et al.*, 2008ba; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008ba) [in IUCN (2009)] report that there appear to be no direct conservation measures in place. It is not known if the species is present in any protected areas. Further surveys are needed to locate populations of this species, and to record additional details on natural history and possible threats.

GENERAL DISTRIBUTION:
This species has only been recorded from four localities in northern Angola (the type locality of Dundo) and southern Democratic Republic of the Congo (Luluabourg, Banana/Netonna, and Thysville).

Native: Angola (Bergmans, 1989; Monadjem *et al.*, 2010d: 554); Congo (The Democratic Republic of the) (Bergmans, 1989; Monadjem *et al.*, 2010d: 554).

POPULATION:
Structure and Density - It is currently only known from four specimens. Some of these records are old, and the species does not appear to have been recorded since the 1950s (Mickleburgh *et al.*, 2008ba; IUCN, 2009).
Trend - 2008 - Unknown (Mickleburgh *et al.*, 2008ba; IUCN, 2009).

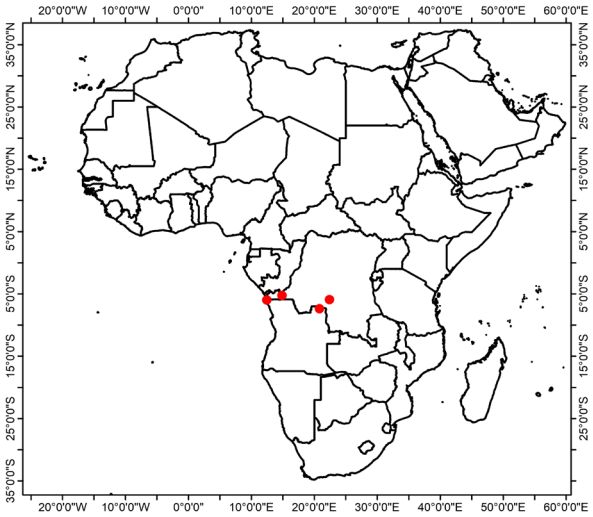

Figure 34. Distribution of *Micropteropus intermedius*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Angola, Congo (Democratic Republic of the).

Micropteropus pusillus (Peters, 1868)

1860. *Epomophorus schoensis:* Tomes, Proc. zool. Soc. Lond., 28: 55 - 56.
1860. *Epomophorus schoënsis:* Tomes, Proc. zool. Soc. Lond., 1860, I: 56. Publication date: February - May 1860. - Comments: Not of Rüppell, 1842.
*1868. *Epomophorus pusillus* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, 870 (for 1867). Type locality: Nigeria: S Nigeria: Yoruba. Holotype: ZMB 3438: imm ♀, skull and alcoholic.

Collected by: A. Mann; collection date: 1862. Presented/Donated by: F. von Krauss. Holotype designated by Bergmans (1989: 96, 99); see Turni and Kock (2008: 9). - Comments: For a discussion on the type locality, see Bergmans (1989). Grubb *et al.* (1998: 70) state that "Peters in effect renamed *Epomophorus schoënsis* Tomes and therefore Tomes's type locality [="Gambia" - fixed by Andersen, 1912b: 559] must stand, even though his syntypes are evidently no longer in existence". However, see Kock *et al.* (2002: 82) for a discussion on the type locality. - Etymology: From the Latin "*pusillus*" (=very small) (see Owen-Ashley and Wilson, 1998: 4).

1974. *Micropteropus pussilus:* Ayensu, Ann. Missouri Bot. Gard., 61: 706. (Lapsus)
1978. *Micropterus pusillus:* Arata and Johnson, in: Pattijn, Ebola Virus Haemorrhagic Fever, 135. (Lapsus)
1990. *Micropteropus pusilis:* King, Davies and Lawrie, Vet. Microbiol., 23 (1-4): 168. Publication date: June 1990. (Lapsus)
2007. *Micropteropus prusillus:* Lameed, Biodiversity, 8 (4): 8. (Lapsus)
? *Epomophorus (Micropteropus) pusillus:* (Name Combination)
? *Micropteropus pusillus:* (Name Combination, Current Combination)
? *Nanonycteris veldkampi:* - Comments: Not of Jentink, 1888.

Taxonomy:

See Bergmans (1989), Owen-Ashley and Wilson (1998) and Simmons (2005: 327).

Common Names:

Chinese: 非洲小狐蝠. Czech: kaloň nigerijský. English: Peters' Lesser Epauletted Fruit Bat, Peters' Lesser Fruit-bat, Peters's Dwarf Epauletted Fruit Bat, Dwarf Epauletted Fruit Bat. French: Petit microptère, Roussette naine de Peters. German: Peters' Kleiner Epaulettenflughund, Peter's Zwergepaulettenflughund. Kiluba (DRC): Mulima. Spanish (Castillian): Murciélago Enano.

Conservation status:

Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, it occurs in a number of protected areas, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008q; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2008q; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2004s; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

Major threats:

There appear to be no major threats to this species as a whole (Mickleburgh *et al.*, 2008q; IUCN, 2009).

Conservation actions:

Mickleburgh *et al.* (2008q) [in IUCN (2009)] report that in view of the species wide range it seems probable that it is present in many protected areas. In general, no direct conservation measures are currently needed for this species as a whole.

General distribution:

Distributed in West Africa, Central Africa and East Africa. It ranges from Senegal and The Gambia, throughout much of West Africa to Cameroon, from here it is distributed into Equatorial Guinea (Rio Muni), Gabon, Congo, Central African Republic, the Democratic Republic of the Congo, Sudan, Uganda and western Ethiopia and Kenya. It is found as far south as central Angola and Zambia.

Native: Angola (Hayman, 1963; Crawford-Cabral, 1989; Bergmans, 1989; Lopes and Crawford-Cabral, 1992; Monadjem *et al.*, 2010d: 554); Benin (Capo-Chichi *et al.*, 2004: 161); Burkina Faso (Kangoyé *et al.*, 2015a: 605); Cameroon; Central African Republic (Morvan *et al.*, 1999: 1195); Chad; Congo (King and Dallimer, 2010: 66); Congo (The Democratic Republic of the) (Schouteden, 1944; Hayman *et al.*, 1966; Dowsett *et al.*, 1991: 259; Van Cakenberghe *et al.*, 1999; Monadjem *et al.*, 2010d: 554); Côte d'Ivoire (Heim de Balsac, 1934b: 24); Equatorial Guinea; Ethiopia; Gabon; Gambia; Ghana; Guinea (Fahr and Ebigbo, 2003: 128; Denys *et al.*, 2013: 281; Decher *et al.*, 2016: 261); Guinea-Bissau (Monard, 1939; Bergmans, 1989; Rainho and Ranco, 2001: 28); Kenya; Liberia (Fahr, 2007a: 103); Mali (Meinig, 2000: 104); Niger; Nigeria; Rwanda; Senegal; Sierra Leone; Sudan; Tanzania; Togo; Uganda (Kityo and Kerbis, 1996: 59); Zambia (Ansell, 1974; Monadjem *et al.*, 2010d: 554).
Presence uncertain: Burundi.

Molecular Biology:

DNA - Unknown.
Karyotype - Haiduk *et al.* (1980; 1981: 226) reported $2n = 35$, FN = 64, a subtelocentric X and two Y chromosomes for males from Cameroon (XY_1Y_2) (see also Nesi *et al.*, 2011: 552).
Protein / allozyme - Unknown.

ROOST:
M. pusillus roosts singly or in pairs in the dense leave cover of shrubs and trees (Kunz, 1996: 44). In Ghana, Ayivor *et al.* (2017: 3) found these bats to roost together with *E. gambianus*, where *M. pusillus* occupied the lower parts of the trees.

DIET:
Ayensu (1974) reports the following plant species being visited by *M. pusillus* during foraging: *Kigelia africana* (Sausage tree), *Anacardium occidentale* (Cashew tree), *Psidium guajava* (Guava tree), and *Spathodea campanulata* (African Tulip tree).

Seltzer *et al.* (2013: table S2) provided an overview of the plant species found beneath bat feeding roosts. For *M. pusillus* these include *Milicia excelsa* (Welw.) C. C. Berg (African Teak - Moraceae) and *Psidium guajava* L. (apple guava - Myrtaceae).

PREDATORS:
Mikula *et al.* (2016: Supplemental data) mention the African harrier-hawk (*Polyboroides typus* Smith, 1829) as diurnal avian predator.

POPULATION:
Structure and Density - This is generally considered to be one of the most common African bats. Large numbers are often recorded from fruit trees (Mickleburgh *et al.*, 2008q; IUCN, 2009).
Trend - 2008 - Stable (Mickleburgh *et al.*, 2008q; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
Thomas and Marshall (1984) reported that females mated at the age of six months and gave birth at 12 months. Males reached puberty at the age of seven months. They also found that there is a clear relation between the bimodal births and the bimodality of the rainfall.

11 out of 18 females reported by Bergmans (1979a: 177) from Pointe Noire and Loandjili (Congo) were pregnant between 25 November and 13 December.

In Sierra Leone, Weber *et al.* (2019: 19) found two pregnant females on 30 and 31 March and five lactating on 6 and 7 April and 28 May.

MATING:
Haft (2002) [in Nesi *et al.* (2011: 552)] indicates that the male's courting call has a frequency of 2800 Hz.

PARASITES:
Held *et al.* (2016: 119) reported one out of 26 examined Gabonese *M. pusillus* specimens to be infected by the bacterium *Staphylococcus aureus*.

Schaer *et al.* (2013a: 17416) report the presence of hemosporidian parasites of the genus *Hepatocystis* in 68 out of 72 investigated bats.

Hirst (1923: 980) indicates that a specimen from Gambia was the host for a mite that was probably referrable to *Ancystropus æthiopicus* Hirst, 1923.

Fain (1967: 367) reported *Teinocoptes epomophori* Rodhain, 1923 (Acari: Teinocoptidae) from a *M. pusillus* specimen from Boma, DRC. He also reported *T. auricularis* Fain, 1959 on this host species from Kabinda, Boma and Beno, DRC.

VIRUSES:
Willoughby *et al.* (2017: Suppl.) report the following viruses: Lagos bat lyssavirus, Rift Valley fever phlebovirus, Zaire ebolavirus.

Coronaviridae - Coronaviruses
Maganga *et al.* (2014a: 5) tested 533 animals from Congo and found only two testing positive.
Anthony *et al.* (2017b: Suppl.) mention the beta-coronavirus Kenya_CoV_BtKY56.

Filoviridae - Filo viruses
Ebolavirus
Muyembe-Tamfum *et al.* (2012: 9) refer to Pourrut *et al.* (2005) who found ZEBOV-specific antibodies.
Marburg
Towner *et al.* (2007) tested 149 individuals from Gabon for Marburg virus RNA by conventional and real-time RT-PCR and 19 individuals for anti-Marburg virus IgG antibodies by ELISA; no positives were found.

Nairoviridae
Orthonairovirus
Only two of the 100 specimens from Gabon and Congo tested by Müller *et al.* (2016: 3) were positive for Crimean Congo hemorrhagic fever virus (CCHFV).

Paramyxoviridae
Drexler *et al.* (2012a: Suppl. Table S1) indicated that none of the 152 specimens they examined from the Democratic Republic of the Congo, the Central African Republic, Gabon, Congo, and Ghana tested positive for *Repirovirus, Henipavirus, Morbillivirus, Rubulavirus* or *Pneumovirus*.

Phenuiviridae
Phlebovirus

de Jong *et al.* (2011: 11) and Luis *et al.* (2013: suppl.) report the occurrence of Rift Valley fever virus.

Rhabdoviridae
Lyssavirus - Rabies related viruses
2006 in Nigeria, Dzikwi *et al.* (2010: 269) tested 55 brains by direct fluorescent antibody (DFA) and mouse inoculation test (MTIT) and all tested negative for lyssavirus antigens.
Lagos bat virus (LBV) - Sureau *et al.* (1977) isolated Lagos bat virus in African Central Republic, from where Greenbaum and Carr (2005: 168) also reported monoclonal antibodies. In 2006, 21 individuals from Nigeria were serum tested by a modified rapid fluorescent focus inhibition test (RFFIT), none tested positive for neutralizing anitibodies (Dzikwi *et al.*, 2010: 269).
Mokola virus (MOKV) - King *et al.* (1990: 168) found monoclonal antibodies for MOKV in bats from the Central African Republic. They also found antibodies for Duvenhage and Denmark bat virus.
In 2006, 21 individuals from Nigeria were serum tested by a modified rapid fluorescent focus inhibition test (RFFIT), where none tested positive for neutralizing anitibodies (Dzikwi *et al.*, 2010: 269).

In their overview table, Maganga *et al.* (2014a: 8) report the following viruses were found on *M. pusillus*: Lagos Bat Virus (LBV), Coronavirus, Zaire Ebola Virus (ZEBOV), Marburg virus (MBGV), Rift Valley Fever virus (RVF).

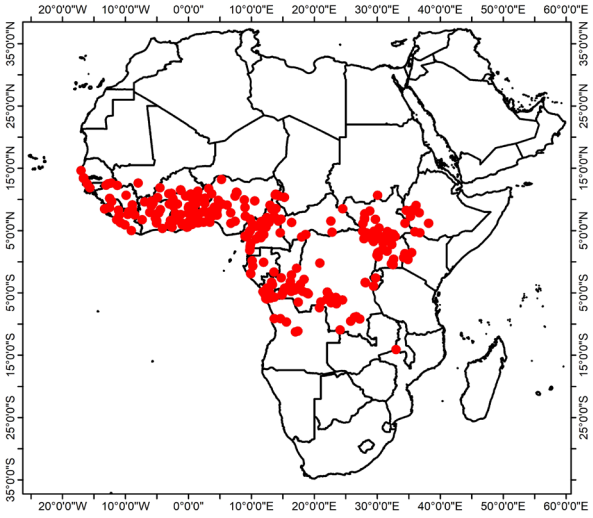

Figure 35. Distribution of *Micropteropus pusillus*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Angola, Benin, Burkina Faso, Burundi, Cameroon, Central African Republic, Congo, Congo (Democratic Republic of the), Côte d'Ivoire, Equatorial Guinea, Ethiopia, Gabon, Ghana, Guinea, Guinea-Bissau, Kenya, Liberia, Mali, Nigeria, Rwanda, Senegal, Sierra Leone, South Sudan, Sudan, Tanzania, The Gambia, Togo, Uganda, Zambia.

Genus ***Myonycteris*** Matschie, 1899

*1899. *[Xantharpyia (]Myonycteris[)]* Matschie, Die Fledermäuse des Berliner Museums für Naturkunde. 1. Lieferung. Die Megachiroptera des Berliner Museums für Naturkunde, 61, 63 [Goto Description]. - Comments: Type species: *Cynonycteris torquata* Dobson, 1878. Originally described as subgenus of *Xantharpyia*. Matschie dated his introduction on 14 May 1899. - Etymology: Derived from the Greek "*mys*" (= mouse) and "*nycteris*" (= bat) meaning mouse-like bat.
1912. *Myonycteris:* K. Andersen. - Etymology: From the Greek "*μύξ*" or "*μυός*", meaning mouse and "*νυκτερισ*", meaning bat (see Palmer, 1904: 440). (Name Combination, Current Combination)
2012. *Lissonycteris:* Nesi, Kadjo, Pourrut, Leroy, Pongombo Shongo, Cruaud and Hassanin, Mol. Phylogenet. Evol., 66 (1): 126.
2015. *Cyonycteris:* Lanza, Funaioli and Riccucci, The bats of Somalia and neighbouring areas, 60. - Etymology: From the Greek adjective "*λισός*" (lissós), meaning "smooth" and the feminine Greek substantive "*νυκτερίς*" (nykterís) [genitive "*νυκτερίδος*" (nikterídos)] meaning "bat", or combined "smooth bat", referring to the smooth fur of the species (see Lanza *et al.*, 2015: 59). (Lapsus)

TAXONOMY:
Two subgenera are presently recognized *Myonycteris* and *Phygetis* (Koopman, 1994; Simmons, 2005: 328). Revised by Bergmans (1976; 1997).

Lawrence and Novick (1963) separated *Lissonycteris* from *Rousettus* because of ethological differences concerning the use of the limbs, and the absence of echolocation in *Lissonycteris*. Juste B. *et al.* (1997) presented allozyme evidence corroborating earlier chromosome studies (Haiduk *et al.* (1980, 1981),

DNA-hybridisation results (Kirsch *et al.*, 1995) and cladistic analysis (Springer *et al.*, 1995) that support the recognition of *Lissonycteris* as a distinct genus. Bergmans (1994: 79; 1997: 136), Lavrenchenko *et al.* (2004b: 136), and Simmons (2005: 325) also consider *Lissonycteris* to be a valid genus.

Included in the Myonycterini tribe by Bergmans (1997: 69) and Almeida *et al.* (2016: 83), which was considered part of the Epomophorinae by the former and of the Rousettinae by the latter.

Known species of *Myonycteris*: ***angolensis*** (Bocage, 1898), ***brachycephala*** (Bocage, 1889); ***leptodon*** K. Andersen, 1908; ***relicta*** Bergmans, 1980; ***torquata*** (Dobson, 1878).

COMMON NAMES:
Czech: límcoví kaloni, měkkosrstí kaloni. English: Collared Fruit-bats, Little Collared Fruit-bats, Dwarf Epauletted Bat, Lesser Epauletted Bat, Smooth-haired Fruit-bats, Soft-furred Fruit-bats. French: Lissonyctères, Myonyctères, Roussettes à collier. German: Halskrausen-Flughunde, Samtfell-Flughunde.

PARASITES:
Szentiványi *et al.* (2019: Suppl.) indicated that a non specified Ugandan *Myonycteris* was parasitized by a *Dipseliopoda* bat fly (Nycteribiidae), which was infected by Kanyawara virus (KYAV).

VIRUSES:
Goldberg *et al.* (2017: 3, 4) described a new virus from Uganda (Kanyawara virus, genus *Ledantevirus, Rhabdoviridae*, Mononegavirales) from a new nycteribiid bat fly (genus *Dipseliopoda* Theodor, 1955, which in turn was captured on a (probably) new species of bat belonging to the genus *Myonycteris*. The bat was originally identified as *M. angolensis*, but an analysis of its mitochondrial DNA showed it to belong to an outgroup.

Myonycteris angolensis (Bocage, 1898)

*1898. *Cynonycteris Angolensis* Bocage, J. Sci. mat. phys. nat., ser. 2, 5 (19): 133, 138, text-fig. Publication date: June 1898. Type locality: Angola: Quibula, Cahata, north of Quanza River: Pungo Andongo [09 40 S 15 35 E, 1 200 m] [Goto Description]. Syntype: BMNH 1897.8.6.1: juv ♀, skull and alcoholic. Collected by: José Alberto de Oliveira Anchieta; collection date: 1891. Presented/Donated by: Lisbon Museum. See Andersen (1912b: 54), Bergmans (1997: 37). Syntype: MLZA T113 [a]: ad ♀, mounted skin (skull missing). Collected by: José Alberto de Oliveira Anchieta; collection date: 1891. Destroyed by fire in 1978; see Bergmans (1997: 37). Syntype: MLZA T113 [b]: juv, mounted skin (skull not removed). Collected by: José Alberto de Oliveira Anchieta; collection date: 1891. Destroyed by fire in 1978; see Bergmans (1997: 37). - Comments: From the feminine scientific Latin adjective *angolènsis,* meaning "Angolan" referring to the country where the type specimen was collected (see Lanza *et al.*, 2015: 60). - Etymology: Referring to the country where the type specimen was collected.

1920. *Rousettus (Lissonycteris) crypticola* Cabrera, Bol. r. Soc. espan. Hist. nat. , 20 (3 - 4): 106. Type locality: Equatorial Guinea: Bioko: Malabo, Basilé: San Fernando, cave of [03 44 N 08 49 E, 1 100 m]. Holotype: MNCN 53 / 20-II-25-5: ad ♀, complete skeleton. Collected by: D. Manuel M. de la Escalera; collection date: 26 July 1919; original number: 2.057. See Cabrera (1920: 107); Ibáñez and Fernández (1989: 7); Bergmans (1997: 35). Publication date: March - April 1920. Paratype: MNCN 54: juv ♂, skin only. Collected by: D. Manuel M. de la Escalera; collection date: 26 July 1919. See Ibáñez and Fernández (1989: 7); Bergmans (1997: 35).

2007. *Lyssonycteris angolensis:* Müller, M. A.; Paweska, J. T.; Leman, P. A.; Drosten, C.; Grywna, K.; Kemp, A.; Braack, L. E. O.; Sonnenberg, K.; Niedrig, M.; Swanepoel, R., Emerg. Inf. Dis., 13 (9): 1368. (Lapsus)

2013. *Myonycteris angolensis:* Nesi, Kadjo, Pourrut, Leroy, Pongombo Shongo, Cruaud and Hassanin, Mol. Phylogenet. Evol., 66 (1): 135. Publication date: 10 October 2012. (Name Combination, Current Combination)

? *Lissonycteris angolensis:* (Name Combination)

? *Rousettus (Lissonycteris) angolensis:* (Name Combination)

? *Rousettus angolensis angolensis:* (Name Combination)

? *Rousettus angolensis:*

TAXONOMY:
Peterson *et al.* (1995: 48), Schaer *et al.* (2013a), and Kerbis Peterhans *et al.* (2013: 189) include *angolensis* in the genus *Myonycteris*. Simmons (2005: 325) recognizes *goliath*, *petraea*, *ruwenzorii* and *smithii* as subspecies of *angolensis*, indicating that more than one species may be present in this complex.

Known subspecies of *M. angolensis*: ***angolensis*** (Bocage, 1898); ***goliath*** Bergmans, 1997; ***petraea*** Bergmans, 1997; ***smithii*** (Thomas, 1908).

COMMON NAMES:
Afrikaans: Bocage se vrugtevlermuis, Bocage-vrugtevlermuis. Chinese: 安哥拉领果蝠. Czech: kaloň měkkosrstý. English: Angolan Soft-furred Fruit-bat, Angolan Long-haired Fruit-bat, Angolan Rousette, Angolan Fruit Bat, Bocage's Fruit-bat, Long-haired Rousette, Canon Smith's Rousette. French: Lissonyctère d'Angola, Roussette d'Angola, Roussette de Bocage, Roussette à longs poils. German: Angolanischer Samtfell-Flughund, Angola-Weichfellflughund. Italian: Lissonittèride angolàna, Lissonictèride angolàna. Kiluba (DRC): Mulima. Kinande (DRC): Mulima. Portuguese: Morcego Frugivoro de Bocage. Spanish (Castillian): Ruseta de Angola.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) [as *Lissonycteris angolensis*] in view of its wide distribution, presumed large population, its occurrence in a number of protected areas, its tolerance of a degree of habitat modification, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008o; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) [assessed including *L. goliath*, *L. petraea*, *L. ruwenzorii*, *L. smithii* as synonyms] (Mickleburgh *et al.*, 2008o; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2004z; IUCN, 2004). 2003 - LR/lc [assessed as *Rousettus angolensis*] (IUCN, 2003). 1996 - LR/lc [assessed as *Rousettus angolensis*] (Baillie and Groombridge, 1996).

MAJOR THREATS:
There appear to be no major threats to this species as a whole (Mickleburgh *et al.*, 2008o; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008o) [in IUCN (2009)] report that this species is present in a number of protected areas.

GENERAL DISTRIBUTION:
Myonycteris angolensis is widely distributed at elevations ranging from sea level to 4,000 m asl, in West Africa, Central Africa and East Africa, with some distinct populations present within southern Africa. It ranges from Senegal and The Gambia in the west, through most of West Africa to Cameroon; from here it ranges southwards into Congo, eastern Democratic Republic of the Congo and Angola, and eastwards into Central African Republic, southern Sudan, eastern and southern Democratic Republic of the Congo and Rwanda and Burundi. In East Africa it is distributed from Ethiopia in the north through Uganda, Kenya and Tanzania. In southern Africa has been recorded from northwestern Angola, central and southern Cameroon, Central African Republic, central Congo, Equatorial Guinea (Bioko, Mbini), Gabon, eastern Nigeria, and northwestern and southwestern Democratic Republic of the Congo.

Native: Angola (Crawford-Cabral, 1989; Bergmans, 1997; Monadjem *et al.*, 2010d: 554); Burkina Faso (Kangoyé *et al.*, 2015a: 605); Burundi; Cameroon; Central African Republic; Congo (Bates *et al.*, 2013: 333); Congo (The Democratic Republic of the) (Hayman *et al.*, 1966; Monadjem *et al.*, 2010d: 554); Côte d'Ivoire; Equatorial Guinea; Ethiopia; Gambia; Ghana; Guinea (Denys *et al.*, 2013: 281); Guinea-Bissau (Veiga-Ferreira, 1948; Lopes and Crawford-Cabral, 1992; Rainho and Ranco, 2001: 35); Kenya; Liberia; Mozambique; Nigeria; Rwanda; Senegal; Sierra Leone; Sudan; Tanzania (Stanley and Goodman, 2011: 40); Togo; Uganda; Zambia (Ansell, 1967; Ansell, 1974; Monadjem *et al.*, 2010d: 554); Zimbabwe.
Presence uncertain: Benin; Gabon.

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
From western Uganda, Monadjem *et al.* (2011: 30) reported the following data for 8 specimens: Fa: 77.70 ± 1.634 mm, mass: 78.1 ± 7.31 g, wing loading: 17.7 ± 1.52 N/m^2, aspect ratio: 15.9 ± 0.46.

An albino specimen - of "*Lissonycteris angolensis*?" - was reported from a cave in Uganda by Neal (1971) and Lucati and López-Baucells (2016: Suppl.).

DETAILED MORPHOLOGY:
Chernova (2002) studied the structure of the cuticle of guard hairs of several Pteropodid bats and found that the structure of these hairs in *angolensis* was nonring-forming as in *Epomophorus wahlbergi* as oposed to ring-forming as in *Myonycteris angolensis* [as *Rousettus*].

FUNCTIONAL MORPHOLOGY:
Mainoya and Howell (1979: 164) found no glandular cells in the neck skin patch of male "*Rousettus angolensis*", and concluded that this patch serves as a visual cue during social encounters.

MOLECULAR BIOLOGY:
DNA - Unknown.
Karyotype - Haiduk *et al.* (1980, 1981: 223) reported 2*n* = 36, FN = 66, BA = 32, and a subtelocentric X chromosome. Denys *et al.* (2013: 281) also reported 2*n* = 36 and Fna = 66, but with two medium-sized submetacentric X chromosomes.
Protein / allozyme - Unknown.

ROOST:
Weber and Fahr (2006: 4) indicate that [as *Lissonycteris angolensis*] largely or exclusively depends on the availability of caves as day roosts.

POPULATION:
Structure and Density - This species can be common in some localities (Mickleburgh *et al.*, 2008o; IUCN, 2009).
Trend - 2008 - Decreasing (Mickleburgh *et al.*, 2008o; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
Stanley and Goodman (2011: 38) reported pregnant females collected in the West and East Usambara Mountains (Tanzania) on 1 July 1991, and between 25 July and 5 August 1992. They also found six pregnant females in the South Pare Mountains between 18 and 23 July 1993, and on 25 August 1994.

In Sierra Leone, Weber *et al.* (2019: 20) captured two lactating females on 25 March.

PARASITES:
Adam (1973: 3) reported *Plasmodium voltaicum* Van Der Kaay, 1964 (Haemosporida) from the Republic of Congo. He also mentioned that this parasite can be detected in the blood of the bats six to eight days after infection and then persists chronically for an persistent period. Schaer *et al.* (2013a: 17416) recorded the same parasite in three out of three investigated bats, and Perkins and Schaer (2016: Suppl.) mention it furthermore from Ghana and Guinea.

Adam (1973: 4) also reported on a [as *Lissonycteris angolensis*] specimen that was transported from the Republic of Congo to Paris and that was infected by *Hepatocystis perronae*.

ACARI

Teinocoptidae; Fain (1967: 363) described *Teinocoptes ituriensis* from "*Rousettus (Lissonycteris) angolensis*" from Saliboko, Lake Albert, Ituri, Congo.
Trombiculidae: *Trombigastia (Trombigastia) rousetti* was described by Vercammen-Grandjean and Fain (1958: 16) from "*Rousettus (Lissonycteris) angolensis*" from Nyakibanda, Rwanda (Stekolnikov, 2018a: 120). They also described (p. 18) *Trombigastia (Trombigastia) hirsuta* from bats from Katana, N of Bukavu, DRC (Stekolnikov, 2018a: 118). Fain (1959a: 346) mentions *Nycteridocoptes macrophallus* Fain, 1958 from "*R. angolensis*" from Mulungu, DRC. Stekolnikov (2018a: 130, 152) also reported *Chiroptella adami* Taufflieb, 1972 on "*Lissonycteris angolensis smithii*" from Senegal, and *Microtrombicula hexasternalis* Vercammen-Grandjean, 1965 on bats from Bukavu, DRC.

DIPTERA
Nycteribiidae: *Eucampsipoda africanum* Theodor 1955, widely distributed over the Ethiopian region and recorded from localities in Senegal to the Sudan and southwards mirroring the hosts distribution (Haeselbarth *et al.*, 1966: 115). *Dipseliopoda biannulate* (Oldroyd 1953) distributed over the tropical parts of Africa and recorded from localities in Nigeria, Cameroon, the Congo and the Sudan and Kenya (Haeselbarth *et al.*, 1966: 116). *Cyclopodia greeffi* Karsch 1884 found in a belt across central Africa, between lat. 10° south and north, while in West Africa it occurs further north up to lat. 20° (Haeselbarth *et al.*, 1966: 117).

VIRUSES:
Coronaviridae - Coronaviruses
SARS-CoV - Müller *et al.* (2007b) [as *Lyssonycteris angolensis*] tested between 1986 to 1999, for antibody to SARS-CoV in sera in 16 individuals from Oriental Province, DRC, one was tested positive (1/16, 6.3 %) and two individuals from Bandundu Province, DRC, none tested positive (0/2) (1/18, 5.6 %).
None of the nine Kenyan specimens tested by Tao *et al.* (2017: Suppl.) were positive for CoV.

Paramyxoviridae
Drexler *et al.* (2012a: Suppl. Table S1) indicated that none of the 3 specimens they examined from the Democratic Republic of the Congo tested positive for *Repirovirus, Henipavirus, Morbillivirus, Rubulavirus* or *Pneumovirus*.

Polyomaviridae
Polyomavirus - Conrardy *et al.* (2014: 259) tested 11 specimens from the Kakamega cave (Kenya) and found one of them to test positive for this virus.

This was also the case for the single specimen from Kisumu.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Angola, Burkina Faso, Burundi, Cameroon, Congo, Congo (Democratic Republic of the), Côte d'Ivoire, Equatorial Guinea, Ethiopia, Ghana, Guinea, Kenya, Liberia, Malawi, Mozambique, Nigeria, Rwanda, Senegal, Sierra Leone, Tanzania, Togo, Uganda, Zambia

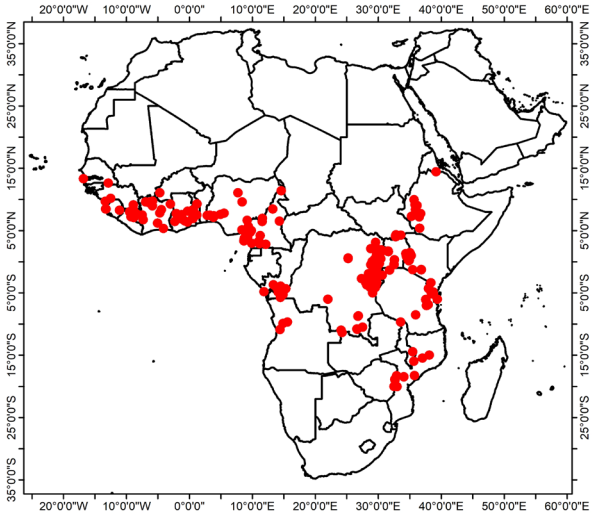

Figure 36. Distribution of *Myonycteris angolensis*

.

Myonycteris angolensis angolensis (Bocage, 1898)

*1898. *Cynonycteris Angolensis* Bocage, J. Sci. mat. phys. nat., ser. 2, 5 (19): 133, 138, text-fig. Publication date: June 1898. Type locality: Angola: Quibula, Cahata, north of Quanza River: Pungo Andongo [09 40 S 15 35 E, 1 200 m] [Goto Description]. Syntype: BMNH 1897.8.6.1: juv ♀, skull and alcoholic. Collected by: José Alberto de Oliveira Anchieta; collection date: 1891. Presented/Donated by: Lisbon Museum. See Andersen (1912b: 54), Bergmans (1997: 37). Syntype: MLZA T113 [a]: ad ♀, mounted skin (skull missing). Collected by: José Alberto de Oliveira Anchieta; collection date: 1891. Destroyed by fire in 1978; see Bergmans (1997: 37). Syntype: MLZA T113 [b]: juv, mounted skin (skull not removed). Collected by: José Alberto de Oliveira Anchieta; collection date: 1891. Destroyed by fire in 1978; see Bergmans (1997: 37). - Comments: From the feminine scientific Latin adjective *angolènsis,* meaning "Angolan" referring to the country where the type specimen was collected (see Lanza *et al.*, 2015: 60). - Etymology: Referring to the country where the type specimen was collected.

2015. *Myonycteris angolensis angolensis:* ACR. (Name Combination, Current Combination)

? *Lissonycteris angolensis angolensis:* (Name Combination)

GENERAL DISTRIBUTION:
Recorded from northwestern Angola, central and southern Cameroon, Central African Republic, central Congo, Equatorial Guinea [Bioko, Mbini], Gabon, eastern Nigeria, and northwestern and southwestern Democratic Republic of the Congo.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Angola, Cameroon, Congo, Congo (Democratic Republic of the), Equatorial Guinea, Nigeria.

Myonycteris angolensis goliath (Bergmans, 1997)

*1997. *Lissonycteris angolensis goliath* Bergmans, Beaufortia, 47 (2): 46. Publication date: 20 June 1997. Type locality: Zimbabwe: Inyanga: Gleneagles (Estate) [18 17 S 32 54 E] [Goto Description]. Holotype: NHMZ 59831: ad ♀, skin and skull. Collected by: Michael P. Stuart Irving *et al.*; collection date: 19 March 1970; original number: T1854. 8 paratypes; see Bergmans (1997: 46). Paratype: ZMA MAM.24710: ad ♀, skin and skull. Collected by: S. Irwin; collection date: 19 March 1970; original number: T1853. Presented/Donated by: ?: Collector Unknown. Paratype: ZMA MAM.24719: ♀, skin and skull. Collected by: S. Irwin; collection date: 19 March 1970; original number: T1853. Presented/Donated by: ?: Collector Unknown. Locality: Gleneagles (18 15 - 18 30 S, 32 45 - 33 0 E, 6000ft), see Bergmans (2011: 841). - Etymology: Referring to the biblical giant with the same name.

2001. *Lissonycteris goliath:* Cotterill, Durban Mus. Novit., 26: 53. (Name Combination, Current Combination)

2015. *Myonycteris angolensis goliath:* ACR. (Name Combination, Current Combination)

TAXONOMY:
Bergmans (1997) showed that craniological characters also distinguish *Lissonycteris* from *Rousettus*, and assigned the specimens from Zimbabwe to a new subspecies (*L. a. goliath*). Liberally applying the evolutionary species concept, which holds that any diagnosable or allopatric population is a valid species, Cotterill (2001e) elevated *goliath* to full species rank. Bergmans (2011: 841) still considers it a subspecies, at most.

COMMON NAMES:
English: Harrison's fruit bat. French: Lissonyctère goliath. German: Harrisons Samtfell-Flughund.

CONSERVATION STATUS:
Global - VU A3c+4c ver 3.1 (2001) (IUCN, 2004; Mickleburgh *et al.*, 2004ar); LC ver 3.1 (2001) included as a synonym of *L. angolensis* (Mickleburgh *et al.*, 2008o; IUCN, 2009).

MAJOR THREATS:
May be threatened by loss of habitat resulting from logging operations, and disturbance of cave roosting sites. It is possible that some populations of this species are threatened by over harvesting for subsistence food (Mickleburgh *et al.*, 2008o; IUCN, 2009).

CONSERVATION ACTIONS:
There is a need to protect the habitat (Mickleburgh *et al.*, 2008o; IUCN, 2009).

GENERAL DISTRIBUTION:
Lissonycteris goliath is known from four localities in south-east Africa (the border area of Mozambique and Zambia) between sea level and 1,800 m asl.

Native: Mozambique (Monadjem *et al.*, 2010d: 554; Monadjem *et al.*, 2010c: 376); Zambia; Zimbabwe (Monadjem *et al.*, 2010d: 554).

Myonycteris angolensis petraea (Bergmans, 1997)

*1997. *Lissonycteris angolensis petraea* Bergmans, Beaufortia, 47 (2): 44. Publication date: 20 June 1997. Type locality: Ethiopia: Ilubabor province: 10 km from Agaro: Jimma, road to [07 50 N 36 38 E] [Goto Description]. Holotype: MNHN ZM-MO-1972-482a: ad ♂, skull and alcoholic. Collected by: Jean Pierre Dorst *et al.*; collection date: 10 - 13 June 1968; original number: 4017. Presented/Donated by: ?: Collector Unknown. 10 paratypes; see Bergmans (1997). Paratype: MNHN ZM-MO-1972-482b: skull and alcoholic. Collected by: Jean Pierre Dorst *et al.*; collection date: 10 - 13 June 1968; original number: 4018. Presented/Donated by: ?: Collector Unknown. Paratype: MNHN ZM-MO-1972-482c: skull and alcoholic. Collected by: Jean Pierre Dorst *et al.*; collection date: 10 - 13 June 1968; original number: 4019. Presented/Donated by: ?: Collector Unknown. Paratype: ZMA MAM.25180: ad ♂, skull and alcoholic. Collected by: Jean Pierre Dorst *et al.*; collection date: 10-13 June 1968. Presented/Donated by: ?: Collector Unknown. Locality: 10 km from Agaro (07 50 N 36 38 E), at the road to Jimma (07 39 N 36 47 E), Ethiopia, 1650 m (see: Bergmans, 2011: 842).

2001. *Lissonycteris petraea:* Cotterill, Durban Mus. Novit., 26: 53. (Name Combination)

2015. *Myonycteris angolensis petraea:* ACR. (Name Combination, Current Combination)

TAXONOMY:
Simmons (2005: 325) states that the status of *petraea* remains unclear, but recognized it as a subspecies of *angolensis*.

COMMON NAMES:
English: Petra fruit bat. French: Lissonyctère d'Ethiopie. German: Äthiopischer Samtfell-Flughund.

CONSERVATION STATUS:
Global - VU A4c ver 3.1 (2001) (IUCN, 2004; Mickleburgh *et al.*, 2004ab); LC ver 3.1 (2001) included as a synonym of *L. angolensis* (Mickleburgh *et al.*, 2008o; IUCN, 2009).

CONSERVATION ACTIONS:
There is a need to protect the habitat (Mickleburgh *et al.*, 2008o; IUCN, 2009).

GENERAL DISTRIBUTION:
Found only in Ethiopia, where it has been recorded from six localities between 1,190 and 2,600 m asl.

Native: Ethiopia.

Myonycteris angolensis ruwenzorii (Eisentraut, 1965)

*1965. *Rousettus angolensis ruwenzorii* Eisentraut, Bonn. zool. Beitr., 16 (1/2): 3, fig. 1. Type locality: Uganda: Ruwenzori East [1 575 m] [Goto Description]. Holotype: BMNH 1906.12.4.1: ♂. Presented/Donated by: ?: Collector Unknown. - Etymology: Referring to the country where the type specimen was collected.
2015. *Myonycteris angolensis ruwenzorii:* ACR. (Name Combination, Current Combination)
? *Lissonycteris angolensis ruwenzorii:* (Name Combination)

COMMON NAMES:
English: Ruwenzori Long-haired rousette. French: Lissonyctère du Ruwenzori, Roussette à long poils du Ruwenzori. German: Ruwenzori-Langhaarflughund.

GENERAL DISTRIBUTION:
M. a. ruwenzorii has been recorded from Ethiopia, Kenya, Mozambique, Rwanda, southern Sudan, Tanzania, Uganda, northeastern and southeastern Democratic Republic of the Congo, Zambia and Zimbabwe.

Myonycteris angolensis smithii (Thomas, 1908)

*1908. *Rousettus smithii* Thomas, Ann. Mag. nat. Hist., ser. 8, 2 (10): 375. Publication date: 1 October 1908. Type locality: Sierra Leone: Freetown [08 30 N 13 15 W] [Goto Description]. Holotype: BMNH 1908.9.11.1: sad ♀. Collected by: Canon F.C. Smith. Presented/Donated by: Canon F.C. Smith. - Comments: Grubb *et al.* (1998: 67) mention that the type locality is almost certainly Freetown, according to Rosevear (1965: 84).
1974. *Lissonycteris angolensis smithi:* Bergmans, Bellier and Vissault, Rev. Zool. afr., 88 (1): 38. (Name Combination)
2012. *Myonycteris angolensis smithii:* Nesi, Kadjo, Pourrut, Leroy, Pongombo Shongo, Cruaud and Hassanin, Mol. Phylogenet. Evol., suppl. 3. (Name Combination, Current Combination)
? *Lissonycteris angolensis smithii:* (Name Combination)
? *Lissonycteris smithii:* (Name Combination)
? *Rousettus angolensis smithi:* (Name Combination)
? *Rousettus smithi:* (Name Combination, Alternate Spelling)

TAXONOMY:
Mentioned as *smithii* by Allen (1939a: 63), Meester *et al.* (1986: 30), Koopman (1993a), Bergmans (1997: 33), Grubb *et al.* (1998: 67), Kock *et al.* (2002: 79), but as *smithi* by Peterson *et al.* (1995: 48), who also consider it a valid species in the genus *Myonycteris*. Kock *et al.* (2002: 79) include it as subspecies in *angolensis*, due to clinal differentiation (as does Bergmans, 1997: 33). Simmons (2005: 325) follows Kock *et al.* (2002), who support Bergmans (1997), in treating *smithii* as a subspecies of *angolensis*.

COMMON NAMES:
English: Smith's fruit bat. French: Lissonyctère de Simth. German: Smiths Samtfell-Flughund.

CONSERVATION STATUS:
Global - LC ver 3.1 (2001) (IUCN, 2004; Mickleburgh *et al.*, 2004u); LC ver 3.1 (2001) included as a synonym of *L. angolensis* (Mickleburgh *et al.*, 2008o; IUCN, 2009).

GENERAL DISTRIBUTION:
Distributed in the lowlands of western Africa, where its distribution follows the savanna and forest zone, it is found up to 1,400 m asl on Mount Nimba.

Native: Bioko; Burkina Faso; Ghana; Guinea (Decher *et al.*, 2016: 262); Guinea Bissau; Côte d'Ivoire; Liberia; Nigeria; Sierra Leone; Senegal; Togo.

HABITAT:
Monadjem *et al.* (2016y: 364) indicate that the (sub)species is restricted to montane forests in West Africa.

Myonycteris brachycephala (Bocage, 1889)

*1889. *Cynonycteris brachycephala* Bocage, J. Sci. mat. phys. nat., ser. 2, 1 (3): 198. Publication date: December 1889. Type locality: São Tomé and Principé: São Tomé Island. Holotype: MLZA 449a: ad ♀, mounted skin and skull. Collected by: F. Newton and Pires; collection date: 1868. Holotype number "T114"; destroyed by fire in 1978: see Bergmans (1997: 53).
1898. *Cynonycteris brachycephalus:* Seabra, J. Sci. mat. phys. nat., ser. 2, 5: 170. (Alternate Spelling)
1995. *M[yonycteris] brachyptera:* Peterson, Eger, and Mitchell, : 48. - Comments: Mentioned by Peterson *et al.* (1995: 48) only with the remark "La situation exacte de ce taxon suppose une étude plus poussée". [The exact situation of this taxon needs a more thorough study]. (Lapsus)
? *Myonycteris (Myonycteris) brachyptera:* (Lapsus)
? *Myonycteris (Phygetis) brachycephala:* (Name Combination)
? *Myonycteris brachycephala:* (Name Combination, Current Combination)

TAXONOMY:
Reviewed by Bergmans (1997). See Simmons (2005: 328).

COMMON NAMES:
Czech: kaloň tomášský. English: Sao Tomé Collared Fruit Bat. French: Myonyctère de São Tomé, Chauve-souris frugivore à collier de São Tomé. German Halskrausen-Flughund, São Tomé Halskrausen-Flughund.

CONSERVATION STATUS:
Global - Listed as Endangered because its extent of occurrence is less than 1,000 km^2, all individuals are in a single location (the uplands of Sao Tomé), and there is continuing decline in the extent and quality of its habitat (Juste *et al.*, 2008a; IUCN, 2009).

Assessment History -
2008 - EN B1ab(iii) ver 3.1 (2001) (Juste *et al.*, 2008a; IUCN, 2009). 2004 - EN B1ab(iii) ver 3.1 (2001) (Juste *et al.*, 2004b; IUCN, 2004). 2000 - EN (Hilton-Taylor, 2000). 1996 - VU (Baillie and Groombridge, 1996). 1994 - VU (Groombridge, 1994).

MAJOR THREATS:
Within the species' relatively limited range it is threatened by ongoing habitat loss, presumably related to logging activities and the conversion of land to agricultural use (Juste *et al.*, 2008a; IUCN, 2009).
Rainho *et al.* (2010b: 257) indicate that hunting might also be a problem for this island endemic.

CONSERVATION ACTIONS:
Juste *et al.* (2008a) [in IUCN (2009)] report that there appear to be no direct conservation measures in place. It is not known if the species is present in any protected areas. There is a need to protect suitable areas of remaining natural habitat for this species, with additional research required into the persistence of populations in modified habitats (such as cocoa plantations). Further surveys are needed to identify additional localities for this species, and to better understand its natural history.

GENERAL DISTRIBUTION:
Myonycteris brachycephala is endemic to the uplands of São Tomé Island of São Tomé and Príncipe. It is absent from the northern part of the island. It has only been recorded from three localities, and no colonies have been reported. Individuals have been recorded between 300 and 1,200 m asl.

Native: Sao Tomé and Principe (Bergmans, 1997; Simmons, 2005: 328; Rainho *et al.*, 2010a: 18).

DENTAL FORMULA:
Juste and Ibáñez (1993a: 221) report on an asymmetric dental formula in *M. brachycephala*, which resulted from the absence of a lower internal incisor, either in the left or right mandible. They indicate that this might be related to a developmental instability associated with the colonization by the island species.

POPULATION:
Structure and Density - It appears to be a naturally rare species (Juste *et al.*, 2008a; IUCN, 2009).
Trend - 2008 - Decreasing (Juste *et al.*, 2008a; IUCN, 2009; Rainho *et al.*, 2010b: 257).

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
São Tomé and Principé.

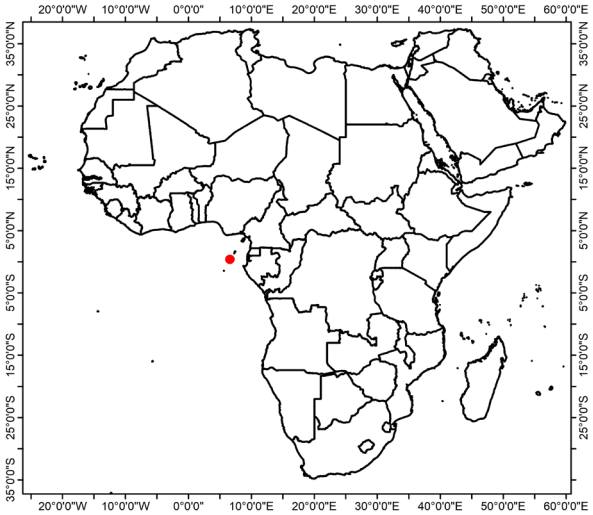

Figure 37. Distribution of *Myonycteris brachycephala*

Myonycteris leptodon K. Andersen, 1908

*1908. *Myonycteris leptodon* K. Andersen, Ann. Mag. nat. Hist., ser. 8, 2 (11): 450. Publication date: 1 November 1908. Type locality: Sierra Leone: "Sierra Leone" [Goto Description]. Holotype: BMNH 1891.2.13.1: ad ♂. Collected by: J. Hickman Esq. Collection date: prior to 1891. (Current Combination)
1971. *M[yonycteris (Myonycteris)] t[orquata] leptodon:* Hayman and Hill, in: Meester and Setzer, The mammals of Africa. Order Chiroptera. (Name Combination)
1971. *Myonycteris torquata leptodon:* Jones, J. Mamm., 52 (1): 129. Publication date: February 1971. (Name Combination)
? *Myonycteris (Myonycteris) leptodon:* (Name Combination)
? *Myonycteris (Myonycteris) torquata leptodon:* (Name Combination)

TAXONOMY:
Based on the study of cytochrome *b* sequences, Nesi *et al.* (2012) concluded that West African *Myonycteris torquata* (Dobson, 1878) differed considerably from those from Central African.

COMMON NAMES:
German: Sierra-Leone Halskrausen-Flughund

ETYMOLOGY OF COMMON NAME:
From the Greek λεπτός meaning slender or narrow and όδους meaning tooth.

GENERAL DISTRIBUTION:
Nesi *et al.* (2012) indicated that the *M. torquata* specimens from West Africa were considerably different from those from the remaining part of the continent, but they did not include specimens from the area between the Dahomey Gap and the Niger delta. Herkt *et al.* (2017: Appendix S9) were not able to determine a preferential habitat type in that area for either *M. torquata* or *M. leptodon*. They were, however, able to determine that the Dahomey Gap was a pronounced break in the habitat suitability predictions of both species. Therefore, they considered the specimens on the western side of the Gap to belong to *leptodon* and on the eastern side to *torquata*.

Native: Native: Côte d'Ivoire (Heim de Balsac, 1934b: 24); Ghana (Decher and Fahr, 2007: 12); Guinea (Simmons, 2005: 328; Denys *et al.*, 2013: 281; Decher *et al.*, 2016: 263); Liberia (Monadjem and Fahr, 2007: 50); Sierra Leone (Simmons, 2005: 328); Togo.

HABITAT:
In the Mount Nimba area, Monadjem *et al.* (2016y: 364) recorded this species from a wide range of forested habitats on both Liberian and Guinean sides, between 450 m and 1,350 m.

REPRODUCTION AND ONTOGENY:
Weber *et al.* (2019: 20) captured one lactating female on 7 April in Sierra Leone.

PARASITES:
HAEMOSPORIDA
Schaer *et al.* (2013a: "2") report the presence of hemosporidian parasites of the genus *Hepatocystis* in 11 out of 63 investigated bats.

VIRUSES:
Filoviridae - Filo viruses
Ebolavirus
Nesi *et al.* (2012: 126) suggest that the high nucleotide distance between Ebola virus Côte d'Ivoire and Ebola virus Zaire can be correlated with the Plio/Pleistocene divergence between their putative reservoir host species, i.e., *Myonycteris leptodon* and *Myonycteris torquata*, respectively.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Côte d'Ivoire, Ghana, Guinea, Liberia, Sierra Leone, Togo.

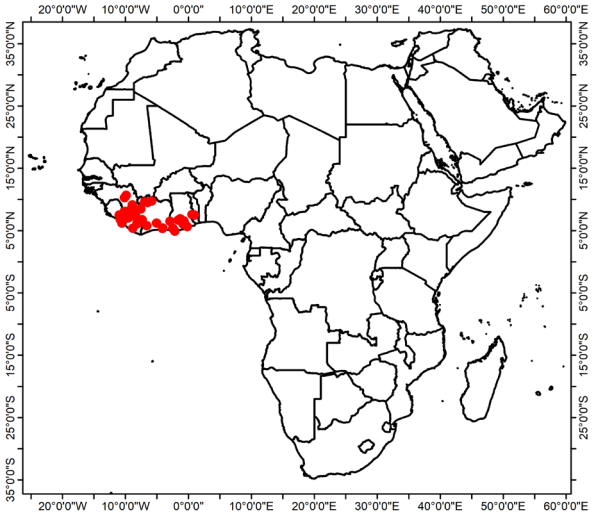

Figure 38. Distribution of *Myonycteris leptodon*

Myonycteris relicta Bergmans, 1980

*1980. *Myonycteris relicta* Bergmans, Zool. Meded. RMNH, Leiden, 55 (14): 171, 173, figs 1 - 10. Publication date: 4 March 1980. Type locality: Kenya: Coast province: Kwale district: Shimba Hills, Lukore area: Mukanda River [ca. 04 13 S 39 25 E] [Goto Description]. Holotype: RMNH MAM.27909: ad ♂. Collected by: Robert N. Kyongo; collection date: 30 July 1978. See Bergmans (1997: 56). Paratype: ZMB 54936: ad ♂, skull and alcoholic. Collection date: January 1900. See Turni and Kock (2008). Paratype: ZMB 54937: ad ♀, skull and alcoholic. Collection date: January 1900. See Turni and Kock (2008). (Current Combination)
? *Myonycteris (Myonycteris) relicta:* (Name Combination)

TAXONOMY:
Bronner *et al.* (2003) state that *Myonycteris relicta* was described by Bergmans (1980) based on the re-identification of a specimen from the Nguru Mountains, and two specimens from the Usambara Mountains, in Tanzania. Peterson *et al.* (1995: 48) regarded *M. relicta* as a species of *Rousettus*, in contrast to Koopman (1982), Corbet and Hill (1980), Koopman (1993a: 143), Bergmans (1997) and Simmons (2005: 328) who retained this taxon in *Myonycteris*.

COMMON NAMES:
Chinese: 孤领果蝠. Czech: kaloň východoafrický. English: East African Collared Fruit-bat, Relict Collared Fruit-bat, East African Little Collared Fruit Bat, Bergmans's Small Fruit Bat, Bergmans's Collared Fruit Bat. French: Myonyctère d'Afrique orientale, Chauve-souris frugivore à collier d'Afrique orientale, Roussette du Kenya. German: Reliktärer Halskrausen-Flughund.

ETYMOLOGY OF COMMON NAME:
First described by Wim Bergmans after examining and reclassifying specimens previously ascribed to *Rousettus* (*Lissonycteris*) *angolensis* and following his discovery of the type specimen from the Mukonda River in Kenya (see Taylor, 2005).

CONSERVATION STATUS:
Global - Listed as Vulnerable because it is suspected that a population decline, estimated to be more than 30% would be met over a ten-year period which is ongoing from the recent past to the near future, inferred from the loss of its forest habitat (Mickleburgh *et al.*, 2008ao; IUCN, 2009).

Assessment History -
2008 - VU A4c ver 3.1 (2001) (Mickleburgh *et al.*, 2008ao; IUCN, 2009). 2004 - VU A4c ver 3.1 (2001) (Mickleburgh *et al.*, 2004bd; IUCN, 2004). 1996 - VU (Baillie and Groombridge, 1996). 1994 - VU (Groombridge, 1994).

MAJOR THREATS:
Although the natural history of this species is little known, there is considerable ongoing habitat loss within the species range (through logging, harvesting of firewood and conversion of land to agricultural use) (Mickleburgh *et al.*, 2008ao; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008ao) [in IUCN (2009)] report that there appear to be no direct conservation measures in place for this species. In Zimbabwe it has been recorded from the Haroni and Rusitu protected areas, but the forest has still been declining at these localities over the past three decades. Further surveys are needed to better determine the full extent of this species range. There is a need to conserve remaining lowland forest throughout much of East Africa.

GENERAL DISTRIBUTION:
Bergmans (1997) reports that the species is known from the Shimba Hills in southeast Kenya, the Usambara and Nguru Mountains in Tanzania. Several other unpublished localities in Tanzania and more recently from eastern Zimbabwe and Mozambique.

A female specimen captured in Haroni Forest (Zimbabwe) in 1973 and originally identified incorrectly as *Rousettus* (=*Lissonycteris*) *angolensis*, was re-identified as *Myonycteris relicta* (Cotterill, 1995; Bergmans, 1997).

Native: Kenya (Simmons, 2005: 328); Mozambique (Simmons, 2005: 328;: 554; Monadjem *et al.*, 2010c: 376); Tanzania (Simmons, 2005: 328; Stanley and Goodman, 2011: 40); Zimbabwe (Simmons, 2005: 328; Monadjem *et al.*, 2010d: 554).

HABITAT:
All localities known with some accuracy are in East African Zanzibar-Inhambane coastal mosaic: forest patches or in undifferentiated Afromontane vegetation bordering on East African Zanzibar-Inhambane coastal mosaic (Bergmans, 1997). The holotype specimen was caught over the Mukanda River, bordered by big thorn trees and fig trees, in the Shimba Hills, which are covered with a mosaic of open country and forest patches (Bergmans, 1997).

POPULATION:
Structure and Density -There is little known about the population of this species. Nearly all collections have been of single specimens caught in mist nets (Mickleburgh *et al.*, 2008ao; IUCN, 2009).
Trend - 2008 - Decreasing (Mickleburgh *et al.*, 2008ao; IUCN, 2009).

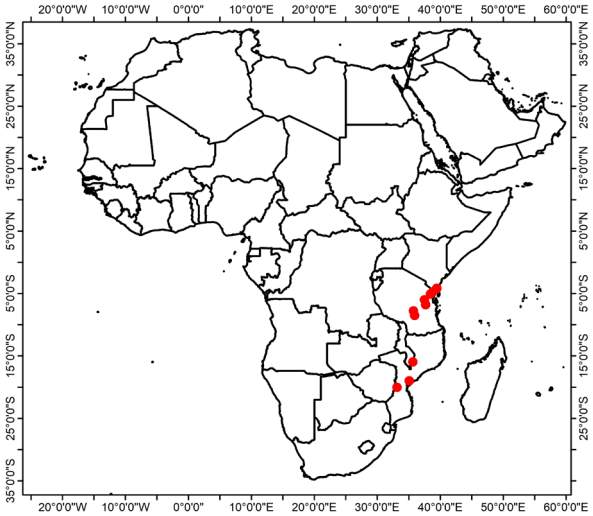

Figure 39. Distribution of *Myonycteris relicta*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Kenya, Malawi, Mozambique, Tanzania, Zimbabwe.

Myonycteris torquata (Dobson, 1878)

1870. *Cynopterus collaris* Gray, Catalogue of Monkeys, Lemurs and Fruit-eating bats in the collection of the British Museum London, 123. Type locality: Angola: "Angola" [Goto Description]. Holotype: BMNH 1843.9.27.2:. - Comments: Not of Kolenati, 1860 [=*Rousettus leachi*] not of Geoffroy. Cat. Monkeys, Lemurs, Fruit-eating Bats Brit. Mus., p. 123. Type locality "W Africa, Lower Congo; Angola" see Allen (1939a: 58). Andersen (1912b: 581) mentions "The type was obtained 'near Congo' by one Mr. Currer, from whom it came into the hands of Dr. (afterwards Sir) J. Richardson, who presented it to the British Museum. Gray's statement that the specimen is 'young' is incorrect; his quotation of 'Gray, List Mamm. B. M. (1843),' where the specimen is stated to have been mentioned under the name *Xantharpyia collaris*, does not refer to the printed text of that book, but to a hand-written addition by Gray in his own copy of the book.".

*1878. *Cynonycteris torquata* Dobson, Catalogue of the Chiroptera of the collection of the British Museum, xxxvii, 71, 76, pl. 5, fig. 1. Publication date: June 1878. Type locality: Angola: N Angola: Lower Cuanza region: Golungo Alto [Goto Description]. Lectotype: BMNH 1866.1.20.4: ad ♂, skull and alcoholic. Collected by: F. Welwitsch; collection date: 1853 - 1860. See Bergmans (1997: 49). - Comments: Grubb *et al.* (1998: 68) indicate "definite restriction of the type locality is not possible at present (Bergmans, 1976: 210 - 211)". Bergmans (1997: 49) indicates that Bergmans (1976) restricted the type locality to "Lower Cuanza Region" and the area was restricted to Golungo Alto by Crawford-Cabral (1989).

2014. *Myonycteris tarquata:* Ndara R., IJISR, 12 (1): 253. Publication date: November 2014. (Lapsus)
? *Myonycteris (Myonycteris) torquata:* (Name Combination)
? *Myonycteris torquata:* (Name Combination, Current Combination)
? *Myopterus torquata:* (Name Combination, Lapsus)

TAXONOMY:
See Hayman and Hill (1971), Peterson *et al.* (1995), Bergmans (1976; 1997) and Simmons (2005: 328). Subspecies follow Koopman (1994), but see Bergmans (1997).

In their study on cytochrome *b* sequences, Nesi *et al.* (2012) concluded that West African *Myonycteris torquata* (Dobson, 1878) differed considerably from the specimens from Central African, which resulted in the recognition of *M. leptodon* as a separate species.

COMMON NAMES:
Czech: kaloň límcový. English: Little Collared Fruit-bat, Little Collared Fruit Bat. French: Petit Myonyctère, Petite Chauve-souris frugivore à collier. German: Kleiner Halskrausen-Flughund, Kleiner Halsbandflughund. Spanish (Castillian): Zorra Voladora de Collar.

CONSERVATION STATUS:
Global - Listed as Least Concern in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008bb; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2008bb; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2004bz; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
There are generally no major threats to this species. It is threatened in parts of its range by severe habitat loss, presumably through general logging operations and the conversion of land to agricultural use (Mickleburgh *et al.*, 2008bb; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008bb) [in IUCN (2009)] reported that the species has been recorded from Tai National Park (Côte d'Ivoire) and it seems probable that it is present in a number of West African and Central African protected areas. No direct conservation measures are currently needed for this species as a whole.

GENERAL DISTRIBUTION:
Myonycteris torquata used to be considered widespread in West Africa and Central Africa, ranging into western East Africa, but since the recognition of *M. leptodon* as a separate species, its distribution range starts from Nigeria and Cameroon into Equatorial Guinea (Rio Muni and Bioko), Gabon, Congo, Central African Republic, Democratic Republic of the Congo, Angola, extreme northwestern Zambia, Rwanda, Uganda and possibly southern Sudan. It is a lowland species found up to 800 m asl.

Nesi *et al.* (2012) did not include specimens from the area between the Dahomey Gap and the Niger delta, and Herkt *et al.* (2017: Appendix S9) were not able to determine a preferential habitat type in that area for either *M. torquata* or *M. leptodon*. However, they were able to determine that the Dahomey Gap was a pronounced break in the habitat suitability predictions of both species. Therefore, they considered the specimens on the western side of the Gap to belong to *leptodon* and on the eastern side to *torquata*.

Native: Angola (Bergmans, 1997; Simmons, 2005: 328; Monadjem *et al.*, 2010d: 554); Cameroon; Central African Republic (Morvan *et al.*, 1999: 1195); Congo (King and Dallimer, 2010: 65); Congo (The Democratic Republic of the) (Bergmans, 1997; Dowsett *et al.*, 1991: 259; Monadjem *et al.*, 2010d: 554); Ethiopia (Lavrenchenko *et al.*, 2004b: 136); Equatorial Guinea (Bioko) (Fahr and Ebigbo, 2003: 128; Simmons, 2005: 328); Gabon; Nigeria (Capo-Chichi *et al.*, 2004: 161); Rwanda; Uganda (Kityo and Kerbis, 1996: 59; Simmons, 2005: 328); Zambia (Bergmans, 1997; Simmons, 2005: 328; Monadjem *et al.*, 2010d: 554).

Presence uncertain: Sudan.

MOLECULAR BIOLOGY:
DNA - Unknown.
Karyotype - Haiduk *et al.*, 1980; 1981: 223) reported $2n$ = 36, FN = 66, BA = 32, a subtelocentric X chromosome and an acrocentric Y chromosome for specimens from Cameroon. Identical karyotypes were reported by Primus *et al.* (2006) for specimens from Gabon.
Protein / allozyme - Unknown.

DIET:
In Cameroon, Grünmeier (1993: 35) found the following pollen in the gut and faeces: *Mucuna flagellipes* Hook.f. (Fabaceae), *Anthocleista* sp. (Gentianaceae), *Kigelia africana* (Lam.) Benth. (Bignoniaceae), *Elaeis* cf. *guineensis* Jacq. (Arecaceae), *Musa* sp. (Musaceae), Bombacaceae indet., and Mimosaceae indet.

In Congo, Kipalu (2009: 16) reported *M. torquata* visiting/consuming fruits of *Chlorophora excelsa* (African teak) and *Ficus mucuso*.

Gembu Tungaluna (2012: 102 - 104) reported the following fruits being eaten in the Kisangani area (DRC) during the various seasons: First heavy rain season (September - November): *Uapaca guineensis* Müll.Arg., 1864 (Sugar plum, red cedar, false mahogany, rikio) (19%), *Ficus leprieuri* Miq., 1867 (17%), *Carica papaya* L. (papaya) (11%), *Musanga cecropioides* R.Br. & Tedlie (African corkwood tree, umbrella tree) (11%), *Pseudospondias microcarpa* (A. Rich.) Engl. (8%), *Persea americana* Mill., 1786 (avocado) (8%), *Dacryoides edulis* H.J. Lam (safou, African pear, bush pear, Nsafu, bush butter tree, butterfruit) (8%), *Ficus wildemanniana* Warb. (6%), *Ficus vallis-choudae* Delile (6%), *Ficus mucoso* Welw. (3%), *Spondias cytherea* Sonnerat, 1782 (Ambarella, otaheite apple, great hog plum) (3%).
First mild rain/dry season (December - February): *Elaeis guineensis* Jacq. (African oil palm, macaw-fat) (50%), *Myrianthus arboreus* P.Beauvois, 1805 (giant yellow mulberry, bush pineapple, corkwood) (50%).
Second heavy rain season (March - May): *Pseudospondias microcarpa* (17%), *Musanga cecropioides* (14%), *Spondias cytherea* (9%), *Ficus leprieuri* (8%), *Ficus* sp1 (8%), *Uapaca guineensis* (8%), *Annonidium mannii* (Oliv.) Engl. & Diels (Junglesop) (6%), *Ficus vallis-choudae* (6%), *Ficus wildemanniana* (3%), *Ficus* sp2 (3%), *Dacryoides edulis* (3%), *Elaeis guineensis* (3%), *Parinari excelsa* Sabine (Guinea plum) (3%), Musa sp. (3%)
Second mild rain/dry season (June - August): *Ficus leprieuri* (34%), *Myrianthus arboreus* (33%), *Annonidium mannii* (Junglesop) (33%).

POPULATION:
Structure and Density - Although the species is infrequently caught in ground level nets, it is commonly caught in canopy nets. In Tai National Park (Côte d'Ivoire) its one of the most common fruit bats (Mickleburgh *et al.*, 2008bb; IUCN, 2009).
Trend - 2008 - Stable (Mickleburgh *et al.*, 2008bb; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
In Congo, Bergmans (1979a: 169) caught a female with a large foetus on 25 November, and a male with large, but not active testes on 28 November.

PARASITES:
BACTERIA
Gram-negative bacterium - Of the 40 bats tested by Nowak *et al.* (2017: 6) in the Republic of Congo, 22 tested positive for *E. coli*. One isolate was identified as *E. albertii*.

HAEMOSPORIDA
Lutz *et al.* (2016: 9) examined 7 *M. torquata* specimens from East Africa and found four of them infected with *Hepatocystis* sp. Perkins and Schaer (2016: Suppl.) mention the presence of *Hepatocystis perronae* Landau and Adam, 1971 in bats from the Republic of Congo and the Central African Republic (see also Adam, 1973: 4; Miltgen *et al.*, 1977: 595).

VIRUSES:
Coronaviridae - Coronaviruses
SARS-CoV - Müller *et al.* (2007b) tested between 1986 and 1999 for antibodies to SARS-CoV in sera of seven individuals from Bandundu Province, DRC, one specimen tested positive (1/7, 14.3 %).

Filoviridae - Filo viruses
Ebolavirus
Pourrut *et al.* (2007) showed that there is a homogeneous ZEBOV [Zaire Ebolavirus] infection in the wild populations of *M. torquata* in Gabon and the Democratic Republic of the Congo. Four out of 58 bats had immunoglobulin G (IgG) specific for Ebola in Gabon during a test performed by Leroy *et al.* (2005: 575).

Bausch and Schwarz (2014: 1) and Pigott *et al.* (2014: 9) indicate that *M. torquata* is one of the leading candidates for introducing Ebola in Guinea (together with *Epomops franqueti* and *Hypsignathus monstrosus*). While Vogel (2014: 140) names *M. torquata* the leading suspect for the Ebola outbreak in Guinea in the beginnig of 2014. However, no proof has been provided that this was indeed the case.

Marburgvirus
Towner *et al.* (2007) tested 264 individuals from Gabon for Marburg virus RNA by conventional and real-time RT-PCR and 55 individuals for anti-Marburg virus IgG antibodies by ELISA; no positives were found.

Nairoviridae
Orthonairovirus

Only three of the 100 specimens from Congo tested by Müller *et al.* (2016: 3) were positive for Crimean Congo hemorrhagic fever virus (CCHFV).

Paramyxoviridae
Drexler *et al.* (2012a: Suppl. Table S1) indicated that three of the 111 specimens (2.7 %) they examined from Gabon, Congo and the Democratic Republic of the Congo tested positive for *Henipavirus*.

Rhabdoviridae
Kalemba *et al.* (2017: 409) reported that out of 6 bats examined from the DRC, two tested positive for Lagos Bat Virus neutralizing antibodies.

In their overview table, Maganga *et al.* (2014a: 8) reported that the following viruses were already found on *M. torquata*: Zaire Ebola virus (ZEBOV), Coronavirus (SARS-CoV), Henipavirus.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Angola, Cameroon, Central African Republic, Chad, Congo, Congo (Democratic Republic of the), Equatorial Guinea, Gabon, Ghana, Nigeria, Uganda, Zambia.

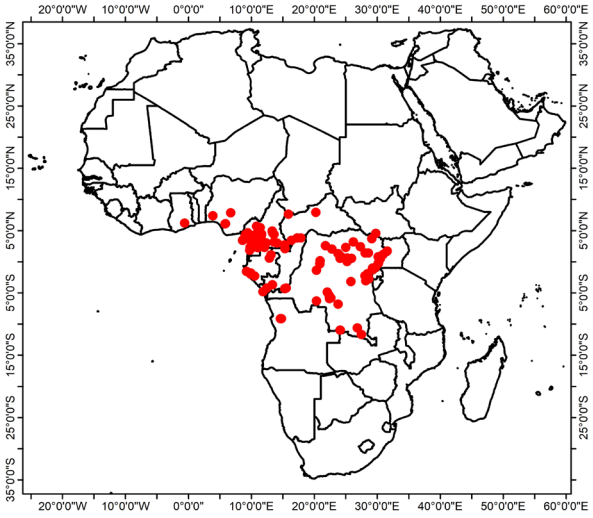

Figure 40. Distribution of *Myonycteris torquata*

Myonycteris torquata torquata (Dobson, 1878)

*1878. *Cynonycteris torquata* Dobson, Catalogue of the Chiroptera of the collection of the British Museum, xxxvii, 71, 76, pl. 5, fig. 1. Publication date: June 1878. Type locality: Angola: N Angola: Lower Cuanza region: Golungo Alto [Goto Description]. - Comments: Grubb *et al.* (1998: 68) indicate "definite restriction of the type locality is not possible at present (Bergmans, 1976: 210 - 211)". Bergmans (1997: 49) indicates that Bergmans (1976) restricted the type locality to "Lower Cuanza Region" and the area was restricted to Golungo Alto by Crawford-Cabral (1989).
1971. *M[yonycteris (Myonycteris)] t[orquata] torquata:* Hayman and Hill, in: Meester and Setzer, The mammals of Africa. Order Chiroptera, 12. (Name Combination)
? *Myonycteris (Myonycteris) torquata torquata:* (Name Combination)
? *Myonycteris torquata torquata:* (Name Combination)

VIRUSES:
Nesi *et al.* (2012: 126) suggest that the high nucleotide distance between Ebola virus Côte d'Ivoire and Ebola virus Zaire can be correlated with the Plio/Pleistocene divergence between their putative reservoir host species, i.e., *Myonycteris torquata leptodon* and *Myonycteris torquata torquata*, respectively.

Myonycteris torquata wroughtoni K. Andersen, 1908

*1908. *Myonycteris wroughtoni* K. Andersen, Ann. Mag. nat. Hist., ser. 8, 2 (11): 450. Publication date: 1 November 1908. Type locality: Congo (Democratic Republic of the): Oriental province: Uele district: Likandi river [=Litaki river] [03 20 N 26 10 E] [Goto Description]. Holotype: BMNH 1907.7.8.25: ad ♂, skin and skull. Collected by: The Alexander-Gosling Expedition; collection date: 18 April 1906. See Andersen (1908c: 450); Bergmans (1997: 50). Paratype: BMNH 1907.7.8.26: ♂. Collected by: ?: Collector Unknown. Presented/Donated by: ?: Collector Unknown. - Etymology: In honour of Mr. Robert Charles Wroughton, who assisted in working out the mammals collected during the Alexander-Gosling Expedition: see Andersen (1908c: 450).
1971. *M[yonycteris (Myonycteris] t[orquata] wroughtoni:* Hayman and Hill, in: Meester and Setzer, The mammals of Africa. Order Chiroptera, 13. (Name Combination)

1971. *Myonycteris torquata wroughtoni:* Jones, J. Mamm., 52 (1): 129. Publication date: February 1971. (Name Combination, Current Combination)
? *Myonycteris (Myonycteris) torquata wroughtoni:* (Name Combination, Current Combination)

Genus ***Nanonycteris*** Matschie, 1899

*1899. *[Epomophorus (]Nanonycteris[)]* Matschie, Die Fledermäuse des Berliner Museums für Naturkunde. 1. Lieferung. Die Megachiroptera des Berliner Museums für Naturkunde, 35, 58 [Goto Description]. - Comments: Described as a subgenus of *Epomophorus* Bennett, 1836. Type species: *Epomophorus veldkampii* Jentink, 1888. Matschie dated his introduction on 14 May 1899. - Etymology: From the Greek "*νάνος*", meaning dwarf and "*νυκτερια*", meaning bat (see Palmer, 1904: 448).
1943. *Nannonycteris:* Pohle, Sber. Ges. naturf. Freunde Berlin, 78 (for 1942). (Lapsus)
2007. *Nnonycteris:* Lameed, Biodiversity, 8 (4): 8. (Lapsus)
2019. *Nanonycteri:* Mbu'u, Mbacham, Gontao, Kamdem, Nlôga, Groschup, Wade, Fischer and Balkema-Buschmann, Vector-Borne Zoon. Dis., xxx: "6".. Publication date: 13 April 2019. (Lapsus)
? *Epomophorus:* - Comments: Not of Gray, 1836.
? *Nanonycteris:* (Name Combination, Current Combination)

TAXONOMY:
Revised by Bergmans (1989). See Simmons (2005: 328).

Included in the Epomophorinii tribe by Bergmans (1997: 69) and Almeida *et al.* (2016: 83), which was considered part of the Epomophorinae by the former and of the Rousettinae by the latter.

Known species of *Nanonycteris*: ***veldkampii*** (Jentink, 1888).

COMMON NAMES:
Czech: Veldkampovi kaloni. English: Dwarf Fruit-bats, Little Flying Cow. French: Roussettes naines. German: Zwergflughunde.

Nanonycteris veldkampii (Jentink, 1888)

*1888. *Epomophorus veldkampii* Jentink, Notes Leyden Mus., 10: 51 (for 1887). Publication date: April 1888. Type locality: Liberia: Fisherman Lake: Buluma [06 43 N 11 14 W] [Goto Description]. Holotype: RMNH [unknown]: ad ♀, alcoholic (skull not removed). Collected by: Johan Büttikofer and C.F. Sala; collection date: Jan-April 1882. - Etymology: Jentink (1887b: 52) states: "I call this new species *veldkampii*, as Büttikofer wishes to connect the name of one of his Liberian friends with this new acquisition. Mr. Veldkamp, at present Consul for the Netherlands in Liberia, has helped our travellers as much as he could, has promoted their investigations in every way and finally assisted to Sala's funeral.".
2000. *Nanonycteris weldkampi:* Konstantinov, Pema, Labzin and Farafonova, Plecotus et al., 3: 145. (Lapsus)
2015. *N[anonycteris] Weldkampi:* Sylla, Pourrut, Diatta, Diop, Ndiaye and Gonzalez, Afr. J. Microbio. Res., 9 (22): 1464. Publication date: 3 June 2015. (Lapsus)
? *Epomophorus (Nanonycteris) veldkampii:* (Name Combination)
? *Nanonycteris veldkampii:* (Name Combination, Current Combination)

TAXONOMY:
See Bergmans (1989) and Simmons (2005: 328).

COMMON NAMES:
Czech: kaloň Veldkampův. English: Veldkamp's Dwarf Fruit-bat, Veldkamp's Bat, Little Flying Cow, Flying Calf. French: Roussette naine de Veldkamp, Chauve-souris de Veldkamp, Nanonyctère, Petite vache-volante. German: Veldkamps Zwergflughund.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, tolerance of

a degree of habitat modification, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008be; IUCN, 2009).

Assessment Histroy -
2008 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2008be; IUCN, 2009). 2004 - LC ver 3.1 (2001) [as *Nononycteris veldkampi*] (Mickleburgh *et al.*, 2004cb; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
In general there appear to be no current major threats to this species as a whole. The species is dependent on certain food trees where they visit flowers, and habitat degradation might be a problem in parts of the range (Mickleburgh *et al.*, 2008be; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008be) [in IUCN (2009)] report that, in view of the species wide range, it seems probable that it is present in a number of protected areas. There is a need to determine if there have been any local declines in this species resulting from the loss of food trees.

GENERAL DISTRIBUTION:
Nanonycteris veldkampii is widely distributed in West Africa and western parts of Central Africa. It ranges from Guinea and Sierra Leone in the west, through each country in West Africa to Cameroon, with a single record from the southern region of Central African Republic. It is generally a lowland species, but has been recorded up to 1,200 m asl.

Native: Benin (Capo-Chichi *et al.*, 2004: 161); Burkina Faso (Kangoyé *et al.*, 2012: 6023; 2015a: 605); Cameroon; Central African Republic; Côte d'Ivoire (Heim de Balsac, 1934b: 24); Ghana (Decher and Fahr, 2007: 12); Guinea (Denys *et al.*, 2013: 281); Liberia (Monadjem and Fahr, 2007: 50); Nigeria; Sierra Leone; Togo.

HABITAT:
Monadjem *et al.* (2016y: 364) indicate that this species occurs in forested habitats between 500 and 1200 m in the Mount Nimba area of Liberia and Guinea.

ROOST:
N. veldkampii roosts singly or in small groups of well-spaced individuals (Kunz, 1996: 44).

MIGRATION:
Thomas (1983) [in Kangoyé *et al.* (2015a: 605)] reported that this species migrates during the wet season from the forest zone to the northern Sudanian zone.

DIET:
Ayensu (1974) reports feeding visits to *Parkia clappertonia* (Dawadawa), *Ceiba pentandra* (Silk-Cotton tree or Kapok tree), *Psidium guajava* (Guava tree), and *Carica papaya* (Papaya or pawpaw).

Fahr (2011a: 114) shows a picture of *N. veldkampii* feeding on *Cola cordifolia*.

Seltzer *et al.* (2013: table S2) provide an overview of the plant species found beneath bat feeding roosts. For *N. veldkampii* this included *Psidium guajava* L. (apple guava - Myrtaceae).

POPULATION:
Structure and Density - This species can be abundant, although this partly depends on migration patterns (Mickleburgh *et al.*, 2008be; IUCN, 2009).
Trend - 2008 - Unknown (Mickleburgh *et al.*, 2008be; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
Weber *et al.* (2019: 20) reported on five pregnant (25, 30, 31 March, 2 April) and 11 lactating (25, 27, 30, 31 March, 1, 3, 7, 8 April) in Sierra Leone.

PARASITES:
HAEMOSPORIDA
Witsenburg *et al.* (2012: Suppl. Table 1) report on GenBank data for *Hepatocystis*, retrieved from *N. veldkampii*. These parasites were also reported by Schaer *et al.* (2013a: "2") from six out of 8 investigated bats.

VIRUSES:
Filoviridae - Filoviruses
Ebolavirus
One out of four specimens tested by Hayman *et al.* (2012d: 1208) in the Greater Accra region, Ghana, was positive for EBOV antibodies.

Paramyxoviridae
Drexler *et al.* (2012a: Suppl. Table S1) reported that none of the 23 specimens they examined from Ghana tested positive for *Repirovirus, Henipavirus, Morbillivirus, Rubulavirus* or *Pneumovirus*.

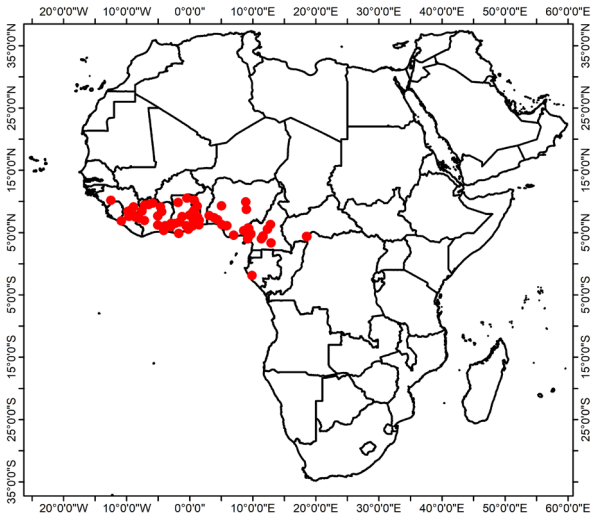

Figure 41. Distribution of *Nanonycteris veldkampii*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Benin, Cameroon, Central African Republic, Congo (Democratic Republic of the), Côte d'Ivoire, Gabon, Ghana, Guinea, Liberia, Nigeria, Sierra Leone, Togo.

Genus ***Plerotes*** K. Andersen, 1910

*1910. *Plerotes* K. Andersen, Ann. Mag. nat. Hist., ser. 8, 5 (25): 97. Publication date: 1 January 1910. - Comments: Type species: *Epomophorus anchietæ* Seabra, 1900. - Etymology: From the Greek "*πλεροτες*", meaning one who renders full or complete. (Current Combination)
2014. *Plerote:* Ndara R., IJISR, 12 (1): 253. Publication date: November 2014. (Lapsus)

TAXONOMY:
Revised by Bergmans (1989). See Simmons (2005: 333).

Included in the Plerotini tribe by Bergmans (1997: 69) and Almeida *et al.* (2016: 83), which was considered part of the Epomophorinae by the former and of the Rousettinae by the latter.

Known species of *Plerotes*: ***anchietae*** (Seabra, 1900).

COMMON NAMES:
Czech: pyložraví kaloni. English: Plerote Fruit-bats, Plerotes Fruit-bats. French: Plérotes. German: Breitgesicht-Flughunde.

Plerotes anchietae (Seabra, 1900)

*1900. *Epomophorus anchietæ* Seabra, J. Sci. mat. phys. nat., ser. 2, 6: 116. Publication date: August 1900. Type locality: Angola: Benguela district: East of Hanha: Galanga [12 04 S 15 09 E]. Holotype: MLZA 481a: ♀, mounted skin and skull. Collected by: José Alberto de Oliveira Anchieta. Presented/Donated by: ?: Collector Unknown. Neotype: CZL 31-59026: imm ♀. Collected by: Jaime V. Santos; collection date: 8 December 1959. Presented/Donated by: ?: Collector Unknown. Designated by Bergmans (1989: 144). - Comments: Andersen (1912b: 487) mentions: "Type, in the Lisbon Museum, an adult female, mounted, skull extracted, obtained by Sr. Anchieta.".
2014. *Plerote anchetae:* Ndara R., IJISR, 12 (1): 253. Publication date: November 2014. (Lapsus)
? *Epomophorus anchietae:* (Name Combination)
? *Epomophorus n. sp.:*
? *Nanonycteris veldkampii:* - Comments: Not of Jentink, 1888. (Lapsus)
? *Plerotes ancheilae:* (Lapsus)
? *Plerotes anchietae:* (Name Combination, Current Combination)
? *Plerotes anchietai:* (Lapsus)

TAXONOMY:
Koopman (1993a: 145) mentions this name as *anchietai*, whereas Allen (1939a: 59) and Kock (1969a: 114) use *anchietae*. See Simmons (2005: 333).

Almeida *et al.* (2016: 82) found that the only adult male specimen (SMF 85744 from Malawi) showed some interesting morphological features (i.e. a ruff of enlarged, clustered glandular hairs) that link *Plerotes* to the myonycterines (*Megaloglossus* and *Myonycteris*).

COMMON NAMES:
Czech: kaloň pyložravý. English: Anchieta's Plerote Fruit-bat, Benguela Fruit-bat, D'Anchieta's Fruit Bat, Anchieta's Fruit Bat. French: Plérote d'Anchieta, Chauve-souris frugivore d'Anchieta. German: Anchietas Breitgesicht-Flughund. Kiluba (DRC): Mulima.

CONSERVATION STATUS:
Global - Listed as Data Deficient (DD ver 3.1 (2001)) in view of the absence of sufficient information on its extent of occurrence, natural history, threats and conservation status (Mickleburgh *et al.*, 2008br; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) (Mickleburgh *et al.*, 2008br; IUCN, 2009). 2004 - DD ver 3.1 (2001) (Mickleburgh *et al.*, 2004ch; IUCN, 2004). 2000 - DD (Hilton-Taylor, 2000). 1996 - VU (Baillie and Groombridge, 1996). 1994 - Rare (Groombridge, 1994).

MAJOR THREATS:
Within the Angolan and Malawian parts of the species range it may be threatened by habitat destruction resulting from agricultural development, collection of timber and firewood, and setting of fires by poachers (Mickleburgh *et al.*, 2008br; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008br) [in IUCN (2009)] report that although there appear to be no direct conservation measures in place, it has been recorded from a number of protected areas in Malawi and the Democratic Republic of the Congo. Further field surveys are needed to better determine the current status of this poorly known species.

GENERAL DISTRIBUTION:
Plerotes anchietae is largely known from scattered records in Central Africa. Most reports of this species are from the 1950's in Angola, the Democratic Republic of the Congo, Malawi and Zambia. A single specimen was collected in Malawi in 1997. It has been recorded between 1,000 and 2,000 m asl (Bergmans, 1989).

Native: Angola (Bergmans, 1989; Monadjem *et al.*, 2010d: 555; Taylor *et al.*, 2018b: 60); Congo (The Democratic Republic of the) (Hayman *et al.*, 1966; Bergmans, 1989; Monadjem *et al.*, 2010d: 555); Malawi (Kock *et al.*, 1998a; Monadjem *et al.*, 2010d: 555); Zambia (Bergmans, 1989; Monadjem *et al.*, 2010d: 555).

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Harrison (1960c: 68) described the colour of the hairs on the dorsal surface of a subadult male from Zambia as "terminally a uniform light brown (nearest to Suntan Merida+Mayfair Tan-, Plates 13 and 7B, Maerz and Paul, 1950), becoming a little more rufous on the tibiae. The bases of the hairs are paler, buffy coloured". On the ventral surface, the pelage is "pale greyish buff, without any indication of a darker neck band".

DENTAL FORMULA:
The dental formula is i $^{1}/_{2}$ c $^{1}/_{1}$ p $^{3}/_{3}$ m $^{1}/_{3}$. Harrison (1960c: 69) also indicates that almost all known specimens of the genus *Plerotes* have some difference in the dental formula.

FUNCTIONAL MORPHOLOGY:
Harrison (1960c: 69) indicates that the tongue is 20 mm long (sub-equal to the mandibular length) and 9.5 mm wide at the base of the epiglottis. The dorsal tip and anterior quarter is covered with filiform papillae.

POPULATION:
Structure and Density - It appears to be a rare, or at least a rarely recorded, species (Mickleburgh *et al.*, 2008br; IUCN, 2009).
Trend - 2008 - Unknown (Mickleburgh *et al.*, 2008br; IUCN, 2009).

VIRUSES:
Paramyxoviridae
Drexler *et al.* (2012a: Suppl. Table S1) indicated that single specimen they examined from Gabon did not test positive for *Repirovirus, Henipavirus, Morbillivirus, Rubulavirus* or *Pneumovirus*.

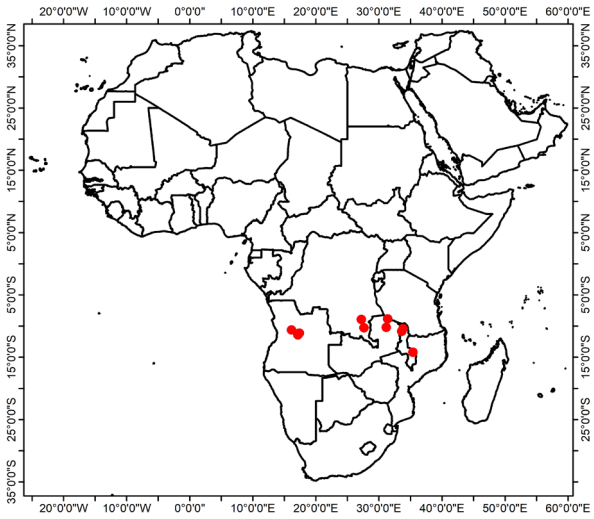

Figure 42. Distribution of *Plerotes anchietae*

DISTRIBUTION BASED ON VOUCHER SPECIMENS: Angola, Congo (Democratic Republic of the), Malawi, Zambia.

Genus ***Rousettus*** Gray, 1821

*1821. *Rousettus* Gray, London Med. Repos., 15: 299. Publication date: 1 April 1921. - Comments: Type species: *Pteropus Egyptiacus* E. Geoffroy Saint-Hilaire, 1810. Not *Pteropus aegyptiacus* Geoffroy, 1818 (see Corbet and Hill, 1992: 67). - Etymology: From the French "*rousette*" for the rosette of glandular hairs on the neck of males (see Flannery, 1995a: 304) or from the French "*rousse*" for reddish or reddish brown, referring to the fur colour of the earliest specimens taken in Egypt (see Kwiecinski and Griffiths, 1999: 7). (Current Combination)

1829. *Cercopteropus* Burnett, Quart. J. Sci., Lit. and Art, pt. 1, art. 5, p. 269. Publication date: April - June 1829. - Comments: Type species: *Pteropus aegyptiacus* E. Geoffroy Saint-Hilaire, 1818 (Designated by Andersen, 1912b: 23). Burnett (1829: 269) did mention both *Ægyptiacus* and *Amplexicaud* [for *amplexicaudata*] as being included in his genus. - Etymology: From the Greek "*κέρκος*", meaning tail and "*Pteropus*" (see Palmer, 1904: 172).

1843. *Xantharpyia* Gray, Catalogue of the species of mammals of the British Museum, xix, 37. Publication date: 13 May 1843. - Comments: Type species: *Pteropus amplexicaudatus* E. Geoffroy Saint-Hilaire, 1810. - Etymology: From the Greek "*ξανθός*", meaning yellow and *Harpyia* from the characteristic colour (see Palmer, 1904: 710).

1844. *Eleutherura* Gray, Mammalia, in Voyage "Sulphur", Zool., 1: 29. - Comments: Type species: *Pteropus leachii* A. Smith, 1829 (=*Pteropus aegyptiacus* E. Geoffroy Saint-Hilaire, 1810). Andersen (1912b: 24) mentions *Pteropus hottentotus* Temminck, 1832 as type species, which is a synonym of *P. leachi* A. Smith 1829. Preoccupied by *Eleutherura* Gray, 1843; nom. nud. (Andersen, 1912b: 16; Meester *et al.*, 1986: 28; Pavlinov *et al.*, 1995: 61). Allen (1939a: 61) indicates that Gray (1843 - List. Spec. Mamm. Brit. Mus., p. xix) is a nomen nudum, but that it is redescribed in the 1844 publication. - Etymology: From the Greek "*ἐλεύθερος*", meaning free and "*οὐρά*", meaning tail, referring to having the tail free from the interfemoral membrane (see Palmer, 1904: 255).

1852. *Cynonycteris* Peters, Naturwissenschaftliche Reise nach Mossambique, Zoologie, Säugethiere, 25 [Goto Description]. - Comments: Type species: *Pteropus collaris* Liechtenstein [not Illiger] (=*Pteropus aegyptiacus* E. Geoffroy Saint-Hilaire, 1810). - Etymology: From the Greek "*κύων*" or "*κυνός*", meaning dog and "*νυκτερις*", meaning bat, probably referring to the dog-like head (see Palmer, 1904: 212).

1870. *Senonycteris* Gray, Catalogue of Monkeys, Lemurs and Fruit-eating bats in the collection of the British Museum London, 115. - Comments: Type species: *Pteropus seminudus* Kelaart, 1850 (=*Pteropus lechenaulti* Desmarest, 1820). Described as subgenus of *Xantharpyia*.

1899. *Mynonycteris* Matschie, Die Fledermäuse des Berliner Museums für Naturkunde. 1. Lieferung. Die Megachiroptera des Berliner Museums für Naturkunde, p. 63.

1906. *Roussettus (Xantharpyia):* Johnston, Liberia, Volume II: 690. (Name Combination, Lapsus)
1906. *Roussettus:* Johnston, Liberia, Volume II: 688. (Lapsus)
1992. *Rosetus:* Agrawal, Das, Chakraborty, Ghose, Mandal, Chakrabo, Zoological Survey of India, State Fauna Series 3, 49. - Comments: Lapsus. See Bergmans (1994: 82). (Lapsus)
1999. *Rosettus:* Buffenstein, Maloney and Bronner, S. Afr. J. Zool., 34 (1): 16. (Lapsus)
2007. *Rousetus:* Nel and Markotter, Crit. Rev. Microbiol., 33 (4): 308. (Lapsus)
2015. *Rousettes:* Lee, Kulcsar, Elliott, Khiabanian, Nagle, Jones, Amman, Sanchez-Lockhart, Towner, Palacios and Rabadan, BMC Genomics, 16 (1033): 1. Publication date: 7 December 2015. (Lapsus)

TAXONOMY:
Meester *et al.* (1986) mention that the inclusion of *Lissonycteris* as a subgenus of *Rousettus* is open to question. Lawrence and Novick (1963) maintain that *Lissonycteris* should be regarded as a valid genus, more closely related to *Myonycteris* Matschie, 1899, than to *Rousettus*. In this, they are followed by Rosevear (1965), Ansell (1978), Corbet and Hill (1980), Almeida *et al.* (2011a), and Patterson and Webala (2012). Koopman (1975), on the other hand, concludes that although there is a close relationship between *Lissonycteris* and *Myonycteris*, the relationship of *Lissonycteris* with *Rousettus* is sufficiently close for it to be retained as subgenus. Koopman (1982) again treats *Lissonycteris* as a subgenus, as is done also by Hayman and Hill (1971). Bronner *et al.* (2003), following Lawrence and Novick (1963), separated *Lissonycteris* from *Rousettus* because of ethological differences concerning the use of the limbs, and the absence of echolocation in *Lissonycteris*. Juste B. *et al.* (1997) presented allozyme evidence corroborating earlier chromosome studies (Haiduk *et al.*, 1980, 1981), DNA-hybridisation results (Kirsch *et al.*, 1995) and cladistic analysis (Springer *et al.*, 1995) that support the recognition of *Lissonycteris* as a distinct genus. Three subgenera are often recognized (*Rousettus*, *Boneia*, and *Stenonycteris*), although Bergmans (1994), rejected the use of subgenera for the African species (Simmons, 2005: 347).

A key to the species is provided by Kwiecinski and Griffiths (1999: 1, Mammalian Species, 611).

Included in the Rousettini tribe by Almeida *et al.* (2016: 83).

Known species of *Rousettus*: ***aegyptiacus*** (E.Geoffroy, 1810); *amplexicaudatus* (E. Geoffroy, 1810) – Cambodia, Thailand, Burma, and Laos, Peninsular Malaysia through Indonesia, Java, and Bali, Philippines; New Guinea, Bismarck Archipelago, Solomon Islands (Simmons, 2005: 347); *celebensis* K. Andersen, 1907- Sulawesi, Mangole, Sanana, Sangihe Islands (Indonesia) (Simmons, 2005: 347); *leschenaulti* (Desmarest, 1820) – Sri Lanka, Pakistan to Vietnam and southern China, Peninsular Malaysia, Sumatra, Java, Bali, and Mentawai Islands (Indonesia) (Simmons, 2005: 348); *linduensis* Maryanto and Yani, 2003 – central Sulawesi (Simmons, 2005: 348); ***madagascariensis*** G. Grandidier, 1928; ***obliviosus*** Kock, 1978; *shortridgei* Thomas and Wroughton, 1909 – Indonesia (Bali, Java, Lombok); *spinalatus* Bergmans and Hill, 1980 – Sumatra, Borneo (Simmons, 2005: 348); *tangkokoensis* Lengkong, Arisoesilaningsih, Hakim and Sudarto, 2016 – Indonesia (Sulawesi).

COMMON NAMES:
Czech: egyptští kaloni, noční kaloni, psi noční. English: Rousettes, Rousette Fruit-bats. French: Roussettes. German: Höhlenflughunde. Italian: Rossétti.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Horácek *et al.* (2013b: 1) report on two tooth fragments from the Middle Pleistocene Israeli site Qesem Cave, which they tentatively attribute to cf. *Rousettus* sp. If this identification is confirmed, they suggest that the current Mediterranean population of *R. aegyptiacus* could be seen as a paleochoric element. However, the teeth they report on are larger than similar teeth in extant *R. aegyptiacus* specimens, so they might be from a different species or there might have been phenotypic rearrangements such as increased body size (as they suggest on page 13).

BIOGEOGRAPHY:
Several hypotheses have been proposed about the origin of the genus *Rousettus* on the phylogenetic inference, and centers of diversity pinpoint a southeastern Asian origin (Juste B. *et al.*, 1999). Three separate routes have been suggested for western expansion of pteropodids into Africa, via a middle Asian-European-Gibraltar route, a middle-Asian, Middle Eastern route, and an Indian subcontinent-western Indian Ocean, east African route (Juste B. *et al.*, 1999). Giannini and Simmons (2003, 2005) support the Middle Eastern route with the Afrotropical clade

composed of *R. aegyptiacus* and *R. madagascariensis* being the sister group to *R. leschenaulti*.

Almeida *et al.* (2016: 82) indicate that *Rousettus* expanded from Asia into Africa in the late Pliocene or early Pleistocene, where the continental *R. aegyptiacus* already split off in the early Pleistocene, slightly later followed by a split of the two island forms.

PARASITES:
ACARI

Trombiculidae: Stekolnikov (2018a: 50) reported *Rousettus* sp. to be the type host of *Whartonia oweni* Vercammen-Grandjean and Brennan, 1957.

DIPTERA
Nycteribiidae: *Tripselia blainvillii* (Leach 1817) single record (Haeselbarth *et al.*, 1966: 113). Morse *et al.* (2013: Suppl. 1) refer to *Dipseliopoda biannulata* collected from a non-specified Kenyan *Rousettus* specimen. This bat fly was itself infected by an *Arsenophonus* sp. bacteria (Szentiványi *et al.*, 2019: Suppl.).

Rousettus aegyptiacus (E. Geoffroy St.-Hilaire, 1810)

*1810. *Pteropus Egyptiacus* E. Geoffroy Saint-Hilaire, Ann. Mus. Hist. nat. Paris, 15: 96. Type locality: Egypt: Giza province: Giza: Great Pyramid [30 01 N 31 13 E]. Holotype: MNHN A.70: ad ♀. Presented/Donated by: ?: Collector Unknown. Allotype: MNHN A.69: ♂, mounted skin (skull not removed). Collected by: Etienne Geoffroy-Saint-Hilaire. Rode (1941: 234) also mentions numbers 762A and 167a. Andersen (1912b: 32) mentions that there were several specimens, but only one was still present: an adult male (A.69). - Comments: Type locality originally "la basse Egypte - le plafond d'une des chambres de la grande Pyramide". See Kwiecinski and Griffiths (1999: 1). Type MNHN A.70 (ad ♀, alcoholic and skull: Qumsiyeh, 1985: 13). - Etymology: The name is derived from the fact that the species was originally described from a specimen from the Great Pyramid of Giza in Egypt (see Smithers, 1983: 63).

1818. *Pteropus aegyptiacus* E. Geoffroy Saint-Hilaire, Description des Mammifères qui se trouve en Egypte, 2: 134, pl. 3, No 2. Holotype: MNHN A.70: ad ♀, skull and alcoholic. Collected by: Etienne Geoffroy-Saint-Hilaire. See Qumsiyeh (1985: 13). Number 167 in Rode (1941). - Comments: Emendation of *egyptiacus*. Unjustified according to Corbet and Hill (1992: 67), justified according to Kock (2001c). - Etymology: From the scientific Latin masculine adjective *aegyptiàcus*, meaning "Egyptian", as the species was described from an Egyptian specimen (see Lanza *et al.*, 2015: 69). (Emendation)

1823. *Pteropus collaris* Lichtenstein, Verzeichniss der Doubletten des Zool. Mus. K. Univ. Berlin, 3, 5. Type locality: South Africa: "Terra Caffrorum". - Comments: Preoccupied by *Pteropus collaris* Illiger, 1815; see Kwiecinski and Griffiths (1999: 1).

1825. *Pteropus geoffroyi* Temminck, Monogr. Mamm, 1 (5): 197, pl. 15, f. 14, 15. Type locality: Senegal: Senegal and north coast of Africa. - Comments: Meester *et al.* (1986: 29) mention that the type locality is restricted to Giza, Egypt by Koopman (1975: 361). Andersen (1912b: 32) mentions it as a replacement name for *R. aegyptiacus*, since "vu que l'espèce se trouve au Sénégal, et probablement sur toute la côte septentrionale d'Afrique," [= "in view of the fact that the species occurs in Senegal and probably over the the entire northern coast of Africa."].

1827. *Pteropus amphiplexicaudatus:* Temminck, Monogr. Mamm. Type locality: South Africa: Cape. - Comments: Probably a lapsus which should be assigned to Roberts (1951: 55) since that author mentions it as "not of Geoffroy", which would probably refer to *amplexicaudatus*. (Lapsus)

1829. *Pteropus Leachii* A. Smith, Zool. Journ., 4 (16): 433. Publication date: May 1829. Type locality: South Africa: Gardens about Cape Town [ca. 33 56 S 18 28 E] [Goto Description]. Paratype: SMF 891: juv ♂, skin and skull. Collected by: ?: Collector Unknown. Presented/Donated by: ?: Collector Unknown. Cotype: BMNH 1875.11.3.2: ad ♀, alcoholic (skull not removed). Collected by: Sir Andrew Smith. Exchanged by G.E. Dobson (see Andersen, 1912b: 28). - Etymology: In honour of the celebrated naturalist, Dr. Leach, F.R.S. (see Smith, 1829: 433).

1832. *Pteropus hottentottus*Temminck, in: Smuts, Enumer. Mamm. Capensium, 3. Type locality: South Africa: Cape province: originally ""circa urbem apensem" see Andersen (1912b: 28), restricted to Capt Town.: Cape Town [33 56 S 18 28 E] [Goto Description]. - Comments: Mentioned as "*hottentotus*" by), Simmons (2005), but as *hottentottus* by Allen (1939a: 62), Roberts (1951: 55), Meester *et al.* (1986: 29), Kwiecinski and Griffiths (1999). Andersen

(1912b: 29) mentions that the type is in the RMNH, but also indicates that there are "authentic specimens" in the BMNH: 1837.4.28.33-34, 38, 40, 67 (4 ad + 1 imm; sks and skulls), from "near Cape Town" (J. Smuts), and purchased from the Leyden Museum.

1862. *Xantharpyia ægyptiaca:* Gerrard, Catalogue of the bones of Mammalia in the collection of the British Museum, 57. Type locality: Egypt. (Name Combination)

1862. *Xantharpyia leachii:* Gerrard, Catalogue of the bones of Mammalia in the collection of the British Museum, 57.

1870. *Eleutherura unicolor* Gray, Catalogue of Monkeys, Lemurs and Fruit-eating bats in the collection of the British Museum London, 117. Type locality: Gabon: "Gabon" [Goto Description]. Holotype: BMNH 1862.8.26.1: ad ♂, skin and skull. Purchased Verreaux: see Andersen (1912b: 32).

1906. *R[oussettus (Xantharpyia)] collaris:* Johnston, Liberia, Volume II: 690. (Lapsus)

1908. *Rousettus sjöstedti* Lönnberg, Wiss. Ergebn. Swedischen Zool. Exp. u. Leitung Sjöstedt, Kilimandjaro-Meru, 1 (2): 7. Type locality: Tanzania: near Tanga: Mkulumusi caves. [Goto Description]. Holotype: NRM [unknown]: ad ♀, alcoholic (skull not removed). Collected by: Bror Yngve Sjöstedt; collection date: 4 May 1905. Kilimandjaro-Meru Expedition. See Lönnberg (1908b: 7) and Andersen (1912b: 810).

1911. *Cynonycteris collaris:* Mitchell, Proc. zool. Soc. Lond., 1911, II: 444. Publication date: 6 July 1911.

1958. *Rousettus aegypticus:* Griffin, Novick and Kornfield, Biol. Bull., 115 (1): 107. Publication date: August 1958. (Lapsus)

1960. *Rousettus aegyptiacus occidentalis* Eisentraut, Bonn. zool. Beitr., 10: 231, figs 8, 13 (for 1959). Publication date: 10 January 1960. Type locality: Cameroon: N side of Mount Cameroon: Mueli [04 23 N 09 07 E, ca. 600 m]. Holotype: ZFMK 1959.0450: ad ♂, skin and skull. Collected by: Prof. Dr. Martin Eisentraut; collection date: 20 February 1958; original number: 648. Paratype: ZFMK 1961.0575: Collected by: Prof. Dr. Martin Eisentraut; collection date: January 1958. Lager IV [= Camp IV], near lake Koto Barombi, 120 m, N side Mount Cameroon (see Hutterer, 1984: 29; Hutterer and Peters, 2010: 10). Paratype: ZFMK 1961.0576: Collected by: Prof. Dr. Martin Eisentraut; collection date: February 1958. Lager V [= Camp V], above Mueli, 600 m (see Hutterer, 1984: 29; Hutterer and Peters, 2010: 10). Paratype: ZFMK 1961.0577: Collected by: Prof. Dr. Martin Eisentraut; collection date: March 1958. Lager VI [= Camp VI], Isobi, 30 m, W side Mount Cameroon (see Hutterer, 1984: 29; Hutterer and Peters, 2010: 10). Paratype: ZFMK 1961.0578: Collected by: Prof. Dr. Martin Eisentraut; collection date: February 1958. Lager V [= Camp V], above Mueli, 600 m (see Hutterer, 1984: 29; Hutterer and Peters, 2010: 10). Paratype: ZFMK 1961.0579: Collected by: Prof. Dr. Martin Eisentraut; collection date: January 1958. TAXONOMY:
Andersen (1912b) recorded *R. aegyptiacus*, *R. arabicus* and *R. leachii* as species in the genus *Rousettus*. Miller (1912) and Ellerman and Morrison-Scott (1951) recognized *R. arabicus* as a valid species. Harrison (1964a) stated that *R. aegyptiacus* is represented by the subspecies *R. a. aegyptiacus* and *R. a. arabicus*. Bergmans (1994) recognised *R. a. aegyptiacus*, *R. a. leachii*, *R. a. unicolor*, and *R. a. arabicus* as valid subspecies.

Corbet and Hill (1992) corrected Geoffroy Saint-Hilaire's spelling of *Rousettus aegyptiacus* to *R. egyptiacus*, a change endorsed by Koopman (1993a: 152) and Bergmans (1994). Kock (2001c), however, has presented a detailed and convincing case for regarding *egyptiacus* as an incorrect original spelling and treating *aegyptiacus* as the valid name (Bronner *et al.* (2003). Kock (1969a: 16), Qumsiyeh *et al.* (1992: 104) and Horácek *et al.* (2000) state that Geoffroy Saint-Hilaire (1818: 134) already corrected the spelling

to *aegyptiacus*. Allen (1939a: 62) also indicates that it was a misprint in the 1810 publication, which was corrected in the 1818 publication.
Meester *et al.* (1986) state that, while *leachii* is clearly the Southern African subspecies extending well beyond the limits of this subregion, Hayman and Hill (1971) mention that intergradation with *aegyptiacus* may occur in the equatorial zone. Koopman (1975: 361) indicates that in the Sudan there is a hiatus between the ranges of these two sub-species, and he remarks that if they make contact it will be in Ethiopia, north of the equator. See Simmons (2005: 347).

Horácek *et al.* (2010: 175) indicate that the specimens from the Mediterranean area differ with more than 10 % in their mtDNA from the Sub-Saharan populations, which might suggest that these specimens represent a different species. Benda *et al.* (2012b: 1230) showed that, although two size morphotypes were found, the Palaearctic populations of *R. aegyptiacus* represent only one form, which is uniform in genetic traits (mitochondrial genome [nd1 and cyt *b*]) but plastic in metric traits.

Avery and Avery (2011: 539 - 540) report that a separation between the ancestor of *R. aegyptiacus* and those of genera such as *Myotis* and *Kerivoula* occurred some 64 million years ago. The separation with *Rhinolophus* and *Hipposideros* occurred slightly less than 60 million years ago, and that with *Pteropus* some 22 million years ago.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Hildebrand *et al.* (2010: 268) recorded this species from the Kumali site in southern Ethiopia.

Van Neer (1990) reported on the presence of archeozoological material from this species in a number of localities in Central Africa.

CONSERVATION STATUS:
Global - This species is broadly distributed and abundant, and is unlikely to be declining at nearly the rate required to qualify for listing in a threatened category, hence is listed as Least Concern (LC ver 3.1 (2001)) (Benda *et al.*, 2008a; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Benda *et al.*, 2008a; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2004ct; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - LC ver 3.1 (2001) (Markotter *et al.*, 2016). 2004 - LC ver 3.1 (2001) (Friedmann and Daly, 2004).

MAJOR THREATS:
This species faces a number of threats, but none of them are considered a serious threat to the species at the global level. Hunted for food in some cave systems in Africa. Cave disturbance and persecution are also a problem in parts of the range. The species is considered as a pest by fruit farmers and consequently cave roosts have been fumigated and destroyed in Israel, Turkey and Cyprus, resulting in incidental killing of many insectivorous bats of the genera *Rhinolophus* and *Myotis* (Benda *et al.*, 2008a; IUCN, 2009). The

Israeli Nature Conservation Society is trying to prevent this lethal control (D. Kock, *pers. comm.*, in Benda *et al.*, 2008a, in IUCN, 2009), as campaigns during the 1950s led to the unintended death of 90 % of the insectivorous bats that roosted in the same caves (Makin and Mendelssohn, 1985 [in Guyton and Brook, 2014: 77]).

Sherwin *et al.* (2012: 174) identified that *R. aegyptiacus*'s frugivory and long-distance dispersal are major risk factors linked with climatic change.

MacEwan (2016: 3) reports on *R. aegyptiacus* as fatalities of wind turbine blades.

Monadjem *et al.* (2016y: 364) report that the species has disappeared from the Liberian side of Mount Nimba, possibly as a result of hunting.

CONSERVATION ACTIONS:
Benda *et al.* (2008a) [in IUCN (2009)] report on International legal obligations for protection through the Bonn Convention (Eurobats) in areas where this applies. Included in Annex IV of the EU Habitats Directive in areas where this applies. Occurs in a number of protected areas. There is a need to enforce measures to protect this species, especially to prevent the fumigation of caves.

GENERAL DISTRIBUTION:
Rousettus aegyptiacus is patchily distributed across sub-Saharan Africa and North Africa; also ranges outside of Africa through south-west Asia to Iran, Pakistan and India; also on Cyprus.
In the Western Palaearctic it occurs as two forms: *R. a. arabicus* (Iran, southern Arabia, Pakistan), *R. a. aegyptiacus* (rest of range). For more details on the Palaearctic distribution, see Benda *et al.* (2011a). In sub-Saharan Africa occurs as four forms: subspecies *leachi* is found in SW Ethiopia, S Sudan, E and S DR Congo, Uganda, Kenya, Tanzania (including the islands of Pemba and Unguja [see O'Brien (2011: 286]), Zambia, Malawi, Zimbabwe, Mozambique, and the extreme E and south of South Africa, including Swaziland and Lesotho; subspecies *princeps* is endemic to Principe Island in the Gulf of Guinea; subspecies *tomensis* is endemic to São Tomé; and subspecies *unicolor* is found from Senegal and the Gambia east to Liberia, Côte d'Ivoire, Ghana, Togo, south to northern central Nigeria and W Cameroon and Bioko Island, then south from Gabon and Congo to western DRC and W Angola. Elevational range: from sea level to 4,000 m asl.

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 692,896 km^2. In the RSA, its distribution is best predicted by geology (Babiker Salata, 2012: 50).

Nogales *et al.* (2006: 52) report on a population of *R. aegyptiacus*, which escaped in 2000 from two zoos on Tenerife, where they were kept from around 1992. This population was eradicated in 2009 (see Simons *et al.*, 2014: 2091).

Native: Angola (Crawford-Cabral, 1989; Bergmans, 1994; Monadjem *et al.*, 2010d: 555); Burkina Faso (Kangoyé *et al.*, 2012: 6024; 2015a: 607); Burundi; Cameroon; Central African Republic (Morvan *et al.*, 1999: 1195); Congo; Congo (The Democratic Republic of the) (Hayman *et al.*, 1966; Dowsett *et al.*, 1991: 259; Monadjem *et al.*, 2010d: 555); Côte d'Ivoire; Cyprus; Egypt (Benda *et al.*, 2008f: 1); Equatorial Guinea (Fahr and Ebigbo, 2003: 128); Eritrea; Ethiopia (Lavrenchenko *et al.*, 2004b: 135); Gabon; Gambia; Ghana; Greece (Strachinis *et al.*, 2018: 611); Guinea (Denys *et al.*, 2013: 281; Decher *et al.*, 2016: 263); Guinea-Bissau (Rainho and Ranco, 2001: 33); India (Rainho *et al.*, 2010a), Iran, Islamic Republic of; Israel; Jordan; Kenya; Lebanon; Lesotho; Liberia (Monadjem and Fahr, 2007: 50); Libyan Arab Jamahiriya; Macaronesian islands (Tenerife island (Fajardo, 2002; Rodriguez-Luengo and Garacia Casanova, 2002; Trujillo, 2003; Nogales *et al.*, 2006; Masseti, 2010)); Malawi (Happold *et al.*, 1988; Ansell and Dowsett, 1988: 28; Bergmans, 1994; Monadjem *et al.*, 2010d: 555); Mozambique (Smithers and Lobão Tello, 1976; Monadjem *et al.*, 2010d: 555; Monadjem *et al.*, 2010c: 377); Nigeria (Capo-Chichi *et al.*, 2004: 161); Oman; Pakistan; Palestinian Territory, Occupied; Rwanda; São Tomé and Principé (Juste and Ibáñez, 1993b: 906; Rainho *et al.*, 2010a: 19 as *R. a. tomensis*); Saudi Arabia; Senegal; Sierra Leone; South Africa (Monadjem *et al.*, 2010d: 555); Sudan; Syrian Arab Republic; Tanzania (Stanley and Goodman, 2011: 40); Togo; Turkey; Uganda (Kityo and Kerbis, 1996: 59); United Arab Emirates (Anonymus, 2008: 38); Yemen (Benda *et al.*, 2011b: 26) ; Zambia (Ansell, 1969; Bergmans, 1994; Cotterill, 2004a: 260; Monadjem *et al.*, 2010d: 555); Zimbabwe (Cotterill, 2004a: 260; Monadjem *et al.*, 2010d: 555).

BIOGEOGRAPHY:
Horácek *et al.* (2013a: 71) suggest a few hypotheses about the presence of *R. aegyptiacus* in the eastern Mediterranean. These populations might be the result of immigration from sub-Saharan Africa or southern Arabia, although they also indicate that the Mediterranean form might have been the source population for the spread of *R. aegyptiacus* towards Africa.

Hulva *et al.* (2013: 74) indicate that the colonisation of northeastern Africa and the Middle East was connected with the spread of agricultural plants, and might therefore have an anthropogenic component.

DETAILED MORPHOLOGY:
Baculum - See Albayrak *et al.* (2008) for samples from Turkey.

Brain - Chawana *et al.* (2013: 160) reported the average brain mass for two specimens to be 2.01 g. Maseko *et al.* (2007) used immunohistochemical techniques to describe the nuclear parcellation and neuronal morphology of the cholinergic, catecholaminergic and serotonergic systems within the brain of three adult female *R. aegyptiacus*, captured from a cave adjacent to Legalametse Nature Reserve, Limpopo Province, South Africa. Naumann *et al.* (2015) investigated the medial entorhinal cortex architecture in layer 2 of the bat's brain.

The cytoarchitecture of *R. aegyptiacus*'s brain was investigated by Rodenas-Cuadrado *et al.* (2018: 1237) to determine the expression patterns of *FoxP2, FoxP1*, and *Cntnap2*, which are implicated in human speech and language phenotypes.

Schönenberger and Lane (1971: 653) studied the peripherical nervous system in the wings of *R. aegyptiacus*. The nerve bundle consists of a number of fasciles and each of these contains both myelinated and non-myelinated fibres. They also found that some of these nerves react positively to an histochimical test for catecholamine. The accompanying veins and arteries were studied by Lane *et al.* (1971).

Tongue - The arrangement of mechanical filiform papillae and gustatory papillae is regarded as being useful for the efficient uptake of semiliquid food and also an adaptation to a fruit diet (Jackowiak *et al.*, 2009). Abumandour and El-Bakary (2013: 230) report four types of lingual papillae: two mechanical (filiform and conical)l and two gustatory (fungiform and circumvallate) in which the shape, size, number, distribution, nomenclature and orientation of these lingual papillae are region specific according and in relation to feeding habits and food types. Abumandour (2014: 1407) distinguishes four types of lingual papillae, of which the filiform papillae can be subdivided into six subtypes: three on the anterior part (small, conical and giant), two on the middle part (cornflower and leaf-like papillae), and rosette shape filiform papillae on the posterior part.

Stomach - The histomorphological characters of the stomach were studied by Abumandour and Pérez (2017), who concluded that this had special characters different to other mammals. The C-shaped stomach is divided into three parts: an elongated fundic cecal region with a blunt end, a long and narrow tubular pyloric part, and a small cardiac vestibular part. These characteristics of frugivorous species will help in their adaptations to accumulate large quantities of bulky food material.

Eye - Bojarski and Bernard (1988: 155) found that the retina shows a marked folding due to papillae projecting inwards from the inner choroid layer. These papillae are directed towards the nodal point of the dioptric apparatus, which makes that light coming in from an angle onto the papillae produces no shadow on the retina, which would otherwise result in the formation of an incomplete image. The eye of *R. aegyptiacus* possesses a tapetum lucidum, which increases the visual sensitivity by reflecting more light onto the retina and causes a faint red eyeshine observed while collecting the specimens.

The eyes of this bat contain an average of 160,000 retinal ganglion cells (Coimbra *et al.*, 2016: 191). These authors also calculated the minimum angle of resolution as about 0.167° (ca. 5-6 mm at 1 m distance). Surprisingly, the eye of *R. aegyptiacus* contained a horizontal streak, which is generally found in species which roost in open environments (e.g. *E. helvum, E. franqueti* or *E. wahlbergi*. The horizontal streak of high retinal ganglion cell density in megachiropterans may afford increased resolution across the horizon, potentially assisting with predator surveillance (Coimbra *et al.*, 2016: 195).

Skull - Curtis and Simmons (2018: 1390) described the extensive calcification of the external rostral cartilages surrounding the dorsolateral sides of the nostrils. These elements do not seem to be composed of bone as no porosity nor trabeculae were found.

Michelmore *et al.* (1998: 319) and Meng *et al.* (2016: 1) reported that the endocrine component of the pancreas occupied 9.1 % of the total volume, which is at least nine times higher than in humans. The former authors (p. 324) also indicated that the endocrine structure of the pancreas is more similar to that of snakes than that of other mammals.

FUNCTIONAL MORPHOLOGY:
Holland and Walters (2005: 83) report on the movements of the pinnae in free flight and demonstrated that the ears have a greater sensitivity to click stimuli in front of the animal when directed forwards than when directed back and to the side. They also indicated (p. 87) that

echolocation signals are significantly more likely to be emitted during the forward sweep of the ears.

Lancaster *et al.* (1997: 110) studied the wing temperature during flight and found that, on average, the wing surface temperatures were about 15 °C below the body temperature, and only some 1.8 (± 0.5) °C above the ambient temperature. Barclay *et al.* (2017: 572) found that the bat's body temperature exhibited a circadian cycle, with an average temperature of 37.7 °C when returning from foraging and decreasing to 35.5 °C by mid-day. Just before leaving for foraging, the temperature was on average 37 °C. Korine and Arad (1993: 61) indicated that the thermoneutral zone ranged between 31 and 36 °C, and that the bat's oxygen consumption in this range averaged 0.95 ± 0.15 ml g^{-1} h^{-1}.

In their study on the kinematics of the chiropteran shoulder girdle in flight, Panyutina *et al.* (2013: 393) found that the scapula and clavicle are making a very minor contribution to the wing movement as compared to the input of humerus movements relative to scapula in the shoulder joint. The shoulder girdle moves relative to thorax as a crank mechanism, where the clavicle plays the role of crank, and the scapula the role of connecting rod.

Amador *et al.* (2015: 447) refer to Norberg (1972), who provided a detailed description of the left wrist of *R. aegyptiacus*. From this (and their own study of the handwing of a number of yangochiropteran bats), they concluded that the "dactylopatagium brevis" (the small piece of wing between the thumb and the second digit) functionally belongs to the propatagium (the piece of wing in front of the arm, between the thumb and the body).

Greville *et al.* (2018: 974) studied the flight membrane healing in *R. aegyptiacus* and found that wounds in the plagiopatagium took about 50 % longer to heal than wounds in the chiropatagium.

The interaction between vision and echolocation was investigated by Danilovich and Yovel (2019), who found that the bats learn the 3D shape of objects through vision and that they can classify objects using echolocation. During navigation, both senses are used: vision to decide where to fly and echolocation when approaching an obstacle.

SEXUAL DIMORPHISM:
See Albayrak *et al.* (2008) for samples from Turkey.

In South Africa, Jacobsen and Du Plessis (1976: 272) found that females were on average 18 g lighter than males during winter and spring. Females had a slightly larger average forearm length (92.3 versus 89 mm).

ECHOLOCATION:
Griffin *et al.* (1958: 112) performed a number of experiments in total darkness where *R. eagyptiacus* bats were able to avoid vertically placed metallic wires of 3 mm diameter in 85 % of the time. For 1.07 mm wires, the succes percentage was reduced to 68 %, and for 0.46 mm wires it dropped to 45 %, which was still better than chance.

Rainho *et al.* (2010a: 21) report the calls for 8 individuals from Saõ Tomé.

Waters and Vollrath (2003: 209) found that the sonar clicks have a duration of about 250 micoseconds, with most of its energy occurring during the first 100 microseconds. With these clicks, the bats can detect and avoid wires of at least 6 mm in diameter.

Yovel *et al.* (2011b: 515, 522) indicate that the sonar clicks produced by *Rousettus* species do not have a long duration as was generally believed, but are actually extremely short: 50 - 100 microseconds. The peak energy of the click is at 30 kHz, and the bandwidth is about 57 kHz. These signals could be, in some parameters, as good or even better than the signals used by *Eptesicus fuscus* (see Geva *et al.*, 2010: 147). Davies *et al.* (2013b: Table S8) report a peak energy frequency of 35.03 kHz and a range between 12 and 70 kHz.

Benda *et al.* (2012a: 182) report the following data for Iranian specimens: Start frequency: 29.7 ± 3.5 (25.7 - 31.8) kHz, end frequency: 23.4 ± 4.0 (19.1 - 26.9) kHz, FMAXE: 30.7 ± 3.9 (23.3 - 35.0) kHz, pulse duration: 1.4 ± 0.2 (1.0 - 1.5) msec, interpulse interval: 29.8 ± 16.5 (7.0 - 66.3) msec.

Yovel *et al.* (2011a: 2) found that the intensity of the click emissions alters when they approach and lock their sonar on a target, and that *R. aegyptiacus* uses an undescribed strategy to change the spatial region ("field-of-view") their sonar covers: They increase the angle between the sonar beam axes of the click-pairs they emit. Lee *et al.* (2017) studied this further and concluded that the observed beam features can be captured by inducing changes to the pattern of phase differences through moving tongue location (see also Kling, 2018).

Danilovich *et al.* (2015: R1124) also found that the click rate increases prior to landing, indicating that they adjust biosonar sampling in a task-dependent manner.

From tests in a laboratory environment, Danilovich *et al.* (2014: S32) found that *R. aegyptiacus* can transfer information acquired using echolocation to the visual modality, suggesting they can create an echo-based representation of the world that is accessible to other sensory modalities.

As to the value of echolocation for fruit-eating bats, Fenton (1994: 27) suggests it permits access to the relative safety of dark, underground roosts, a situation analogous to the nesting situations of the echolocating birds. However, Danilovich *et al.* (2015: R1124) found that *R. aegyptiacus* not only relies on echolocation in dark caves, but also during orientation and foraging in diverse light environments. The click rate and intensity increased at lower light levels, where visual information was limited.

Fenton (2013: 1) indicated that it remains to be determined if the tongue click signals can be used to monitor the activities of this species as these calls are much less conspicuous than the high intensity call used by other bats.

Boonman *et al.* (2014: 2965) mentioned that they recently recorded wing clicks produced by wild *R. aegyptiacus* bats while they were flying in the field.

Burchardt *et al.* (2019: 2) indicate that wingbeat and echolocation calls in *R. aegyptiacus* are tightly coupled
around 5 - 12 Hz (the so-called theta frequencies: brain wave frequencies which are known to play a role in active movement and stimulus intake), suggesting a neuronal correlation.

A large amount of vocalizations was collected by Prat *et al.* (2017) (for samples see: https://doi.org/10.6084/m9.figshare.c.3666502).

MOLECULAR BIOLOGY:
DNA - See Ali (2011).

Teeling *et al.* (2017: 32) mention the estimated genome size for *R. aegyptiacus* to be 2.11 C, and the assembly size 1.91 Gb.

Szczesniak *et al.* (2013) presented the complete sequence of the mitochondrial genome of "*R. leschenaulti*" (16,704 nt, GenBank record KC702803). However, as pointed out by Botero-Castro *et al.* (2014), the sequence actually pertains to *R. aegyptiacus*.

Lee *et al.* (2015: 2) reported on a "de novo transcriptome assemby of *R. aegyptiacus*" and assessed its quality and biological validity.

In their phylogenetic study, Hassanin *et al.* (2016: 524) found that the *Cytb* from individuals collected in the eastern Mediterranean region (Cyprus and Egypt) differed by 13 mutations from populations of sub-Saharan Africa. Additionally, some *Cytb* haplotypes of southeastern Africa were found to be highly divergent from the others, whereas the population from West Africa did not differ significantly from that of Central Africa.

Karyotype - 2*n* = 36, FNa = 66, BA = 32, and a submetacentric X chromosome (Đulic and Mutere, 1973b; 1977; Haiduk *et al.*, 1981: 223 from South Africa; Albayrak *et al.*, 2008 for samples from Turkey). Albayrak *et al.* (2008) reported FN = 70 for a female and Fna = 66 from Turkey. Sayed (2011: 658) reported FN = 68 for Egyptian specimens and indicates the X chromosome is a medium sized submetacentric and the Y is a minute acrocentric one. She also reported that the metacentric autosomal pair 10 has a secondary constriction near its centromere and is of variable size within the same genome. Pairs 7 and 8 also show polymorphism. Pairs 9, 14, and 15 show a G-negative band in their short arm, and pair 10 has a broad G-negative band around its centromere. Pair 17 has complete heterochromatin, and displays polymorphism, with sometimes one autosome being subacrocentric and the other submetacentric.
Denys *et al.* (2013: 281) report the karyotype of four specimens from the Guinean Mount Nimba area as 2*n* = 36, Fna = 66, with 12 metacentric pairs, two subtelocentric pairs and one small acrocentric pair. The Y chromosome is the smallest in the set.

Protein / allozyme - Unknown.

Hoenerhoff and Williams (2004: 592) reported hepatic copper values for 7 individuals, which ranged from 5.42 to 99.20 parts per million on dry weight basis.

Águeda-Pinto *et al.* (2019: 4) studied the *S100A7* (S100 Calcium Binding Protein A7 = psoriasin) gene in a number of bats and found that *R. aegyptiacus* possessed three copies of this gene, which might contribute to the bat's enhanced tolerance for infections.

HABITAT:
Sclater (1868: 404) reported on a "*Cynonycteris collaris*" specimen that was captured at sea off the St. John's River in Natal on 1 March 1868.

HABITS:
Jacobsen and Du Plessis (1976: 271) report that, in South Africa, radio-tracked *R. aegyptiacus* specimens travelled 24 km between their roost and

foraging sites, which took them about 1 hour and 29 minutes at an average speed of 16.2 km/h (see Jacobsen *et al.*, 1986: 207). They also found that these bats foraged on *Ficus* spp. inside the forest canopy and that seeds were dispersed while flying and consuming fruit on perches. The bats left their roosts between 20 and 40 minutes after sunset and started to return at 2 a.m., with a peak around 3.45 a.m. and most were back at 5 a.m.

In Cape Town, Barclay and Jacobs (2011: 468) report that individuals left the roost cave between 21 and 183 minutes after sunset, and that bats left their roosts later when it was raining at their usual emergence time. Furthermore, males left later than females in September - October (during early pregnancy), but not in November - January (during late pregnancy and lactation). The difference in emergence time between females and males in September - October is attributed to the males having to defend their roosting territory (Barclay and Jacobs, 2011: 471), and not to females having to reach fruit resources before males, or to travel to more distant fruit patches, because of the greater energy demands as was also suggested by Korine *et al.* (1994) for *R. aegyptiacus* in Israel. Barclay and Jacobs (2011: 469) also observed that the individuals left their roost in a consistent order. The bats returned to their roost between 217 and 21 minutes before sunrise, without any differences among the sexes. Barclay and Jacobs (2011: 469) furthermore found that native forest was prefered over residential areas (59.1 % versus 40.9 %) to forage in, but there were great individual differences.

Tsoar *et al.* (2010: 300) report that tracked fruit bats flew over relatively long distances (14.6 ± 3.7 km) at a speed of 33.0 ± 5.2 km/hr and at relatively high altitudes (108 ± 52.6 m) to commute between their roosting and feeding sites. Geva-Sagiv *et al.* (2015: 99) indicate that there are five main types of navigational strategies: beaconing, route following (or route guidance), path integration, cognitive map, map and compass. They also suggest that combinaties of these strategies can be used.

In the Dakhla Oasis in Egypt; Lucan *et al.* (2011: 36) reported that some individuals made quite long flights of about 60 km at the beginning of their night activity. They also found that spatial activities (e.g. roost changes and night exploration of foraging grounds) was strongly reduced by the end of winter, when few food resources remained available. Using an automated tracking system, Rerucha *et al.* (2014: 14) found that the feeding time showed a much larger variation in summer than in spring or winter, whereas the search time per night remained more or less stable. The oposite was true for winter, where the total feeding time remained more or less stable, but the total search time showed a large variation.

Jahelková and Vašícková (2010: 182) describe some socal calls and social behaviour (e.g. protection of mother and juvenile by a male during lactation) in a captive population. Prat *et al.* (2016: 1) examined the vocalizations of these bats and found that these contained information about identity of the emitter, the context of the call, the behavioral response to the call, and even the call's addressee. These vocalizations are composed of sequences containing 1 to 20 broad-band multi-harmonic syllables. Almost all of the communication calls were emitted during aggressive pairwise interactions.

Mann *et al.* (2011: 416) indicated that males do not form random associations with nearby conspecifics, but that they establish stable groups, in which some form of dominance hierarchy exists. They also found that *R. aegyptiacus* can make a distinction between familiar and unfamiliar conspecifics, most likely by means of olfactory and/or visual cues (Mann *et al.*, 2011: 411).

ROOST:
Type - Caves (Albayrak *et al.*, 2008); abandoned factories (Albayrak *et al.*, 2008).
Microclimate - Unknown.
Orozco (2012: 379), referring to Braack (1989), indicates that no scarab beetles were found in over 40 South African caves inhabited by *R. aegyptiacus*. Braack (1989: 77), however, does mention the presence of reduviid bugs (*Platymeris guttatipennis* (Stal)) preying on cockroaches (*Gyna caffrorum* (Stal, 1856), *Gyna* spp., *Herbardina* spp., *Symploce incuriosa* (Saussure, 1899)), parasitic evaniid and chalcidoid wasps (*Hockeria* sp.), trogid beetles (*Trox zumpti* Haaf, 1957) utilizing dead bats, tenebrionid (*Tenebrio guineensis Imhoff, 1843*) and ptinid beetles, thysanurans, as well as numerous haematophagous argasid ticks (*Ornithodoros faini* Hoogstraal, 1960) and nycteribiid flies (*Eucampsipoda africana* Theodor, 1955) using the bats as food source. Other "visitors" of cave, inhabited by *R. aegyptiacus*, were ants (*Pheidole crassinoda* Emery, 1895), spiders (*Smeringopus* sp.), troglophilic crickets,

In South Africa, Herzig-Straschil and Robinson (1978: 104) found *R. aegyptiacus* roosting together with *Miniopterus natalensis* [as *M. schreibersi*], *Rhinolophus capensis*, a few *M. fraterculus* and possibly *R. clivosus*. Similar associations were also reported from Zambia (Leopard's Hill cave) by Grafitti *et al.* (2003: 70), who reported on a colony of approximately 10,000

R. aegyptiacus, together with three colonies of *M. schreibersi* of about 50 - 300 animals, and single specimens of *R. hildebrandtii, R. simulator* and *Nycteris* sp.

DIET:
In Turkey, Albayrak *et al.* (2008) found two wild fruits were important (*Ficus elastica* (Rubber tree) and *Melia azadirachta* (Persian lilac)). In South Africa, Barclay and Jacobs (2011: 467) report that the diet includes the fruit of multiple species of figs, but also those of Cape ash (*Ekebergia capensis* Sparrm.), saffronwood (*Cassine crocea* (Thunb.) Kuntze), yellowwood (genus *Podocarpus* Persoon), *Diospyros* L., and *Syzygium* R.Br. Ex Gaertn. Herzig-Straschil and Robinson (1978: 101) also included Bushman's poison (*Acokanthera oppositifolia* (Lam.) Codd) and Mistletoe (*Viscum obscurumi* Thunb.).

Lamb *et al.* (2010: 215) reported that Cypriotic *R. aegyptiacus* specimens fed on *Agave americana* (Century plant) during mid-summer, but moved on to *Ficus carica* (figs) when these became available. During late-winter, the most important food items were *Phoenix dactylifera* (dates), *Melia azedarach* (Persian lilac), and flowers of eucalypt, *Myrtus communis* (common myrtle), mandarines and lemons. Del Vaglio *et al.* (2011: 283) identified 11 plant species in the droppings of Cypriotic specimens, including *Melia azedarach* (Perzian lilac or Chinaberry tree), *Morus* spp. (Plum tree), *Ceratonia siliqua* (Carob tree or St John's-bread), *Eryobotria japonica* (loquat, Japanese medlar or Japanese plum), *Ficus carica / F. microcarpa* (Common fig tree / Laurel fig), *Arbutus andrachne* (Eastern or Greek Strawberry Tree), *Washingtonia filifera* (Washingtonia), *Crataegus azarolus* (Mediterranean hawthorn), *Citrus sinensis* (Orange tree), and *Styrax officinalis* (Stirax). All of these plant species had limited economic importance.

Baum (1995: 339) mentioned that *R. aegyptiacus* is a frequent visitor of *Adansonia digitata* (Baobab), especially in the first two hours after dusk, where they licked nectar from the petal bases. Jacobsen and Du Plessis (1976: 271) found that in South Africa this bat fed mainly on *Ficus* spp. [*F. capensis, F. petersii, F. sansibarica*], although other fruits (e.g. *Litchis chinensis* - litchis, *Syzgium gerrardii* - water pear, *Syzgium jamba* - jamba, *Syzygium cordatum* - water berry, *Harpephyllum caffrum* - kaffll plum, *Ekebergia capensis* - Cape ash, *Prunus africana* - bitter almond/red stinkwood, and possibly *Olea capensis* and *O. africana*) were eaten in other seasons. Nader and Kock (1983c: 271) also reported that captive bats ate 8 to 9 litchis per night or 97 g of fruit (bananas). The bats were probably also feeding on the nectar of *Aloe dolomitica* as they found a number of animals covered in pollen and their faeces contained pollen too.

Seltzer *et al.* (2013: table S2) provided an overview of the plant species found beneath bat feeding roosts. For *R. aegyptiacus* these include *Ficus mucuso* Welw. ex Ficalho (Ipoh's terrible tree - Moraceae), *Ficus sur* Forssk. (Broom cluster fig - Moraceae) and *Eriobotrya japonica* (Thunb.) Lindl. (Loquat - Rosaceae).

Amitai *et al.* (2010: 2693) used stable carbon isotope ratio in exhaled CO_2 to assess the origin of metabolized substrates in 16 *R. aegyptiacus*, which were maintained on a diet of C3 plants. Amitai *et al.* (2010: 2693) found that both resting and flying individuals directly fueled their metabolism with freshly ingested exogenous substrates.

In Cape Town, Barclay *et al.* (2006: 549) observed *R. aegyptiacus* deliberately feeding on Scarabid garden fruit chaffer beetles (*Pachnoda sinuata*). Del Vaglio *et al.* (2011: 285) also reported the presence of coleopterans, lepidopterans (caterpillars), dipterans (fruit flies) and ticks in the bat's droppings, but these were most probably ingested by accident.

In his study on *R. aegyptiacus* from the Kruger Park, Braack (1989: 79) found that they were feeding on the fruits of *Ficus sycomorus* (sycamore fig or fig-mulberry), *Diospyros mespiliformis* (Jackalberry, African Ebony, jakkalsbessie), and *Xanthocercis zambesiaca* (Mashatu tree or Nyala tree).

In the Kisangani area (DRC), Gembu Tungaluna (2012: 106 - 108) followed the fruit intake by *R. aegyptiacus* during the different seasons and came up with the following list: First heavy rain season (September - November): *Carica papaya* L. (papaya) (28%), *Musanga cecropioides* R. Br. & Tedlie (African corkwood tree, umbrella tree) (14%), *Dacryoides edulis* H.J. Lam (safou, African pear, bush pear, Nsafu, bush butter tree, butterfruit) (11%), *Persea americana* Mill., 1786 (avocado) (8%), *Oncoba welwitschii* Oliv. (8%), *Myrianthus arboreus* P. Beauvois, 1805 (giant yellow mulberry, bush pineapple, corkwood) (8%), *Spondias cytherea* Sonnerat, 1782 (Ambarella, otaheite apple, great hog plum) (6%), *Annonidium mannii* (Oliv.) Engl. & Diels (Junglesop) (6%), *Ficus wildemanniana* Warb. (5%), *Ficus leprieuri* Miq., 1867 (3%), *Ficus vallis-choudae* Delile (3%). First mild rain season (December - February): *Musanga cecropioides* (36%), *Myrianthus arboreus* (22%), *Ficus vallis-choudae* (10%), *Annonidium mannii* (6%), *Spondias cytherea* (6%),

Carica papaya (6%), *Uapaca guineensis* Müll.Arg., 1864 (Sugar plum, red cedar, false mahogany, rikio) (6%), *Elaeis guineensis* Jacq. (African oil palm, macaw-fat) (2%), *Ficus wildemanniana* (2%), *Pseudospondias microcarpa* (A. Rich.) Engl. (2%), Musa sp. (2%).
Second heavy rain season (March - May): *Persea americana* (19%), *Annonidium mannii* (16%), *Carica papaya* (16%), *Dacryoides edulis* (11%), *Spondias cytherea* (10%), *Musanga cecropioides* (7%), *Oncoba welwitschii* (7%), Myrianthus cecropioides (7%), *Uapaca guineensis* (3%), *Ficus vallis-choudae* (3%), Musa sp. (3%), *Parinari excelsa* Sabine (Guinea plum) (1%), Ficus sp. (1%).
"Dry" season (June - August): *Oncoba welwitschii* (29%), *Ficus vallis-choudae* (15%), *Parinari excelsa* (14%), *Carica papaya* (14%), *Myrianthus arboreus* (14%), *Musanga cecropioides* (14%).

Izhaki *et al.* (1995: 340) report, that in Israel, *R. aegyptiacus* ingested only 2 % of the small seeds (< 4 mg), all other seeds were spat out between 25 and 400 m from the parent tree. Korine *et al.* (1998: 151) indicate that *R. aegyptiacus* feeds on two types of fruit ("syndromes"). The first one is similar to that eaten by most fruit bats: variable size (range 0.53 - 32.3 g), relatively high water content (57 - 87 %), relatively low fat content (1.3 - 4.1 %), low protein content (1.1 - 6.75 %), and relatively high sugar content (69 - 86 %). The second type is only found in eastern Mediterranean habitats and is characterized by the extremely low water content: 13 - 24 %. This type of food is generally eaten during winter, when other food sources are scarce.

A case of hemochromatosis or ISD (iron storage disease or excessive burden of iron) was reported by Clauss and Paglia (2012: S8) as the result of an accidental excessive dietary iron supplementation. Stasiak *et al.* (2014: 111) investigated whether mutations in the hepcidin gene might be the reason for the increased susceptibility to ISD, but they were unable to identify any differences in the sequence of the portion of the hepcidin gene that encodes the mature peptide. In their ISD study, Leone *et al.* (2016: 45) provided evidence of a positive correlation between hemochromatosis and HCC in any species other than humans.

In a study of *R. aegyptiacus* this was not evident as its blood plasma glucose concentrations were observed to be greater than 40 mmol/l after glucose uptake (Keegan, 1977; Michelmore *et al.*, 1998), this was not after natural feeding but during an oral glucose tolerance test (Mqokeli and Downs, 2012a: 351).

Herrera M. *et al.* (2015: 409) investigated the relationship between food and energy intakes, salt content and sugar types.

PREDATORS:
Jacobsen and Du Plessis (1976: 273) indicate that *R. aegyptiacus* has relatively few natural enemies in South Africa, but that genets (*Genetta* sp.) and Lanner falcon (*Falco biarmicus* Temminck, 1825) took them as prey.

Mikula *et al.* (2016: Supplemental data) mention the following avian predators: Black sparrowhawk (*Accipiter melanoleucus* Smith, 1830), Lanner falcon (*Falco biarmicus* Temminck, 1825), Peregrine falcon (*Falco peregrinus* Tunstall, 1771), Bat hawk (*Macheiramphus alcinus* Bonaparte, 1850); Black-and-white-casqued hornbill (*Bycanistes subcylindricus* (Sclater, 1871)).

Mikkola (2018: 4) shows a photo of a dead bat (with sucking pup) brought to the nest by an Eagle owl (*Bubo bubo* (L., 1758)).

POPULATION:
Structure and Density - Common in parts of Africa; generally uncommon in SW Asia although locally abundant in Israel and Jordan (Z. Amr *pers. comm.,* 2005 in Benda *et al.*, 2008a in IUCN, 2009). In Africa it occurs in large colonies of up to 40,000 to 50,000 individuals. In SW Asia colonies generally number 50 to 500 individuals, although up to 3,000 individuals were recorded in a cave in Jordan. The population in Turkey is estimated at 5,000 to 10,000 individuals; the population there may be decreasing due to control measures in caves (A. Karatas *pers. comm.,* 2007 in Benda *et al.*, 2008a in IUCN, 2009). In Syria only a single locality is known of 1,000 to 2,000 animals (A. Karatas *pers. comm.,* 2007 in Benda *et al.*, 2008a in IUCN, 2009). Also see Albayrak *et al.* (2008).
Horácek *et al.* (2010: 175) indicate that there is a clear decline in the Cypriotic population, whereas the situation in other Mediterranean countries (Lebanon, Jordan, Egypt) is more or less stable. They estimate the total Mediterranean population to include at most 75,000 specimens. Lucan *et al.* (2014c: 111) report a population decline of 90 % on Cyprus between 2005 and 2013 (from 8,000 to 800 animals).

Trend - 2008 - Stable (Benda *et al.*, 2008a; IUCN, 2009). *R. aegyptiacus* populations within the Asia Minor and Levant region are predicted to have a stable population trend, under climate change scenarios (Bilgin *et al.*, 2012: 433).

LIFESPAN:
Mitchell (1911: 444) mentions for 13 captive specimens (as *Cynonycteris collaris*) an average lifespan of 18 months and a maximum lifespan of 108 months (= 25 yrs). Cushing *et al.* (2013: 794) reported on a captive female of over 11 years of age that needed to be euthanised following a deterioriation of its health due to a metastatic pancreatic carcinoma. Szekely *et al.* (2015: Suppl.) report a maximum longevity of 22.9 years.

Olds *et al.* (2015: 325) found the following tumor types in a captive population of male *R. aegyptiacus*: fibrosarcoma, cutaneous lymphoma, benign focal bronchioloalveolar neoplasm, anaplastic sarcoma, and sebaceous epithelioma.

ACTIVITY AND BEHAVIOUR:
Carpenter (1986: 93) mentions that the heart beat for this species is as high as 728 beats per minute during a flight with airspeeds of 5 m/s.

During displacement experiments, Tsoar *et al.* (2011: E722) found that *R. aegyptiacus* primarily uses self-triangulation based on multiple distal visual landmarks to return to their roost cave. Ulanovsky *et al.* (2010: 302) provide evidence that the bats used a large-scale navigational map to return to their roosts after having been displaced over 44 km.

From flight corridor tests, Riskin *et al.* (2012: 2946) determined the average flight speed to be 4.41 ± 0.54 m/s.

In captive groups, Carter and Leffer (2015: 3) found that a group consisting of nine females and two castrated males spent 0.26 % of their awake time on social grooming. In a group of five males, no social grooming was observed at all.

REPRODUCTION AND ONTOGENY:
Korine and Arad (1999) [in Andrianaivoarivelo *et al.* (2011a: 77)] mention that the newborns of *R. aegyptiacus* are completely dependent on their mothers for the first 6 weeks of life. At birth, the pup weights about 18.0 % of the mother's body mass (22.7 versus 126.0 g) (Kurta and Kunz, 1987: 82). Barclay and Jacobs (2011: 467) indicate that the lactation period lasts from 9 to 12 weeks in South Africa. Davis (2007: 4) indicates that young are dependent until three months after birth in the UAE. At that time, they are able to fly, but do not leave the family colony.

In Uganda, Mutere (1968) observed a bimodal breeding pattern (pregnancies from December to March and from July to October and births in March and October), which was correlated to two rainfall peaks (April-May and October-November). Bartonicka *et al.* (2013: 17) report that in both the Levant (Turkey, Cyprus, Lebanon and Jordan) and in the Dakhla Oasis in Egypt, births take place during most of the year, except for the winter months. The births peak in April-May and in August-September.

In Sierra Leone, Weber *et al.* (2019: 20) captured one lactating female on 7 April.

Lucan *et al.* (2014a: 110; 2014b: 1036) investigated the reproductive cycle in populations from the Mediterranean region and the Egyptian desert and found that both had a bimodality in birth timing regarless of climatic differences. The differences in birth times between the two populations were linked with differences in fruiting phenology of their major dietary plants. They also hypothesize that food abundance is an important trigger of male sexual activity.

Spitzenberger and Bauer (1979: 440, 448) also found a bimodal reproduction cycle for *R. aegyptiacus* on Cyprus, but remarked that the succession of the two phases is so quick that females only take part in one cycle.

Kozhurina and Ilchenko (2016: 13) found a bimodal reproducion cycle in captive *R. aegyptiacus* with a "tropical" polyoestrous continuous reproductive pattern, but found their cycle to take 11 months rather than 12. They also found that females usually began to produce offspring at the age of 14 - 15 months up to 2 years. The gestation period was very variable and lasted from 95 to 129 days.

Mahmoud *et al.* (2018: 293) tested 3-monochloropropane-1, 2-diol (3-MCPD) to sterilize male rousettes to assess its use as pest management tool.

Stanley and Goodman (2011: 40) reported on three adult males with scrotal testes collected in the first half of August 1992 in Tanzania. Two females collected in the first halfs of August 1992 and 1993 were pregnant with a single embryo. Trentin and Rovero (2011: 49) report a lactating female captured in December 2005 in the Uzungwa Scarp Forest Reserve, Tanzania. For West Africa, Krutzsch (2000: 110) indicates that the male reproductive cycle is apparently in synchrony with the female, since they undergo biseasonal testicular hypertrophy.

In the southern Cape province of South Africa, Herzig-Straschil and Robinson (1978: 108) calculated that births took place from October to June. At Matlapitsi (RSA), Dietrich *et al.* (2018b: 4) found that 64 % of the females they sampled in

September 2015 were pregnant, indicating that there were also non-pregnant females and both scrotal and non-scrotal males. In January 2016, they found large amounts of juveniles and lactating females, whereas in April 2016, most of the bats (83 %) were flying juveniles.

In the United Arab Emirates, Davis (2007: 4) indicated that mating takes place from June to September, and that a single young (exceptionally twins) are born in October-December after a gestation period of 115 to 120 days. Szekely *et al.* (2015: Suppl.) report a gestation period of 116 days and they mention that weaning occurs after 122 days. During that period, the weight of the young has increased from 21.06 g to 73.8 g (adult: 125 g).

Laboratory tests performed by Taub *et al.* (2014: S122) provided strong evidence for vocal learning in this species.

MATING:
Jacobsen and Du Plessis (1976: 272) and Barclay and Jacobs (2011: 467) mention that in South Africa, *R. aegyptiacus* mates in spring (July to September) and, after a gestation of approximately 4 months, a single pup is born in summer (end October to December). Occasionally, Start (1969: 272) recorded the birth of twins.

In a colony in the Prague zoo, Jahelková *et al.* (2013: 76) found courtship behaviour and matings taking place throughout the year, but parturitions were strongly synchronized in a one-week period in September/October and March/April.

In a captive colony in Israel, Harten *et al.* (2019: 1895) determined the paternity of pups and found that females gave birth to young of males from which they used to scrounge food [=obtaining food from the mouth of the male], supporting the food-for-sex hypothesis in this species.

POSTNATAL DEVELOPMENT:
Prat *et al.* (2013: 123) studied *R. aegyptiacus* pups raised in small colonies and in acoustic isolation and found that the latter displayed delayed vocal development and that their calls differed from young of the same age raised in colonies. The first sounds produced by young in both groups were isolation calls (Prat *et al.*, 2015: 1). These calls are innate and appear at postnatal day 1.

PARASITES:
BACTERIA
Gram-negative bacterium - Pinus and Müller (1980) and Sara (2002: 41) reported *Citrobacter freudii*, *Enterobacter cloacae*, *Escherichia coli*, *Klebsiella pneumonia*, *Proteus morganii*, and *Proteus rettgeri*. Han *et al.* (2010) isolated a pure sample of *Kluyvera ascorbata* from blood of an individual found dead at a zoo in Seoul, Korea, which had originally been imported (possibly illegally) from Egypt. Childs-Sanford *et al.* (2009: 8) reported *Yersinia pseudotuberculosis* from a colony of bats kept in a zoo in Syracuse, New York. Two of three bats from the Republic of Congo, tested by Nowak *et al.* (2017: 6) were positive for *E. coli*.

Hughes *et al.* (2018: 867) reported the presence of *Yersinia pseudotuberculosis* in bats from a zoo colony.

Gram-positive bacterium - Three out of 55 tested *R. aegyptiacus* bats from Gabon tested positive for *Staphylococcus aureus* and two for *S. schweitzeri* (Held *et al.*, 2016: 119). The positive bats were captured at the fringe of the forest, in the vicinity of humans. None of the bats that were captured in the forest were infected by this bacterium.

Bartonellae - Bacteria
Bartonella - Kosoy *et al.* (2010: 1878) found 15 *Bartonella* spp. *gltA* sequences in *R. aegyptiacus*, and also found six unique *gltA* varients of *Bartonella* which clustered in a monophyletic genogroup. Kosoy *et al.* (2010: 1877) and Bai and Kosoy (2012: 58) reported a prelevence of *Bartonella* spp. in *R. aegyptiacus* from Kenya of 22/105 (21.0%) cultured from blood samples. See also Kosoy (2010: 719) for further information. Dietrich *et al.* (2016b: 3) found one positive testing bat (out of 7) in Mahune (RSA).
Bai *et al.* (2018: 2319) identified a new *Bartonella* species (*B. rousetti*) from bats collected in the Idanre Hills area in Nigeria, which can infect humans as they also found antibodies against this bacteria in people living in surrounding communities.

Lei and Olival (2014: Suppl.) mention *R. aegyptiacus* as host for *Leptospira* bacteria. These were further identified as *L. interrogans* and a second species as having sequences closely related to *L. borgpetersenii*.

Nakamura *et al.* (2012: 410) report on an outbreak of yersiniosis (caused by *Yersinia pseudotuberculosis*) in a colony of captive *R. aegyptiacus* in a zoological park in the Kanto region in Japan.

Kolodny *et al.* (2018: 116) examined the microbial composition of fur and gut samples of a captive and free-living colony of Egyptian fruit bats and found that the fur samples of different animals from the same colony taken at the same time were more similar than samples taken from the same animal

at different time. The gut samples, however, were more individualized and sex related.

Dietrich and Markotter (2019: 1733, Suppl.) investigated the differences between direct and indirect sampling of urine and feces in South African *R. aegyptiacus*. During this study, they found the following bacteria in the urine (in descending LDA [Linear discriminant analysis] order): direct: *Streptococcus, Bacillus, Rhizobium, Brevudimonas*, Rhizobiales, *Corynebacterium, Achromobacter, Acinetobacter, Phenylobacterium, Deinococcus, Methylobacterium, Paenibacillus, Lyninibacillus, Cellulomonas, Cellulosimicrobium*, Planococcaceae, *Nocardiodes, Serratia, Devosia, Solirubracacter, Providencia, Brucella*, Sphingomonadacea, *Stenotrophomonas*, Oxalobacteraceae, *Gp4, Terribacillus, Gemmatimonas, Ochrobactrum, Gp6, Blastococcus*, Comamonadaceae, *Microvirga*, Sphingobacteriaceae, Microbacteriaceae, *Gp3*, Solirubrobacterales, *Massilia, Arthrobacter*, Geodermatophilaceae, *Microbacterium, Leucobacter*, Beijerickiaceae, Planococcaceae, Burkholderiales, *Shinella, Rubellimicrobium, Gp16, Novosphingobium*, Alcaligenaceae, *Rubrobacter*, Betaproteobacteria, *Dyadobacter, Actinomyces, Agromyces*, Ruminococcaceae, Polyangiaceae, *Lysobacter*, Bradyrhizobiaceae, *Moraxella, Aurantimonas*, Acetobacteraceae, *Flavobacterium, Ramlibacter, Caenispirillum, Bordetella, Leifsonia*, Paenibacillaceae_1, Bacillaceae_1, Xanthobacteraceae; indirect: Planctomycetes, *Lentibacillus, Actinocatenispora*, Xanthomonadales, *Marinomonas, Ignavibacterium*, Jiangellaceae, *Methylohalomonas, Fodinicurvata, Salinicoccus, Nocardiopsis*, Deinococcales, Ectothiorhodospiraceae, *Nitrosospira, Nocardia, Saccharopolyspora*, Nocardiopsaceae, Nakamurellaceae, *Ureoplasma, Pntibaca, Phycisphaera, Nitrococcus, Actinophytocola, Nesterenkonia, Luteibacter*, Enterobacteriaceae, *Jiangella, Brevibacteriu*, Bacteroidetes, Gammaproteobacteria, *Salinisphaera*, Actinomycetales, *Gracillimonas*. In the faeces, the following bacteria were found: direct: *Actinobacillus*, Pasteurellaceae, Flavobacteriaceae, *Salinisphaera, Gp1*, Gammaproteobacteria, *Kytococcus, Mycobacterium, Gracilimonas, Chryseobacterium, Mycoplasma*, Geodermatophilaceae, Chloroflexi, *Rhizobium*, unclassified Bacteria, *Helicobacter, Rhodococcus, Blastococcus, Deinococcus*, Chitinophagaceae, *Acinetobacter, Brevundimonas*, Sphingobacteriales, Comamonadaceae, *Sphingomonas, Mosesorhizobium, Comamonas, Gemmatimonas*, Proteobacteria, *Achromobacter, Agrmyces, Nitrosococcus, Devosia, Gp10, Gp3, Flavobacterium, Roseomonas, Marmoricola, Gp6*, Ectothiorhodospiraceae, *Campylobacter*, Solirubrobacterales, *Isoptericola*, Nocardioidaceae, Deltaproteobacteria, *Gordonia*, Sphingomonadaceae, Neisseriaceae, *Luteibacter, Actinomadura*, Erythrobacteraceae, Acidimicrobiales, "3_genus_incertae_sedis", *Nocardioides, Spirosoma, Truepera*, Sphingomonadales, *Moraxella, Solirubrobacter, Tessaracoccus*, Alphaproteobacterai, Myxococcales, *Paenibacillus*, Bacteroidetes, Oxalobacteraceae, *Stenotrophomonas, Phenyobacterium*, Caulobacteraceae, *Gp7, Arthrobacter*, Polyangiaceae, *Geminicoccus, Rubellimicrobium, Gp4, Azospirillum*, Sphingobacteriaceae, Rhodospirillaceae, *Dermacoccus, Nitrospira*, Pseudomonadaceae, Acetobacteraceae, *Cellulosimicrobium, Lysobacter, Dyadobacter, Sphingopyxis*, Betaproteobacteria, *Ornithobacterium*; indirect: *Granulicatella*, Carnobacteriaceae, Streptococcaceae, *Alkalibacterium, Nesterenkonia*.

HAEMOSPORIDA

Perkins and Schaer (2016: Suppl.) mentioned the presence of *Plasmodium roussetti* van Riel, l'Hoest et l'Hoest, 1951 in bats from the DRC.

Adam (1973: 8) mention on an infection by *Trypanosoma megadermae* Wenyon, 1909. Barbosa *et al.* (2016: 215) and Espinosa-Álvarez *et al.* (2018: Suppl.) reported a specimen from Gabon being infected by "*Trypanosoma* sp. bat".

ACARI

Spinturnicidae: Hirst (1923: 979) indicates that Kolenati stated that either *R. microphyllum* or *Pteropus ægyptiacus* [=*Rousettus aegyptiacus*] is the host for *Ancystropus zelebori* Kolenati, 1856 (Acari). Another mite, he reported (p. 987) from *R. aegyptiacus* is *Ancystropus* (*Meristaspis*) *lateralis* Kolenati. Taufflieb (1962: 112) also reported *Ancystropus leleupi* Benoit, 1959.

Trombiculidae: Stekolnikov (2018a: 50) reported this species as host for *Whartonia novemsetosa* Goff, 1982 in Tanzania.

Korine *et al.* (2012: 1435) experimentally infected *R. aegyptiacus* specimens with the flea *Xenopsylla ramesis*, whose natural host is Sundevall's jird (*Meriones crassus*). They found that female fleas engorged the same amount of blood from these bats as from the jirds. Male fleas, however, sucked much less blood.

From the Lanner Gorge cave [22°27'S 31°09'E], in the Kruger National Park, Braack (1989: 81) reported argasid ticks (*Ornithodoros faini*

Hoogstraal, 1960), nycteribiid flies *Eucampsipoda africana* Theodor, 1955), spinturnicid mites (*Ancystropus zeleborii*, Kolenati, 1857), and the flea *Thaumapsylla breviceps* Rothschild, 1907 (Ischnopsyllidae).

In Jordan, Benda *et al.* (2010b: 201) found the following ectoparasites: Argasidae: *Argas vespertilionis* (Latreille, 1802), *Ornithodoros* (*Reticulinasus*) *salahi* (Hoogstraal, 1953).

Nycteridocoptes pteropodi Rodhain and Gedoelst, 1923 (Acari: Sarcoptidae) was reported by Fain (1958: 236) from "*Rousettus leachi*" specimens from Kivu, DRC. Fain (1958: 244, 245) also described *Nycteridocoptes lavoipierrei*, *Nycteridocoptes macrophallus* and *Nycteridocoptes rousetti* from the same bat species collected at Mahuysa cave, Katana-Kivu, DRC. Another species (*Nycteridocoptes rousetti* Fain,1958) was mentioned by Fain (1959a: 345) from *R. aegyptiacus* from Thysville (=Mbanza-Ngungu), DRC. Fain (1960: 83) described *Stomatodex rousetti* (Acari: Demodecidae) from "*R. leachi*" from Mahyusha cave, near Katana, DRC. Fain (1967: 367) furthermore reported on the presence of *Teinocoptes rousetti* Fain, 1959 on *R. aegyptiacus leachi* from Mahyusha cave, Kivu, DRC.

Reinhardt *et al.* (2008: 173) report that the cimicid bug *Afrocimex constrictus* Ferris and Usinger, 1957 infested *R. aegyptiacus* colonies at Makingeny and Ngwarisha (Mount Elgon region, Kenya) and that these bats were bitten between 0.5 and 1.5 times a day, and that to up to 28 µl of blood was removed each time.

Afrocimex leleupi Schouteden, 1951 was reported by Kock and Aellen (1987: 877) the Kakontwe cave (DRC).

In Iran, Benda *et al.* (2012a: 185) report the presence of *Meristaspis lateralis* (Kolenati, 1856) (Spinturnicidae). This mite was already reported by Delfinado (1963: 913) to be widely distributed on *R. aegyptiacus* in Egypt and Palestine.

DIPTERA

Streblidae: *Brachytarsina africana* (Walker, 1849) recorded in Katanga, but Haeselbarth *et al.* (1966: 100) suggests that this may be accidental and *R. aegyptiacus* is not its true host. *Brachytarsina alluaudi* (Falcoz, 1923) recorded in Katanga (Haeselbarth *et al.*, 1966: 101), Gabon (Obame-Nkoghe *et al.*, 2016: 5). *Brachytarsina bequaerti* (Jobling, 1936) collected in Tanzania and Kenya (Haeselbarth *et al.*, 1966: 101).

Nycteribiidae: *Eucampsipoda africana* (Theodor, 1955), widely distributed over the Ethiopian region and recorded from localities in Senegal to the Sudan and southwards to the Cape (Haeselbarth *et al.*, 1966: 115; Duron *et al.*, 2014: 2108; Obame-Nkoghe *et al.*, 2016: 5). This bat fly might be a carrier of *Bartonella* (Zhu *et al.*, 2014: 2160; Szentiványi *et al.*, 2019: Suppl.) and *Arsenophonus* bacteria (Szentiványi *et al.*, 2019: Suppl.), and the fungus *Anthrorhynchus eucampsipodae* Thaxter, 1901 (see Balazuc, 1971: 214; Haelewaters *et al.*, 2017: Suppl. for a record from Gabon; Haelewaters *et al.*, 2018: 794; Szentiványi *et al.*, 2019: Suppl.), as well as the blood parasite *Polychromophilus melanipherus* and Mahlapitsi and Wolkberg viruses [Szentiványi *et al.*, 2019: Suppl.). *Eucampsipoda hyrtlii* (Kolenati, 1856) has been identified with certainty only from the Middle East (Arabia, Egypt, Palestine and Syria), but probably also occurs in East Africa (Haeselbarth *et al.*, 1966: 115). Balazuc (1971: 214) reported this bat fly from a "Chiroptera" from Egypt, which was infected by the fungus *Anthrorhynchus eucampsipodae* Thaxter, 1901. However, as pointed out by Blackwell (1980: 151), *E. hyrtlii* is only known as parasiting on *R. aegyptiacus* (see also Haelewaters *et al.*, 2018: 794). *Dipseliopoda biannulate* (Oldroyd 1953) distributed over the tropical parts of Africa and recorded from localities in Nigeria, Cameroon, the Congo and the Sudan and Kenya (Haeselbarth *et al.*, 1966: 116). Morse *et al.* (2013: Suppl. 1) refer to *Eucampsipoda africana* (Diptera: Hippoboscoidea: Nycteribiidae: Cyclopodiinae) collected from a Kenyan *R. aegyptiacus*. This bat fly was also reported from Sierra Leone by Blackwell (1980: 146), where it was found to be infected by the fungus *Arthrorhynchus eucampsipodae* Thaxter, 1901. In Jordan, Benda *et al.* (2010b: 201) found *Eucampsipoda aegyptia* (Macquart, 1851). They also mention that two other Nycteribiidae were previously found in Palestine: *Nycteribia pedicularia* Latreille, 1805 and *N. schmidlii* Schiner, 1853. The latter species (as *Nycteribia schmidlii scotti* Falcoz, 1923) was also reported from Gabon by Obame-Nkoghe *et al.* (2016: 5).

Jansen van Vuren *et al.* (2016: 1) describe a new orthoreovirus, which was collected from a bat fly (*Eucampsipoda africana* (Theodor, 1955)), which in turn was captured from a *R. aegyptiacus* bat from South Africa.

SIPHONAPTERA

Ischnopsyllidae: *Thaumapsylla breviceps* Rothschild 1907, where the nominate subspecies *T. b. breviceps* Hopkins and Rothschild, 1956, was found in the Cape, Natal and Transvaal provinces

of South Africa, Kenya and DRC (Haeselbarth *et al.*, 1966: 186).

VIRUSES:
In their country-wide survey of Kenyan bats, Waruhiu *et al.* (2017) found the following viruses in *Rousettus aegyptiacus*: Adenoviruses, Astroviruses, Caliciviruses, Coronaviruses, and Rotaviruses.

Willoughby *et al.* (2017: Suppl.) mention the following viruses: Chikungunya virus, European bat 1 lyssavirus, Israel turkey meningoencephalomyelitis virus, Kasokero orthonairovirus, Lagos bat lyssavirus, Marburg marburgvirus, Rousettus bat coronavirus HKU9, Shamonda orthobunyavirus, West Nile virus, Yogue virus, Zaire ebolavirus.

In Uganda, Kading *et al.* (2018: 3) found neutralizing antibodies against Yellow fever virus (YFV), non-specific Flaviviruses, Babanki virus (BBKV), non-specific Alphaviruses, and Rift Valley fever virus (RVFV).

Adenoviridae
Mastadenovirus
Jansen van Vuren *et al.* (2018: 1) isolated a new virus (RaegAdV-3085) from an apparently healthy wild-caught Egyptian fruit bat in South Africa.

Coronaviridae - Coronaviruses
SARS - Müller *et al.* (2007b) tested between 1986 and 1999, for antibody to SARS-CoV in sera in 29 individuals from Limpopo Province, South Africa, 11 were tested positive (11/29, 37.9 %) and 142 individuals from Oriental Province, DRC, 17 tested positive (17/142, 12 %) (28/171, 16.4 %). In Nigeria during June 2008, Quan *et al.* (2010) screened the gastrointestinal tissue for the presence of coronaviruses by PCRs, none tested positive.
Van Doremalen *et al.* (2018: 3, 10) inoculated 12 adult bats from a captive colony with WIV1-CoV (SARS-like WIV1-coronavirus) and were unable to detect efficient replication of the virus and only modest seroconversion in two of the bats.

Tong *et al.* (2009) found several alpha- and betacoronaviruses in *Rousettus aegyptiacus* collected in Kenya in 2006 based on detection of coronavirus RNA in fecal swabs. Some of the coronaviruses were highly divergent, whereas others showed similarity to *Rousettus* sp. coronaviruses identified in China.
Shehata *et al.* (2016) tested 265 Egyptian bats and found 12 infected with HKU9-like viruses.
Anthony *et al.* (2017b: Suppl.) mention beta-coronaviruses Bat_CoV_HKU9 and Kenya_CoV_BtKY56.
19 out of 397 (4.8 %) of the Kenyan bats tested by Tao *et al.* (2017: Suppl.) were positive for CoV.

Filoviridae - Filo viruses
Ebolavirus
Muyembe-Tamfum *et al.* (2012: 9) refers to Pourrut *et al.* (2005) who found ZEBOV-specific antibodies in this species.
Paweska *et al.* (2016: 1) experimentally inoculated *R. aegyptiacus* bats and were unable to find any viral RNA in oral, nasal, ocular, vaginal, penile and rectal swabs from any of the experimental groups. They concluded (p. 9) that these bats are unlikely to maintain and perpetuate EBOV in nature (see also Mandl *et al.*, 2018: 7).

Marburgvirus
Towner *et al.* (2007) tested 283 individuals from Gabon for Marburg virus [MARV] RNA by conventional and real-time RT-PCR and 242 individuals for anti-Marburg virus IgG antibodies by ELISA; 4 individuals (1.5 %) were PCR positive and 29 (12 %) were IgG positive. Peterson and Holder (2012: 1831) indicate that the Gabonese clade represents a virus form that has not been reported from human infections. Kuzmin *et al.* (2010b) detected RNA in a female *R. aegyptiacus* bat collected at Kitum cave in July 2007. Adjemian *et al.* (2011: S796 - S798) report on four cases of MHR [Marburg hemorrhagic fever] in miners, which they contracted while working in a mine tunnel at Kitaka mine in Ibanda District, Uganda, where thousands of *R. aegyptiacus* bats lived. These cases resulted in the destruction of the residing bat population. Van Paassen *et al.* (2012: 635) report on the death of a Dutch woman, who probably contracted the virus after visiting a cave in Uganda, where *R. aegyptiacus* bats were living. Amman *et al.* (2013: 6) indicate that a long-term study at this site showed that 2 to 5 % of the bat population was actively infected by the MARV virus. Amman *et al.* (2014: 1762) estimated that both the cave and the mine contained about 40,000 to 100,000 *R. aegyptiacus* bats at the time the miners and the tourist were infected. The bats were exterminated by November 2008, but in November 2012 a small colony was (1 - 5 % of the original numbers) was found in the re-opened Kitaka Mine.
Maganga *et al.* (2011: S800) indicate that MARV is enzootic in Gabon due to the fact that MARV-positive bats were captured in between 2005 and 2009.
Kuzmin *et al.* (2011a: 4) report that MARV RNA was found in bats from Gabon, Uganda, and Kenya.
Paweska *et al.* (2012: 1) inoculated captive *R. aegyptiacus* specimens - captured in northeastern South Africa - and were able to confirm the susceptibility of this species to infections with

MARV irrespective of sex and age. In a subsequent study, Paweska *et al.* (2015) recovered the virus from 15 different tissues and plasma, but only sporadically in mucal swab, urine and fecal samples. Amman *et al.* (2015b) also experimentally infected bats and found viruses in liver, spleen, blood, kidneys, salivary glands, bladder, large intestine as well as in oral and rectal swaps. The infected bats did not show any significant changes in daily food consumption, body weight, or daily body temperature, and no signs of overt morbidity or behavioral changes such as waning appetite, overly aggressive behavior, separation from cage mates, lethargy, or reduced or abandoned grooming (p. 121). Schuh *et al.* (2017c) found prove for horizontal transmission of MARV as virus RNA was found in contact bats that were kept together with MARV-inoculated bats. Schuh *et al.* (2017b), furthermore, reported that following infection of ERBs with MARV, virus-specific IgG antibodies are induced, but after 3 months the bats are seronegative again.
Amman *et al.* (2012: 1) and Albariño *et al.* (2013a: 99) link an outbreak of MARV in October 2012 in Uganda with the second annual virus pulse in *R. aegyptiacus* populations, more specifically in older juvenile bats of about six months of age. The viral genome sequences collected from infected humans were approximately 99.3 % to two MARV isolates captured in 2008 and 2009 in the Python Cave in the Queen Elisabeth National Park. Amman *et al.* (2013: 6) indicate that at the time of these pulses, the juvenile bats are about 6 months old and are 5 to 6 times more likely to be infected by the virus than the adults (see also Olival and Hayman, 2014). Storm *et al.* (2018: 1) found that maternal immunity against MARV was lost in juvenile bats by 5 months of age, and that antibodies to MARV remained present in 84 % of naturally exposed bats at least 11 months after capture.
Peterson and Holder (2012: 1832) state that *R. aegyptiacus* is now seen as central in the picture of Marburg virus maintenance, but they also are somewhat confused about the fact that two lineages of Marburg virus are maintained in the same cave or mine in Uganda.
Carroll *et al.* (2012: 2613) indicate that *Rousettus aegyptiacus* has been identified as a potential natural reservoir for Marburg and Ravn viruses (*Marburg marburgvirus*).
Jones (2015: 3420) experimentally inoculated *R. aegyptiacus* specimens with Marburg and five Ebola viruses (Sudan, Ebola, Bundibugyo, Taï Forest, and Reston). In the Ebola virus groups, viral RNA tissue distribution was limited, wheras in the Marburg virus group, the virus was widely dissimated. They concluded that this bat species is very unlikely to be a source for Ebola viruses in nature and that there is support for a single filovirus - single reservoir host relationship (here with Marburg virus).
Paweska *et al.* (2018: 1135) tested 1,431 South African bats and found 53.04 % (759) to be positive for antibodies against MARV. These percentages varied between 17.75 % in April 2013 and 82.1 % in October 2013. In adults, these numbers varied between 39.6 % in August 2013 and 100 % in February 2013 (overal 71.56 %), whereas in young bats, they varied between 1.3 % in June 2013 and 77.3 % in January 2014 (overal 30.6 %).
An extensive test by Changula *et al.* (2018: S313-S315) showed 158 out of 290 Zambian *R. aegyptiacus* bats was positive for anti-filovirus antibodies, but no viral RNA genomes were detected. They also found that the seroprevalence peaked in November-December and decreased in January-February. The seroprevalence was also lowest in animals weighing 51 - 60 g, and increased when the bats grew, suggesting that maternal antibodies might have disappeared.
Jones *et al.* (2019: 1) inoculated Egyptian fruit bats with MARV to investigated the clinical and pathologic effects. They found a mild elevation in alanine aminotransferase (ALT) at 3, 6 and 7 days after inoculation. Nine days after inoculation, Lymphocyte and monocyte counts were slightly elevated and the liver histology revealed small foci of inflammatory infiltrate, similar to lesions previously described in wild, naturally-infected bats.

The role of the argasi tick *Ornithodoros faini* as transmission vector between *R. aegyptiacus* specimens in Uganda was rejected by Schuh *et al.* (2016: 1) as none of the 3,125 ticks examined tested positive for the Marburg virus.

Flaviviridae

Flavivirus

Uganda S virus- reported in 1947 from Uganda by Butenko (1996). This virus was mentioned by Luis *et al.* (2013: suppl.). Maganga *et al.* (2014a: 5) tested 305 animals from Gabon, of which only one tested positive for a *Flavivirus*.
Malmlov *et al.* (2019: 3) referred to Simpson *et al.* (1968) who experimentally inoculated three Egyptian fruit bats with Zika virus, of which one became viremic and two seroconverted.

Pegivirus (BPgV)

Quan *et al.* (2013: Table S5) found 3 out of 26 Kenyan and 9 out of 91 Nigerian bats examined to be infected with clade K type *Pegivirus* (overal 10.3 % infection).

Herpesviridae

Jánoska *et al.* (2011: 118) reported two viruses, from captive specimens from the Budapest Zoo,

belinging to the *Betaherpesvirinae* and *Gammaherpesvirinae*.

Nairoviridae
Orthonairovirus
de Jong *et al.* (2011: 12) and Luis *et al.* (2013: suppl.) mention the presence of an unassigned Kasokero virus, as well as an unassigned Yogue virus. The latter was also reported by Kemp (1975: 617) from Senegal in June 1968.
Of the 1979 specimens from Gabon tested by Müller *et al.* (2016: 3), 48 were positive for Crimean Congo hemorrhagic fever virus (CCHFV).
Jansen van Vuren *et al.* (2017: 935) discovered an orthobynyavirus (Wolkberg virus - WBV) in a bat fly (*Eucampsipoda africana*) collected on a *R. aegyptiacus* from South Africa. WBV was detected in one serum pool from bats, and at relatively low concentration.

Orthomyxoviridae
Kandeil *et al.* (2019: 1) reported a new influenza A virus (IAV) from bats collected in the Nile delta.

Papillomaviridae
McKnight *et al.* (2006: 193) reported some carcinomas near the eye and on wing membranes of a *R. aegyptiacus* kept in captivity in the USA. These were caused by a putative novel close-to-root papillomavirus, belonging to a new genus. Tse *et al.* (2012: 7) refer to a *Rousettus aegyptiacus* papillomavirus type 1 (RaPV1), belonging to the genus *Psipapillomavirus* (GenBank: DQ366842).

Paramyxoviridae
Drexler *et al.* (2012a: Suppl. Table S1) reported that three of the 213 specimens (1.4 %) they examined from Gabon and Congo tested positive for *Henipavirus*. 15 of these bats (7.0 %) were positive for *Rubulavirus*. Conrardy *et al.* (2014: 259) found one out of 10 tested animals from the Kitum cave (Kenya) and one of six from the Watamu cave to test positive for *Paramyxovirus*.
Amman *et al.* (2015a: 776) tested 1331 Ugandan *R. aegyptiacus* specimens of which 62 (4.6 %) tested positive for Sosuga virus.
Two out of 84 Kenyan *R. aegyptiacus* specimens tested by Mortlock *et al.* (2015: 1481) were found to test positive for *Paramyxovirus* sequences.
In South Africa, Mortlock *et al.* (2019b: 13) found a number of putative *Rubula*- and related virus RNA in spleen (9.54 %) and urine samples. In October, the virus observations peaked, which coincides with females aggregating in the cave during late stages of gestation. Additionally, high values were also found during December-January, when the bats were lactating. A second excretion peak was found in June-July, probably linked with the juveniles being no longer protected by maternal antibodies.

Phenuiviridae:
Phlebovirus - Balkema-Buschmann *et al.* (2018: 3) infected three bats from a captive colony with Rift Valley fever phlebovirus (RVFV) and found that viruses could be isolated from the spleens of all three animals and from the liver of one of them, proving that the virus can replicate in the bats.

Polyomaviridae:
Polyomavirus - Initially, two polyomaviruses were detected from Kenya in 2006 by Tao *et al.* (2012). Further surveillance identified four more from Kenyan caves (including Watamu cave) where three of the 11 individuals tested positive (Conrardy *et al.*, 2014: 259).

Reoviridae:
Orbivirus - Fagre *et al.* (2019: 1) described Bukakata orbivirus (BUKV) from a bat from Uganda.

Rotavirus - Sasaki *et al.* (2018: 106) isolated Group A Rotavirus (RVA) from *R. aegyptiacus* in Zambia, which was very similar to the strain they collected from *Eidolon helvum* specimens from that country, suggesting interspecies transmission and genetic reassortment between these bat species.

Rhabdoviridae
Lyssavirus - Rabies related viruses
In Nigeria during June 2008, Quan *et al.* (2010) did not detect any lyssavirus-specific antigens from the brains by use of direct fluroescent antibody testing.
European bat lyssavirus 1 is reported by Van der Poel *et al.* (2000: 1919), Wellenberg *et al.* (2002: 349), Omatsu *et al.* (2008:169), de Jong *et al.* (2011: 9), Luis *et al.* (2013: suppl.).
Lagos bat virus: Kuzmin *et al.* (2008a) found a 29 - 46% seroprevalence of Lagos bat virus neutralizing antibodies in Kenya. Kuzmin *et al.* (2011b: 1467) reported 37 seropositive Kenyan bats on a total of 79 examined (46.8 %). Picard-Meyer *et al.* (2004) isolated the virus from a *R. aegyptiacus* from an unknown location in Africa. Hayman *et al.* (2011a: 88) and Kuzmin *et al.* (2011a: 3) refer to a *R. aegyptiacus* specimen from France, which came originally from either Egypt or Togo.
Shimoni bat virus: Kuzmin *et al.* (2011b: 1467) found 26 bats to be seropositive for this virus on a total of 79 specimens examined in Kenya between 2009 and 2010.
Horton *et al.* (2014: Table S1) tested 54 Kenyan *R. aegyptiacus* specimens, but failed to find neutralising antibodies to IKOV (Ikoma lyssavirus).

Togaviridae
Alphavirus: de Jong *et al.* (2011: 10) and Luis *et al.* (2013: suppl.) reported Chikungunya virus occurring on *R. aegyptiacus*.

In their overview table, Maganga *et al.* (2014a: 8) report the following viruses were already found on *R. aegyptiacus*: Lagos Bat Virus (LBV), Bat Gammaherpesvirus (1, 2, 4, 5, 6, 7), Bat Gammaherpesvirus 3, Betaherpesvirus, Marburg virus (MBGV), Coronavirus, Zaire Ebola virus (ZEBOV), Yogue virus, Kasokero virus, Chiropteran Papillomavirus, Henipavirus, Rubulavirus, Flavivirus.

In their literature review, Fagre and Kading (2019) reported that seriologic evidence was found for the following viruses: Crimean-Congo Hemorrhagic Fever Virus (CCHF), Rift Valley fever virus (RVFV) and Bunyamwera virus (BUNV). The latter virus was also isolated or molecular evidence was found, which was also the case for Kasokero (KKOV) and Yogue (YOGV) viruses.

Goldberg *et al.* (2017: 2) and Feng *et al.* (2017: 99) mention that two viruses were identified from Nycteribiid bat flies (*Eucampsipoda africana*), which were retrieved from *R. aegyptiacus*: the putative orthoreovirus Mahlapitsi virus (from South Africa) and the putative orthobunyavirus Wolkberg virus.

UTILISATION:
Vora *et al.* (2014: 334) report on an annual bat festival in Idanre, Nigeria, where males of all ages enter caves inhabited by *R. aegyptiacus* to capture these bats. Many of these animals are prepared as food and some are transported to markets in other parts of the country to be sold as bushmeat. During the Yam hunting festival in Buoyem, Ghana, fruit bats (possibly *R. aegyptiacus* were collected (Anti *et al.*, 2015: 1418).

ANTHROPOPHILOUS:
In Turkey, Albayrak *et al.* (2008) observed 11 of 15 roosts (73%) were destroyed by human efforts to exterminate the bats over a five-year period.

Centeno-Cuadros *et al.* (2017: 6234) found that, in the Mediterranean area, *R. aegyptiacus* benefits from human-mediated habitats for daily movements and foraging behaviour. On the other hand, they also found that dispersal (promotor of gene flow between colonies) is apparently not influenced by human-altered habitats.

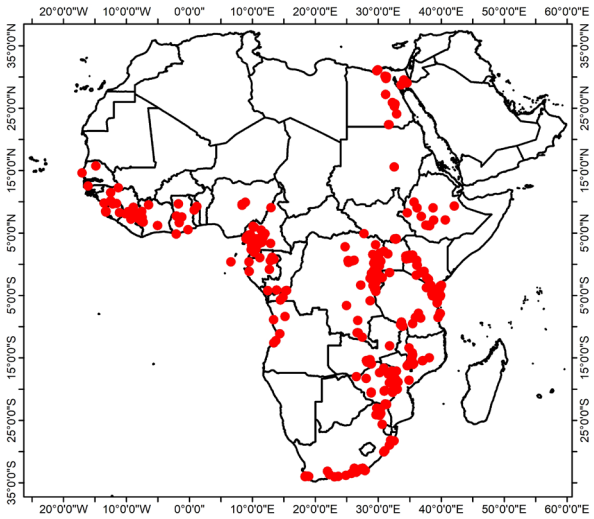

Figure 43. Distribution of *Rousettus aegyptiacus*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Angola, Burundi, Cameroon, Congo, Congo (Democratic Republic of the), Côte d'Ivoire, Egypt, Equatorial Guinea, Ethiopia, Gabon, Ghana, Guinea, Kenya, Liberia, Malawi, Mali, Mozambique, Nigeria, Rwanda, São Tomé and Principé, Senegal, Sierra Leone, South Africa, South Sudan, Sudan, Tanzania, The Gambia, Togo, Uganda, Zambia, Zimbabwe.

Rousettus madagascariensis G. Grandidier, 1929

*1929. *Rousettus madagascariensis* G. Grandidier, Bull. Acad. Malgache, (N.S.) 11: 91, pl. 4 text-figs (for 1928). Type locality: Madagascar: E Madagascar: Beforona: between Tananarive [=Antananrivo] and Andevoranto: Grand Forêt de l'Est. Holotype: MCZ 45432: ad ♂, skull and alcoholic. Collection date: 1917. Presented/Donated by: Guillaume Grandidier. Received from the "Académie Malgache" in 1917; see Bergmans (1994: 119); Peterson *et al.* (1995: 49); Helgen and McFadden (2001: 141). (Current Combination)
2016. *R[ousettus] madagascar:* Lengkong, Arisoesilaningsih, Hakim and Sudarto, Online J. Biol. Sci., 16 (2): 98. Publication date: 14 April 2016. (Lapsus)
? *Rousettus madagascariensis madagascariensis:* (Name Combination)
? *Rousettus sp. cf. R. madagascariensis*

TAXONOMY:
Considered a subspecies of *lanosus* by Hayman and Hill (1971: 12); but see Bergmans (1977a) and Simmons (2005: 348).
Bergmans (1994: 119) indicates that the year of publication is often cited as 1928, but Tome XI of the Bulletin de l'Academie Malgache, Nouvelle Série, for 1928, in which it appeared, was published in 1929. Helgen and McFadden (2001: 141) indicate that it might even be published in 1930.

COMMON NAMES:
Czech: kaloň Grandidierův. English: Madagascan Rousette, Madagascar Rousette. French: Roussette de Madagascar. German: Madagaskar-Höhlenflughund.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Samonds (2007: 57 - 58) found *Rousettus* sp. cf. *R. madagascariensis* within the deposits (NCC-1 locality) dating estimated as 69,600 to 86,800 years old within the Anjohibe cave. Samonds (2007: 60) found samples of *R. madagascariensis* in deposit (SS2) which was collected from the surface near the main cave entrance, the dating attemps revealed this sample was contaminated, therefore no date is known for Anjohibe cave, Madagascar.
Gunnell *et al.* (2014: 3) also refer to Goodman and Junkers (2013), who report on fossil material from the Andrahomana cave in Madagascar.

CONSERVATION STATUS:
Global - This species is listed as Near Threatened (NT ver 3.1 (2001)) as it is believed to have undergone a decline in the region of 20-25% over the past 15 years or so primarily as a result of chronic hunting. Almost qualifies for listing as threatened under criterion A2d. This species is not thought to be declining fast enough to place it in a category of higher threat, although a review of this assessment may be warranted in future, especially with further information on the degree to which it may be impacted by habitat loss (Andriafidison *et al.*, 2008q; IUCN, 2009).

Assessment History -
2008 - NT ver 3.1 (2001) (Andriafidison *et al.*, 2008q; IUCN, 2009). 2000 - LR/nt ver 2.3 (1994). 1996 - Vu ver 2.3 (1994).

MAJOR THREATS:
Andriafidison *et al.* (2008q) [in IUCN (2009)] report that the extent to which the destruction and degradation of natural forest threatens this species is poorly understood, while Andrianaivoarivelo *et al.* (2011b: 81) indicate that this is an indirect threat. Although Goodman *et al.* (2005a) suggested that *R. madagascariensis* is not dependent on relatively intact forest there are insufficient data on its annual dietary requirements to decide this matter. It is clear, however, that some of the roosting colonies are located some distance from intact forest and additional study is therefore needed on the mobility of this species. The main threats to *R. madagascariensis* are to its roosts where it is subject to hunting pressure (Jenkins *et al.*, 2007a; Rakotonandrasana and Goodman, 2007; Jenkins and Racey, 2008; Andrianaivoarivelo *et al.*, 2011b: 78, 81) in virtually all sites that are not inside protected areas (Goodman *et al.*, 2005a) or considered sacred (Rakotoarivelo and Randrianandrianina, 2007). Jenkins *et al.* (2011: 1), however, indicate that the taboo on hunting in sacred areas is rapidly eroding. It appears to be hunted exclusively for subsistence and bats are harvested using locally made traps as well as being knocked down from the cave ceiling with wooden batons (Rakotonandrasana and Goodman, 2007). *R. madagascariensis* can legally be hunted between the first of May and the first of September (Anonymus, 2007b: 6). On Ile Sainte Marie the reported offtake was between 360 and 480 bats per year (Rakotonandrasana and Goodman, 2007).

Jenkins *et al.* (2007b: 213) point out that *R. madagascariensis* is very vulnerable to hunters because it roosts in caves, which can easily be covered by a trap system. They mention that one local farmer was able to capture 170 bats in a single night.

Cardiff *et al.* (2012: 479) investigated the influence of tourist disturbance on roosting *R. madagascariensis*. They found that the bats were slightly less disturbed when ambient light was present. Directly illuminating the bats resulted in higher disturbance. Also in roosts which were previously visited by hunters, the bats were more easily disturbed. They suggest keeping a minimum visit distance of 12 m, not illuminating the bats directly, and not opening other roost sites for tourism to limit the disturbance of the bats.

CONSERVATION ACTIONS:
Andriafidison *et al.* (2008q) [in IUCN (2009)] report that, as a game species under Malagasy law (Durbin, 2007), *R. madagascariensis* is only protected when it occurs in nature reserves. In a survey of western Madagascar, it was found in six protected areas: Réserve Spéciale d'Ankarana, Réserve Spéciale d'Analamerana, Parc National d'Ankarafantsika, Parc National de Namoroka, Parc National du Tsingy de Bemaraha and Parc National d'Isalo (Goodman *et al.*, 2005a). Roosts within existing protected areas (only three of which are known - Cardiff and Jenkins, 2016: 99) need to

receive close attention from park staff to discourage hunting. Other roosts need to be conserved and this might be best achieved through their inclusion within new protected areas and with the cooperation of local communities.

GENERAL DISTRIBUTION:
Rousettus madagascariensis is endemic to the island of Madagascar where it is widespread but rare or absent from the central highlands and the arid south-west (MacKinnon *et al.*, 2003; Goodman *et al.*, 2005a). It has also been recorded from the off-shore islands of Nosy Be, Nosy Komba, and Ile Sainte-Marie (Rakotonandrasana and Goodman, 2007: 6).

Native: Madagascar (MacKinnon *et al.*, 2003; Goodman *et al.*, 2005a; Rakotonandrasana and Goodman, 2007: 6).

BIOGEOGRAPHY:
Goodman *et al.* (2010b: 600) did not find any clear phylogeographic structure for populations of *R. madagascariensis* on Madagascar. Across the 1,600 km length of Madagascar individuals of *R. madagascariensis* from extreme ends of the island and across numerous biomes, and nearshore islands up to 13 km from the island, demonstrated complete genetic mixing.

DETAILED MORPHOLOGY:
Baculum:
Rakotondramanana and Goodman (2017: 55) indicate that the baculum has a rounded distal tip and a distinctly narrower proximal base; length: 2.25 ± 0.228 (1.96 - 2.57) mm, width: 0.98 ± 0.179 (0.76 - 1.19) mm.

SEXUAL DIMORPHISM:
Goodman *et al.* (2017b: 72) measured 271 adult males and 289 adult females, and found males to be significantly larger in both forearm length and body mass, although with a considerable overlap: ♂♂: Fa: 75.3 ± 2.00 (70 - 80) mm, Weight: 64.6 ± 6.85 (48.0 - 81.5) g; ♀♀: Fa: 73.0 ± 2.04 (66 - 80) mm, Weight: 56.8 ± 6.54 (31.0 - 75.5) g.

MOLECULAR BIOLOGY:
DNA - Goodman *et al.* (2010b) examined Cyt-*b* from 131 individuals from 17 sites across Madagascar.
Andrianaivoarivelo *et al.* (2008: 1025) isolated 22 nuclear microsatellite loci, which will provide valuable information for population genetic studies.

Karyotype - 2n = 36 and FN = 66, containing 7 large metacentrics, 4 medium-sized submetacentrics, 5 small metacentrics and one acrocentric pair; X: large submetacentric; Y: smallest chromosome, largely heterochromatic (see Richards *et al.*, 2016d: 187, 189).

Protein / allozyme - Unknown.

HABITAT:
Due to its small size, Andrianaivoarivelo *et al.* (2011a: 70) suggest that it is potentially an important seed disperser and pollinator inside forests, since the two other Madagascan fruit bat species are rather large and unable to fly within dense foliage. It was also found to forage in relatively intact forest and highly modified habitats close to villages (see Andrianaivoarivelo *et al.*, 2011a: 76), although this contradicts observations by Randrianandriananina *et al.* (2006), who did not find any *R. madagascariensis* specimens in relatively intact humid forest.

Dammhahn and Goodman (2013: 108) indicate that mid- to upper-canopy in forest and trees growing in open areas form the foraging habitat of this species.

HABITS:
Using radio tracking and light-tagged individuals, Andrianaivoarivelo *et al.* (2011a: 69, 73) found that these bats travelled over 8 km (up to 14.2 km for females and 14.8 km for males) from their roost sites to their feeding grounds, and that round trips might be as far as 27 km. Goodman (1999: 253) and Andrianaivoarivelo *et al.* (2011a: 73) report that they only grasp a ripe fruit in their mouths and then fly off to consume it.

ROOST:
Rousettus madagascariensis roosts in caves and although it is widespread, relatively few roosts are known (MacKinnon *et al.*, 2003). Even though some roosts are protected from hunters because they occur in protected areas (Kofoky *et al.*, 2007) or sacred sites (Rakotoarivelo and Randrianandrianina, 2007), there are many reports of hunting in and around caves (Rakotonandrasana and Goodman, 2007; Jenkins *et al.*, 2007b).

DIET:
Goodman (1999: 253), Andrianaivoarivelo *et al.* (2007: 3) and Andrianaivoarivelo *et al.* (2011a: 69) reported that this species extensively feeds on the fruits of banana (*Musa paradisiaca*, family Musaceae), litchi (*Litchi chinensis*, family Sapindaceae), and *Dimocarpus longan* (Sapindaceae). Jenkins *et al.* (2007b: 213) [referring to Rakotonirainy, 2001] mention these bats visiting *Ficus soroceoides, F. pyrifolia*, and *F. guatteriifolia*. However, Andrianaivoarivelo *et al.* (2012: 19) indicate that in flight cage experiments, *R. madagascariensis* preferred native or

introduced fruit of no commercial value (*Ficus polita, Syzygium jambos* and *S. malaccense* (Myrtaceae)) to commercially important fruits (*Litchi chinensis* and *Diospyros kaki*).

Faecal analysis performed by Nogales *et al.* (2006: 69) indicated that small amounts of seeds were present, which suggests that these bats either feed on nectar, flowers and leaves or on fruits with seeds too large to swallow. They did find *Ficus* seeds in the faeces during the months of March and April.

Jenkins (2007: 17) reported the following plant species being found in faecal samples: *Ficus soroceoides, Ficus botryoïdes, Ficus pyrifolia, Ficus brachyclada* and *Rubus mollucanus*. Seeds less than 2.5 mm in length were swallowed. The seeds that passed through the bat's gut germinated faster than non-ingested seeds.

Andrianaivoarivelo *et al.* (2011a: 75) also indicate that seeds of *Ficus rubra*, which have passed through the digestive tract of *R. madagascariensis* germinate faster than those not passing through it.

Ramanantsalama *et al.* (2018: 6) reported that adult *R. madagascariensis* consumed 37 ± 16 (range 2 - 67) ectoparasites (Streblidae and Nycteribiidae) per day while grooming, whereas juveniles did not ingest any parasites. However, they do admit that this number is an overestimation as they refer to Rajemison *et al.* (2017b), who reported an average of 6.6 bat flies per adult.

PREDATORS:
In one locality on Madagascar (near Antonibe), Goodman and Griffiths (2006: 555) found that 81.3% of the total biomass predated by the barn owl (*Tyto alba*) consisted of *R. madagascariensis*.

POPULATION:
Structure and Density - It roosts in aggregations of up over a thousand individuals (MacKinnon *et al.*, 2003; Rakotoarivelo and Randrianandrianina, 2007), but smaller colonies of a few hundred are also known (Jenkins *et al.*, 2007a; Kofoky *et al.*, 2007; Andrianaivoarivelo *et al.*, 2011b: 80). It can be locally abundant and is often the most commonly trapped species in mist-netting surveys in the west of Madagascar (Kofoky *et al.*, 2007; Rakotoarivelo and Randrianandrianina, 2007).

For the "Grotte des Chauves-souris, Ankarana", Lalarivoniaina Noroalintseheno *et al.* (2017: 72) estimated the population size to be between 675 and 4000 (IC 95 %, between September 2014 and September 2015). For the same population, Noroalintseheno Lalarivoniaina *et al.* (2018: 26-27) found that in adults there was a male bias during the dry season and a female bias during the wet season, whereas this was the inverse for juvenile bats. Adults were also present in higher numbers during the dry season than during the wet season.

Trend - 2008 - Decreasing (Andriafidison *et al.*, 2008q; IUCN, 2009; Andrianaivoarivelo *et al.*, 2011b: 80).

LIFESPAN:
Lalarivoniaina Noroalintseheno *et al.* (2017: 73) found that the survival rate of males tended to exceed that of females.

REPRODUCTION AND ONTOGENY:
Andrianaivoarivelo *et al.* (2011a: 69, 73) report that most juveniles were captured between March and July, and they suspect that young are weaned before 8 weeks of age. Pregnancy (October-December), lactation (December-January) and weaning occurs in the austral summer, when food is readily available.
Lalarivoniaina Noroalintseheno *et al.* (2017: 69) indicate that mating occurs in the dry season and births follow in the wet season. This was also confirmed by Noroalintseheno Lalarivoniaina *et al.* (2018: 26), who only found neonates during the wet season, with an unbiased sex ratio.

MATING:
Goodman *et al.* (2017b: 74) indicate that this species probably has a diffused polygamous mating system, with male-male competition for access to females.

POSTNATAL DEVELOPMENT:
Andrianaivoarivelo *et al.* (2011a: 69) were unable to distinguish juveniles from adults in December, and therefore assume that *R. madagascariensis* reaches somatic maturity within one year.

PARASITES:
Gomard *et al.* (2016: 5) found 15 out of the 49 bats they tested to be positive for *Leptospira* bacteria.

DIPTERA
Tortosa *et al.* (2013: 3), Wilkinson *et al.* (2016), Rajemison *et al.* (2017a; 2017c: 805) and Ramasindrazana *et al.* (2017: Suppl.) report the presence of the Nycteribiid bat fly *Eucampsipoda madagascarensis* Theodor, 1955. Rajemison *et al.* (2017b: 72; Rajemison *et al.* (2017c: 805) reported a second bat fly: *Megastrebla wenzeli* (Jobling, 1952), belonging to the Streblidae. They found that the number of *E. madagascariensis* flies per bat (up to 27) varied by season and was lowest during the rainy season, and that the sex ratio for this fly was biased towards males (especially during the dry season). As for the bats, adult

males were more infected by *E. madagascariensis* than females, subadults and neonates. No such variation was observed for *M. wenzeli*.
Szentiványi *et al.* (2019: Suppl.) indicated that the *E. madagascariensis* bat flies were found to carry Enterobacteriales and *Rickettsia* bacteria.

SIPHONAPTERA
Hastriter (2016: 15) reported the collection of a male flea (*Araeopsylla martialis* (Rotschild, 1903)) from a *Rousettus madagascariensis*, but believes this to be an accidental association.

VIRUSES:
Astroviridae
Two out of 41 by Lebarbenchon *et al.* (2017: Suppl.) tested bats were positive for Astroviruses.

Paramyxoviridae
Henipavirus
Nipah (NiV) - In Madagascar during 2003 - 2004, Iehlé *et al.* (2007) could not detect the virus. Kuzmin *et al.* (2011a: 5) suggest that their exposure to NiV might be the result of contact with infected *Pteropus rufus* specimens.
Hendra (HeV) - In Madagascar during 2003 - 2004, Iehlé *et al.* (2007) were unable to detect the virus.
Tioman (TiV) - In Madagascar during 2003 - 2004, Iehlé *et al.* (2007) found an overall contamination of 20.0 %.

Rhabdoviridae
Lyssavirus
Lagos bat virus (LBV) - A sero reaction was found by Mélade *et al.* (2016a: 6) in seven out of 35 bats tested.
Duvenhage lyssavirus (DUVV) - Four out of 33 bats tested positive in the same study.

UTILISATION:
Golden (2005) reported large annual harvests in the Makira forest and Maroantsetra were unsustainable.
See Jenkins *et al.* (2007b) and Goodman *et al.* (2008d).

Golden and Comaroff (2015: 5) indicate that flying foxes and other fruit bats (including *R. madagascariensis*) are frequently the subject of food taboos, which they link to the fact that these bats are carriers of virulent zoonotic diseases.

ANTHROPOPHILOUS:
Cardiff *et al.* (2012) suggests that a minimum visit distance of 12 m should be maintained and not illuminating the bats directly at tourist caves, as well as not opening other roost sites to tourism, is likely to help to limit disturbance of *R. madagascariensis* by tourists at Ankarana.

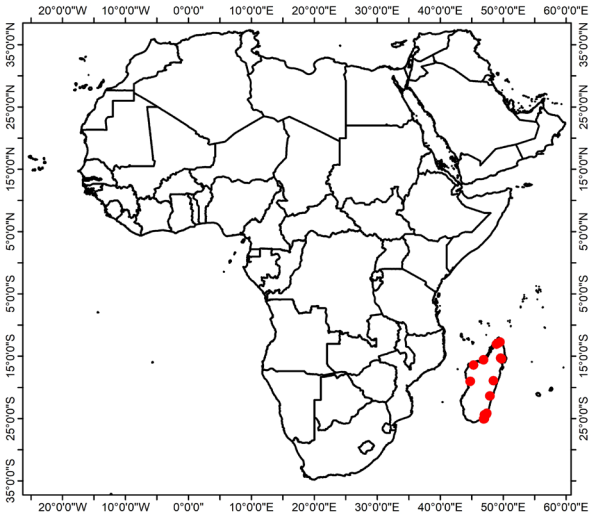

Figure 44. Distribution of *Rousettus madagascariensis*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Madagascar.

Rousettus obliviosus Kock, 1978

*1978. *Rousettus (Rousettus) obliviosus* Kock, in: Olembo, Castelino, and Mutere, Proceedings of the 4th International Bat Research Conference Nairobi, 208. Type locality: Comoros: Grand Comoro: Boboni, cave near [ca. 11 35 S 43 20 E, 640 m]. Holotype: ZFMK 1958.0207:. Presented/Donated by: ?: Collector Unknown. Holotype: ZMB 58207: ad ♂. ? *Rousettus obliviosus:* (Name Combination, Current Combination)

TAXONOMY:
Considered a valid species by Meirte (1987), Koopman (1993a: 153), Bergmans (1994: 79), Wilson and Cole (2000: 40), and Simmons (2005: 348), but as a subspecies of *madagascariensis* by Peterson *et al.* (1995: 48).

Goodman *et al.*, 2010b: 599) shows that *R. obliviosus* is a sister taxa to *R. madagascariensis* with a 6.2-8.7 % sequence divergence, and clearly form a reciprocally monophyletic clades.

COMMON NAMES:
Czech: kaloň Kockův. English: Comoro Rousette. French: Roussette des Comores, la petite roussette des Comores. German: Komoren-Höhlenflughund.

CONSERVATION STATUS:
Global - Listed as Vulnerable (VU B1ab(iii)+2ab(iii) ver 3.1 (2001)) in view of its extent of occurrence of and area of occupancy being a maximum of 1,659 km^2), with all individuals in fewer than ten locations (six roosting caves known), and a continuing decline in the extent and quality of its habitat. If the roosting locality of Bandakalala has been abandoned, and no additional roosting sites located, then the species will qualify as Endangered B1ab(iii)+2ab(iii) in view of its restricted range and being limited to five or fewer localities (roosting caves) (Mickleburgh *et al.*, 2008v; IUCN, 2009).

Assessment History - 2008 - VU B1ab(iii)+2ab(iii) ver 3.1 (2001) (Mickleburgh *et al.*, 2008v; IUCN, 2009). 2004 - NT ver 3.1 (2001) (Mickleburgh *et al.*, 2004cr; IUCN, 2004). 1996 - LR/nt (Baillie and Groombridge, 1996).

MAJOR THREATS:
Mickleburgh *et al.* (2008v) [in IUCN (2009)] report that the species is sensitive to disturbance at roost sites and this appears to be the major threat to this restricted range bat. During the early 1990s, deforestation on the Comoros averaged 5.8% per year, with human population growth at 2.5%. While the species is regularly recorded from agricultural areas, and it seems that deforestation is possibly not a major threat, this bat also uses areas of both natural and underplanted forests which are expected to help the species cope with seasonal and year to year environmental variation, including droughts and cyclones (Sewall *et al.*, 2003: 350). Anonymus (2000: 31) also points out that the fact that rivers become dried out, forms a major threat for this species.

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008v) [in IUCN (2009)] report that there are currently no direct conservation actions in place for this species. The National Conservation Action Plan for *Pteropus livingstoni* (Sewall *et al.*, 2003) includes an appendix for the conservation of *R. obliviosus*. While the few known roosting sites are in remote areas, there is a need to ensure that these caves are not disturbed. Sewall *et al.* (2003) note that the roosting site at Bandakalala on Moheli might have

been abandoned. Additional field surveys are needed to confirm this, as are attempts to locate any additional roost sites for this species. Anonymus (2000: 31) indicates that an action plan for the conservation of the Comoran fruit bats needs to be worked out and implemented. Also a local and national education and sensibilisation (Projet Biodiversité, …) needs to be put in place to make people aware of the importance of fruit bats and their role in the forests.

GENERAL DISTRIBUTION:
Rousettus obliviosus is restricted to the lower elevations of the islands of Grande Comores, Moheli and Ajouan in the Comoros, western Indian Ocean. The species has not been reported on Mayotte Island (Louette, 1999; Sewall *et al.*, 2003; Goodman *et al.*, 2010c: 124); Goodman *et al.* (2010c: 125) suggest that the reason for the absence from Mayotte island is that it is geologically the oldest (Emerick and Duncan, 1982) and the former lava tubes - important day roost sites for this species elsewhere in the archipelago - have collapsed (Goodman *et al.*, 2010c: 125). On Grande Comore it has an elevational range from near 30 to 1,750 m, on Anjouan from 200 to 1,350 m, and on Moheli from 10 to 700 m (Sewall *et al.*, 2003; Goodman *et al.*, 2010c: 125).

Native: Comoros (Mickleburgh *et al.*, 1992; Carroll and Feistner, 1996; Sewall *et al.*, 2003; Goodman *et al.*, 2010c: 124).

BIOGEOGRAPHY:
Goodman *et al.* (2010b: 600) did not find any clear phylogeographic structure for populations of *R. obliviosus* on Grand Comore, Anjouan and Moheli, with open-water distances separating these islands between 40 and 80 km.

ECHOLOCATION:
Although Reason *et al.* (1994: 402) did not see flying *R. obliviosus* before dusk, it is unknown whether this species is able to echolocate.

MOLECULAR BIOLOGY:
DNA - Goodman *et al.* (2010b) examined Cyt-*b* from 44 individuals from three islands in the Comoro island (Grande Comore, Anjouan, and Moheli).
Karyotype - Unknown.
Protein / allozyme - Unknown.

HABITAT:
R. obliviosus has been found roosting in forest caves near waterfalls (Anonymus, 2000: 30) and it feeds in the Comoron rain forests. Forages in agricultural zones, degraded or largely intact-forested areas, and understory plantations (Goodman *et al.*, 2010c: 125). A number of cave roost sites are at considerable distances from native forests (Goodman *et al.*, 2010c: 125).

HABITS:
R. obliviosus is strictly nocturnal, as Goodman *et al.* (2010c: 125) recorded exit times commenced on the 16 November 2006 at 18h45, after complete darkness at a cave roost at Nyamaoui Panga (Grand Comore).

ROOST:
Roosts in lava tube caves or difficult to access rock crevices (Goodman *et al.*, 2010c: 125). Reason *et al.* (1994) suggested that it uses tree hollows for day roost sites. However, there is no evidence for this (Goodman *et al.*, 2010c: 125). Wilkinson *et al.* (2012: 160) indicate that caves are typical roosting sites for this species on the Comoros.

Middleton and Hume (2010: 137) found a colony of a few thousand animals in a large overhang 12.4 m high, 15 m deep and about 35 m long, beside a waterfall on Anjouan Island.

DIET:
Young *et al.* (1993) [in Carroll and Feistner (1996: 330)] indicate that *R. obliviosus* and *P. livingstonii* were captured at the same kapok and fig feeding sites on Anjouan, which would suggest that their feeding niches might overlap. However, they also indicate that there might be a vertical separation between the two species.

Based on direct observations and food plants recovered from ejecta, *R. obliviosus* commonly feeds on several species of introduced fruiting plants (Mickleburgh *et al.*, 1992; Sewall *et al.*, 2003). Goodman *et al.* (2010c: 125) list *Ceiba pentandra* [= Kapok tree] (Malvaceae), *Musa* spp. [= Banana] (Musaceae), *Artocarpus integrifolia* [= Jackfruit] (Moraceae), and *Carica papaya* [= Papaya] (Caricaceae). Most of these are introduced plants which are abundant in agricultural areas with degraded forest. Ratrimomanarivo (2007) characterized *R. obliviosus* as a forest dependent species, which is not supported by Goodman *et al.* (2010c: 125).

POPULATION:
Structure and Density - The species is fairly common, with colony roost size ranging from around 100 to several thousand animals (Sewall *et al.*, 2003; Goodman *et al.*, 2010c: 125). Hume and Middleton (2011: 35) report that over 2,000 animals were hanging from the ceiling of a cave called "Rousettus Overhang" on Anjouan. The total estimated population is between 7,100 and 17,100 bats (Sewall *et al.*, 2003).

Reason *et al.* (1994: 399) reported a female sex ratio bias on Anjouan, which was not statistically significant.

Trend - 2008 - Decreasing (Mickleburgh *et al.*, 2008v; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
Reason *et al.* (1994: 125) noted that during the months of July and August 1992 on Anjouan, non-reproductive subadults were captured, estimated to be between 3 and 12 months old. Similarly, Carroll and Thorpe (1991) on Anjouan late July 1990 captured four parous adult females and two non-parous adult females; not one showed signs of reproductive activity. On the 16 November, Goodman *et al.* (2010c: 125) visited Nyamaoui Panga on Grande Comore, where among the 14 free-flying adults captured, seven were male, one of which had scrotal testes measuring 8 x 4 mm with partially convoluted epididymes, and the remaining six were not in reproductive condition. Amongst the seven females, two were pregnant, with single embryos measuring 2 - 31 mm in crown rump length, four lactating, and one non-reproductive. Goodman *et al.* (2010c: 125) revisited the site on the 6 December 2006 and amongst the six individuals caught, one male had abdominal testes, one was a female that had previously reproduced and showed no sign of active reproduction, and the balance were lactating females with single placental scars. This indicates that individuals at different reproductive stages during the same period, and there also appears to be notable inter-island synchronization in the reproductive season (Goodman *et al.*, 2010c: 125). The birthing period would seem to coincide with the wet season, October to April.

Reason *et al.* (1994: 401) suggest that females can reach sexual maturity in their first year (earlier than males).

PARASITES:
R. obliviosus from the Comoros tested positive for *Leptospira* bacteria (Lagadec *et al.*, 2012: 1696). Dietrich *et al.* (2018a: 3) identified these further as *L. interrogans* and *L. borgpetersenii*. Lei and Olival (2014: Suppl.) mention that the species is also a host for *Bartonella* bacteria.

Tortosa *et al.* (2013: 3) and Wilkinson *et al.* (2016) report the presence of the Nycteribiid bat fly *Eucampsipoda theodori*. These bat files were found to carry Enterobacteriales and *Bartonella* bacteria (Szentiványi *et al.*, 2019: Suppl.).

Reason *et al.* (1994: 399) collected *Brachytarsia* sp. (possibly *B. wenzeli* [=?*Megastrebla wenzeli*]).

VIRUSES:
Paramyxoviridae
Wilkinson *et al.* (2012: 160) tested 26 individuals from the Comoros using RT-PCR specific for Respirovirus/Morbillivirus/Henipahvirus (RMH) and Paramyxovirinae (PMV) and found 0 positive results for viral nucleic acids.

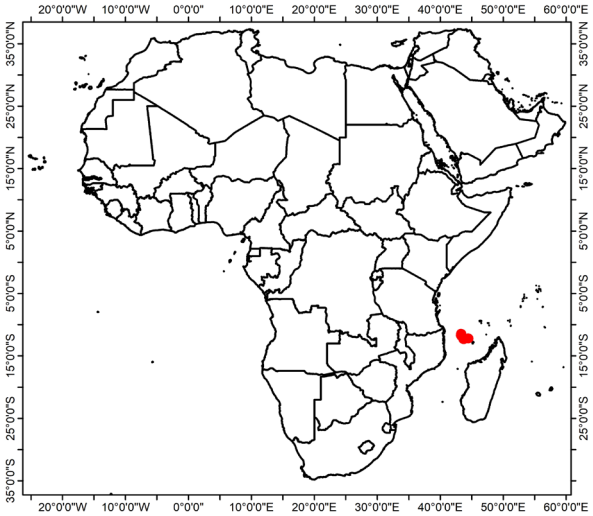

Figure 45. Distribution of *Rousettus obliviosus*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Comoros, South Africa.

Genus ***Scotonycteris*** Matschie, 1894

*1894. *Scotonycteris* Matschie, Sber. Ges. naturf. Freunde Berlin, 200. - Comments: Type species: *Scotonycteris zenkeri* Matschie, 1894. - Etymology: From the Greek "*σκόοτος*", meaning darkness and "*νυκτερίς*", meaning bat (see Palmer, 1904: 627). (Current Combination)

TAXONOMY:
Reviewed by Bergmans (1991). See also Simmons (2005: 349), Hassanin *et al.* (2015). Based on cyt *b* analyses, Hassanin (2014: 141) transferred *ophiodon* Pohle, 1943 from *Scotonycteris* to *Casinycteris*. Further analyses on cyt *b* and nuclear DNA data led Hassanin *et al.*

(2015: 206) to split up *S. zenkeri* in four clades of which they recognized three as full species.

Included in the Scotonycterini tribe by Bergmans (1997: 69) and Almeida *et al.* (2016: 83), which was considered part of the Epomophorinae by the former and of the Rousettinae by the latter.

Known species of *Scotonycteris*: ***bergmansi*** Hassanin, Khouider, Gembu, Goodman, Kadjo, Nesi, Pourrut, Nakouné, and Bonillo, 2015, ***occidentalis*** Hayman, 1947, ***zenkeri*** Matschie, 1894.

COMMON NAMES:
Czech: hadozubí kaloni. English: Harlequin Fruit-bats, Tear-drop Fruit-bats, West African fruit bats. French: Scotonyctères. German: Harlekin-Flughunde.

MOLECULAR BIOLOGY:
Based on analyses of mitochondrial cyt *b* and nuclear DNA sequences, Hassanin *et al.* (2015: 205) found support for four clades: Upper Guinea (Liberia and Côte d'Ivoire), Cameroon, western Equatorial Africa (EG, Gabon, RC, and southwestern CAR), and eastern DRC. The mtDNA distances calculated between these four geographic clades are slightly higher than those found between the three species of the genus *Casinycteris*, which suggest that *S. zenkeri* might contain four cryptic species. These results are confirmed nuclear DNA data, except for the eastern DRC clade. Hassanin *et al.* (2015) suggest that females from eastern DRC and western Equatorial Africa have remained isolated since the end of the Pliocene (2.7 Mya), whereas males were able to disperse, at least occasionally during interglacial periods, resulting in male-mediated nuclear gene flow between these distant populations, apparently from western Equatorial Africa to eastern DRC.

Scotonycteris bergmansi Hassanin, Khouider, Gembu, Goodman, Kadjo, Nesi, Pourrut, Nakouné, and Bonillo, 2015

*2015. *Scotonycteris bergmansi* Hassanin, Khouider, Gembu, Goodman, Kadjo, Nesi, Pourrut, Nakouné, and Bonillo, C. R. Biologies, 338 (3): 206. Publication date: 27 January 2015. Type locality: Central African Republic: Mabaéré-Bodingué National Park: Case of Kpoka [3.90 N 17.16 E, 430 m] [Goto Description]. Holotype: MNHN ZM-2011-713: ad ♀, alcoholic (skull not removed). Collected by: Alexandre Hassanin, Emmanuel Nakouné, Nicolas Nesi and Carine Ngoagouni; collection date: 16 November 2008; original number: R08-119. Presented/Donated by: ?: Collector Unknown. - Etymology: In honour of Dr. Wim Bergmans, a Dutch zoologist, for his outstanding contributions in the fields of taxonomy and biogeography of African fruit bats (see Hassanin *et al.* (2015: 206).

COMMON NAMES:
English: Bergmans's fruit bat. French: Scotonyctère de Bergmans. German: Bergmans Harlekin-Flughund.

GENERAL DISTRIBUTION:
Scotonycteris bergmansi occurs in Equatorial Africa, where it is known from the rainforests of Gabon, Equatorial Guinea, Republic of Congo, southern Central African Republic, and eastern Democratic Republic of the Congo Hassanin *et al.* (2015: 207).

Native: Gabon, Equatorial Guinea, Congo, Central African Republic, Democratic Republic of the Congo.

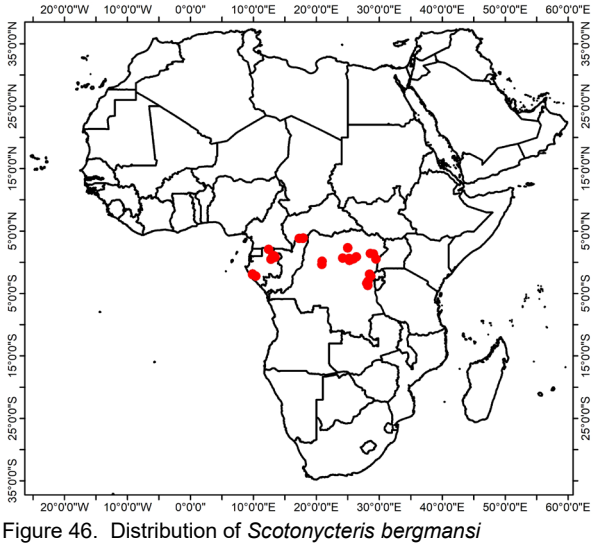

Figure 46. Distribution of *Scotonycteris bergmansi*

Scotonycteris bergmansi bergmansi Hassanin, Khouider, Gembu, Goodman, Kadjo, Nesi, Pourrut, Nakouné, and Bonillo, 2015

*2015. *Scotonycteris bergmansi bergmansi* Hassanin, Khouider, Gembu, Goodman, Kadjo, Nesi, Pourrut, Nakouné, and Bonillo, C. R. Biologies, 338 (3): 206. Publication date: 27 January 2015. Type locality: Central African Republic: Mabaéré-Bodingué National Park: Case of Kpoka [3.90 N 17.16 E, 430 m] [Goto Description]. - Etymology: In honour of Dr. Wim Bergmans, a Dutch zoologist, for his outstanding contributions in the fields of taxonomy and biogeography of African fruit bats (see Hassanin *et al.* (2015: 206).

GENERAL DISTRIBUTION:
Scotonycteris bergmansi bergmansi is found in the rainforests of western Equatorial Africa in the following countries: Central African Republic (South), Republic of Congo, Gabon, and Equatorial Guinea.

MOLECULAR BIOLOGY:
DNA - Unknown.
Karyotype - Primus *et al.* (2006) reported a male "*S. zenkeri*" from Gabon with a 2*n* = 32.
Protein / allozyme - Unknown.

Scotonycteris bergmansi congoensis Hassanin, Khouider, Gembu, Goodman, Kadjo, Nesi, Pourrut, Nakouné, and Bonillo, 2015

*2015. *Scotonycteris bergmansi congoensis* Hassanin, Khouider, Gembu, Goodman, Kadjo, Nesi, Pourrut, Nakouné, and Bonillo, C. R. Biologies, 338 (3): 207. Publication date: 27 January 2015. Type locality: Congo (Democratic Republic of the): Sukisa [2.31 N 24.98 E, 470 m] [Goto Description]. Holotype: MNHN ZM-2014-564: ad ♀, alcoholic (skull not removed). Collected by: ?: Collector Unknown; original number: K13-48. Presented/Donated by: ?: Collector Unknown.

GENERAL DISTRIBUTION:
Scotonycteris bergmansi congoensis is found in the rainforests of eastern DRC.

Native: Congo (Democratic Republic of the).

DIET:
Gembu Tungaluna (2012: 110 - 112) reported the following fruits being eaten by "*Scotonycteris zenkeri*" in the Kisangani area (DRC) during the various seasons: First heavy rain season (September - November): *Ficus leprieuri* Miq., 1867 (29%), *Ficus wildemanniana* Warb. (22%), *Uapaca guineensis* Müll.Arg., 1864 (Sugar plum, red cedar, false mahogany, rikio) (14%), *Musanga cecropioides* R.Br. & Tedlie (African corkwood tree, umbrella tree) (14%), *Spondias cytherea* Sonnerat, 1782 (Ambarella, otaheite apple, great hog plum) (7%), *Annonidium mannii* (Oliv.) Engl. & Diels (Junglesop) (7%), *Pseudospondias microcarpa* (A. Rich.) Engl. (7%).
First mild rain season (December - February): *Ficus wildemanniana* (33%), *Ficus leprieuri* (27%), *Myrianthus arboreus* P. Beauvois, 1805 (giant yellow mulberry, bush pineapple, corkwood) (20%), *Musanga cecropioides* (20%).
Second heavy rain season (March - May): *Annonidium mannii* (17%), *Musanga cecropioides* (17%), *Oncoba welwitschii* Oliv. (11%), *Ficus leprieuri* (11%), *Ficus vallis-choudae* Delile (11%), *Ficus* sp1 (11%), *Parinari excelsa* Sabine (Guinea plum) (6%), *Carica papaya* L. (papaya) (6%), *Uapaca guineensis* (5%), *Spondias cytherea* (5%).
"Dry" season (June - August): *Parinari excelsa* (50%), *Ficus leprieuri* (25%), *Musanga cecropioides* (25%).

Scotonycteris occidentalis Hayman, 1947

1947. *Scotonycteris zenkeri occidentalis* Hayman, Ann. Mag. nat. Hist., ser. 11, 13 (104): 547 (for 1946). Publication date: 25 June 1947. Type locality: Ghana: Central province: Oda [05 55 N 00 56 W] [Goto Description]. Holotype: BMNH 1946.898: ad ♀, skin and skull. Collected by: George Soper Cansdale; collection date: 1946. - Etymology: *occidentalis* refers to the western Africa.

COMMON NAMES:
English: Hayman's tear-drop fruit bat. French: Scotonyctère de Hayman. German: Haymans Harlekin-Flughund.

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008bm) [in IUCN (2009)] report that although there appear to be no direct conservation measures in place [for "*S. zenkeri*"], it has been recorded from a number of protected areas (e.g. Tai National Park, Côte d'Ivoire). There is a need to investigate whether this species can adapt to secondary forest habitats. Further studies are needed to fully determine if the species is present in forested areas between known localities.

GENERAL DISTRIBUTION:
Scotonycteris occidentalis is distributed in West Africa, where it ranges from Liberia and Guinea, into Côte d'Ivoire, Ghana and possibly Nigeria.

Native: Côte d'Ivoire (Heim de Balsac, 1934b: 24 - as "*S. zenkeri*); Ghana; Guinea; Liberia; Nigeria [Hassanin *et al.* (2015: 206) indicate that some Nigerian populations might belong to *S. zenkeri*, leaving the possibility that some others might belong to *S. occidentalis*].

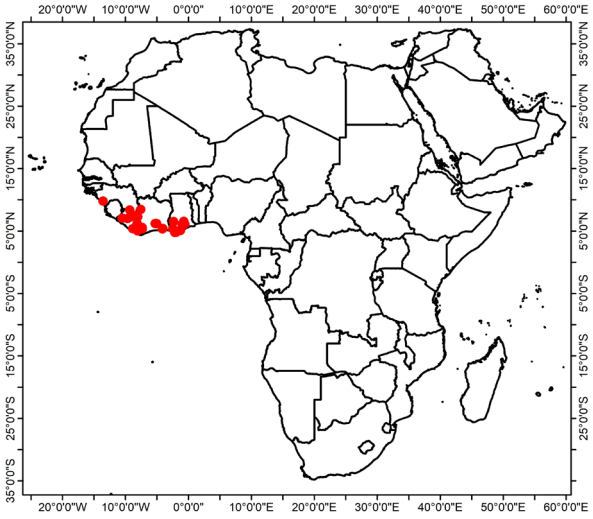

Figure 47. Distribution of *Scotonycteris occidentalis*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Côte d'Ivoire, Ghana, Guinea, Liberia.

Scotonycteris zenkeri Matschie, 1894

*1894. *Scotonycteris zenkeri* Matschie, Sber. Ges. naturf. Freunde Berlin, 202. Type locality: Cameroon: Yaunde [03 52 N 11 31 E]. Holotype: ZMB 66533: ad ♀, skull and alcoholic. Collected by: Georg August Zenker. See Turni and Kock (2008: 21). (Current Combination)

1904. *Scotonycteris bedfordi* Thomas, Abstr. Proc. Zool. Soc. Lond., 4: 14. Publication date: 8 March 1904. Type locality: Equatorial Guinea: Bioko: Fish Town [10 m] [Goto Description]. Holotype: BMNH 1904.7.1.28: ad ♀, skin and skull. Collected by: E. Seimund; collection date: 2 January 1904; original number: 31. Presented by Fernando Poo Committee: see Andersen (1912b: 568).

? *Scotonycteris zenkeri zenkeri:* (Name Combination)

TAXONOMY:
See Simmons (2005: 349).

See also Hassanin *et al.* (2015: 206), who split-off *occidentalis* and *bergmansi*.

COMMON NAMES:
Czech: kaloň Zenkerův. English: Zenker's Harlequin Fruit-bat, Zenker's Tear-drop Fruit-bat, Zenker's Fruit Bat. French: Scontonyctère de Zenker, Roussette de Zenker. German: Zenkers Harlekin-Flughund, Zenker's Traenenflughund. Spanish (Castillian): Zorra Voladora de Zenker.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, it occurs in some protected areas, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008bm; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2008bm; IUCN, 2009). 2004 - NT ver 3.1 (2001) (Mickleburgh *et al.*, 2004bk; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

This status is for *S. zenkeri* as perceived prior to the publication of Hassanin *et al.* (2015) and will need to be re-evaluated in view of the split-up of this species.

MAJOR THREATS:
The species is threatened by habitat loss, presumably largely through logging and mining operations and the conversion of land to agricultural use (Mickleburgh *et al.*, 2008bm; IUCN, 2009).

GENERAL DISTRIBUTION:
Hassanin *et al.* (2015: 206) restricted the distribution of *S. zenkeri* to Cameroon, with the remark that additional data are needed to assess the taxonomic status of some populations from Nigeria. Tentatively, we assigned the Nigerian specimens to this species.

Native: Cameroon; Nigeria(?).

DETAILED MORPHOLOGY:
Chawana *et al.* (2013: 160) mention that the average brain mass for 2 specimens was 0.64 g.

FUNCTIONAL MORPHOLOGY:
Sagot and Chaverri (2015: 191) indicated that the retinal area in the eye of *S. zenkeri* covers about 40 - 50 mm^2 and contains about 90,000 retinal ganglion cells. The minimum angle of resolution was about 0.227° (ca. 8 mm at 1 m distance).

MOLECULAR BIOLOGY:
DNA - Unknown.
Karyotype - Primus *et al.* (2006) reported a male from Gabon with a 2*n* = 32, but the specimen on which this is based, would currently be assigned to *S. bergmansi*, so the karyotype for *S. zenkeri* is still to be confirmed.
Protein / allozyme - Unknown.

HABITAT:
Juste B. and Perez del Val (1995: 144) reported that *S. zenkeri* was only netted below 400 m, and was found more frequently in cultivated clearings than in rainforests.

POPULATION:
Structure and Density - It appears to be a rare, or at least rarely recorded, species (Mickleburgh *et al.*, 2008bm; IUCN, 2009).
Trend - 2008 - Decreasing (Mickleburgh *et al.*, 2008bm; IUCN, 2009).

The above statements pertain to *S. zenkeri* s.l. and need to be re-evaluated in view of the split-up proposed by Hassanin *et al.* (2015: 206).

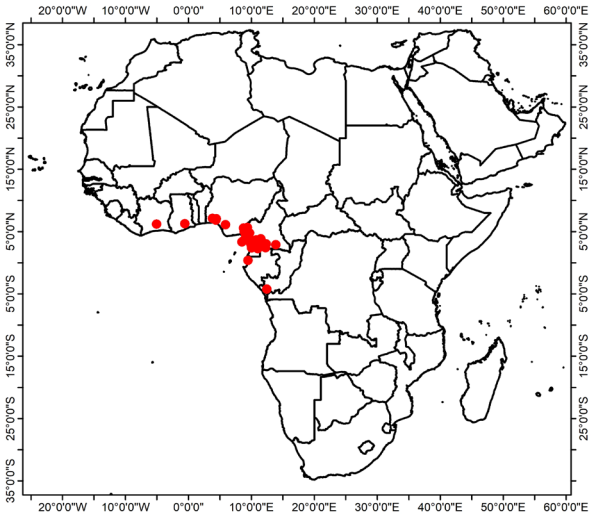

Figure 48. Distribution of *Scotonycteris zenkeri*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Cameroon, Congo, Côte d'Ivoire, Equatorial Guinea, Gabon, Ghana, Nigeria.

Genus ***Stenonycteris*** Gray, 1870

1870. *Stenonycteris* Gray, Catalogue of Monkeys, Lemurs and Fruit-eating bats in the collection of the British Museum London, 127. - Comments: Considered a valid genus by Giannini and Simmons (2003: 504), Lavrenchenko *et al.* (2004b: 130), but only a synonym according to Bergmans (1994: 79). Sometimes considered a valid subgenus containing *lanosus*. Allen (1939a: 62), Meester *et al.* (1986: 28), Bergmans (1994: 80), and Kwiecinski and Griffiths (1999: 1) assigned this name to K. Andersen, Cat. Chiroptera Brit. Mus., 1: 23, 1912. - Etymology: From the Greek *stenos* meaning narrow and *nycteris* meaning bat (see Andersen, 1912b: 23).

TAXONOMY:
Included in the Stenonycterini tribe (Almeida *et al.*, 2016: 83).

Known species of *Stenonycteris*: ***lanosus*** (Thomas, 1906).

Stenonycteris lanosus (Thomas, 1906)

*1906. *Rousettus lanosus* Thomas, Ann. Mag. nat. Hist., ser. 7, 18 (104): 137. Publication date: 1 August 1906. Type locality: Uganda: Ruwenzori East: Mubuku Valley [00 15 N 30 10 E, 13 000 ft] [Goto Description]. Holotype: BMNH 1906.7.1.2: ad ♂, skull and alcoholic. Collected by: Mr. R.B. Woosnam. Presented by Ruwenzori Exploration Committee: see

Andersen (1912b). - Comments: Type locality originally "Ruwenzori East at 13,000 ft", but restricted to Mubuku Valley by Hayman *et al.* (1966: 30) (see Bergmans, 1994: 109). - Etymology: From the Greek/Latin? "*lanosus*" for woolly. (Current Combination)

1909. *Rousettus kempi* Thomas, Ann. Mag. nat. Hist., ser. 8, 4 (24): 543. Publication date: 1 December 1909. Type locality: Kenya: Southern slopes Mount Elgon, Kirui's: Twere [ca. 00 46 N 34 37 E, 6 000 ft] [Goto Description]. Holotype: BMNH 1910.4.1.6: sad ♂, skin and skull. Collected by: Robin Kemp; collection date: 16 September 1909; original number: 269. Presented/Donated by: C.D. Rudd Esq. Formerly in Rudd collection.

2012. *Stenonycteris lanosus:* Nesi, Kadjo, Pourrut, Leroy, Pongombo Shongo, Cruaud and Hassanin, Mol. Phylog. Evol., 66 (1): 135 (for 2013). Publication date: 10 October 2012. (Name Combination, Current Combination)

? *Rousettus (Stenonycteris) lanosus:* (Name Combination)

? *Rousettus lanosus kempi:* (Name Combination)

? *Rousettus lanosus lanosus:* (Name Combination)

TAXONOMY:
Revised by Bergmans (1994), but see Simmons (2005: 348).

Included in the genus *Stenonycteris* by Almeida *et al.* (2011a: 5, 7, 9, 10) and Patterson and Webala (2012: 10) since it consistently recovered in another clade allied to *Myonycteris, Lissonycteris*, and *Megaloglossus*.

Nesi *et al.* (2012: 126) confirm that *Stenonycteris* should be considered a separate genus and should even be placed in its own tribe (Stenonycterini), within the subfamily Epomophorinae.

COMMON NAMES:
Chinese: 狭齿果蝠. Czech: kaloň vlnatý. English: Mountain Rousette, Long-haired Rousette, Woolly Rousette, Ruwenzori Long-haired Rousette. French: Roussette du Ruwenzori, Roussette à longs poils. German: Gebirgs-Höhlenflughund. Kinande (DRC): Karakonube

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) [as *Rousettus lanosus*] in view of its wide distribution, presumed large population, it occurs in a number of protected areas, and because the global population is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008dg; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2008dg; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2004cx; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
The major threats to this species include ongoing deforestation in montane regions, likely disturbance of cave roosting sites (possibly from tourists in parts of its range), and possible overhunting of bats at roost sites for subsistence food by local people (Mickleburgh *et al.*, 2008dg; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008dg) [in IUCN (2009)] report that although there appear to be no direct conservation measures in place, it has been recorded from a number of protected areas (e.g. Mount Elgon National Park, Kenya). There is a need to maintain remaining areas of suitable montane forest and to protect major roosting colonies from disturbance. In areas where this species is identified as being overhunted, there is a need to encourage the sustainable use of susceptible populations.

GENERAL DISTRIBUTION:
Stenonycteris lanosus is distributed in East Africa and marginally in Central Africa. It ranges from Ethiopia and southern Sudan in the north of its range, into Kenya, Uganda, eastern Democratic Republic of the Congo and Rwanda, to Tanzania and northern Malawi. It is largely, but not strictly, a montane species being found between 500 and 4,000 m asl (with most records above 1,000 m, e.g. at 13,000 ft in the Mubuku Valley, E. Ruwenzori [Thomas, 1910b: 486]).

Native: Congo (The Democratic Republic of the); Ethiopia (Bergmans, 1994: 79); Kenya; Malawi (Bergmans, 1994; Bergmans, 1994: 79; Monadjem *et al.*, 2010d: 555); Rwanda (Bergmans, 1994: 79); Sudan; Tanzania (Stanley and Goodman, 2011: 41); Uganda (Kityo and Kerbis, 1996: 60).

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
From western Uganda, Monadjem *et al.* (2011: 30) reported the following data: Fa: 94.5 mm, mass: 121 g, wing loading: 21.8 N/m^2, aspect ratio: 5.6.

POPULATION:
Structure and Density - This appears to be a little recorded, but locally abundant species (Mickleburgh *et al.*, 1992). It forms colonies of up to a few hundred bats (Mickleburgh *et al.*, 2008dg; IUCN, 2009).
Trend - 2008 - Decreasing (Mickleburgh *et al.*, 2008dg; IUCN, 2009).

LIFESPAN:
Szekely *et al.* (2015: Suppl.) report a maximum longevity of 18.7 years.

REPRODUCTION AND ONTOGENY:
Stanley and Goodman (2011: 40) reported on five pregnant females collected between 19 and 24 July 1993 in the South Pare Mountains (Tanzania).

Kingdon (1974) [in Krutzsch (2000: 111)] showed that *S. lanosus* is one of the species in which pregnant or lactating females are present in the population in all months of the year, and where most adult males have enlarged spermatogenic testes and hypertrophied, secretion-filled accessory glands. This would indicate that while males are fecund population-wide, they enter periods of inactivity individually.

PARASITES:
HAEMATOSPORIDA
The two South Sudanese "*Rousettus lanosus*" specimens tested by Schaer *et al.* (2017: 2) were infected by *Hepatocystis* parasites.

DIPTERA
Nycteribiidae: *Dipseliopoda setosa* Theodor, 1955 from Kenya and Tanzania (Haeselbarth *et al.*, 1966: 116).
The fly *Stylidia scissa* Speiser, 1901 was collected on a bat from South Sudan (the same bat where also *T. dina* was collected from, see below), although Bergmans (1982: 161) indicates that this fly is generally found on Microchiropterans and its find might "be due to straggling between spirit specimens".

SIPHONAPTERA
Ischnopsyllidae: *Thaumapsylla breviceps* Rothschild 1907, where the nominate subspecies *T. b. breviceps* Hopkins and Rothschild, 1956 is occurring in Kenya and the DRC (Haeselbarth *et al.*, 1966: 186). *Thaumapsylla dina* Jordan, 1937 in the mountains of the Ruwenzori, Congo and Kenya (Haeselbarth *et al.*, 1966: 186). (Bergmans (1982: 161) reported that this flea was also collected from a "*Rousettus lanosus*" from South Sudan.

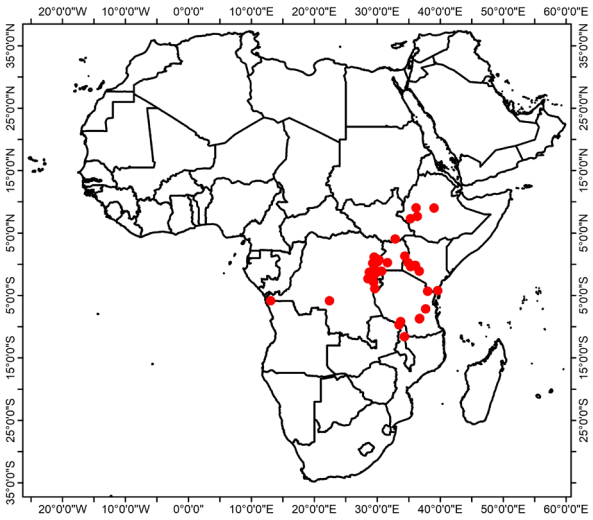

Figure 49. Distribution of *Stenonycteris lanosus*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Burundi, Congo (Democratic Republic of the), Egypt, Ethiopia, Kenya, Malawi, Rwanda, South Sudan, Tanzania, Uganda.

INFRAORDER RHINOLOPHIFORMACEI Van Cakenberghe, Kearney and Seamark, 2007

1866. *Histiorrhina* Haeckel, Generelle Morphologie der Organismen., 2: clx. - Comments: Proposed as family, including the genera *Rhinolophus* Lacépède, 1799; *Megaderma* É. Geoffroy, 1810; and *Phyllostoma* G. Cuvier, 1800 [= *Phyllostomus* Lacépède, 1799] (see Jackson and Groves, 2015: 229).
1998. *Megachiropteramorpha* Simmons and Geisler, Bull. Am. Mus. Nat. Hist., 235: 135, 136. - Comments: Originally included the fossil *Archaeopteropus* Meschinelli, 1903 and the suborder Megachiroptera (Dobson, 1875) (see Jackson and Groves (2015: 229).
*2007. *RHINOLOPHIFORMACEI* Van Cakenberghe, Kearney and Seamark, African Chiroptera Report. Publication date: July 2007. - Comments: The name of the Infraorder is based on *Rhinolophus* Lacépède, 1799 (type of RHINOLOPHIDAE Gray, 1825). (Current Combination)

Superfamily RHINOLOPHOIDEA J. E. Gray, 1825

1825. *Rhinolophina* Gray, Ann. Philos., 10 (5): 338. - Comments: Proposed as tribe and originally containing the genera *Megaderma* É. Geoffroy, 1810; *Rhinolophus* Lacépède, 1799; *Nycteris* É. Geoffroy & G. Cuvier, 1795; *Mormoops* Leach, 1821 and *Nyctophilus* Leach, 1821. Jackson and Groves (2015: 241, 242) placed this name in the synonymy of both Rhinolophoidea and Rhinolophidae.

*1825. *Rhinolophoidea* Gray. - Comments: The name of the Superfamily is based on *Rhinolophus* Lacépède, 1799 (type of RHINOLOPHIDAE Gray, 1825).

Some publications assigned the name to Bell (1836). (Current Combination)

COMMON NAMES:
Czech: vrápencovci, vrápenci.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Shi and Rabosky (2015: 1532) [based on Teeling *et al.* (2005)] mention 55 milion years ago as approximate fossil date for the Rhinolophoidea, and Patterson and Webala (2012: 12) indicate that the separation between the Rhinolophidae and the Hipposideridae took place some 28.7 mya, although Shi and Rabosky (2015: 1532) set this about 8 million years earlier (at 37 mya). Foley *et al.* (2014: 320) provide another estimate for the African divergence between the Rhinolophidae and the Hipposideridae from their common ancestor: 42 mya. Based on transcriptome RNA-seq data, Lei and Dong (2016: 2) placed the split at about 40 mya.

Ravel *et al.* (2016: 358) indicate that the oldest occurrence of the Hipposideridae in northern Africa and the oldest occurrence of the Rhinolophidae in eastern Asia suggest that a common ancestor for these two families might have occurred in Central Asia. Unfortunately, there are no fossil records to substantiate this.

BIOGEOGRAPHY:
Foley *et al.* (2014: 320) indicate that the Rhinolophoidea and Pteropodidae diverged approximately 59 Mya. While within the Rhinolophoidae, the families Rhinolophidae and Hipposideridae diverged in Africa from their common ancestor approximately 42 May during the Eocene. The family Rhinonycteridae separated from the other Hipposideridae approximately 39 Mya, also in Africa (Foley *et al.*, 2014: 320).

Family HIPPOSIDERIDAE Lydekker, 1891

1860. *Phyllorhina* Koch, Bericht der Oberhessischen Gesellschaft für Natur- und Heilkunde, 8 (4): 26. - Comments: Type genus: *Phyllorrhina* Bonaparte, 1837 [1832–1841] [= *Hipposideros* J. Gray, 1831]. Jackson and Groves (2015: 245) indicate the name is unavailable.

1860. *Phyllorrhina* Koch. - Comments: Pavlinov *et al.* (1995: 75) mention *Phyllorrhina* with a question mark as synonym of Hipposideridae. Lanza *et al.* (2015: 121) mention "*Phyllorhina*" Koch as a synonym of the genus *Asellia*.

*1891. *Hipposideridae* Lydekker, in: Flower and Lydekker, Mammals Living and Extinct, 657. (Current Combination)

*1891. *Hipposiderinae* Lydekker, in: Flower and Lydekker, Mammals Living and Extinct, 657. - Comments: Type genus: *Hipposideros* Gray, 1831. Originally included the genera *Hipposiderus* [sic] J. Gray, 1834 [= *Hipposideros* J. Gray, 1831]; *Anthops* Thomas, 1888; *Rhinonicteris* J. Gray, 1847; *Triaenops* Dobson, 1871; and *Coelops* Blyth, 1848 (see Jackson and Groves, 2015: 244). (Current Combination)

1907. *Hipposideridae* Miller, Bull. U.S. natl. Mus., 57: viii, 109. Publication date: 29 June 1907. - Comments: Type genus: *Hipposideros* J. Gray, 1831. Originally included the genera *Hipposideros* J. Gray, 1831; *Asellia* J. Gray, 1838; *Anthops* Thomas, 1888; *Coelops* Blyth, 1848; *Cloeotis* Thomas, 1901; *Rhinonicteris* J. Gray, 1847; and *Triaenops* Dobson, 1871 (see Jackson and Groves, 2015: 245).

1941. *Coelopinae* Tate, Am. Mus. Novit., 1140: 11. Publication date: 20 August 1941. - Comments: Type genus: *Coelops* Blyth, 1848.

1970. *Hipposiderini* Koopman and J.K. Jones Jr., in: Slaughter, Classification of bats, 25. - Comments: Type genus: *Hipposideros* J. Gray, 1831. Proposed as tribe and originally

included the genera *Hipposideros* J. Gray, 1831; *Aselliscus* Tate, 1941; *Cloeotis* Thomas, 1901; *Rhinonicteris* J. Gray, 1847 and *Triaenops* Dobson, 1871 (see Jackson and Groves, 2015: 245).

1994. *Hipposiderina* Koopman, in: Niethammer et al., Chiroptera: Systematics, 60. - Comments: Type genus: *Hipposideros* J. Gray, 1831. Proposed as subtribe and originally included the genera *Hipposideros* J. Gray, 1831; *Anthops* Thomas, 1888 and *Asellia* J. Gray, 1838 (see Jackson and Groves, 2015: 245).

1995. *Coelopsinae:* Pavlinov, Borissenko, Kruskop and Jahonton, Archives of the Zoological Museum, Moscow State University,, 133: 84. - Comments: Mentioned as a synonym of the Hipposideridae by Pavlinov *et al.* (1995: 84). (Lapsus)

2014. *Hippossideridae:* Ndara R., IJISR, 12 (1): 253. Publication date: November 2014. (Lapsus)

2014. *Hippossyderidae:* Ndara R., IJISR, 12 (1): 252. Publication date: November 2014. (Lapsus)

2015. *Hypposideridae:* Lanza, Funaioli and Riccucci, The bats of Somalia and neighbouring areas, 118. (Lapsus)

2018. *Hipossidaridae:* Malekani, Musaba, Gembu, Bugentho, Toengaho, Badjedjea, Ngabu, Mutombo, Laudisoit, Ewango, Van Cakenberghe, Verheyen, Asimonyo, Masudi, Bongo and Ngbolua, Nat. Conserv. Res., 3 (1): 68. Publication date: January 2018. (Lapsus)

Taxonomy:

Considered a subfamily of the Rhinolophidae by Koopman (1993a: 169), Schutt and Simmons (1998: 28), but see Harrison and Bates (1991: 51), Corbet and Hill (1992: 104), Peterson *et al.* (1995: 66), Hutson *et al.* (2001), Simmons (2005: 365), who consider this to be a valid family. Hoofer and Van Den Bussche (2003: 10 - 12) suggest that the Hipposideridae might not be monophyletic, with *Triaenops* being different, although they state this might be the result of inadequate sampling.

McKenna and Bell (1997) used the name Rhinonycterinae Gray, 1866 for this group, but this has not been accepted by other authors (Simmons, 2005: 365). Although Rhinonycteridae (= Rhinonycterina Gray, 1866) has priority over Hipposideridae as a family-group name, nobody other than Gray (1866b) used the former name until it was resurrected by McKenna and Bell (1997). Miller (1907) used the name Hipposideridae for this group because *Hipposideros* Gray, 1831 has priority over *Rhinonycteris* Gray, 1866 (= *Rhinonicteris* Gray, 1847). Subsequent authors have followed Miller (1907) usage of Hipposideridae/inae, and Simmons (2005: 365) believes that there is little to be gained by replacing it with an unknown name. Simmons (2005: 365) therefore retains Hipposideridae for this group pending action by the International Commission on Zoological Nomenclature.

Due to the recent split off of *Cloetis, Paratriaenops, Rhinonicteris* and *Triaenops* into a separate family, the above naming issue has resolved itself.

McKenna and Bell (1997) proposed a tribal classification for hipposiderids (which they treated as a subfamily), but many of the groups they defined have subsequently been shown to be paraphyletic (Bogdanowicz and Owen, 1998, Hand and Kirsch, 1998); accordingly, Simmons (2005: 365) did not recognize subfamilies or tribes within Hipposideridae.

Known genera of Hipposideridae: *Anthops* Thomas, 1888, ***Asellia*** Gray, 1838, *Aselliscus* Tate, 1941, *Coelops* Blyth, 1848, ***Doryrhina*** Peters, 1871, ***Hipposideros*** Gray, 1831, ***Macronycteris*** Gray, 1866, †*Miophyllorhina* Hand, 1997, †*Palaeophyllophora* Revilliod, 1917, *Paracoelops* Dorst, 1947, †*Riversleigha* Hand, 1998, †*Vaylatsia* Sigé, 1990.

Common Names:

Czech: pavrápencovití, listonosovití. Dutch: Bladneusvleermuizen. English: Old-World leaf-nosed bat, Trident bats, Leaf-nosed bats. French: Hipposidéridés. German: Rundblattnasen. Italian: Ipposidèridi. Norwegian: Rundbladneser, falske hesteskoneser. Russian: Листоносы, Подковогубы, Ложные подковоносы. Vietnamese: Họ dơi mũi.

Similar Species:

Key characters for the genera:

Anthops - Head and body is about 50 mm, the tail is very short (less than half as long as the femur), and the forearm length is about 48 - 51 mm. The horseshoe-shape part of the nose leaf has two lateral leaflets, the inner one being quite small and the outer one large. Traces of a small frontal sac are present (Nowak, 1994: 115).

Asellia - Head and body length is about 46 - 62 mm, tail length is 18 - 27 mm (tail protruding up to 7 mm beyond interfemoral membrane), and forearm length is 45 - 52 mm. Posterior

component of noseleaf with three short, triangular projections. Only one upper premolar on each side, M^3 greatly reduced (two ridges) (Nowak, 1994: 114, Happold, 2013al: 357).
Aselliscus - Head and body length is about 38 - 45 mm, tail length is 20 - 40 mm (tail extends beyond the membrane, as in *Asellia*), and forearm length is 35 - 45 mm. The upper margin of the transverse noseleaf is divided into three points, and two lateral leaflets margin the horseshoe (Nowak, 1994: 116).
Coelops - Head and body length is 28 - 50 mm, the tail is extremely short or absent, and forearm length is 33 - 47 mm. Lateral leaflets are lacking on the noseleaf, or they are obscured by dense, stiff hairs (Nowak, 1994: 119).
Hipposideros - Head and body is about 35 - 100 mm, tail length is 18 - 70 mm, and forearm length is about 33 - 105 mm. Posterior component of noseleaf roughly elliptical in outline (although the outline of upper margin varies from almost flat to low-arched or even subtriangular), without three projections (Nowak, 1994: 111, Happold, 2013al: 357).
Paracoelops - Head and body length, 45 mm; tail absent, forearm length is about 42 mm. The nose leaf is horseshoe-shaped and surmounted by a round leaf with radial striations (Nowak, 1994: 119).

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
The Hipposideridae have been found from the Miocene of Songhor (Butler, 1969) and from the Mio-Pliocene of Morocco (Lavocat, 1961). The family goes back to the middle Eocene in Europe (Butler, 1978), where the genus *Palaeophyllophora* is considered to be the oldest representative (Ravel *et al.*, 2016: 412). Early Oligocene to recent in Arabia, early Miocene to recent in Africa, Pleistocene to recent in Asia, late Oligocene to recent in Australia (Hand and Kirsch, 1998). Because they are predominantly cave-dwelling bats, their remains are frequently preserved in Cenozoic limestone sediments (Happold, 2013al: 357). The earliest known *Hipposideros* is from the early Miocene, and the subgenus *Syndesmotis* (into which *H. megalotis* is sometimes placed) appears to have separated from *Hipposideros* in the middle Miocene (Happold, 2013al: 357). The fossils of Hipposideridae from the late Eocene and early Oligocene of France were already distinct from the Rhinolophidae that occurred in the same deposits (Lekagul and McNeely, 1977).

Based on phylogenetic analyses, Bogdanowicz and Owen (1998) suggest that the Hipposideridae probably originated somewhere in the Oriental region. In contrast, based on evidence from fossils, Hand and Kirsch (1998) suggest that the family originated in Australia.

Shi and Rabosky (2015: 1537) calculated the family-level stem and crown ages to be respectively 49.9 and 49.3 Mya.

BIOGEOGRAPHY:
The Hipposideridae diverged from the Rhinolophidae from a common ancestor in Africa approximately 42 Mya during the Eocene (Foley *et al.*, 2014: 320). While the family Rhinonycteridae separated from the other Hipposideridae approximately 39 Mya, also in Africa (Foley *et al.*, 2014: 320). The monophyletic *Hipposideros* clade diverged from other Hipposideridae approximately 31 Mya during the Oligocene in Africa (Foley *et al.*, 2014: 320). During the Miocene at about 15 Mya, *Hipposideros* diversified into distinct clades based on geography: these being the African, India and South East Asia clades (Foley *et al.*, 2014: 320).

DENTAL FORMULA:
$^{1123}/_{2123}$ = 30.
Except in *Asellia* and *Hipposideros megalotis*, which have a dental formula of $^{1113}/_{2123}$ = 28.

DETAILED MORPHOLOGY:
In their comparative study on bat brains, Bhatnagar *et al.* (2016) found that Hipposiderids stand apart from all other examined bats due to their relatively large adenohypophysis

HABITS:
Hipposiderids are often fly-catchers and gleaners but they also forage by slow-hawking, some to a greater extent than others (Happold, 2013al: 358). Unlike most rhinolophids, many hipposiderids forage in small groups (Happold, 2013al: 358).
Hipposiderids are unable to scuttle over the ground, and apparently cannot climb (Happold, 2013al: 358).

DIET:
Hipposiderids are insectivorous: the taxa and size of prey varies according to the size of the bat and the robustness of its teeth (Happold, 2013al: 358).

PARASITES:
Fain (1994: 1280) reports that the Hipposideridae are hosts for four genera of Myobiidae (Acari): *Hipposiderobia* with 12 species (parasiting on five genera of bats), *Metabinuncus* also with 12 species (occurring only on the genus *Hipposideros*), *Binunculoides* with one species on *Hipposideros*, and *Triaenomyobia*, with one species on *Triaenops*.

Genus ***Asellia*** Gray, 1838

*1838. *Asellia* Gray, Mag. Zool. Bot., Edinburgh, 2 (12): 493. Publication date: 1 February 1838. - Comments: Type species: *Rhinolophus tridens* E. Geoffroy Saint-Hilaire, 1813. - Etymology: From the Greek "*α*-" "alpha privative" and the Greek feminine substantive "*σέλλα*" (sélla), meaning "saddle", referring to the absence of a sella in the noseleaf (see Lanza *et al.*, 2015: 121). Palmer (1904: 124), however, mentions that *Asellia* is an adjective used as a noun, from the Latin "*asellus*", a little ass - probably in allusion to the long, pointed ears. (Current Combination)
1957. *Aseltia:* Harrison, Mammalia, 21 (1): 8. Publication date: March 1957. (Lapsus)
2008. *Ascidia:* Selim, Nahla, and Shelfeh, Tishreen Univ. J. Res. Sci. Stud. - Biol. Sci. Ser., 30 (1): 253. (Lapsus)

TAXONOMY:
Allen (1939a: 78) mentioned that *Asellia* was originally described as subgenus of *Hipposideros*.

Known species of the genus *Asellia*: †*vetus* Lavocat, 1961; ***arabica*** Benda, Vallo and Reiter, 2011; ***italosomalica*** de Beaux, 1931; ***patrizii*** de Beaux, 1931; ***tridens*** (E. Geoffroy St.-Hilaire, 1813).

COMMON NAMES:
Czech: trojzubcoví pavrápenci. English: Lesser Trident Bats, Trident Bats, Trident Leaf-nosed Bats. French: Tridents, Asellia, Chauve-souris à 3 endentures. German: Dreizackblattnasen. Italian: Asèllie.

Asellia italosomalica de Beaux, 1931

*1931. *Asellia tridens italo-somalica* de Beaux, Ann. Mus. civ. Stor. nat. Genova, 55: 190. Publication date: 6 June 1931. Type locality: Somalia: Oddur. Holotype: MSNG 30942: ♀, skin and skull. Collected by: N. Mosconi Brozzi; collection date: 1929. Presented/Donated by: ?: Collector Unknown. See Benda *et al.* (2011f: 266). - Etymology: From the feminine scientific Latin adjective *italosomalica*, meaning "inhabiting Italian Somalia, referring to country where the type specimens were collected (see Lanza *et al.*, 2015: 123)..
? *Asellia italosomalica:* (Current Combination)
? *Asellia tridens italosomalica:* (Alternate Spelling)

TAXONOMY:
Based on morphometric analyses and a K2P genetic distance of 12.3 to 13.7 % with other *Asellia* populations, Benda *et al.* (2011f: 262) distinguish *italosomalica* specimens from Socotra and Somalia as a different, well-defined taxon, which is best considered to be a separate species.

COMMON NAMES:
English: De Beaux's Trident Bat. German: Somalische Dreizackblattnase. Italian: Asèllia italosòmala.

GENERAL DISTRIBUTION:
Socotra, Somalia

Asellia patrizii de Beaux, 1931

*1931. *Asellia patrizii* de Beaux, Ann. Mus. civ. Stor. nat. Genova, 55: 186. Publication date: 6 June 1931. Type locality: Eritrea: Dancalia: Gaare [13 13 N 42 07 E]. Holotype: MSNG 13313: ♂, skull and alcoholic. Collected by: Marquis Saverio Patrizi Montoro; collection date: December 1912. Presented/Donated by: ?: Collector Unknown. See Benda *et al.* (2011f: 267). Paratype: MSNG 13314: ♀, skull and alcoholic. Collected by: Marquis Saverio Patrizi Montoro; collection date: December 1929. Presented/Donated by: ?: Collector Unknown. See Benda *et al.* (2011f: 267), who mention this specimen along with the holotype, but not explicity as "paratype". They do mention three further paratypes from the series: MSNG 33203, 33204 [S+B], 31315a, 31315b, collected at Attab (Eritrea), in July 1893 by G. Pestalozza and October 1906 by P. Felter. - Etymology: In honour of the Marquis Saverio Patrizi Nero Montoro (1902 - 1978), eminent Italian entomologist, biospeleologist and explorer, collector of zoological material especially in central and

eastern Africa, Sardinia and eastern Mediterranean countries (see Lanza *et al.*, 2015: 128). (Current Combination)

TAXONOMY:
See Simmons (2005).

COMMON NAMES:
Czech: pavrápenec eritrejský. English: Patrizi's Lesser Trident Bat, Patrizi's Trident Leaf-nosed Bat. French: Trident de Patrizi, Asellia de Patrizi. German: Patrizis Dreizackblattnase. Italian: Asèllia di Patrìzi.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, tolerance of a degree of habitat modification, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008a; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2008a; IUCN, 2009). 2004 - VU D2 ver 3.1 (2001) (Mickleburgh *et al.*, 2004ad; IUCN, 2004). 1996 - VU (Baillie and Groombridge, 1996).

MAJOR THREATS:
There is very little information, but roost disturbance is a possible threat. However, the species is associated with habitats that are not under significant threat, and has been found in buildings, and so can adapt to human presence (Mickleburgh *et al.*, 2008a; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008a) suggest surveys are needed to determine the distribution of this species, both in northeastern Africa and in the Arabian Peninsula.
Has been recorded from Awash National Park (Hill and Morris, 1971).

GENERAL DISTRIBUTION:
This species has a restricted known range in northeastern Africa, from central Ethiopia north to Eritrea (Yalden *et al.*, 1996), and also from islands in the Red Sea including Farasan Island and Segid Island (=As-Saqid) of southwestern Saudi Arabia (Moeschler *et al.*, 1990; Harrison and Bates, 1991: 316; Horácek *et al.*, 2000). It probably occurs more widely in this poorly explored region (Mickleburgh *et al.*, 2008a).

Native: Eritrea (Yalden *et al.*, 1996); Ethiopia (Yalden *et al.*, 1996); Saudi Arabia (Moeschler *et al.*, 1990; Harrison and Bates, 1991: 316; Horácek *et al.*, 2000).

HABITAT:
Dry open terrain such as the semi-desert grassland of the Awash National Park (Hill and Morris, 1971).

ROOST:
It roosts in caves and buildings and in dry open terrain such as the semi-desert grassland of the Awash National Park (Hill and Morris, 1971).

POPULATION:
Structure and Density - Appears to be rare with small roosts. There is a possibility that it will be found in larger roosts, but to date none have been found (Mickleburgh *et al.*, 2008a; IUCN, 2009).
Trend - 2008 - Unknown (Mickleburgh *et al.*, 2008a; IUCN, 2009). 2004 - Decreasing (Mickleburgh *et al.*, 2004ad; IIUCN, 2004).

ACTIVITY AND BEHAVIOUR:
It flies close to the ground catching insects (Mickleburgh *et al.*, 2008a; IUCN, 2009).

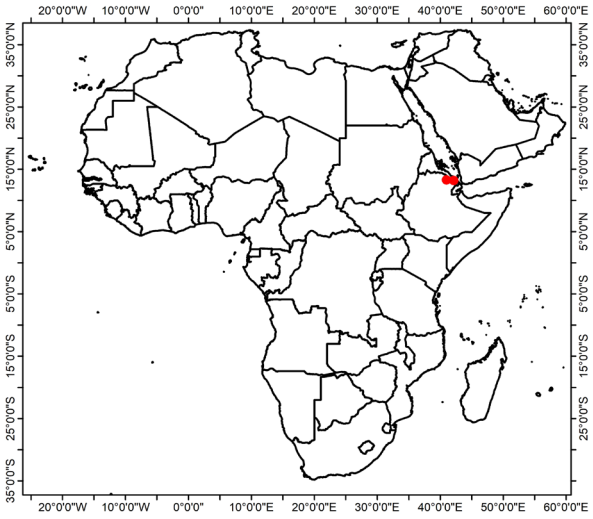

Figure 50. Distribution of *Asellia patrizii*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Eritrea, Ethiopia.

Asellia tridens (E. Geoffroy St.-Hilaire, 1813)

*1813. *Rhinolophus tridens* E. Geoffroy Saint-Hilaire, Ann. Mus. Hist. nat. Paris, 20: 260, pl. 5. Publication date: 1813. Type locality: Egypt: Qena province: Luxor, near [ca. 25 41 N 32

39 E] [Goto Description]. Syntype: MNHN A.235: ad ♂, alcoholic (skull not removed). Number 187 in Rode (1941: 240), who mentions this specimen as holotype. Furthermore, he remarks that the skull is not removed, so the skull in the atlas, pl. IV, fig. 2, 2', 2" does not correspond to any of the skins in the collection. See also Qumsiyeh (1985: 41). Benda *et al.* (2011f: 267) mention MNHN 1986-1068 as lectotype and indicate this is collected by E. Geoffroy Saint-Hilaire. Syntype: MNHN A.237: ad ♀, alcoholic (skull not removed). Number 187a in Rode (1941: 240), who considers this to be an allotype. - Comments: Grubb *et al.* (1998: 82) mention p. 265. Kock (1969a: 122), Corbet and Hill (1992: 116) and Horácek *et al.* (2000: 98) only mention "Egypt" as type locality. Kock (1969a: 122) also indicates that E. Geoffroy Saint-Hilaire (1818: 127) restricted the type locality to "Grab der Könige (=Theben, Luxor)".

1855. *Ph[yllorhina] tridens:* Giebel, Die Säugethiere., 987. (Name Combination)

1881. *Phyllorhina tridens murraiana* Anderson, Catalogue of the Mammals in the Indian Museum, vol. I: 113. Type locality: Pakistan: Sind: Karachi [24 51 N 67 02 E].

1918. *Asellia tridens diluta* K. Andersen, Ann. Mag. nat. Hist., ser. 9, 2 (10): 375. Publication date: 1 October 1918. Type locality: Algeria: Algerian Sahara: El Golea [30 35 N 02 53 E] [Goto Description]. Holotype: BMNH 1912.11.14.2: ♀. Collected by: Dr. Ernst Johnann Otto Hartert; collection date: 16 May 1912; original number: 42. Presented/Donated by: Nathanial Charles Rothschild. See Andersen (1918: 379).

1937. *Asellia tridens pallida* Laurent, Mammalia, 1: 111, fig. 8. Type locality: Morocco: Anti Atlas: Oued Tata [=Tata] [29 44 N 07 56 W] [Goto Description].

2008. *Ascidia tridens:* Selim, Nahla, and Shelfeh, Tishreen Univ. J. Res. Sci. Stud. - Biol. Sci. Ser., 30 (1): 253. (Name Combination, Lapsus)

? *Asellia tridens murraiana:* (Name Combination)

? *Asellia tridens tridens:* (Name Combination)

? *Asellia tridens:* (Current Combination)

TAXONOMY:
Simmons (2005: 366) recognises three subspecies *A. t. diluta* Andersen, 1918 [see discussion below]; *A. t. italosomalica* De Beaux, 1931; and *A. t. murraiana* Anderson, 1881.
Simmons (2005: 366) assigned *A. tridens diluta* to J. Anderson (1881), which would make this form Asian. However, no description is found in J. Anderson's publication, but a description is found in Andersen (1918: 379) as is confirmed by Owen and Qumsiyeh (1987 334), who mention "Andersen, 1918" as author.

Owen and Qumsiyeh (1987: 335) did not examine any specimens from *A. t. italosomalica* De Beaux, 1931, but Benda *et al.* (2011f: 261) consider *italosomalica* to be a separate species, a view that is followed here.

COMMON NAMES:
Arabian: Khaffash. Czech: pavrápenec trojzubcový, wrápenec trojzeykowý, listonos trojzubcový. Dutch: Drietandbladneusvleermuis. English: Geoffroy's Lesser Tident Bat, Trident Leaf-nosed Bat, Trident bat, Trident Rhinolophe. French: Trident du désert, Asellia à trois endentures, Chauve-souris trident, Trident, Rhinolophe trident. German: Dreizackblattnase, Geoffroys Dreizackblattnase, Dreyzahnige Kammnase. Hebrew: pasafon, Parsafon.

ETYMOLOGY OF COMMON NAME:
So named because of the three-pronged process at the top of the nose-leaves and noticeably short ears (Taylor, 2005).

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Kock *et al.*, 2008b; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Kock *et al.*, 2008b; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2004l; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
The main threat is the widespread use of pesticides against locusts, while human disturbance in caves and old buildings is affecting some populations (Kock *et al.*, 2008b; IUCN, 2009).

Besides water stress and their aerial hawking feeding style, roosting in caves and trees is an important risk factor linked with climatic change (Sherwin *et al.*, 2012: 174).

CONSERVATION ACTIONS:
Kock *et al.* (2008b) [in IUCN (2009)] suggest underground roost management is needed in some places and a study on the impacts of pesticides is required, especially ways in which the impact might be minimised.

It presumably occurs in several protected areas (Kock *et al.*, 2008b; IUCN, 2009).

GENERAL DISTRIBUTION:
Asellia tridens ranges widely in the Sahara, through the Arabian Peninsula and the Middle East, to Afghanistan, Pakistan, and India. It is absent from the northern parts of Morocco and Algeria, and Tunisia, and occurs south to Ethiopia and Somalia.

Native: Afghanistan; Algeria (Kowalski and Rzebik-Kowalska, 1991: 64); Burkina Faso (Kangoyé *et al.*, 2015a: 607); Chad; Djibouti; Egypt; Eritrea; Ethiopia (Lavrenchenko *et al.*, 2004b: 147); Gambia (Kock *et al.*, 2002: 86); India (Senacha and Dookia, 2013: 21); Iran, Islamic Republic of; Israel; Libyan Arab Jamahiriya; Mali; Mauritania (Brito *et al.*, 2010: 453, Allegrini *et al.*, 2011: 2); Morocco (Aulagnier and Thevenot, 1986: 38; Benda *et al.*, 2010a: 157; El Ibrahimi and Rguibi Idrissi, 2015: 360); Niger; Oman; Pakistan; Saudi Arabia; Senegal; Sudan; Syrian Arab Republic; Tunisia (Horácek *et al.*, 2000: 99); Western Sahara.

Presence uncertain: Iraq; Kuwait; Lebanon; Qatar; United Arab Emirates.

A record from Zanzibar (Peters, 1871) has never been confirmed (though often repeated) and may be a MNHN mislabelled specimen. Records from Socotra and Somalia are now considered to belong to *A. italosomalica* (see Benda *et al.*, 2011f).

DETAILED MORPHOLOGY:
Brain:
Adult hippocampal neurogenesis was studied by Chawana R. *et al.* (2016: 1551).

ECHOLOCATION:
Search-phase call-shape: CF/FM. CF component is sometimes of very low amplitude, but is always present (Pye, 1972). For 11 Egyptian bats, the CF-frequency varied from 115 - 120 kHz; each individual emitted a narrow range of frequencies, and different individuals emitted different ranges of frequencies (ibid.). For 18 Tunisian bats, resting, CF-frequency: 111 - 124 kHz (the CF-frequency varied from bat to bat, individuals kept the frequency constant); band-width of terminal FM component: 19-21 kHz; call-duration 7 - 10 ms; minimum intercall interval 27 - 215 ms (depending on degree of alertness) (Gustafson and Schnitzler, 1979). Flying bats lowered their emission frequency to compensate for Doppler shifts caused by the flight movement; call-duration: 9 - 11 ms; minimum intercall interval: 26 ms. For bats in a roost in Gambia containing thousands of individuals, CF-frequency: 108 - 122 kHz (frequency found to be negatively correlated with FA length within sexes); lowest frequency of the terminal FM sweep: 97 kHz: call-duration: 7.5 - 9 ms, inter-call interval: 10 - 20 ms (Jones *et al.*, 1993). In the UAE, Davis (2007: 5) reports a CF-frequency with an FM-ending (117 - 124 kHz).

Benda *et al.* (2012a: 182) provide two sets of data for Iranian *A. tridens*: **1**: F_{start}: 118.4 ± 0.6 (117.5 - 119.0) kHz, F_{end}: 117.1 ± 0.6 (116.3 - 118.0) kHz, F_{peak}: 117.9 ± 0.6 (117.0 - 118.5) kHz, duration: 10.3 ± 2.1 (6.8 - 13.1) msec, and interpulse interval: 32.3 ± 15.7 (13.4 - 55.9) msec; **2** (with bat in resting position): F_{start}: 122.3 ± 0.4 (121.7 - 122.8) kHz, F_{end}: 119.7 ± 4.1 (112.5 - 123.0) kHz, F_{peak}: 122.0 ± 0.4 (121.3 - 122.6) kHz, duration: 9.0 ± 0.4 (8.4 - 9.3) msec, and interpulse interval: 28.0 ± 7.7 (19.3 - 38.4) msec.

From Israel, the following values were reported by Hackett *et al.* (2016: 223) for 56 calls: Pulse duration: 7.97 ± 0.29 msec, F_{start}: 117.74 ± 12.58 (114.2 - 121) kHz, F_{end}: 106.96 ± 10.44 (96.6 - 101.91) kHz, F_{peak}: 116.60 ± 10.69 (107.4 - 120.1) kHz.

Jones and Siemers (2010: 449 - 450) indicate that females emit pulses with a higher frequency than males, and also that juveniles emit lower frequencies than adults (see also Jones *et al.*, 1993; Kunz and Hood, 2000: 420).

MOLECULAR BIOLOGY:
DNA - Unknown.
Karyotype - Baker *et al.* (1974) reported 2*n* = 50, FN = 62, a submetacentric X chromosome and an acrocentric Y chromosome. Baker et al. (1975) reported BA = 14.
Protein / allozyme - Unknown.

Bray and Benda (2016: 283) studied concatenated fragments of Cytochrome-*b*, NADH Dehydrogenase 2, and Cytochrome Oxidase 1 genes of primarily Saudi-Arabian bats, but also covered African representatives.

HABITAT:
Arid and semi-desert habitats.

HABITS:
This is a gregarious and colonial species (Kock *et al.*, 2008b).

ROOST:
It roosts in temples, caves, mines, open-wells, underground irrigation tunnels and old tombs and buildings and in the desert and semi desert vegetation zones it occurs in crevices or in cliffs (Kock *et al.*, 2008b). From Israel, Amichai *et al.* (2012: 96 - 97) report they use abandoned man-made structures (such as military bunkers), where the sexes are initially roosting separately. Later on (October), when their young become independent, this sexual segregation weakens.

MIGRATION:
In the Dakhla Oasis in Egypt, Benda *et al.* (2014b: 55) found *A. tridens* to be the most common bat during the summer months until the beginning of October, with at least 5,000 individuals divided over several roosts. However, from November to the beginning of April, these roosts were empty (except for a few single animals). In that period, only small colonies were found (70 - 120 ind.), and no animals were observed during the night. Benda *et al.* (2014b) were unable to determine whether the bats disappeared to the Nile Valley (long-distance migration) or whether they moved over short distances to other roosts in the neighbourhood, although there is some evidence that the latter is the case.

DIET:
Amichai *et al.* (2012: 101) report its diet in Israel to consist primarily of Coleoptera and Heteroptera, whereas Lepidoptera, Hymenoptera, Diptera were important additions in different parts of the country. In Iran, Benda *et al.* (2012a: 265) report that Coleoptera - mostly Scarabaeidae, but also Cerambycidae and Curculionidae were dominatingly present, but another faecal sample was dominated by Blattodea. The most frequent representatives of Heteroptera in the diet samples collected on both occasions were bugs of the family Tingidae.

In Libya, Benda *et al.* (2014c: 37) examined the digestive tract of one bat and found it contain 80 % (by volume) Coleoptera (Scarabeidae) and 20 % of Hymenoptera (Formicoidea).

Benarbia and Fentrouci (2017: 44) found the following items in droppings of *A. tridens* in Algeria: Arachnida: Aranea: Araneidae: *Aranea* sp. Ind1; Insecta: Coleoptera: Carabidae: *Megacephala australis*; Chrisomilidae: *Chrisomelida* sp.; Curculionidae: *Curculionida* sp., *Phyllognatnus* sp.; Anthicidae: *Anthicidae* sp. / *Anthicus* sp.; Carabidae: *Cicindella* sp.; Tenebrionidae: *Akis* sp.; Aphodiidae: *Aphodius* sp.; Blatidae: *Blatida* sp.; Hymenoptera: Formicidae: *Messor* sp., *Cataglyphis* sp., *Myrmecina* sp., *Formica* sp.; Vespoidae sp.; Orthoptera: Gryllidae: *Gryllus* sp.; *Ensiphera* sp.; Orthoptera sp.; Odonatoptera; Diptera: Tabanidae sp; Ephemeroptera sp., and Plantea: Planta: Arecaceae: *Phoenix dactilifera*.

POPULATION:
Structure - Unknown.
Density - It is a very common species, found in colonies of up to several hundred in North Africa, and in its Asian distribution it has been found in groups up to 5,000 animals (Kock *et al.*, 2008b; IUCN, 2009).
Trend - 2008 - Stable (Kock *et al.*, 2008b; IUCN, 2009). 2004 - Unknown (Mickleburgh *et al.*, 2004l; IUCN, 2004). *A. tridens* populations within the Asia Minor and Levant region are predicted to have a stable population trend, under climate change scenarios (Bilgin *et al.*, 2012: 433).

ACTIVITY AND BEHAVIOUR:
Forages over desert and semi-desert vegetation zones, mainly in oases (Kock *et al.*, 2008b). Forages by slow hawking, has been observed foraging around palm trees and buildings, and over water (Kock *et al.*, 2008b).

REPRODUCTION AND ONTOGENY:
Amichai *et al.* (2012: 96) report that almost all females arrive in their summer roosts in Israel at an advanced stage of pregnancy, and that births take place between the end of June and mid July. There is one young, which is born hairless, with closed eyes and weighting up to 30 % (2.5 - 3 g) of its mother's weight. In the United Arab Emirates, Davis (2007: 5) found females to be pregnant in April-May, and giving birth in June after a gestation period of about 9 to 10 weeks. The lactation period lasts for 40 days.

Intrauterine ultrasonography of pregnant females performed by Amichai *et al.* (2019: 1) showed that the development of the horseshoe is completed (100%) *in-utero*, whereas skull (70%) and forearm (40%) development continues after birth. Neonates already begin emitting precursor echolocation calls two days after birth, and they are able to fly three weeks after birth.

PARASITES:
ACARI:
Trombiculidae: *Neoschoengastia elegans* (Vercammen-Grandjean, Rohde and Mesghali, 1970) from Iran. *Myotrombicula aselliae* Vercammen-Grandjean, 1963, *Riedlinia platypygia* Vercammen-Grandjean, 1963, and *R. afghanensis* Vercammen-Grandjean, 1963, all three from Afghanistan (Benda *et al.*, 2012a: 266-267).
Myobiidae: *Ugandobia euthrix* Fain, 1972 from Saudi Arabia (Fain 1972 [in Benda *et al.*, 2012a:

267]) and *Hipposiderobia heteronycha* (Berlese et Trouessart, 1889) from Saudi Arabia and various parts of Africa (Radford 1949, Fain 1972, 1978 [in Benda *et al.*, 2012a: 267]).
Argasidae: *Argas boueti* Roubaud et Colas-Belcour, 1933 from various countries in Africa (Roubaud & Colas-Belcour 1933, Hoogstraal 1955 [in Benda *et al.*, 2012a: 267]).

DIPTERA:
Streblidae: *Raymondia huberi* Frauenfeld, 1856 from Tanzania (Haeselbarth *et al.*, 1966: 102), and Iran (Benda *et al.*, 2012a: 266) (see also Shapiro *et al.*, 2016: 254). *Raymondia setosa* Jobling, 1930 from Israel (Haeselbarth *et al.*, 1966: 104).
Nycteriibidae: *Nycteribia schmidlii* Schiner, 1853 from the Levant (Benda *et al.*, 2012a: 266). *Nycteribia (Listropoda) schmidlii schmidlii* Schiner, 1853 and *Penicillidia (Penicillidia) dufourii* Westwood, 1835 were reported by Bendjeddou *et al.* (2017: 15) from Algeria.
Hippoboscidae: *Penicillidia dufourii* Westwood, 1834 from the Levant (Benda *et al.*, 2012a: 266). *Brachytarsina flavipennis* Macquart, 1851 from the Levant (Benda *et al.*, 2012a: 266).

SIPHONAPTERA:
Ischnopsyllidae: *Chiropteropsylla brockmani* Rothschild, 1915 from Iran and Iraq (Benda *et al.*, 2012a: 266). *Rhinolophopsylla unipectinata* (Taschenberg, 1880) from Iraq (Benda *et al.*, 2012a: 266).

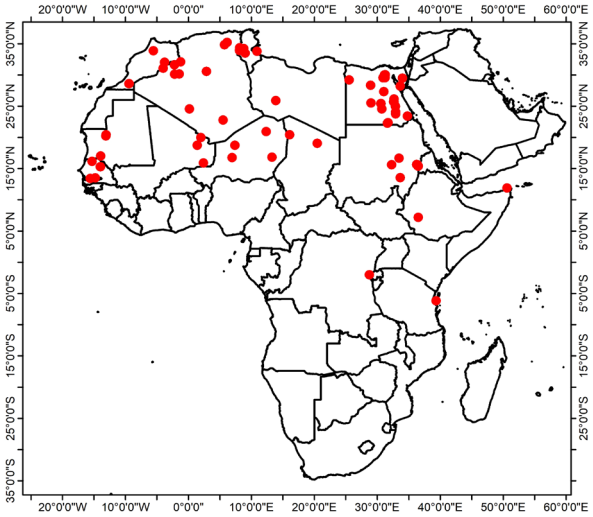

Figure 51. Distribution of *Asellia tridens*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Algeria, Burkina Faso, Chad, Congo (Democratic Republic of the), Egypt, Ethiopia, Libya, Mali, Mauritania, Morocco, Niger, Saudi Arabia, Senegal, Somalia, Sudan, Tanzania, The Gambia, Tunisia.

Genus ***Doryrhina*** Peters, 1871

*1871. *Doryrhina* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, 314. Publication date: 1871 [Goto Description]. - Comments: Grubb *et al.* (1998: 79) mention p. 324. Type species: *Phyllorrhina cyclops* Temminck, 1853, by monotypy (see Decher and Fahr, 2005: 1; Jackson and Groves, 2015: 246).. - Etymology: From the Greek "*δόρυ*", meaning spear and "*ρινός*", meaning nose, referring to the club-shaped process which is directed forward from the base of the sella, or to the slender and somewhat longer vertical process which projects upward from the margin of the transverse erect nose leaf (see Palmer, 1904: 244).

TAXONOMY:
Generally considered a synonym of the genus *Hipposideros*, but based on Cyt-*b* analyses, Foley *et al.* (2017: 12) considered *cyclops* to be that different from the other members of this genus to be placed in a separate genus.

Due to the generally recognized close relation between *cyclops* and *camerunensis*, Musila *et al.* (2018a: 21) provisionally placed the latter in the genus *Doryrhina*, but they also indicated that this still needs to be confirmed.

MOLECULAR BIOLOGY:
Karyology -
The genus *Hipposideros* s.l. shows an extreme conservatism concerning the 2*n* complement. Almost all species have 32 chromosomes. The only exceptions are the species transferred by Foley *et al.* (2017) to the genus *Macronycteris*, which have 52, and *cyclops*, which has 2*n* = 36.

Doryrhina cyclops (Temminck, 1853)

*1853. *Phyllorrhina cyclops* Temminck, Esquisses zoologiques sur la Côte de Guiné. 1e partie, les Mammifères, 75. Publication date: 1853. Type locality: Ghana: Boutry River [=Butre river] [ca. 04 49 N 01 55 W] [Goto Description]. - Comments: Type locality originally: "sur la rivière Boutry, côte de Guiné". - Etymology: Refers to the one-eyed giants of Greek

mythology and alludes to the orifice in the center of the forehead of these bats (see Rosevear, 1965 in Decher and Fahr, 2005: 4).

1897. *Rhinolophus micaceus* de Winton, Ann. Mag. nat. Hist., ser. 6, 20 (120): 524. Publication date: 1 December 1897. Type locality: Gabon: 75 mi (112.5 km) from Gaboon: Como River [Goto Description]. Holotype: BMNH 1897.12.1.7: ♀. Collected by: George Latimer Bates Esq. Collection date: 6 July 1897; original number: GLB 230. Note: Smoked out of hollow tree.

1899. *Hipposideros cyclops:* de Winton, Ann. Mag. nat. Hist., ser. 7, 4 (23): 354. Publication date: 1 November 1899. (Name Combination)

1917. *Hipposideros langi* J.A. Allen, Bull. Am. Mus. Nat. Hist., 37 (18): 434, text-fig. 4 - 6. Publication date: 29 September 1917. Type locality: Congo (Democratic Republic of the): Oriental province: Avakubi [01 18 N 27 32 E] [Goto Description]. Holotype: AMNH 49098: ad ♂, skin and skull. Collected by: Herbert Lang, James Paul Chapin and The American Museum Congo Expedition; collection date: 24 January 1914; original number: 2481.

1922. *H[ipposideros]. cyclops micaceus:* J.A. Allen, Bull. Am. Mus. Nat. Hist., 47: 2, footnote. (Name Combination)

1922. *Hipposideros cyclops langi:* J.A. Allen, Bull. Am. Mus. Nat. Hist., 47: 2, footnote. (Name Combination)

2017. *Doryrhina cyclops:* Foley, Goodman, Whelan, Puechmaille and Teeling, Acta Chiropt., 19 (1): 12. Publication date: June 2017. (Current Combination)

TAXONOMY:
Simmons (2005: 370) includes this taxon in the *Hipposideros cyclops* species group. See Decher and Fahr (2005, Mammalian Species, 763), but see also Foley *et al.* (2017: 12), who transferred it to the genus *Doryrhina*.

COMMON NAMES:
Chinese: 大眼蹄蝠. Czech: pavrápenec Kyklop. English: Cyclops Leaf-nosed Bat, Cyclops Roundleaf Bat, Cyclops Bat. Fang: angon. French: Phyllorine des Cyclopes, Phyllorine cyclope. German: Zyklopen-Rundblattnase, Zyklossen-Blattnase.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008bw; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2008bw; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2004cn; IUCN, 2004). 1994 - LR/lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
Although not threatened throughout its range, the species may disappear from many areas that are threatened by deforestation, especially on the extreme limits of its distribution (Decher and Fahr, 2005).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008bw) [in IUCN (2009)] report that the roosting habits of this bat requires very large hollow trees, so conservation of these must be a priority. It is found in some protected areas, for example Kwamgumi Forest Reserve in Tanzania, and the Udzungwa Mountains National Park of Tanzania.

GENERAL DISTRIBUTION:
Doryrhina cyclops has been recorded widely over much of West Africa and Central Africa, with a few scattered records from East Africa. It ranges from Senegal and The Gambia in the west, through most countries in West Africa, to Cameroon, Equatorial Guinea (Rio Muni and Bioko), Gabon, Congo (The Democratic Republic of the) Congo, Central African Republic and Rwanda, being recorded from East Africa in southern Sudan, Uganda and western Kenya, with an isolated population in southeastern Kenya and northeastern Tanzania in coastal forests and Eastern Arc Mountains (Decher and Fahr, 2005: 3). It has been collected at Tongwe Forest near Tanga and Kwamgumi Forest Reserve in Tanzania (K. Howell *pers. comm.* 2004). There is a dubious record from the border area of Chad and the Central African Republic. It occurs from sea-level up to at least 1,000 m.

Native: Benin; Burkina Faso (Kangoyé *et al.*, 2012: 6024; 2015a: 608); Cameroon (Hill, 1968; Eisentraut, 1973); Central African Republic (Lunde *et al.*, 2001); Congo (Bates *et al.*, 2013: 335); Congo (The Democratic Republic of the); Côte d'Ivoire; Equatorial Guinea (Bioko); Gabon; Gambia; Ghana (Decher and Fahr, 2007: 17); Guinea; Guinea-Bissau (Veiga-Ferreira, 1949;

Lopes and Crawford-Cabral, 1992; Rainho and Ranco, 2001: 52); Kenya (Aggundey and Schlitter, 1984); Liberia; Nigeria (Happold, 1987); Rwanda; Senegal; Sierra Leone; Sudan; Tanzania (Decher and Fahr, 2005: 3; Stanley *et al.*, 2005b), United Republic of; Togo; Uganda.
Presence uncertain: Burundi; Chad.

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
From western Uganda, Monadjem *et al.* (2011: 30) reported the following data for 6 specimens: Fa: 70.63 ± 1.942 mm, mass: 37.3 ± 3.27 g, wing loading: 11.5 ± 0.53 N/m^2, aspect ratio: 5.5 ± 0.46.

DETAILED MORPHOLOGY:
Baculum - Unknown
Brain - Amrein *et al.* (2007) reported from specimens collected in Bénin that proliferating cells, detected with Ki-67 and MCM2, in the subgranular layer of the dentate gyrus were found to be absent. They also reported moderate to ample proliferating cells (Ki-67 positive cells) and migrating young neurons (DCX positive cells) in the rostral migratory stream. No NeuroD was detected in the hippocampal granule cells (Amrein *et al.*, 2007).

SEXUAL DIMORPHISM:
Decher and Fahr (2005) [in Kangoyé *et al.* (2015a: 608)] indicate that a pronounced sexual dimorphism exists, with females being larger than males.

ECHOLOCATION:
Monadjem *et al.* (2013b: 351) report a F_{max} of 55.5 (55 - 56) kHz for two specimens from Mount Nimba.

From western Uganda, Monadjem *et al.* (2011: 32) report the following values for 6 calls: F_{min}: 51.24 ± 0.670 kHz, F_{max}: 51.54 ± 0.387 kHz, F_{char}: 51.37 ± 0.459 kHz, F_{knee}: 51.51 ± 0.395 kHz, duration: 14.5 ± 2.02 msec.

In Sierra Leone, Weber *et al.* (2019: 21) reported on two females calling at 54.5 (54.0 - 55.0) kHz.

MOLECULAR BIOLOGY:
DNA - See Hoofer and Van Den Bussche (2003).
Karyotype - Koubínová *et al.* (2010b) report for one female from Senegal, 2*n*= 36, Fna= 62 (as "*Hipposideros cyclops*") , while the chromosomal complement comprised 15 metacentric or submetacentric, and three small acrocentric pairs.
Protein / allozyme - Unknown.

HABITAT:
Monadjem *et al.* (2016y: 365) recorded it from two forested sites in the Mount Nimba area, between 480 and 730 m.

ROOST:
Killick-Kendrick (1973: 641) reported on pygmy flying squirrels (*Idiurus macrotis* Miller, 1898) collected from hollow trees, which were associated with "*Hipposideros cyclops*".

POPULATION:
Structure and Density - It is a reasonably common species in some areas (Mickleburgh *et al.*, 2008bw; IUCN, 2009).
Trend - 2008 - Decreasing (Mickleburgh *et al.*, 2008bw; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
One female, carrying a furred female infant, was captured in December 2005 at Uzungwa Scarp Forest Reserve, Tanzania (Trentin and Rovero, 2011: 50).

Two lactating females were reported on 26 and 28 May from Sierra Leone by Weber *et al.* (2019: 24).

PARASITES:
HAEMOSPORIDA:
Schaer *et al.* (2013a: 17416) report the presence of the hemosporidian parasite *Plasmodium cyclopsi* Landau and Chabaud, 1978 in three out of four investigated bats. Up until now, *Macronycteris cyclops* is the only known host species for this parasite. Lutz *et al.* (2016: 9) examined three *M. cyclops* specimens from East Africa and found all of them infected with *Nycteria* sp.
Perkins and Schaer (2016: Suppl.) also mention *Dionisia bunoi* Landau, Chabaud, Miltgen and Baccam, 1980 from bats from Gabon, *Nycteria* sp. from Uganda, *Plasmodium cyclopsi* from Gabon and Liberia.
Landau *et al.* (1980a: 272), furthermore, mentioned a third atypical hematozoon: *Trypanosoma lizae* Miltgen and Landau, 1979.

DIPTERA:
Streblidae: *Raymondia brachyphysa* Jobling, 1956 from Abidjan, Côte d'Ivoire (Haeselbarth *et al.*, 1966: 102; Shapiro *et al.*, 2016: 254). *Raymondia intermedia* Jobling, 1936 in Côte d'Ivoire (Haeselbarth *et al.*, 1966: 102).

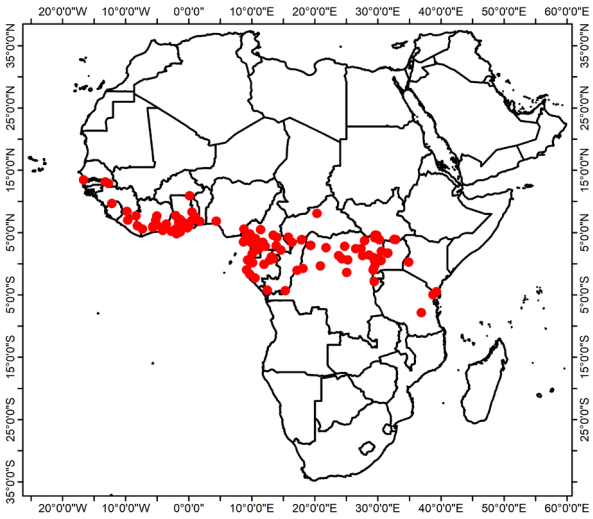

Figure 52. Distribution of *Doryrhina cyclops*

DISTRIBUTION BASED ON VOUCHER SPECIMENS: "Africa", Benin, Burundi, Cameroon, Central African Republic, Congo, Congo (Democratic Republic of the), Côte d'Ivoire, Equatorial Guinea, Gabon, Ghana, Guinea, Kenya, Liberia, Nigeria, Senegal, Sierra Leone, South Sudan, Tanzania, The Gambia, Togo, Uganda.

Genus ***Hipposideros*** Gray, 1831

*1831. *Hipposideros* Gray, Zool. Misc., 1: 37. Publication date: 1831. - Comments: Type species: *Vespertilio speoris* Schneider, 1800, by subsequent designation by Sclater (1901: 166) (see Meester *et al.*, 1986: 41; Jackson and Groves, 2015: 245). - Etymology: From the Greek "*ἵππος*", meaning horse and "*σίδηρος*", meaning iron (=horse-iron, horseshoe), an allusion to the shape of the noseleaf (see Palmer, 1904: 327). (Current Combination)

1831. *Phyllorrhina* Bonaparte, Icon. Fauna Ital.. - Comments: *Nomen nudum* (see Palmer, 1904: 535).

1834. *Hipposiderus* Gray, Proc. zool. Soc. Lond., 1834, II (xviii): 53. Publication date: 26 September 1834. - Comments: Unjustified emendation (see Meester *et al.*, 1986: 41; Pavlinov *et al.*, 1995: 84; Decher and Fahr, 2005: 1; Jackson and Groves (2015: 245). Blanford (1888: 638) claims the name *Hipposiderus* was published by Gray (1831: 37), but this is in error. (Emendation)

1837. *Phyllorhina:* Bonaparte, Iconografia Fauna italiana, 1, fasc. 21: 3. Publication date: 1837. - Comments: Type species: *Rhinolophus diadema* E. Geoffroy Saint Hillaire, 1813. Preoccupied by *Phyllorhina* Leach, 1816 (see Pavlinov *et al.*, 1995: 84; although they do not explicitly mention its preoccupation), although also see Fenton and Rautenbach (1998: 535), who refers to Bonaparte (1837) to refute this. Fenton and Rautenbach (1998: 535) and Allen (1939a: 79) indicated that it was described as a subgenus of *Rhinolophus*. - Etymology: From the Greek "*φύλλον*", meaning leaf and "*ρίς*" or "*ρινος*", meaning nose, referring to the nose-leaf (see Palmer, 1904: 535).

1837. *Phyllorrhina* Bonaparte, Icon. Fauna Ital., 1, fasc. 21: 3. - Comments: Type species: *Rhinolophus diadema* É. Geoffroy, 1813, by subsequent designation by Sclater (1901: 116) (see Decher and Fahr, 2005: 1; Jackson and Groves, 2015: 245).

1866. *Chrysonycteris* Gray, Proc. zool. Soc. Lond., 1866, I (vi): 82. Publication date: May 1866. - Comments: Type species: *Hipposideros fulvus* Gray, 1838, by monotypy (see Decher and Fahr, 2005: 1; Jackson and Groves, 2015: 246). - Etymology: From the Greek "*χρυδός*", meaning gold and "*νυκτερις*", meaning bat, referring to the briljant golden yellow fur (see Palmer, 1904: 189).

1866. *Gloionycteris* Gray, Proc. zool. Soc. Lond., 1866, I (vi): 82. Publication date: May 1866. - Comments: Type species: *Rhinolophus armiger* Hodgson, 1835, by monotypy (see Decher and Fahr, 2005: 1; Jackson and Groves, 2015: 246). - Etymology: From the Greek "*γλοιός*", meaning gum and "*νυκτερις*", meaning bat, referring to the large glandular elevations on the sides of the forehead (see Palmer, 1904: 297).

1866. *Rhinophylla* Gray, Proc. zool. Soc. Lond., 1866, I (vi): 82. Publication date: May 1866. - Comments: Type species: *Phyllorrhina labuanensis* Tomes, 1859, by monotypy (see Jackson and Groves, 2015: 246). Preoccupied by *Rhinophylla* Peters, 1865 (Chiroptera, Phyllostomidae) (see Pavlinov *et al.*, 1995: 84).

1866. *Speorifera* Gray, Proc. zool. Soc. Lond., 1866, I (vi): 82. Publication date: May 1866. - Comments: Type species: *Rhinolophus vulgaris* Horsfield, 1823 (=*Rhinolophus larvatus* Horsfield).

1871. *Cyclorhina* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, 326. Publication date: 1871. - Comments: Type species: *Phyllorrhina obscura* Peters, 1861 and *Phyllorrhina doriae* Peters, 1871. Meester *et al.* (1986: 42) retain only *Phyllorhina obscura* Peters as type species, by subsequent designation by Moreau *et al.* (1946: 208), Tate (1941a: 354), Corbet and Hill (1992: 105) (see Jackson and Groves, 2015: 246). Not *Cyclorhina* J. Hall and Clarke, 1894 (Brachiopoda, Rhynchonellata, Rhynchonellida, Machaerariidae) (see Jackson and Groves, 2015: 246). - Etymology: From the Greek "*κύκλος*", meaning circle, and "*ρις*" or "*ρινός*", meaning nose (see Palmer, 1904: 208).

1871. *Ptychorhina* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, 325. Publication date: 1871. - Comments: Type species: *Rhinolophus caffer* Sundevall, 1846, by monotypy (according to Decher and Fahr, 2005: 1) or by subsequent designation by Palmer (1904: 597) (according to Jackson and Groves, 2015: 246).

1871. *Sideroderma* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, 324. Publication date: 1871. - Comments: Type species: *Phyllorrhina fuliginosa* Temminck, 1853, by monotypy (see Decher and Fahr, 2005: 1; Jackson and Groves, 2015: 246). - Etymology: From the Greek "*σίδηρος*", meaning iron and "*δέρμα*", meaning skin, referring to the dark brown or reddish colour of the fur (see Palmer, 1904: 630).

1871. *Sybdesmotus* Peters.

1871. *Syndesmotis* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, 329. Publication date: 1871. - Comments: Type species: *Phyllorhina megalotis* Heuglin, 1862, by monotypy (see Jackson and Groves, 2015: 247).

1871. *Thyreorhina* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, 327. Publication date: 1871. - Comments: Type species: *Phyllorrhina coronata* Peters, 1871, by monotypy (see Decher and Fahr, 2005: 1; Jackson and Groves, 2015: 246). - Etymology: From the Greek "*θυρεός*", meaning a large, oblong shield and "*ρις*" or "*ρινός*", meaning nose, referring to the upper noseleaf with thickened edge (see Palmer, 1904: 678).

1902. *Syndesmotus* C.O. Waterhouse, Index Zoologicus. - Comments: Objective synonym of *Syndesmotis* Peters, 1871 (see Simmons, 2005) or incorrect subsequent spelling of *Syndesmotis* Peters, 1871 (see Jackson and Groves, 2015: 247). - Etymology: From the Greek "*σύνδεσμος*", meaning bond or fastening and "*ούς*" or "*ώτός*", meaning ear (see Palmer, 1904: 656).

2015. *Hypposideros:* Sylla, Pourrut, Diatta, Diop, Ndiaye and Gonzalez, Afr. J. Microbio. Res., 9 (22): 1460. Publication date: 3 June 2015. (Lapsus)

2016. *Hipposieros:* Simmons, Seiffert and Gunnell, Am. Mus. Novit., 3857: 42. Publication date: 9 May 2016. (Lapsus)

2017. *Hipposidereos:* Hammond, Tan and Johnson, Protein Sci., 26: 1727. Publication date: 5 June 2017. (Lapsus)

? *Hipposideros sp.:*

TAXONOMY:

For review of the genus see Hill (1963a), on which the above synonymy and the treatment that follows are largely based, followed by Meester *et al.* (1986); Koopman (1993a: 170). Hill (1963a) recognizes seven species groups, five are recognized in Africa *speoris*, *bicolor*, *cyclops*, *commersoni*, and *megalotis* (Simmons, 2005: 367 - 379). However, see also Bogdanowicz and Owen (1998: 38), who indicate that recent species are not expressed accurately by current systematic arrangements based on the supraspecific groupings proposed by Hill (1963a), and that the genus *Hippoderos* might be a paraphyletic taxon. This is confirmed by Foley *et al.* (2014: 324), who indicate that *H. commersoni* and *H. vittatus* pose a problem here. Without these species, the monophyly of the remaining *Hipposideros* species is supported by all of their analyses. Foley *et al.* (2017: 2) furthermore indicate that the species groups, currently recognized in the genus, have yet to be thoroughly evaluated using molecular data.

One of the most controversial groups in the African *Hipposideros* representatives is the *caffer/ruber* complex. Vallo *et al.* (2009: 196) subdivided this in four main groups, of which three are again subdivided in two lineages, and which were tentatively called: A1, A2, B1, B2, C1, C2, and D. These lineages would represent at least five species. Monadjem *et al.* (2013b: 345) separated two further lineages in southern African *H. caffer*: A1a and A2b, and two in Senegalese *H.* cf. *ruber*: D1 and D2; and one in Ghanian (E2) and Liberian and Côte d'Ivorian *H.* cf. *ruber*: (E1).

Known species to the genus *Hipposideros*: †***besaoka*** Samonds 2007; †***kaumbului*** Wesselman 1984; ***abae*** J.A. Allen, 1917; *armiger* (Hodgson,

1835) – Northern India, Nepal, Burma, south and southeastern China, Vietnam, Laos, Cambodia, Thailand, Malay Peninsula, Taiwan (Simmons, 2005: 367); *ater* Templeton, 1848 – Sri Lanka; India to western Malaysia, through Philippines, Indonesia, and New Guinea to northern Queensland, north Northern Territory, and north Western Australia (Australia) (Simmons, 2005: 367); ***beatus*** (K. Andersen, 1906); *bicolor* (Temminck, 1834) – Laos, Vietnam, southern Thailand and Malaysia to Borneo and the Philippines, Java, Sumbawa, Seralu, Sumba, Savu, Roti and Timor Isls (Indonesia) and adjacent small islands (Simmons, 2005: 368); *breviceps* Tate, 1941 – Mentawai Isls (Indonesia) (Simmons, 2005: 368); ***caffer*** (Sundevall, 1846); *calcaratus* (Dobson, 1877) – central New Guinea (Simmons, 2005: 368); ***cameruensis*** Eisentraut, 1956; *cervinus* (Gould, 1854) – western Malaysia, Sumatra, and Mindanao (Philippines) to the Mollucca Isls, Vanuatu, and northeastern Australia (Simmons, 2005: 369); *cineraceus* Blyth, 1853 – Pakistan and India to Burma, Thailand, Laos, Vietnam, Sumatra and Borneo, adjacent small islands including Kangean Isls (Indonesia) (Simmons, 2005: 369); *coronatus* (Peters, 1871) – northeastern Mindanao (Philippines) (Simmons, 2005: 369); *corynophyllus* Hill, 1985 – central New Guinea (Simmons, 2005: 370); *coxi* Shelford, 1901 – Sarawak (Borneo, Malaysian part) (Simmons, 2005: 370); *crumeniferus* (Lesueur and Petit, 1807) – Timor (Indonesia) (Simmons, 2005: 370); ***curtus*** G.M. Allen, 1921; *demissus* K. Andersen, 1909 – San Cristobal Isl (Solomon Isls) (Simmons, 2005: 370); *diadema* (E. Geoffroy, 1813) – Burma and Vietnam through Thailand, Laos, western Malaysia and Indonesia (including Sumatra, Borneo and Bali) to New Guinea, Bismarck Arch., Solomon Isls and northeastern Australia, Philippines, Nicobar Isls (Simmons, 2005: 370); *dinops* K. Andersen, 1905 – Solomon Isls; Bougainville Isl (Paua New Guinea) (Simmons, 2005: 370); *doriae* (Peters, 1871) – western Malaysia, Sarawak and Sabah (Malaysia), Borneo and Sumatra (Indonesia) (Simmons, 2005: 371); *durgadasi* Khajuria, 1970 – central India (Simmons, 2005: 371); *dyacorum* Thomas, 1902 – Borneo (including Sarawak, Malaysia), Peninsular Thailand (Simmons, 2005: 371); *edwardshilli* Flannery and Colgan, 1993 – northwestern Papua New Guinea (Simmons, 2005: 371); ***fuliginosus*** (Temminck, 1853); *fulvus* Gray, 1838 – Afganistan, India, Sri Lanka, Pakistan to Vietnam (Simmons, 2005: 371); *galeritus* Cantor, 1846 – Sri Lanka and India through southeast Asia (including Burma, Thailand and Peninsular Malaysia) to Java and Borneo, Sanana Isl (Sula Group, Moluccas Isls) (Simmons, 2005: 372); *grandis* G.M. Allen, 1936 – Burma, Thailand and Vietnam (Simmons, 2005: 372); *halophyllus* Hill and Yenbutra, 1984 – Thailand (Simmons, 2005: 372); *hypophyllus* Kock and Bhat, 1994 – southern India (Simmons, 2005: 372); *inexpectus* Laurie and Hill, 1954 – northern Sulawesi (Indonesia) (Simmons, 2005: 372); *inornatus* McKean, 1970 – Northern Territory (Australia) (Simmons, 2005: 373); ***jonesi*** Hayman, 1947; ***lamottei*** Brosset, 1985; *lankadiva* Kelaart, 1850 – Sri Lanka, southern and central India (Simmons, 2005: 373); *larvatus* (Horsefield, 1823) – northern and eastern India and Bangladesh; Yunnan, Kwangsi and Hainan (China), Burma, Thailand, Cambodia, Laos and Vietnam, western Malaysia to Sumatra, Java, Borneo and adjacent small islands including Kangean Isls (Indonesia) (Simmons, 2005: 373); *lekaguli* Thonglongya and Hill, 1974 – Thailand, peninsular Malaysia, Luzon (Philippines) (Simmons, 2005: 373); *lylei* Thomas, 1913 – Burma, Vietnam, Thailand, western Malaysia (Simmons, 2005: 374); *macrobullatus* Tate, 1941 – Sulawesi, Seram (Molucca Isls) and Kangean Isls (Indonesia) (Simmons, 2005: 374); *madurae* Kitchener and Maryanto, 1993 – Madura Isl, central Java (Indonesia) (Simmons, 2005: 374); *maggietaylorae* Smith and Hill, 1981 – New Guinea, Bismarck Arch (Simmons, 2005: 374); ***marisae*** Aellen, 1954; ***megalotis*** (Heuglin, 1861); *muscinus* (Thomas and Doria, 1886) – New Guinea (Simmons, 2005: 374); *nequam* K. Andersen, 1918 – Malaysia (Simmons, 2005: 375); *obscurus* (Peters, 1861) – Philippines except Palawan region (Simmons, 2005: 375); *orbiculus* Francis, Kock, and Habersetzer, 1999 – Sumatra (Indonesia), Peninsular Malaysia (Simmons, 2005: 375); *papua* (Thomas and Doria, 1886) – Biak and Numfoor Isls, western New Guinea and northern Molucca Isls (Simmons, 2005: 375); *pelingensis* Shamel, 1940 – Peleng Isl and Sulawesi (Indonesia) (Simmons, 2005: 375); *pomona* K. Andersen, 1918 – Bangladesh and India to Burma, Thailand, Laos, Cambodia, Vietnam, southern China and western Malaysia (Simmons, 2005: 375); *pratti* Thomas, 1891 – southern China, Burma, Thailand, Vietnam, western Malaysia (Simmons, 2005: 375); *pygmaeus* (Waterhouse, 1843) – Philippines except Palawan region (Simmons, 2005: 376); *ridleyi* Robinson and Kloss, 1911 – Penninsular Malaysia, Singapore, northern Borneo (Simmons, 2005: 376); *rotalis* Francis, Kock, and Habersetzer, 1999 – Laos (Simmons, 2005: 376); ***ruber*** (Noack, 1893); *scutinares* Robinson, Jenkins, Francis, and Fulford, 2003 – Loas, Vietnam (Simmons, 2005: 376); *semoni* Matschie, 1903 – northern Queensland (Australia), eastern New Guinea (Simmons, 2005: 376); *sorenseni* Kitchener and Maryanto, 1993 – central and western Java (Indonesia) (Simmons, 2005: 376); *speoris* (Schneider, 1800) – India, Sri Lanka (Simmons, 2005: 377); *stenotis* Thomas, 1913 – Northern Territory, north Western Australia and northern Queensland (Australia) (Simmons, 2005:

377); *sumbae* Oei, 1960 – Sumba, Roti, Sumbawa, Flores, Semau and Savu Isls (Indonesia) (Simmons, 2005: 377); ***tephrus*** (Cabrera, 1906); ***thomensis*** (Bocage, 1891); *turpis* Bangs, 1901 – Peninsular Thailand and Vietnam; Ryukyu Isls (Japan) (Simmons, 2005: 377); *wollastoni* Thomas, 1913 – western and central New Guinea (Simmons, 2005: 378).

COMMON NAMES:
Czech: praví pavrápenci. English: Leaf-nosed Bats, Leafnosed Bats, Roundleaf Bats. French: Phyllorhines. German: Altwelt-Rundblattnasen. Italian: Ipposidèri.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
The approximate fossil date for crown *Hipposideros* is set by Shi and Rabosky (2015: 1532) to 40.4 Mya.

At Songhor, Butler (1969, 1978) found *Hipposideros* sp. from Early Miocene deposits.

BIOGEOGRAPHY:
During the Miocene at about 15 Mya, *Hipposideros* diversified into distinct clades based on geography: these being the African, Indian and South East Asian clades (Foley *et al.*, 2014: 320).

PARASITES:
HAEMATOSPORIDA
Schaer *et al.* (2017: 2) examined 23 *Hipposideros* specimens from South Sudan, of which 1 (4 %) was infected by *Hepatocystis*.

VIRUSES:
Coronaviridae - Coronaviruses
SARS-CoV - During Febuary 2008 in Ghana, Pfefferle *et al.* (2009) tested fecal samples of various *Hipposideros* species of the *caffer*/*ruber* complex, where the specific identification needs to be confirmed, and therefore is presented here - Pfefferle *et al.* (2009) as *Hipposideros caffer ruber* tested 40 fecal samples, 10 tested positive for coronavirus (CoV) RNA, while 4 were positive for group 1 CoV and 6 for group 2 CoV. Pfefferle *et al.* (2009) as *Hipposideros* cf. *ruber* tested 8 fecal samples which tested negative for coronavirus (CoV) RNA, from Booyem A cave. While from Booyem B cave [identified as *H* cf. *ruber* two morphotypes], in Ghana 11 fecal samples, 2 samples tested positive for coronavirus (CoV) RNA, while the one was positive for group 1 CoV and the other for group 2 CoV (Pfefferle *et al.*, 2009).

Drexler *et al.* (2013a: 50) and Hu *et al.* (2015: 5) indicate that *Hipposideros* betacoronaviruses detected in Africa (Ghana, Kenya, and Nigeria) and Asia are clearly distinct from SARS-related coronaviruses.

27.6 % (?; 16 out of 68) of the Kenyan *Hipposideros* specimens tested by Tao *et al.* (2017: 3, Suppl.) were positive for CoV.

Paramyxoviridae
Mortlock *et al.* (2015: 1841) reported that one out of eight examined Kenyan *Hipposideros* sp. specimens tested positive for *Paramyxovirus* sequences. This was also the case for one out of 39 specimens from Cameroon, and one out of three Nigerian specimens.

Rhabdoviridae
Lyssavirus - Rabies related viruses
Horton *et al.* (2014: Table S1) tested 16 Tanzanian *Hipposideros* sp. specimens, but failed to find neutralising antibodies to IKOV (Ikoma lyssavirus).

†***Hipposideros africanum*** Ravel, 2016

*2016. *Hipposideros (Pseudorhinolophus) africanum* Ravel, in: Ravel et al., Geodiversitas, 38 (3): 356, 372, figs 8 - 10. Publication date: 30 September 2016. Type locality: Tunisia: Kassérine province: Djebel Chambi National Park: Chambi [35 14 03 N 08 45 29 E, 630 m] [Goto Description]. - Etymology: The name refers to the African continent and underlines the geographic importance as the genus was herethereto only reported from Europe (see Ravel et al., 372).

GENERAL COMMENTS:
This fossil species is generally assigned to the subgenus *Pseudorhinolophus* Schlosser, 1887.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Timeframe:
Late lower Eocene to early middle Eocene.

†***Hipposideros amenhotepos*** Gunnell, Winkler, Miller, Head, El-Barkooky, Gawad, Sanders, and Gingerich, 2015

*2015. *Hipposideros (Pseudorhinolophus) amenhotepos* Gunnell, Winkler, Miller, Head, El-Barkooky, Gawad, Sanders, and Gingerich, Hist. Bio., 28 (1-2): 162, figs 4, 5, 6 (for 2016). Publication date: 1 October 2015. Type locality: Egypt: Eastern Desert: Khasm El-Raqaba [28.451 N 31.834 E] [Goto Description]. Holotype: CGM 83763: Collected by: ?: Collector Unknown. Presented/Donated by: ?: Collector Unknown. Right M1. - Comments: The paper was published online on 1 October 2015, and in print on 17 February 2016. - Etymology: Named after Amenhotep IV (= Akhenaten), an Egyptian 18th Dynasty pharaoh, whose capital city of Amarna was located in the Eastern Desert not far from the type locality of this species (see Gunnell *et al.*, 2015b: 162).

†***Hipposideros kaumbului*** Wesselman, 1984

*1984. *Hipposideros kaumbului* Wesselman, Contributions to vertebrate evolution, 7: 59. Type locality: Ethiopia: Locality 28, lower Member S, Shungura Formation. - Etymology: This taxon is named in honour of John Kaumbulu Kimau, a Wakamba tribesman from Kikoko, Kenya, who worked with H.B. Wesselman as his field assistant following the 1972 and 1973 field seasons and helped with the task of handpicking almost 20 tons of screenwashed residues (Wesselman, 1984: 59). (Current Combination)

TAXONOMY:
Wesselman (1984: 59) suggests that this taxon may be ancestral to "*Hipposideros commersoni*" (=*Macronycteris commersoni*. Rakotoarivelo *et al.* (2019: 14), however, indicate that many different taxa included in the *commersoni*) group are morphologically very similar to each other, yet genetically quite distinct

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Late Pliocene (2.08 Mya) (Wesselman, 1984: 59).

†***Hipposideros vetus*** (Lavocat, 1961)

*1961. *Asellia vetus* Lavocat, Notes Mém. Serv. Mines Carte geol. Maroc, 155: ?. - Comments: Marandat (1994: 61) mentions that the holotype consists of a left maxillary fragment with P^4-M^3.
1982. *Hipposideros (Syndesmotis) vetus:* Legendre, J. Vert. Paleont., 2 (3): 379. Publication date: December 1982. (Name Combination)
2013. *Asellia/Hipposideros vetus:* Stoetzel, Palaeog., Palaeoclim., Palaeoecol., 392: 363. Publication date: 29 September 2013. (Name Combination)
? *Hipposideros vetus:* (Current Combination)

TAXONOMY:
Originally described in the genus *Asellia*, the generic assignment of this taxon was unclear. Some authors (e.g. Legendre, 1982: 372; Gunnell *et al.*, 2011: 71; Hugueney *et al.*, 2015) assign it to the genus *Hipposideros*, whereas others (e.g. Aulagnier, 2013a: 360) assign it to the genus *Asellia*. Stoetzel, 2013: 363) furthermore mentions it as *Asellia/Hipposideros vetus*.

Legendre (1982: 382) examined the teeth and dental characters and found that although the absence of a P^2 and the degree of reduction of M^2 as well als M^3 are similar to those of other fossil *Asellia*, there are characters that are incompatible with this genus: upper canines with a separate secondary cusp on the distal edge, mandible with a long and slender horizontal ramus; low coronoid process; long and outward deflected angular process. These characters are much more similar to those of *Hipposideros*. Legendre (1982: 383) assigned *vetus* to the subgenus *Syndesmotis*, together with *H. megalotis*.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Miocene - Pliocene.

Hipposideros abae J.A. Allen, 1917

*1917. *Hipposideros abæ* J.A. Allen, Bull. Am. Mus. Nat. Hist., 37 (18): 432. Publication date: 29 September 1917. Type locality: Congo (Democratic Republic of the): Oriental province: Uele district: Aba [03 53 N 30 17 E] [Goto Description]. Holotype: AMNH 49123: ad ♂,

skin and skull. Collected by: Herbert Lang, James Paul Chapin and The American Museum Congo Expedition; collection date: 13 December 1911; original number: 1715. - Etymology: Referring to the locality where the type specimen was collected (Aba). (Current Combination)

? *Hipposideros abae:* (Current Spelling)

TAXONOMY:
Simmons (2005: 367) places it in the *speoris* species group.

COMMON NAMES:
Czech: pavrápenec abánský. English: Aba Roundleaf Bat, Aba Leaf-nosed Bat. French: Phyllorhine d'Aba. German: Aba-Rundblattnase.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, tolerance of a degree of habitat modification, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008at; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2008at; IUCN, 2009). 2004 - NT ver 3.1 (2001) (Mickleburgh *et al.*, 2004bq; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
There are no known major threats to this species. It appears to have taken advantage of forest clearance by moving into formerly forested land (Mickleburgh *et al.*, 2008at; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008at) [in IUCN (2009)] report that no specific conservation measures are in place, but it occurs in Comoe National Park in Côte d'Ivoire, and presumably also in other protected areas across its wide range.

GENERAL DISTRIBUTION:
Hipposideros abae is patchily distributed in a range which extends from Guinea-Bissau in West Africa (also the most northerly record) to northern Uganda (also the most eastern and southerly record) (Simmons, 2005: 367). It is a lowland species found below 1,000 m.

Native: Burkina Faso (Koopman *et al.*, 1978: 4; Kangoyé *et al.*, 2015a: 608); Cameroon; Central African Republic; Congo (The Democratic Republic of the); Côte d'Ivoire; Ethiopia (Kruskop *et al.*, 2016: 57); Ghana; Guinea (Weber and Fahr, 2007); Guinea-Bissau (Veiga-Ferreira, 1949; Lopes and Crawford-Cabral, 1992; Rainho and Ranco, 2001: 56); Liberia; Nigeria; Sierra Leone; Sudan; Togo; Uganda (Kityo and Kerbis, 1996: 61).
Presence uncertain: Benin; Chad; Mali.

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Young (1975: 76) indicates that two distinct colour phases can be found: rufous (orange) and grey.

ECHOLOCATION:
In Sierra Leone, Weber *et al.* (2019: 21) recorded the call of one female with CF at 103.0 kHz.

MOLECULAR BIOLOGY:
DNA - See Hoofer and Van Den Bussche (2003).
Karyotype - Unknown.
Protein / allozyme - Unknown.

ROOST:
It roosts in caves and rocky crevices or on the undersides of boulders, but apparently not in houses (Happold, 1987). For Guinea, Weber and Fahr (2006: 4) indicate that *H. abae* largely or exclusively depends on the availability of caves as day roosts.

POPULATION:
Structure and Density - Is thought to be sparsely distributed throughout its range, and to roost in small colonies (approximate group size in the dozens, not hundreds) (Mickleburgh *et al.*, 2008at; IUCN, 2009).
Trend - 2008 - Unknown (Mickleburgh *et al.*, 2008at; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
One female captured on 24 May in Sierra Leone was lactating (Weber *et al.*, 2019: 23).

PARASITES:
ACARI
Fain (1959c: 239) described *Psorergates (Psorergatoides) hipposideros* (Acari: Psoridatidae) from a *H. abae* captured near Bunia, Ituri, DRC.

DIPTERA
Streblidae: *Ascodipteron jonesi* Jobling 1952 from the wing at Njala, Sierra Leone (Haeselbarth *et al.*, 1966: 106).

VIRUSES:
Coronaviridae

SARS-CoV - During Febuary 2008 in Ghana, 16 fecal samples for coronavirus (CoV) RNA from two localities tested negative Pfefferle *et al.*, 2009). Corman *et al.* (2015: 11859) tested 242 Ghanese bats and found 19 (7.8 %) to test positive for 229E-related coronaviruses.

Hepeviridae
Drexler *et al.* (2012b: 9137) reported two positive feacal samples out of a total of 57 examined (3.51 %) from Ghana. Johne *et al.* (2014: 223, 224) suggested to place the Bat hepatitis E virus found in *H. abae*, as well as Hepevirus-species occuring in other bat families into a separate genus: *Chiropteranhepevirus*.

Paramyxoviridae
Drexler *et al.* (2012a: Suppl. Table S1) reported that none of the 80 specimens they examined from Ghana tested positive for *Repirovirus, Henipavirus, Morbillivirus, Rubulavirus* or *Pneumovirus*.

Phenuiviridae
Phlebovirus
de Jong *et al.* (2011: 11), Luis *et al.* (2013: Suppl.), and Willoughby *et al.* (2017: Suppl.) report the occurrence of Rift Valley fever virus.

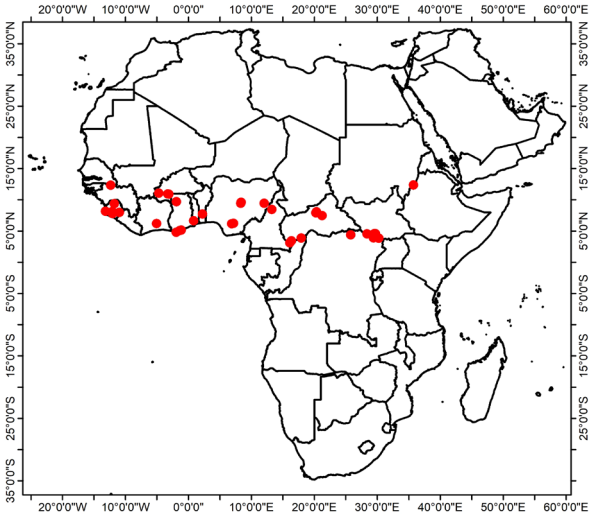

Figure 53. Distribution of *Hipposideros abae*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Benin, Burkina Faso, Cameroon, Central African Republic, Congo (Democratic Republic of the), Côte d'Ivoire, Ethiopia, Ghana, Nigeria, Senegal, Sierra Leone, South Sudan, Togo.

Hipposideros beatus (K. Andersen, 1906)

*1906. *Hipposiderus beatus* K. Andersen, Ann. Mag. nat. Hist., ser. 7, 17 (99): 275, 279. Publication date: 1 March 1906. Type locality: Equatorial Guinea: Rio Muni: Benito River, 15 mi (24 km) from [01 31 N 09 52 E] [Goto Description]. Holotype: BMNH 1900.2.5.45: ad ♀, alcoholic (skull not removed). Collected by: George Latimer Bates Esq. Collection date: February 1899. (Current Combination)

1957. *Hipposideros beatus maximus* Verschuren, Exploration du Parc national du Garamba, 7: 365. Type locality: Congo (Democratic Republic of the): Garamba National Park: Pidigala-Nord, Source area of [04 38 N 29 42 E]. Holotype: RBINS 13768: ad ♂. Collected by: Jacques Verschuren; collection date: 23 April 1952; original number: 4565. Presented/Donated by: ?: Collector Unknown. Holotype: RBINS 4037: ad ♂. Collected by: Gaston-François de Witte *et al.*; collection date: 23 April 1952; original number: 4565. Presented/Donated by: ?: Collector Unknown.

? *Hipposideros beatus beatus:* (Name Combination)

? *Hipposideros beatus:* (Current Spelling)

TAXONOMY:
Simmons (2005: 368) places it in the *bicolor* species group.

COMMON NAMES:
Czech: pavrápenec guinejský. English: Benito Roundleaf Bat, Benito Leaf-nosed Bat, Dwarf Leaf-nosed Bat. French: Phyllorine naine, Phyllorhine de Benito. German: Benito-Rundblattnase, Benito-Blattnase. Spanish (Castillian): Murciélago de Nariz de Hoja.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008bz; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2008bz; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2004ck; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
Habitat loss is the major threat to this species (Mickleburgh *et al.*, 2008bz; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008bz) [in IUCN (2009)] report that it occurs in the Mount Allen National Park (Equatorial Guinea), and Garamba National Park (Democratic Republic of Congo), and presumably in several other protected areas.

GENERAL DISTRIBUTION:
Hipposideros beatus has been recorded from Sierra Leone eastwards across the forest zone west and central Africa, as far east as the Sudan/Democratic Republic of Congo border. There are records from Sierra Leone, Guinea, Liberia, Côte d'Ivoire, Ghana, Togo, Nigeria, Cameroon, Equatorial Guinea, Congo, Democratic Republic of Congo and Sudan. A previous report of this species in Central African Republic is in error, though it might occur in the south of that country.

Native: Cameroon (Eisentraut, 1973); Congo (The Democratic Republic of the); Côte d'Ivoire; Equatorial Guinea; Gabon; Ghana (Decher and Fahr, 2007: 16); Guinea; Guinea-Bissau (Rainho and Ranco, 2001: 59); Kenya (Webala *et al.*, 2019: 13); Liberia; Nigeria (Happold, 1987); Sierra Leone; Sudan; Togo.
Presence uncertain: Central African Republic.

Bates *et al.* (2013: 338) reject the presence of *H. beatus* in the Republic of Congo, because previous authors (e.g. Malbrant and Maclatchy, 1949; Dowsett *et al.*, 1991) indicated it would be 'likely' to occur in that country.

ECHOLOCATION:
Monadjem *et al.* (2013b: 351) report the F_{max} to be 129.0 kHz at Mount Nimba.

Heller and Volleth (2016: 4) report different bandwidths for *H. beatus* specimens from various parts of Africa: Côte d'Ivoire: 139 - 147 kHz (Happold, 2013ap), Mount Nimba: 129 kHz (Monadjem *et al.*, 2013b), Lake Tumba, DRC: 108 and 129 kHz (2 specimens; see Novick, 1958), and Irangi, DRC: 109.2 kHz (their study). This 20 kHz difference makes them suggest that two cryptic species might be present.

In Kenya, Webala *et al.* (2019: 15) report F_{max}: 114.8 - 123.7 kHz, duration: 7.0 - 9.1 msec for three females and F_{max}: 124.0 kHz, duration: 8.0 - 8.4 msec for two males.

HABITAT:
In Nigeria, it is widely distributed in the rainforest zone (Happold, 1987). Monadjem *et al.* (2016y: 365) also report its wide distribution in forested habitats in the Mount Nimba area, on altitudes between 420 and 700 m.

POPULATION:
Structure and Density - It has a patchy distribution, typically found in small familial groups, but can be found in groups of up to 20 individuals. There is no information on overall abundance (Mickleburgh *et al.*, 2008bz; IUCN, 2009).
Trend - 2008 - Decreasing (Mickleburgh *et al.*, 2008bz; IUCN, 2009).

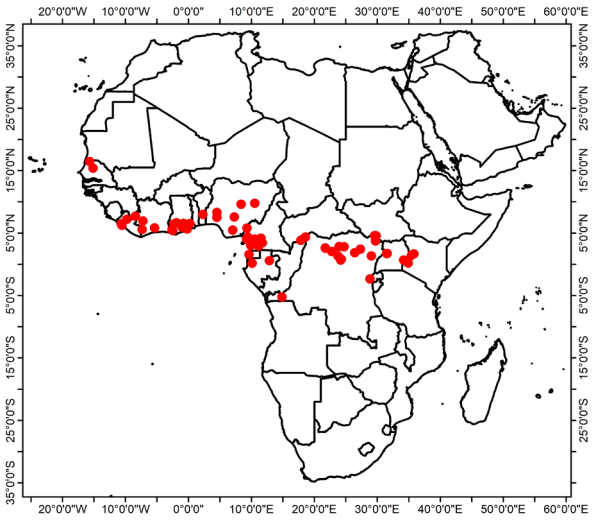

Figure 54. Distribution of *Hipposideros beatus*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Benin, Cameroon, Central African Republic, Congo (Democratic Republic of the), Côte d'Ivoire, Equatorial Guinea, Gabon, Ghana, Guinea, Kenya, Liberia, Nigeria, Senegal, Uganda.

Hipposideros caffer (Sundevall, 1846)

*1846. *Rhinolophus caffer* Sundevall, Öfvers. kongl. Sv. Vet.-Akad. Förhandl., 3 (4): 118. Publication date: 1846. Type locality: South Africa: KwaZulu-Natal: Port Natal [=Durban], near [ca. 29 52 S 31 00 E] [Goto Description]. Syntype: BMNH 1848.6.2.16: skull only. "Cotype" from Stockholm Museum, labeled "*Hipposideros caffer typicus*" locality Natal. Syntype: BMNH 1849.11.22.11: skin only. - Comments: Type locality originally mentioned as "Circa Port-Natal inventus". - Etymology: From the masculine scientific Latin adjective *càffer* "Kafir", referring to the southern African locality where the type specimen was collected (see Lanza *et al.*, 2015: 139).

1852. *Phyllorhina caffra* Peters, Naturwissenschaftliche Reise nach Mossambique, Zoologie, Säugethiere, 39, pl. 8. Publication date: 1852. Type locality: Mozambique: Ibo island. (Name Combination)

1852. *Phyllorrhina gracilis* Peters, Naturwissenschaftliche Reise nach Mossambique, Zoologie, Säugethiere, 36, pl. 7, fig. 1 - 4; pl. 13, fig. 14 - 15. Publication date: 1852. Type locality: Mozambique: Lower Zambesi River: Tete [16 10 S 33 35 E, 230 m] [Goto Description]. Holotype: ZMB 364/85624: ♂. Collected by: Prof. Wilhelm Carl Hartwig Peters; collection date: between 1843 and 1847; original number: An 16311. See Turni and Kock (2008: 38) [skin & skull: ZMB 364 + skeleton: ZMB 85624].

1852. *Phyllorrhina patellifera* Peters, Naturw. Reise Mossamb., Säugethiere, p. 39. Type locality: Mozambique: Ibo island. - Comments: Manuscript name, cited by Peters (1852: 39, 40).

1898. *Phyllorhina angolensis* Seabra, J. Sci. mat. phys. nat., ser. 2, 5: 256. Publication date: December 1898. Type locality: Angola: Rio Coroca [=Curoca river] [15 43 S 11 55 E]. Syntype: BMNH 1906.1.3.2:. - Comments: Meester *et al.* (1986: 43) indicate "Benguela, Angola, restricted by Hill and Carter (1941: 40), who point out that the name is based on four specimens from Benguela, housed in the Museu Bocage, Lisbon, and one from Rio Coroca, Angola, in the British Museum (Natural History). Koopman (in litt.) points out that, as the Museu Bocage had been destroyed by fire, the Rio Coroca specimen may be the only remaining of the type series.".

1917. *Hipposideros nanus* J.A. Allen, Bull. Am. Mus. Nat. Hist., 37 (18): 434. Publication date: 29 September 1917. Type locality: Congo (Democratic Republic of the): Oriental province: Uele district: Faradje [03 44 N 29 43 E] [Goto Description]. Holotype: AMNH 49426: ad ♀, skull and alcoholic. Collected by: Herbert Lang, James Paul Chapin and The American Museum Congo Expedition; collection date: 24 September 1912; original number: 1689. Allen (1917: 434) erroneously mentioned 24 October 1912 as collection date, see Goodwin (1953: 245).

1924. *Hipposideros caffer aurantiaca* de Beaux, Atti Soc. Lig. Sci. Nat. Geogr, 3: 155. Type locality: Somalia: Basso Giuba [=Lower Juba river]: Belet Mamu. - Comments: Lanza *et al.* (2015: 139) indicate that the correct spelling shoud actually be "*aurantiacus*" as the generic name ("*Hipposideros*") is a masculine name.

2015. *H[ipposideros] cafer:* Gunnell, Winkler, Miller, Head, El-Barkooky, Gawad, Sanders, and Gingerich, Hist. Bio., 28 (1 - 2): 163. Publication date: 1 October 2015. (Lapsus)

? *Hipposideros caffer angolensis:* (Name Combination)

? *Hipposideros caffer caffer:*

? *Hipposideros caffer centralis:*

? *Hipposideros caffer nanus:* (Name Combination)

? *Hipposideros caffer:* (Name Combination, Current Combination)

TAXONOMY:

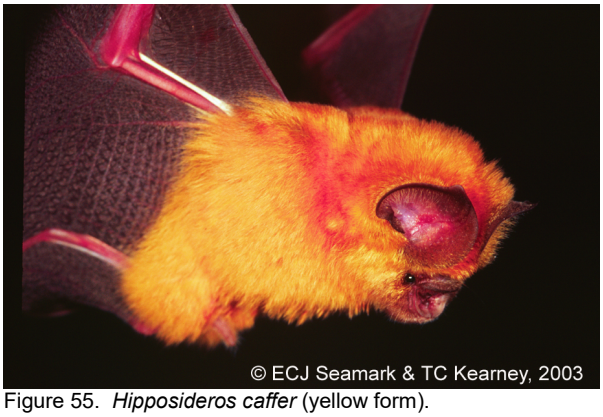

Figure 55. *Hipposideros caffer* (yellow form).

Meester *et al.* (1986) state that further extralimital [to Southern Africa] subspecies may include *centralis* Andersen, 1906, *tephrus* Cabrera, 1906, *nanus* J.A. Allen, 1917 (Koopman, 1975), and also *guineensis* Andersen, 1906, and *niapu* J.A. Allen, 1917 (Hill, 1963a). Most recent authors appear to regard *ruber* Noack, 1893, as a separate species (Kock, 1969a; Hayman and Hill, 1971; Ansell, 1978; Corbet and Hill, 1980, Koopman, 1982). Although Hill (1963a) and Koopman (1975 regard *ruber* as only subspecifically distinct from *caffer*. Simmons (2005: 368) places *H. caffer* within the *bicolor* species group. Vallo *et al.* (2007: 257) consider *tephrus* to be a separate species, based on cytochrome *b* analysis. Reviewed by Vallo *et al.* (2009).

COMMON NAMES:

Afrikaans: Sundevall se bladneusvlermuis, Sundevall-bladneusvlermuis, Sundevallse blaarneusvlermuis, Kaapse Blaarneusvlermuis. Azande (DRC): Nkulo. Chinese: 松氏蹄蝠. English: Sundevall's Leaf-nosed Bat, Common African Leaf-nosed Bat, Lesser Leaf-nosed bat, Sundevall's Roundleaf Bat, Cape Leaf-nosed bat, Sundevall's African

Leaf-nosed Bat, South African Lesser Leaf-nosed Bat. French: Phyllorhine de Cafrerie, Phyllorhine de Sundevall, Rhinolophe de Cafrerie. German: Sundevalls Rundblattnase, Sundevall's Blattnase. Italian: Ipposìdero càfro. Kiluba (DRC): Kasusu. Nyungwe: Kalemawalema (Malawi; not specific). Portuguese: Morcego de nariz enfolhado da cafraria.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining at nearly the rate required to qualify for listing in a threatened category (Kock *et al.*, 2008c; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Kock *et al.*, 2008c; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2004ae; IUCN, 2004). 1994 - LR/lc (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - LC ver 3.1 (2001) (Monadjem *et al.*, 2016t). 2004 - DD ver 3.1 (2001) (Friedmann and Daly, 2004).

MAJOR THREATS:
Human disturbance to roosting sites (caves) could have a negative effect (Kock *et al.*, 2008c; IUCN, 2009).

Sherwin *et al.* (2012: 174) consider aerial hawking and water stress to be the major risk factors linked to climatic change.

CONSERVATION ACTIONS:
Kock *et al.* (2008c) [in IUCN (2009)] report that no specific conservation measures are in place. Occurs in protected areas throughout its range.

GENERAL DISTRIBUTION:
Hipposideros caffer is a very wide ranging species, occurring from the south-western Arabian Peninsula (including Yemen) and across most of sub-Saharan Africa (except for central forested regions) (Simmons, 2005: 368). This species has also been recorded in southern Algeria, central Niger, eastern Chad, the Senegal/Mauritania border. Elevation ranges from sea level to 2,500 m in this area.

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 1,581,888 km^2. In South Africa, its distribution is stongly associated with the mean temperature of the coldest quarter (Babiker Salata, 2012: 49).

Specimens from Morocco need verification as these may be attributed to *H. tephrus* (Cabrera, 1906). A supposed record from southern Algeria requires confirmation.

Specimens identified by Fahr *et al.* (2006a) as *H. caffer* from Mount Nimba might need to be reassigned, as this species is restricted to southern Africa (Monadjem *et al.*, 2016y: 365).

Native: Angola (Crawford-Cabral, 1989; Cotterill, 2004a: 261; Monadjem *et al.*, 2010d: 536); Benin; Botswana (Monadjem *et al.*, 2010d: 536); Burkina Faso; Burundi; Cameroon; Chad; Congo (Bates *et al.*, 2013: 335); Congo (The Democratic Republic of the) (Hayman *et al.*, 1966; Dowsett *et al.*, 1991: 259; Monadjem *et al.*, 2010d: 536); Côte d'Ivoire; Equatorial Guinea; Eritrea; Ethiopia; Gabon (Brosset, 1966c); Gambia; Ghana; Guinea; Guinea-Bissau (Seabra, 1900c; Monard, 1939;; Lopes and Crawford-Cabral, 1992; Rainho and Ranco, 2001: 50); Kenya; Malawi (Happold *et al.*, 1988; Monadjem *et al.*, 2010d:536); Mali; Mauritania; Morocco (El Ibrahimi and Rguibi Idrissi, 2015: 360); Mozambique (Lopes and Crawford-Cabral, 1992; Monadjem *et al.*, 2010d: 536; Monadjem *et al.*, 2010c: 380); Namibia (Monadjem *et al.*, 2010d: 536); Niger; Nigeria (Menzies, 1973); Rwanda; Saudi Arabia; Senegal; Sierra Leone; Somalia; South Africa (Taylor, 2000: 140; Monadjem *et al.*, 2010d: 537); Sudan; Swaziland (Monadjem *et al.*, 2010d: 537); Tanzania (including the islands of Pemba, Unguja, and Mafia [see O'Brien, 2011: 287]); Togo; Uganda (Kityo and Kerbis, 1996: 61); Yemen; Zambia (Ansell, 1969; Ansell, 1978; Ansell, 1986; Cotterill, 2002b: 5; Monadjem *et al.*, 2010d: 537); Zimbabwe (Monadjem *et al.*, 2010d: 537).
Presence uncertain: Algeria; Liberia.

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Menzies (1973) [in Young (1975: 76) indicates that, in some colonies in northern Nigeria, rufous bats get a grey fur during the molting season, and subsequently change back to rufous. Young (1975: 76) also mentions that the majority of *H. caffer* specimens in Angola and south-west Africa (Namibia) is grey, whereas in eastern Africa, the rufous phase is more common.

From western Uganda, Monadjem *et al.* (2011: 30) reported the following data for 5 *H.* cf. *caffer* specimens: Fa: 51.50 ± 1.398 mm, mass: 10.2 ± 1.10 g, wing loading: 5.2 ± 0.27 N/m^2, aspect ratio: 5.8 ± 0.10.

DETAILED MORPHOLOGY:
Baculum - Unknown
Brain - Amrein *et al.* (2007), from specimens collected from Bénin, reported moderate

proliferating cell activity, detected with Ki-67 and MCM2, in the subgranular layer of the dentate gyrus, with doublecortin (DCX) they detected highest levels of young migrating neuron in the subgrannular layer of the hippocampus. Amrein *et al.* (2007) also reported moderate to ample proliferating cells (Ki-67 positive cells) and migrating young neurons (DCX positive cells) in the rostral migratory stream. No NeuroD was detected in the hippocampal granule cells (Amrein *et al.* (2007).

ECHOLOCATION:
At Irangi (Kivu province, DRC), Heller (1992: 77) was able to distinguish *H. caffer* from *H. ruber* as the prior emitted calls at a much higher frequency: 137 - 160 kHz (versus 130 - 140 kHz in *ruber*).

In Guinea, Fahr and Ebigbo (2003) reported a constant frequency component of 160.2 - 164.1 kHz (these may not represent *H. caffer* see Vallo *et al.*, 2009). In Kenya, Taylor *et al.* (2005) reported a maximum frequency of 157 (± 0.2) kHz, using a Pettersson D980 detector. From the same country, Eisenring *et al.* (2016: SI 2.) reported the following values: PF: 144.0, HF: 149.4, LF: 110.9, DT: 0.1, DF: 38.5, and IPI: 0.0. At Sengwa in Zimbabwe, Fenton (1986a) reported a maximum frequency of 141.5 (± 2.7) kHz, whereas previously Jacobs (1996) and Fenton and Bell (1981) had reported a maximum frequency of 138 kHz from the same locality. In South Africa, Fenton (1986a) reported a maximum frequency of 145.4 (± 2.5) kHz from Levuvhu, while Taylor (1999b) using a Pettersson D980 detector reported a similar maximum frequency 145 (± 0.2) kHz from Jozini Dam. Monadjem *et al.* (2007a), using an Anabat detector, reported a maximum frequency of 143.0 (± 1.43) kHz from various localities in Swaziland. See also Pye (1972, O'Shea and Vaughan, 1980). Monadjem *et al.* (2010c: 381) reported from Mozambique that the peak echolocation frequencies of two individuals were recorded at 145 kHz (ANABAT).

Monadjem *et al.* (2007a) also reported sexual dimorphism in the call with males emitting a higher call than females (males 145.0 (± 0.76) kHz, females 142.9 (± 1.39) kHz).

For 13 calls from Swaziland, Taylor *et al.* (2013b: 19) reported the following parameters: F_{max}: 142.9 ± 0.96 (140.4 - 144.1) kHz, F_{min}: 123.2 ± 6.40 (108.9 - 130.3) kHz, F_{knee}: 141.5 ± 0.95 (139.3 - 142.9) kHz, F_{char}: 142.0 ± 1.00 (139.8 - 143.5) kHz, duration: 4.2 ± 0.28 (3.7 - 4.7) msec. Monadjem *et al.* (2017c: 180) indicated that calls from this species could not be detected at a distance of more than 0.5 m, using an Anabat detector. They also reported the following values: F_{min}: 121.2 ± 5.88 (109.1 - 127.3) kHz, F_{knee}: 141.4 ± 1.97 (138.7 - 144.3) kHz, F_c: 141.7 ± 1.69 (139.5 - 144.0) kHz, duration: 4.8 ± 1.08 (3.7 - 6.7) msec.

Monadjem *et al.* (2011: 32) reported on 3 calls from *Hipposideros* cf. *caffer* from western Uganda: F_{min}: 144.11 ± 6.373 kHz, F_{max}: 151.73 ± 1.661 kHz, F_{char}: 146.88 ± 3.909 kHz, F_{knee}: 151.13 ± 1.650 kHz, duration: 2.8 ± 1.18 msec.

In the Mapungubwe National Park (RSA), Parker and Bernard (2018: 57) recorded the following parameters: F_{char}: 143.00 ± 1.64 kHz, F_{max}: 143.28 ± 1.63 kHz, F_{min}: 124.99 ± 5.92 kHz, F>sub knee: 143.14 ± 1.64 kHz, duration: 7.41 ± 0.91 msec, with 12.29 ± 7.81 calls/sec.

In Kenya, Webala *et al.* (2019: 15) reported echolocation data from nine localities, where F_{max} varied between 148.9 and 153.6 for seven unsexed bats, 145.0 and 155.8 for eight males, and 145.5 and 150.9 for ; 5.0 - 9.7 for six males. The call durations varied respectively between 6.7 and 9.7, 5.4 and 10.6, and 5.0 and 9.7 msec.

MOLECULAR BIOLOGY:
DNA - Vallo *et al.* (2009).
Karyotype - Đulic and Mutere (1974), Peterson and Nagorsen (1975), Rautenbach *et al.* (1993) and Porter *et al.* (2010) all reported 2*n* = 32, FN = 60, and BA = 30. Peterson and Nagorsen (1975) and Rautenbach *et al.* (1993) also agreed on an acrocentric Y chromosome. However, Đulic and Mutere (1974) reported a metacentric X chromosome, Peterson and Nagorsen (1975) reported a subtelocentric X chromosome, and Rautenbach *et al.* (1993) reported a submetacentric X chromosome.
Protein / allozyme - Unknown.

HABITAT:
This species occurs in savanna, bushveld and coastal forest, and is usually associated with rivers and other water resources (Taylor, 2000: 140).

ROOST:
Weber and Fahr (2006: 4) indicate that *H. caffer*, in Guinea, largely or exclusively depends on the availability of caves as day roosts. In the Durban area, Taylor *et al.* (1999: 70) reported it roosting in a tunnel of the Songweni Dam.

DIET:
In their study of *H. caffer* bats from Skukuza (Kruger National Park, RSA), Dunning and Krüger (1996: 708) found that they overwhelmingly fed upon tympanate Lepidoptera, whereby relative numbers of noctuid, pyralid, and arctiid moths taken by the bats were proportional to the representation of these families in the general

population of moths in the area. They also took much less moths belonging to the Geometridae, and arctiid moths that were able to produce clicking sounds.

Taylor *et al.* (2017b: 245, 252 - 254) reported the diet from bats from the Limpopo province (RSA) to include: one unidentified beetle and seven genera or species of moths belonging to four families: *Sena* sp., *Mimallo amilia DHJ01*, *Xenopseustis* sp., *Pericyma atrifusa*, *Tycomarptes* sp., *Maurilia arcuata*.

From Sudwala (RSA), Jacobs (2000: 201) reported the following proportions of preys: Lepidoptera (65.6 ± 46.3), Coleoptera (19.1 ± 40.0), Isoptera (14.5 ± 35.6), Hemiptera (0.5 ± 1.2) and unknwon (0.3 ± 0.6).

PREDATORS:
Mikula *et al.* (2016: Supplemental data) mention *H. caffer* as a possible prey of the Lanner falcon (*Falco biarmicus* Temminck, 1825), Peregrine falcon (*Falco peregrinus* Tunstall, 1771) and Bat hawk (*Macheiramphus alcinus* Bonaparte, 1850).

POPULATION:
Structure and Density - Are extremely gregarious and capable of forming huge colonies where there is adequate roosting space. In Nigeria, at Shagunu (Menzies, 1973), a colony of about 1,000 individuals inhabited a cave five meters wide, 1-2 m high and 10-15 m deep. In Gabon they live in colonies of 200-1,000 and one exceptionally large cave contained an estimated 500,000 bats (Brosset, 1966c; Happold, 1987).
Trend - 2008 - Decreasing (Kock *et al.*, 2008c; IUCN, 2009)

REPRODUCTION AND ONTOGENY:
For Uganda, Mutere (1968) reported pregnancies between December and March and births in April.

Bernard and Meester (1982: 131) studied the reproductive cycle in *H. caffer* in Natal and found that follicular development began in February, with copulation and ovulation taking place from late April onwards. The duration of the gestation period was about 220 days (zygote: 21 days, embryo: 123 days and foetus: 76 days). Parturition took place in December, after which there was a lactation period until January, during which the bats were anoestrus.

Menzies (1973) claimed it can take up to two months before a blastocyst gets implanted, but this was revoked by Racey (1982: 83), who indicated that some of Menzies' illustrations proved otherwise.

In NE Gabon, Brosset and Saint Girons (1980: 226) found that *H. caffer* was reproducing with a boreal cycle (giving birth in March) in some caves, whereas in others they were following an austral cycle (giving birth in October). A line separating both groups seemed to run just north of the equator. For the northern group, mating occurred in November-December. In both groups, the single young was weaned after three and a half months. In the caves, where the females were following a boreal cycle, the males were in full spermatocytogenesis at the beginning of October. The spermiogenesis was starting in that period and this phase ended between 25 and 30 November. In the other caves, the males were in sexual rest between August and January.

PARASITES:
Adam and Landau (1973a: 5) report that *H. caffer* was rarely infected by a protozoan parasite of the genus *Polychromophilus* (Haemoproteidae). The bats were also found to carry low numbers of the the nycteribiid flies *Penicillidia fulvida* Bigot, 1885 and *Nycteribia schmidlii scotti* Falcoz, 1923, of which the prior was a major carrier of *Polychromophilus* sporozoites. Perkins and Schaer (2016: Suppl.) reported the presence of *Polychromophilus murinus* (Dionisi, 1899).

Wünschmann *et al.* (2010: 178) refer to Boulard (1975), who reported the first case of renal coccidiosis in a bat (on *H. caffer* and *Rhinolophus* sp.) from Sierra Leone and the Congo, and caused by *Klossiella killicki* Boulard, 1975.

Teixeira and Camargo [in Lima *et al.* (2013: 13)] described *Trypanosoma livingstonei* from two bats from Mozambique: *Rhinolophus landeri* (type host) and *H. caffer* (additional host) [see also Barbosa *et al.*, 2016: 215].

Vercammen-Grandjean and Fain (1958: 10, 12, 14, 20, 22, 30, 33) described *Trombigastia (Ascoschongastoïdes) ascoschongastoïdes*, *Trombigastia (Ascoschongastoïdes) berghei*, *Trombigastia (Scapularia) scapularia*, *Trombigastia (Trombigastia) laarmani*, *Trombigastia (Trombigastia) vinckei*, *Trombigastia (Trombigastia) minor*, and *Myotrombicula bidentipalpis* (Acari: Trombiculidae) from 77 *H. caffer centralis* specimens collected at Irangi, DRC. Fain (1959c: 239) described *Psorergates (Psorergatoides) hipposideros* (Acari: Psoridatidae) from a *H. caffer centralis* captured in Kakontwe cave, Jadotville (=Likasi), DRC.

Reviewing African chiggers (Acari: Trombiculidae), Stekolnikov (2018a: 26; 2018b: 268) indicated that *Gahrliepia nana* (Oudemans, 1910) was described from *H. caffer* from Durban,

where it was also the type host for *Austracarus polydiscum* (Oudemans, 1910) (Stekolnikov, 2018a: 43). Stekolnikov (2018a: 49, 50, 117, 119, 121, 154, 160, 179) also reported *Whartonia atracheata* Taufflieb and Mouchet, 1959, *Whartonia oweni* Vercammen-Grandjean and Brennan, 1957, *Trombigastia ascoschoengastoides* Vercammen-Grandjean and Fain, 1958, *Trombigastia berghei* Vercammen-Grandjean and Fain, 1958, *Trombigastia laarmani* Vercammen-Grandjean and Fain, 1958, *Trombigastia minor* Vercammen-Grandjean and Fain, 1958, *Trombigastia scapularia* Vercammen-Grandjean and Fain, 1958, *Trombigastia vinckei* Vercammen-Grandjean and Fain, 1958, *Microtrombicula irangiensis* Vercammen-Grandjean, 1965; *Microtrombicula minutissima* (Oudemans, 1910), and *Myotrombicula bidentipalpis* Vercammen-Grandjean and Fain, 1958.

Periglischrus moucheti Till, 1958 (Acari: Spinturnicidae) was reported by McKechnie *et al.* (2013: 112).

Streblidae: *Brachytarsina africana* (Walker, 1849) has a wide distribution in sub Saharan Africa (Haeselbarth *et al.*, 1966: 100), *Brachytarsina alluaudi* (Falcoz, 1923) in Botswana (Haeselbarth *et al.*, 1966: 101), Gabon (Obame-Nkoghe *et al.*, 2016: 5), *Brachytarsina longiarista* (Jobling, 1949) in Sierra Leone (Haeselbarth *et al.*, 1966: 101), *Raymondia alulata* Speiser, 1908 (Shapiro *et al.*, 2016: 253), *Raymondia aspera* Maa, 1968 in Mozambique (Shapiro *et al.*, 2016: 254), *Raymondia hardyi* in South Africa (Shapiro *et al.*, 2016: 254). *Raymondia huberi* Frauenfeld, 1856 may be associated but remains to be confirmed (Jobling, 1954 [in Haeselbarth *et al.* (1966: 102)]). *Raymondia huberi* Frauenfeld, 1856 group in Gabon (Obame-Nkoghe *et al.*, 2016: 5). *Raymondia intermedia* Jobling, 1936 (Shapiro *et al.*, 2016: 255). *Raymondia seminuda* Jobling, 1954 from Sierra Leone, the Congo, Tanzania, Zimbabwe, South Africa (Haeselbarth *et al.*, 1966: 103; Shapiro *et al.*, 2016: 255). *Raymondia setiloba* Jobling, 1954 from Katanga (Haeselbarth *et al.*, 1966: 104; Shapiro *et al.*, 2016: 256 [host as *H. caffer-ruber* complex]). *Raymondia waterstoni* Jobling, 1931 (Haeselbarth *et al.*, 1966: 104; Shapiro *et al.*, 2016: 256 [host as *H. caffer-ruber* complex]). *Raymondioides leleupi* Jobling, 1954 from Duékoué, Côte d'Ivoire (Haeselbarth *et al.*, 1966: 104). *Ascodipteron jonesi* Jobling, 1952 from Sudan, the Congo, Uganda and Tanzania (Haeselbarth *et al.*, 1966: 106). *Ascodipteron megastigmatos* Jobling, 1956 from Duékoué, Côte d'Ivoire (Haeselbarth *et al.*, 1966: 106). *Ascodipteron semirasum* Maa, 1965 from Botswana, but Maa (1965) doubts the correctness of the host-identification (Haeselbarth *et al.*, 1966: 106).
A *Brachytarsina allaudi* captured on a Gabonese "*H. caffer* complex" bat was carrying a *Polychromophilus melanipherus* blood parasite (Szentiványi *et al.*, 2019: Suppl.).
Theodor (1968) described *Raymondia allisoni* Theodor, 1968 from a *H. caffer* from Ghana, but Shapiro *et al.* (2016: 253) indicate that the bat species is probably not correct and they assigned it to the *H. caffer-ruber* complex. Shapiro *et al.* (2016: 255) also mention *Raymondia pagodarum* Speiser, 1900 from the species complex in Uganda (but here the original host was referred to as *H. ruber*), as well as *Raymondia simplex* Jobling, 1955 (from the DRC). Shapiro *et al.* (2016: 256) furthermore mention an unnamed *Raymondia* species (sp. A) from Congo. Szentiványi *et al.* (2019: Suppl.) indicated that a Gabonese "*H. caffer* complex" bat was parasitized by a *Raymondia huberi* group bat fly, which was carrying the blood parasite *Polychromophilus melanipherus*.

Nycteribiidae: *Nycteribia schmidlii* Schiner, 1853 (Haeselbarth *et al.*, 1966: 108; Duron *et al.*, 2014: 2108; Obame-Nkoghe *et al.*, 2016: 5). *Nycteribia scissa sudanica* Theodor, 1957 from Ethiopia, the Sudan and the Congo (Haeselbarth *et al.*, 1966: 108). *Nycteribia integra* Theodor and Moscona, 1954 (Haeselbarth *et al.*, 1966: 109). *Nycteribia ovalis* Theodor, 1957 from Sierra Leone (Haeselbarth *et al.*, 1966: 110). *Nycteribia tecta* Theodor, 1957 from Zimbabwe and South Africa, but Haeselbarth *et al.* (1966: 110) suggests these may represent a distinct subspecies. *Penicillidia pachymela* Speiser, 1901, from Somalia, Sudan, Kenya, Tanzania, the Congo, Guinea and the Cameroon Mts (Haeselbarth *et al.*, 1966: 114), and Zambia (Blackwell, 1980: 145 - itself infected by the fungus *Arthrorhynchus nycteribiae* (Peyritsch) Thaxter). *Eucampsipoda africana* Theodor, 1955 and *Penicilidia fulvida* Bigot, 1885, found both on bats from the *H. caffer* complex in Gabon (Obame-Nkoghe *et al.*, 2016: 5).

Haelewaters *et al.* (2018: 794) also mention the Nycteribiid *Penicillidia pachymela* Speiser, 1900, which might be the host for the fungus *Arthrorhynchus nycteribiae* (Peyr.) Thaxt.

VIRUSES:
In their country-wide survey of Kenyan bats, Waruhiu *et al.* (2017) found the following viruses in *Hipposideros caffer*: Astroviruses, Coronaviruses and Paramyxoviruses.

Willoughby *et al.* (2017: Suppl.) report the following viruses: Chikungunya virus, Human coronavirus 229E, Rift Valley fever phlebovirus.

Astroviridae
10 of 57 bats from Mozambique, tested by Hoarau *et al.* (2018: 2) were positive for Astroviruses.

Coronaviridae - Coronaviruses
SARS-CoV - Müller *et al.* (2007b) tested between 1986 and 1999, for antibody to SARS-CoV in sera in five individuals from Limpopo Province, South Africa. None were tested positive (0/5), neither did nine individuals from Oriental Province, DRC (0/9). See also note under "viruses" for the genus as possiblitiy.
Pfefferle *et al.* (2009) report the detection of several alpha- and betacoronaviruses from *H.* cf. *caffer/ruber*. The alphacoronaviruses were related to the human coronavirus HCoV-229E, and Porcine coronaviruses.
Anthony *et al.* (2017b: Suppl.) mention the beta-coronaviruses Predict_CoV_43 and Predict_CoV_44.
Both alpha- and betacoranoviruses were reported from Zimbabwe by Bourgarel *et al.* (2018: 255à.

Hepadnaviridae
Roundleaf bat HBV – detected in the lung and liver of *H.* cf. *caffer/ruber* from Gabon.

Nairoviridae
Orthonairovirus
Only three of the 36 *H.* cf. *caffer* specimens from Gabon tested by Müller *et al.* (2016: 3) were positive for Crimean Congo hemorrhagic fever virus (CCHFV).

Paramyxoviridae
Drexler *et al.* (2012a: Suppl. Table S1) indicated that one of the 80 *H.* cf. *caffer* specimens they examined from Ghana tested positive for *Morbillivirus*. Of the 337 specimens from Gabon they identified as belonging to *H.* cf. *caffer/ruber*, two tested positive for *Morbillivirus* and one for *Rubulavirus*.
Mortlock *et al.* (2015: 1841) reported that two out of six examined South African *H. caffer* specimens tested positive for *Paramyxovirus* sequences.

In *H. caffer* bats from Zimbabwbe, Bourgarel *et al.* (2018: 255) identified viruses belonging to the genus *Jeilongvirus*.

Phenuiviridae
Phlebovirus
de Jong *et al.* (2011: 11) and Luis *et al.* (2013: suppl.) report the occurrence of Rift Valley fever virus (RVFV), either by virus isolation or molecular evidence (see Fagre and Kading, 2019: 5).

Togaviridae
Alphavirus
de Jong *et al.* (2011: 10) and Luis *et al.* (2013: suppl.) reported Chikungunya virus occurring on *H. caffer*.

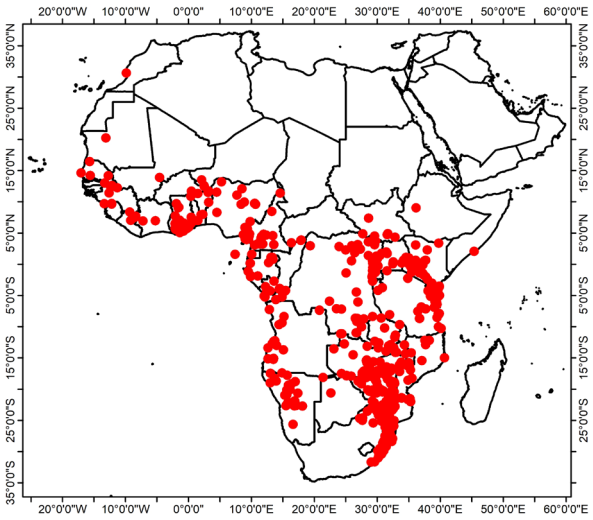

Figure 56. Distribution of *Hipposideros caffer*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Angola, Benin, Botswana, Burkina Faso, Burundi, Cameroon, Central African Republic, Congo, Congo (Democratic Republic of the), Côte d'Ivoire, Equatorial Guinea, Ethiopia, Gabon, Ghana, Guinea, Kenya, Liberia, Malawi, Mali, Mauritania, Morocco, Mozambique, Namibia, Niger, Nigeria, Rwanda, São Tomé and Principé, Senegal, Sierra Leone, Somalia, South Africa, South Sudan, Swaziland, Tanzania, The Gambia, Togo, Uganda, Zambia, Zimbabwe.

Hipposideros camerunensis Eisentraut, 1956

*1956. *Hipposideros camerunensis* Eisentraut, Zool. Jb. Syst., 84 (3): 526, fig. 6 - 8. Publication date: 27 December 1956. Type locality: Cameroon: Buea, near [ca. 04 09 N 09 13 E] [Goto Description]. Holotype: SMNS 5194: ad ♂, skin and skull. Collected by: Prof. Dr. Martin Eisentraut; collection date: 29 April 1954; original number: 505. Presented/Donated by: ?: Collector Unknown. See Dieterlen *et al.* (2013: 294). Paratype: SMNS 5195: ad ♂, alcoholic (skull not removed). Collected by: Prof. Dr. Martin Eisentraut; collection date: 29 April 1954; original number: 510. Presented/Donated by: ?: Collector Unknown. See Hutterer (1984: 29 - 30), Dieterlen *et al.* (2013: 294). Paratype: SMNS 5197: ad ♂, skull and alcoholic. Collected by: Prof. Dr. Martin Eisentraut; collection date: 29 April 1954; original number: 511. Presented/Donated by: ?: Collector Unknown. See Hutterer (1984:

29 - 30), Dieterlen *et al.* (2013: 294). Paratype: ZFMK 1979.0138: ad ♀. Collected by: Prof. Dr. Martin Eisentraut; collection date: 29 April 1954; original number: 506. Exchanged from SMNS in March 1979; SMNS catalog number 5196 (see Hutterer, 1984: 29 - 30; Hutterer and Peters, 2010: 12), Dieterlen *et al.*, 2013: 294). - Etymology: Referring to the country where the type specimen was collected (Cameroon). (Current Combination)

2015. *H[ipposideros] camarunensis:* Gunnell, Winkler, Miller, Head, El-Barkooky, Gawad, Sanders, and Gingerich, Hist. Bio., 28 (1 - 2): 163. Publication date: 1 October 2015. (Lapsus)

2018. *Doryrhina camerunensis:* Musila, Monadjem, Webala, Patterson, Hutterer, De Jong, Butynski, Mwangi, Chen and Jiang, Zool. Res. (China), 40 (1): 21 (for 2019). Publication date: 17 October 2018. - Comments: Due to the view that *camerunensis* and *cyclops* are closely related, Musila *et al.* (2018a: 21) provisionally placed this taxon in the genus *Doryrhina*. (Name Combination)

TAXONOMY:
Simmons (2005: 369) as part of the *cyclops* species group.

Mickleburgh *et al.* (2008l) in IUCN (2009) report that there is debate as to whether all the records comprise a single species, or whether there might be two or three different species involved. The records from the Democratic Republic of Congo and Kenya could refer to other, possibly undescribed, species.

COMMON NAMES:
Chinese: 喀麦隆蹄蝠. Czech: pavrápenec kamerunský. English: Cameroon Leaf-nosed Bat, Greater Roundleaf Bat, Greater Cyclops, Eisentraut's Leaf-nosed Bat. French: Phyllorine du Cameroun, Phyllorine d'Eisentraut. German: Kamerun-Rundblattnase, Kamerun-Blattnase.

CONSERVATION STATUS:
Global - Listed as Data Deficient (DD ver 3.1 (2001)) in view of continuing uncertainties as to its taxonomic status, extent of occurrence and ecological requirements (Mickleburgh *et al.*, 2008l; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) (Mickleburgh *et al.*, 2008l; IUCN, 2009). 2004 - DD ver 3.1 (2001) (Mickleburgh *et al.*, 2004ac; IUCN, 2004). 1996 - LR/nt (Baillie and Groombridge, 1996).

MAJOR THREATS:
If it is a forest-dependent species, then it is probably suffering from ongoing forest loss. If future taxonomic studies show it to be restricted to Mount Cameroon, then it could be seriously threatened by habitat destruction (Mickleburgh *et al.*, 2008l; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008l) [in IUCN (2009)] report that no conservation measures are currently in place. It is not known from any protected areas. Taxonomic studies are urgently needed to determine whether or not the three recorded localities all refer to the same species.

GENERAL DISTRIBUTION:
Hipposideros camerunensis is known only from three localities: Buea in Cameroon (type locality); Shabunda in eastern Democratic Republic of Congo; and at the Kakamega Forest in western Kenya close to Lake Victoria. If it is a single species, then it is likely to be found in future in intervening locations. Its elevational range is from sea-level to 500 m, and probably higher.

Native: Cameroon (Eisentraut, 1956b, 1963, 1973); Congo (The Democratic Republic of the); Kenya (Schlitter *et al.*, 1986).

ECHOLOCATION:
Webala *et al.* (2019: 15) reported a F value of 50.8 kHz for a male and 51.1 kHz for a female the Kakamega Forest (Kenya). The duration of the calls was 24.5 to 27.7 msec for the male's call and 23.1 to 27.1 msec for the female's.

HABITAT:
The Kakamega specimen was captured in 'Intermediate Evergreen Forest' (Schlitter *et al.*, 1986).

ROOST:
The type specimens were taken from a hollow tree (Eisentraut, 1963).

POPULATION:
Structure and Density - Very little known about the species. It is known form only three records in a general region that is not widely surveyed (Mickleburgh *et al.*, 2008l; IUCN, 2009).
Trend - 2008 - Unknown (Mickleburgh *et al.*, 2008l; IUCN, 2009).

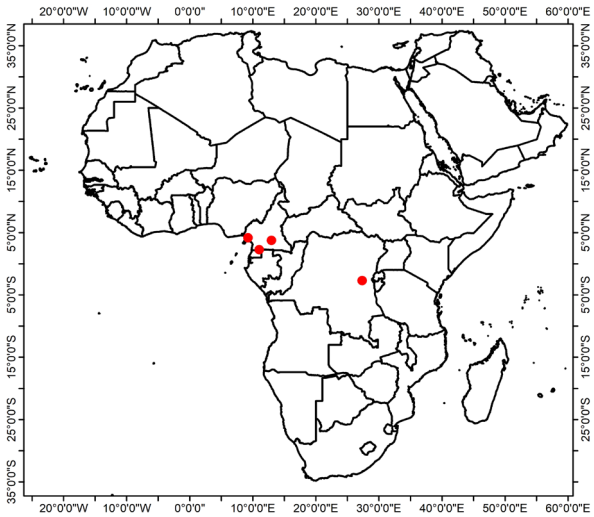

Figure 57. Distribution of *Hipposideros camerunensis*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Cameroon, Congo (Democratic Republic of the).

Hipposideros cf. centralis Andersen, 1906

2016. *Hipposideros cf. centralis:* Kruskop, Benda, Vasenkov and Lavrenchenko, Lynx, 47: 56.

TAXONOMY:
Generally, this taxon is considered to be a subspecies of *H. ruber*, but Kruskop *et al.* (2016: 57) consider the large-sized NE African individuals from the *H. caffer* group to represent a separate species, although they indicate that a genetic comparison with specimens from Uganda and NE DRC is still required.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Ethiopia.

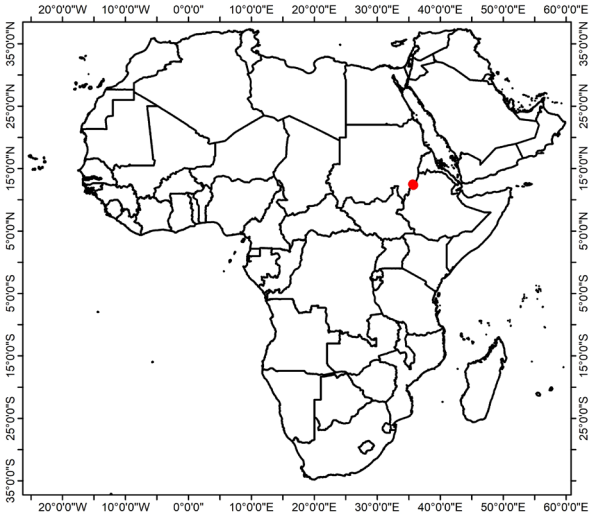

Figure 58 Distribution of *Hipposideros* cf. *centralis*

Hipposideros curtus G.M. Allen, 1921

*1921. *Hipposideros curtus* G.M. Allen, Rev. Zool. afr., 9 (2): 194. Publication date: December 1921. Type locality: Cameroon: Littoral province: on the Sanaga River: Sakbayeme [04 02 N 10 35 E] [Goto Description]. Holotype: MCZ 19305: ad ♀, alcoholic (skull not removed). Collected by: Rév. George W. Schwab; collection date: 1920. See Helgen and McFadden (2001: 142). - Comments: The cover of issue 9 (2) mentions 15 October 1921 as publication date, but the actual date might be December 1921. (Current Combination)

1937. *Hipposideros sandersoni* Sanderson, Animal Treasure, 290 (fig.), p. 296. Publication date: September 1937. Type locality: Cameroon: near Mamfe [05 47 N 09 18 E]. - Comments: ("bluish-grey and small"). The type locality (Mamfe) was originally situated in Nigeria, but is currently located in Cameroon.

TAXONOMY:
Simmons (2005: 370) placed it as part of the *bicolor* species group. Includes *sandersoni* (Hill, 1963a: 60).

The taxonomic relationship between *Hipposideros curtus* and *H. vittatus* is unclear and needs further investigation (Mickleburgh *et al.*, 2008dj; IUCN, 2009).

COMMON NAMES:
Czech: pavrápenec krátkoocasý. English: Short-tailed Leaf-nosed Bat, Short-tailed Roundleaf Bat. French: Phyllorine à queue courte. German: Kurzschwanz-Rundblattnase.

CONSERVATION STATUS:
Global - Listed as Vulnerable (VU B2ab(iii) ver 3.1 (2001)) because its area of occupancy (cave roosting localities) is probably less than 2,000 km², its distribution is severely fragmented, and there is continuing decline in the extent and quality of its habitat (Mickleburgh *et al.*, 2008dj; IUCN, 2009).

Assessment History -
2008 - VU B2ab(iii) ver 3.1 (2001) (Mickleburgh *et al.*, 2008dj; IUCN, 2009). 2004 - VU A3c ver 3.1 (2001) (Mickleburgh *et al.*, 2004da; IUCN, 2004). 1996 - LR/nt (Baillie and Groombridge, 1996).

MAJOR THREATS:
Threats to this species include ongoing forest loss, and disturbance of cave roosting sites. A number of the few known roosts have already been deserted presumably because of disturbance (Mickleburgh *et al.*, 2008dj; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008dj) [in IUCN (2009)] report that this species has not been recorded from any protected areas. There is an urgent need to protect any important roosting site, and to maintain suitable foraging habitat in the vicinity of these. Further field surveys are needed to locate additional populations of this species, and to determine if the species is present in Nigeria.

GENERAL DISTRIBUTION:
Hipposideros curtus is restricted to southwestern Cameroon and Equatorial Guinea (both Bioko island and Rio Muni). The species might be present in Nigeria, however, this needs confirmation. It is a lowland species found at elevations from sea-level to 500 m.

Native: Cameroon (Eisentraut, 1973); Equatorial Guinea (Bioko) (Juste B. and Ibáñez, 1994b).
Presence uncertain: Nigeria.

POPULATION:
Structure and Density - Has been rarely recorded and is known only from a few locations (Mickleburgh *et al.*, 2008dj; IUCN, 2009).
Trend - 2008 - Decreasing (Mickleburgh *et al.*, 2008dj; IUCN, 2009).

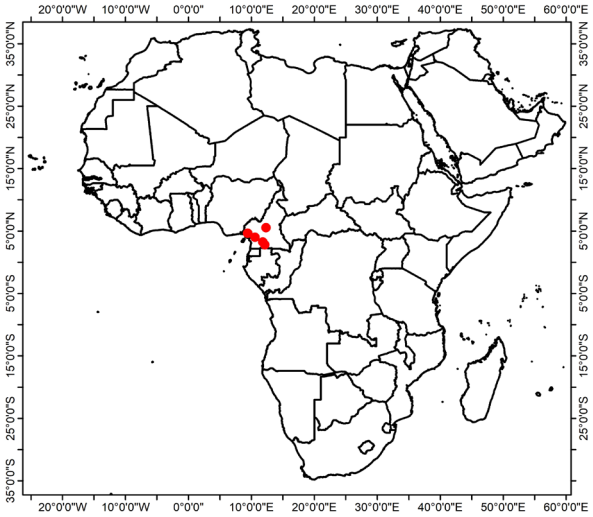

Figure 59. Distribution of *Hipposideros curtus*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Cameroon.

Hipposideros fuliginosus (Temminck, 1853)

*1853. *Phyllorrhina fuliginosa* Temminck, Esquisses zoologiques sur la Côte de Guiné. 1e partie, les Mammifères, 77. Publication date: 1853. Type locality: Ghana: "Ghana" [Goto Description]. - Comments: Allen (1939a: 81) mentioned the type locality as "La côte de Guiné". Grubb *et al.* (1998: 79) mention the type locality as "La Côte de Guiné". Jentink (1888b: 167) gave it as 'Côte d'Or, Pays des Aschantes.').
1895. *Phyllorhina fuliginosa:* Bocage, J. Sci. mat. phys. nat., ser. 2, 4 (8): 4. Publication date: December 1895. (Name Combination)
2014. *Hipposideros fuliganosas:* Chawana, Alagaili, Patzke, Spocter, Mohammed, Kaswera, Gilissen, Bennett, Ihunwo, and Manger, Neuroscience, 277: 725. Publication date: 26 September 2014. (Lapsus)
2016. *Hipposideros fulginosus:* Simmons, Seiffert and Gunnell, Am. Mus. Novit., 3857: 42. Publication date: 9 May 2016. (Lapsus)
? *Hipposideros fuliginosus:* (Name Combination, Current Combination)

TAXONOMY:
Simmons (2005: 371) as part of the *bicolor* species group.

Populations from central Africa may well represent a different species from those in western central (west of about 15°) and the Ethiopian records represent another, possibly undescribed, species (Mickleburgh *et al.*, 2008da in IUCN, 2009) based on J. Fahr *pers. comm.*). Herkt *et al.* (2017: Appendix S9) indicate that genetic tests evaluating the distinct species status are still lacking, and no clear major geographic gap between both putative species ranges can be discerned.

COMMON NAMES:
Czech: pavrápenec sazový. English: Sooty Leaf-nosed Bat, Sooty Roundleaf Bat, Dusky leaf-nosed bat. French: Phyllorine sombre, Phyllorine fuligineuse, Phyllorhine fuligineux. German: Temmincks Rundblattnase, Rußfarbene Rundblattnase.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008da; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2008da; IUCN, 2009). 2004 - NT ver 3.1 (2001) (Mickleburgh *et al.*, 2004cp; IUCN, 2004). 1996 - LR/nt (Baillie and Groombridge, 1996).

MAJOR THREATS:
The major threat to this species is deforestation or degradation of its habitat. Presumably this is largely a result of logging operations and the conversion of land to agricultural use (Mickleburgh *et al.*, 2008da; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008da) [in IUCN (2009)] report that although there are no specific conservation measures in place for this bat, it is presumably present in several protected areas. There is a specific need to maintain large trees as roosting sites for the species. Further studies are needed into the taxonomy, distribution, natural history and possible additional threats to this species.

GENERAL DISTRIBUTION:
Hipposideros fuliginosus has been recorded in West Africa and Central Africa. It ranges from Guinea and Sierra Leone in the west, and has been recorded from Liberia, Côte d'Ivoire, Ghana and Nigeria. In Central Africa it is distributed in southern Cameroon, with scattered records from Gabon, Central African Republic, northern parts of Democratic Republic of the Congo and western Uganda. It is generally a lowland species, being recorded up to 500 m asl.

Native: Cameroon (Eisentraut, 1973); Congo (The Democratic Republic of the) (Hayman *et al.*, 1966; Monadjem *et al.*, 2010d: 538); Côte d'Ivoire; Gabon; Ghana (Decher and Fahr, 2007: 16); Guinea (Fahr and Ebigbo, 2003: 128; Decher *et al.*, 2016: 265); Guinea-Bissau (Rainho and Ranco, 2001: 58); Liberia (Koopman, 1989b; Koopman *et al.*, 1995); Nigeria; Sierra Leone; Uganda.
Presence uncertain: Central African Republic; Congo; Equatorial Guinea.

DETAILED MORPHOLOGY:
Brain:
Adult hippocampal neurogenesis was studied by Chawana R. *et al.* (2016: 1551).

ECHOLOCATION:
In Guinea Fahr and Ebigbo (2003) reported the frequency of the CF-component at 122.5 ± 1.3 (120.0 - 123.3) kHz.

POPULATION:
Structure and Density - There is little information on its overall abundance. It is usually found in small groups, but sometimes in congregations of up two hundred bats (Mickleburgh *et al.*, 2008da; IUCN, 2009).
Trend - 2008 - Decreasing (Mickleburgh *et al.*, 2008da; IUCN, 2009).

PARASITES:
DIPTERA:
Streblidae: *Raymondia huberi huberi* Frauenfeld, 1855 (Shapiro *et al.*, 2016: 254). *Raymondia seminuda* Jobling, 1954 in southern Nigeria (Haeselbarth *et al.*, 1966: 103).

VIRUSES:
Paramyxoviridae
Mortlock *et al.* (2015: 1841) reported that three out of 21 examined *H. fuliginosus* specimens from the DRC tested positive for *Paramyxovirus* sequences.

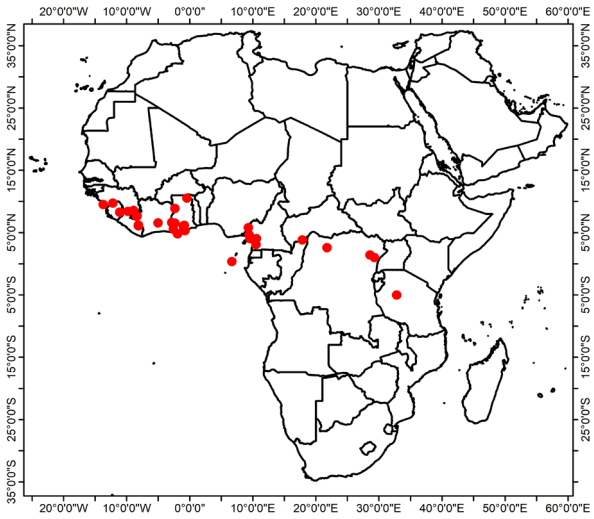

Figure 60. Distribution of *Hipposideros fuliginosus*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Cameroon, Central African Republic, Congo (Democratic Republic of the), Côte d'Ivoire, Ethiopia, Gabon, Ghana, Guinea, Liberia, São Tomé and Principé, Senegal, Sierra Leone, Tanzania.

Hipposideros jonesi Hayman, 1947

*1947. *Hipposideros jonesi* Hayman, Ann. Mag. nat. Hist., ser. 11, 14 (109): 71, fig. 1. Publication date: 19 November 1947. Type locality: Sierra Leone: Makeni [08 57 N 12 02 W] [Goto Description]. Holotype: BMNH 1947.629: ad ♀, skull and alcoholic. Collected by: Theo Simpson Jones; collection date: 12 December 1946; original number: 42. - Etymology: In honour of Mr. T.S. Jones, the collector of the type specimen. (Current Combination)

TAXONOMY:
Simmons (2005: 373) as part of the *bicolor* species group.

COMMON NAMES:
Czech: pavrápenec Jonesův. English: Jones' Leaf-nosed Bat, Jones' Roundleaf Bat, Jones's Roundleaf Bat, Western Africa leaf-nosed bat. French: Phyllorine de Jones, Phyllorine d'Afrique occidentale. German: Jones' Rundblattnase.

CONSERVATION STATUS:
Global - Listed as Near Threatened (NT ver 3.1 (2001)) since the species depends on caves for roost sites, and the area of occupancy might not be much greater than 2,000 km^2. The quality of its limited roosting habitat is likely to be declining through disturbance of caves, thus making the species close to qualifying for Vulnerable under criterion B2 (Mickleburgh *et al.*, 2008au; IUCN, 2009).

Assessment History -
2008 - NT ver 3.1 (2001) Mickleburgh *et al.*, 2008au; IUCN, 2009). 2004 - NT ver 3.1 (2001) (Mickleburgh *et al.*, 2004br; IUCN, 2004). 1996 - LR/nt (Baillie and Groombridge, 1996).

MAJOR THREATS:
The species is generally threatened by the disturbance of roosting caves and might additionally be threatened by subsistence hunting although this needs to be confirmed (Mickleburgh *et al.*, 2008au; IUCN, 2009). Nkrumah *et al.* (2018: 755) indicate that *H. jonesi* is a generalist in the Kwamang agro-ecosystem of Ghana, and as such, might not be sensitive to increased disturbance. However, they also mention that their results need to be cautiously interpreted.

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008au) [in IUCN (2009)] report that there appear to be no direct conservation measures in place for this species. It is not known if the species is present within any protected areas. There is a need to conserve important roosts for this species. Additional studies are needed into the distribution, natural history and threats to this species.

GENERAL DISTRIBUTION:
Hipposideros jonesi is a West African endemic, closely associated with caves. It has been recorded from Sierra Leone and Guinea to Mali, Burkina Faso, Ghana and Nigeria. It is found between sea level and 1,400 m asl.

Native: Burkina Faso (Kangoyé *et al.*, 2015a: 608); Côte d'Ivoire; Ghana; Guinea (Decher *et al.*, 2016: 265); Liberia (Fahr, 2007a: 104); Mali; Nigeria (Happold, 1987); Sierra Leone (Hayman, 1947d; Grubb *et al.*, 1998).

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Young (1975: 76) indicates that two distinct colour phases can be found: rufous (orange) and grey.

MOLECULAR BIOLOGY:
DNA - Unknown
Karyotype - Koubínová *et al.* (2010b) report for on a single male from Senegal, 2*n*= 32, Fna= 60 and FN= 64, these included 30 biarmed autosomes, including four metacentric, eight submetacentric and three subtelocentric, eight submetacentric and three subtelocentric pairs. A secondary constriction situated near the centromere was observed in one pair of the medium-sized submetacentric autosomes (approximately the 9th largest pair). The X chromosome was identified as a large metacentric element, the Y chromosome as a medium submetacentric.
Protein / allozyme - Unknown.

HABITS:
Lawer and Darkoh (2016: 429) found that this bat's activity declined with increasing lunar illumination, indicating that bright moonlight suppresses the nocturnal activities of both insectivorous bats and insects. They also found a negative association between wind speed and overal insectivorour bat activity (p. 430).

ROOST:
Weber and Fahr (2006: 4) indicate that in Guinea *H. jonesi* largely or exclusively depends on the availability of caves as day roosts.

DIET:
In the Kwamang agro-ecosystem in Ghana, E.K. Badu (in Nkrumah *et al.*, 2018: 755) found that the diet of *H. jonesi* consists of nearly 100 % Lepidoptera.

POPULATION:
Structure and Density - This species forms roosts of only a few animals, usually in the dozens rather than hundreds. There is a pronounced geographic morphological variation between populations, suggesting that there may be little movement of animals between populations (Mickleburgh *et al.*, 2008au; IUCN, 2009).
Trend - 2008 - Decreasing (Mickleburgh *et al.*, 2008au; IUCN, 2009).

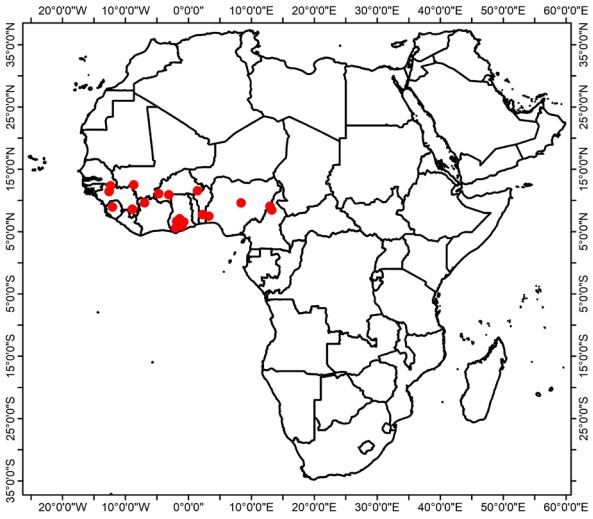

Figure 61. Distribution of *Hipposideros jonesi*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Benin, Burkina Faso, Cameroon, Côte d'Ivoire, Ghana, Guinea, Liberia, Mali, Nigeria, Senegal, Sierra Leone.

Hipposideros lamottei Brosset, 1985

*1985. *Hipposideros lamottei* Brosset, Mammalia, 48 (4): 548 (for 1984). Publication date: 1985. Type locality: Guinea: Mount Nimba: Pierré Richaud [07 41 N 08 22 W] [Goto Description]. Holotype: MNHN ZM-MO-1984-487: ad ♂. Collected by: André Brosset; collection date: December 1983. Paratype: MHNG ad ♂. Collected by: André Brosset; collection date: December 1983. Paratype: MNHN ZM-MO-1984-488: ad ♂. Collected by: André Brosset; collection date: December 1983. Paratype: MNHN ZM-MO-1984-489: ad ♂. Collected by: André Brosset; collection date: December 1983. (Current Combination)

TAXONOMY:
Simmons (2005: 373) *bicolor* species group. Distinction from *H. ruber* is not entirely clear (Koopman, 1993a: 173; Koopman *et al.*, 1995; Simmons, 2005: 373). Monadjem *et al.* (2013b: 341) state that, morphologically, *H. lamottei* falls within the *caffer/ruber* group.

COMMON NAMES:
Czech: pavrápenec nimbánský. English: Lamotte's Leaf-nosed Bat, Lamotte's Roundleaf Bat, Mount Nimba Leaf-nosed Bat. French: Phyllorine de Lamotte, Phyllorine du Mont Nimba. German: Mount Nimba-Rundblattnase, Lamottes Rundblattnase.

CONSERVATION STATUS:
Global - Listed as Critically Endangered (CE B1ab(I,ii,iii,iv,v)+2ab(I,ii,iii,iv,v) ver 3.1 (2001)) because its extent of occurrence is probably less than 100 km^2 and its area of occupancy (cave roosting sites) is likely to be less than 10 km^2, all individuals are in a single location (Mount Nimba), and there is continuing decline in the extent and

quality of its habitat (Mickleburgh *et al.*, 2008av; IUCN, 2009).
Kouame *et al.* (2012: 2748) indicate that *H. lamottei* is a highly threatened species, which only occurs in one single KBA [= Key Biodiversity Area] in the Upper Guinea Forest: Mount Nimba.
Collen *et al.* (2011: 2616) rank it on position 62 (as only African mainland Chiropteran) out of 100 mammal species requiring urgent conservation attention.

Assessment History -
2008 - CE B1ab(I,ii,iii,iv,v)+2ab(I,ii,iii,iv,v) ver 3.1 (2001) (Mickleburgh *et al.*, 2008av; IUCN, 2009). 2004 - CR B1ab(iii) ver 3.1 (2001) (Mickleburgh *et al.*, 2004bs; IUCN, 2004). 1996 - DD (Baillie and Groombridge, 1996).

MAJOR THREATS:
The species is believed to be highly threatened because of extensive iron ore mining activities underway, and planned, within its limited range on Mount Nimba. It is probably additionally threatened by general deforestation in parts of its range. Indiscriminate subsistence hunting of bats for food occurs in caves on Mount Nimba and likely impacts this species (Mickleburgh *et al.*, 2008av; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008av) [in IUCN (2009)] report that it is present within the Mount Nimba Strict Nature Reserve World Heritage Site. There is a need to enforce the protection of this area. Additional surveys are needed to learn more about the distribution, natural history and threats to this species.

GENERAL DISTRIBUTION:
Known only from Mt. Nimba on Guinea-Liberia border, but probably more widespread. However, Fahr (2007a: 104) and Decher and Fahr (2007: 5) indicate that specimens from Liberia, Ghana, Sierra Leone and Cameroon (mentioned by Koopman *et al.*, 1995 and Grubb *et al.*, 1998) were re-identified as belonging to *H. caffer*. They restrict the distribution of *lamottei* to the Guinean side of Mt. Nimba. It has been recorded between 500 and 1,400 m asl.

Native: Guinea (Brosset, 1985; Denys *et al.*, 2013: 284).

ECHOLOCATION:
Monadjem *et al.* (2013b: 351) report a F_{max} of 119.0 (118 - 120) kHz for two specimens from Mount Nimba.

POPULATION:
Structure and Density - Only six specimens are currently known from two localities (Mickleburgh *et al.*, 2008av; IUCN, 2009).
Trend - 2008 - Decreasing (Mickleburgh *et al.*, 2008av; IUCN, 2009).

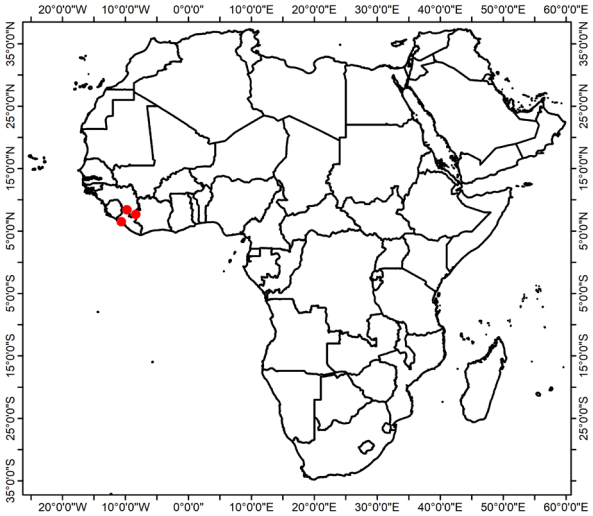

Figure 62. Distribution of *Hipposideros lamottei*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Guinea, Liberia.

Hipposideros marisae Aellen, 1954

*1954. *Hipposideros marisae* Aellen, Rev. suisse Zool., 61 (24): 474. Type locality: Côte d'Ivoire: Duékoué: White Leopard Rock [Goto Description]. Holotype: [Unknown] ad ♂. Collection date: 13 May 1953; original number: 400. See Aellen (1954: 474). - Comments: Type locality original: roche de la Panthère Blanche. - Etymology: In honour of Mrs. Aellen (Aellen, 1954: 474). (Current Combination)

TAXONOMY:
Simmons (2005: 374) as part of the *bicolor* species group. Monadjem *et al.* (2013b: 346) indicate that *H. marisae* is a sistergroup to *H. jonesi*.

COMMON NAMES:
Czech: pavrápenec Aellenův. English: Marisa's Leaf-nosed Bat, Aellen's Leaf-nosed Bat, Aellen's Roundleaf Bat. French: Phyllorine d'Aellen. German: Marisas Rundblattnase.

CONSERVATION STATUS:
Global - Listed as Vulnerable (VU B2b(ii,iii,iv,v) ver 3.1 (2001)) because its area of occupancy is probably less than 2,000 km^2, its distribution is possibly severely fragmented (roosting sites), there is continuing decline in the quality of its cave habitats (through disturbance), and there is likely to be a corresponding decline in subpopulations and individuals (with over hunting likely at some colonies) (Mickleburgh *et al.*, 2008aw; IUCN, 2009).

Assessment History -
2008 - VU B2b(ii,iii,iv,v) ver 3.1 (2001) (Mickleburgh *et al.*, 2008aw; IUCN, 2009). 2004 - EN A4c ver 3.1 (2001) (Mickleburgh *et al.*, 2004bt; IUCN, 2004). 1996 - VU (Baillie and Groombridge, 1996).

MAJOR THREATS:
The species is threatened by general deforestation, mining operations on Mount Nimba and the disturbance of roosting caves. It is likely harvested for subsistence use as food (Mickleburgh *et al.*, 2008aw; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008aw) [in IUCN (2009)] report that it is present within the Mount Nimba Strict Nature Reserve World Heritage Site. There is a need to protect important roost sites and areas of suitable forest habitat. Further studies are needed into the distribution of this species.

GENERAL DISTRIBUTION:
This West African species has been recorded from seven localities in Guinea, Liberia (central and western uplands), and Côte d'Ivoire, and two localities in Sierra Leone. It may range into Ghana, although there is no record from this country (Grubb *et al.*, 1998). It is a lowland species recorded between sea level and 650 m asl.

Native: Côte d'Ivoire (Aellen, 1954); Guinea; Liberia (Kuhn, 1965; Hill, 1982a; Wolton *et al.*, 1982; Koopman *et al.*, 1995; Monadjem and Fahr, 2007: 53); Sierra Leone (Weber *et al.*, 2019: 22 - first record). Presence uncertain: Ghana.

ECHOLOCATION:
Monadjem *et al.* (2013b: 351) report F_{max} to be 146.0 kHz at Mount Nimba.

In Sierra Leone, Weber *et al.* (2019: 21) recorded two females calling at 142.5 (141.0 - 144.0) kHz and two males at 146.5 (146.0 - 147.0) kHz.

HABITAT:
Weber *et al.* (2019: 22) indicate that this is an extremely rare species, which might depend on suitable caves as day roost and forest habitats.

POPULATION:
Structure and Density - It is generally considered to be a very rare species (Mickleburgh *et al.*, 2008aw; IUCN, 2009). Monadjem *et al.* (2013b: 342) state that this species has not been captured nor seen since 1990.

Trend - 2008 - Decreasing (Mickleburgh *et al.*, 2008aw; IUCN, 2009).

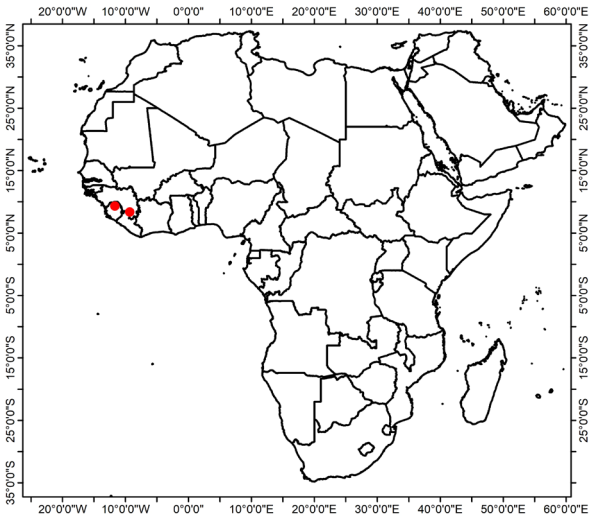

Figure 63. Distribution of *Hipposideros marisae*

Hipposideros megalotis (Heuglin, 1861)

*1861. *Phyllorrhina megalotis* Heuglin, Nov. Act. Acad. Cæs. Leop.-Carol., 29 (8): 4, 8. Publication date: 1861. Type locality: Eritrea: Bogos country [=Keren region] [ca. 15 45 N 38 20 E] [Goto Description]. Holotype: SMNS 984: ad ♂, skull and alcoholic. Collected by: Martin Theodor von Heuglin; collection date: 1861. Presented/Donated by: ?: Collector Unknown. See: Dieterlen *et al.* (2013: 294). - Comments: Type specimen: SMNS, ???. Horácek *et al.* (2000: 98) mention "Monatsber. Königl. Preuss. Akad. Wiss. Berlin: 329". Nancy Simmons (pers. comm.) checked this and rejected this reference. - Etymology: From the Greek adjective "*μέγα*" (méga), meaning "big" and the neuter Greek substantive "*οὖς*" (genitive "*ώτός*", "*ûs*", "*ōtós*"), meaning "ear" referring to the large ears of the species (see Lanza *et al.*, 2015: 145).

? *Hipposideros megalotis:* (Name Combination, Current Combination)

TAXONOMY:
Placed in the subgenus *Syndesmotis* by Legendre (1982), Gaucher and Brosset (1990) and Horácek *et al.* (2000: 98) include it with a question mark). Horácek *et al.* (2000: 98) as part of the *megalotis* species group, followed by Simmons (2005: 374).

COMMON NAMES:
Chinese: 串耳蹄蝠. Czech: pavrápenec ušatý. English: Large-eared Leaf-nosed Bat, Ethiopian Large-eared Leaf-nosed Bat, Ethiopian Large-eared Roundleaf Bat, Big-eared leaf-nosed bat. French: Phyllorine à grandes oreilles d'Ethiopie, Phyllorine à grandes oreilles. German: Großohr-Rundblattnase. Italian: Ipposìdero orecchiùto.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) because, although it is seldom recorded, it has a relatively wide distribution, is tolerant of a range of habitats, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008ax; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2008ax; IUCN, 2009). 2004 - NT ver 3.1 (2001) (Mickleburgh *et al.*, 2004bu; IUCN, 2004). 2000 - LR/nt (Hilton-Taylor, 2000). 1996 - LR/lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
The threats to this species remain poorly known. Its is suspected to be threatened by habitat loss resulting from the conversion of land to agricultural use, and by disturbance of roosting sites (Mickleburgh *et al.*, 2008ax; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008ax) [in IUCN (2009)] report that there are no direct conservation measures in place for this species. It is not known if the species is present in any protected areas. Additional studies are needed into the distribution, abundance, general ecology and threats to this little-known species.

GENERAL DISTRIBUTION:
Hipposideros megalotis has been reported from Eritrea (including the type locality of Keren (Heuglin, 1861)), Ethiopia (including Sidamo in southern Ethiopia (Hayman and Hill, 1971)), Kenya (where it has been recorded from the localities of Kinangop and Nakuru (Hayman, 1954)), Somalia, Djibouti (Heuglin, 1861; Pearch *et al.*, 2001) and from Jeddah in Saudi Arabia (Gaucher and Brosset, 1990). It has been reported at elevations of up to 2,000 m asl.

Native: Djibouti (Heuglin, 1861; Pearch *et al.*, 2001); Eritrea (Heuglin, 1861); Ethiopia (Hayman and Hill, 1971); Kenya (Hayman, 1954); Saudi Arabia (Gaucher and Brosset, 1990).
Presence uncertain: Somalia (Senna, 1905).

POPULATION:
Structure and Density - Little is known about the population of this species. Very few animals have ever been recorded (Mickleburgh *et al.*, 2008ax; IUCN, 2009).
Trend - 2008 - Unknown (Mickleburgh *et al.*, 2008ax; IUCN, 2009).

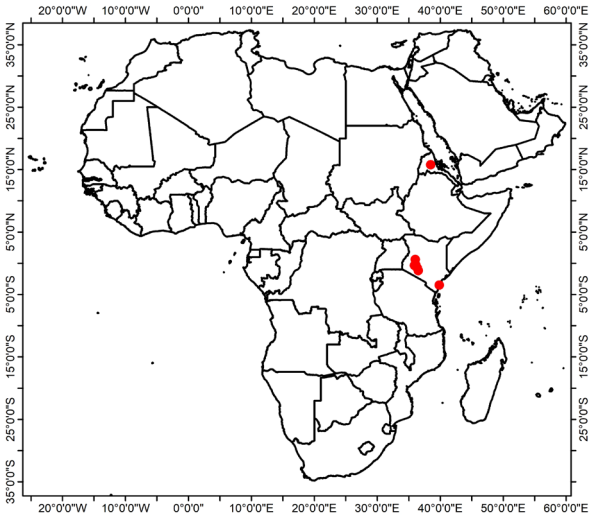

Figure 64. Distribution of *Hipposideros megalotis*

Hipposideros ruber (Noack, 1893)

*1893. *Phyllorhina rubra* Noack, Zool. Jahrb. Abt. Syst. Oekol. Geogr. Tiere, 7: 586, pl. 18, fig. 14, 15. Publication date: 23 December 1893. Type locality: Tanzania: Eastern province: Ngerengere River [ca 07 00 S 38 00 E]. Holotype: ZMB 89571: skin only. Collected by: Dr. Emin Pasha; collection date: 20 May 1890. Formerly Noack collection number 5, see Turni and Kock (2008: 38). Holotype: ZMB no number: skin only. Collected by: Dr. Emin Pasha; collection date: 20 May 1890. Formerly Noack collection number 5; see Turni and

Kock (2008: 38). - Comments: Allen (1939a: 81) mentioned the type locality as "Lugerrunjere Fluss, Tanganyika Territory". Grubb *et al.* (1998: 80) mention the type locality as "Lugerrunjere Fluss = Ngerengere River, Tanzania - probably Ngerengere village, 32 miles east of Morogor according to Swynnerton, 1945, Proc. Zool. Soc. Lond., 115: 69". - Etymology: From the Latin "*ruber*" meaning red.

1906. *Hipposiderus caffer centralis* K. Andersen, Ann. Mag. nat. Hist., ser. 7, 17 (99): 275, 277. Publication date: 1 March 1906. Type locality: Uganda: Entebbe [Ntebbi] [00 04 N 32 28 E, 3 800 ft] [Goto Description]. Holotype: BMNH 1899.8.4.8: ad ♂, skin only. Collection date: 5 April 1893. Presented/Donated by: Sir Frederic John Jackson.

1906. *Hipposiderus caffer guineensis* K. Andersen, Ann. Mag. nat. Hist., ser. 7, 17 (99): 275, 278. Publication date: 1 March 1906. Type locality: Gabon: 70 mi (105 km) from Gaboon: Como River [ca. sea level] [Goto Description]. Holotype: BMNH 1897.12.1.11: ad ♀, skin only. Collected by: George Latimer Bates Esq. Collection date: 3 June 1897; original number: GLB 215. Note: caught under large rock, Fang name- Otan. - Comments: Considered a valid subspecies by Grubb *et al.* (1998: 80).

1917. *Hipposideros caffer niapu* J.A. Allen, Bull. Am. Mus. Nat. Hist., 37 (18): 431. Publication date: 29 September 1917. Type locality: Congo (Democratic Republic of the): NE Congo: Niapu [02 25 N 26 28 E] [Goto Description]. Holotype: AMNH 49414: ad ♂, skull and alcoholic. Collected by: Herbert Lang, James Paul Chapin and The American Museum Congo Expedition; collection date: 27 January 1914; original number: 2322. Topotype: MCZ 17224: ♂, alcoholic (skull not removed). Collected by: Herbert Lang, James Paul Chapin and The American Museum Congo Expedition; collection date: 27 February 1914. Presented/Donated by: ?: Collector Unknown.

2016. *Hipposideros aff. ruber:* Nkrumah, Vallo, Klose, Ripperger, Badu, Drosten, Kalko, Tschapka and Oppong, Acta Chiropt., 18 (1): 239. Publication date: June 2016. - Comments: Nkrumah *et al.* (2016b: 3) indicate that this is the same form as "*H. ruber* lineage D from Vallo *et al.* (2009: 196), and which is evolutionarily distant to *Hipposideros ruber* s. str. from East Africa. (Name Combination)

2018. *H[ipposideros] rubber:* Malekani, Musaba, Gembu, Bugentho, Toengaho, Badjedjea, Ngabu, Mutombo, Laudisoit, Ewango, Van Cakenberghe, Verheyen, Asimonyo, Masudi, Bongo and Ngbolua, Nat. Conserv. Res., 3 (1): 67.. Publication date: January 2018. (Lapsus)

2018. *Hip[posideros] caffer rufer:* Bourgarel, Pfukenyi, Boué, Talignani, Chiweshe, Diop, Caron, Matope, Missé and Liégeois, Infec. Gen. Evol., 58: 255. Publication date: 10 January 2018. (Lapsus)

? *Hipposideros caffer guineensis:*

? *Hipposideros caffer ruber:* (Name Combination)

? *Hipposideros ruber centralis:* (Name Combination)

? *Hipposideros ruber guineensis:* (Name Combination)

? *Hipposideros ruber niapu:* (Name Combination)

? *Hipposideros ruber ruber:* (Name Combination)

? *Hipposideros ruber:* (Name Combination, Current Combination)

TAXONOMY:

Simmons (2005: 376) recognised it as part of the *bicolor* species group, and indicated that the subspecies limits are problematic, and it possible that this species complex includes more than one species. Vallo *et al.* (2007: 257; 2009: 193) indicate that two sympatric lineages exist in *ruber* based on analysis of complete sequences of the mitochondrial gene for cytochrome *b*, with possibly a third form in West Africa. Mitochondrial DNA analyses on specimens from the Niokolo Koba National Park in Senegal indicated that two distinct lineages of *H.* aff. *ruber* exists in that area (Vallo *et al.*, 2011b: 84).

Decher *et al.* (2016: 265) indicate that they provisionally include all Simandou records (Guinea), previously named *H. caffer* or *H. ruber* in *H.* cf. *ruber*.

Nkrumah *et al.* (2016a: 240) used *H.* aff. *ruber* for their Ghanaian specimen as their cytochrome *b* genotype belongs to the D lineage, which is rather distant from *H. ruber* s.s. from East Africa. Nkrumah *et al.* (2017: 348) assigned their Ghanaian bats to *H.* cf. *ruber* as these include multiple genetic lineages.

COMMON NAMES:

Chinese: 诺氏蹄蝠. English: Noack's Leaf-nosed Bat, Noack's Roundleaf Bat, Red Leaf-nosed Bat.

French: Phyllorine rouge, Phyllorine de Noack. German: Noacks Rundblattnase, Kamerun-Blattnase.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008ay; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2008ay; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2004bv; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
The species is locally threatened by the loss and conversion of suitable habitat. It is also threatened in parts of its range by collection for subsistence use (Mickleburgh *et al.*, 2008ay; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008ay) [in IUCN (2009)] report that in view of its wide range it seems likely that the species is present in a number of protected areas. It has been recorded from the Manga Forest Reserve of Tanzania (Doggart *et al.*, 1999b). No direct conservation measures are currently needed for this species as a whole.

GENERAL DISTRIBUTION:
Hipposideros ruber is a widespread species recorded throughout much of West, Central, and East Africa and part of southern Africa including Angola, southern Democratic Republic of the Congo, northern and eastern Zambia, southern Malawi and northwestern Mozambique. It is found between sea level and 2,300 m asl.

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 625,018 km^2.

Native: Angola (Hayman, 1963; Crawford-Cabral, 1989; Monadjem *et al.*, 2010d: 538); Benin; Burkina Faso (Kangoyé *et al.*, 2015a 608); Burundi (Hayman *et al.*, 1966); Cameroon; Central African Republic (Lunde *et al.*, 2001: 537); Chad; Congo (Bates *et al.*, 2013: 318 - 1st authenticated records); Congo (The Democratic Republic of the) (Allen, 1917; Römer, 1862; Hayman *et al.*, 1966; Monadjem *et al.*, 2010d: 538) ; Côte d'Ivoire; Equatorial Guinea; Ethiopia; Gabon; Gambia (Emms and Barnett, 2005: 50); Ghana (Decher and Fahr, 2007: 13 - 15); Guinea (Fahr and Ebigbo, 2003: 128; Denys *et al.*, 2013: 283; Decher *et al.*, 2016: 265 mention it as "*Hipposideros cf. ruber*"; Weber and Fahr, 2007); Guinea-Bissau; Kenya; Liberia (Monadjem and Fahr, 2007: 50); Malawi (Happold *et al.*, 1988; Monadjem *et al.*, 2010d: 538); Mali; Mozambique (Monadjem *et al.*, 2010d: 538; Monadjem *et al.*, 2010c: 381); Niger; Nigeria (Happold, 1987; Rwanda (Hayman *et al.*, 1966); Saõ Tomé (Rainho *et al.*, 2010a: 28); Senegal; Sierra Leone; Sudan; Tanzania , United Republic of (Cunneyworth, 1996b; Doggart *et al.*, 1999b); Togo; Uganda (Kityo and Kerbis, 1996: 61); Zambia (Monadjem *et al.*, 2010d: 538).

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Lucati and López-Baucells (2016: Suppl.) report on five albino and nine piebald (all-white fur/skin patches, eyes always normally coloured) specimens from mines in Tanzania (Howell and Mainoya, 1974: 155; Howell, 1980).

ECHOLOCATION:
From Irangi (Kivu province, DRC), Heller (1992: 75) reported that *H. ruber* emitted calls with frequencies between 130 and 140 kHz, distinguishing them from *H. caffer*, which emitted calls at a higher frequency.

Fahr and Ebigbo (2003) reported for an individual of *H* cf. *ruber* from the Simandou Range in southeastern Guinea a CF-component of 146.7 kHz. At Sengwa in Zimbabwe, Jacobs (1996) and Fenton and Bell (1981) reported a highest frequency of 138 kHz. Monadjem *et al.* (2010c: 378) reported from Mozambique that the peak echolocation frequencies ranged between 132 - 136 kHz (ANABAT) and 130.5 kHz (Petterson D240x). Rainho *et al.* (2010a: 21) report the call parameters from Saõ Tomé Island.

Monadjem *et al.* (2013b: 351) report on two lineages of *H.* cf. *ruber* from Mount Nimba: C1 with a F_{max} of 147.7 ± 1.45 (145 - 150) Khz, and E1 with F_{max} of 127.5 (127 - 128) kHz.

Jones and Siemers (2010: 449 - 450) indicated that males emit pulses with a higher frequency than females, and that the CF-frequency is positively related to the body condition (mass/forearm length).

Trentin and Rovero (2011: 56) describe the call from bats at Uzungwa Scarp Forest Reserve, Tanzania, as having a first modulated component starting at 143.9 kHz, which increases to a maximum frequency of 148.6 kHz, which continues for about 7 msecs, and then drops to 121.4 kHz in about 1 msec. The maximum intensity is at 144.8 kHz.

For three Kenyan males and two females, Webala *et al.* (2019: 15) reported F_{max} between 132.6 and 134.5, and 140.4 and 145.3 kHz, whereas the duration ranged from 7.4 to 8.8 and 7.3 to 7.7 msec respectively.

In Sierra Leone, Weber *et al.* (2019: 21) recorded calls from two types of *H. ruber*: **C1** (n=3): 145.7 ± 4.5 (142.0 - 152.0) kHz and **D** 4 FF: 122.5 ± 2.4 (120.0 - 125.0) kHz and 2 MM: 127.0 kHz.

MOLECULAR BIOLOGY:
DNA - Lim (2007), Vallo *et al.* (2007).
Karyotype - Koubínová *et al.* (2010b) report on seven females from Senegal, 2*n*= 32, Fna= 60 and FN= 64, they comprised 30 biarmed autosomes, including four metacentric, eight submetacentric and three subtelocentric, eight submetacentric and three subtelocentric pairs, a secondary constriction situated near the centromere was observed in one pair of the medium-sized submetacentric autosomes (approximately the 9th largest pair). The X chromosome was identified as a large metacentric element, the Y chromosome as a medium submetacentric.
Denys *et al.* (2013: 284) report the following karyotype for a male *H.* cf. *ruber* from the Guinean Mount Nimba area: 2*n* = 32, FNa =60, including 15 pairs of meta- and submetacentric chromosomes. The X chromosome is middle-sized submetacentric and the Y chromosome is small subtelocentric.

Protein / allozyme - Unknown.

HABITAT:
In Ghana, Nkrumah *et al.* (2016b: 5) reported *H.* aff. *ruber* to prefer foraging in seminatural habitats, followed by mixed farm areas, and, to a much lesser extent, tree farms and savanna grasslands.

HABITS:
Russo *et al.* (2010b: 701) report *H. ruber* to be diurnally active on the island of São Tomé, and indicate that adult males were much more active during the daytime than females, whereas during the night the opposite was true, possibly leading to a temporal niche partitioning. Russo *et al.* (2010a: 271) indicate that about one fifth of a colony may be out during daytime, also due to the absence of forest-dwelling avian predators.

In Ghana, Nkrumah *et al.* (2016a: 239) found that during the night, males of *H.* aff. *ruber* returned more often to their cave roosts than females. Based on that data for 13 bats, they calculated the bat's homerange as 36 ± 35 (6 - 95) ha. The foraging range covered 50 % of this and the core area 2 %. Nkrumah *et al.* (2016b: 6) found that females had a night activity pattern that peaks between 6 and 8 p.m., with a smaller peak around midnight and another peak between 5 and 6 a.m. In between the flight duration dropped to almost zero. In males, the activity peaked around 8 p.m., midnight and between 4 and 5 a.m. However, their activity in the first part of the night did only decrease by a maximum of 10 minutes. Nkrumah *et al.* (2017: 350) found that activity patters of the bats differed from cave to cave.

ROOST:
Weber and Fahr (2006: 4) indicate that *H. ruber* largely or exclusively depends on the availability of caves as day roosts in Guinea.

In Ghana, Nkrumah *et al.* (2016a: 239) found that caves were used as main roost, but that *H.* aff. *ruber* also used trees as individual night roosts. In the Mframabuom cave, the roost contained some 3,500 individuals (together with *H. abae, H. jonesi* and *Nycteris* cf. *thebaica*).

DIET:
Bell and Fenton (1984) [in Fenton, 1986a] found that *H. ruber* depends on flutter to find its prey and varies its hunting pattern by taking both flying prey and gleaning targets from surfaces such as foliage and water. They also found no restriction to a specific prey species or size class.

Nkrumah *et al.* (2017: 353) reports that *H.* cf. *ruber* feeds primarlily on Lepidoptera in Ghana.

POPULATION:
Structure and Density - This is one of the most common bats in Africa, with some colonies containing up to 500,000 individuals (Mickleburgh *et al.*, 2008ay; IUCN, 2009).
Trend - 2008 - Unknown (Mickleburgh *et al.*, 2008ay; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
Trentin and Rovero (2011: 50) captured nine lactating and two pregnant females in December 2005 at Uzungwa Scarp Forest Reserve, Tanzania.

In Kwamang (Ghana), the bats gave birth from late March to early May (Nkrumah *et al.*, 2017: 348).

In Sierra Leone, Weber *et al.* (2019: 23) reported two pregnant females (type "**C1**") on 1 and 7 April, and one pregnant (24 March) and one lactating (2 April) female (type "**D**").

PARASITES:
Peralta-Rodríguez *et al.* (2012: 1006) report on the infection of *H. ruber* by *Spirura hipposiderosi* Khalil, 1975 (Nematode) in Tanzania.

In his review of African chiggers (Acari: Trombiculidae), Stekolnikov (2018a: 49, 50, 72, 117, 119, 121, 123, 173, 179, 184) reported the presence of *Whartonia lepidopteriscuta* Vercammen-Grandjean, 1965, *Whartonia oweni* Vercammen-Grandjean and Brennan, 1957, *Riedlinia willmanni* Vercammen-Grandjean and Minter, 1964, *Trombigastia ascoschoengastoides* Vercammen-Grandjean and Fain, 1958, *Trombigastia berghei* Vercammen-Grandjean and Fain, 1958, *Trombigastia laarmani* Vercammen-Grandjean and Fain, 1958 and *Trombigastia minor* Vercammen-Grandjean and Fain, 1958, *Trombigastia scapularia* Vercammen-Grandjean and Fain, 1958, *Trombigastia vinckei* Vercammen-Grandjean and Fain, 1958, *Afrotrombicula machadoi* (Taufflieb, 1962), *Microtrombicula tanzaniae* Goff, 1982, *Myotrombicula bidentipalpis* Vercammen-Grandjean and Fain, 1958, and *Oudemansidium howelli* (Goff, 1983).

Decher *et al.* (2016: 266) found the bat fly *Penicillida allison* Theodor, 1968 (Nycteribiidae) on a Guinean "*H.* cf. *ruber*".

VIRUSES:
Coronaviridae - Coronaviruses
SARS-CoV - See also note under "viruses" for the genus as possiblitiy.
Corman *et al.* (2015: 11859) tested 1,611 Ghanese *H.* cf. *ruber* specimens, of which 62 (3.8 %) tested positive for 229E-related coronavirsues.
Anthony *et al.* (2017b: Suppl.) mention the beta-coronavirus Predict_CoV_20.
Willoughby *et al.* (2017: Suppl.) report Human coronavirus 229E.

Flaviviridae
In Uganda, Kading *et al.* (2018: 3) found neutralizing antibodies against non-specific Flaviviruses.

Hantaviridae (formerly included in Bunyaviridae)
Hantavirus
Witkowski *et al.* (2016: 113) report a new hantavirus from Gabon: Makokou virus (MAKV). Arai *et al.* (2019: 2) tetatively assigned this virus to the genus *Mobatvirus*.

Hepadnaviridiae
Hepatitis B virus (HBV)
Drexler *et al.* (2013c: 16152) report on four out of 51 examined *H.* cf. *ruber* specimens from Gabon that were positive for roundleaf bat HBV (RBHBV). Nie *et al.* (2017: 89) refer to this virus as horseshoe bat HBV (HBHBV).

Paramyxoviridae
Drexler *et al.* (2012a: Suppl. Table S1) reported that two of the 117 specimens they identified as belonging to *H.* cf. *ruber* from Ghana tested positive for *Morbillivirus*. Two of the 337 specimens from Gabon, they identified as *H.* cf. *caffer/ruber* also tested positive for *Morbillivirus* and one other specimen for *Rubulavirus*.

In their overview table, Maganga *et al.* (2014a: 8) report the following viruses were already found on *H.* cf. *ruber*: Rift Valley Fever virus (RVF), Rubulavirus, Morbillivirus unclassified, Coronavirus.

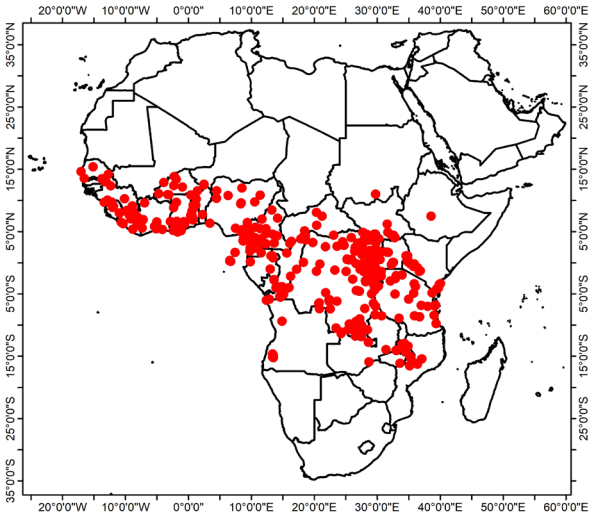

Figure 65. Distribution of *Hipposideros ruber*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Angola, Benin, Burkina Faso, Burundi, Cameroon, Central African Republic, Congo, Congo (Democratic Republic of the), Côte d'Ivoire, Equatorial Guinea, Ethiopia, Gabon, Ghana, Guinea, Kenya, Liberia, Malawi, Mali, Mozambique, Niger, Nigeria, Rwanda, São Tomé and Principé, Senegal, Sierra Leone, South Sudan, Sudan, Tanzania, The Gambia, Togo, Uganda, Zambia.

Hipposideros tephrus (Cabrera, 1906)

1861. *Phyllorrhina bicornis* Heuglin, Nov. Act. Acad. Cæs. Leop.-Carol., 29 (8): 4, 7. Publication date: 1861. Type locality: Eritrea: Kérén region [ca. 15 45 N 38 20 E] [Goto Description]. Lectotype: ZMB 2795: ♂, skull and alcoholic. Collected by: Martin Theodor von Heuglin; collection date: undated. Formerly in SMNS. Lectotype designated by Turni and Kock (2008: 36). - Comments: Meester *et al.* (1986: 43) and Turni and Kock (2008:36) mentioned it as *Phyllorhina bicornis*.

*1906. *Hipposiderus tephrus* Cabrera, Bol. r. Soc. espan. Hist. nat. , 6: 358. Publication date: June 1906. Type locality: Morocco: Mogador [=Essaouira] [31 31 N 09 46 W]. Holotype: MNCN 110: ad ♂. Collected by: Mr. Martínez de la Escalera; collection date: 29 August 1905. See Ibáñez and Fernández (1989: 11). Paratype: MNCN 111: ad ♀. See Ibáñez and Fernández (1989: 11). (Current Combination)
1939. *Hipposideros braima* Monard, Arq. Mus. Bocage, 10: 73, fig. 5. Publication date: March 1939. Type locality: Guinea-Bissau: Bagíngarà [12 35 N 14 28 W] [Goto Description]. Holotype: [Unknown] ad ♀. Original number: 602. See Monard (1939: 73).
1965. *Hipposideros braimah:* Rosevear, Bats of West Africa, 221, 226. - Comments: Lapsus for braima Monard, 1939 (see Kock, 1969a: 130).
2014. *Hipposideros (caffer) tephrus:* Moores and Brown, Go-South Bull., 11: 19. (Name Combination)
? *Hipposideros caffer tephrus:*
? *Hipposideros tephrus:* (Name Combination, Current Spelling)

TAXONOMY:
Hayman and Hill (1971) and Simmons (2005: 376) recognised it as a subspecies of *caffer*. Vallo *et al.* (2009: 200) suggest that this taxon is elevated to species rank based on the genetic distance, the small size and the wide geographical separation from South-African true *Hipposideros caffer*.

COMMON NAMES:
Czech: pavrápenec sahelský. Dutch: Cabrera's rondbladneus. English: Lesser leaf-nosed bat, Lesser (Sundevall's) Leaf-nosed Bat. French: Phyllorine cendrée, Rhinolophe de Cafrerie. German: Marokkanische Rundblattnase.

GENERAL DISTRIBUTION:
Morocco to Senegal, and Yemen (Vallo *et al.*, 2009; Benda *et al.*, 2011b: 29). *H. tephrus* is confined to the coastal areas of northern Morocco. Probably Mauritania (Padial and Ibáñez, 2005: 240); Ethiopia (Lavrenchenko *et al.*, 2004b: 133); SW Saudi Arabia. Possibly Gambia (Emms and Barnett, 2005: 50), Guinea (Fahr and Ebigbo, 2003: 128, as "*Hipposideros* cf. *caffer*"), Benin (Capo-Chichi *et al.*, 2004: 162), Liberia (Fahr, 2007a: 104).

Native: Burkina Faso (Kangoyé *et al.*, 2015a: 608); Mauritania (Allegrini *et al.*, 2011: 2); Morocco (Disca *et al.*, 2014: 209; Moores and Brown, 2014: 20); Yemen (Benda *et al.*, 2011b: 29).

ECHOLOCATION:
Mayer *et al.* (2007) reported a CF-component of 133 to 137 kHz for Morocccan specimens. See also Jones *et al.* (1993).

Disca *et al.* (2014: 226) indicate that the type of call is FC-FM, with the following parameters: F_{start}: 147.1 ± 1.1 kHz, F_{end}: 128.2 ± 5.4 kHz, F_{peak}: 146.8 ± 1.3 kHz, bandwidth: 19 ± 4.7 kHz, duration: 6.6 ± 1.1 msec. They also mention (p. 213) that the maximum energy is in the FC part of the third harmonic. The start frequency is also at least 10 kHz above the value provided by Dietz et al. (2009).

Moores and Brown (2014: 21) recorded the following values for social calls at Bou Jerif fortress, Morocco: F_{peak}: 46.7 kHz, F_{start}: 55 kHz, F_{end}: 29 kHz, duration: 8 msec.

MOLECULAR BIOLOGY:
DNA - Vallo *et al.* (2009).
Karyotype - Koubínová *et al.* (2010b) report on three females and two males from Senegal, 2*n*= 32, Fna= 60 and FN= 64, they comprised of 30 biarmed autosomes, including four metacentric, eight submetacentric and three subtelocentric pairs. A secondary constriction situated near the centromere was observed in one pair of the medium-sized submetacentric autosomes (approximately the 9th largest pair). The X chromosome was identified as a large metacentric element, the Y chromosome as a medium submetacentric.
Protein / allozyme - Unknown.

PARASITES:
Okafor (1988: 11) reported the presence of the cestode *Oochoristica agamae* Baylis, 1919 (Eucestoda, Linstowiidae) from *H. caffer tephrus* specimens from Nsukka, Nigeria.

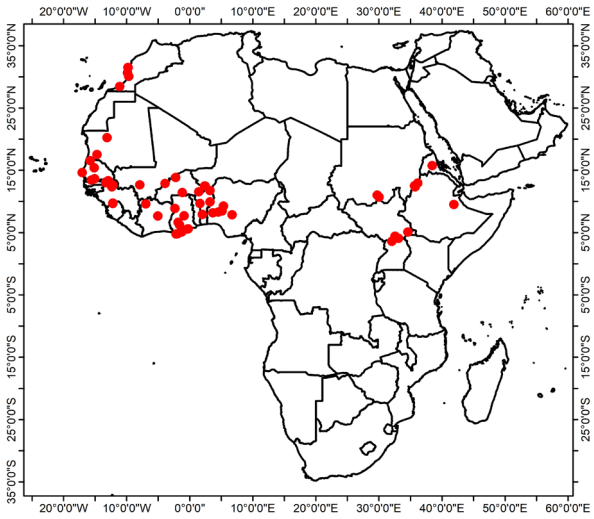

Figure 66. Distribution of *Hipposideros tephrus*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Benin, Burkina Faso, Côte d'Ivoire, Eritrea, Ethiopia, Ghana, Mali, Mauritania, Morocco, Niger, Nigeria, Senegal, Sierra Leone, South Sudan, Sudan, The Gambia, Uganda.

Genus ***Macronycteris*** Gray, 1866

*1866. *Macronycteris* Gray, Proc. zool. Soc. Lond., 1866, I (vi): 82. Publication date: May 1866 [Goto Description]. - Comments: Type species: *Rhinolophus gigas* Wagner, 1845, by monotypy (see Decher and Fahr, 2005: 1; Jackson and Groves, 2015: 246). - Etymology: From the Greek "*μακρός*", meaning large and "*νυκτερις*", meaning bat (see Palmer, 1904: 393).

TAXONOMY:
This taxon was longtime considered to be a synonym of *Hipposideros*, but molecular analyses of Cyt-*b* by Foley *et al.* (2017) indicated that its representatives are sufficiently different from that genus to be assigned to a separate genus.

MOLECULAR BIOLOGY:
Karyotype -
Foley *et al.* (2017: 11) indicate that the karyotype of the genus *Hipposideros* is very conservative, with almost all species having 2*n* = 32. Both *M. commersoni* and *M. gigas*, however, have 2*n* = 52.

†***Macronycteris besaoka*** (Samonds, 2007)

*2007. *Hipposideros besaoka* Samonds, Acta Chiropt., 9 (1): 49, fig 5A - C, 6A - D. Type locality: Madagascar: Anjohibe cave [Goto Description]. Holotype: UA 9478:. Right maxialla: see Samonds (2007: 49). - Etymology: The word *besaoka* is derived from the Malagasy and means 'big chin' (see Samonds, 2007). - Phonetics: bay-SOH-ka. (Current Combination)

2019. *M[acronycteris] besaoka:* Rakotoarivelo, Goodman, Schoeman and Willows-Munro, PeerJ, 7 (e5866): 15. Publication date: 17 January 2019. (Current Combination)

TAXONOMY:
Goodman *et al.* (2016: 435) examined some *besaoka* skulls and found these to have a more robust mandibula and lower teeth than both other Madagascan "*Hipposideros*" [=*Macronycteris*"] species (*commersoni* and *cryptovalorna*), but further DNA study is required to see whether it is genetically distinct from either of them.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Samonds (2007: 49 - 53) found samples in deposits (TW-10) dated at 10,000 yrs old or younger within the Anjohibe cave, Madagascar.

Timeframe:
Pleistocene.

HABITAT:
Rakotoarivelo *et al.* (2019: 14) presume that *M. besaoka* was ecologically similar to *M. commersoni*.

Macronycteris commersoni (E. Geoffroy St.-Hilaire, 1813)

*1813. *Rhinolophus Commersonii* E. Geoffroy Saint-Hilaire, Ann. Mus. Hist. nat. Paris, 20: 263, pl. 5. Publication date: 1813. Type locality: Madagascar: Tuléar province: Fort Dauphin [25 02 S 47 00 E] [Goto Description]. Neotype: FMNH 175972: ad ♀, skull and alcoholic. Collected by: Steven M. Goodman; collection date: 9 December 2002; original number: SMG 13401. Presented/Donated by: ?: Collector Unknown. Type locality: Madagascar: Province de Fianarantsoa, Parc National de l'Isalo, along Sahanafa River, near foot of Bevato Mountain, 28 km south-east of Berenty-Betsileo, 22°19.0'S, 45°17.6'E, 550 m a.s.l. (see Goodman *et al.*, 2016: 437). - Etymology: Geoffroy's description was based on drawings and notes found among Mr. Philibert Commerson's papers, in who's honour Geoffroy named this species (see Smithers, 1983: 133; Taylor, 2005).

2017. *M[acronycteris] commersonii:* Foley, Goodman, Whelan, Peuchmaille and Teeling, Acta Chiropt., 19 (1): 10. Publication date: June 2017. (Current Combination)

? *Hipposideros commersoni commersoni:* (Name Combination)

? *Hipposideros commersoni:* (Name Combination)

? *Hipposideros sp. cf. H. commersoni:*

TAXONOMY:
Simmons (2005: 369, 372, 377) restricts "*Hipposideros commersoni*" to Madagascar, and assigns "*H. gigas*", "*M. vittatus*" (including *marugensis*) and "*H. thomensis*" as the mainland forms based on morphology and echolocation differences.

A combined molecular and morphological study by Rakotoarivelo *et al.* (2015: 1) indicates that cryptic species exist in Madagascan *M. commersoni*, but also that a further fine-scale phylogeographic study is needed to fully resolve the systematics of this species (see *M. cryptovalorona*). Rakotoarivelo *et al.* (2019: 1) investigated this further and found several lineages in bats from the western part of Madagascar: the animals from northern Madagascar formed a single monophyletic clade (clade C), whereas the animals from the southwestern part of the island (clade B) showed more phylogeographical partitioning where different mtDNA haplotypes frequencies were detected between populations from different bioclimatic regions.

Goodman *et al.* (2016: 439) point out that the orginal spelling by Geoffroy (1813) was "*Rhinolophus Commersonii*", but that most of the subsequent authors spelled it with only one "i". They refer to article 33.3.1 of the ICZN code to maintain the usage of the single "i" version.

COMMON NAMES:
Afrikaans: Commerson se bladneusvlermuis, Commerson-bladneusvlermuis, Commersonse Blaarneusvlermuis. Czech: pavrápenec Commersonův. English: Commerson's Leaf-nosed Bat, Giant Leaf-nosed Bat, Commerson's roundleaf bat, Commerson's Rhinolph. French: Chauve-souris de Commerson à nez feuillu, Phyllorine de Commerson. German: Madagaskar-Rundblattnase, Riesen-Rundblattnase, Marungu-Rundblattnase. Portuguese: Morcego de nariz enfolhado de commerson.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Sabatier and Legendre (1985: 23) reported the presence of *M. commersoni* (and *Hipposideros* sp.) in the Tsimanampetsotsa deposit.
Samonds (2007: 45 - 46, 58 - 60) found samples in deposit (OLD SE locality) dated at 10,000 yrs old or younger and deposit (SS2) which was collected from the surface near the main cave entrance, the dating attemps revealed that this sample was contaminated, therefore no date is known, these two sites identified specimens belonging to *M.* sp. cf. *commersoni*. Samonds (2007: 54 - 55) also found *M. commersoni* within the deposit (NCC-1 locality) dating at 69,000 to 86,800 years old, from within the Anjohibe cave, Madagascar.
Gunnell *et al.* (2014: 3) refer to Goodman and Junkers (2013), who report on fossil material from the Andrahomana cave in Madagascar.

CONSERVATION STATUS:
Global - This species is listed [as *Hipposideros commersoni*] as Near Threatened (NT ver 3.1 (2001)) in view of the significant threat from hunting in the west, which is likely to have resulted in a decline in the region of 20 - 25 % over the past 15 years. Almost qualifies as threatened under criterion A. However, as this species is generally widespread across Madagascar, occurs both in and outside a number of protected areas, and has an ability to tolerate some degree of habitat modification, it is unlikely to be declining fast enough to warrant listing in a threatened category (Andriafidison *et al.*, 2008d; IUCN, 2009).

Assessment History -

2008 - NT ver 3.1 (2001) (Andriafidison *et al.*, 2008d; IUCN, 2009). 2004 - Not assessed (IUCN, 2004).

MAJOR THREATS:
Andriafidison *et al.* (2008d) state that besides habitat loss, it is also threatened by hunting and is particularly vulnerable at roosting sites where bats are hunted as they emerge at dusk (Goodman *et al.*, 2008d; Jenkins and Racey, 2008). It can be legally hunted on between the first of February and the first of May (Anonymus, 2007b: 6). In the extreme south-west of Madagascar, there were an estimated 140,000 individuals harvested for food annually between January and March (Goodman, 2006). This hunting is thought to occur throughout western Madagascar in areas where local people live in close proximity to roosting colonies (Jenkins and Racey, 2008).

CONSERVATION ACTIONS:
Andriafidison *et al.* (2008d) report that this species occurs in a number of protected areas as well as other forest areas that are actively managed for conservation (Goodman *et al.*, 2005a; Rakotoarivelo and Randrianandrianina, 2007; Ranivo and Goodman, 2007b).

Due to the existence of several clades within *M. commersoni*, Rakotoarivelo *et al.* (2019: 16) stress the conservation importance of the localities where clade C was found to occur: Analamera, Ankarana, Montagne d'Ambre, and Marovaza.

GENERAL DISTRIBUTION:
Madagascar; adjacent small islands.

GEOGRAPHIC VARIATION:
Ranivo and Goodman (2007b: 48) indicate that there is a clinal variation in *commersoni* on Madagascar, where the individuals from the north are larger than those from the south. In the Isalo region, both sizes were found together, which might indicate that there are two cryptic species.

DETAILED MORPHOLOGY:
Baculum:
Rakotondramanana and Goodman (2017: 56) reported that the baculum of *commersoni* has a bifurcated distal tip, a straight central shaft and a basal portion that is narrower than the distal part; length: 3.73 ± 0.540 (3.00 - 4.52) mm, width: 1.92 ± 0.330 (1.48 - 2.41) mm. In the bat's clades (sensu Rakotoarivelo *et al.*, 2015), they found two morphotypes with some slight differences: Morphotype A/Clade B: distinct bicurcated distal tip, sometimes with an indentation; length: 3.77 ± 0.545 (3.00 - 4.52) mm, width: 1.94 ± 0.325 (1.50 - 2.41) mm; Morphotype B/Clade C: "This same structure is also found in certain animals allocated to Clade C, with the exception of two" (unfortunately, without further details); length: 3.05, 3.37 mm, width: 1.48, 1.69 mm.

ECHOLOCATION:
In Madagascar Russ *et al.* (2001) recorded a constant-frequency of 64 kHz. Kofoky *et al.* (2009: 379) reported the calls of 28 individuals from six different sites in Madagascar, which produced narrowband and long CF calls which terminate with brief FM elements with a high duty cycle (31.2 %) and maximum energy at about 66.6 kHz. The calls consisted of a maximum of three harmonics most energy in the fundamental or second harmonic.

Ramasindrazana *et al.* (2015b: 85) reported a sexual dimorphism in bats from the western half of Madagascar. In males, the average forearm length was 93.1 mm and they emitted calls at 68.6 kHz. In females, the average forearm length was 83.9 mm and their calls were at 72.9 kHz. They also found that females from the far northern part of the island (Ankarana) emitted calls that were much lower than expected from size.

MOLECULAR BIOLOGY:
DNA - Unknown.

Karyotype - 2N = 52 and FN = 60, containing one large metacentric, a medium-sized submetacentric, three pairs of medium-to-small-sized metacentrics. The others are acrocentric. The X chromosome is a large sub-metacentric one and the Y an acrocentric (see Richards *et al.*, 2016d: 187, 191).

Protein / allozyme - Unknown.

HABITAT:
Dammhahn and Goodman (2013: 108) indicate that the lower one-half of forest and perhaps partially open areas form the foraging habitat of this species. The home range of males is 31.8 ± 9.2 ha and of females 41.7 ± 12.9 ha (Razafimanahaka *et al.*, 2016: 423).

HABITS:
Bouchard (2001b: 109) mentions that males scent-mark their territories and mates by rubbing them with their glandular areas.

ROOST:
M. commersoni roosts singly in trees at some sites (Jenkins and Racey, 2008). Razafimanahaka *et al.* (2016: 427) found that these roosts are generally on braches of trees (*Uapaca ferruginea* Baill., *Canarium boivinii* Engl., *Diospyros* sp., *Gaertnera* sp. and *Erythroxylum corymbosum* Boivin ex Baill.) with a diameter at breast height of

about 8.2 ± 0.7 cm and at 5.4 ± 0.2 m above the ground. *Aucoumea klaineana* Pierre [angouma, gaboon, or okoumé], an introduced tree in plantations, is hardly used by the bats. The mean distance between the roost and the foraging area was 313.9 ± 15.3 m (max: 1.6 km).

MIGRATION:
Reher *et al.* (2019: 121) found that *M. commersoni* was only present in two southwestern Madagascan caves during the wet season, whereas other species such as *Triaenops menamena* and *Miniopterus mahafaliensis* were present in both the dry and wet season.

DIET:
Razakarivony *et al.* (2005) examined the stomachs of 11 individuals and found that 90 % of the diet were Coleoptera. Rakotoarivelo *et al.* (2007) found *M. commersoni* mainly to consume Coleoptera, but also included large-bodied taxa such as Cicadidae, Lucanidae, and Passalidae.

In the Tsimanampetsotsa NP, Ramasindrazana *et al.* (2012: 120-121) reported feacal pellets containing 76.2 ± 19.1 volume percent Coleoptera, 20.0 ± 20.0 Blattaria, 2.4 ± 1.0 Homoptera/Hemiptera and 1.4 ± 0.9 Hymenoptera. No Blattaria were found during the wet season, whereas the percentage Coleoptera rose to 93.0 (from 72.0 in the dry season).

Rakotondramanana *et al.* (2015: 78) report the following prey items (mean volume percentages ± 1 SD, mean frequency percentages ± 1 SD): Coleoptera (46.6 ± 38.85, 77.7 ± 36.36); Hymenoptera (6.6 ± 11.49, 26.1 ± 40.70); Lepidoptera (8.2 ± 13.34, 26.1 ± 37.85); Isoptera (37.4 ± 40.53, 49.2 ± 48.41); Homoptera (0.9 ± 3.49, 6.7 ± 19.85); Blattoidea (0.2 ± 0.98, 0.2 ± 0.98); Arachnida (0.04 ± 0.20, 0.77 ± 3.92).

PREDATORS:
Goodman *et al.* (1991: 22) reported an almost intact skull in a pellet from the Madagascar Long-eared Owl *Asio madagascariensis*. Additionally, Goodman and Griffiths (2006) found that *M. commersoni* comprised 0.6 % of the total biomass predated by the barn owl (*Tyto alba*).

Mikula *et al.* (2016: Supplemental data) mention the Madagascan serpent eagle (*Eutriorchis astur* (Sharpe, 1875)) as avian diurnal predator.

ACTIVITY AND BEHAVIOUR:
Preliminary observations in Madagascar reveal that foraging behavior of *M. commersoni* involves short hunting flights from night perches (Russ *et al.*, 2003).

REPRODUCTION AND ONTOGENY:
Razafimanahaka *et al.* (2016: 429) recorded flying juveniles in early February and March, which suggests that births take probably place in January. They were also unable to catch females in nets in January, possibly because they were not foraging or because they had moved to materity roosts.

PARASITES:
Gomard *et al.* (2016: 5) reported the presence of *Leptospira* bacteria in 13 out of 27 tested bats (48.1 %).

VIRUSES:
Rhabdoviridae
The serum of one of six bats tested by Mélade *et al.* (2016a: 6) showed a reaction against *Duvenhage lyssavirus*, and one of four against *European bat lyssavirus 1*.

UTILISATION:
Goodman (2006) observed in February 2005, in south-western Madagascar, that local people were extensively hunting *M. commersoni*. This coincided with the onset of famine in the region. Goodman (2006) describes the hunting method used by local inhabitants. In PN d'Ankarafantsika, local people - while collecting forest tubers - occasionally encounter roosting *M. commersoni* which are taken back to the village and eaten (Jenkins and Racey, 2008).
In the villages *M. commersoni* is either roasted over a fire or boiled.
Goodman (2006) concluded that harvest level of *M. commersoni* (ca. 70,000 - 140,000 bats annually) surpasses the likely productivity of the species in the area. Goodman *et al.* (2002) suggested that hunting at the Mitoho Cave in PN de Tsimanampetsotsa may have been the reason *M. commersoni* abandoned the site.
See also Goodman *et al.* (2008d) and Jenkins and Racey (2008).

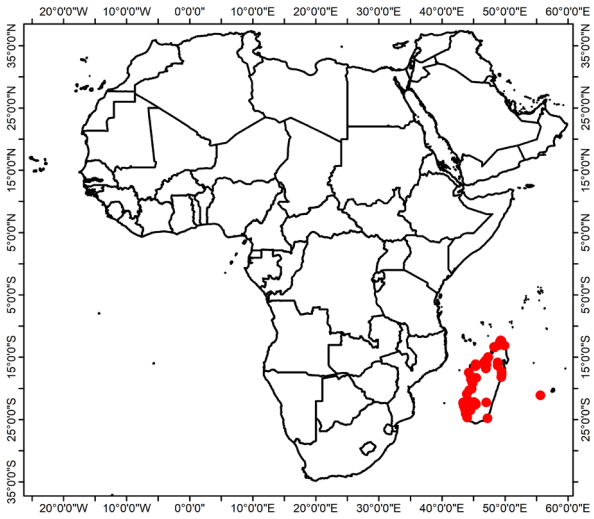

Figure 67. Distribution of *Macronycteris commersoni*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Madagascar, Réunion.

Macronycteris cryptovalorona (Goodman, Schoeman, Rakotoarivelo and Willows-Munro, 2016)

*2016. *Hipposideros cryptovalorona* Goodman, Schoeman, Rakotoarivelo and Willows-Munro, Zool. J. Linn. Soc., 177 (2):428, 443. Publication date: 20 May 2016. Type locality: Madagascar: Fianarantsoa province: Parc National de l'Isalo, along Sahanafa River, near foot of Bevato: Berenty-Betsileo, 28 km SE [22 19.0 S 45 17.6 E, 550 m] [Goto Description]. Holotype: FMNH 175970: ad ♀, skull and alcoholic. Collected by: Steven M. Goodman; collection date: 9 December 2002; original number: SMG 13399. Presented/Donated by: ?: Collector Unknown. Type locality: Madagascar: Province de Fianarantsoa, Parc National de l'Isalo, along Sahanafa River, near foot of Bevato, 28 km south-east of Berenty-Betsileo, 22°19.0'S, 45°17.6'E, 550 m a.s.l. Paratype: FMNH 184173: ♀. Collected by: Steven M. Goodman; collection date: February 2005; original number: SMG 14582. Presented/Donated by: ?: Collector Unknown. - Etymology: The name is derived from the Greek "kryptos", meaning hidden or concealed, and from the Sakalava dialect of Malagasy "valorona", which is the local vernacular name of *Hipposideros* and refers to its distinct nasal structure, and can be translated as "eight nose", referring to the complicated and multiple layers of the nose structure (see Goodman *et al.* (2016: 444).

2017. *M[acronycteris] cryptovalorona* Foley, Goodman, Whelan, Puechmaille and Teeling, Acta Chiropt., 19 (1): 10. Publication date: June 2017. (Current Combination)

TAXONOMY:
Analysing the cyt *b* sequences of 148 Madagascan *M. commersoni* s.l. specimens, Goodman *et al.* (2016: 428) found three well-supported monophyletic clades: A, B, and C. Clades B and C form a monophyletic lineage, which they were able to refer to *M. commersoni* s.s. Clade A showed a 9 to 11 % sequence variation with *M. commersoni* s.s., enough to warrant a separate species status. This new species is known from two adult females only.

COMMON NAMES:
English: Madagascar cryptic leaf-nosed bat. French: La Phyllorhine cryptique de Madagascar. German: Kryptische Madagaskar-Rundblattnase.

? *Hipposideros marungensis:*

TAXONOMY:
McWilliam (1982: 9) found two forms of "*Hipposideros commersoni*" occurring sympatrically in Kenya, which he separated into "*H. commersoni*" and "*H. gigas*", with the latter species being significantly larger and heavier than the prior.

Simmons (2005: 369, 372, 377) restricts "*Hipposideros commersoni*" to Madagascar, and assigns *H. gigas*, *H. vittatus* (including *marugensis*) and *H. thomensis* as the mainland forms based on morphology and echolocation differences. Meester *et al.* (1986) state that Hayman and Hill (1971) note that *marungensis* may be antedated by *vittata* Peters, 1852, from Ibo Island, which is more often regarded as a synonym of the subspecies *gigas* Wagner, 1845 (Allen, 1939a, Ellerman *et al.*, 1953, Hill, 1963a).

The karyotypic studies for the African mainland forms (*M. vittatus* and *M. gigas*) indicate that they share the exact same numbers and forms (Porter *et al.*, 2010); Rautenbach *et al.*, 1993; Koubínová *et al.*, 2010b). Koubínová *et al.* (2010b) suggest that African mainland forms may belong to the same species.

COMMON NAMES:
Afrikaans: Commerson se bladneusvlermuis, Commerson-bladneusvlermuis, Commersonse Blaarneusvlermuis. Chinese: 巨蹄蝠. Czech: pavrápenec obrovský. GENERAL DISTRIBUTION:
Gambia over Liberia (Monadjem *et al.*, 2016y: 365 as *Hipposideros gigas*), Ghana (Decher and Fahr, 2007: 17 as *Hipposideros gigas*), Benin (Capo-Chichi *et al.*, 2004: 162), Central African Republic (Lunde *et al.*, 2001: 537), Republic of the Congo (Hayman *et al.*, 1966; Dowsett *et al.*, 1991: 259; Monadjem *et al.*, 2010d: 538 as *H. vittatus*; Bates *et al.*, 2013: 335, as *H. commersoni*) to Ethiopia, south to Angola (Crawford-Cabral, 1989: 17, as *H. c. gigas*; Monadjem *et al.*, 2010d: 538, as *H. gigas* and *H. vittatus*), Zambia (Ansell, 1967; Ansell, 1974; Monadjem *et al.*, 2010d: 538 as *H. vittatus*), Zimbabwe (Monadjem *et al.*, 2010d: 538 as *H. vittatus*), Namibia (Monadjem *et al.*, 2010d: 538 as *H. vittatus*), Botswana (Smithers, 1971; Monadjem *et al.*, 2010d: 538 as *H. vittatus*), Transvaal (South Africa (Monadjem *et al.*, 2010d: 538 as *H. vittatus*), Malawi (Happold *et al.*, 1988; Happold and Happold, 1997b: 818; Monadjem *et al.*, 2010d: 538 as *H. vittatus*) and Mozambique (Monadjem *et al.*, 2010d: 538, Monadjem *et al.*, 2010c: 381 as *H. vittatus*).

Rainho and Ranco (2001: 54) report "*H. commersoni*" from Guinea-Bissau (see also Peters, 1870; Seabra, 1900c; Monard, 1939; Veiga-Ferreira, 1949; Lopes and Crawford-Cabral, 1992).

DETAILED MORPHOLOGY:
Baculum - Unknown.
Brain - Kruger *et al.* (2010a) describe - based on three brains from Kenya, and using immunohistochemical methods - the nuclear organization of the cholinergic, catecholaminergic and serotonergic systems. Kruger *et al.* (2010b) also describe the distribution of Orexin-A immunoreactive cell bodies and terminal networks.

ECHOLOCATION:
O'Shea and Vaughan (1980) reported an ultrasonic frequency of 155 kHz for Masalani in Kenya. A highest frequency of 62 kHz was recorded at Sengwa in Zimbabwe by Jacobs (1996) and Fenton and Bell (1981), and at Pafuri in South Africa by Aldridge and Rautenbach (1987). Monadjem *et al.* (2010c: 381) reported from Mozambique [as *M. vittatus*] that the peak echolocation frequencies ranged between 64 - 66 kHz (ANABAT). Rainho *et al.* (2010a: 21) report [as *Hipposideros thomensis*] the calls of 10 individuals from Saõ Tomé.

Monadjem *et al.* (2013b: 351) report the F_{max} to be 52.0 ± 0.41 (51 - 53) kHz for four specimens from Mount Nimba.

For two unsexed bats, two females and three males from the Shimoni cave in Kenya, Webala *et al.* (2019: 15) reported an F_{max} value ranging between 54.8 and 55.3, 53.4 and 54.3, and 53.4 and 54.1 kHz, respectively. The duration of the calls were respectively 12.3 to 14.6, 17.1 to 19.2, and 10.4 to 15.7 msec.

MOLECULAR BIOLOGY:
DNA - Unknown.
Karyotype - Rautenbach *et al.* (1993) reported for female individuals with a diplod number of $2n = 52$, FN = 60?, and BA = 10?. Porter *et al.* (2010) found the same diploid number described by Rautenbach *et al.* (1993) for a single male Gabonese specimen reported as *Hipposideros gigas*, with six pairs of biarmed and 20 pairs of acrocentric chromosomes (including the sex chromosomes). Koubínová *et al.* (2010b) reported for two females from Senegal [as "*Hipposideros*

gigas"] a 2*n*= 52, and FNa= 60, supposing the X chromosomes to be (sub)metacentric. The autosomes would then consist of one pair of large metacentrics, two pairs of medium-sized submetacentrics, one pair of small submetacentrics, one pair of small metacentrics, and 20 pairs of acrocentrics, the two smallest acrocentric pairs were of a dot-like appearance.
Protein / allozyme - Unknown.

HABITAT:
Monadjem *et al.* (2016y: 365) recorded this species widely in forested and disturbed habitats in the Mount Nimba area, at altitudes between 460 and 1,060 m. In Angola, it occurs in lowland forest and moist savanna (Beja *et al.*, 2019: 388).

DIET:
Andreas (2010: 266) indicates that there is some proof from Senegal that *M. gigas* might be carnivorous, as was already suggested by Eger and Mitchell (2003) for *M. commersoni*.

REPRODUCTION AND ONTOGENY:
Kurta and Kunz (1987: 82) report that, at birth, the young has about 25.2 % of the mother's body mass (28.0 versus 111.0 g).
Kurta and Kunz (1987: 227) indicate that in Gabon, all adult females (of *M. commersoni*) were pregnant between July and October (with implantation occurring in mid June), and generally gave birth in October. The young is being fed with milk until the beginning of May. The males were in full spermiogenesis by mid April.

PARASITES:
DIPTERA:
Nycteribiidae: *Nycteribia schmidlii scotti* Falcoz, 1923, *Eucampsipoda africana* Theodor, 1955, and *Penicilidia fulvida* Bigot, 1885 (Obame-Nkoghe *et al.*, 2016: 5, Gabon)

Streblidae: *Brachytarsina allaudi* (Falcoz, 1923) (Obame-Nkoghe *et al.*, 2016: 5, Gabon) Szentiványi *et al.* (2019: Suppl.) indicated that a similar bat fly from a Gabonese "*Hipposideros gigas*" was carrying an *Arsenophonus* sp. bacteria. *Raymondia huberi* Frauenfeld, 1856 group (Obame-Nkoghe *et al.*, 2016: 5, Gabon).

VIRUSES:
In their country-wide survey of Kenyan bats, Waruhiu *et al.* (2017) found the following viruses in "*Hipposideros commersonii*" [as they considered "*H. vittatus*" to be a separate species, the bats probably represent *M. gigas*]: Astroviruses.

Coronaviridae - Coronaviruses
SARS-CoV - Müller *et al.* (2007b) tested between 1986 to 1999, for antibodies for SARS-CoV in sera of 16 individuals from the Oriental Province, DRC. None tested positive (0/16). Tong *et al.* (2009) found coronavirus RNA in this bat, collected in 2006 in Kenya. In Nigeria, Quan *et al.* (2010) screened the gastrointestinal tissue for the presence of coronaviruses by PCRs.

Filoviridae - Filoviruses
Marburgvirus:
Towner *et al.* (2007) reported on one individual [as *Hipposideros gigas*] from Gabon, which they tested for Marburg virus RNA by conventional and real-time RT-PCR and for anti-Marburg virus IgG antibodies by ELISA. The results were negative.

Ebolavirus:
Fiorillo *et al.* (2018: 7) included "*Hipposideros gigas*" in their Ebola distribution model, indicating that there is evidence that suggests their relation with filoviruses infection cases, although they provide no details on this.

Flaviviridae
Pegivirus (BPgV) - 1 out of 5 Nigerian specimens examined by Quan *et al.* (2013: Table S5) was infected by clade K type *Pegivirus*.
Maganga *et al.* (2014a: 5) tested 227 bats from Gabon of which only one tested positive for a *Flavivurus*.

Nairoviridae
Orthonairovirus
Ishii *et al.* (2014: 2) isolated a new Nairovirus (tentatively called Leopards Hill Virus - LPHV) from a *H. gigas* specimen collected in the Leopards Hill cave in Lusaka, Zambia. In a test on 129 specimens from Gabon, Müller *et al.* (2016: 3) found 32 of them positive for Crimean Congo hemorrhagic fever virus (CCHFV).

Rhabdoviridae
Lyssavirus - Rabies related viruses:
In Nigeria, Quan *et al.* (2010) did not detect any lyssavirus-specific antigens from the brains by use of direct fluroescent anitbody testing.
Shimoni:
Kuzmin *et al.* (2010a) detected a new lyssavirus, Shimoni bat lyssavirus from the brain of a dead "*H. commersoni*" bat found in the coastal region of Kenya. Genetic distances demonstrated that this may be a new lyssavirus species.

Paramyxoviridae
Drexler *et al.* (2012a: Suppl. Table S1) indicated that two of the 20 specimens they examined from Ghana tested positive for *Morbillivirus*, and one for *Rubulavirus*.

In their overview table, Maganga *et al.* (2014a: 8) report that the following viruses were already

found on "*Hipposideros gigas*": Rubulavirus, Morbillivirus unclassified, Flavivirus, Shimoni bat virus, SARS-like CoV

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Angola, Benin, Burkina Faso, Cameroon, Central African Republic, Congo, Congo (Democratic Republic of the), Côte d'Ivoire, Equatorial Guinea, Gabon, Ghana, Guinea, Guinea-Bissau, Kenya, Liberia, Niger, Nigeria, São Tomé and Principé, Senegal, Tanzania, The Gambia, Togo.

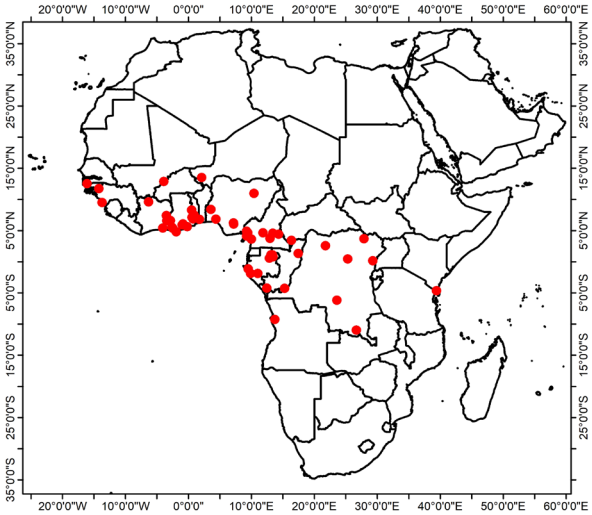

Figure 69. Distribution of *Macronycteris gigas*

Macronycteris vittatus (Peters, 1852)

*1852. *Phyllorrhina vittata* Peters, Naturwissenschaftliche Reise nach Mossambique, Zoologie, Säugethiere, 32, pl. 6; pl. 13, fig 7 - 13. Publication date: 1852. Type locality: Mozambique: Cap Delgado group [=Querimba islands]: Ibo Island [ca. 12 20 S] [Goto Description]. Syntype: ZMB 363: ♀, alcoholic, skull and skeleton. Collected by: Prof. Wilhelm Carl Hartwig Peters; collection date: between 1843 and 1847. See Turni and Kock (2008). Syntype: ZMB 37150: ♂, skin and skull. Collected by: Prof. Wilhelm Carl Hartwig Peters; collection date: between 1843 and 1847. Legs and wings missing, see Turni and Kock (2008: 40). - Etymology: From the feminine Latin adjective *vittàta* meaning "striped", referring to the occurrence of dorsal light bands in this species (Lanza *et al.*, 2015 149).

1879. *Phyllorhina commersoni:* Dobson, Proc. zool. Soc. Lond., 1878, IV: 879. Publication date: April 1879.

1887. *Phyllorhina commersonii var. marungensis* Noack, Zool. Jb. Syst., 2 (2): 272, pl. 10, fig. 31 - 33. Publication date: 7 May 1887. Type locality: Congo (Democratic Republic of the): W Shore Lake Tanganyika, Marungu: Qua Mpala [=Mpala / Pala] [06 43 S 29 31 E] [Goto Description]. Syntype: ZMB 6312: ♂, skin and skull. Collected by: Richard Böhm; collection date: 12 July 1883. See Turni and Kock (2008). Syntype: ZMB 86257: skin and skull. Collected by: Richard Böhm; collection date: 12 July 1883. Old number A4269; see Turni and Kock (2008). Syntype: ZMB 86258: skull only. Collected by: Richard Böhm; collection date: 12 July 1883. Old number A4268; see Turni and Kock (2008). Syntype: ZMB 86259: skull only. Collected by: Richard Böhm; collection date: 12 July 1883; original number: A4270. See Turni and Kock (2008). - Comments: Actually, in Noack (1887: 272), the name is mentioned as "*Phyllor hinacommersonii Peters, var. marungensis N.*". Noack (1887: 272) also mentions five specimens, including one female, collected in July-August. Ansell and Dowsett (1988: 34) refer to Hayman and Hill (1971: 28) who indicate that *marungensis* may be antedated by *vittata* Peters, 1852.

1891. *Phyllorhina commersoni var. thomensis* Bocage, J. Sci. mat. phys. nat., ser. 2, 2 (6): 88. Publication date: September 1891. Type locality: São Tomé and Principé: São Tomé Island [Goto Description]. - Comments: Bocage (1891: 88) mentions one male and one female specimen.

1904. *Hipposideros Commersoni mostellum* Thomas, Ann. Mag. nat. Hist., ser. 7, 13 (77): 385. Publication date: 1 May 1904. Type locality: Kenya: Tana River [ca. 02 33 S 40 31 E, 700 ft] [Goto Description]. Holotype: BMNH 1889.3.8.3: ad ♂, skin and skull. Presented/Donated by: H.C.V. Hunter Esq.

1993. *Hipposideros commersoni matungensis:* Koneval, Honors Projects - Illinois Wesleyan University: 1. (Lapsus)

2017. *M[acronycteris] thomensis:* Foley, Goodman, Whelan, Puechmaille and Teeling, Acta Chiropt., 19 (1): 10. Publication date: June 2017. (Current Combination)

2017. *M[acronycteris] vittatus:* Foley, Goodman, Whelan, Puechmaille and Teeling, Acta Chiropt., 19 (1): 10. Publication date: June 2017. (Current Combination)

2018. *Macronycteris vittata:* Musila, Monadjem, Webala, Patterson, Hutterer, De Jong, Butynski, Mwangi, Chen and Jiang, Zool. Res. (China), 40 (1): 21 (for 2019). Publication date: 17 October 2018. (Alternate Spelling)
2018. *Macronycteris vittata:* Musila, Syingi, Gichuki and Castro-Arellano, J. Bat Res. Conserv., 11 (1): 44.. (Name Combination)
? *Hipposideros commersoni marungensis:*
? *Hipposideros commersoni:* (Name Combination)
? *Hipposideros thomensis:* (Name Combination)
? *Hipposideros vittatus:* (Name Combination, Current Combination)
? *Macronycteris vittatus:* (Current Combination)

TAXONOMY:
Simmons (2005: 369, 372, 377) restricts "*Hippposideros commersoni*" to Madagascar, and assigns *H. gigas*, *H. vittatus* (including *marugensis*) and *H. thomensis* as the mainland forms based on morphology and echolocation differences. Meester *et al.* (1986) state that Hayman and Hill (1971) noted that *marungensis* may be antedated by *vittata* Peters, 1852, from Ibo Island, which is more often regarded as a synonym of the subspecies *gigas* Wagner, 1845 (Allen, 1939a, Ellerman *et al.*, 1953, Hill, 1963a).

The karyotypic studies for the African mainland forms (*M. vittatus* and *M. gigas*) indicate that they share the exact same numbers and forms (Porter *et al.*, 2010); Rautenbach *et al.*, 1993; Koubínová *et al.*, 2010b). Koubínová *et al.* (2010b) suggests that African mainland forms may belong to the same species.

Foley *et al.* (2017: 3) indicate that the morphological characters used to distinguish *M. gigas* from *M. vittatus* are not straightforward and that these are generally used in combination with habitat and distribution data, which is complicated by the fact that their distributions partially overlap. They also indicate that the differences between the forms *gambensis* [sic], *marungensis, niangarae* and *viegasi* have been based on non-molecular characters, and as such the assignment of these synonyms is not yet definitive.

COMMON NAMES:
Chinese: 大白纹蹄蝠. Czech: pavrápenec pruhovaný. English: Striped Leaf-nosed Bat. German: Streifen-Rundblattnase. Italian: Ipposìdero vittàto.

CONSERVATION STATUS:
Global -

Assessment History -
2008 - NT ver 3.1 (2001) (Mickleburgh *et al.*, 2008z; Mickleburgh *et al.*, 2008z).

Regional -
South Africa: 2016 - LC ver 3.1 (2001) (Monadjem *et al.*, 2016v). 2004 - considered a vagrant not assessed, single locality (Friedmann and Daly, 2004). 1986 - Indeterminate (Smithers, 1986).
Bioko: Conenna *et al.* (2017: Suppl.) mentioned the status of "*Hipposideros thomensis*" as Least Concern (LC).

GENERAL DISTRIBUTION:
Gambia over Benin (Capo-Chichi *et al.*, 2004: 162), Ghana (Decher and Fahr, 2007: 17 as *H. gigas*), Burkina Faso (Kangoyé *et al.*, 2015a: 608); Central African Republic (Lunde *et al.*, 2001: 537), Republic of the Congo (Hayman *et al.*, 1966; Dowsett *et al.*, 1991: 259; Monadjem *et al.*, 2010d: 538 as *H. vittatus*) to Ethiopia, south to Angola (Crawford-Cabral, 1989: 17, as *H. c. gigas*; Monadjem *et al.*, 2010d: 538, as *H. gigas* and *H. vittatus*; Taylor *et al.*, 2018b: 62), Zambia (Ansell, 1967; Ansell, 1974; Monadjem *et al.*, 2010d: 538 as *H. vittatus*), Zimbabwe (Monadjem *et al.*, 2010d: 538 as *H. vittatus*), Namibia (Monadjem *et al.*, 2010d: 538 as *H. vittatus*), Botswana (Smithers, 1971; Monadjem *et al.*, 2010d: 538 as *H. vittatus*), Transvaal (South Africa (Monadjem *et al.*, 2010d: 538 as *H. vittatus*)), Malawi (Happold *et al.*, 1988; Happold and Happold, 1997b: 818; Monadjem *et al.*, 2010d: 538 as *H. vittatus*) and Mozambique (Monadjem *et al.*, 2010d: 538, Monadjem *et al.*, 2010c: 381 as *H. vittatus*; Madagascar; adjacent small islands; Saõ Tomé (Rainho *et al.*, 2010a: 26 as *H. thomensis*).

Reported from the Tanzanian island of Pemba by O'Brien (2011: 287).

Rainho and Ranco (2001: 54) report "*H. commersoni*" from Guineu-Bissau (see also Peters, 1870; Seabra, 1900c; Monard, 1939; Veiga-Ferreira, 1949; Lopes and Crawford-Cabral, 1992).

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 1,043,916 km^2.

DETAILED MORPHOLOGY:
Baculum - Unknown.

Brain - Using immunohistochemical methods, Kruger *et al.* (2010a) describe the nuclear organization of the cholinergic, catecholaminergic and serotonergic systems based on three brains from Kenya. Kruger *et al.* (2010b) also describe the distribution of Orexin-A immunoreactive cell bodies and terminal networks.

Koneval (1993) described several significant differences in the hyoid morphology of "*Hipposideros commersoni matungensis*" (from Kenya) and other bats of the family Rhinolophidae (including Hipposideridae): a modified stylohyal, fused to the auditory bulla; loss of the stylohyoid; addition of a new muscle, possibly from the stylopharyngeus; a modified mylohyoid profundus; and insertion of the ceratohyoid onto only the stylohyal. She found this morphology to be closest related to this of the east Asian *H. armiger*.

ECHOLOCATION:
O'Shea and Vaughan (1980) reported an ultrasonic frequency of 155 kHz for Masalani in Kenya. A highest frequency of 62 kHz was recorded at Sengwa in Zimbabwe by Jacobs (1996) and Fenton and Bell (1981), and at Pafuri in South Africa by Aldridge and Rautenbach (1987). From Mozambique, Monadjem *et al.* (2010c: 381) reported [as *H. vittatus*] that the peak echolocation frequencies ranged between 64 - 66 kHz (ANABAT). Rainho *et al.* (2010a: 21) reports [as *H. thomensis*] the calls of 10 individuials from Saõ Tomé.

Musila *et al.* (2018c: 44) [referring to Monadjem *et al.* (2010d: 162]) mention a high-duty, constant frequency call with a peak frequency of 61 kHz.

Two males and 7 females from three localities in Kenya had F^{max} values between respectively 67.9 and 70.1, and 64.3 and 69.7 kHz, whereas the duration was 14.3 to 17.9 msec for the males and 10.6 to 17.8 for the females.

In Sierra Leone, Weber *et al.* (2019: 21) recorded calls from a male and a female with a CF value of 62.5 (62.0 - 63.0) kHz.

MOLECULAR BIOLOGY:
DNA - Unknown.
Karyotype - Rautenbach *et al.* (1993) reported for female individuals with a diplod number of $2n$ = 52, FN = 60?, and BA = 10?. Porter *et al.* (2010) found the same diploid described by Rautenbach *et al.* (1993) for a single male Gabonese specimen reported as "*Hipposideros gigas*", with six pairs of biarmed and 20 pairs of acrocentric chromosomes. While, Koubínová *et al.* (2010b) reported for two females from Senegal [as *H. gigas*] a $2n$= 52, and FNa= 60, including a pair of large metacentrics, three pairs of medium-sized sub-metacentrics, one pair of small submetacentrics, one pair of small metacentrics, and 20 pairs of acrocentrics, the two smallest acrocentric pairs were of a dot-like appearance.
Protein / allozyme - Unknown.

ROOST:
In Angola, *M. vittatus* roosts in very large colonies in cave, mainly in the southern part of the country (Beja *et al.*, 2019: 388).

PREDATORS:
Messana *et al.* (1985: 337) shows a photo, taken in a cave in Somalia, on which a dead body of "*Hipposideros commersoni*" is being fed on by *Phaeophilacris* sp. (Insecta: Orthoptera: Grillidae) and *Tura mesopotamica* Taiti & Ferrara, 1985 (Isopoda: Porcellionidae).

REPRODUCTION AND ONTOGENY:
A pregnant female was recorded on 26 March by Weber *et al.* (2019: 23) in Sierra Leone.

PARASITES:
HAEMOSPORIDA:
Blood samples from Zambian *M. vittatus* examined by Qiu *et al.* (2019: 236) revealed the presence of two *Trypanosoma* sp., very similar to *T. conorhini* and *T. dionisii* clades.

DIPTERA:
Streblidae: *Ascodipteron variisetosum* Maa, 1965 from Robertspoort, Liberia and Ghana, where the cysts were found under the upper arm (Haeselbarth *et al.*, 1966: 107, hosts identified as *H. commersoni*). *Raymondia huberi huberi* Frauenfeld, 1855 (Shapiro *et al.*, 2016: 254).

VIRUSES:
In their country-wide survey of Kenyan bats, Waruhiu *et al.* (2017) found the following viruses in "*Hipposideros vittatus*": Paramyxovirus.

Coronaviridae - Coronaviruses
SARS-CoV - Müller *et al.* (2007b) tested between 1986 to 1999, for antibodies for SARS-CoV in sera of 16 individuals from the Oriental Province, DRC. None tested positive (0/16). Tong *et al.* (2009) found coronavirus RNA (Kenya-bat-coronavirus [BtKY07]) from fecal material in 2006 in Kenya, and was similar to *Rousettus sp.* coronaviruses from China. In Nigeria, Quan *et al.* (2010) screened the gastrointestinal tissue for the presence of coronaviruses by PCRs.
One out of 123 (0.8 %) Kenyan bats tested by Tao *et al.* (2017: Suppl.) was positive for CoV.

Filoviridae - Filoviruses

Marburgvirus - Towner *et al.* (2007) as *H. gigas*, tested 1 individual from Gabon for Marburg virus RNA by conventional and real-time RT-PCR and for anti-Marburg virus IgG antibodies by ELISA; the results were negative.

Flaviviridae
Hepacivirus (BHV) - Quan *et al.* (2013: Table S5) report 2 with clade A infected Kenyan specimens on a total of 75 tested (2.7 %), and 4 specimens (5.3 %) that were infected with clade D virus.
Pegivirus (BPgV) - Quan *et al.* (2013: Table S5) also indicated that 2 of the 75 specimens were infected with a clade K type *Pegivirus*.

Polyomaviridae
Polyomavirus - Conrardy *et al.* (2014: 259) examined nine "*Hipposideros commersoni*" specimens from the Shimoni cave (Kenya), and found one of them testing positive for this virus.

Rhabdoviridae
Lyssavirus - Rabies related viruses
In Nigeria, Quan *et al.* (2010) did not detect any lyssavirus-specific antigens from the brains by use of direct fluroescent antibody testing.
Shimoni - Kuzmin *et al.* (2010a) detected a new lyssavirus, Shimoni bat lyssavirus from the brain of a dead "*H. commersoni*" bat found in the coastal region of Kenya. Genetic distances demonstrated that this may be a new lyssavirus species.
Fikirini rhabdovirus (FKRV)
Kading *et al.* (2013) report on this new rhabdovirus from a *M. vittatus* specimen collected at Three Caves, Shimoni cave in Southern Kenya.
Horton *et al.* (2014: Table S1) tested 77 Kenyan "*H. commersoni*" specimens, but failed to find neutralising antibodies to IKOV (Ikoma lyssavirus).

ANTHROPOPHILOUS:
Dandurand *et al.* (2018: 284) studied the influence of condensation-corrosion processes caused by urine and droppings on the walls of Drotsky's cave (Botswana) and their consequences on archaeological remains and cave art.

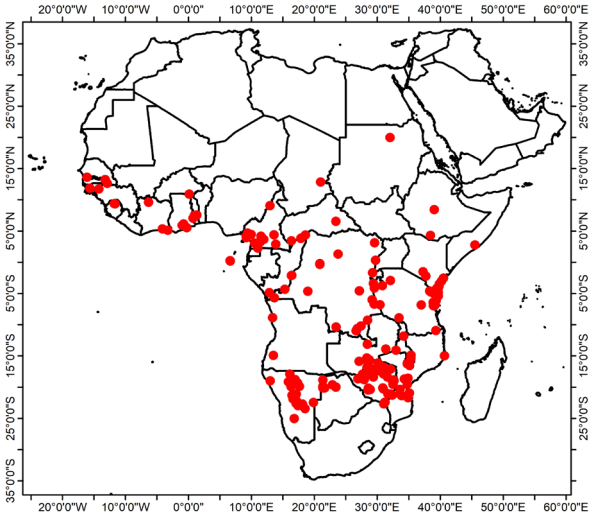

Figure 70. Distribution of *Macronycteris vittatus*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Angola, Botswana, Burundi, Cameroon, Central African Republic, Chad, Congo (Democratic Republic of the), Côte d'Ivoire, Ethiopia, Ghana, Guinea-Bissau, Kenya, Madagascar, Malawi, Mozambique, Namibia, Niger, Rwanda, São Tomé and Principé, Senegal, Sierra Leone, Somalia, South Africa, Sudan, Tanzania, The Gambia, Togo, Zambia, Zimbabwe.

†Genus ***Palaeophyllophora*** Revilliod, 1917

1917. *Palaeophyllophora* Revilliod, Abh. Grossherz.-hess. Geol. Landesanst., 7: 1??.

†***Palaeophyllophora tunisiensis*** (Ravel, 2016)

*2016. *?Palaeophyllophora tunisiensis* Ravel, in: Ravel et al., Geodiversitas, 38 (3): 356, 368, figs 6, 7. Publication date: 30 September 2016. Type locality: Tunisia: Kassérine province: Dejbel Chambi National Park: Chambi [35 14 03 N 08 45 29 E, 630 m] [Goto Description]. - Etymology: The species name refers to the country from which uit was described: Tunisia.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS: Late lower Eocene to early middle Eocene.
Timeframe:

Family MEGADERMATIDAE H. Allen, 1864

*1864. *Megadermatidae* H. Allen, Monograph of North American Bats, xxiii, 1. - Comments: Type genus: *Megaderma* Geoffroy, 1810. See Handley (1980: 10) for the correct formation of the family name. (Current Combination)
1866. *Megadermata* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, 1865: 256. - Comments: In Part (see Taylor, 1934). Originally included the genera *Rhinopoma* É. Geoffroy, 1818; *Megaderma* É. Geoffroy, 1810; *Nycteris* É. Geoffroy & G. Cuvier, 1795; and *Nyctophilus* Leach, 1821 (see Jackson and Groves, 2015: 241).
1866. *Megadermina* Gray, Proc. zool. Soc. Lond., 1866, I: 83. Publication date: May 1866.
1872. *Megadermidae* Gill, Arr. Families of Mammalia, p. 17. - Comments: Originally included the subfamilies Vampyrinae Peters, 1865 [= Family Phyllostomidae Gray, 1825], Glossophaginae Bonaparte, 1845 and Stenoderminae Gill, 1872 (see Jackson and Groves, 2015: 241).
1893. *Megadermatini* Winge, Samling af Afhandlinger. E Museo Lundii, 2 (1): 24. - Comments: Proposed as tribe (?) and originally included the genera *Nycteris* É. Geoffroy and G. Cuvier, 1795 and *Megaderma* É. Geoffroy, 1810 (see Jackson and Groves, 2015: 241).

TAXONOMY:
Based on morphological data, the Family Megadermatidae was placed in the superfamily Rhinolophoidea with the families Nycteridae, Rhinolophidae and Hipposideridae (Simmons, 1998; Simmons and Geisler, 1998), but more recent molecular studies have contradicted many groupings based on morphological data. Hand (1985, 1996) and Griffiths *et al.* (1992) have provided alternative phylogenies for the group.

See Handley (1980) [in Corbet and Hill (1992: 89)] for correct formation of family name.

No subfamilies recognized (Simmons, 2005: 379).

Known genera of the family Megadermatidae: †***Saharaderma*** Gunnell, Simons and Seiffert, 2008; ***Cardioderma*** Peters, 1873; ***Lavia*** Gray, 1838; *Macroderma* Miller, 1906; *Megaderma* E. Geoffroy, 1810.

COMMON NAMES:
Czech: lyronosovití, kožnatcovití, megadermovití. Dutch: Onechte vampieren. English: False Vampire Bats, Large-winged Bats. Finnish: Valevampyyrit. French: Mégadermatidés. German: Grossblattnasen, Großblattnasen, Falsche Vampire. Italian: Megadermàtidi, Fàlsi vampìri. Norwegian: Storøreflaggermus, falske vampyrer. Russian: Лжевампиры. Vietnamese: Họ dơi ma.

ETYMOLOGY OF COMMON NAME:
The common name of the family, false vampire bats, stems from the old, erroneous belief that they fed on blood, as do the true vampire bats of the New World (Happold, 2013ay: 401). There are no blood-sucking bats in Africa.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
The Megadermatidae appear in the late Eocene or early Oligocene of Europe (Butler, 1978). Butler and Hopwood (1957) reported an indetermined species of Megadermatidae from the early Miocene at Rusinga. The locality was corrected by Butler (1984: 185) to Kaswanga, where it was found in the Hiwegi Formation.

Russell and Sigé (1970) suggest that *Afropterus gigas* Lavocat, 1961, is a megadermatid.

Shi and Rabosky (2015: 1532) indicate that the Megadermatidae split of from the Rhinopomatidae some 34 million years ago. They also reported (p. 1537) the family-level stem age to be 53.4 Mya and the crown age 27.2 Mya.

DENTAL FORMULA:
$^{0113}/_{2123}$ = 26.
Except in one non-African species, which has two upper premolars.

Genus ***Cardioderma*** Peters, 1873

*1873. *Cardioderma* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, 488. Publication date: 23 June 1873. - Comments: Type species: *Megaderma cor* Peters, 1872. - Etymology: From the Greek "*καρδία*", meaning heart and "*δέρμα*", meaning skin, referring to the "cordiform" base of the central longitudinal crest of the nose-leaf (see Palmer, 1904: 160; Csada, 1996: 3). (Current Combination)

TAXONOMY:
See Simmons (2005).

Known species of the genus *Cardioderma*: ***cor*** (Peters, 1872), ***†leakeyi*** Gunnell, Butler, Greenwood and Simmons, 2015.

COMMON NAMES:
Czech: srdcoví lyronosi. English: Heart-nosed Bats, African False Vampire Bats. French: Cardiodermes. German: Herznasen-Fledermäuse. Italian: Cardiodèrma.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Cardioderma sp. has been found in the early Pleistocene deposits in Olduvai (Butler and Greenwood, 1965; Butler, 1978).

†*Cardioderma leakeyi* Gunnell, Butler, Greenwood and Simmons, 2015

*2015. *Cardioderma leakeyi* Gunnell, Butler, Greenwood and Simmons, Am. Mus. Novit., 3846: 1, 7, figs 4B-D, 5C. Publication date: 16 December 2015. Type locality: Tanzania: Arusha province: Olduvai Gorge: Bed I, FLK NI, Layer 2. [Goto Description]. - Etymology: Named in honor of Louis S.B. Leakey who was instrumental in initiating and leading the search for vertebrate fossils, especially fossil humans, in East Africa (Gunnell *et al.*, 2015a: 7).

SIMILAR SPECIES:
The teeth of *C. leakeyi* are on average 18 - 20 % larger than those of *C. cor* (Gunnell *et al.*, 2015a: 8).

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Timeframe: Pleistocene.

Cardioderma cor (Peters, 1872)

*1872. *Megaderma cor* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, 194. Type locality: Ethiopia: "Ethiopia". Holotype: ZMB 4181: ad ♂, skull and alcoholic. Collection date: undated. Vendor Gerrard; see Turni and Kock (2008: 28). - Etymology: From the neuter Latin substantive *cor* meaning "heart", used as an apposition, referring to the heart-shaped noseleaf (see Lanza *et al.*, 2015: 167).
? *Cardioderma cor:* (Current Combination)

TAXONOMY:
See Csada (1996, Mammalian Species, 519).

COMMON NAMES:
Chinese: 非洲假吸血蝠. Czech: lyronos srdcový, megaderma africká. Dutch: Hartneusvleermuis. English: Heart-nosed Bat, African Heart-nosed Bat, African False Vampire Bat, Heart-nosed Big-eared Bat. French: Cardioderme à nez en cœur, Pseudo-vampire à nez en cœur. German: Herznasen-Fledermaus. Italian: Cardiodèrma nàso a cuòre, Fàlso vampìro dàl nàso a cuòre.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008b; IUCN, 2004).

Assessment History -
2008 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2008b; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2004a; IUCN, 2004). 1996 - LR/nt (Baillie and Groombridge, 1996).

MAJOR THREATS:
Mickleburgh *et al.* (2008b) [in IUCN (2009)] report that there appear to be no major threats to this species, however, further studies are needed into the impact of disturbance on roosting sites.

CONSERVATION ACTIONS:
The species has been recorded from protected areas in Kenya (e.g. Tsavo West National Park (Vaughan, 1976; Aggundey and Schlitter, 1984) and is likely to be present in protected areas in some other East African countries. Additional studies are needed into the impact of disturbance on this species (Mickleburgh *et al.*, 2008b; IUCN).

GENERAL DISTRIBUTION:
Cardioderma cor is distributed from north-east Sudan (near the Red Sea) south to central Tanzania. The distribution extends from the border area of Uganda and Sudan in the west, to east Somalia (near the tip of the Horn of Africa) in the east.

Native: Djibouti (Pearch *et al.*, 2001: 397); Eritrea; Ethiopia (Glass, 1965: 179); Kenya; Somalia; Sudan; Tanzania; Uganda, Zanzibar.

DETAILED MORPHOLOGY:
Baculum - Unknown
Brain - Based on three brains from Kenya, Kruger *et al.* (2010a) describe the nuclear organization of the cholinergic, catecholaminergic and seroton-ergic systems, using immunohistochemical methods. Kruger *et al.*, 2010b) describe the distribution of Orexin-A immunoreactive cell bodies and terminal networks based on three brains from Kenya.

ECHOLOCATION:
See O'Shea and Vaughan (1980) and Taylor *et al.* (2005).

Davies *et al.* (2013b: Table S8) report a peak frequency of 56.7 kHz and a range between 39.6 and 90.9 Khz.
Kanuch *et al.* (2015: 55) found that the bats emitted relative broadband FM signals with a very sort duration (2 ms). The average peak frequency was 50.4 kHz (49.2 - 51.7 kHz), and the mean inter-signal interval was 186 ms (130 - 286 ms). The signals also had a second (around 65 kHz) and third (around 88 kHz) component, which are probably not true harmonics.

Smarsh and Smotherman (2016: 429) report up to four harmonics, of which the second and third are emphasized and the first suppressed. They also present the following data (p. 435): F_{peak}: 49.13 ± 1.39 kHz, F_{max}: 62.19 ± 2.29 kHz, F_{min}: 40.14 ± 0.73 kHz, bandwidth: 22.04 ± 2.72 kHz, duration: 1.34 ± 0.06 ms, and interpulse interval: 47.53 ± 22.19 ms. Furthermore, males had significantly lower F_{min} values than females.

HABITAT:
Typically this species has been recorded from lowland savanna, shrubland, and the coastal strip, and in some instances, it may be observed in river valleys (Varty and Hill, 1988; Csada, 1996). Highest altitudinal record is 940 m (Csada, 1996). Stanley *et al.* (2007c: 58) mention that *C. cor* is a common resident of baobab trees (*Adansonia digitata* L.).

HABITS:
McWilliam (1987a: 243) reported that *C. cor* males sing to mark their feeding territories. Contrary to echolocation calls, which are produced nasally, these songs are produced orally (Smarsh and Smotherman, 2017: 2), and are seasonally. Smarsh and Smotherman (2017: 11) also found that *C. cor* reacted to play-back sounds by producing faster, lower-frequency songs.

Smarsh and Smotherman (2016: 429) [referring to Bogdanowicz and Owen (1990)] mention that *Cardioderma cor* is a surface gleaner, which sits in perches and scans the environment, rotating its body and pinnae until it detects a prey to pick off the surface in the dense scrub habitat. Vaughan (1976) [in Fenton, 1986a], however, indicated that *C. cor* alternates between prey on the ground and flying prey, either from a perch about 1 m from the ground or from flight.

ROOST:
It roosts alone, or in small numbers, in caves, hollow trees (e.g. baobab) and abandoned buildings (Kingdon, 1974; Vaughan, 1976; Ryan and Tuttle, 1987; Csada, 1996; Pearch *et al.*, 2001; Smarsh and Smotherman, 2016: 429). When roosting in trees, open sites are preferred, since this species doesn't seem to be very agile in roosting situations (Kunz, 1996: 50). In the Mago National Park (Ethiopia), Kanuch *et al.* (2015: 55) found that dozens of male and female bats were roosting in two underground cesspits of the toilet, which they entered through waste holes.

POPULATION:
Structure and Density - Although there is little overall information on the abundance of this species, up to 81 bats have been found roosting in a hollow baobab tree (Vaughan, 1976).
Trend - 2008 - Unknown (Mickleburgh *et al.*, 2008b; IUCN, 2009). 2004 - Unknown (Mickleburgh *et al.*, 2004a; IUCN, 2004).

ACTIVITY AND BEHAVIOUR:
Smotherman *et al.* (2016: 537) refer to Vaughan (1976) and McWilliam (1987a) in describing the song structure for this species as consisting of different syllable types in a basic motif.

REPRODUCTION AND ONTOGENY:
Tuttle and Stevenson (1982: 121) mention that both males and females need about 16 months to attain sexual maturity.

Matthews (1941) and Krutzsch (2000: 95) indicate that the central duct of the ampullary gland seems to act as a temporary storage site for spermatozoa. They also mention that *C. cor* is the only polyoestrous species in the Megadermatidae, all others are seasonally monoestrous.

Vaughan (1976) and Kunz and Hood (2000: 418) suggest that paternal recognition of young would occur in monogamous species, such as *C. cor*, where males participate in the care of young. The males also defend the foraging territories in which

young bats learn to feed (Kunz and Hood, 2000: 440).

MATING:
Vaughan (1976), McWilliam (1987a), and McCracken and Wilkinson (2000: 351) report this species to be monogamous.

PARASITES:
PROTOZOA
Kassahun *et al.* (2015: 168) tested one *C. cor* specimen from Awash-Methara (Ethiopia) and found it to be infected by *Leishmania tropica* Wright, 1903.

ACARI
Trombiculidae: *Grandjeana kanuchi* Kalúz and Ševcík, 2015 collected and described from *C. cor* in Ethiopia (Kalúz and Ševcík, 2015: 381; Stekolnikov, 2018a: 136).

DIPTERA
Streblidae: *Raymondia huberi huberi* Frauenfeld, 1855 (Shapiro *et al.*, 2016: 254). *Raymondia planiceps* Jobling, 1930 (Haeselbarth *et al.*, 1966: 102; Kanuch *et al.*, 2015: 55; Shapiro *et al.*, 2016: 255); *Raymondia seminuda* Jobling, 1954 in Ethiopia (Jobling (1954) in (Haeselbarth *et al.*, 1966: 104).

Nycteribiidae: *Basilia daganiae* Theodor and Moscona, 1954 from Mombasa, Kenya (Haeselbarth *et al.*, 1966: 110).

VIRUSES:
In their country-wide survey of Kenyan bats, Waruhiu *et al.* (2017) found the following viruses in *Cardioderma cor*: Adenoviruses and Astroviruses.

Coronaviridae - Coronaviruses
SARS-CoV - Tong *et al.* (2009) found coronavirus RNA in fecal samples collected of one bat collected in Kenya in 2006.

Tao *et al.* (2017: 3) indicate that one (25 %) of the Kenyan *C. cor* they examined tested positive for CoV.

Paramyxoviridae
Conrardy *et al.* (2014: 259) tested 14 individuals from Kenya with the use of an RT-PCR assay. Of the 10 individuals tested from Panga Yambo cave, one individual tested positive for paramyxovirus RNA that grouped phylogenetically to an *Otomops martiensseni*-related paramyxovirus.

Polyomaviridae
Cardioderma PyV KY336 - Tao *et al.*, 2012 detected polyomavirus DNA in fecal/oral swabs from Kenya in 2006.

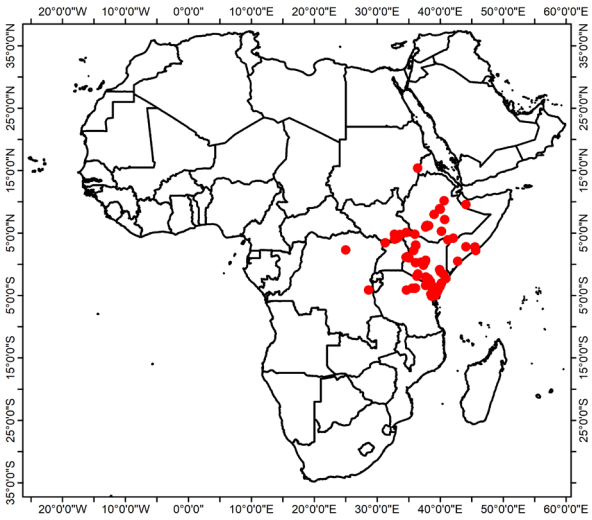

Figure 71. Distribution of *Cardioderma cor*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Congo (Democratic Republic of the), Egypt, Eritrea, Ethiopia, Kenya, Somalia, South Sudan, Sudan, Tanzania, Uganda.

Genus ***Lavia*** Gray, 1838

*1838. *Lavia* Gray, Mag. Zool. Bot., Edinburgh, 2 (12): 490. Publication date: 1 February 1838. - Comments: Type species: *Megaderma frons* E. Geoffroy Saint-Hilaire, 1810. - Etymology: From "*lavo*" meaning fine, elegant, splendid (see Vonhof and Kalcounis, 1999: 4). Lanza *et al.* (2015: 172), however, indicate that *lavo* is a Latin verb meaning "wash, wash away, wash off, wet, moisten, bathe, soak", while its passive Latin perfect participle *lauta* (corresponding to a feminine verbal adjectiv) actually means - besides "washed", "clean", and "sumptuous" - "splendid" and "magnificent", referring to the beauty of the animal. (Current Combination)

1846. *Livia:* Agassiz, Nomenclator. Zool., Mamm., addenda 6. (Lapsus)

TAXONOMY:
See Simmons (2005).

Known species of the genus *Lavia*: ***frons*** (E. Geoffroy, 1810.

COMMON NAMES:
Czech: žlutokřídlí lyronosi. English: Yellow-winged Bats. French: Mégadermes à ailes orangées. German: Gelbflügel-Fledermäuse. Italian: Fàlsi vampìri dàlle àli giàlle.

Lavia frons (E. Geoffroy St.-Hilaire, 1810)

1800. *Vespertilio megalotis* Bechstein. Type locality: South Africa: Great Namaqualand: Orange River, 50 mi [=75 km] N. - Comments: Nomen oblitum. See Grubb (2004: 91 - 92) for a discussion.
*1810. *Megaderma frons* E. Geoffroy Saint-Hilaire, Ann. Mus. Hist. nat. Paris, 15: 192. Type locality: Senegal: "Senegal". Holotype: MNHN 928:. Number 175 in Rode (1941: 236). Skull number A6844. Paratype: MNHN 929: skin only. Skull removed and lost. Number 175a in Rode (1941: 236). Paratype: MNHN 929.C: skin only. Number 175b in Rode (1941: 2436). Paratype: MNHN 929.D: skin only. Number 175c in Rode (1941: 236). - Etymology: From the Latin "*frons*" meaning forehead (see Vonhof and Kalcounis, 1999: 4).
1905. *Lavia rex* Miller, Proc. Biol. Soc. Wash., 18: 227. Publication date: 9 December 1905. Type locality: Kenya: Taveta [03 23 S 37 40 E] [Goto Description]. Holotype: USNM 18993/38197: ad ♂, skin and skull. Collected by: Dr. William Louis Abbott; collection date: 1889. Skin catalogued 24 June 1890; skull catalogued 18 February 1904: see Miller (1905: 227), Lyon and Osgood (1909: 260), Poole and Schantz (1942: 118).
1907. *Lavia frons affinis* K. Andersen and Wroughton, Ann. Mag. nat. Hist., ser. 7, 19 (110): 138, 140. Publication date: 1 February 1907. Type locality: Sudan: White Nile: Kaka [10 41 N 32 13 E] [Goto Description]. Holotype: BMNH 1901.8.8.3: ad ♂, skin only. Collected by: R. McDonald Hawker Esq. - Comments: Not mentioned by Vonhof and Kalcounis (1999: 1).
? *Lavia frons frons:* (Name Combination)
? *Lavia frons rex:* (Name Combination)
? *Lavia frons:* (Name Combination, Current Combination)

TAXONOMY:
See Vonhof and Kalcounis (1999, Mammalian Species, 614). Grubb (2004: 91) calls *Megaderma frons* a "nomen protectum".

COMMON NAMES:
Azande (DRC): Ndima. Chinese: 黃翼蝠. Czech: lyronos žlutokřídlý, weloblánec lupenatý, megaderma žlutokřídlá. English: Yellow-winged Bat, African Yellow-winged Bat. Finnish: Keltapoimulepakko. French: Feuille de Daubenton, Megaderme à ailes orangées, Lavie à ailes jaunes, Le Megaderme feuille, Megaderme à ailes orangées. German: Gelbflügelige Großblattnase, Gelbflügel-Fledermaus. Italian: Fàlso vampìre dàlle ali giàlle. Kiluba (DRC): Kasusu. Kinande (DRC): Kakoro kombe.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008n; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2008n; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2004y; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
While Vonhof and Kalcounis (1999) state that the effects of human activity on population dynamics of this bat are unknown, there do not appear to be any major threats to the species (Mickleburgh *et al.*, 2008n; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008n) [in IUCN (2009)] report that it is present in a number of protected areas (e.g. Garamba National Park, Democratic Republic of the Congo). Other than studies into the possible effects of human activity on population dynamics of this bat, and additional research into the range of this species, no conservation measures are currently needed for this widespread species.

GENERAL DISTRIBUTION:
Lavia frons is broadly distributed south of the Sahara from Gambia and Senegal, through much of West and Central Africa, to southern and central Sudan, Eritrea, Ethiopia and Somalia in the east; ranging southwards as far as northern Zambia and northern Malawi. It is typically a lowland species found below 2,000 m asl.

Native: Benin (Capo-Chichi *et al.*, 2004: 162); Burkina Faso (Kangoyé *et al.*, 2015a: 610); Burundi; Cameroon; Central African Republic; Chad; Congo (The Democratic Republic of the) (Schouteden, 1944; Hayman *et al.*, 1966; Monadjem *et al.*, 2010d: 539); Côte d'Ivoire; Eritrea; Ethiopia (Yalden *et al.*, 1996; Lavrenchenko *et al.*, 2004b: 132); Gabon; Gambia (Grubb *et al.*, 1998); Ghana; Guinea; Guinea-Bissau (Seabra, 1900a; Monard, 1939; Rainho and Ranco, 2001: 46); Kenya (Aggundey and Schlitter, 1984); Malawi (Happold *et al.*, 1988; Ansell and Dowsett, 1988; Vonhof and Kalcounis, 1999; Monadjem *et al.*, 2010d: 539); Mali; Niger; Nigeria; Rwanda (Baeten *et al.*, 1984; Senegal; Sierra Leone; Somalia (Funaioli and Simonetta, 1966); Sudan; Tanzania; Togo; Uganda (Kityo and Kerbis, 1996: 61); Zambia (Ansell, 1967; Ansell, 1978; Monadjem *et al.*, 2010d: 539).
Presence uncertain: Namibia, Zanzibar.

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
From western Uganda, Monadjem *et al.* (2011: 30) reported the following data: Fa: 59.5 mm, mass: 23 g, wing loading: 7.8 N/m^2, aspect ratio: 5.2.

DENTAL FORMULA:
Dorst (1953a: 83 - 84) indicates that he was unable to find any trace of a milk dentition in a foetus of about 35 mm in size (Fa: 25 mm), but also that the permanent teeth were already perfectly formed, but were not yet grown above the gum.

SEXUAL DIMORPHISM:
Krutzsch (2000: 115) mentions the presence of dorsal skin glands in males.

Kangoyé *et al.* (2015a: 610) found no differences in body and cranial measurements between the two sexes.

ECHOLOCATION:
See Taylor *et al.* (2005).

Davies *et al.* (2013b: Table S8) report a peak frequency of 18.5 kHz and a range between 16.9 and 82.9 kHz.

Smarsh and Smotherman (2016: 429) report up to four harmonics of which the second and third are emphasized and the first suppressed, with males having a significantly lower F_{min}. They also provide the following data: F_{peak}: 42.21 ± 2.35 kHz, F_{max}: 48.50 ± 2.08 kHz, F_{min}: 35.08 ± 1.25 kHz, bandwidth: 13.42 ± 3.04 kHz, duration: 3.25 ± 2.98 ms, and interpulse interval: 53.99 ± 32.24 ms.

HABITAT:
R.B. Woosnam [in Thomas, 1910b: 488] mentions it to be plentiful among the acacia trees on the plains around the south end of Ruwenzori at 3,400 ft (1,000 m), where it was found hanging fully exposed to the sun.

HABITS:
Vaughan and Vaughan (1987) [in McCracken and Wilkinson (2000: 353)] found that the single young remains closely associated with both parents at roost sites and on the foraging area for up to 50 days after it becomes volant.

Smarsh and Smotherman (2016: 430) consider *L. frons* to be an aerial-hawker, capturing insects in vegetation gaps.

ROOST:
L. frons roosts in trees, but prefers relatively open sites as it seems to be less agile in roosting situations (Kunz, 1996: 50). McCracken and Wilkinson (2000: 351) indicate that male/female pairs roost in the same territory, and that pair-specific roost sites and foraging areas remain stable for at least several months.
Smarsh and Smotherman (2016: 429) indicate that *L. frons* roost in male-female pairs in Acacia trees within a foraging territory.

PREDATORS:
Schätti (1984: 339) refers to Loveridge (in Allen, 1940), who found a specimen in the stomach of a Black Mamba (*Dendroaspis polylepis*).
Mikula *et al.* (2016: Supplemental data) mention the Grey kestrel (*Falco ardosiaceus* Vieillot, 1823), Common kestrel (*Falco tinnunculus* Linnaeus, 1758) and Bat hawk (*Macheiramphus alcinus* Bonaparte, 1850) as avian diurnal predators.

POPULATION:
Structure and Density - Although there is little information on the abundance of this species, it is probably uncommon (Vonhof and Kalcounis, 1999).
Trend - 2008 - Stable (Mickleburgh *et al.*, 2008n; IUCN, 2009).

ACTIVITY AND BEHAVIOUR:
Smotherman *et al.* (2016: 537) refer to Wickler and Uhrig (1969) and Vaughan and Vaughan (1986) in describing the song structure for this species as consisting of simple syllable types in a basic motif.

REPRODUCTION AND ONTOGENY:
Vaughan and Vaughan (1987: 217) report that females give birth to one young, which hangs on to its mother for about a week, and then starts flying. The young is weaned about 20 days after its first flight, but remains at least 50 days in close contact with its parents, during which time it learns to become a skilled opportunistic forager.

MATING:
Duron *et al.* (2014: 351) reports that *L. frons* is a monogamous species.

PARASITES:
SIPHONAPTERA
Pulicidae: *Echidnophaga aethiops* Jordan and Rothschild, 1906 locality not mentioned (Haeselbarth *et al.*, 1966: 135).
Ischnopsyllidae: *Chiropteropsylla brockmani* Rothschild, 1915 widespread (Haeselbarth *et al.*, 1966: 192).

ANTHROPOPHILOUS:
Jeffreys (1944: 73) [referring to Schweinfurt (1878)] mentions the following "Among the Bongo of the Anglo-Egyptian Sudan much the same superstition lurks - 'Spirits, devils and witches have their general appellation of 'Bitaboh', wood-goblins being specially called 'Ronga'. Comprehended under the same term are all the bats (especially the *Megaderma frons*, which flutters about from tree to tree in broad daylight).'"

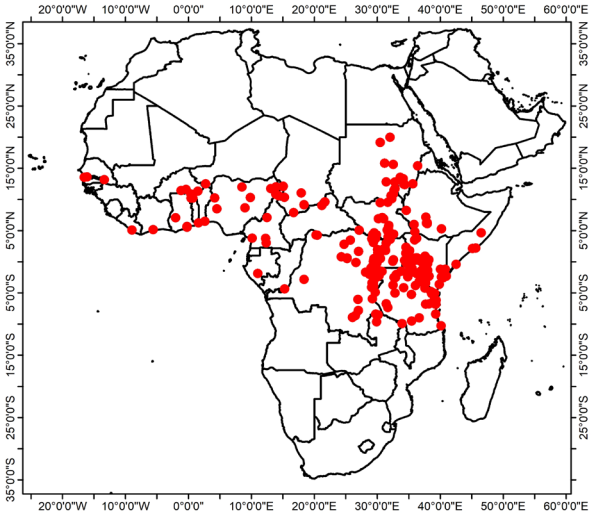

Figure 72. Distribution of *Lavia frons*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Benin, Burkina Faso, Burundi, Cameroon, Central African Republic, Chad, Congo (Democratic Republic of the), Côte d'Ivoire, Egypt, Ethiopia, Gabon, Ghana, Guinea, Kenya, Liberia, Malawi, Niger, Nigeria, Rwanda, Senegal, Sierra Leone, Somalia, South Sudan, Sudan, Tanzania, The Gambia, Togo, Uganda, Zambia.

Genus ***Megaderma*** E. Geoffroy St.-Hilaire, 1810

*1810. *Megaderma* E. Geoffroy St.-Hillaire, Ann. Mus. Hist. nat. Paris, 15: 197. - Comments: Type species: *Vespertilio spasma* Linnaeus, 1758. - Etymology: From the Greek "*μέγας*", meaning great or large and "*δέρμα*", meaning skin, referring to the large wings and interfemoral membrane (see Palmer, 1904: 403). (Current Combination)
1847. *Eucheira* Hodgson. - Comments: not *Eucheira* Westwood, 1838, an insect.
1866. *Spasma* Gray.
1872. *Lyroderma* Peters.
1961. *Afropterus* Lavocat, Notes Mém. Serv. Mines Carte geol. Maroc, 155: ?. - Comments: Mid Miocene-Pliocene in Morocco.

TAXONOMY:
Includes *Lyroderma*, but see Hand (1985).
Two subgenera (*Megaderma* and *Lyroderma*) are recognized by Corbet and Hill (1992) and Simmons (2005: 380).

Known species of the genus *Megaderma*: †***gigas*** Lavocat, 1961; †***jaegeri*** Sigé, 1976; *lyra* E. Geoffroy, 1810 – Afganistan to southern China, Burma, Thailand, Cambodia, Laos, Vietnam; south to Sri Lanka and western Malaysia; Bangladesh (Simmons, 2005: 380); *spasma* (Linnaeus, 1758) – Sri Lanka and India through south east Asia (including Vietnam) to Lesser Sundas, the Philippines and Molucca Isls, various adjacent islands (Simmons, 2005: 380).

†***Saharaderma pseudovampyrus*** Gunnell, Simons and Seiffert, 2008

*2008. *Saharaderma pseudovampyrus* Gunnell, Simons and Seiffert, J. Vert. Paleont., 28 (1): 3, 7, fig. 7. Type locality: Egypt: Fayum Depression: Quarry L-41: Lower Sequence, Jebel Qatrani Formation. Holotype: CGM 83672:. Right dentary p4-m3: see Gunnell *et al.* (2008: 7). - Comments: latest Eocene, Priabonian. - Etymology: 'Pseudo- and Vampyrus' in reference to the common name of megadermatids (False Vampire Bats), from Slavic, 'wampir', blood-sucking ghost (Gunnell *et al.*, 2008). (Current Combination)

TAXONOMY:
See Gunnell *et al.* (2008).

SIMILAR SPECIES:
See Gunnell *et al.* (2008).

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
See Gunnell *et al.* (2008).

Timeframe:
Latest Eocene (Priabonian), Lower Sequence, Jebel Qatrani formation.

GENERAL DISTRIBUTION:
Egypt (Gunnell *et al.*, 2008).

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:
See Gunnell *et al.* (2008).

Family RHINOLOPHIDAE Gray, 1825

*1825. *Rhinolophidae* Gray, Zool. Journ., 2 (6): 242. - Comments: Type genus: *Rhinolophus* Lacépède, 1799. Corbet and Hill (1992: 90) mention "Bell, 1836: 599" as author. Jackson and Groves (2015: 242) mention "T. Bell, 1836: 599" as author of this spelling, but attributed the family name to Gray, 1825. (Current Combination)

1825. *Rhinolophina* Gray, Ann. Philos., 10 (5): 338. - Comments: Proposed as tribe and originally containing the genera *Megaderma* É. Geoffroy, 1810; *Rhinolophus* Lacépède, 1799; *Nycteris* É. Geoffroy & G. Cuvier, 1795; *Mormoops* Leach, 1821 and *Nyctophilus* Leach, 1821. Jackson and Groves (2015: 241, 242) placed this name in the synonymy of both Rhinolophoidea and Rhinolophidae.

1827. *Rhinolophina* Lesson, Mannuel de mammalogie, p. 81. - Comments: In Part (see Taylor, 1934).

1854. *Rhinolophides* Gervais, Histoire naturelle des mammifères, p. 200. - Comments: In Part (see Taylor, 1934).

1855. *Histiorhina* Van der Hoeven, Handboek Dierkunde, 2nd ed., 2: 1033. - Comments: Proposed as tribe (?), which was not based on a genus name (see Jackson and Groves, 2015: 242).

1865. *Rhinolophi* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, p. 256. - Comments: In Part (see Taylor, 1934). Originally included the genera *Rhinolophus* Lacépède, 1799; *Phyllorrhina* Bonaparte, 1837 [1832–1841] [= *Hipposideros* J. Gray, 1831b]; and *Coelops* Blyth, 1848 (see Jackson and Groves, 2015: 242).

1883. *Phyllorhinidae* de Rochebrune, Act. Soc. Linn. Bordeaux, 37 (4) 7: 94. - Comments: Originally included the genus *Phyllorhina* Leach, 1816 [= *Rhinolophus* Lacépède, 1799]. Howev,er the name is unavailable (see Jackson and Groves, 2015: 242).

1893. *Rhinolophini* Winge, Samling af Afhandlinger. E Museo Lundii, 2 (1): 24. - Comments: Proposed as tribe (?) and originally included the genera *Phyllorhina* [sic] Bonaparte, 1837 [1832–1841] [= *Hipposideros* J. Gray, 1831]; *Anthops* Thomas, 1888: *Rhinonicteris* J. Gray, 1847; *Triaenops* Dobson, 1871; *Coelops* Blyth, 1848; and *Rhinolophus* Lacépède, 1799 (ee Jackson and Groves, 2015: 242).

TAXONOMY:
Koopman and Jones, 1970; Swanepoel *et al.* (1980: 157), Harrison and Bates (1991: 51), Corbet and Hill (1992: 104 - with comment), Pavlinov *et al.* (1995), Peterson *et al.* (1995: 66), Hutson *et al.* (2001: 16) and Simmons (2005: 350) included the Hipposideridae. Hill (1982b) listed Hipposideridae as a distinct family, without comment and Hill and Smith (1984) retained this separation and discussed the question.

Foley *et al.* (2014: 319) state that the Rhinolophidae form a fully supported monophyletic group, but that the intrafamilial relationships are less well resolved than for the Hipposideridae.

Currently known genera of the family Rhinolophidae: ***Rhinolophus*** Lacépède, 1799.

COMMON NAMES:
Czech: vrápencovití, vlastní vrápenci. Dutch: Hoefijzerneusvleermuizen, Hoefijzerneuzen. English: Horseshoe bats. Finnish: Hevosenkenkäyököt, Kaviokuonoyököt. French: Rhinolophidés, Fers-à-cheval, Rhinolophes. German: Hufeisennasen, Hufeisennasen-Fledermäuse. Italian: Rinolòfidi. Norwegian: Hesteskoneser, Ekte hesteskonese. Polish: podkowcowate. Romanian: Lilieci cu pliuri nazale. Russian: Подковоносые. Vietnamese: Họ dơi lá.

ETYMOLOGY OF COMMON NAME:
They are called horseshoe bats because the anterior nose-leaf is shaped like a horseshoe.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
The Rhinolophidae, date from the late Eocene or early Oligocene of Europe and have been recorded in Africa only from the Mio-Pliocene of

Morocco (Lavocat, 1961) and the late Pliocene of Makapansgat (De Graaf, 1960).
The family-level stem and crown ages were calculated as 49.9 and 49.8 Mya by Shi and Rabosky (2015: 1537).

BIOGEOGRAPHY:
During the Miocene at about 17 Ma, the *Rhinolophus* diversified into distinct clades (Foley *et al.*, 2014: 320).

FUNCTIONAL MORPHOLOGY:
Using micro computed tomography (micro-CT) scans, Curtis A. A. and Simmons N. B. (2016: 310) examined the turbinal morphology in the Rhinolophidae and found strangely formed maxilloturbinal bones within the respiratory airway. These looked distinct in form from the scrolled, branched, or plate shaped turbinals reported in other mammals, including other nasophonating bats.

VIRUSES:
Coronaviridae
SARS-related coronaviruses have only been detected in the *Rhinolophus* genus.

Genus ***Rhinolophus*** Lacépède, 1799

*1799. *Rhinolophus* Lacépède, Tabl. Div. Subd. Orders Genres Mammifères, 15. - Comments: Type species (by monotypy): *Vespertilio ferrum-equinum* Schreber, 1774. Conserved by Opinion 91 (1926) and Direction 24 (1955) (see Corbet and Hill, 1992: 91). - Etymology: From the Greek "*ρις*" or "*ρινός*", meaning nose and "*λόφος*", meaning crest, referring to the complex nose-leaf, consisting of three parts (Palmer, 1904: 606; Taylor, 2005). Lanza *et al.* (2015: 76) translate "*λόφος*" as "comb", which leads to "with a comb on the nose or, more properly, on the snout". (Current Combination)

1816. *Phyllorhina* Leach, Systematic Catalogue of the species of indigenious Mammals in the British Museum, 5. - Comments: Type species: *Vespertilio minutus* Montagu, 1808. By subsequent designation (see Jackson and Groves, 2015: 243). Not *Phyllorrhina* Bonaparte, 1831 (Mammalia, Chiroptera, Rhinolophidae), a Nomen nudum according to Palmer (1904: 535), nor *Phyllorrhina* Bonaparte, 1837 [1832–1841] (Mammalia, Chiroptera, Hipposideridae) (see Jackson and Groves, 2015: 243).

1836. *Rhinocrepis* Gervais, Dictionnaire Pittoresque d'Histoire naturelle, 4 (2): pt. 318, p. 617. - Comments: Type species: *Vespertilio ferrum-equinum* Schreber, 1774. By "implication" according to Allen (1939a: 72) or by subsequent designation (Palmer, 1904: 606).

1847. *Aquias* Gray, Proc. zool. Soc. Lond., 1847, XV (clxix): 15. Publication date: 13 April 1847. - Comments: Type species: *Rhinolophus luctus* Temminck, 1838 / *Rhinolophus trifoliatus* Temminck, 1834. Restricted to *R. luctus* by Ellerman *et al.* (1953): see Meester *et al.* (1986: 36).

1866. *Phyllotis* Gray, Proc. zool. Soc. Lond., 1866, I (vi): 81. Publication date: May 1866. - Comments: Type species (by monotypy): *Rhinolophus philippinensis* Waterhouse, 1843. Preoccupied by *Phyllotis* Waterhouse 1837 (Mammalia, Rodentia, Cricetidae) (see Jackson and Groves, 2015: 243).

1867. *Cœloephyllus* Peters, Proc. zool. Soc. Lond., 1866, III: 427. Publication date: April 1867. - Comments: Type species: *Rhinolophus cœlophyllus* Peters, 1867.

1867. *Coelophyllus* Peters, Proc. zool. Soc. Lond., 1866, III: 427. Publication date: April 1867. - Comments: Type species (by monotypy): *Rhinolophus coelophyllus* Peters, 1867 (see Jackson and Groves, 2015: 243).

1901. *Euryalus* Matschie, Sber. Ges. naturf. Freunde Berlin, 225. - Comments: Type species (by monotypy): *Rhinolophus mehelyi* Matschie, 1901. Described as a subgenus of *Rhinolophus* (see Meester *et al.*, 1986: 36; Jackson and Groves, 2015: 243). - Etymology: From the specific name *euryale* ("*Ευρυάλη*"), being one of the Gorgons (see Palmer, 1904: 279).

1941. *Rhinophyllotis* Troughton, Furred Animals of Australia, 1st edn: 342. - Comments: Type species (by monotypy): *Rhinolophus megaphyllus* Gray, 1834. Redescription for *Rhinophyllotus* Iredale and Troughton, 1934, "nomen nudum" (see Meester *et al.*, 1986: 36).

1951. *Rhinomegalophus* Bourret, Bull. Mus. natn. Hist. nat., Paris, sér. 2, 23 (6): 607. - Comments: Type species (by monotypy): *Rhinomegalophus paradoxolophus* Bourret, 1951 (see Jackson and Groves, 2015: 243).

1973. *Rhinomegaphyllus:* Thonglongya, Mammalia, 37: 587. - Comments: Lapsus for *Rhinomegalophus* Bourret, 1951 (see Eger and Fenton, 2003: 1). (Lapsus)

1993. *Rhinilophus:* Amr and Qumsiyeh, Ent. News, 104 (1): 44. (Lapsus)
2003. *Indorhinolophus* Guillén-Servent, Francis and Ricklefs, in: Csorba, Ujhelyi and Thomas, Horseshoe Bats of the World.
2015. *Rhrynolophus:* Thies and Lewis, Occ. Pap. Mus. Texas Tech Univ., 330: 7. Publication date: 10 February 2015. (Lapsus)
2015. *Rhynolophus:* Thies and Lewis, Occ. Pap. Mus. Texas Tech Univ., 330: 7. Publication date: 10 February 2015. (Lapsus)
2018. *Rhinolphus:* Leopardi, Holmes, Gastaldelli, Tassoni, Priori, Scaravelli, Zamperin and De Benedictis, Infec. Gen. Evol., 58: 283. Publication date: 30 January. (Lapsus)
? *Rhinolophus sp.:*

TAXONOMY:
The radiation (about 15 million years ago) of Rhinolophidae into five main clades apparently occurred rapidly and the distinct clades could be regarded as different genera (Servent *et al.*, 2003: xvi). Following tradition Servent *et al.* (2003: xvi) split the six subgenera (*Aquias*, *Phyllorhina*, *Rhinolophus*, *Indorhinolophus*, *Coelophyllus*, *Rhinophyllotis*) into groups corresponding to smaller lineages in the phylogeny. All African and Palaearctic species are contained within a single clade (Servent *et al.*, 2003: xvii). This confirms the views proposed by Bogdanowicz (1992) and Bogdanowicz and Owen (1992), who suspected that the relationship was monophyletic. Qumsiyeh *et al.* (1988) studied protein electrophoresis of a limited number of African taxa, which grouped together in their phylogeny. All African and Palaeartic Rhinolophid species karyotyped show a diploid number of 58, which differs from all other *Rhinolophus* with the exception of some populations of *R. hipposideros* (Zima *et al.*, 1992b). Servent *et al.* (2003: xvii) note that the geographical distribution of taxa and the phylogeny are strongly congruent.

Species groups recognized by Servent *et al.* (2003: xvi), for African taxa:
Rhinolophus: ***R. landeri*** - *landeri*, *alcyone*, ?*guineensis*. ***R. euryale*** - *blasii*, *euryale*, *mehelyi*. ***R. capensis*** - ?*capensis*, ?*swinnyi*, ?*denti*, *simulator*. ***R. adami*** - ?*adami*, ?*maendeleo*. ***R. ferrumequinum*** - *ferrumequinum*, *clivosus*, ?*silvestris*, ?*deckenii*. ***R. maclaudi*** - ?*maclaudi*, *ruwenzorii*. ***R. fumigatus*** - *fumigatus*, *eloquens*, *hildebrandti*, *darlingi*.

Stoffberg *et al.* (2010a: 6 - 7) refer to Guillén-Servent *et al.* (2003), who, based on the complete cytochrome *b* gene, propose that *Rhinolophus* should be divided into six subgenera: *Aquias* (*trifoliatus* group), *Coelophyllus* (*affinis*, *coelophyllus*, *euryotis*, and *pearsonii* groups), *Indorhinolophus* (*rouxi* group), *Phyllorhina* (*hipposideros* group), *Rhinolophus* (*adami*, *capensis*, *euryale*, *ferrumequinum*, *fumigatus*, *landeri*, and *maclaudi* groups), and *Rhinophyllotis* (*acuminatus*, *borneensis*, *macrotis*, *malayanus*, *megaphyllus*, and *pusillus* groups), and confirm most of these.

See Csorba *et al.* (2003: 1 - 3) for key to species. See Taylor *et al.* (2019: 316) for a discussion on the recent increase in Afro-Madagascan species.

Known species of the genus *Rhinolophus*: ***†maghrebensis*** Gunnell, Eiting, and Geraads, 2011; *acuminatus* Peters, 1871 – Thailand, Laos, Cambodia, Peninsular Malaysia and Sabah, Borneo, Sumatra (including Nias and Engano Isls), Java, Karkatau, Lombok, and Bali (Indonesia), Palawan, Balabac, Busuanga (Philippines) (Csorba *et al.*, 2003: 98; Simmons, 2005: 350); ***adami*** Aellen and Brosset, 1968; *affinis* Horsfield, 1823 – India and Nepal to south China and Vietnam, through Malaysia to Borneo and Lesser Sunda Isls, Andaman Isls (India) (Csorba *et al.*, 2003: 68; Simmons, 2005: 351); ***alcyone*** Temminck, 1853; *arcuatus* Peters, 1871 – Sumatra to Philippines, New Guinea and South Molucca Isls (Csorba *et al.*, 2003: 20; Simmons, 2005: 351); *beddomei* K. Andersen, 1905 – southern India, Sri Lanka (Csorba *et al.*, 2003: 123; Simmons, 2005: 351); ***blasii*** Peters, 1867; *bocharicus* Kastchenko and Akimov, 1917 – Kyrgyzstan, western Tajikistan, northeastern Iran, Uzbekistan, Turkmenistan, Afghanistan (Csorba *et al.*, 2003: 35; Simmons, 2005: 352); *borneensis* Peters, 1861 – Borneo, Labuan and Banguey Isls (Malaysia), Java, Karimata Isls and South Natuna Isls (Indonesia), Cambodia, Laos and Vietnam (Csorba *et al.*, 2003: 70; Simmons, 2005: 352); *canuti* Thomas and Wroughton, 1909 – Java, Bali, Timor (Indonesia) (Csorba *et al.*, 2003: 22; Simmons, 2005: 352); ***capensis*** Lichtenstein, 1823; *celebensis* K. Andersen, 1905 – Java, Bali, Timor, Sulawesi, Sangihe, Kangean and Talaud Isls (Indonesia) (Csorba *et al.*, 2003: 72; Simmons, 2005: 352); ***clivosus*** Cretzschmar, 1828; *coelophyllus* Peters, 1867 – western Malaysia, Thailand, Burma, Laos (Csorba *et al.*, 2003: 24; Simmons, 2005: 353); *cognatus* K. Andersen, 1906 – Andaman Isls (India) (Csorba *et al.*, 2003: 99; Simmons, 2005: 353); ***cohenae*** Taylor, Stoffberg, Monadjem, Schoeman, Bayliss and Cotterill, 2012; *convexus* Csorba, 1997 –

Peninsular Malaysia, Laos (Csorba *et al.*, 2003: 100; Simmons, 2005: 353); *cornutus* Temminck, 1834 – Japan (Csorba *et al.*, 2003: 102; Simmons, 2005: 353); *creaghi* Thomas, 1896 – Borneo, Madura Isl, Kalimantan (Indonesia), Sabah, Sarawak (Malaysia) (Csorba *et al.*, 2003: 25; Simmons, 2005: 354); ***darlingi*** K. Andersen, 1905; ***deckenii*** Peters, 1868; ***denti*** Thomas, 1904; ***eloquens*** K. Andersen, 1905; ***euryale*** Blasius, 1853; *euryotis* Temminck, 1835 – Aru Isls, Buru, Bacan, Amboina, Seram and Tanimbar Isls, Kai Isls, Halmahera and Sulawesi (Indonesia), New Guinea, Bismarch Arch, adjacent small islands (Csorba *et al.*, 2003: 27; Simmons, 2005: 355); ***ferrumequinum*** (Schreber, 1774); *formosae* Sanborn, 1939 – Taiwan (Csorba *et al.*, 2003: 124; Simmons, 2005: 355); ***fumigatus*** Rüppell, 1842; ***gorongosae*** Taylor, MacDonald, Goodman, Kearney, Cotterill, Stoffberg, Monadjem, Schoeman, Guyton, Naskrecki and Richards, 2018; ***guineensis*** Eisentraut, 1960; ***hildebrandtii*** Peters, 1878; ***hilli*** Aellen, 1973; ***hillorum*** Koopman, 1989; ***hipposideros*** (Brechstein, 1800); ***horaceki*** Benda and Vallo, 2012; *imaizumii* Hill and Yoshiyuki, 1980 – Iriomote Isl and Yaeyama Isl (Japan: Ryukyu Isls) (Csorba *et al.*, 2003: 104; Simmons, 2005: 357); *inops* K. Andersen, 1905 – Philippines except Palawan region (Csorba *et al.*, 2003: 29; Simmons, 2005: 357); *keyensis* Peters, 1871 – Many islands in Indonesia (Simmons, 2005: 357); ***landeri*** Martin, 1838; *lepidus* Blyth, 1844 – Afghanistan, Pakistan, northern India, Nepal, Burma, Thailand, Szechwan and Yunnan (China), Peninsular Malaysia, Sumatra (Indonesia) (Csorba *et al.*, 2003: 106; Simmons, 2005: 358); ***lobatus*** Peters, 1852; *luctus* Temmink, 1834 – India, Nepal, Burma, Sri Lanka, south China, Vietnam, Cambodia, Laos, Thailand, Peninsular Malaysia, Borneo, Sumatra, Java and Bali (Indonesia) (Csorba *et al.*, 2003: 126; Simmons, 2005: 358); ***mabuensis*** Taylor, Stoffberg, Monadjem, Scoeman, Bayliss and Cotterill, 2012; ***maclaudi*** Pousargues, 1897; *macrotis* Blyth, 1844 – Pakistan, northern India, Nepal to south China, Burma, Thailand, Laos, Vietnam and Peninsular Malaysia, Sumatra (Indonesia), Philippines (Csorba *et al.*, 2003: 87; Simmons, 2005: 358); *madurensis* K. Andersen, 1918 – Madura and Kangean Isls (Indonesia) (Simmons, 2005: 358); ***maendeleo*** Kock, Csorba and Howell, 2000; *malayanus* Bonhote, 1903 – Thailand, Burma, Cambodia, Laos, Vietnam, Peninsular Malaysia (Csorba *et al.*, 2003: 74; Simmons, 2005: 359); *marshalli* Thonglongya, 1973 – Thailand, Burma, Vietnam, Laos, Peninsular Malaysia (Csorba *et al.*, 2003: 89; Simmons, 2005: 359); *megaphyllus* Gray, 1834 – eastern New Guinea; Misima Isl (Louisiade Arch.), Goodenough Isl (D'Entrecasteaux Isls) and Bismarck Arch. (Papua New Guinea), Moluccas, Lesser Sundas, eastern Queensland, eastern New South Wales and eastern Victoria (Australia) (Csorba *et al.*, 2003: 76; Simmons, 2005: 359); ***mehelyi*** Matschie, 1901; *mitratus* Blyth, 1844 – India (Csorba *et al.*, 2003: 131; Simmons, 2005: 360); *monoceros* K.Andersen, 1905 – Taiwan (Csorba *et al.*, 2003: 108; Simmons, 2005: 360); *montanus* Goodwin, 1979 – Timor (Indonesia) (Csorba *et al.*, 2003: 91; Simmons, 2005: 360); ***mossambicus*** Taylor, Stoffberg, Monadjem, Schoeman, Bayliss and Cotterill, 2012; *nereis* K. Andersen, 1905 – Anamba and North Natuna Isls (Indonesia) (Csorba *et al.*, 2003: 78; Simmons, 2005: 360); *osgoodi* Sanborn, 1939 – Yunnan (China) (Csorba *et al.*, 2003: 109; Simmons, 2005: 360); *paradoxolophus* (Bourret, 1951) – Vietnam, Thailand, Laos and China (Csorba *et al.*, 2003: 92; Simmons, 2005: 360); *pearsoni* Horsfield, 1851 – northern India, Nepal, Bhutan, Burma, Tibet, Szechwan, Anhwei and Fukien (China) to Vietnam, Laos, Thailand, Peninsular Malaysia (Csorba *et al.*, 2003: 83; Simmons, 2005: 360); *philippinensis* Waterhouse, 1843 – Phillipines, Kai Isls, Sabah, Sarawak and Sulawesi (Indonesia), Borneo, New Guinea, northeastern Queensland (Australia) (Csorba *et al.*, 2003: 94; Simmons, 2005: 361); *pusillus* Temminck, 1834 – India, Nepal, Thailand, Burma, Laos, south China, Peninsular Malaysia, Mentawai Isls, Java and Lesser Sunda Isls (Indonesia), small adjacent islands (Csorba *et al.*, 2003: 112; Simmons, 2005: 361); *rex* G. M. Allen, 1923 – southwestern China (Csorba *et al.*, 2003: 96; Simmons, 2005: 361); ***rhodesiae*** Roberts, 1946; *robinsoni* K. Andersen, 1918 – western Malaysia, Thailand, adjacent small islands (Simmons, 2005: 361); *rouxii* Temminck, 1835 – Sri Lanka, peninsular India to southern Burma and Vietnam (Csorba *et al.*, 2003: 117; Simmons, 2005: 362); *rufus* Eydoux and Gervais, 1836 – Philippines (Csorba *et al.*, 2003: 30; Simmons, 2005: 362); ***ruwenzorii*** J. Eric Hill, 1942; ***sakejiensis*** Cotterill, 2002; *sedulus* K. Andersen, 1905 – Peninsular Malaysia, Sarawak and Sabah (Malaysia), Borneo (Indonesia) (Csorba *et al.*, 2003: 128; Simmons, 2005: 362); *shameli* Tate, 1943 – Burma, Thailand, Laos, Cambodia, Peninsular Malaysia (Csorba *et al.*, 2003: 31; Simmons, 2005: 363); *shortridgei* K. Andersen, 1918 – northern India, Burma (Csorba *et al.*, 2003: 114; Simmons, 2005: 363); *siamensis* Gyldenstolpe, 1917 – Thailand, Laos, Vietnam (Simmons, 2005: 363); ***silvestris*** Aellen, 1959; ***simulator*** K.Andersen, 1904; ***smithersi*** Taylor, Stoffberg, Monadjem, Schoeman, Bayliss and Cotterill, 2012; *sinicus* K. Andersen, 1905 – Burma, Vietnam, Thailand, Laos (Csorba *et al.*, 2003: 121; Simmons, 2005: 364); *trifoliatus* Temminck, 1834 – northeastern India, southwestern Thailand and Burma, Peninsular Malaysia, Sarawak and Sabah (Malaysia), Singapore, Borneo, Sumatra, Riau Archipelago, Banguey Isl, Java, Banka Isl and Nias Isl (Indonesia) (Csorba *et al.*, 2003: 130; Simmons, 2005: 364); *virgo* K. Andersen, 1905 – Philippines (Csorba *et al.*, 2003: 81; Simmons, 2005: 364); *yunanensis* Dobson, 1872 – Yunnan (China), Burma, Thailand, northeastern India (Csorba *et al.*, 2003: 85; Simmons, 2005: 365); ***ziama*** Fahr, Vierhaus, Hutterer and Kock, 2002.

Nesi *et al.* (2015: 1) indicate that the taxonomy and true number of species of African *Rhinolophus* remains unresolved because of the highly convergent morphology observed across taxa, and that the current species delimitation is based on slight variations in morphological measurements and echolocation call frequency. Due to the extensive phenotypic variation, these characters are not always very clearly separable and as such the true diversity of the the genus is most probably underestimated, based on these methods alone.

COMMON NAMES:
Czech: vrápenci, wrápenecové, vrápníkové, vrápeníkové, podkováčkové, vrápenec. Dutch: Hoefijzerneuzen. English: Horseshoe bats. French: Rhinolophes, Fers-à-cheval. German: Hufeisennasen, Hufeisennasen-Fledermäuse. Italian: Fèrri di cavàllo, Rinòlofi. Kiluba (DRC): Kasusu.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
The approximate fossil date for the crown *Rhinolophus* is placed at about 37.2 MYA by Shi and Rabosky (2015: 1532).

Three or four *Rhinolophus* species were reported by Avery (2007: 619) from Pleistocene deposits at Wonderwerk Cave, South Africa.

Geraads *et al.* (2010: 279) reported the presence of *Rhinolophus* in Late Cenozoic (ca. 2.5 MYA) deposits in Ahl al Oughlam, Morocco.

BIOGEOGRAPHY:
See Servent *et al.* (2003: xii - xxiv) for discussion on phylogeny and biogeography of the horseshoe bats.

During the Miocene at about 17 Mya, *Rhinolophus* diversified into three distinct clades, two of these clades showed distinct geographical origins (Foley *et al.*, 2014: 320). In Eastern/South Eastern Asia represented by *R. trifoliatus* and *R. luctus* and East Asia represented by *R. pearsoni*, *R. sinicus*, *R. creaghi*, *R. shameli* and *R. pusillus*. While the clade that contains *R. hipposideros*, *R. ferrumequinum* and *R. euryale* is less clear indicating a widespread geographical origin including Europe, East Asia, Middle East and Africa.

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Schmieder *et al.* (2015) studied the wing morphology of five species of European Rhinolophid bats, which also occur in northern Africa: *R. blasii, R. euryale, R. ferrumequinum, R. hipposideros*, and *R. mehelyi*, and they provide a table of geometric differences (p. 8).

DENTAL FORMULA:
The dental formula is variable, usually $^{1123}/_{2133}$ = 32.

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:
Santana and Lofgren (2013: 2521) investigated the evolution of skull morphology and modularity in the recent radiation of rhinolophid bats and predict that nasal echolocation has resulted in the evolution of a third cranial module (the 'nasal dome'), in addition to the two cranial modules conserved across mammals.

FUNCTIONAL MORPHOLOGY:
Jacobs *et al.* (2007a) found that in Africa the peak echolocation frequency was inversely correlated with size in the Rhinolophidae, while for rhinolophids from around the world, peak frequency was inversely correlated with forearm length. Similarly, there was an inverse correlation between mass and peak frequency, between forearm and peak frequency and between wing loading and peak frequency in the African Rhinolophidae (Jacobs *et al.*, 2007a).

ECHOLOCATION:
Jacobs *et al.* (2014: 2829) found that echolocation frequency was positively correlated with bite force, which suggests that its evolution is influenced by a trade-off between the masticatory and sensory functions of the skull. In support of this, variation in skull shape was explained by both echolocation frequency (80 %) and bite force (20 %). They also found that selection has acted on the nasal capsules, which have a frequency-specific impedance matching function during vocalization.

In the Mapungubwe National Park (RSA), Parker and Bernard (2018: 56, 57) recorded a *Rhinolophus* species with a F_{char} = 100.72 ± 0.52 kHz, F_{max}: 100.93 ± 0.77 kHz, F_{min}: 91.34 ± 6.08 kHz, F_{knee}: 100.72 ± 0.52 kHz, duration: 34.89 ± 14.42 msec, with 8.32 ± 3.39 calls/sec. This type of call was also recorded by Taylor *et al.* (2013b: 14) from the Soutpansberg area, and probably is produced by an undescribed species.

PREDATORS:
Mikula *et al.* (2016: Supplemental data) mention the following diurnal avian predators: African fish eagle (*Haliaeetus vocifer* (Daudin, 1800)), Bat hawk (*Macheiramphus alcinus* Bonaparte, 1850) [on either *landeri* or *fumigatus* or *hildebrandti*].

PARASITES:
BACTERIA
Bartonellae
Kamani *et al.* (2014: 628) tested 12 Nigerian "*Rhinolophus*" sp. and found at least 8 of them testing positive for *Bartonella* DNA.

HAEMOSPORIDA
Schaer *et al.* (2015: 381) found *Nycteria* sp. parasites in *Rhinolophus* sp. 1 from South Sudan. The same bat species was also infected by *Nycteria* cf. *gabonensis*. Landau *et al.* (2012: 142) and Perkins and Schaer (2016: Suppl.) also reported *Nycteria krampitzi* Rosin, Landau and Hugot, 1978 from the Republic of Congo and Gabon.

Wünschmann *et al.* (2010: 178) refer to Boulard (1975), who reported the first case of renal coccidiosis in a bat (on *H. caffer* and *Rhinolophus* sp.) from Sierra Leone and the Congo and caused by *Klossiella killicki*.

Garnham (1973: 236) refers to Anciaux de Faveaux for a *Polychromophilus ? murinus* from "Africa".

HEMIPTERA
Cimicidae: Haeselbarth *et al.* (1966: 10) records that only three males of *Loxaspis setipes* Ferris and Usinger, 1957 are known from unknown *Rhinolophus*, from Lukolela, Congo.

DIPTERA
Streblidae: *Brachytarsina africana* (Walker, 1849) is a typical ectoparasite of the genus *Rhinolophus* in sub Saharan Africa (Haeselbarth *et al.*, 1966: 100). *Ascodipteron brevior* Maa, 1965 from Sudan (Haeselbarth *et al.*, 1966: 106). *Ascodipteron lophotes* Monticelli, 1898 from Yemen (Haeselbarth *et al.*, 1966: 106). *Raymondia alulata* Speiser, 1908 (Shapiro *et al.*, 2016: 253). *Raymondia aspera* Maa, 1968 (Shapiro *et al.*, 2016: 253). *Raymondia boquieni* Vermeil, 1965 from Congo and the DRC (Shapiro *et al.*, 2016: 254). *Raymondia huberi huberi* Frauenfeld, 1855 (Shapiro *et al.*, 2016: 254). *Raymondia intermedia* Jobling, 1936 (Shapiro *et al.*, 2016: 255). *Raymondia seminuda* Jobling, 1954 (Shapiro *et al.*, 2016: 255). *Raymondia setiloba* (Jobling, 1954) (Shapiro *et al.*, 2016: 256). *Raymondia waterstoni* Jobling, 1931 (Shapiro *et al.*, 2016: 256). *Raymondia* sp. B (Shapiro *et al.*, 2016: 257).

Nycteribiidae: *Nycteribia integra* Theodor and Moscona, 1954 common in Egypt (Haeselbarth *et al.*, 1966: 109). *Nycteribia ovalis* Theodor, 1957 from Tanzania (Haeselbarth *et al.*, 1966: 110). *Nycteribia tecta* Theodor, 1957 (Haeselbarth *et al.*, 1966: 110). *Dipseliopoda biannulate* (Oldroyd, 1953) from the Sudan (Haeselbarth *et al.*, 1966: 116). Kamani *et al.* (2014: 628) reported the presence of *Cyclopodia greeffi* Karsch, 1884 on bats from Nigeria.

SIPHONAPTERA
Ischnopsyllidae: Members of the genus *Rhinolophopsylla* Oudemans, 1909 are known to be parasites of *Miniopterus* and *Rhinolophus* (Haeselbarth *et al.*, 1966: 191).

ACARI
Myobiidae: Fain (1994: 1280) indicates that only two endemic genera are found on *Rhinolophus* species: *Neomyobia* with 13 species and three subspecies, and *Rhinomyobia* with one species. Another genus/species - *Calcarmyobia rhinolophi* - was described from *Rhinolophus lobatus*, but this probably should be from *Miniopterus natalensis arenarius* (Uchikawa, 1985a: 15).

VIRUSES:
Adenoviridae
These viruses were found by Waruhiu *et al.* (2017) in bats from Kenya.

Coronaviridae
Tao *et al.* (2017: 3) found 28.9 % (13 out of 45) of the Kenyan *Rhinolophus* sp. Specimens they tested to be positive for CoV. Tao and Tong (2019: 1) report the complete genomic sequence of a strain of betacoronavirus (BtKY72/*Rhinolophus* sp./Kenya/2007 - BtKY72).

Paramyxoviridae
1 out of nine tested *Rhinolophus* sp. from Cameroon was found to test positive for *Paramyxovirus* sequences by Mortlock *et al.* (2015: 1841).

Rhabdoviridae
Lyssavirus - Rabies related viruses

Horton *et al.* (2014: Table S1) tested 16 Kenyan *Rhinolophus* sp. specimens, but failed to find neutralising antibodies to IKOV (Ikoma lyssavirus).

†***Rhinolophus maghrebensis*** Gunnell, Eiting, and Geraads, 2011

*2011. *Rhinolophus maghrebensis* Gunnell, Eiting, and Geraads, N. Jb. Geol. Paläont. Abh., 260 (1): 56, figs 3A, 7A. Publication date: January 2011. Type locality: Morocco: Ahl al Oughlam [ca. 33 35 N 07 30 W] [Goto Description]. Holotype: INSAP AaO 4655: Collected by: ?: Collector Unknown. Presented/Donated by: ?: Collector Unknown. Right maxilla with P4-M3. Paratype: INSAP AaO 4673: Collected by: ?: Collector Unknown. Presented/Donated by: ?: Collector Unknown. Left dentary p4-m3. - Etymology: Name taken from *Maghreb* ("countries of the setting sun"), the Arabic name for north-western African countries (Morocco, Algeria, Tunisia) (see Gunnell *et al.*, 2011: 56). (Current Combination)

2013. *Rhinolophus maghrebiensis:* Stoetzel, Palaeog., Palaeoclim., Palaeoecol., 392: 373. Publication date: 29 September 2013. (Lapsus)

TAXONOMY:
Gunnell *et al.* (2011: 56) describe it as a large species of the *Rhinolophus ferrumequinum* phenotypic group - larger than extant African *Rhinolophus* species *R. alticolus, R. blasii, R. euryale, R. denti, R. landeri, R. mehelyi, R. hipposideros*, and *R. simulator*, smaller than *R. hildebrandtii*.

†***Rhinolophus mellali*** Lavocat, 1961

*1961. *Rhinolophus ferrumequinum mellali* Lavocat, Notes Mém. Serv. Mines Carte geol. Maroc, 155: xxx. Type locality: Morocco: Beni Mellal. - Comments: The holotype consists of a left mandibular fragment with I, C, P_2-M_1 (Marandat, 1994: 60).

? *Rhinolophus mellali:* (Current Combination)

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Early late Miocene.

GENERAL DISTRIBUTION:
Northern Africa (Gunnell *et al.*, 2011: 70).

Rhinolophus adami Aellen and Brosset, 1968

*1968. *Rhinolophus adami* Aellen and Brosset, Rev. suisse Zool., 75 (14): 443. Type locality: Congo: Kouilou [ca. 04 00 N 12 00 E] [Goto Description]. Holotype: MNHN ZM-MO-1968-408: ad ♀, alcoholic (skull not removed). Collected by: Jean-Paul Adam; collection date: 9 January 1967; original number: 12/8G. 3 paratypes see Aellen and Brosset (1968: 443). Paratype: MHNG 1129.084: skull only. Collected by: ?: Collector Unknown. Presented/Donated by: ?: Collector Unknown. - Etymology: In honour of J.-P. Adam, the collector of the type specimen. (Current Combination)

TAXONOMY:
Kock *et al.* (2000) place it in the *adami* species group, followed by Csorba *et al.* (2003: xvi, 4 - 5) and Simmons (2005: 351). Species group reviewed by Kock *et al.* (2000). See Csorba *et al.* (2003: 5) for taxonomic background.

COMMON NAMES:
Czech: vrápenec Adamův. English: Adam's Horseshoe Bat, Congo Horseshoe Bat. French: Rhinolophe du Congo. German: Adams Hufeisennase.

CONSERVATION STATUS:
Global - Listed as Data Deficient (DD ver 3.1 (2001)) in view of the absence of sufficient information on its extent of occurrence, natural history, threats and conservation status (Jacobs *et al.*, 2008x; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) (Jacobs *et al.*, 2008x; IUCN, 2009). 2004 - DD ver 3.1 (2001) (Jacobs *et al.*, 2004ab; IUCN, 2004). 1996 - DD (Baillie and Groombridge, 1996).

MAJOR THREATS:
The threats to this species are currently unknown. It is possible that it is threatened by cave disturbance, however, this needs to be confirmed (Jacobs *et al.*, 2008x; IUCN, 2009).

CONSERVATION ACTIONS:
Jacobs *et al.* (2008x) [in IUCN (2009)] report that it is not known if the species is present in any protected areas. Further studies are needed into the distribution, abundance, natural history, and threats to this species.

GENERAL DISTRIBUTION:
Rhinolophus adami is known only from the type series collected in Kimanika cave, Kouilou, in the Republic of Congo.

Native: Congo (Aellen and Brosset, 1968; Csorba *et al.*, 2003: 5; Simmons, 2005:351).

DETAILED MORPHOLOGY:
Baculum - See Csorba *et al.* (2003: 4).

POPULATION:
Structure and Density - It is known only from ten specimens held in the Paris and Geneva museums (Aellen and Brosset, 1968), and may be naturally rare, however, this requires confirmation (Jacobs *et al.*, 2008x; IUCN, 2009).
Trend - 2008 - Unknown (Jacobs *et al.*, 2008x; IUCN, 2009).

PARASITES:
Adam and Landau (1973a: 5) report on the presence of a protozoan parasite of the genus *Polychromophilus* (Haemoproteidae) in *R. adami* from the Republic of Congo. About 50 % of the specimens they examined were found to be infected. Gametocytes were found year-round. The bats were also infested (in low numbers) by the nycteribiid flies *Penicillidia fulvida* Bigot, 1885 and *Nycteribia schmidlii scotti* Falcoz, 1923, of which the prior was a major carrier of *Polychromophilus* sporozoites.

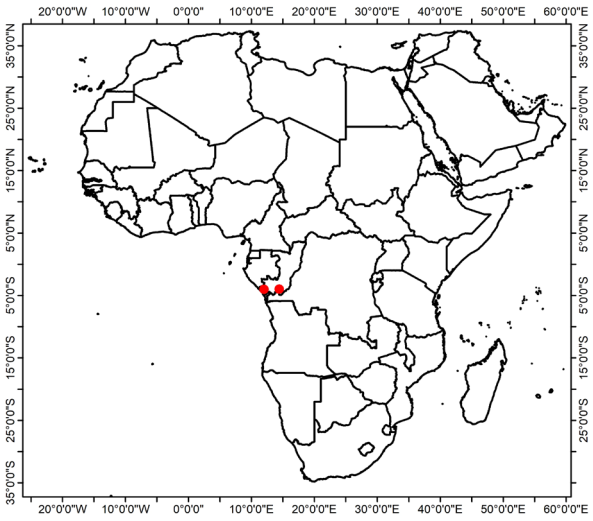

Figure 73. Distribution of *Rhinolophus adami*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Congo.

Rhinolophus alcyone Temminck, 1853

*1853. *Rhinolophus alcyone* Temminck, Esquisses zoologiques sur la Côte de Guiné. 1e partie, les Mammifères., 80. Type locality: Ghana: Boutry River [=Butre river] [ca. 04 49 N 01 55 W] [Goto Description]. Holotype: RMNH MAM.35892:. Allen (1939a: 73) notes: 'Type in Leiden Mus., but description has not "one single word of any value for identifying the species or determining its affinities" - K. Andersen'. - Comments: Allen (1939a: 73), Kock (1969a: 121), Grubb *et al.* (1998: 77) mention 1852 as year of publication. - Etymology: alcyone: "[=Alkuone] mythological name for the kingfisher" and this is sometimes written as "Halcyon". Alkuone herself is the "daughter of Aiolos, who threw herself in the sea, where her husband Keüks (or Ceyx) was drowned. Thetis changed her in a kingfisher and her husband in a seagull". (Current Combination)

TAXONOMY:
Forms part of the *landeri* species group (Csorba *et al.*, 2003: 55 - 57; Simmons, 2005: 351). See Csorba *et al.* (2003: 56) for remarks on taxonomy.

COMMON NAMES:
Czech: vrápenec Alcyone. English: Halcyon Horseshoe Bat. French: Rhinolophe Alcyon, Rhinolophe d'Halcyon. German: Temmincks Hufeisennase, Rothen Kamnase, Halcyon Rundblattnase. Spanish (Castillian): Murciélago de Herradura

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Jacobs *et al.*, 2008y; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Jacobs *et al.*, 2008y; IUCN, 2009). 2004 -LC ver 3.1 (2001) (Jacobs *et al.*, 2004y; IUCN, 2004). 1996 - LR/nt (Baillie and Groombridge, 1996).

MAJOR THREATS:
This widespread species is threatened in parts of its range by habitat loss, largely resulting from logging and conversion of land to agricultural use. In some areas the species is hunted for food, although it is unclear whether this represents a major threat (Jacobs *et al.*, 2008y; IUCN, 2009).

CONSERVATION ACTIONS:
Jacobs *et al.* (2008y) [in IUCN (2009)] reported that it is not known if the species is present in any protected areas. Further studies are needed into the taxonomy and distribution of this species.

GENERAL DISTRIBUTION:
Rhinolophus alcyone ranges through much of West and Central Africa. It has been recorded from Senegal in the west through to Togo, and then from Nigeria to southern Sudan and western Uganda, with patchy records from the Congo basin (although it likely occurs throughout the Congo). It ranges as far south as central Democratic Republic of the Congo.

The record of this species from Gabon needs to be reexamined as it may represent a misidentified specimen of *Rhinolophus sylvestris* (Dowsett *et al.*, 1991).

Amori *et al.* (2016: 219) pointed out that a number of localities, originally situated in Togo, are currently in Ghana.

Native: Bioko, Burkina Faso (Kangoyé *et al.*, 2012: 6025; 2015a: 610); Cameroon; Central African Republic (Lunde *et al.*, 2001: 537); Congo (Dowsett *et al.*, 1991: 259); Congo (The Democratic Republic of the) (Monadjem *et al.*, 2010d: 555); Côte d'Ivoire; Equatorial Guinea; Gabon (?); Ghana; Guinea (Fahr and Ebigbo, 2003: 128); Guinea-Bissau (Rainho and Ranco, 2001: 47); Kenya; Liberia (Monadjem and Fahr, 2007: 50); Nigeria; Senegal; Sierra Leone; Sudan; Togo (?); Uganda.
Presence uncertain: Gabon.

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Young (1975: 76) indicates that two distinct colour phases can be found: rufous (orange) and grey.

ECHOLOCATION:
In Guinea, Fahr and Ebigbo (2003) reported the frequency of the CF-component at 67.4 kHz.

MOLECULAR BIOLOGY:
DNA - See Hoofer and Van Den Bussche (2003) and Lim (2007).
Karyotype - Unknown.
Protein / allozyme - Unknown.

POPULATION:
Structure and Density - This species is easily found in colonies of up to 20 animals (Jacobs *et al.*, 2008y; IUCN, 2009).
Trend - 2008 - Unknown (Jacobs *et al.*, 2008y; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
Csorba *et al.* (2003: 57) refer to Kingdon (1984), who indicated that three females from western Uganda were pregnant in mid-June, whereas a fourth one was lactating. One birth was reported in September.

PARASITES:
HAEMOSPORIDA
Schaer *et al.* (2013a: 17416; 2015: 381) report the presence of hemosporidian parasites of the genus *Nycteria* in one investigated bat from Côte d'Ivoire. In the DRC, Karadjian *et al.* (2016: 9835) found *R. alcyone* specimens infected with *Nycteria gabonensis* Rosin, Landay & Hugot 1978.

DIPTERA
Streblidae: *Raymondia allisoni* Theodor, 1968 from Ghana (Shapiro *et al.*, 2016: 253).

Nycteribiidae: *Nycteribia inopinata* Theodor, 1957 from Ebolowa, Cameroon (Haeselbarth *et al.*, 1966: 109).

VIRUSES:
Hepadnaviridiae
Hepatitis B virus (HBV)
Drexler *et al.* (2013c: 16152) report on one *R. alcyone* on 16 examined specimens from Gabon that was positive for horseshoe bat HBV (HBHBV).

Paramyxoviridae
Drexler *et al.* (2012a: Suppl. Table S1) indicated that none of the 15 specimens they examined from Gabon tested positive for *Repirovirus, Henipavirus, Morbillivirus, Rubulavirus* or *Pneumovirus*.

Rhabdoviridae
Lyssavirus - Rabies related viruses
2006 in Nigeria, Dzikwi *et al.* (2010: 269) tested 43 brains by direct fluorescent antibody (DFA) and mouse inoculation test (MIT) which tested negative for lyssavirus antigens.
Lagos bat virus (LBV) - In 2006, 2 individuals from Nigeria were serum tested by a modified rapid fluorescent focus inhibition test (RFFIT), none

tested positive for neutralizing anitibodies (Dzikwi *et al.*, 2010: 269).
Mokola virus (MOKV) - In 2006, 2 individuals from Nigeria were serum tested by a modified rapid fluorescent focus inhibition test (RFFIT), none tested positive for neutralizing anitibodies (Dzikwi *et al.*, 2010: 269).

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Cameroon, Central African Republic, Congo, Congo (Democratic Republic of the), Côte d'Ivoire, Equatorial Guinea, Gabon, Ghana, Nigeria, Senegal, Sierra Leone, Uganda.

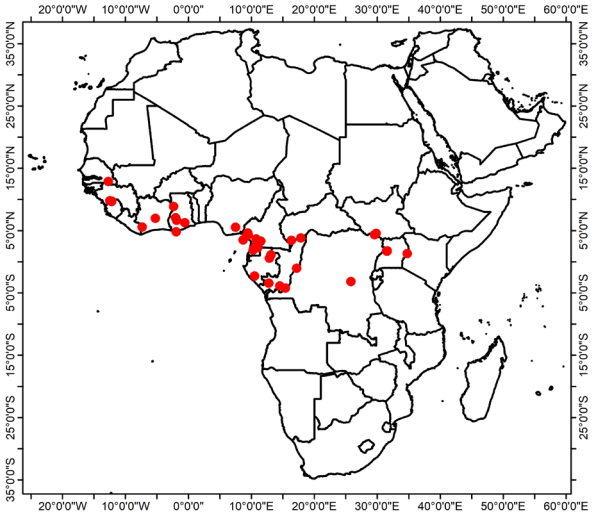

Figure 74. Distribution of *Rhinolophus alcyone*

Rhinolophus blasii Peters, 1867

1857. *Rhinolophus clivosus:* Blasius, Säugethiere Deutschlands, 33, figs 10, 11. Type locality: Italy: "Italy". - Comments: Preoccupied by *clivosus* Cretzschmar, 1828 (see Corbet and Hill, 1992: 100 and Pavlinov *et al.*, 1995: 81).

*1867. *Rhinolophus blasii* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, 17 (for 1866). Publication date: 1867. Type locality: Italy: "Italy". Holotype: ZMB 557: ♂, alcoholic (skull not removed). Collected by: Johan Heinrich Blasius. See Turni and Kock (2008). - Comments: Type locality originally SE Europe, but restricted to Italy by Ellerman *et al.* (1953: 59), and Trieste (see Turni and Kock (2008). - Etymology: In honour of the German naturalist Johann Heinrich Blasius (1809 - 1870) (see Kozhurina, 2002: 14). (Current Combination)

1904. *Rhinolophus empusa* K. Andersen, Ann. Mag. nat. Hist., ser. 7, 14 (83): 378. Publication date: 1 Novmber 1904. Type locality: Malawi: Zomba [15 23 S 35 19 E,, 800 - 900 m] [Goto Description]. Holotype: BMNH 1893.7.9.33: ad ♀. Collected by: Alexander ("Alex") Whyte (F.Z.S); collection date: January 1893. - Comments: Considered a valid subspecies by Ansell and Dowsett (1988: 33), Taylor (1998: 37).

1905. *Rhinolophus andreinii* Senna, Arch. Zool. ital., 2: 256, pl. 16, f. 1; pl. 18, f. 7 - 16. Publication date: 30 September 1905. Type locality: Eritrea: Adi Ugri [14 53 N 38 49 E, 1 900 m].

1910. *Rhinolophus blasiusi* Trouessart, Fauna des Mammifères d'Europe, 9.

1910. *Rhinolophus brockmani* Thomas, Ann. Mag. nat. Hist., ser. 8, 5 (26): 192. Publication date: 1 February 1910. Type locality: Somalia: Upper Sheikh [4 500 ft] [Goto Description]. Holotype: BMNH 1909.12.17.4: ad ♀. Collected by: Dr. Ralph Evelyn Drake-Brockman; collection date: 13 November 1909; original number: 237. Thomas (1910a: 193) mentions two specimens. - Etymology: In honour of Dr. R.E. Drake-Browkman, the collector of the type specimen.

? *Rhinolophus blasii andreinii:* (Name Combination)

? *Rhinolophus blasii empusa:* (Name Combination)

TAXONOMY:
Includes *brockmani*; see Koopman (1975: 383). Replacement for *clivosus* Blasius, 1857, which was preoccupied (see Ansell and Dowsett, 1988: 33). Part of the *landeri* species group (Csorba *et al.*, 2003: 57 - 59; Simmons (2005: 351 - 352). See Csorba *et al.* (2003: 58 - 59) for remarks on taxonomy.

Herkt *et al.* (2017: Appendix S9) indicate that three subspecies are recognized in continental Africa which are relatively isolated geographically: *blasii* in Northwest Africa, *andreinii* in Ethiopia and *empusa* in southern Africa. No genetic tests have been performed yet to check the validity of these taxa. The analyses carried out by Herkt *et al.* (2017), however, indicatte substantial ecological niche differences as well as major geographic gaps in suitable habitat areas between them.

COMMON NAMES:

Ukrainian: Підковик (Підковоніс) Блазіуса. Welsh: Ystlum pedol Blasius.

CONSERVATION STATUS:
Global - Assessed as Least Concern (LC ver 3.1 (2001)). Widespread, although patchily distributed. There are some large colonies and the global population is likely to considerably exceed 10,000. Although the population is declining in some areas (e.g. western Balkans), it is stable in others (Jacobs *et al.*, 2008ag; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Jacobs *et al.*, 2008ag; IUCN, 2009). 2004 - NT ver 3.1 (2001) (Jacobs *et al.*, 2004x; IUCN, 2004). 1996 - LR/nt (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - NT D1 ver 3.1 (2001) (Jacobs *et al.*, 2016b). 2004 - VU D2 ver 3.1 (2001) (Friedmann and Daly, 2004). 1986 - Indeterminate (Smithers, 1986).

MAJOR THREATS:
Threats to the species include loss of Mediterranean woodlands, disturbance and loss of underground habitats, and destruction of roost sites (Kryštufek, 1999). In a number of range states the species is disturbed by tourist visits to caves and by use of the caves as shelters for livestock (Jacobs *et al.*, 2008ag; IUCN, 2009).

The most important risk factors related to climatic change were identified by Sherwin *et al.* (2012: 174) as being their roosting in caves/trees, the aerial feeding style and its long-distance dispersal. Bilgin *et al.* (2012: 434) predict that *R. blasii* will have a major range contraction as a result of climatic change.

CONSERVATION ACTIONS:
Jacobs *et al.* (2008ag) [in IUCN (2009)] reported that *Rhinolophus blasii* is protected by national legislation in some range states. There are international legal obligations for the protection of this species through the Bonn Convention (Eurobats) and Bern Convention in areas to which these apply. It is included in Annex II (and Annex IV) of the EU Habitats and Species Directive, and hence requires specific conservation measures in some range states, including the designation of Special Areas for Conservation. It occurs in some protected areas. Taxonomic research is needed to clarify the status of the African populations. Monitoring and protection of caves is also required.

GENERAL DISTRIBUTION:
Rhinolophus blasii has a large range in the Palaearctic and the Afrotropics, throughout which it is widely but patchily distributed. Its range extends marginally into the Indomalayan region.

In Africa, it occurs from northeastern South Africa and the Democratic Republic of Congo, through south Malawi, to East African, Ethiopia and Somalia, and in North Africa. Follow Taylor (2000) for southern African distribution. In North African it is only present in Morocco and Algeria (it may occur in Tunisia but there are no confirmed records yet, and likewise for Egypt). Altitude range is from sea level to 1,400 m.

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 602,154 km^2. In South Africa, its distribution is strongly associated with the amount of precipitation in the warmest quarter of the year (Babiker Salata, 2012: 49).

In Asia, it has a patchy distribution extending from Turkey in the west to Pakistan in the east, and from the Caucasus in the north to Yemen in the south (Simmons, 2005). It was confirmed in Georgia in 2006 (Z. Nagy *pers. obs.*). In Europe, it is extinct in northeastern Italy and has not been recorded in Slovenia during the last 50 years (Kryštufek, 2001). Also recorded from western Anatolia and from the Levant (Syria, Lebanon, Jordan, Palestine and Israel). It is now restricted to the Balkan peninsula and to some Mediterranean islands including Crete and Cyprus. There are no recent records in Romania and northern Bulgaria despite intensive work by Christian Dietz (Z. Nagy *pers. comm.,* 2006). Past records from this area are disputed: no specimen has been found in museums in Romania, and the presence of *R. euryale* in the same area might have caused confusion (Z. Nagy *pers. comm.,* 2006).

It occurs from sea level to 2,215 m in Yemen.

Native: Afghanistan; Albania; Algeria; Armenia; Austria; Azerbaijan; Bosnia and Herzegovina; Botswana; Bulgaria; Congo (The Democratic Republic of the) (Hayman *et al.*, 1966; Monadjem *et al.*, 2010d: 555); Croatia; Cyprus; Eritrea; Ethiopia; Greece (Kriti); Iran, Islamic Republic of; Israel; Italy; Jordan; Libyan Arab Jamahiriya; Malawi (Ansell, 1978; Happold *et al.*, 1988; Happold and Happold, 1997b: 818; Monadjem *et al.*, 2010d: 555); Montenegro; Morocco (Benda *et al.*, 2010a: 157; El Ibrahimi and Rguibi Idrissi, 2015: 359); Mozambique (Smithers and Lobão Tello, 1976; Monadjem *et al.*, 2010d: 555; Monadjem *et al.*, 2010c: 377); Oman; Pakistan; Palestinian Territory, occupied; Serbia; Somalia; South Africa (Monadjem *et al.*, 2010d: 555); Swaziland (Monadjem, 2005: 5; Monadjem *et al.*, 2010d: 555); Syrian Arab Republic; Tanzania; Tunisia (Aellen and Strinati, 1970; Cockrum, 1996; Dalhoumi *et al.*, 2011; 2014: 53); Turkey; Turkmenistan; Yemen; Yugoslavia; Zambia (Ansell, 1969; Ansell, 1978; Monadjem *et al.*, 2010d: 555); Zimbabwe (Monadjem *et al.*, 2010d: 555).
Possibly extinct: Slovenia.

DETAILED MORPHOLOGY:
Baculum - See Csorba *et al.* (2003: 4).

In their study on take-off performance, Gardiner *et al.* (2014: 1059) determined a wing beat frequency of 12.96 ± 0.27 Hz.

FUNCTIONAL MORPHOLOGY:
In a study of flight-initiating jumps, Gardiner and Nudds (2011: 2187) found that the ground gleaning *R. blasii* did not outperform the fast-flying hawker (*Miniopterus schreibersii*) nor the trawling (*Myotis capaccinii*), although it spends a major part of its time foraging on the ground.

ECHOLOCATION:
Jacobs *et al.* (2007a) reported for individuals from South Africa a peak frequency of 86.6 (± 0.7) kHz (detector type not reported), while Monadjem *et al.* (2007a), using an Anabat detector, reported the same peak frequency albeit a different standard deviation (± 0.23) for an individual from Swaziland. Also from Swaziland, Monadjem *et al.* (2017c: 179) reported F_{min}: 79.4 ± 1.86 (77.9 - 81.5) kHz, F_{knee}: 86.3 ± 0.24 (86.1 - 86.6) kHz, F_c: 86.2 ± 0.21 (86.0 - 86.4) kHz, duration: 20.8 ± 0.72 (19.9 - 21.3) msec. Monadjem *et al.* (2010c: 377) reported for Mozambique that peak echolocation frequencies ranged between 93.2 - 95.4 kHz (ANABAT, Petterson D240x).

Jones and Siemers (2010: 449 - 450) indicated that females emit pulses with a higher frequency than males, and that juveniles emit lower frequencies than adults.

Papadatou *et al.* (2008b: 132) report the following data for 37 Greek specimens: F_{start}: 90.3 ± 4.85 kHz, F_{end}: 78.1 ± 4.48 kHz, F_{peak}: 94.0 ± 0.92 kHz, bandwidth: 4.0 ± 1.65 kHz, duration 44.1 ± 12.14 msec and interpulse interval: 71.8 ± 23.10 msec.

The following data for 10 Iranian calls were reported by Benda *et al.* (2012a: 182): F_{start}: 94.0 ± 0.1 (94.2 - 94.4) kHz, F_{end}: 92.0 ± 0.1 (91.8 - 92.1) kHz, F_{peak}: 93.1 ± 0.1 (93.0 - 93.3) kHz, duration: 48.6 ± 9.4 (40.1 - 68.3) msec and interpulse interval: 109.3 ± 5.6 (103.1 - 117.1) msec.

Walters *et al.* (2012: suppl.) report the following figures for 26 calls (4 sequences) from bats from Algeria and Greece: duration: 44.90 ± 8.52 msec, F_{max}: 95.51 ± 1.34 kHz, F_{min}: 80.58 ± 3.52 kHz, bandwidth: 14.93 ± 3.82 kHz, F_{peak}: 95.41 ± 1.33 kHz.

Disca *et al.* (2014: 226) indicate that in Morocco the type of call is FM-FC-FM, with F_{peak}: 96.7 ± 0.3 kHz and duration: 20.7 ± 4.9 msec.

MOLECULAR BIOLOGY:
DNA - Unknown.

Karyotype - Đulic (1967) reported 2*n* = 58, FN = 60, BA = 4, a submetacentric X and an acrocentric Y for specimens from Croatia. Qumsiyeh *et al.* (1986) and Rautenbach (1986) also reported 2*n* = 58, FN = 60, BA = 4, but differed in the X chromosome being reported in the respective publications as metacentric and submetacentric, and the Y chromosome as acrocentric and metacentric. Arslan and Zima (2014: 9) report that the autosomal complement consists of two medium-size bi-armed pairs and 26 acrocentric pairs, with one of the acrocentrics having a secondary constriction.

Protein / allozyme - Unknown.

HABITS:
Siemers and Ivanova (2004: 470) report that *R. blasii* uses aerial and foliage-gleaning in flight, as well as ground-gleaning (including landing) to detect and capture their prey.

DIET:
In northern Algeria, Ahmim and Moali (2013: 46) found that *R. blasii* droppings contained 96.87 % Insecta and 3.13 % Chilopoda. The most frequent insect preys were Diptera (37.50 %), specifically Chironomidae/Ceratopogonidae (9.38 %), Culicidae, Anisopodidae and Sphaeroceridae (6.25 %). Trichoptera also were frequently present (15.63 %), followed by Lepidoptera and Hemiptera (both 12.50 %).

Gardiner *et al.* (2014: 1058) assessed its foraging strategy as "low altitude slow aerial hawking", sometimes with gleaning.

POPULATION:
Structure and Density - Africa: Not very common. Asia: This species has a widespread distribution and the populations in Pakistan and Afghanistan seem to be stable and doing well (Molur *et al.*, 2002). Europe: A rare or infrequent species, probably the rarest horseshoe bat in Europe (Kryštufek, 1999). Summer colonies of ca. 20 - 30 are typical, although up to 400 females may be found in a single colony. In winter, it congregates in mixed-species clusters with other *Rhinolophus* species (up to 2,000 animals in Serbia). There are large colonies in Serbia, Bulgaria and Greece. It is suspected to be declining because of loss of Mediterranean woodlands and cave disturbance, and is considered vulnerable in many range states (e.g., the western Balkans); however, the populations in the eastern Balkans are stable (Mediterranean Workshop, 2007) (Jacobs *et al.*, 2008ag; IUCN, 2009).
Trend - 2008 - Decreasing (Jacobs *et al.*, 2008ag; IUCN, 2009). *R. blasii* populations within the Asia Minor and Levant region are predicted to have a declining population trend, under climate change scenarios (Bilgin *et al.*, 2012: 433).

PARASITES:
Ševcík *et al.* (2012: 35) report on the presence of the bat flies *Phthiridium biarticulatum* Hermann, 1804 (Nycteribiidae) and *Brachytarsina flavipennis* Macquart, 1851 (Streblidae) on bats from Cyprus. The same parasites were found by Benda *et al.* (2010b: 243) in Jordan. *B. flavipennis* was also reported from Iran by Benda *et al.* (2012a: 255). Benda *et al.* (2010b) also refer to previous records of *Penicillidia conspicua* Speiser, 1901 and *P. dufourii* (Westwood, 1835) from Palestine, *Phthiridium integrum* (Theodor and Moscona, 1954) and *Penicillidia fulvida* (Bigot, 1885) from Yemen (all Nycteribiidae); a streblid *Ascodipteron africanum rhinolophi* Jobling, 1958 from Yemen; and an ischnopsillid *Rhinolophopsylla unipectinata* (Taschenberg, 1880) from Yemen.

Nycteridocoptes eyndhoveni Fain, 1959 (Acari: Sarcoptidae) was reported from "*R. blasii empusa*" from Tanganika Moba, DCR by Fain (1959a: 341).

Streblidae: *Brachytarsina africana* (Walker, 1849) has a wide distribution in sub Saharan Africa (Haeselbarth *et al.*, 1966: 100). *Raymondia alulata* Speiser, 1908 (Shapiro *et al.*, 2016: 253). *Raymondia hardyi* Fiedler, 1954 (Shapiro *et al.*, 2016: 254). *Raymondia waterstoni* Jobling, 1931 (Haeselbarth *et al.*, 1966: 104). *Ascodipteron lophotes* Monticelli, 1898 (Haeselbarth *et al.*, 1966: 106, but Maa (1965) suggests that these records need verification).

Nycteribiidae: *Nycteribia integra* Theodor and Moscona, 1954 (Haeselbarth *et al.*, 1966: 109). *Penicillidia fulvida* (Bigot, 1885) (Haeselbarth *et al.*, 1966: 114).

Bendjeddou *et al.* (2017: 15) reported the following ectoparasites from Algerian bats: Nycteribiidae: *Nycteribia (Nycteribia) latreillii* (Leach, 1817), *Penicillidia (Penicillidia) dufourii* Westwood, 1835 and *Phthiridium biarticulatum* Hermann, 1804; Streblidae: *Brachytarsina (Brachytarsina) flavipennis* Macquart, 1851 and Arachnida: *Eyndhovenia euryalis* (G. Canestrini, 1885).

VIRUSES:
Coronaviridae - Coronaviruses
Luis *et al.* (2013: suppl.) mention the presence of BatCoV BB98-15 and a SARS coronavirus-related virus.

Alphacoronavirus
Kohl and Kurth (2014: 3112) reported this virus from German bats.
Betacoronavirus

Reported from bats from Bulgaria and Germany by Kohl and Kurth (2014: 3112).

Polyomaviridae
Carr *et al.* (2017) reported two new virsuses from *R. blasii* from Zambia: *Rhinolophus blasii polyomavirus 1* and *Rhinolophus blasii polyomavirus 2*.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Algeria, Congo (Democratic Republic of the), Eritrea, Ethiopia, Italy, Malawi, Morocco, Mozambique, Somalia, South Africa, Swaziland, Tanzania, Tunisia, Zambia, Zimbabwe.

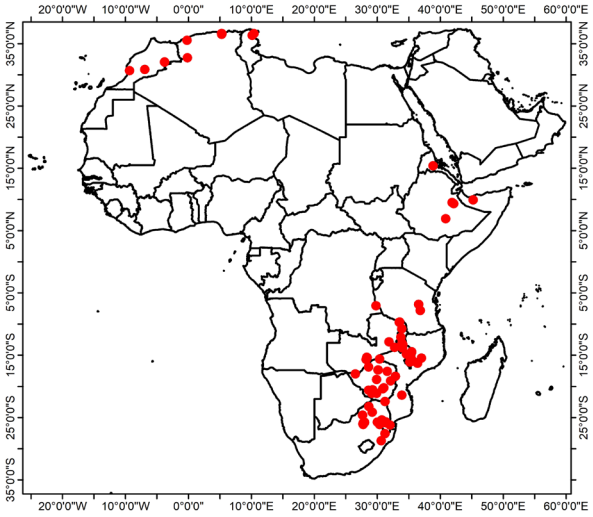

Figure 75. Distribution of *Rhinolophus blasii*

Rhinolophus capensis Lichtenstein, 1823

*1823. *Rhinolophus capensis* Lichtenstein, Verzeichniss der Doubletten des Zool. Mus. K. Univ. Berlin, 4. Type locality: South Africa: Cape province: Cape of Good Hope [ca. 33 56 S 18 28 E]. Lectotype: ZMB 377: juv, skin and skull. Collected by: Krebs; collection date: 1822. Skull damaged. Lectotype designated by Turni and Kock (2008: 32). - Comments: Turni and Kock (2008: 32) also indicate that originally there were two additional specimens, which might have been sold to an unknown collection. Furthermore, Turni and Kock (2008: 32) mention that ZMB 376 and 378, which were longtime considered syntypes of *capensis*, were re-identified by Karl Koopman as belonging to *Rhinolophus clivosus* Cretzschmar, 1828. - Etymology: Referring to Cape of Good Hope or the Cape province, from where the type specimen was obtained. (Current Combination)

1860. *Rhinolophus auritus* Sundevall, Kongl. Svenska Vet.-Akad. Hand., ser. 2, 2: no 10, p. 13, footnote. Type locality: South Africa: Southern Cape province: Cape of Good Hope, near Knysna: Belvedere [ca. 33 53 S 22 59 E]. Holotype: NRM ♂. Collection date: 3 April 1854. Victorin; Grill 1859; Mam. Ex. No. 1907: see Andersen (1904c: 456).

TAXONOMY:
Part of the *capensis* species group (Csorba *et al.*, 2003: 7 - 8; Simmons, 2005: 352). See Csorba *et al.* (2003: 8) for remarks on taxonomy. Reviewed by Stoffberg (2008).

COMMON NAMES:
Afrikaans: Kaapse saalneusvlermuis, Kaapse Vlermuis. Czech: vrápenec jihoafrický. English: Cape Horseshoe Bat, Southern Africa horseshoe bat. French: Rhinolophe d'Afrique du Sud, Rhinolophe du Cap. German: Kap-Hufeisennase, Capischen Kamnase, Russbraunen Kamnase. Portuguese: Morcego ferradura de cabo.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
De Graaf (1960) identified material as *R* cf. *capensis* from the Late Pliocene, at Makapansgat, South Africa. Avery and Avery (2011: 16) reported Holocene remains from Blinkklipkop, Powerhouse Cave, Wonderwerk (Northern Cape province, South Africa), as well as Pleistocene remains from the latter locality.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population (there are many records of this species from coastal caves), and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Jacobs *et al.*, 2008z; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Jacobs *et al.*, 2008z; IUCN, 2009). 2004 - NT ver 3.1 (2001) (Jacobs *et al.*, 2004w; IUCN, 2004). 1996 - VU (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - LC ver 3.1 (2001) (Jacobs *et al.*, 2016c). 2004 - NT ver 3.1 (2001) (Friedmann and Daly, 2004).

MAJOR THREATS:
The species is threatened in parts of its range by disturbance of cave roosts (often by recreational and tourism activities), and the conversion of suitable foraging habitat to agricultural use (Jacobs *et al.*, 2008z; IUCN, 2009).

CONSERVATION ACTIONS:
Jacobs *et al.* (2008z) [in IUCN (2009)] reported this species as present in some protected areas. There is a need to identify and protect important roost sites for this species. Further studies are needed into the distribution of this species.

GENERAL DISTRIBUTION:
Rhinolophus capensis is restricted to the coastal belt of the Northern Cape, the Western Cape and the Eastern Cape of South Africa, as far east along the coast as the vicinity of East London (Csorba *et al.*, 2003: 8; Stoffberg, 2008: 2). Odendaal *et al.* (2014: 4) indicate that the geographic range of *R. capensis* is determined by two environmental gradients that influence the regional rainfall patterns. First, there is the increasing aridity towards the north and secondly a seasonality shift from west to east, whereby the rains are dominant during the winter in the west, then becoming aseasonal and finally being dominant during the summer in the extreme east.

Simmons (2005: 352) follows Ansell and Dowsett (1988: 33) and Koopman (1993a: 164), who list South Africa, Zimbabwe and Mozambique, but does indicate doubt about its occurrence outside of South Africa. Koopman (1993a: 164) states that the records from Zambia and Malawi are erroneous. Griffin (1999: 32), however, suspects its occurrence in Namibia. In the RSA, the species' distribution is best predicted by biome: desert, Albany thicket, fynbos and grassland (Babiker Salata, 2012: 50, 118).

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 277,925 km^2 (or 4 % of the total surface of the area).

Native: South Africa (Eastern Cape Province, Northern Cape Province, Western Cape Province) (Ellerman *et al.*, 1953; Maree and Grant, 1997; Csorba *et al.*, 2003: 8; Monadjem *et al.*, 2010d: 556).
Presence uncertain: Namibia.

FUNCTIONAL MORPHOLOGY:
Jacobs *et al.* (2007a), at De Hoop, South Africa, found *R. capensis* to have a lower mean wing loading and aspect ratio than *R. clivosus*, but no differences in their mean shape indices.

SEXUAL DIMORPHISM:
At De Hoop, South Africa, Jacobs *et al.* (2007a) found females were heavier than males, but there were no differences in forearm length, or wingspan.

ECHOLOCATION:
Jacobs *et al.* (2007a) reported a peak frequency of 83.9 (± 1.2) kHz for individuals from South Africa.

Odendaal and Jacobs (2009: 62) found some sort of local dialects in the echolocation calls for South African *R. capensis*: 84.60 ± 0.82 kHz at De Hoop, 85.84 ± 0.73 kHz at Table Farm, and 80.66 ± 0.50 kHz at Steenkampskraal, which is probably the result of interactions with other *Rhinolophus* species: *R. swinnyi* at Steenkampskraal, and *R. darlingi* at Table Farm, as well as with *R. clivosus*. Bastian and Jacobs (2013: 18) and Odendaal *et al.* (2013: 112) indicate that the peak frequency ranges from 75.7 kHz at the western end of the species' coastal distribution in South Africa to 85 - 86.5 kHz at the eastern end. This increase seems to be linked with the mean annual rainfall (Odendaal *et al.*, 2013). Bastian and Jacobs (2013: 18) also found that the 85 kHz specimens were able to discriminate between 85 kHz calls from conspecifics and calls from *R. damarensis*, which also peaks at 85 kHz. The 75 kHz specimens were unable to make that discrimination.

Odendaal and Jacobs (2010b: 240) reported that there was no relation between body size and peak frequency across populations. However, nasal chamber length was found to be the best predictor on peak frequency. They also found that in each population, the females were larger than the males and produced calls with higher frequencies, and therefore suggest that there might be a potential social role for the peak frequency.

When flying with conspecifics, Fawcett *et al.* (2013: 49) found that the terminal FM sweep became longer and wider in bandwidth than when flying alone. Fawcett *et al.* (2015: 693), furthermore, found that *R. capensis* produced longer frequency-modulated downward sweeps at the end of their call when they flew together with bats from the same species or with *Miniopterus natalensis* than when they flew alone. Additionally, when they were flying with *R. clivosus* (a larger high-duty cycle bat), its calls were shorter than when flying alone or with other *R. capensis* individuals.

Bastian and Jacobs (2015) investigated the ability for *R. capensis* to discriminate their own calls from those of allopatric (*R. damarensis*) and sympatric (*R. clivosus*) congeners. The bats had no

problems with the calls from *R. clivosus*, but the calls from *R. damarensis* could only be discriminated by one of the test groups.

MOLECULAR BIOLOGY:
DNA - Unknown.
Karyotype - Rautenbach (1986) reported 2*n* = 58, FN = 60, BA = 4, and the X and Y chromosomes as submetacentric. Erasmus and Rautenbach (1984: 94) mention 52 acrocentric and four bi-armed autosomal chromosomes, resulting in 60 autosomal arms.

Protein / allozyme - see Maree and Grant (1997).

HABITAT:
Sirami *et al.* (2013: 34) recorded in the Western Cape Province, South Africa that *R. capensis* activity was not significantly, nor positively influenced by size of wetland, while habitats 100 m surrounding wetlands were also significantly and positively influenced by the water body. *R. capensis* preferentially flew near trees, orchards surrounding wetlands and over these wetlands (Sirami *et al.*, 2013: 35).

HABITS:
Jacobs *et al.* (2007a) at De Hoop, South Africa found that the average esitmated flying height above ground 1.00 ± 0.77 m, *n*= 11. At the same locality, Thomas and Jacobs (2013: 129) found that Lepidoptera eating bats (e.g. *R. capensis* and *Nycteris thebaica*) emerged earlier than bats feeding on Diptera (e.g. *Tadarida aegyptiaca*).

DIET:
Jacobs *et al.* (2007a) at De Hoop, South Africa, found that the diet mainly comprised Lepidoptera and Coleoptera with lesser amounts of Neuroptera, Hemiptera and Diptera. The mean size of measurable prey taken by *R. capensis* was smaller than that taken by *R. clivosus*, although the range of prey sizes taken by the two species overlapped (Jacobs *et al.*, 2007a).

PREDATORS:
Avery *et al.* (2005: 1054) found this species in pellets from *Tyto alba* in South Africa.

POPULATION:
Structure and Density - *Rhinolophus capensis* can be found in colonies consisting of thousands of individuals (Taylor, 2000; Skinner and Chimimba, 2005). Skinner and Chimimba (2005) state that 'they are abundant in the Western Cape and the Eastern Cape, where there are many records from coastal caves' (Jacobs *et al.*, 2008z; IUCN, 2009).
Trend - 2008 - Decreasing (Jacobs *et al.*, 2008z; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
Bojarski and Bernard (1992) [in Anthony (2000: 16)] report that immunocytochemical indices of gonadotropic function rise significantly during the spermatogenic period, coincident with high plasma testosterone levels.

Bernard (1985: 129) and Martin and Bernard (2000: 36) mention that spermatogenesis starts in spring (October in South Africa) and ends after early winter (May) although sperm remain in the caudae epididymides through winter (May to September). Copulation and ovulation occur in August to September, at the end of winter hibernation. Parturition occurs in November and December after a gestation period of three to four months (see also Bernard, 1984; Krutzsch, 2000).

Bernard (1985: 134) indicates that females do not become reproductively mature in their first year, and that males would only be able to mate in their second year.

PARASITES:
Streblidae: *Brachytarsina africana* (Walker, 1849) has a wide distribution in sub Saharan Africa (Haeselbarth *et al.*, 1966: 100).
Nycteribiidae: *Nycteribia schmidlii* Schiner, 1853 (Haeselbarth *et al.*, 1966: 108).

SIPHONAPTERA
Ischnopsyllidae: *Rhinolophopsylla ashworthi* (Waterson, 1913) known only from a few specimens from the Cape Province (King William's Town, Willowmore and Oudtshoorn), South Africa (Haeselbarth *et al.*, 1966: 191). *Rhinolophopsylla capensis* Jordan and Rothschild, 1921 (Haeselbarth *et al.*, 1966: 191).

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Namibia, South Africa.

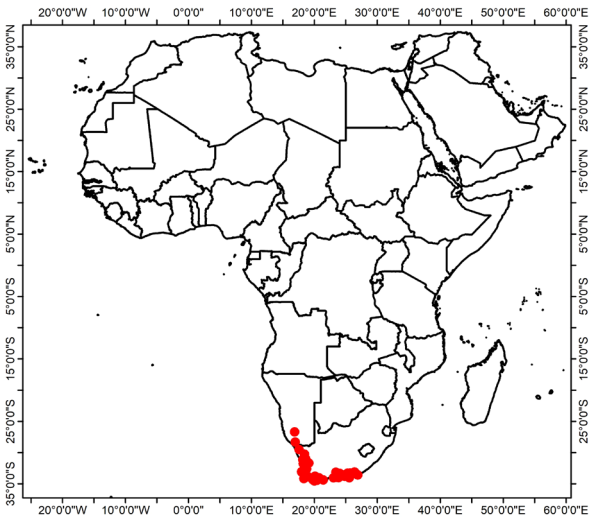

Figure 76. Distribution of *Rhinolophus capensis*

Rhinolophus clivosus Cretzschmar, 1828

*1828. *Rhinolophus clivosus* Cretzschmar, in: Rüppell, Atlas Reise Nördlichen Afrika, Zoologie Säugethiere, 1: 47, pl. 18. Type locality: Saudi Arabia: Red Sea Coast: Al Muwaylih [=Mohila] [ca. 27 49 N 35 30 E] [Goto Description]. Paratype: SMF 12311: skin only. Collected by: ?: Collector Unknown. Presented/Donated by: ?: Collector Unknown. Lectotype: SMF 4371: mounted skin (skull not removed). Collected by: Wilhem Peter Edward Simon Rüppell; collection date: 1826. Old catalog: II.F.4.a; see Mertens (1925: 20). - Comments: Allen (1939a: 74) mentions "1826" (as mentioned on the title page) as year of publication of Cretzschmar's work, other authors mention it as "1827", "1828", "1830-1831". - Etymology: From the masculine Latin adjective *clivósus*, meaning "characterized by slopes, steep", referring to a seemingly unreliable distinctive character of the noseleaf "*Rhinolophus apparato olfactorio externo clivis gradatim elatis non dissimili*" (Cretzschmar 1828) (see Lanza *et al.* (2015: 80). (Current Combination)

1829. *Rhinolophus Geoffroyii* A. Smith, Zool. Journ., 4 (16): 433. Publication date: May 1829. Type locality: South Africa: "South Africa" [Goto Description]. - Comments: Roberts (1951: 61) nominated Cape Town as type locality; see Meester *et al.* (1986: 38). Allen (1939a: 75) mentioned *geoffroyii* as a separate species. Meester *et al.* (1986: 38) follow Ellerman *et al.* (1953: 57) in considering *geoffroyii* as unidentifiable.

1861. *Rhinolophus acrotis* Heuglin, Nov. Act. Acad. Cæs. Leop.-Carol., 29 (8): 4, 10. Publication date: 1861. Type locality: Eritrea: Kérén [ca. 15 45 N 38 20 E] [Goto Description]. Holotype: SMNS 986a: ad ♂, alcoholic (skull not removed). Collected by: Martin Theodor von Heuglin; collection date: 1862. Paratype: SMNS 986b: juv ♂, alcoholic (skull not removed). Collected by: Martin Theodor von Heuglin; collection date: 1862. Presented/Donated by: ?: Collector Unknown. Dieterlen *et al.* (2013: 293) mention this specimen as a possible paratype, although they do indicate that Heuglin based his description on one single specimen (probably SMNH 986a). They also indicate that this specimen was marked as "Cotype" by Krauss. - Etymology: From the two neuter Greek substantives "*ἄκρον*" (akron), meaning "extremity" and "*οὖς*", meaning "ear" (see Lanza *et al.*, 2015: 80).

1904. *Rhinolophus Andersoni* Thomas, Ann. Mag. nat. Hist., ser. 7, 14 (80): 156. Publication date: 1 August 1904. Type locality: Egypt: Eastern desert of Egypt [ca. 22 N 35 E] [Goto Description]. Holotype: BMNH 1904.11.4.2: imm ♂. Collected by: Arthur M. MacKilligan; collection date: 3 August 1903; original number: 26. - Comments: Kock (1969a: 113) mentions: "Eastern Desert, im Gebiet des Wadi Alagi, 22 N 35 E, Sudan".

1904. *Rhinolophus augur* K. Andersen, Ann. Mag. nat. Hist., ser. 7, 14 (83): 380. Publication date: 1 November 1904. Type locality: South Africa: Northern Cape province: [formerly Bechuanaland]: Kuruman [26 28 S 22 27 E, 4 000 ft] [Goto Description]. Holotype: BMNH 1904.10.1.1: ad ♂, skin and skull. Collected by: Mr. R.B. Woosnam; collection date: 19 April 1904; original number: 26.

1904. *Rhinolophus augur zambesiensis* K. Andersen, Ann. Mag. nat. Hist., ser. 7, 14 (83): 383. Publication date: 1 November 1904. Type locality: Malawi: Fort Hill [=Chitipa] [09 42 S 33 16 E, 1 300 m] [Goto Description]. Holotype: BMNH 1897.10.1.18: ad ♂, skin and skull. Collected by: Alexander ("Alex") Whyte (F.Z.S); collection date: July 1896; original number: 136. Presented/Donated by: Sir Harry Hamilton Johnston. - Comments: Considered a synonym of *zuluensis* by Ansell and Dowsett (1988: 32).

1904. *Rhinolophus augur zuluensis* K. Andersen, Ann. Mag. nat. Hist., ser. 7, 14 (83): 383. Publication date: 1 November 1904. Type locality: South Africa: KwaZulu-Natal: 20 mi [=32 km] NW Eshowe: Jususie valley [=Insuzi valley] [28 53 S 31 03 E, 1 000 ft] [Goto Description]. Holotype: BMNH 1904.5.1.8: ad ♀, skin and skull. Collected by: Captain Claude Henry Baxter Grant; collection date: 17 November 1903; original number: 602. Presented/Donated by: C.D. Rudd Esq. - Comments: Considered a valid subspecies by Ansell and Dowsett (1988: 32), Taylor (1998: 35).

1905. *Rhinolophus acrotis brachygnatus* K. Andersen, Ann. Mag. nat. Hist., ser. 7, 15 (85): 73. Publication date: 1 January 1905. Type locality: Egypt: Giza province: Giza [30 01 N 31 13 E] [Goto Description]. Holotype: BMNH 1892.9.9.7: ad ♂, alcoholic (skull not removed). Collected by: Dr. John Anderson; collection date: 16 December 1891. See Qumsiyeh

(1985: 35). Paratype: [Unknown] imm ♀, alcoholic (skull not removed). See Qumsiyeh (1985: 35).

1916. *Rhinolophus keniensis* Hollister, Smiths. Misc. Coll., 66 (1) (2406): 2. Publication date: 10 February 1916. Type locality: Kenya: W side Mount Kenya [ca. 00 10 S 37 19 E, 7 000 ft] [Goto Description]. Holotype: USNM 166352: ad ♂, skull and alcoholic. Collected by: Edmund Heller; collection date: 27 August 1909; original number: 1154. Fisher and Ludwig (2015: 54) indicate that the Field Catalog mentions that this specimen was collected at the Base Camp on the West side of Mount Kenya.

1932. *Rhinolophus geoffroyi zuluensis:* Ortlepp, 18th Report of the Director of Veterinary Sciences and Animal Industry. Union of South Africa. (Name Combination)

1934. *Rhinolophus acrotis schwarzi* Heim de Balsac, Bull. Mus. natn. Hist. nat., Paris, sér. 2, 7: 483. Publication date: November 1934. Type locality: Algeria: Sahara, Tassai des Azdjers: Djanet [24 34 N 09 30 E] [Goto Description]. Holotype: MNHN ♀, alcoholic (skull not removed). Collected by: La Mission Augiéras Draper. Holotype: MNHN ZM-MO-2006-246: ♀, skull and alcoholic. Collected by: Dr. Henry Foley; collection date: 1934. Paratype: MNHN ZM-MO-2006-247: ♀, skull only. Collected by: Dr. Henry Foley; collection date: 1934. Paratype: MNHN ZM-MO-2006-248: ♀, skull only. Collected by: Dr. Henry Foley; collection date: 1934.

1959. *Rhinolophus ferrum-equinum keniensis:* Harrison, Occ. Pap. Nat. Mus. S. Rhod., 23B: 228.. (Name Combination)

1980. *Rhinolophus ferrumequinum keniensis:* Blackwell, Mycologia, 72 (1): 145. (Name Combination)

1993. *angur:* Koopman, in: Wilson and Reeder, Mammal species of the World (2nd Edition): Chiroptera, 164. (Lapsus)

? *Rhinolophus clivosus acrotis:* (Name Combination)

? *Rhinolophus clivosus augur:* (Name Combination)

? *Rhinolophus clivosus brachygnathus:* (Name Combination)

? *Rhinolophus clivosus clivosus:* (Name Combination)

? *Rhinolophus clivosus keniensis:* (Name Combination)

? *Rhinolophus clivosus zuluensis:* (Name Combination)

? *Rhinolophus ferrum-equinum zuluensis:* (Name Combination)

? *Rhinolophus geoffroyi:* (Name Combination, Alternate Spelling)

TAXONOMY:

Figure 77. *Rhinolophus clivosus*.

ferrumequinum species group (Csorba *et al.*, 2003: 35 - 39; Simmons, 2005: 353). See Csorba *et al.* (2003: 36 - 37) for review of taxonomy.

Roberts (1919: 112) points out that *geoffroyii* Smith, 1829 antedates *augur* Andersen, 1904, and later (Roberts, 1951) regards *augur* as a subspecies of *geoffroyii*. Allen (1939a) follows Roberts in regarding *geoffroyii* as the prior name, but Ellerman *et al.* (1953) reject this, pointing out that the description does not identify *geoffroyii* and that the type is apparently lost, and therefore propose that the name be discarded as unidentifiable. The next available name would be *Rhinolophus augur* Andersen, 1904.

Stoffberg *et al.* (2012: 1) indicate that southern African representatives of *R. clivosus* s.l. are as distinct from more northern African samples as they are from *R. ferrumequinum*. In southern Africa, they (p. 5) distinguish five geographic groups: Western Cape clade, Knysna region clade, Northern Cape clade, a predominantly KwaZulu-Natal/Mpumalanga mixed group and a Mpumalanga/Limpopo Province clade. About 3.7 Mya, these groups were separated from more northern groups (Kenya, Tanzania and Mozambique) and all of these were separated from the Egyptian populations at about 4.26 Mya. Stoffberg *et al.* (2012: 2; fig. 1) show the distribution area for four subspecies: *geoffroyi* in the Western Cape province and the coastal part of the Northern Cape province; *zuluensis* in the

Eastern Cape province, KwaZulu-Natal province, Mpumalange province, southern Limpopo province and Swaziland and Lesotho; *augur* in eastern Northern Cape province and central Botswana; and *zambesiensis* in Mozambique, Zambia, Zimbabwe and the extreme southeastern DRC. On the other hand, Benda and Vallo (2012: 83) suggest that all populations occurring in the savanna belt from the Cape to Kenya belong to one taxon (subspecies): *augur*. Unfortunately, neither Stoffberg *et al.* (2012) nor Benda and Vallo (2012) provide any information on the validiy of the name "*geoffroyii*". Therefore, pending further investigation in the taxonomy of this complex, we retain the usage of the name *R. clivosus*.

COMMON NAMES:
Afrikaans: Geoffroy se saalneusvlermuis, Geoffroy-saalneusvlermuis, Geoffroyse vlermuis. Arabian: Khafash abu hadweh arabi, Khaffash. Chinese: 佐氏菊头蝠. Czech: vrápenec pouštní, wrápenec pahrbečný, vrapenec pahrbeční. Dutch: Geoffroy's hoefijzerneus. English: Arabian Horseshoe Bat, Cretzschmar's Horseshoe bat, Geoffroy's Horseshoe Bat. French: Rhinolophe de Cretzschmar, Rhinolophe de Geoffroy. German: Geoffroys Hufeisennase. Hebrew: Parsaf HaNegev. Italian: Rinòlofo di Cretzschrnar, Fèrro di cavàllo di Cretzschmar. Portuguese: Morcego ferradura gigante.

ETYMOLOGY OF COMMON NAME:
Colloquial name after E. Geoffroy Saint-Hilaire, who collected bats in Egypt during the early part of the nineteenth century (see Taylor, 2005).

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
R. clivosus has been recovered from both the upper Pleistocene and very late Holocene at Border Cave and is possibly present in the late Holocene at Nkupe, South Africa (Avery, 1991: 6). Avery and Avery (2011: 17) report additional Holocene (Blinkklipkop and Wonderwerk), and Pleistocene (Wonderwerk) remains from the Northern Cape province (South Africa).

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough globally to qualify for listing in a more threatened category (Kock *et al.*, 2008a; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Kock *et al.*, 2008a; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Jacobs *et al.*, 2004an; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).
Regional -
South Africa: 2016 - LC ver 3.1 (2001) (Jacobs *et al.*, 2016d). 2004 - NT ver 3.1 (2001) (Friedmann and Daly, 2004).

MAJOR THREATS:
Although there are generally considered to be no major threats to the species as a whole, some populations are locally threatened by disturbance of their roosting sites, and indirect poisoning resulting from the use of insecticides, pesticides and similar chemicals (Kock *et al.*, 2008a; IUCN, 2009).

CONSERVATION ACTIONS:
Kock *et al.* (2008a) [in IUCN (2009)] reported that in view of the species wide range it seems likely that it is present in several protected areas. All bats, including *Rhinolophus clivosus*, are protected by national legislation in Jordan (Amr *pers. comm.*, 2004). Bats of the genus *Rhinolophus* are generally susceptible to indirect poisoning through the local use of insecticides; there is a need to evaluate the impact of this threat on populations (especially in southwest Asia), and to investigate alternative methods of insect control (Kock *pers. comm.*, 2004).

GENERAL DISTRIBUTION:
Rhinolophus clivosus is widespread in North, East and southern Africa, and also in parts of southwest Asia, including western and southeastern areas of the Arabian Peninsula. In North Africa it has been recorded from Algeria, Libya and Egypt; in East Africa, it ranges from Sudan in the north, through all East African countries to Malawi in the south; in southern Africa, it is present in Mozambique and Zambia in the north, ranging southwards into South Africa, Namibia and southern Angola. In addition, there are a number of records from southern and eastern parts of the Democratic Republic of the Congo. In southwest Asia, it ranges from Israel, Jordan and the Sinai Peninsula of Egypt in the north, through the western and southeastern part of the Arabian Peninsula of Saudi Arabia, Yemen and Oman, with a few additional records of the species from central regions of the Arabian Peninsula.

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 1,120,944 km^2.

In South Africa, its distributoin is strongly associated with annual precipitation (Babiker Salata, 2012: 49).

ZMB has two specimens from the Central African Republic, that seem to be outliers.

Native: Afghanistan; Algeria; Angola; Burundi; Cameroon; Chad; Congo (The Democratic Republic of the) (Hayman *et al.*, 1966; Monadjem *et al.*, 2010d: 556); Djibouti (Pearch *et al.*, 2001: 397); Egypt; Eritrea; Ethiopia (Lavrenchenko *et al.*, 2004b: 133); Israel; Jordan; Kenya (Lavrenchenko *et al.*, 2004b: 133); Lesotho (Lynch, 1994: 190; Monadjem *et al.*, 2010d: 556); Liberia; Libyan Arab Jamahiriya; Malawi (Happold *et al.*, 1988; Happold and Happold, 1997b: 818; Monadjem *et al.*, 2010d: 556); Mozambique (Smithers and Lobão Tello, 1976; Monadjem *et al.*, 2010d: 556; Monadjem *et al.*, 2010c: 377); Namibia (Cotterill, 2004a: 261); Oman; Rwanda; Saudi Arabia; Somalia; South Africa (Monadjem *et al.*, 2010d: 556); Sudan; Swaziland (Monadjem, 2005: 5; Monadjem *et al.*, 2010d: 557); Tanzania (Stanley and Goodman, 2011: 41); Turkmenistan; Uganda (Kityo and Kerbis, 1996: 63); Yemen; Zambia (Ansell, 1978; Monadjem *et al.*, 2010d: 557); Zimbabwe (Cotterill, 2004a: 261; Monadjem *et al.*, 2010d: 557).
Presence uncertain: Palestinian Territory, Occupied.

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
For 5 specimens from the Algeria Forestry Station (RSA) Schoeman and Jacobs (2002: 157) reported the following wing parameters: Fa: 53.4 ± 1.5 mm, Wing area: 175.9 ± 5.8 cm^2, Wing span: 33.8 ± 1.1 cm, Wing loading: 9.2 ± 0.8 N/m^2, and aspect ratio: 6.5 ± 0.3.

DETAILED MORPHOLOGY:
Baculum - See Thomas (1997) and Csorba *et al.* (2003: 36).

Jacobs *et al.* (2013b: 76) found that *R. clivosus* has a smaller nasal capsule volume than predicted from its size.

FUNCTIONAL MORPHOLOGY:
Jacobs *et al.* (2007a), at De Hoop, South Africa, found *R. clivosus* to have a higher mean wing loading and aspect ratio than *R. capensis*, but no differences in their mean shape indices.

SEXUAL DIMORPHISM:
At De Hoop, South Africa, Jacobs *et al.* (2007a) found that females were heavier than males, but there were no differences in forearm length, or wingspan.

ECHOLOCATION:
Finger *et al.* (2017: 144) found that echolocation signals enables *R. clivosus* to distinguish the sex of the caller (probably linked with the initial and terminal FM components of the signal) and even its indentity (probably linked with resting frequency). Raw *et al.* (2018: 1) furthermore found that *R. clivosus* could discriminate readily between species using echolocation pulses with discrete frequencies. To discriminate between species with overlapping frequencies, additional parameters such as sweep rate of the FM and duty cycle were used.

For individuals in South Africa, Taylor (1999b), using a Pettersson D980 detector at a locality in Dundee, reported a maximum frequency of 94.3 (± 0.2) kHz, while Jacobs *et al.* (2007a) (detector type and locality not reported) reported a peak frequency of 92.1 (± 0.7) kHz. Monadjem *et al.* (2007a), using an Anabat detector at several different localities in Swaziland, reported a maximum frequency of 91.9 (± 0.65) kHz. From the same country, Monadjem *et al.* (2017c: 179) reported F_{min}: 75.7 ± 3.15 (70.4 - 80.3) kHz, F_{knee}: 91.5 ± 0.70 (90.0 - 92.3) kHz, F_c: 91.3 ± 1.06 (88.9 - 92.5) kHz and duration: 32.9 ± 5.35 (23.3 - 40.1) msec. Taylor (2000) indicates a constant frequency component of 94 kHz. Monadjem *et al.* (2010c: 378) reported from Mozambique that the peak echolocation frequencies ranged between 79.8 - 81.0 kHz (ANABAT, Petterson D240x).

From Algeria Forest Station (RSA), Schoeman and Jacobs (2002: 157) reported the type of calls to be high duty echolocation dominated by constant frequency calls, with a F_{peak}: 92.7 ± 0.5 kHz.

Monadjem *et al.* (2007a) also reported sexual dimorphism in the call with females emitting a higher frequency call than males (females 92.5 (± 0.04) kHz, males 91.6 (± 0.61) kHz).

Taylor *et al.* (2013b: 19) recorded the following parameters for 10 calls from Soutpansberg, South Africa: F_{max}: 92.1 ± 0.51 (91.5 - 92.8) kHz, F_{min}: 86.7 ± 3.21 (89.6 - 90.9) kHz, F_{knee}: 90.3 ± 0.42 (89.6 - 90.9) kHz, F_{char}: 90.7 ± 0.40 (90.1 - 91.4) kHz, duration: 14.3 ± 3.63 (8.6 - 19.4) msec.
Linden *et al.* (2014: 40) reported the following parameters from the Soutpansberg area (RSA): F_{min}: 79 - 90 kHz, F_{char}: 90 - 91 kHz, F_{knee}: 91 - 91 kHz, Slope: 280 - 606 OPS, duration: 9 - 19 msec.

Jacobs (2016: 133) and Jacobs *et al.* (2017b: 3) indicated that the call frequency of about 92 kHz in South Africa is much higher than expected for an animal of that size (which would be something around 66 kHz). They found that climatic factors, especially temperature, play an important role.

Eisenring *et al.* (2016: SI 2) reported the following for 28 calls from the Aberdares Range in Kenya: PF: 84.9 ± 5.0 (66.9 - 88.3), HF: 86.8 ± 4.3 (69.7 - 89.7), LF: 68.4 ± 6.4 (56.4 - 81.8), DT: 0.4 ± 0.2 (0.0 - 0.6), DF: 18.4 ± 7.3 (4.9 - 32.5), IPI: 0.7 ± 0.7 (0.1 - 3.8).

In Jordan, Benda *et al.* (2010b: 204) recorded the following parameters for 10 calls: F_{start}: 73.1 ± 1.9 (71.5 - 77.0) kHz, F_{end}: 73.8 ± 2.3 (70.0 - 77.0) kHz, F_{peak}: 84.4 ± 0.4 (83.5 - 85.0) kHz, Pulse duration: 48.0 ± 4.8 (43.0 - 59.0) msec, and Inter-pulse interval: 39.6 ± 12.9 (27.0 - 59.0) msec.

From Israel, Hackett *et al.* (2016: 223) reported 66 calls with these values: Pulse duration: 54.48 ± 11.22 msec, F_{start}: 78.92 ± 5.18 (69.3 - 88.8) kHz, F_{end}: 78.81 ± 5.26 (68.3 - 88.8) kHz, F_{peak}: 85.18 ± 0.57 (83.4 - 88.8) kHz.

MOLECULAR BIOLOGY:
DNA - Unknown.

Karyotype - Both Đulic and Mutere (1974) and Rautenbach *et al.* (1993) reported 2*n* = 58. However, Đulic and Mutere (1974) reported FN = 62, BA = 6, a large acrocentric X chromosome, and a small acrocentric Y chromosome, whereas Rautenbach *et al.* (1993) reported FN = 60, BA = 4, and submetacentric X and Y chromosomes. Richards *et al.* (2016d: 187, 192) mentioned 2*n* = 58 and FN = 60, with primarily acrocentric chromosomes and two small metacentric pairs. Erasmus and Rautenbach (1984: 94) mention 50 acrocentric and six bi-armed autosomal chromosomes, resulting in 62 autosomal arms.

Protein / allozyme - Unknown.

HABITAT:
Sirami *et al.* (2013: 34) recorded in the Western Cape Province, South Africa that *R. clivosus* activity was not significantly, nor positively influenced by size of wetland, while habitats 100 m surrounding wetlands were also significantly and positively influenced by the water body. *R. clivosus* preferentially near trees, orchards surrounding wetlands and over these wetlands (Sirami *et al.*, 2013: 35).

HABITS:
Jacobs *et al.* (2007a) at De Hoop, South Africa found that the average esitmated flying height above ground 0.84 ± 0.20 m, *n*= 6. At the same locality, Thomas and Jacobs (2013: 124) found that *R. clivosus* emerged earlier than the other species in the area (in order of emergence): *Miniopterus natalensis, Rhinolophus capensis, Nycteris thebaica, Myotis tricolor, Neoromicia capensis* and *Tadarida aegyptiaca*.

Petersen *et al.* (2019: 439) studied the behaviour and social calls of captive bats and found four acoustically distinct call types: 1) cascading/rising frequency-modulated (FM) calls, 2) oscillatory FM calls, 3) noisy screech calls and 4) whistle calls. These call types showed only weak associations with specific behaviours, situational categories or functional contexts.

ROOST:
Avery *et al.* (1990: 7) indicate that cool and moist caves or cave-like structures are used as daytime roosts. Taylor *et al.* (1999: 70) reported a roost containing 20 animals in the Shongweni Dam tunnel (RSA).

DIET:
From the Algeria Forestry Station (RSA) Schoeman and Jacobs (2002: 157) reported the following prey groups based on 46 faecal pellets from 5 bats (in volume percent): Lepidoptera (62.6 ± 30.8), Coleoptera (29.4 ± 24.8), Hemiptera (2.0 ± 4.5), Hymenoptera (1.4 ± 3.1), and unknown (4.6 ± 6.4).

Jacobs *et al.* (2007a) at De Hoop, South Africa, found that the diet mainly consisted of Lepidoptera and Coleoptera with lesser amounts of Neuroptera, Hemiptera and Diptera. The mean size of measurable prey taken by *R. clivosus* was larger than that taken by *R. capensis*, although the range of prey sizes taken by the two species overlapped (Jacobs *et al.*, 2007a).

PREDATORS:
Avery *et al.* (2005: 1054) found this species to be present in pellets from the barn olw (*Tyto alba*) in South Africa.

Mikula *et al.* (2016: Supplemental data) mention the Bat hawk (*Macheiramphus alcinus* Bonaparte, 1850) as diurnal avian predator.

POPULATION:
Structure and Density - *Rhinolophus clivosus* is common in some parts of its range, including South Africa, but is uncommon to rare in other areas, such as in Zimbabwe. In Swaziland, three separate populations contained over a thousand individuals, while in Jordan forty individuals were observed at a single location (Amr, 2000). Although the population appears to be stable in many regions, in Jordan the population is in decline and this bat may be declining throughout its range in the Arabian Peninsula (Amr *pers. comm.*) (Kock *et al.*, 2008a; IUCN, 2009).
Trend - 2008 - Unknown (Kock *et al.*, 2008a; IUCN, 2009). *R. clivosus* populations within the Asia Minor and Levant region have an unknown population trend, under predictive climate change scenarios (Bilgin *et al.*, 2012: 433).

REPRODUCTION AND ONTOGENY:
Krutzsch (2000: 116) indicates that spermatogenesis occurs in late spring/summer/early fall. Copulation occurs in fall

and is followed by sperm storage in the female until arousal and conception in the following spring.

Stanley and Goodman (2011: 41) reported on four females collected in East Usambara (Tanzania), of which two (collected on 17 August 1992) had small teats and two (collected in the first half of August 1991 and 1993) had large, non-lactating teats. Six males collected in the first half of August included three animals with scrotal testes and three with abdominal testes. Four males collected between July and September 1991 to 1993 in West Usambara had scrotal testes too.

PARASITES:
Hirst (1923: 989) mentions that Kolenati gave "*R. clivosus* [= *R. blasii*]" as host for the mite *Periglischrus interruptus* Kolenati, but that he corrected this later to *R. euryale*. Kolenati gave a new name to a mite from a *R. clivosus* specimen from Egypt: *Periglischrus glutinimargo*.
From Jordan, Benda *et al.* (2010b: 229) reported the presence of a bat fly: *Phthiridium biarticulatum* Hermann, 1804 (Nycteribiidae) and a flea *Rhinolophopsylla unipectinata unipectinata* (Taschenberg, 1880) (Ischnopsyllidae). Additionally, they also mention literature date for *Phthiridium integrum* from Saudi Arabia and Yemen, *Ascodipteron africanum rhinolophi* Jobling, 1958 (Streblidae) from Yemen, and five mites from Yemen: *Trombicula knighti* Radford, 1954, *T. filamentosa* Radford, 1953, *T. brevitarsa* Radford, 1952, *Brennanella longispina* Radford, 1953, and *Labidocarpus nasicolus* Lawrence, 1938.

ACARI
Sarcoptidae: Fain (1959a: 340) mentions a paratype of *Nycteridocoptes eyndhoveni* Fain, 1959, collected from a *R. clivosus zuluensis* from Lubudi, DRC. Fain (1959c: 237) reported *Psorergates (Psorergatoides) rhinolophi* Fain from *R. clivosus zuluensis* from Uvira, Kivu, DRC.
Trombiculidae: *Trombicula (Grandjeana) reticulata* (Vercammen-Grandjean & Nadchatram, 1963) collected from "*R. geoffroyi zuluensis*" [= *R. clivosus zuluensis*] from South Africa (Vercammen-Grandjean and Nadchatram, 1963; Stekolnikov, 2018a: 136). Stekolnikov (2018a: 189) also mentioned *Willmannium natalense* (Lawrence, 1949).

DIPTERA:
Streblidae: *Ascodipteron lophotes* Monticelli, 1898 from Eritrea (Haeselbarth *et al.*, 1966: 106), South Africa (Haeselbarth *et al.*, 1966: 106), Yemen (Haeselbarth *et al.*, 1966: 106, host referred to as *R. acrotis*). *Brachytarsina africana* (Walker, 1849) has a wide distribution in sub Saharan Africa (Haeselbarth *et al.*, 1966: 100). *Nycteribosca africana* Walker, 1849 (Zumpt, 1950: 96 - on "*R. geoffroyi*". *Raymondia hardyi* Fiedler, 1954 from South Africa (Shapiro *et al.*, 2016: 254). *Raymondia intermedia* Jobling, 1936 (Shapiro *et al.*, 2016: 255). *Raymondia waterstoni* Jobling, 1931 (Zumpt, 1950: 96; Haeselbarth *et al.*, 1966: 104). *Brachytarsina (Brachytarsina) flavipennis* Macquart, 1851 and *Raymondia huberi* Frauenfeld, 1855 from Algeria (Bendjeddou *et al.*, 2017: 15).

Nycteribiidae: *Nycteribia schmidlii* Schiner, 1853 (Haeselbarth *et al.*, 1966: 108; Bendjeddou *et al.*, 2017: 15). *Nycteribia scissa scissa* Speiser, 1901 the nominate form found exclusively on *R. clivosus* from South Africa and Namibia (Haeselbarth *et al.*, 1966: 108). *Nycteribia ovalis* Theodor, 1957 from Pietermaritzburg, South Africa (Haeselbarth *et al.*, 1966: 110). *Penicillidia fulvida* (Bigot 1885) (Zumpt, 1950: 97 - on "*R. geoffroyi*"; Haeselbarth *et al.*, 1966: 114). *Nycteribia integra* Theodor and Moscona, 1954 (Haeselbarth *et al.*, 1966: 109, host referred to as *R. acrotis*). *Nycteribia scissa* Speiser, 1901 (Zumpt, 1950: 97 - on "*R. geoffroyi*")
.
Szentiványi *et al.* (2019: Suppl.) also mentions *Penicillidia fulvida* bat flies from Kenyan "*Rhinolophus ferrumequinum keniensis*" which were carrying *Arthrorhynchus nycteribiae* fungi.

Calliphoridae: Zumpt (1950: 88) reported a calyptrate larva of *Calliphora croceipalpis* Jaennicke, 1867, which was found in decomposing bats ("*Rhinolophus geoffroyi*") on the bottom of the Sterkfontein caves (RSA). Other magots developed into an unidentified Borboridae and a Phoridae.

SIPHONAPTERA
Ischnopsyllidae: *Rhinolophopsylla ashworthi* (Waterston, 1913) known only from a few specimens from the Cape Province (King William's Town, Willowmore and Oudtshoorn) (Haeselbarth *et al.*, 1966: 191). *Rhinolophopsylla capensis* Jordan and Rothschild, 1921 (Zumpt, 1950: 97 - on "*R. geoffroyi*"; Haeselbarth *et al.*, 1966: 191, Beaucournu and Kock, 1996).

ACARI
Spinturnicidae: *Spinturnix viduus* and *Periglischrus africanus* were described by Zumpt (1950: 92, 93) from "*Rhinolophus geoffroyi*" from the Sterkfontein caves (RSA).
Ixodidae: ?*Ixodes simplex* Neumann, 1906 (see Zumpt, 1950: 96); *Ixodes pilosus howardi* Neumann (on "*Rhinolophus augur*", see Howard, 1908: 168).
Trombiculidae: *Trombicula natalensis* Lawrence, 1949 (see Zumpt, 1950: 96).

Listrophoridae: *Alabidocarpus nasicolus* Lawrence, 1938 (see Zumpt, 1950: 96).

VIRUSES:
Bunyaviridae
Phlebovirus
Rift Valley Fever Virus (RVFV) - Oelofsen and Van der Ryst (1999) tested 40 individuals from eight localities in the Free State Province, South Africa for RVFV antigen using an enzyme linked immunosorbet assay (ELISA), none tested positive.

Coronaviridae
Anthony *et al.* (2017b: Suppl.) mention the following alpha-coronaviruses: Predict_CoV_70, Human_CoV_229E, Predict_CoV_65, and the beta-coronavirus: Predict_CoV_43.

Rhabdoviridae
Lyssavirus - Rabies related viruses
Rabies: Oelofsen and Smith (1993) tested 85 individual brains, from 14 localities by means of the "Rapid rabies enzyme immunodiagnosis" (RREID) test (Diagnostic Pasteur), none were tested positive.

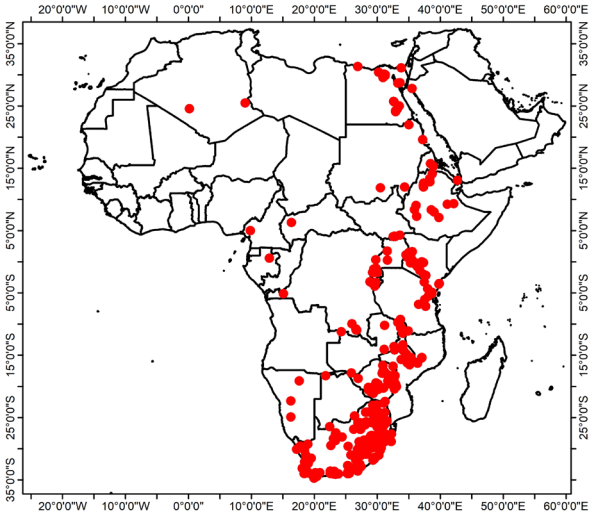

Figure 78. Distribution of *Rhinolophus clivosus*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Algeria, Botswana, Burundi, Cameroon, Central African Republic, Congo (Democratic Republic of the), Egypt, Eritrea, Ethiopia, Gabon, Kenya, Lesotho, Malawi, Mozambique, Namibia, Rwanda, Saudi Arabia, Somalia, South Africa, South Sudan, Sudan, Swaziland, Tanzania, Uganda, Zambia, Zimbabwe.

Rhinolophus cohenae Taylor, Stoffberg, Monadjem, Schoeman, Bayliss and Cotterill, 2012

*2012. *Rhinolophus cohenae* Taylor, Stoffberg, Monadjem, Schoeman, Bayliss and Cotterill, PLoS ONE, 7(9): 16. Publication date: 12 September 2012. Type locality: South Africa: Mpumalanga: Barberton: Mountainland Nature Reserve [25 43 08 S 31 15 58 E, 690m] [Goto Description]. Holotype: DNSM 8626: ad ♂, skull and alcoholic. Collected by: Lientjie Cohen (Mpumalanga Park). Presented/Donated by: ?: Collector Unknown. Baculum prepared. Skull and mandible in good condition (Taylor *et al.*, 2012c: 16). Paratype: DNSM 11620: ad ♂, skull and alcoholic. Collected by: Dr Samantha Stoffberg and Lientjie Cohen; collection date: 27 September 2009. Presented/Donated by: ?: Collector Unknown. Paratype: DNSM 11918: ad ♂, skull and alcoholic. Collected by: Dr Samantha Stoffberg and Lientjie Cohen; collection date: 27 September 2009. Presented/Donated by: ?: Collector Unknown. Paratype: DNSM 11919: ad ♂, skull and alcoholic. Collected by: Dr Samantha Stoffberg and Lientjie Cohen; collection date: 27 September 2009. Presented/Donated by: ?: Collector Unknown. Paratype: DNSM 7886: ad ♂, skull and alcoholic. Collected by: Lientjie Cohen (Mpumalanga Park); collection date: 27 September 2004. Presented/Donated by: ?: Collector Unknown. - Etymology: Recognition of Lientjie Cohen who collected the type specimen and contributed significantly to the conservation of bats in South Africa, particularly in Mpumalanga Province. The species name combines the surname Cohen and genitive singular case-ending "ae" indicative of feminine gender (Taylor *et al.*, 2012c: 17). - ZooBank: D0E1C9DD-7D36-4C01-AE0D-60AD474960A0. (Current Combination)

TAXONOMY:

Figure 79. *Rhinolophus cohenae* from Mpumalanga, South Africa.

Based on mitochondrial and nuclear DNA sequences and morphological and morphometric data, Taylor *et al.* (2012c) found that the *Rhinolophus hildebrandtii* group includes more species than previously recognized.

COMMON NAMES:
English: Cohen's Horseshoe Bat. German: Cohens Hufeisennase.

CONSERVATION STATUS:
Global - not assessed.

Assessment History
Global - not assessed.

Regional -
South Africa: 2016 - VU C2a(ii), D2 ver 3.1 (2001) (Cohen *et al.*, 2016).

GENERAL DISTRIBUTION:
Known only from three closely-spaced localities in Mpumalanga Province of South Africa in the vicinity of Nelspruit Taylor *et al.* (2012c: 17).

Accurate delimitation of this species' range is subject to further collecting and reappraisal of existing museum material, previously refered to as *R. hildebrandtii*.

Native: South Africa (Taylor *et al.*, 2012c: 17).

ECHOLOCATION:
Lowest recorded peak frequency 33.0 kHz in the holotype; mean 32.86 ± 0.24 kHz, n= 7 in type series Taylor *et al.* (2012c: 16).

PARASITES:
DIPTERA:
Streblidae: *Raymondia hardyi* Fiedler, 1954 from South Africa (Shapiro *et al.*, 2016: 254; based on a record by Theodor (1968), who mentioned "*R. hildebrandtii*" as host).

ZOOBANK:
D0E1C9DD-7D36-4C01-AE0D-60AD474960A0

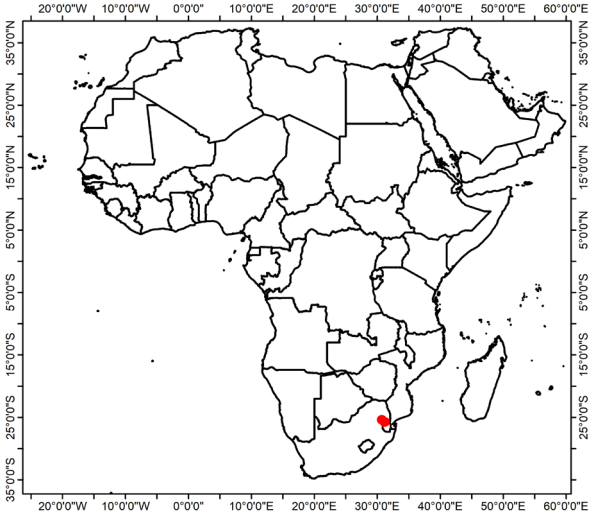

Figure 80. Distribution of *Rhinolophus cohenae*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
South Africa.

Rhinolophus damarensis Roberts, 1946

*1946. *Rhinolophus darlingi damarensis* Roberts, Ann. Transv. Mus., 20 (4): 303. Type locality: Namibia: Damaraland: Okahandja district: Oserikari [Goto Description]. Holotype: TM 9474: ad ♀, skin and skull. Collected by: Austin Roberts; collection date: 10 August 1941. Note: Caught in bedroom at night.
? *Rhinolophus damarensis:* (Name Combination, Current Combination)

TAXONOMY:
Jacobs *et al.* (2013a: 12) showed that *R. darlingi* (*sensu lato*) was polyphyletic comprising two non-sister lineages (*R. darlingi* (*sensu stricto*) and *R. damarensis*), with disjunct distributions in southern Africa, which diverged about 9.7 Mya. They further showed that despite the genetic divergence between the two lineages (*R. darlingi* (*sensu stricto*) and *R. damarensis*) echolocation frequencies as well as skull and post-cranial morphology, apart from bacula, were highly convergent.

Two lineages which within the *R. damarensis* clade can be seen: a northern (where the type of *damarensis* falls) and a southern linage, which diverged about 5 Mya (Jacobs *et al.*, 2013a: 12).

R. damarensis is embedded in the *fumigatus* clade that includes *R. darlingi*, *R. fumigatus*, *R. eloquens* and *R. hildebrandtii* (Jacobs *et al.* (2013a: 12).

Based on DNA sequencing, morphometrics, and echolocation data, Jacobs *et al.* (2013a) concluded that the western population of *R. darlingi* represents a separate species, which was separated from the eastern population some 9.7 Mya.

COMMON NAMES:
German: Damara-Hufeisennase.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) [as part of *R. darlingi*] in view of its wide distribution, presumed large population, it occurs in a number of protected areas, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Jacobs *et al.*, 2008aa; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) [as part of *R. darlingi*] (Jacobs *et al.*, 2008aa; IUCN, 2009). 2004 - LC ver 3.1 (2001) [as part of *R. darlingi*] (Jacobs *et al.*, 2004v); IUCN, 2004). 1996 - LR/lc [as part of *R. darlingi*] (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - LC ver 3.1 (2001) (Jacobs *et al.*, 2016i). 2004 - NT ver 3.1 (2001) [as part of *R. darlingi*] (Friedmann and Daly, 2004).

ECHOLOCATION:
In South Africa, Maluleke *et al.* (2017: 7347) studied the variation in echolocation calls along a latitudinal gradient between 16 and 32° S. They observed resting frequencies of 85.43 ± 1.3 kHz and average call duration of 31.14 ± 5.9 msec, with a slight sexual dimorphism: in females the frequencies varied between 84.4 ± 0.7 kHz and 87.6 ± 1.1 kHz in the different localities, and in males between 84.4 kHz ± 0.9 to 86.9 ± 1.1 kHz. The only factor they found to be responsible for the divergence in resting frequency was annual mean temperature.

MOLECULAR BIOLOGY:
DNA - Jacobs *et al.* (2013a: 12) sequenced the Cytochrome *b* gene from the type specimen of *R. d. damarensis* Roberts, 1924 (TM 9474) (Genbank Nr- KF683224), which grouped distinctly from the eastern populations now referred to as *R. darlingi* (*sensu stricto*). Two lineages which within the *R. damarensis* clade can be seen a northern (where the type of *damarensis* falls, and a southern linage.

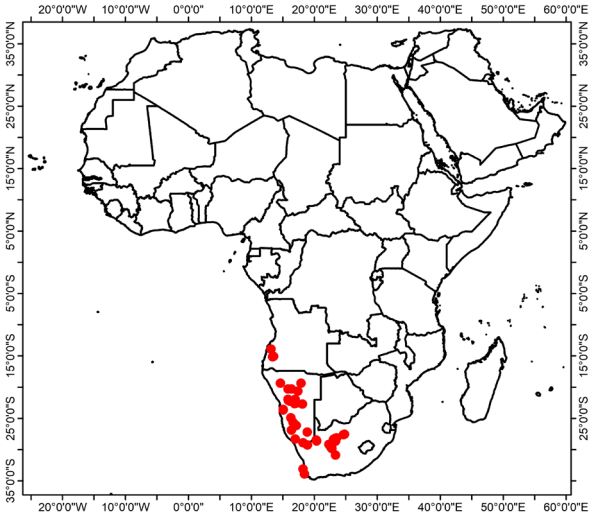

Figure 81. Distribution of *Rhinolophus damarensis*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Angola, Namibia, South Africa.

Rhinolophus darlingi K. Andersen, 1905

*1905. *Rhinolophus Darlingi* K. Andersen, Ann. Mag. nat. Hist., ser. 7, 15 (85): 70. Publication date: 1 January 1905. Type locality: Zimbabwe: Mashonaland: Mazoe [17 30 S 31 03 E, 4 000 ft] [Goto Description]. Holotype: BMNH 1895.8.27.1: ad, skin only. Collected by: J.ff. Darling Esq. Collection date: 13 June 1895; original number: 35. Paratype: BMNH [a]:. Paratype: BMNH [b]:. Paratype: BMNH [c]:. Paratype: BMNH [d]:. Paratype: BMNH [e]:. - Etymology: In honour of J. ff. Darling, a mining engineer, who first collected this species in Mazoe, Zimbabwe, in the early part of the twentieth century (see Smithers, 1983: 126; Taylor, 2005). (Current Combination)

1924. *Rhinolophus darlingi barbertonensis* Roberts, Ann. Transv. Mus., 10: 59. Publication date: 31 January 1924. Type locality: South Africa: SE Transvaal province: Barberton district: Louw's creek [Goto Description]. Holotype: TM 2476: ad ♀, skin and skull. Collected by: Austin Roberts; collection date: 14 March 1920. Note: Caught in old mine drive.

2016. *Rhinolophus darling:* Hoffmaster and Vonk, Behav. Sci., 6 (25): 1. Publication date: 20 November 2016. (Lapsus)

? *Rhinolophus darlingi darlingi:* (Name Combination)

? *Rhinolophus darlingi:* (Current Spelling)

TAXONOMY:
Jacobs *et al.* (2013a: 12) showed that *R. darlingi* (*sensu lato*) was polyphyletic, comprising two non-sister lineages (*R. darlingi* (*sensu stricto*) and *R. damarensis*), with disjunct distributions in southern Africa, which diverged about 9.7 Mya. They further showed that despite the genetic divergence between the two lineages (*R. darlingi* (*sensu stricto*) and *R. damarensis*) echolocation frequencies as well as skull and post-cranial morphology, except for the bacula, were highly convergent.

R. darlingi is embedded in the *fumigatus* clade (Csorba *et al.*, 2003: 39 - 40; Simmons (2005: 354) that includes – *R. damarensis*, *R. fumigatus*, *R. eloquens* and *R. hildebrandtii* (Jacobs *et al.* (2013a: 12).

R. darlingi includes *R. d. barbertonensis* Roberts, 1924.

COMMON NAMES:
Afrikaans: Darling se saalneusvlermuis, Darling-saalneusvlermuis. Czech: vrápenec Darlingův. English: Darling's Horseshoe Bat. French: Fer-à-Cheval de Darling, Rhinolophe de Darling. German: Darlings Hufeisennase. Portuguese: Morcego ferradura de Darling.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
R. darlingi is represented intermittently in the upper Pleistocene and in the very late Holocene at Border Cave (Avery, 1991: 6).

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, it occurs in a number of protected areas, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Jacobs *et al.*, 2008aa; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Jacobs *et al.*, 2008aa; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Jacobs *et al.*, 2004v); IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - LC ver 3.1 (2001) (Jacobs *et al.*, 2016j). 2004 - NT ver 3.1 (2001) (Friedmann and Daly, 2004).

MAJOR THREATS:
Jacobs *et al.* (2008aa) [in IUCN (2009)] reported that there appear to be no major threats to this species as a whole.

CONSERVATION ACTIONS:
This species is present within several protected areas. Further taxonomic studies are needed for populations recorded outside of southern Africa. No direct conservation measures are currently needed for the species (Jacobs *et al.*, 2008aa; IUCN, 2009).

GENERAL DISTRIBUTION:
Rhinolophus darlingi is largely distributed in southern Africa with some additional records outside of this area. Skinner and Chimimba (2005) report that it has been recorded from Namibia and northeastern Botswana; that it is widely distributed in Zimbabwe; in South Africa, where its distribution is best predicted by geology (Babiker Salata, 2012: 50), it is known from Limpopo Province, eastern Mpumalanga, northern Gauteng, in parts of the Eastern Cape and the Northern Cape, and from KwaZulu-Natal. In much of eastern Mozambique; and in the lowveld and Lubombo regions of Swaziland. It is unclear if the species is present in Lesotho. Outside of southern Africa, it has been recorded from Benguela in Angola, Banagi in Tanzania, and possibly from Nigeria suggesting a wider distribution than is currently known (Skinner and Chimimba, 2005). Herkt *et al.* (2017: Appendix S9), however, found that there are substantial differences in terms of occupied ecological niches between the populations from southern Africa and those from Nigeria, which support the statement in IUCN (2013) that they may represent a separate species.

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 1,217,047 km^2.

CAS has 5 specimens from the Pyramids of Giza, Egypt, which may be possible misidentifications as these seem to be well outside of the distribution range of the species.

Native: Angola (Crawford-Cabral, 1989; Monadjem *et al.*, 2010d: 557); Botswana (Monadjem *et al.*, 2010d: 557); Burundi; Congo (The Democratic Republic of the); Kenya; Malawi (Happold *et al.*, 1988; Monadjem *et al.*, 2010d: 557); Mozambique (Smithers and Lobão Tello, 1976; Monadjem *et al.*, 2010d: 557); Namibia (Monadjem *et al.*, 2010d: 557); South Africa (Monadjem *et al.*, 2010d: 557); Swaziland (Monadjem *et al.*, 2010d: 558); Tanzania; Zambia (Cotterill, 2004a: 261; Monadjem *et al.*, 2010d: 558); Zimbabwe (Monadjem *et al.*, 2010d: 558).
Presence uncertain: Lesotho; Nigeria.

ECHOLOCATION:
Jacobs *et al.* (2007a) reported a peak frequency of 88.1 (± 2.0) kHz for individuals from South Africa (detector type not reported). For individuals from Swaziland Taylor (1999b) using a Petterssen D980 at Mlawula reported a maximum frequency of 86.2 (± 0.1) kHz, while Monadjem *et al.* (2007a) using an Anabat detector at a number of localities reported a maximum frequency of 85.8 (± 0.36) kHz. Taylor (2000) reported a constant frequency component of 86 kHz. Monadjem *et al.* (2017c: 179) registered the following parameters: F_{min}: 74.3 ± 4.28 (70.8 - 79.1) kHz, F_{knee}: 85.7 ± 0.46 (85.2 - 86.1) kHz, F_c: 85.6 ± 0.38 (85.2 - 85.8) kHz and duration: 26.5 ± 3.74 (22.6 - 30.0) msec. They also indicated that the maximum detection distance was 2 m.

One call from Waterberg, South Africa had the following parameters: Fmax: 87.4 kHz, Fmin: 84.2 kHz, Fknee: 85.6 kHz, Fchar: 85.1 kHz, duration: 28.0 msec (Taylor *et al.*, 2013b: 19). These authors also reported an additional four calls from Swaziland: Fmax: 85.8 ± 0.25 (85.5 - 86.0) kHz, Fmin: 74.5 ± 4.54 (72.3 - 76.1) kHz, Fknee: 84.8 ± 0.52 (84.1 - 85.2) kHz, Fchar: 85.2 ± 0.54 (84.5 - 85.6) kHz, duration: 17.8 ± 3.39 (13.3 - 21.5) msec.

Jacobs (2016: 119) indicates that the second harmonic of this bat coincides with the fourth harmonic of *R. hildebrandtii*, which possibly might illustrate "harmonic hopping".

MOLECULAR BIOLOGY:
DNA - Jacobs *et al.* (2013a: 12) sequenced the Cytochrome *b* gene from the type specimen of *R. d. barbetonensis* Roberts 1924 (TM 2476) (Genbank Nr- KF683217), which grouped with specimens collected from the type locality of the type of *R. darlingi* (Mazoe, Zimbabwe).
Karyotype - Both Peterson and Nagorsen (1975) and Rautenbach (1986) reported, for specimens from Zimbabwe and South Africa respectively, 2*n* = 58, FN = 60, BA = 4, and subtelocentric X and Y chromosomes.
Erasmus and Rautenbach (1984: 94) mention 52 acrocentric and four bi-armed autosomal chromosomes, resulting in 60 autosomal arms.

Protein / allozyme - Unknown.

POPULATION:
Structure and Density - *Rhinolophus darlingi* is a locally common species that, while usually found in small numbers, can be represented by hundreds of bats in a colony (Skinner and Chimimba, 2005) (Jacobs *et al.*, 2008aa; IUCN, 2009).
Trend - 2008 - Unknown (Jacobs *et al.*, 2008aa; IUCN, 2009).

POSTNATAL DEVELOPMENT:
Hoffmaster and Vonk (2016: 1) refer to Carter and Wilkinson (2013), who suggest that *R. darlingi* mothers, cooperating to keep all of the offspring warm, increase the probability of their own offspring's survival.

PARASITES:
Streblidae: *Brachytarsina africana* (Walker, 1849) has a wide distribution in sub Saharan Africa (Haeselbarth *et al.*, 1966: 100).
Nycteribiidae: *Nycteribia scissa rhodesiensis* Theodor, 1957 from Zimbabwe and Malawi (Haeselbarth *et al.*, 1966: 108). *Nycteribia tecta* Theodor,1957 from Zimbabwe and South Africa, but Haeselbarth *et al.* (1966: 110) suggests these may represent a distinct subspecies.

SIPHONAPTERA
Pulicidae: *Echidnophaga aethiops* Jordan and Rothschild, 1906 locality not mentioned (Haeselbarth *et al.*, 1966: 135).

VIRUSES:
Coronaviridae - Coronaviruses
SARS-CoV: Müller *et al.* (2007b) tested between 1986 and 1999, for antibody to SARS-CoV in sera in one individual from Limpopo Province, South Africa, none were tested positive (0/1).

Rhabdoviridae
Lyssavirus - Rabies related viruses
Rabies: Oelofsen and Smith (1993) tested five individuals from three localities using "Trousse Platelia Rage" ELISA kit (Diagnostic Pasteur), none tested positive for antibodies to rabies virus glycoprotein G. Oelofsen and Smith (1993) tested five individual brains, from three localities by means of the "Rapid rabies enzyme immunodiagnosis" (RREID) test (Diagnostic Pasteur), none were tested positive.

Rhinolophus deckenii Peters, 1868

*1868. *Rhinolophus Deckenii* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, 705 (for 1867). Type locality: Tanzania: Zanzibar coast (mainland opposite Zanzibar) [Goto Description]. Holotype: ZMB 3269: ad ♀, alcoholic (skull missing). Collected by: Baron Karl Klaus von der Decken; collection date: undated. - Etymology: In honour of baron Karl Klaus Von der Decken (1833 - 1865), collector of the type specimen. (Current Combination)
? *Rhinolophus deckeni:* (Alternate Spelling)
? *Rhinolophus deckenii:* (Current Spelling)

TAXONOMY:
Treated as a subspecies of *clivosus* by Hayman and Hill (1971: 23); but see Koopman (1975: 386). *ferrumequinum* species group (Csorba *et al.*, 2003: 41 - 42; Simmons, 2005: 354). See Csorba *et al.* (2003: 41) for remarks on taxonomy.

COMMON NAMES:
Chinese: 德氏菊头蝠. Czech: vrápenec východoafrický. English: Decken's Horseshoe Bat, Eastern Africa horseshoe bat. French: Fer-à-Cheval d'Afrique orientale, Rhinolophe de Decken, Rhinolophe d'Afrique orientale. German: Deckens Hufeisennase. Italian: Rinòlofo di Dècken, Fèrro di cavàllo di Dècken.

CONSERVATION STATUS:
Global - Listed as Near Threatened (NT ver 3.1 (2001)) because this species is probably in significant decline (but probably at a rate of less than, though close to, 30 % over ten years) because of deforestation through much of its range, thus making the species close to qualifying for Vulnerable A2c (Jacobs *et al.*, 2008ab; IUCN, 2009).

Assessment History -
2008 - NT ver 3.1 (2001) (Jacobs *et al.*, 2008ab; IUCN, 2009). 2004 - DD ver 3.1 (2001) (Jacobs *et al.*, 2004p; IUCN, 2004). 1996 - DD (Baillie and Groombridge, 1996).

MAJOR THREATS:
Jacobs *et al.* (2008ab) [in IUCN (2009)] reported that this species is presumably threatened by the logging and conversion of forest land to agricultural use, especially in coastal areas.

CONSERVATION ACTIONS:
There appear to be no direct conservation measures in place. It has been recorded from some National Parks and Forest Reserves in Tanzania. There is a need to maintain areas of suitable forest habitat for this species. Further research is needed into the species taxonomy, biology and overall natural history (Jacobs *et al.*, 2008ab; IUCN, 2009).

GENERAL DISTRIBUTION:
Rhinolophus deckenii, a little-known East African species has been recorded from Uganda, Kenya, and Tanzania (including the islands of Pemba, and Unguja [=Zanzibar] [see O'Brien, 2011: 286]). It has recently been found in Mozambique.

Native: Kenya; Mozambique (Monadjem *et al.*, 2010d: 558; Monadjem *et al.*, 2010c: 378); Tanzania (including the islands of Zanzibar and Pemba) (Stanley and Goodman, 2011: 42); Uganda.

ECHOLOCATION:
Monadjem *et al.* (2010c: 378) reported from Mozambique that the peak echolocation frequency of a single male was recorded at 72 kHz (ANABAT).

POPULATION:
Structure and density - Small colonies of less than 20 individuals. It is reported to be locally common in some areas, such as the Manga Forest Reserve, Tanzania (Doggart *et al.*, 1999b) (Jacobs *et al.*, 2008ab; IUCN, 2009).
Trend - 2008 - Decreasing (Jacobs *et al.*, 2008ab; IUCN, 2009).

PARASITES:
Streblidae: *Brachytarsina africana* (Walker, 1849) has a wide distribution in sub Saharan Africa (Haeselbarth *et al.*, 1966: 100).
Nycteribiidae: *Nycteribia tecta* Theodor 1957 from Kenya, Uganda, Tanzania and the Sudan (Haeselbarth *et al.*, 1966: 110).

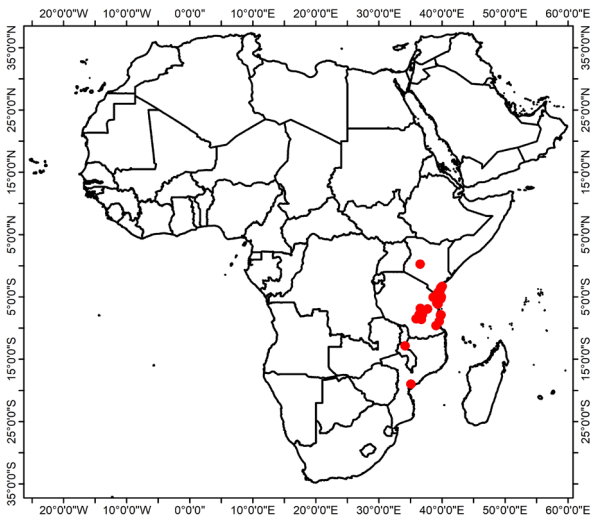

Figure 83. Distribution of *Rhinolophus deckenii*

DISTRIBUTION BASED ON VOUCHER SPECIMENS: Kenya, Malawi, Mozambique, Tanzania.

Rhinolophus denti Thomas, 1904

*1904. *Rhinolophus Denti* Thomas, Ann. Mag. nat. Hist., ser. 7, 13 (77): 386. Publication date: 1 May 1904. Type locality: South Africa: Northern Cape province: [formerly Bechuanaland]: Kuruman [26 28 S 22 27 E, 1 300 m] [Goto Description]. Holotype: BMNH 1904.4.8.2: ♂. Collected by: Captain R.E. Dent; collection date: 24 January 1904; original number: 7. - Etymology: In honour of R.E. Dent (Smithers, 1983: 130; Skinner and Smithers, 1990; Taylor (2005), the collector of the type specimen. (Current Combination)

1960. *Rhinolophus denti knorri* Eisentraut, Stuttg. Beitr. Naturk., 39: 3. Publication date: 1 June 1960. Type locality: Guinea: 12 km W Kolenté, Salung Plateau: Nyembaro [ca. 10 05 N 12 30 W] [Goto Description]. Holotype: SMNS 6111: ad ♂, skin and skull. Collected by: Hans Knorr; collection date: 27 November 1956. Presented/Donated by: ?: Collector Unknown. Dieterlen *et al.* (2013: 293) mention the locality for this specimen as "Salung-Plateau near Nyembaro-Nerebili, 10 km western of Kolenté, 400 m, Guinea". Paratype: SMNS 6112: ad ♀, skin and skull. Collected by: Hans Knorr; collection date: 19 November 1956. Presented/Donated by: ?: Collector Unknown. Paratype: SMNS 6112a: ad ♀, skin and skull. Collected by: Hans Knorr; collection date: 19 November 1956. Presented/Donated by: ?: Collector Unknown. Paratype: ZFMK 1959.0174: ♂, skin and skull. Collected by: Hans Knorr; collection date: 15 November 1956; original number: 90. See Hutterer and Peters (2010: 11). Paratype: ZFMK 1959.0175: ♂, skin and skull. Collected by: Hans Knorr; collection date: 19 November 1956. See Hutterer (1984: 30), Hutterer and Peters (2010: 11).. - Comments: Considered a valid subspecies by Grubb *et al.* (1998: 78). Type specimen in the SMNS.

? *Rhinolophus denti denti:* (Name Combination)

? *Rhinolophus denti:* (Current Spelling)

TAXONOMY:

Figure 84. A female *Rhinolophus denti* (TM 48035) caught at Taung, North-West Province, South Africa.

Placed within the *capensis*-group (Csorba *et al.*, 2003: 9 - 10; Simmons, 2005: 354). Possibly includes *R. swinnyi* (see Roberts, 1914; Csorba *et al.*, 2003: 9 - 10). Two subspecies are currently recognised, besides the nominate form described from the Northern Cape Province of South Africa (and including Namibia, Botswana and Zimbabwe), also *R. d. knorri* Eisentraut, 1960 from Guinea (and including Ghana) (Csorba *et al.*, 2003: 9 - 10; Simmons, 2005: 354). *R. d. knorri* is slightly smaller than the nominate form especially in the length of tibia and ear (Csorba *et al.*, 2003: 9 - 10). See Csorba *et al.* (2003: 9 - 10) for further remarks on taxonomy.

COMMON NAMES:
Afrikaans: Dent se saalneusvlermuis, Dent-saalneusvlermuis, Dentse Vlermuis. Czech: vrápenec Dentův. English: Dent's Horseshoe Bat. French: Rhinolophe de Dent. German: Dents Hufeisennase. Portuguese: Morcego ferradura de Dent.

SIMILAR SPECIES:
R. swinnyi (Shortridge, 1934; Roberts, 1914; 1946: 304). Shortridge (1934) was incorrect though, in indicating that Hewitt (1913) described a new subspecies of *R. denti*, from Pirie in the Eastern Cape province of South Africa, when it was actually *R. swinnyi piriensis* (Hewitt, 1913: 402).

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Avery and Avery (2011: 16) indicate that material from the eastern part of the Northern Cape province in South Africa, that was previously assigned to *R. capensis* should probably be assigned to *R. denti*.

CONSERVATION STATUS:
Global - Although this species is known mainly from isolated records from a large area, it is listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Jacobs *et al.*, 2008ak; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Jacobs *et al.*, 2008ak; IUCN, 2009). 2004 - DD ver 3.1 (2001) (Jacobs *et al.*, 2004ak; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - NT D1 ver 3.1 (2001) (Schoeman *et al.*, 2016a). 2004 - NT ver 3.1 (2001) (Friedmann and Daly, 2004). 1986 - Indeterminate (Smithers, 1986).

MAJOR THREATS:
Jacobs *et al.* (2008ak) [in IUCN (2009)] reported there appear to be no major threats to this species. It might be locally threatened in parts of its range by disturbance to roosting caves.

CONSERVATION ACTIONS:
There appear to be no direct conservation measures in place. It is not known if the species is present in any protected areas. Further studies are needed into the distribution of this species (particularly in West and Central Africa) (Jacobs *et al.*, 2008ak; IUCN, 2009).

GENERAL DISTRIBUTION:
Rhinolophus denti is widely, but patchily, recorded in West and southern Africa. It ranges from southeastern Senegal, through northern parts of West Africa to northeastern Ghana; in Central Africa it appears to have only been recorded from eastern Congo and southern Angola; in southern Africa, it is present in Namibia, northwestern and southwestern Botswana and northern parts of South Africa, where the species' distribution is linked with land use/land cover (Babiker Salata, 2012: 50).

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 781,091 km^2.

A record from Gambia is doubtful according to Kock *et al.* (2002: 85), since it is possibly of an adolescent *R. landeri*, as is the record from Côte d'Ivoire (Csorba *et al.*, 2003: 10) that is also apparently a *R. landeri* (see Simmons, 2005: 354). Records have been reported from Zimbabwe (Smithers and Wilson, 1979: 57; Fenton and Bell, 1981). However, Smithers (1983) later indicated three records from northeastern Zimbabwe in Smithers and Wilson (1979) and Csorba *et al.* (2003: 10) are misidentifications.

Herkt *et al.* (2017: Appendix S9) found that there are major differences between the occupied ecological niches for *denti* from southwestern Africa and *knorri* from West Africa.

Native: Angola (Crawford-Cabral, 1989; Monadjem *et al.*, 2010d: 558); Botswana (Smithers, 1971; Csorba *et al.*, 2003: 10; Monadjem *et al.*, 2010d: 558); Ghana (Csorba *et al.*, 2003: 10); Guinea (Csorba *et al.*, 2003: 10); Guinea-Bissau (Rainho and Ranco, 2001: 48; Simmons, 2005: 354); Mozambique (Smithers and Lobão Tello, 1976; Csorba *et al.*, 2003: 10; Smithers and Lobão Tello, 1976); Namibia (Ellerman *et al.*, 1953; Kock and Howell, 1988; Csorba *et al.*, 2003: 10; Monadjem *et al.*, 2010d: 558); Senegal; South Africa (Northern Cape Province (Ellerman *et al.*, 1953; Herselman and Norton, 1985; Rautenbach, 1986; Monadjem *et al.*, 2010d: 558; Csorba *et al.*, 2003: 10), North West Province (James, 1986; Csorba *et al.*, 2003: 10), Free State Province (Watson, 1998; Monadjem *et al.*, 2010d: 558)).

Bates *et al.* (2013: 338) reject the presence of *R. denti* in the Republic of Congo.

GEOGRAPHIC VARIATION:
See "Taxonomy" section.

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
See Smithers (1983), Skinner and Smithers (1990), Taylor (2000), Csorba *et al.* (2003: 9 - 10), Taylor (2005).

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:
See Smithers (1983), Skinner and Smithers (1990), Taylor (2000), Csorba *et al.* (2003: 9 - 10), Taylor (2005).

DETAILED MORPHOLOGY:
Baculum - Unknown
Of the skull, teeth and noseleaves see Csorba *et al.* (2003: 9 - 10).

SEXUAL DIMORPHISM:
Five mensural characters (forearm length, fourth metacarpal length, width across the upper canines, rostral width, and length of the mandibular toothrow) showed significant variation between the sexes in an analysis of specimens from Koegelbeen Cave in the Northern Cape Province of South Africa (Rautenbach, 1986).

ECHOLOCATION:
For individuals at Sengwa in Zimbabwe Jacobs (1996) and Fenton and Bell (1981) reported a maximum frequency of 110 kHz. Jacobs *et al.* (2007a) reported a similar peak frequency of 110.9 (± 1.7) kHz for individuals in South Africa.

Jacobs (2016: 119) indicates that the second harmonic of this bat coincides with the fourth harmonic of *R. capensis*, which possibly might illustrate "harmonic hopping".

MOLECULAR BIOLOGY:
DNA - Unknown.
Karyotype - Peterson and Nagorsen (1975) reported the diploid number as 2*n* = 58, aFN = 62, BA = 6, X = ST, Y =?, based on specimens from Zimbabwe. These results were supported by Rautenbach (1986) who also reported the Y chromosome to be metacentric. Karyologically identical to *R. swinnyi* (Csorba *et al.* (2003: 9 - 10).
Protein / allozyme - Unknown.

HABITAT:
Found in relatively arid regions (Csorba *et al.*, 2003: 9 - 10). Even the most south easterly record in Africa comes from the drier south-western part of the Free State Province of South Africa (Watson, 1998).

HABITS:
In north western Namibia a specimen shot by Shortridge (1934: 52) at "Rua Cana Falls" had a slow fluttering *Kerivoula*-like flight, and several other individuals were observed "circling low among trees and bushes near the Cunene River on bright moonlight nights". Found roosting at Drotsky's Cave in Namibia throughout the year (Smithers, 1983; Skinner and Smithers, 1990; Taylor, 2005).

ROOST:
Shortridge (1934: 52) records finding a single individual, at Louisvale in the Northern Cape Province of South Africa, inside a low water culvert occupied by a small colony of *Nycteris*. Shortridge, 1934: 52) also records finding two individuals "hanging from the thatched roof inside a small native house at Kaoko-Otavi" in the north western part of Namibia. Also found in caves (Smithers, 1983; Skinner and Smithers, 1990; Taylor, 2005). At Drotsky's Cave in Namibia the bats were "clinging to the sides of stalactites…hanging freely from the sides in open clusters", and were found in semi-dark 90 m from the cave entrance and in total darkness deep in the cave (Smithers, 1983; Skinner and Smithers, 1990; Taylor, 2005). Notes on an index card for specimens in the Transvaal Museum, from a cave near Warrenton in the Northern Cape Province of South Africa, indicate the cave was wet with water on the floor and dripping from stalactites, and that the bats congregated in separate groups. James (1986: 218) recorded a single individual at a disused quarry near Buxton in the North West Province, roosting on the ceiling of a "ruined mine structure which formed a 2 x 2 x 20 m cement, semi-dark room in a hillside".
Weber and Fahr (2006: 4) indicate that, in Guinea, *R. denti* largely or exclusively depends on the availability of caves as day roosts.

MIGRATION:
May not migrate as *R. denti* has been found roosting at Drotsky's Cave in Namibia throughout the year (Smithers, 1983; Skinner and Smithers, 1990; Taylor, 2005).

DIET:
Insectivorous (Smithers, 1983; Skinner and Smithers, 1990; Taylor, 2000; 2005).

POPULATION:
Structure - The species is known from fewer than 100 in colonies in West Africa, and fewer than 200 colonies in southern Africa (Jacobs *et al.*, 2008ak; IUCN, 2009).
Density - "Sparsely distributed", with no records of large colonies (Shortridge, 1934:52). At Drotsky's Cave in Namibia the bats were observed "clinging to the sides of stalactites in dozens" (Smithers, 1983; Skinner and Smithers, 1990; Taylor, 2005). Herselman and Norton (1985: 92) indicated that this species had not been collected from the Northern Cape province in the "last half century"

and could be considered as "extremely rare, possibly extinct, in the Cape Province". Yet, specimens in the Transvaal Museum, collected from the Northern Cape Province of South Africa between 1983 and 1988, indicate that at three different visits; 12, 71 and 15 specimens were taken from Koegelbeen Cave, 12 specimens were taken on a single date from a cave near Warrenton, and 11 specimens were taken on a single date from a locality near Postmasberg.
Trend - 2008 - Unkown (Jacobs *et al.*, 2008ak; IUCN, 2009).

ACTIVITY AND BEHAVIOUR:
Notes on an index card for specimens in the Transvaal Museum, from a cave near Warrenton in the Northern Cape Province of South Africa, indicate that on 14th of June 1983 the bats were in torpor.

PARASITES:
Brennan *et al.* (2015: 145) found no antibodies against *Pseudogymnoascus destructans* (White-nose syndrome) in blood samples from bats from Botswana.

VIRUSES:
Paramyxoviridae
Mortlock *et al.* (2015: 1841) reported that two out of three examined South African *R. denti* specimens tested positive for *Paramyxovirus* sequences.

Rhabdoviridae
Lyssavirus - Rabies related viruses
Rabies: Oelofsen and Smith (1993) tested 12 individuals from three localities using "Trousse Platelia Rage" ELISA kit (Diagnostic Pasteur), none tested positive for antibodies to rabies virus glycoprotein G. Oelofsen and Smith (1993) tested 15 individual brains, from two localities by means of the "Rapid rabies enzyme immunodiagnosis" (RREID) test (Diagnostic Pasteur), none were tested positive.

Rhinolophus eloquens K. Andersen, 1905

*1905. *Rhinolophus Hildebrandti eloquens* K. Andersen, Ann. Mag. nat. Hist., ser. 7, 15 (85): 74. Publication date: 1 January 1905. Type locality: Uganda: Entebbe [00 04 N 32 28 E, 3 800 ft] [Goto Description]. Holotype: BMNH 1899.8.4.4: ad, skin only. Collected by: Sir Frederic John Jackson. See Andersen (1905a: 75). Topotype: ROM 68683: ad ♀, alcoholic (skull not removed). Collected by: Theo Simpson Jones; collection date: 4 July 1963. Presented/Donated by: ?: Collector Unknown. - Etymology: From the Latin masculine adjective *èloquens*. Andersen (1905a) provides no etymological information; however, it is possible that this *Rhinolophus* is "eloquent" from a phylogenetic and zoogeographical point of view, as Andersen (1905a: 75) writes that "The present form is of great interest from phylogenetic no less than from a zoogeographical point of view" (see Lanza *et al.*, 2015: 93).
1922. *Rhinolophus hildebrandti perauritus* de Beaux, Atti Soc. ital. Sci. nat., 61: 22. Publication date: February 1922. Type locality: Somalia: Territory of the Rahanuin [Goto Description].
2016. *Rhinolophus eloquensis:* Amori, Segniagbeto, Decher, Assou, Gippoliti and Luiselli, Zoosystema, 38 (2): 219. Publication date: 24 June 2016. (Lapsus)
? *Rhinolophus aethiops eloquens:* (Name Combination)
? *Rhinolophus eloquens eloquens:* (Name Combination)
? *Rhinolophus eloquens:* (Name Combination, Current Combination)
? *Rhinolophus fumigatus eloquens:* (Name Combination)

TAXONOMY:
Included as subspecies in *aethiops* by Kock (1969a: 121). Includes *perauritus*; see Koopman (1975: 389). *fumigatus* species group (Csorba *et al.*, 2003: 47 - 48; Simmons, 2005: 354). See Csorba *et al.* (2003: 48) for remarks on taxonomy.

COMMON NAMES:
Chinese: 乌干达菊头蝠. Czech: vrápenec ugandský. English: Eloquent Horseshoe Bat. French: Rhinolophe éloquent. German: Andersens Hufeisennase. Italian: Rinòlofo eloquènte, Fèrro di cavàllo eloquènte.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Jacobs *et al.*, 2008ac; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Jacobs *et al.*, 2008ac; IUCN, 2009). 2004 - DD ver 3.1 (2001) (Jacobs *et al.*, 2004u; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
Rhinolophus eloquens is threatened by the general conversion of its habitat to agricultural use (Jacobs *et al.*, 2008ac; IUCN, 2009).

CONSERVATION ACTIONS:
Jacobs *et al.* (2008ac) [in IUCN (2009)] reported there appear to be no direct conservation measures in place. It is not known if the species is present in any protected areas. Further research needed into the distribution, natural history and threats to this bat.

GENERAL DISTRIBUTION:
Rhinolophus eloquens is endemic to Central and Eastern Africa. It has been recorded from southern Sudan, eastern Democratic Republic of the Congo, Rwanda, Uganda, Kenya, Somalia and the islands of Pemba, Unguja [=Zanzibar], and Mafia in Tanzania (see O'Brien, 2011: 286).

Native: Congo, (Democratic Republic of) (Hayman *et al.*, 1966; Monadjem *et al.*, 2010d: 558); Ethiopia (Lavrenchenko *et al.*, 2004b: 147); Kenya; Rwanda; Somalia; Sudan; Tanzania (United Republic of); Uganda.

POPULATION:
Structure and Density - Little information is available on the population abundance or size of this species (Jacobs *et al.*, 2008ac; IUCN, 2009). Trend - 2008 - Unknown (Jacobs *et al.*, 2008ac; IUCN, 2009).

PARASITES:
HEMIPTERA:
Polyctenidae: *Androctenes horvathi* Jordan 1912 recorded from Kenya and Sudan (Haeselbarth *et al.*, 1966: 17).

DIPTERA:
Streblidae: *Brachytarsina africana* (Walker, 1849) has a wide distribution in subsaharan Africa (Haeselbarth *et al.*, 1966: 100). Jobling (1954) as mentions *Raymondia intermedia* Jobling, 1936 as possible parasite of *R. eloquens* (see also Shapiro *et al.*, 2016: 255). *Raymondia seminuda* Jobling, 1954 (Shapiro *et al.*, 2016: 255).
Nycteribiidae: *Nycteribia hoogstraali* Theodor, 1957 from the Torit district in the Sudan (Zumpt 1966: 109). *Penicillidia fulvida* (Bigot, 1885) (Haeselbarth *et al.*, 1966: 114).

ACARI:
Trombiculidae: Stekolnikov (2018a: 50) reported the presence of *Whartonia oweni* Vercammen-Grandjean and Brennan, 1957.

VIRUSES:
Filoviridae - Filoviruses
Marburgvirus
Kuzmin *et al.* (2010b: 353) detected MARV RNA in 3.6 % of the examined *R. eloquens* in the DRC.
Luis *et al.* (2013: suppl.) report the presence of Lake Victoria marburg virus.

Rhabdoviridae
Vesiculovirus
Mount Elgon bat virus is reported by Luis *et al.* (2013: suppl.) although they remark that the bat might have been a *R. hildebrandti*.

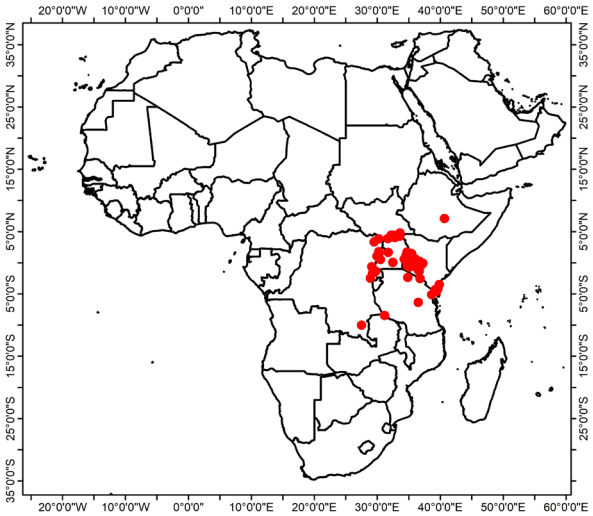

Figure 86. Distribution of *Rhinolophus eloquens*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Congo (Democratic Republic of the), Ethiopia, Kenya, Rwanda, South Sudan, Sudan, Tanzania, Uganda.

Rhinolophus euryale Blasius, 1853

*1853. *Rhinolophus euryale* Blasius, Arch. Naturgesch. Berlin, 19 (1): 49, 52, 54. Publication date: 1853. Type locality: Italy: Milan. - Etymology: Referring to "*Euryale*", one of the Gorgons (see Palmer, 1904: 279). (Current Combination)
1867. *Rhinolophus algirus* Loche, Exploration scientifique de l'Algerie pendant les années 1840, 1841, 1842. Mammifères, Cheiroptères, 83. Publication date: 1867. Type locality: Algeria: "Jardin Marengo". - Comments: Allen (1939a: 74) states that this name is not certainly identifiable, but may possible prove to supersede *barbarus* if the types can be found. Ellerman and Morrison-Scott (1951: 120) include it with a question mark in the synonymy of *R. euryale barbarus*.
1896. *Hipposiderus euryale:* Thomas, Ann. Mus. civ. Stor. nat. Genova, (2) 17 (37): 105. (Name Combination)
1904. *E[uryalus] atlanticus* K. Andersen and Matschie, Sber. Ges. naturf. Freunde Berlin, 77. Type locality: France: Indre-et-Loire: St. Paterna. Holotype: ZMB 12963: ♂, alcoholic (skull not removed). Collected by: Nitsche; collection date: 6 April 1893; original number: (formerly ZMB 6705). See Turni and Kock (2008: 28). Paratype: MNHN ZM-MO-1879-2030: alcoholic (skull not removed). Collected by: The Lataste collection. See Rode (1941: 238).
1904. *E[uryalus] Cabreræ* K. Andersen and Matschie, Sber. Ges. naturf. Freunde Berlin, 78. Type locality: Spain: Madrid: Alcata de Henares [40 25 N 03 43 W]. Holotype: ZMB 12964: ♀, alcoholic (skull not removed). Original number: ex. Museum Madrid. See Turni and Kock (2008: 28). - Comments: Mentioned as *cabrerai* by Trouessart, 1910 (see Cabrera, 1914: 83).
1970. *R[hinolophus] euryole:* Rushton, Ann. Génét. Sél. anim., 2 (4): 463. (Lapsus)
1970. *Rhinolophus euroyle:* Rushton, Ann. Génét. Sél. anim., 2 (4): 466. (Lapsus)

TAXONOMY:
Revised by DeBlase (1972). Gaisler (2001: 68) does not recognises subspecies. *euryale* species group (Csorba *et al.*, 2003: 14 - 16; Simmons, 2005: 354 - 355). See Csorba *et al.* (2003: 16) for remarks on taxonomy.

SIMILAR SPECIES:
Puechmaille and Teeling (2013: 252) point out that visual identification of hibernating bats might be problematic in the case of *R. euryale* and *R. mehelyi*, as bat they originally identified as *R.*

mehelyi turned out to belong to the other species after using non-invasive genetic tests on the animals' droppings.

CONSERVATION STATUS:
Global - Many range states have reported that populations have declined, and colonies have disappeared over the last 27 years (=3 generations). It is inferred that overall population decline has approached 30 % over that period (although the population is now stable and or even increasing in some areas, e.g. France), so the species is assessed as Near Threatened (approaching A2c) (NT ver 3.1 (2001)) (Hutson *et al.*, 2008o; IUCN, 2009).

Assessment History -
2008 - NT ver 3.1 (2001) (Hutson *et al.*, 2008o; IUCN, 2009). 1996 - VU A2c ver 2.3 (1994).

MAJOR THREATS:
Threats include loss of foraging habitat, and disturbance and loss of underground habitats. On a landscape scale, fragmentation and loss of linear elements such as hedgerows and riparian vegetation is a problem because such elements are used as landscape references for commuting. The species' strong dependence upon caves for roosting makes it particularly sensitive to cave disturbance, such as that from caving or tourism. Tourist disturbance of caves affects the species in several range states. The use of organochlorine pesticides is believed to have contributed to the earlier dramatic decline of the species in France (Brosset *et al.*, 1988). In North Africa, threats include habitat loss due to agriculture (livestock) and human disturbance (Hutson *et al.*, 2008o; IUCN, 2009).

Aerial hawking, water stress, and its small distribution range are believed to be the most important risk factors for this species linked with climatic change (Sherwin *et al.* (2012: 174).

CONSERVATION ACTIONS:
Hutson *et al.* (2008o) [in IUCN (2009)] reported *Rhinolophus euryale* is protected by national legislation in most range states. There are also international legal obligations for protection of this species through the Bonn Convention (Eurobats) and Bern Convention, where these apply. It is included in Annex II (and IV) of EU Habitats and Species Directive, and hence requires special measures for conservation including designation of Special Areas for Conservation. There is some habitat protection through Natura 2000, and some roosts are already protected by national legislation). The species is directly or indirectly benefiting from EU LIFEfunded projects in France, Spain and Italy. No specific measures are in place in North Africa.

GENERAL DISTRIBUTION:
Rhinolophus euryale is a western Palaearctic species, occurring in southern Europe, north-west Africa (known range extends across northern Morocco, Algeria, and Tunisia), and the Near East. There is only a single record from Cyprus, but this is regarded by most authors to be *R. mehelyi*. It is widely distributed over its range, and is found from sea level to 1,000 m.

Native: Abkhasia; Albania; Algeria (Csorba *et al.*, 2003: 16); Andorra; Armenia; Azerbaijan; Bosnia and Herzegovina; Bulgaria; Croatia; France (Corse) (Csorba *et al.*, 2003: 16); Georgia; Gibraltar; Greece (East Aegean Is.); Holy See (Vatican City State); Hungary; Iran (Csorba *et al.*, 2003: 16), Islamic Republic of; Iraq; Israel (Csorba *et al.*, 2003: 16); Italy (Sardegna, Sicilia); Jordan; Lebanon [see Horácek *et al.* (2008: 55)] (Csorba *et al.*, 2003: 16); Macedonia, the former Yugoslav Republic of; Monaco; Montenegro; Morocco (Csorba *et al.*, 2003: 16; El Ibrahimi and Rguibi Idrissi, 2015: 359); Palestinian Territory, Occupied; Portugal (Csorba *et al.*, 2003: 16); Romania; Russian Federation; San Marino; Serbia; Slovakia; Slovenia; Spain; Syrian Arab Republic (Csorba *et al.*, 2003: 16); Tunisia (Csorba *et al.*, 2003: 16; Dalhoumi *et al.*, 2016b: 867); Turkey (Csorba *et al.*, 2003: 16).
Regionally extinct: Switzerland.
Presence uncertain: Cyprus [see Benda *et al.* (2007: 71)]; Egypt; Turkmenistan.

DETAILED MORPHOLOGY:
Baculum - See Csorba *et al.* (2003: 15).

In their study on take-off performance, Gardiner *et al.* (2014: 1059) determined a wing beat frequency of 11.48 ± 0.50 Hz.

ECHOLOCATION:
The data for 38 animals from Greece were the following: F_{start}: 91.8 ± 5.00 kHz, F_{end}: 88.7 ± 3.49 kHz, F_{peak}: 104.8 ± 0.96 kHz, bandwidth: 3.5 ± 1.05 kHz, duration 53.8 ± 20.42 msec and interpulse interval: 84.5 ± 30.01 msec (Papadatou *et al.*, 2008b: 132).

Walters *et al.* (2012: suppl.) report the following figures for 26 calls (15 sequences) from French and Italian bats: duration: 35.23 ± 18.06 msec, F_{max}: 102.28 ± 1.20 kHz, F_{min}: 88.22 ± 4.30 kHz, bandwidth: 14.06 ± 3.69 kHz, F_{peak}: 101.68 ± 2.18 kHz.

Animals from Tunisia emitted sounds at 102.39 ± 1.01 kHz (105.0 - 106.5 kHz; Dalhoumi *et al.*, 2016b: 866).

Schuchmann *et al.* (2012: 161) found that both sexes were able to recognize the sex of conspecifics from their echolocation calls.

MOLECULAR BIOLOGY:
DNA - Unknown.
Karyotype - Both Bovey (1949) and Capanna and Manfredi Romanini (1971) reported 2*n* = 58, FN = 60. Rushton (1970: 463) also reported 2*n* = 58, FN=60, with two (sub)metacentric, 24 acrocentrics, and 2 minute pairs or acrocentric chromosomes. The X chromosome is reported as submetacentric and the Y chromosome as minute. Zima *et al.* (1992a) reported 2*n*=58, FN=60, BA=4, a submetacentric X chromosome and a metacentric Y chromosome for a specimen from Greece.

Capanna and Civitelli (1964a: 371) reported 2*n* = 58, including 24 acrocentric pairs, 2 metacentric pairs and two pairs of very small chromosomes. The X chromosome was reported as a large submetacentric and the Y as a very small one.

Protein / allozyme - Unknown.

HABITAT:
Russo *et al.* (2005: 327) and Goiti *et al.* (2008: 498 - 499) indicate that, in Spain, *R. euryale* always foraged in areas where there were trees, and never over open meadows, pastures, heath, gorse- or fern-covered areas (or any other open habitats). About 96 % of the bats they tagged, used hedgerows to forage in. The second most frequented habitat (90 %) was broad-leaved woodland, whereas isolated trees were visited between 1 and 12 %. Exotic tree plantations (e.g. *Eucalyptus* formed the least preferred habitat. Furthermore, the breeding colony size was found to be positively correlated with the availability of edges around breeding sites.

HABITS:
From the Iberian Peninsula, Goiti *et al.* (2006: 141) reported that during pre-breeding foraging occurred on average within 1.3 km, and at most 4.2 km from the roost. For lactating females, the average distance was 4.3 km, and a maximum distance from the roost of 9.2 km was observed. In the same period, males foraged closer (mean 1.9 km). During the post-lactation period, adults travelled a mean of 4.6 km, whereas juveniles flew on average only 2.6 km.

ROOST:
Based on data from Sardinia, Russo *et al.* (2014: 9) rule out that *R. euryale* and *R. mehelyi* compete for roosting sites.

DIET:
In northern Spain, Goiti *et al.* (2008: 496 - 497) examined 810 feces from 168 bats. These showed that the bat's diet included 10 prey categories, of which the Lepidoptera (moths) formed the staple diet (between 68 and 99 % of the diet). Moths are also the most important prey during lactation and post-lactation. Another important prey item, although very seasonal and especially prebreeding, was the beetle *Rhizotrogus* (Scarabaeidae). Other food items (in descending rank) included lacewings (Neuroptera, Chrysopidae and Hemerobiidae), craneflies (Diptera, Tipulidae), brachyceran flies, Psocoptera, and Hymenoptera. Diets were similar for adults and juveniles.

In the southwestern Iberian peninsula, Arrizabalaga-Escudero *et al.* (2018: Suppl.) identified the following food items from faecal samples of *R. euryale* (food items marked with an asterisk were also found in faecal samples of *R. mehelyi*): Coleoptera (Cerambycidae: *Arhopalus ferus* (Mulsant, 1839)*); Diptera (Tachinidae: unidentified*: *Phryno vetula* (Meigen, 1824); Muscidae: *Polietes lardarius* (Fabricius, 1781)); Lepidoptera (Crambidae: *Calamotropha paludella* (Hübner, 1824)*; *Metasia ophialis* (Treitschke, 1829); *Ostrinia nubilalis* (Hübner, 1796)*; Erebidae *Catocala nymphaea* (Esper, 1787); *Catocala nymphagoga* (Esper, 1787)*; *Lygephila lusoria* (Linnaeus, 1758); Gelechiidae: *Teleiopsis* sp.*; Geometridae: *Aplasta ononaria* (Füssli, 1783); *Camptogramma bilineata* (Linnaeus, 1758)*; *Ennomos quercaria* (Hübner, 1813)*; *Gymnoscelis rufifasciata* (Haworth, 1809); *Idaea ochrata/rufaria*; *Pachycnemia hippocastanaria* (Hübner, 1799)*; *Rhoptria asperaria* (Hübner, 1817)*; Noctuidae: *Acronicta rumicis* (Linnaeus, 1758); *Agrotis segetum/trux**; *Agrotis ipsilon* (Hufnagel, 1766)*; *Amphipyra tragopoginis* (Clerck, 1759); *Apamea monoglypha/sicula*; *Apamea arabs* Oberthur, 1881; *Autographa gamma/pulchrina**; *Calophasia platyptera* (Esper, [1788])*; *Cosmia trapezina* (Linnaeus, 1758); *Mythimna albipuncta* (Denis & Schiffermüller, 1775)*; *Mythimna loreyi/sicula**; *Peridroma saucia* (Hübner, 1808)*; *Polyphaenis sericata* (Esper, 1787)*; *Sesamia nonagrioides* (Lefèbvre, 1827)*; Nolidae: *Meganola strigula* (Denis & Schiffermüller, 1775); Praydidae: *Prays fraxinella* Bjerkander, 1784*; Pyralidae: *Ephestia mistralella* (Millière, 1874); *Pempelia palumbella* (Denis & Schiffermüller, 1775)*; *Phycita* sp.; Tortricidae: *Cnephasia* sp. 1*; *Cnephasia* sp. 2*); Neuroptera (Chrysopidae: *Chrysoperla* sp.*;

Cunctochrysa albolineata (Killington, 1935); *Pseudomallada flavifrons* (Brauer, 1851); Myrmeleontidae: *Distoleon tetragrammicus* (Fabricius, 1798)*); Orthoptera (Tettigoniidae: *Tessellana tessellata* (Charpentier 1825)). Of the 62 prey taxa, 32 (representing over 75 % of all food items) were consumed by both bat species.

Andreas *et al.* (2013) using faecal analysis of *R. euryale* from southern Slovakia, showed that this species mainly fed on medium-sized moths (25 - 40 mm) (%f = 60; %vol = 74) and the diet of *R. euryale* contained Neuroptera (Hemerobiidae) (%f = 2.2; %vol = 0.3), nematoceran Diptera (%f = 13.3; %vol = 9.1) and Trichoptera (%f = 6.7; %vol = 3.6). In the same area (and northern Hungaria), Miková *et al.* (2013: 848) investigated the relation between food and ambient temperature during winter.

Ahmim and Moali (2013: 175) examined droppings from northern Algeria, which contained mainly Insecta (96.19%) and Chilopoda (3.81%). Diptera accounted for 29.00 % (Culicidae: 14.29 %, Chironomidae/Ceratopogonidae: 7.14 %, and Tipulidae: 5.71 %. Lepidoptera were the second most important order and accounted for 19.08 %.

Laurent (1944a: 13) tried to (force) feed captive animals with mealworms (*Tenebrio molitor*), but these were rejected.

Gardiner *et al.* (2014: 1058) assessed its foraging strategy as "low altitude slow aerial hawking", with no observations of gleaning.

In Hungary, Maxinová *et al.* (2017a: 98) examined "non-consumptive faeces" (produced during hibernation after no feeding activity) and found these not to contain any insect DNA, but rather bat DNA as well as peptides belonging to other craniates and eukaryotes. They also found bacterial peptides and one Nematode. Furthermore, the high concentration of inorganic material suggest that drinking as well as direct sediment consumption occur inside the cave environment during the hibernation period. They conclude that winter arousals are primarily aimed at regulating the water balance. Maxinová *et al.* (2017b: 93) also found that the bat's digestive enzymes (amylase, chitobiase, endochitinase and glukosaminidase) remained active during the entire hibernation period.

POPULATION:
Structure and Density - According to Hutson *et al.* (2008o) [in IUCN (2009)], *R. euryale* is an infrequent species. Summer colonies number ca. 50 - 1,500 individuals (S. Aulagnier *pers. comm.,* 2007). Winter clusters typically number up to 2,000 animals. It occurs in large vulnerable colonies and is considered threatened in many range states. Large population declines have been reported in several European countries, including Spain (Palomo and Gisbert, 2002). In France, the population declined by ca. 70 % between 1940 and 1980, although subsequently the trend appears to have stabilised (Brosset *et al.*, 1988; S. Aulagnier *pers. comm.,* 2007). Apart from *R. blasii*, which may have gone extinct in the country, *R. euryale* is probably the rarest rhinolophid in Italy, and anecdotal evidence suggests that a number of colonies have declined in the past few decades (D. Russo *pers. comm.,* 2006). The species has a very small and declining population in Portugal (Rodrigues *et al.*, 2003; Cabral *et al.*, 2005). It is stable and common in the central and eastern Balkans (M. Paunovic *pers. comm.,* 2007).
There is little information on population trends outside Europe, although it is suspected that continuing declines have also occurred in at least parts of the non-European range. For example, in Iran the species is no longer found in caves which 30 years ago held 20,000 individuals of different species (M. Sharifi *pers. comm.,* 2005).
Trend - 2008 - Decreasing (Hutson *et al.*, 2008o; IUCN, 2009).

LIFESPAN:
Szekely *et al.* (2015: Suppl.) report a maximum longevity of 13 years, and Ibáñez *et al.* (2018: 80) recaptured a male bat in La Rioja (Spain) that was banded 21 years before.

REPRODUCTION AND ONTOGENY:
Tuttle and Stevenson (1982: 121) indicate that males need about 27 months to reach sexual maturity, whereas females need between 15 and 27 months.

Szekely *et al.* (2015: Suppl.) mention that both males and females become sexually mature after 821 days (= about 27 months). The gestation period takes 90 days, after which a young is born with a weight of 3.89 g (adult: 8.2 g).

POSTNATAL DEVELOPMENT:
In Iran, Eghbali *et al.* (2017: 276) found that the young's body mass increased linearly until day 23, when it attained 74.29 % of the mean mass of adult females. Its body mass increased (from 3.58 g at birth) by 0.36 g per day and its forearm length increased (from 20.10 mm at birth) by 1.41 mm/day. By day 70, the epiphysal gap was closed. The wing load decreased by 0.09 Nm^{-2}/ day until day 36, and subsequently increased again to a maximum of 6.56 ± 0.30 Nm^{-2} by day 80.

PARASITES:
Hirst (1923: 989) mentions that Kolenati described a mite (*Periglischrus interruptus*) from a bat, he originally identified as "*R. clivosus* [= *R. blasii*]", but that he corrected this later to *R. euryale*.

Ševcík *et al.* (2012: 35) report on the presence of the bat flies *Nycteribia schmidlii schmidlii* Schiner, 1853 and *Phthiridium biarticulatum* Hermann, 1804 on bats from Cyprus.

The bat flies *Brachytarsina flavipennis* Macquart, 1851 (Streblidae) and *Phthiridium biarticulatum* Hermann, 1804 (Nycteribiidae) were reported from Jordan by Benda *et al.* (2010b: 238). Benda *et al.* (2010b: 238) also refer to previous reports from Turkey mentioning the following parasites: *Nycteribia pedicularia* Latreille, 1805, *N. schmidlii* Schiner, 1853, *N. kolenatii* Theodor and Moscona, 1954, *N. vexata* Westwood, 1835, *Brachytarsina flavipennis* Macquart, 1851, and *Rhinolophopsylla u. unipectinata* (Taschenberg, 1880) and in Palestine *Penicillidia conspicua* Speiser, 1901 and *P. dufourii* (Westwood, 1835).

Bendjeddou *et al.* (2017: 15) reported the following ectoparasites from Algeria: Nycteribiidae: *Nycteribia (Nycteribia) pedicularia* Latreille, 1805, *Penicillidia (Penicillidia) dufourii* Westwood, 1835 and *Phthiridium biarticulatum* Hermann, 1804; and Siphonaptera: *Rhinolophopsylla unipectinata arabs* Jordan and Rothschild, 1921.

From Tunisia, Vermeil (1960: 738) reported the presence of the Nycteribiids *Nycteribia latreillii* Leach, 1817 and *Nycteribia vexata vexata* Westwood, 1835.

From non-specified areas, Haelewaters *et al.* (2018: 974) reported the Nycteribiid *Penicilidia conspicua* Speiser, 1901, which might be a host for the fungus *Arthrorhynchus nycteribiae* (Peyr.) Thaxt.

Malinicová *et al.* (2017: 211) investigated the gut microflora of Hungarian *R. euryale* during hibernation and found that the number of enterobacteria and enterococci decreased during hibernation and were restored at the end of hibernation.

VIRUSES:
Coronaviridae - Coronaviruses
Luis *et al.* (2013: suppl.) mention the presence of a SARS coronavirus-related virus.

Alphacoronavirus
Reported from Germany by Kohl and Kurth (2014: 3112).
Ar Gouilh *et al.* (2018: 90) reported the EPI 10 virus from an *R. euryale* from Morocco.

Betacoronavirus
Reported from Bulgaria and Germany by Kohl and Kurth (2014: 3112).

Orthomyxoviridae
Despite sampling and testing of 2 individuals of this species, no evidence of influenza A-like viruses (Orthomyxoviridae) were obtained (Fereidouni *et al.*, 2015).

Rhabdoviridae
Lyssavirus
Serra-Cobo *et al.* (2018: 2) found one out of 31 Algerian bats testing seropositive for European bat lyssavirus1 and none of the twelve Moroccan bats.

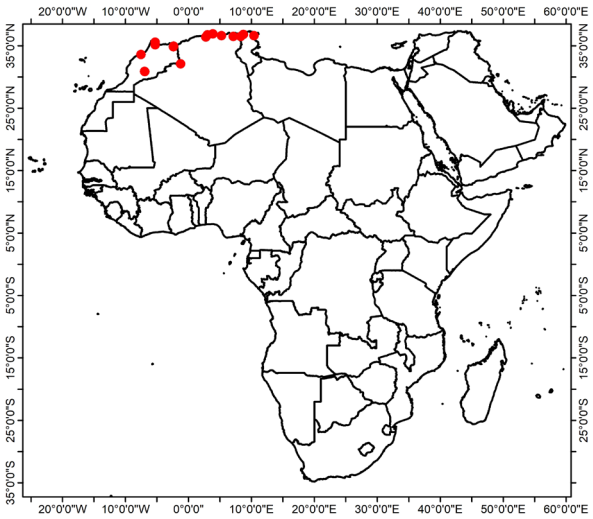

Figure 87. Distribution of *Rhinolophus euryale*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Algeria, Egypt, France, Morocco, Tunisia.

Rhinolophus ferrumequinum (Schreber, 1774)

*1774. *Vespertilio ferrum-equinum* Schreber, Die Säugethiere in Abbildungen nach der Natur mit Beschreibungen, 1 (8): pl. 62, upper fig + 1 (9): 174. Publication date: 1774. Type locality: France: "France". - Etymology: From the Latin "*ferrum*" meaning iron and "*equus*" meaning horse.

1792. *Vespertilio ferrum-equinum major* Kerr, Animal Kingdom, 1 (1): xvii, 99. Type locality: France. - Comments: This might be an African form, but we lack further information.

1803. *major* E. Geoffroy Saint-Hilaire, Catalogue des Mammifères du Muséum national d'Histoire naturelle, Paris, ???. - Comments: This might be an African form, but we lack further information.
1961. *Rhinolophus ferrumequinum millali:* Lavocat, Notes Mém. Serv. Mines Carte geol. Maroc, 155: ?. Type locality: Morocco. - Comments: This is a fossil form from the Miocene-Pliocene. (Name Combination)
? *Rhinolophus ferrumequinum ferrumequinum:* (Name Combination)
? *Rhinolophus ferrumequinum:* (Name Combination, Current Combination)

TAXONOMY:
Taxonomic revisions by Felten *et al.* (1977), Strelkov *et al.* (1978), Kryštufek (1993) and Thomas (1997). Thomas (1997) recognized seven subspecies based on morphological characters (*R. f. ferrumequinum* in Europe and northwest Africa, *R. f. creticum* in Crete, *R. f. irani* in Iran, Iraq and Turkmenistan, *R. f. proximus* from Afghanistan and Pakistan to India, *R. f. tragatus* in north India and China, *R. f. korai* in Korea and *R. f. nippon* in Japan). *ferrumequinum* species group (Csorba *et al.*, 2003: 42 - 45; Simmons, 2005: 355). See Csorba *et al.*, 2003: 44 - 45) for further remarks on the taxonomy.

Based on cytochrome *b* analyses, Koh *et al.* (2014: 97) indicate that northern African populations form one clade with specimens from Europe and western Asia, which is different from three other clades: far-eastern Asia, eastern China and central China.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Lavocat (1961) described a new subspecies found in deposits of the Mio-Pliocene, at Beni Mellal. See Butler (1978).

CONSERVATION STATUS:
Global - This species has a large range. Although there have been marked and well-documented declines in some areas, the species remains widespread, abundant, and apparently stable in other areas. Assessed as Least Concern (LC ver 3.1 (2001)) (Aulagnier *et al.*, 2008a; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Aulagnier *et al.*, 2008a; IUCN, 2009). 2000 - LR/nt. 1996 - LR/nt ver 2.3 (1994).

MAJOR THREATS:
Aulagnier *et al.* (2008a) [in IUCN (2009)] reported the main threats are fragmentation and isolation of habitats, change of management regime of deciduous forests and agricultural areas, loss of insects due to pesticide use, and disturbance and loss of underground habitats and attics. In northwest Europe, habitat change is likely to have been amongst the major causes of declines, the conversion of woodland and small-field landscape

to large-scale agricultural land being particularly damaging. While declines elsewhere, particularly in eastern Europe, may currently not be so marked, the loss of cultural landscapes in those countries as they move towards western-style economies may have significant effects in the near future. The use of pesticides has been a recognized threat to the insect food, particularly where these have been directed against the larvae of favoured food items, such as melolonthid beetles, larvae of noctuid moths or crane-flies. Favoured prey may be affected secondarily by pesticide use, such as the loss of dung fauna from the use of persistent anti-parasitic drugs (avermectins) on cattle. Populations in caves and other underground habitats have suffered from increased disturbance (for example by tourist visits to caves). In buildings, colonies may be affected by human intolerance, renovation work or the application of pesticides, such as some of those used for the remedial treatment of timbers (Hutson *et al.*, 2001). In South Asia, this species is threatened by deforestation, generally resulting from logging operations and the conversion of land for agricultural and other uses. Disturbance to roosting sites is likely to be a potential threat to the populations of this species (Molur *et al.*, 2002).

Concerning climatic change, the most important risk factors identified by Sherwin *et al.* (2012: 174), are water stress, aerial hawking and long-distance dispersal.

CONSERVATION ACTIONS:
Aulagnier *et al.* (2008a) [in IUCN (2009)] reported *Rhinolophus ferrumequinum* has been the subject of widespread conservation activity, especially in Europe. Until recently, this has concentrated on roosts in buildings and caves. Many buildings used as roosts have management agreements and many underground sites have been protected. Nevertheless, sites continue to be lost or damaged. More recently, attention has turned to identifying more precisely the food and foraging requirements. A European meeting (Germany, May 1995) discussed the status and conservation needs for the species on a pan-European scale. The Bern Convention has commissioned a Europe-wide Species Action Plan under the Pan-European Biological and Landscape Diversity Strategy (Ransome and Hutson, 2000). It is protected by national legislation in some range states. There are international legal obligations for its protection through the Bonn Convention (Eurobats) and Bern Convention in parts of its range where these apply. It is included in Annex II (and IV) of the European Union Habitats Directive, and hence requires special measures for conservation including designation of Special Areas for Conservation. There is some habitat protection through Natura 2000 (some roosts are already protected by national legislation).

Flanders and Jones (2009: 894) point out that, in the U.K., management of broad-leaved woodland areas in close proximity (within 4 km) of transitional roosts (used in spring and autumn) should be enhanced.

There are no specific conservation measures in place for the species in North Africa or South Asia. Populations should be monitored to record changes in abundance and distribution (Molur *et al.*, 2002).

GENERAL DISTRIBUTION:
Rhinolophus ferrumequinum has a wide range in the Palaearctic, occuring from North Africa and southern Europe through south-west Asia, the Caucasus, Iran, Afghanistan, Pakistan and the Himalayas to south-eastern China, Korea, and Japan (Csorba *et al.*, 2003; Abe *et al.*, 2005). It usually occurs below 800 m asl, but can be found up to 3,000 m asl in the Caucasus depending on roost availability and humidity (K. Tsytsulina *pers. comm.,* 2005).

Native: Abkhasia; Afghanistan; Albania; Algeria; Andorra; Armenia; Austria; Azerbaijan; Bangladesh; Bhutan; Bosnia and Herzegovina; Bulgaria; China; Croatia; Cyprus; Czech Republic; France (Corse); Georgia; Germany; Gibraltar; Greece (Kriti); Hungary; India; Iran, Islamic Republic of; Iraq; Israel; Italy (Sardegna, Sicilia); Japan; Jordan; Kazakhstan; Korea, Democratic People's Republic of; Korea, Republic of; Kyrgyzstan; Lebanon; Liechtenstein; Luxembourg; Macedonia, the former Yugoslav Republic of; Moldova; Monaco; Montenegro; Morocco (El Ibrahimi and Rguibi Idrissi, 2015: 358); Nepal; Pakistan; Palestinian Territory, Occupied; Poland; Portugal; Romania; Russian Federation; San Marino; Saudi Arabia; Serbia; Slovakia; Slovenia; Spain (Baleares); Switzerland; Syrian Arab Republic; Tajikistan; Tunisia (Dalhoumi *et al.*, 2014: 53, 2016b: "3"); Turkey; Turkmenistan; Ukraine; United Kingdom; Uzbekistan.
Possibly extinct: Malta.
Regionally extinct: Belgium; Netherlands.

BIOGEOGRAPHY:
See Rossiter *et al.* (2007).

GEOGRAPHIC VARIATION:
Benda *et al.* (2014c: 16) mention that the Libyan *R. ferrumequinum* specimens are very small in size, and even the smallest within the Mediterranean range of this species, which led to their confusion with *R. clivosus*.

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Lucati and López-Baucells (2016: Suppl.) refers to an albino specimen that was reported from "South Africa?" by Allen (1939b).

DETAILED MORPHOLOGY:
Baculum - See Csorba *et al.* (2003: 43).

Forman (1973) [in Scillitani *et al.* (2005: 302)] regards the stomach of this bat as primitive for the order and probably represents the ancestral condition of lower Eutheria, because it presents a number of features in common with Insectivora.

R. ferrumequinum is one of the few bat species, where the females can have a baubellum (*os clitoris*) (Lough-Stevens *et al.* (2017: 1078).

FUNCTIONAL MORPHOLOGY:
Kobayashi (2018: 69) found that the bat's *M. quadriceps femoris* has a short muscle belly attached to the proximal portion of the femur and that the insertional tendon of this muscle and its patellar ligament are very thin. These features indicate that *R. ferrumequinum* cannot exert a strong and long-distance extension of its knee joints, which results in the inability to crawl.

ECHOLOCATION:
Fukui *et al.* (2011: 1548) report that, in Japan, the detection range for *Rhinolophus ferrumequinum* calls is less than 5 metres.
Jones and Siemers (2010: 450) indicate that juveniles emit lower frequencies than adults, and Jones and Ransome (1993: 125) found that the young's resting constant-frequency (RF) values are at least partially determined by their mother's RF. Jones and Ransome (1993: 125) furthermore report that calls of *R. ferrumequinum* specimens aged between 1 and 28 years vary seasonally and over a lifetime in a predictable manner.

For 28 Greek specimens, Papadatou *et al.* (2008b: 132) report a start frequency of 66.5 ± 3.23 kHz, a terminating frequency of 64.9 ± 4.33 kHz, and a bandwidth of 3.9 ± 1.34 kHz. The duration of the call is 53.8 ± 10.50 msec, and the interpulse interval is 92.1 ± 24.94 msec.
Andrews *et al.* (2006: 199) analyzed 500 echolocation calls from UK bats, and found an average frequency of 83.8 ± 0.4 kHz and 21.0 ± 6.4 ms duration. Another set of 500 calls had an average frequency of 84.0 ± 0.5 kHz and a duration of 31.9 ± 9.5 ms. Social calls were emitted at frequencies between 15 and 29 kHz and their duration was between 4 and 49 ms (p. 201).
Walters *et al.* (2012: suppl.) report the following figures for 30 calls from bats from France, Switzerland and the UK: duration: 50.08 ± 13.52 msec, F_{max}: 81.66 ± 1.68 kHz, F_{min}: 70.29 ± 3.62 kHz, bandwidth: 11.37 ± 3.19 kHz, F_{peak}: 81.46 ± 1.65 kHz.
Dalhoumi *et al.* (2016b: 866) reported a long constant frequency part between 85 and 88 kHz for Tunisian animals.

From experiments in a flight tunnel, Koselj and Siemers (2013: 81) found that *R. ferrumequinum* bats can extract information from echolocation calls produced by conspecifics. This could facilitate sensory cooperation among echolocating bats.

In China, Sun *et al.* (2013: 1) found regional differences in the resting frequency of echolocation calls of *R. ferrumequinum* which were significantly correlated with geographic distance and mean annual temperature.

Besides the ultrasound calls used in echolocation, Andrews and Andrews (2003: 221) also report on twelve types of ultrasound social calls, which were in the range of 20 to 29 kHz and had a duration of 1 to 49 ms. Furthermore, there were also low frequency (audible) social calls (1 - 10 kHz).

For Morocco, Disca *et al.* (2014: 226) indicate that the type of call is FM-FC-FM, with F_{peak}: 84.6 ± 0.8 kHz and duration: 30.3 ± 7.6 msec.

MOLECULAR BIOLOGY:
DNA - See Rossiter *et al.* (2007).

Karyotype - Makino (1948), Capanna and Civitelli (1964a: 363), Rushton (1970: 463), Baker *et al.* (1974; 1975) and Qumsiyeh *et al.* (1986) all reported 2*n* = 58, FN = 60, a submetacentric X chromosome, and an acrocentric Y chromosome. Volleth and Eick (2012: 167) reported 2*n* = 58 and 28 as segment number. In Turkey, Arslan and Zima (2014: 7) found 2*n* = 58, FNa = 60-62, FN = 64-66, a metacentric X and an acro-/metacentric Y. The autosomal chromosomes consist of two medium-sized bi-armed pairs and 26 acrocentric pairs, but they indicate that one of the acrocentric pairs is considered by some other authors to be bi-armed, leading to the different FN and FNa values. Capanna and Civitelli (1964a: 371) mention 24 pairs of acrocentric chromosomes, 2 metacentric pairs, and 2 pairs of very small chromosomes; the X chromosome was reported as a large submetacentric and the Y as a very small one.

Protein / allozyme: Unknown.

HABITAT:
In the U.K., Flanders and Jones (2009: 891) reported that on an overal area of about 632 ha used by a colony of *R. ferrumequinum* specimens, 28.7 % consisted of pasture, 26.6 % of broad-

leaved woodland, 16.1 % of arable, 8.2 % of mixed woodland, 6.7 % urban, 5.8 % scrub, 4.3% grassland, 1.6 % heathland, 1.4 % water, and 0.7 % coniferous woodland. They also reported the following habitat preferences (high to low): pasture, broad-leaved woodland, mixed woodland, water, scrub, grassland, urban, coniferous woodland, heathland, and arable. Fukui *et al.* (2011: 1551) indicate that, in Japan, this species prefers natural forest gaps over artificially made gaps as in the latter debris is generally removed, leaving no tree branches for it to hang from while scanning for prey.

HABITS:
Park *et al.* (2000) [in Sherwin *et al.* (2012: 172)] found that *R. ferrumequinum* was longer active when the temperatures were higher than 10 °C, which they considered to be a thermal threshold for insect activity.

DIET:
Flanders and Jones (2009: 892) examined 1,580 bat droppings in the U.K. and found that Lepidoptera (moths) were the most abundant prey. In spring, *Melolontha melolontha* (May bugs), beetles of the genus *Geotrupes* (dor beetles), Trichoptera (caddis flies), Tipulidae (crane flies), Ichneumonidae (ichneumonid wasps), and Lepidoptera were contributing to the diet. In autumn, the two beetle species were replaced by representatives of the genus *Aphodius* (dung beetles), and additional to the other groups of insects, Diptera (mainly dung flies) were also part of the main prey types.

Andreas *et al.* (2013) using faecal analysis of *R. euryale* from southern Slovakia, showed that this species fed mainly on large moths (>40mm) (%f = 54; %vol = 89) and comprised also Coleoptera (%f = 19.5; %vol = 4.82), represented by Scarabaeidae, Elateridae and Curculionoidea.

In northern Algeria, Ahmim and Moali (2013: "2") found that *R. ferrumequinum* fed on three groups of arthropods: Insecta (95.31 % [Diptera: 34.56 % and Lepidoptera: 24.13 %]), Chilopoda (4.49 %) and Araneida (0.20 %). The largest groups within the Diptera were Culicidae (10.40 %), Chironomidae/Ceratopogonidae (10.94 %) and Tipulidae (4.28 %).

In Libya, Benda *et al.* (2014c: 19) examined faecal pellets and found one set to contain 84 % by volume larger moths, 9 % ants and 7 % beetles, whereas a second set contained only Lepidoptera with wingspans of ca. 40 mm.

POPULATION:
Structure and Density - *Rhinolophus ferrumequinum* is an infrequent species in most parts of its range, although in at least parts of southwest Asia and the Caucasus it is abundant and widespread (it is the most frequently reported species in Turkey: A. Karatas *pers. comm.,* 2005), with populations in Iran and Turkey considered to be stable (A. Karatas, M. Sharifi and K. Tsytsulina *pers. comm.,* 2005), although it may be decreasing in Russian parts of the Caucasus (S. Kruskop *pers. comm.,* 2005). Summer colonies of c. 30 - 200 individuals (up to 400 animals), and winter clusters of up to 500 animals are typical.
In Europe, the two most widespread *Rhinolophus* species, *R. ferrumequinum* and *R. hipposideros*, are of particular conservation concern and are the subject of considerable research and monitoring. *R. ferrumequinum* has shown marked declines in range in northwest Europe within the last 100 years (e.g. United Kingdom, Germany, Austria), and has gone extinct in some countries (eg. Belgium, Netherlands). However, there are signs of stabilisation and/or recovery in some northwest European countries (Hutson *et al.*, 2001). For example, in the UK the species declined massively in the past, but it is now stable at a low population level (around 5,000 individuals) (Ransome and Hutson, 2000). However, in Austria declines continue, with population reductions of 70 % in the last 10 years (from 100 to 30 breeding individuals: Spitzenberger (2002); F. Spitzenberger *pers. comm.,* 2006). In other parts of Europe, trends vary and are generally less well known: in Malta the species has gone extinct, in Portugal and Spain the trend is not known (although some colonies have disappeared in Spain) (Palomo and Gisbert, 2002; Cabral *et al.*, 2005), in Croatia the population is thought to be stable (N. Tvrtkovic *pers. comm.*), and in Romania the population has been slowly increasing since 1989 due to reduced use of pesticides and a return to traditional agriculture with colonies of up to 800 individuals. In Switzerland the species is very rare (3 maternity roosts with some 200 individuals), but the population trend appears stable (H. Kraettli *pers. comm.*, 2006). In its north African and south Asian range the population size and trends are unknown (Aulagnier *et al.*, 2008a; IUCN, 2009).
Trend - 2008 - Decreasing (Aulagnier *et al.*, 2008a; IUCN, 2009).

LIFESPAN:
Szekely *et al.* (2015: Suppl.) report a maximum longevity of 30.5 years.

ACTIVITY AND BEHAVIOUR:
In the U.K., Flanders and Jones (2009: 891) reported a maximum nightly foraging range of between 2.17 and 2.44 km, and the foraging area

averaged 148.1 ha. Fukui *et al.* (2011: 1551) [referring to Jones and Rayner (1989)] indicate that *R. ferrumequinum* is a "flycatcher" species, meaning that it hangs from tree branches while scanning for its prey.

Smotherman *et al.* (2016: 537) refer to Ma *et al.* (2006) in describing the song-like structure for this species as consisting of different syllable types in series.

REPRODUCTION AND ONTOGENY:
Tuttle and Stevenson (1982: 121) mention that males attain sexual maturity between 15 and 51 months, whereas this for females is between 15 and 39 months. Szekely *et al.* (2015: Suppl.) report 730 days (about 24 months) for both sexes. Gharaibeh (1997: 55) mentions lactating females and juveniles from the cave at Djebel Oust (Tunisia) on 29 July 1996. Benda *et al.* (2014c: 16) collected a pregnant female on 28 May at Nanatalah (Libya).
Kurta and Kunz (1987: 82) report that, at birth, the young weights about 29.3 % of the mother's body mass (5.8 versus 19.8 g), and that its forearm length is about 36.0 % of the mother's length (25.3 versus 70.3 mm).
The gestation period takes 80 days (with the young having a birth weight of 5.8 g - 25.4 % of the adult), and weaning occurs after 60 days (Szekely *et al.*, 2015: Suppl.).

MATING:
Fenton (1984) [in Keeley and Keeley (2004: 117)] reports the existence of copulatory plugs. For *R. ferrumequinum*, these plugs are formed from male secretions, and probably serve to prevent further insemination by other males, rather than preventing sperm leakage from the female's reproductive trace (in that case the plugs would probably be made by the females). However, Rossiter *et al.* (2000b) mention that these plugs can be ejected by the females, which would allow additional matings.

In Britain, Rossiter *et al.* (2000a: 545) found that mating was polygynous, but six females gave birth to young fathered by the same male in different years. This seems to indicate fidelity for either mating sites or individuals or from sperm competition. Females start visiting males for mating in autumn, so breeding partnerships are primarily determined by the female. Mating occurs in territory sites occupied by single males, which can be born both within and outside the female's own natal colony. Relatedness between parents, however, was no less than the average recorded for male/female pairs. Gene flow between colonies is likely to be primarily mediated by both female and male dispersal during the mating period rather than more permanent movements.

Liu *et al.* (2013a: 2179) describe the vocal communications during mating in China. They suggest these calls can serve as an indicator for the female bats to recognize the mating male in order to maintain mate fidelity as greater horseshoe bats are sexually segregated before mating.

PARASITES:
Beaucournu and Kock (1996) mentioned *Rhinolophopsylla unipectinata arabs* Jordan and Rothschild, 1921 on bats from Algeria.

In Europe Genov *et al.* (1992) reported the presence of the following Nematodes: *Molinostrongylus skrjabini* Skarbilovitch, 1934 and *M. alatus* (Ortlepp, 1932).

Ševcík *et al.* (2012: 35) report on the presence of the bat flies *Phthiridium biarticulatum* Hermann, 1804, *Phthiridium biarticulatum* Hermann, 1804, and *Brachytarsina flavipennis* Macquart, 1851 on bats from Crete and Cyprus. *Phthiridium biarticulatum* was also reported on *R. ferrumequinum* from Jordan by Benda *et al.* (2010b: 226), and from Algeria by Bendjeddou *et al.* (2013: 325). The latter authors also found *Brachytarsina flavipennis* and *Penicillidia dufouri* (Westwood, 1825) (Diptera: Nycteribiidae). Bendjeddou *et al.* (2017: 15) added two additional Nycteribiidae: *Nycteribia (Listropoda) schmidlii schmidlii* Schiner, 1853 and *Phthiridium biarticulatum* Hermann, 1804 and one Siphonaptera: *Rhinolophopsylla unipectinata arabs* Jordan and Rothschild, 1921.
Haelewaters *et al.* (2018: 794) also reported *Penicillidia conspicua* Speiser, 1901 and *P. fulvida*, Bigot, 1885, *Phthiridium biarticulatum* Hermann, 1804, which all might be hosts for the fungus *Arthrorhynchus nycteribiae*.

ACARI
Nycteribiidae: *Nycteribia kolenati* Theodor & Moscona, 1954 was reported by Haelewaters *et al.* (2017: 1) from *R. ferrumequinum* from Hungary. Vermeil (1960) reported two bat flies from Tunisian *R. ferrumequinum*: *Nycteribia biarticulata* Hermann, 1804 and *Nycteribosca kollari* Frauenfeld, 1855.
Trombiculidae: Stekolnikov (2018a: 186) mentioned *Sasatrombicula cherrata* (Taufflieb, 1960) from Oued Cherrat (Morocco).

VIRUSES:
In Italy, Balboni *et al.* (2010: 216) reported two *R. ferrumequinum* specimens, which tested positive for a fragment of RNA-dependent RNA

polymerase (RdRp) gene of viruses related to *Coronavirus*. Phylogenetic analysis showed a close correlation between one of these and SARS-related CoV belonging to the genus *Betacoronavirus* (see also de Jong *et al.*, 2011: 10).

Adenoviridae
Mastadenovirus
Kohl and Kurth (2014: 3111) report this virus from Hungary.

Astroviridae
Luis *et al.* (2013: suppl.) report on the presence of an unassigned astrovirus.

Bunyaviridae
Hantavirus
de Jong *et al.* (2011: 9), Luis *et al.* (2013: suppl.) report Hantaan virus occurring on this species, as well as an unassigned Issyk-kul virus (Keterah virus).

Coronaviridae - Coronaviruses
Luis *et al.* (2013: suppl.) mentions the presence of Coronavirus BatCoV BB98-15 and SARS coronavirus.

Alphacoronavirus
Kohl and Kurth (2014: 3112) report this virus to be present in German bats.
Betacoronavirus
This virus was reported from bats from Germany and Bulgaria by Kohl and Kurth (2014: 3112).

Flaviviridae
Flavivirus
Japanese encephalitis virus was reported by Luis *et al.* (2013: suppl.).

Orthomyxoviridae
Despite sampling and testing of 2 individuals of this species, no evidence of influenza A-like viruses (*Orthomyxoviridae*) were obtained (Fereidouni *et al.*, 2015).

Papillomaviridae
Papillomavirus
This virus was reported from Spanish bats by Kohl and Kurth (2014: 3113).

Rhabdoviridae
Lyssavirus - Rabies related viruses
de Jong *et al.* (2011: 9) report the presence of European bat lyssavirus 2.
Serra-Cobo *et al.* (2018: 2) found one seropositive bat among the 47 tested for European bat lyssavirus 1 in Algeria and eight ouf of 67 tested in Morocco.
"Various European bat lyssaviruses" were reported by Kohl and Kurth (2014: 3114) from various European countries.

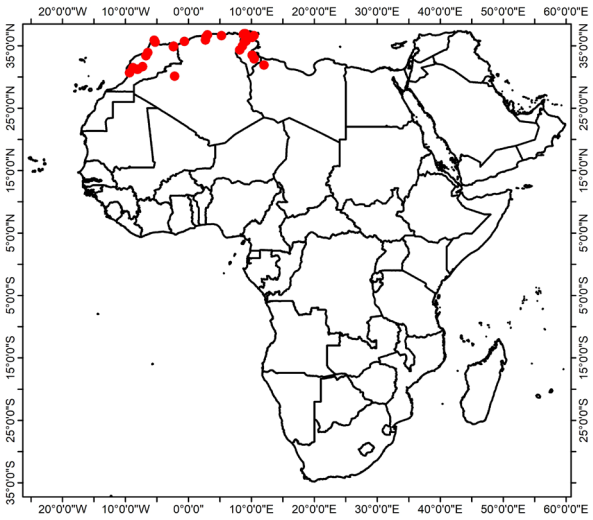

Figure 88. Distribution of *Rhinolophus ferrumequinum*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Algeria, Libya, Morocco, Tunisia.

Rhinolophus fumigatus Rüppell, 1842

*1842. *Rhinolophus fumigatus* Rüppell, Mus. Senckenberg., 3 (2): 132. Type locality: Ethiopia: Shoa province: Shoa province [ca. 09 00 N 39 00 E] [Goto Description]. Lectotype: SMF 4372: ad, mounted skin (skull not removed). Collected by: Wilhem Peter Edward Simon Rüppell; collection date: 1841. Presented/Donated by: Wilhem Peter Edward Simon Rüppell. See: 451). Mertens (1925: 20). Turni and Kock (2008) mention this specimen (old catalog SMF II.F.7.a) as Lectotype. Cotype: SMF II.F.7b:; collection date: 1841. Presented/Donated by: Wilhem Peter Edward Simon Rüppell. See Andersen (1904c: 451). - Etymology: From the passive Latin perfect participle *fumigàtus* meaning "smoked", referring to the fur colour of the species (see Lanza *et al.*, 2015: 96). (Current Combination)

1869. *Rhinolophus æthiops* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, 637 (for 1868). Type locality: Namibia: Damaraland: Otjimbingue [22 15 S 16 10 E]. Syntype: ZMB 3295: ♂, skull and alcoholic. Collected by: Missionary Hahn. See Turni and Kock (2008). Syntype: ZMB 50073: ♀, alcoholic (skull not removed). Collected by: Missionary Hahn. Formerly

second specimen with number ZMB 3295; see Turni and Kock (2008: 30). - Comments: Turni and Kock (2008: 30) referring to Csorba *et al.* (2003: 50) mention that ZMB 3295 might possibly represent a species distinct from *fumigatus*.

1877. *Rhinolophus macrocephalus* Heuglin, Reise in Nordost Afrika, 2: 22. Publication date: 1877. Type locality: Ethiopia: Tigre province: As(s)am river: Adowa [14 10 N 38 54 E, 1 900 m]. Syntype: SMNS 1059: imm ♀, alcoholic (skull not removed). Collected by: Martin Theodor von Heuglin; collection date: 1862. See Andersen (1904c: 451), Dieterlen *et al.* (2013: 294). Syntype: SMNS 1059a: imm ♀. Collected by: Martin Theodor von Heuglin. Presented/Donated by: ?: Collector Unknown. Syntype: SMNS 1059b: ad ♂, alcoholic (skull not removed). Collected by: Martin Theodor von Heuglin; collection date: 1862. See Andersen (1904c: 451), Dieterlen *et al.* (2013 294).

1885. *Rhinolophus antinorii* Dobson, Ann. Mus. civ. Stor. nat. Genova, (2) 2: 16. Publication date: 22 May 1885. Type locality: Ethiopia: Shoa province: Daimbi.

1905. *Rhinolophus fumigatus exsul* K. Andersen, Ann. Mag. nat. Hist., ser. 7, 15 (85): 74. Publication date: 1 January 1905. Type locality: Kenya: Kitui [01 22 S 38 01 E, 3 500 ft] [Goto Description]. Holotype: BMNH 1901.5.6.3: ad, skin only. Collected by: Mrs. Hildegarde Hinde; collection date: 3 January 1901; original number: 68. See Andersen (1905a: 74). - Comments: Considered a valid subspecies by Ansell and Dowsett (1988: 32).

1913. *Rhinolophus foxi* Thomas, Ann. Mag. nat. Hist., ser. 8, 11 (63): 314. Publication date: 1 March 1913. Type locality: Nigeria: Northern Nigeria, Bauchi plateau: Kabwir [09 24 N 09 34 E, 2 500 ft] [Goto Description]. Holotype: BMNH 1913.2.5.1: ad ♂. Collected by: Mr. J.C. Fox and The Cambridge University Mission; collection date: 14 November 1912; original number: 45. Presented/Donated by: Mr. J.C. Fox.

1914. *acrotis* G.M. Allen, Bull. Mus. comp. Zool., 58 (7): ???. - Comments: Preoccupied by *acrotis* Heuglin, 1861.

1917. *Rhinolophus abæ* J.A. Allen, Bull. Am. Mus. Nat. Hist., 37 (18): 428. Publication date: 29 September 1917. Type locality: Congo (Democratic Republic of the): Oriental province: Uele district: Aba [03 53 N 30 17 E] [Goto Description]. Holotype: AMNH 49113: ad ♀, skin and skull. Collected by: Herbert Lang, James Paul Chapin and The American Museum Congo Expedition; collection date: 15 December 1911; original number: 1756.

1939. *Rhinolophus aethiops diversus* Sanborn, Field Mus. Nat. Hist., Zool. Ser., 24 (5): 42. Publication date: 19 September 1939. Type locality: Senegal: Bakel [14 54 N 12 26 W] [Goto Description]. Holotype: BMNH 1919.7.7.2774: ad ♀, alcoholic (skull not removed). Collection date: 27 September 1887. Formerly in the Lataste collection (see: 42). - Comments: Considered a valid subspecies by Grubb *et al.* (1998: 77), but they also remark that it might be a subspecies of *aethiops*.

TAXONOMY:

Does not include *eloquens* or *perauritus*, but does include *aethiops*; see Koopman (1975: 389 - 390). *fumigatus* species group (Csorba *et al.*, 2003: 48 - 51; Simmons, 2005: 356). See Csorba *et al.* (2003: 49 - 50) for remarks on taxonomy, e.g. that *fumigatus* and *aethiops* are probably different species.

Jacobs *et al.* (2016g: 94) refer to Dool *et al.* (2016b), who found that *R. fumigatus* from the western part of Southern Africa seems to be a distinct but sister lineage to *R. fumigatus* from the eastern half of Africa.

COMMON NAMES:

Afrikaans: Rüppell se saalneusvlermuis, Rüppell-saalneusvlermuis. Chinese: 达马拉菊头蝠. Czech: vrápenec kouřový. English: Rüppell's Horseshoe Bat, Smoky Horseshoe Bat, Abyssinian Horseshoe Bat. French: Rhinolophe de Rüppell. German: Rüppells Hufeisennase, Rüppells Hufeisennase, Shoa Kamnase. Italian: Rinòlofo affumicàto, Fèrro di cavàllo affumicàto. Portuguese: Morcego ferradura da Damarlandia.

ETYMOLOGY OF COMMON NAME:

The colloquial name refers to the describer of the species (see Taylor, 2005).

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Jacobs *et al.*, 2008al; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Jacobs *et al.*, 2008al; IUCN, 2009). 2004 - LC ver 3.1 (2001) (IUCN, 2004; Jacobs *et al.*, 2004aj). 1996 - LR/lc (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - LC ver 3.1 (2001) (Jacobs *et al.*, 2016k). 2004 - NT ver 3.1 (2001) (Friedmann and Daly, 2004).

MAJOR THREATS:
There appear to be no major threats to *Rhinolophus fumigatus* as a whole (Jacobs *et al.*, 2008al; IUCN, 2009).

CONSERVATION ACTIONS:
Jacobs *et al.* (2008al) [in IUCN (2009)] reported that in view of the species wide range in East and southern Africa, it seems probable that it is present in several protected areas. No direct conservation measures are currently needed for this species as a whole.

GENERAL DISTRIBUTION:
Rhinolophus fumigatus is widely, but patchily, recorded over much of sub-Saharan Africa. It ranges from Senegal and The Gambia in the east, through West and Central Africa to Ethiopia and Eritrea in the east, and from here through East and southern Africa as far south as Namibia and north-eastern South Africa.

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 1,246,343 km^2.

Native: Angola (Crawford-Cabral, 1989; Monadjem *et al.*, 2010d: 558; Taylor *et al.*, 2018b: 62); Benin (Capo-Chichi *et al.*, 2004: 162); Botswana (Cotterill, 2004a: 261); Burkina Faso (Kangoyé *et al.*, 2015a: 610); Burundi; Cameroon; Central African Republic; Chad; Congo (The Democratic Republic of the) (Hayman *et al.*, 1966; Monadjem *et al.*, 2010d: 558); Côte d'Ivoire; Eritrea; Ethiopia; Gabon; Gambia; Ghana; Guinea; Kenya; Liberia; Malawi (Happold *et al.*, 1988; Monadjem *et al.*, 2010d: 558); Mali (Meinig, 2000: 105); Mauritania; Mozambique (Smithers and Lobão Tello, 1976; Monadjem *et al.*, 2010d: 558; Monadjem *et al.*, 2010c: 378); Namibia (Monadjem *et al.*, 2010d: 559); Niger; Nigeria; Rwanda; Senegal; Sierra Leone; Somalia; South Africa (Monadjem *et al.*, 2010d: 559); Sudan; Tanzania (Stanley and Goodman, 2011: 42); Togo; Uganda; Zambia (Ansell, 1978; Monadjem *et al.*, 2010d: 559); Zimbabwe (Monadjem *et al.*, 2010d: 559).

SEXUAL DIMORPHISM:
Kangoyé *et al.* (2015a: 610) found no differences in body measurement of males and females from Burkina Faso, but the cranial measurements of the males were on average larger than those of the females.

ECHOLOCATION:
Jacobs *et al.* (2007a) reported a peak frequency of 53.8 (± 0.2) kHz for individuals South Africa. Monadjem *et al.* (2010c: 378) reported from Mozambique the peak echolocation frequencies of a single male was 54 kHz (ANABAT).

1 call of tye FM/CF/FM was recorded by Manga Mongombe (2012: 79) from Maroua (Cameroon) with the following parameters: F_{max}: 62.6 kHz, F_{min}: 61.6 kHz, F_{mean}: 61.9 kHz, F_{knee}: 61.7 kHZ, F_{char}: 61.6 kHz, and duration: 0.57 msec.

Kangoyé *et al.* (2015a: 610) reported that five males from Burkina Faso called at 54.2 ± 0.4 (53.4-54.4) kHz.

In Sierra Leone, a flying bat was recorded by Weber *et al.* (2019: 21) at 51.5 kHz.

For two calls from the Aberdares Range in Kenya, Eisenring *et al.* (2016: SI 2) gave the following values: PF: 57.9 ± 1.1 (57.2 - 58.7), HF: 106.7 ± 4.3 (103.7 - 109.8), LF: 54.3 ± 0.3 (54.0 - 54.5), DT: 0.0 ± 0.0 (0.0 - 0.1), DF: 52.5 ± 4.7 (49.2 - 55.8), IPI: 0.7 ± 0.1 (0.6 - 0.8).

For a bat from the Kalahari Desert, Adams and Kwiecinski (2018: 4) reported: F_{char}: 53.9 kHz, F_{max}: 54.4 kHz, F_{min}: 53.6 kHz, and duration: 40.1 msec.

Jacobs (2016: 119) indicates that the second harmonic of this bat coincides with the third harmonic of *R. hildebrandtii*, which possibly might illustrate "harmonic hopping".

MOLECULAR BIOLOGY:
DNA - Unknown.
Karyotype - Rautenbach (1986) reported 2*n* = 58, FN = 60, BA = 4, a subtelocentric X chromosome, and a metacentric Y. Koubínová *et al.* (2010b: 394) reported for Senegal similar results to Rautenbach (1986), but there were only two pairs of small meta- and submetacentric autosomes, and the remaining 26 pairs were acrocentric, a medium sized acrocentric (no. 15) had an achromatic gap near the centromere, while the X was a medium

sized subtelocentric, and the Y was dot-like. Koubínová (2013: 7) reported the karyotype as: 2*n* = 58, FNa = 60, FN = 64.
Protein / allozyme: Unknown.

ROOST:
Lelant and Chenaval (2011d: 13) report on a colony of over 1,000 animals inhabiting a very old Baobab tree (*Adansonia digitata*) in Fadgal, Senegal.

POPULATION:
Structure and Density - It is a locally common species that can be encountered as large colonies. Colonies in southern Africa tend to be smaller (Jacobs *et al.*, 2008al; IUCN, 2009).
Trend - 2008 - Unknown (Jacobs *et al.*, 2008al; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
A pregnant female was collected in August 1992 in the East Usambara Mountains (Tanzania) (Stanley and Goodman, 2011: 42).

PARASITES:
HAEMOSPORIDA
Lutz *et al.* (2016: 9) examined 5 *R. fumigatus* specimens from East Africa and found two of them infected with *Nycteria* sp. Rosskopf *et al.* (2018: Suppl.) mentioned the (same?) record from Malawi.

Fain (1959a: 340) mentions that one of the paratypes of *Nycteridocoptes eyndhoveni* Fain, 1959 (Acari: Sarcoptidae) was collected from a "*R. aethiops*" specimen Kambisa, Angola.

HEMIPTERA:
Polyctenidae: *Androctenes horvathi* Jordan, 1912 recorded from Transvaal, South Africa (Haeselbarth *et al.*, 1966: 17, host referred to as *R. eloquens*).

DIPTERA:
Streblidae: *Ascodipteron brevior* Maa, 1965, female cysts found at the base of the ears in Congo, Namibia and South Africa (Haeselbarth *et al.*, 1966: 106). *Brachytarsina africana* (Walker, 1849) has a wide distribution in sub Saharan Africa (Haeselbarth *et al.*, 1966: 100, host refered to as *R. eloquens*). *Raymondia intermedia* Jobling, 1936 (Shapiro *et al.*, 2016: 255).
Nycteribiidae: *Nycteribia scissa sudanica* Theodor, 1957 from Ethiopia, the Sudan and the Congo (Haeselbarth *et al.*, 1966: 108). *Penicillidia fulvida* (Bigot ,1885) (Haeselbarth *et al.*, 1966: 114, host referred to as *R. foxi*).

SIPHONAPTERA:
Ischnopsyllidae: *Rhinolophopsylla ectopa* (Jordan, 1937) was reported on "*R. aethiops*" from Kenya by Beaucournu and Kock (1996).

VIRUSES:
In their country-wide survey of Kenyan bats, Waruhiu *et al.* (2017) found the following viruses in *Rhinolophus fumigatus*: Coronaviruses and Paramyxoviruses.

Coronaviridae - Coronaviruses
SARS-CoV - Müller *et al.* (2007b) tested between 1986 and 1999, for antibody to SARS-CoV in sera in 204 individuals from Oriental Province, DRC, one tested positive (1/204, 0.5 %).

UTILISATION:
Lelant and Chenaval (2012: 15) report on the use of *R. fumigatus* specimens in traditional medicine in Senegal.

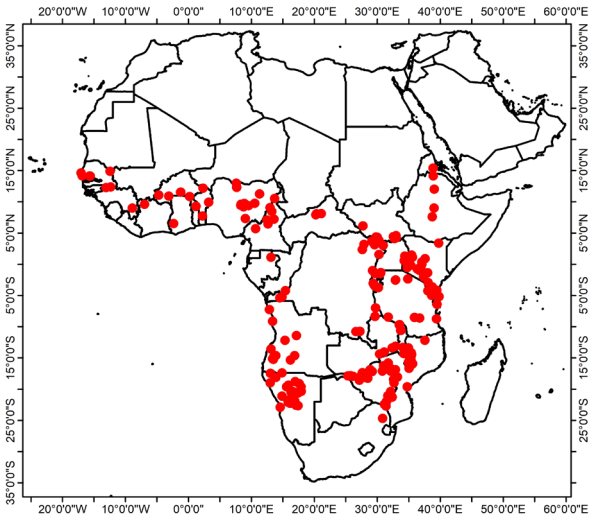

Figure 89. Distribution of *Rhinolophus fumigatus*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Angola, Benin, Burkina Faso, Burundi, Cameroon, Central African Republic, Congo, Congo (Democratic Republic of the), Côte d'Ivoire, Eritrea, Ethiopia, Gabon, Ghana, Guinea, Kenya, Malawi, Mauritania, Morocco, Mozambique, Namibia, Niger, Nigeria, Rwanda, Senegal, Sierra Leone, Somalia, South Africa, South Sudan, Tanzania, The Gambia, Togo, Uganda, Zambia, Zimbabwe.

Rhinolophus gorongosae Taylor, MacDonald, Goodman, Kearney, Cotterill, Stoffberg, Monadjem, Schoeman, Guyton, Naskrecki and Richards, 2018

*2018. *Rhinolophus gorongosae* Taylor, MacDonald, Goodman, Kearney, Cotterill, Stoffberg, Monadjem, Schoeman, Guyton, Naskrecki and Richards, Zool. J. Linn. Soc., 184 (1): 1249, 1262, figs 6, 8, 9, 10, 12. Publication date: 24 April 2018. Type locality: Mozambique: Sofala province: Gorongosa National Park: Bunga Inselberg [18 35 56 S 34 20 35 E, 212 m] [Goto Description]. Holotype: DNSM 14820: ad ♂, skull and alcoholic. Collected by: Jennifer Anna Guyton; collection date: 25 April 2015; original number: JAG 196. Presented/Donated by: ?: Collector Unknown. Paratype: DNSM 14815: ♀. Collected by: Jennifer Anna Guyton; collection date: 24-25 April 2015; original number: JAG 188. Presented/Donated by: ?: Collector Unknown. Paratype: DNSM 14816: Collected by: Jennifer Anna Guyton; collection date: 24-25 April 2015. Presented/Donated by: ?: Collector Unknown. Paratype: DNSM 14817: Collected by: Jennifer Anna Guyton; collection date: 24-25 April 2015. Presented/Donated by: ?: Collector Unknown. Paratype: DNSM 14818: Collected by: Jennifer Anna Guyton; collection date: 24-25 April 2015. Presented/Donated by: ?: Collector Unknown. Paratype: DNSM 14819: Collected by: Jennifer Anna Guyton; collection date: 24-25 April 2015. Presented/Donated by: ?: Collector Unknown. Paratype: DNSM 14828: Collected by: Jennifer Anna Guyton; collection date: 2 May 2015. Presented/Donated by: ?: Collector Unknown. Paratype: DNSM 14843: ♀. Collected by: Jennifer Anna Guyton; collection date: 5 November 2015; original number: JAG 228. Presented/Donated by: ?: Collector Unknown. Paratype: DNSM 14865: Collected by: Jennifer Anna Guyton; collection date: 22 July 2015. Presented/Donated by: ?: Collector Unknown. - Etymology: The name refers to the Gorongosa district (Mozambique) and the Gorongose National Park, where the type specimen was collected (Taylor *et al.* (2018a: 14).

COMMON NAMES:
English: Least horseshoe bat. German: Gorongosa-Hufeisennase.

GENERAL DISTRIBUTION:
This species has only been found in the Gorongosa National Park (Mozambique). Taylor *et al.* (2018a: 17) tentatively assigned a specimen from Mount Inago (Mozambique) to this species, but this specimen needs to be examined further.

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Taylor *et al.* (2018a: 14) indicate that *R. gorongosae* is the smallest rhinolophid in the Ethiopian region, even smaller than *R. denti*.

ECHOLOCATION:
Taylor *et al.* (2018a: 17) report a peak echolocation CF of 106 (104 - 108) kHz.

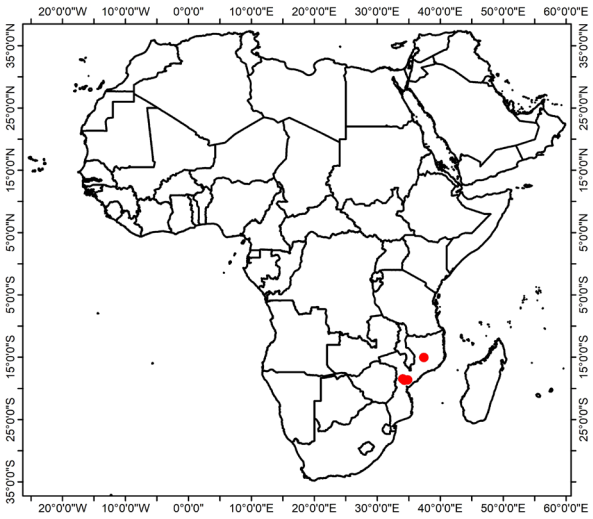

Figure 90. Distribution of *Rhinolophus gorongosae*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Mozambique.

Rhinolophus guineensis Eisentraut, 1960

*1960. *Rhinolophus landeri guineensis* Eisentraut, Stuttg. Beitr. Naturk., 39: 1, fig. 1. Publication date: 1 June 1960. Type locality: Guinea: foot of Kelesi Plateau: Tahiré [ca. 10 05 N 12 30 W, 500 m] [Goto Description]. Holotype: SMNS 6103: ad ♂, skin and skull. Collected by: Hans Knorr; collection date: 5 October 1956. Presented/Donated by: ?: Collector Unknown. Paratype: SMNS 6104: ad, skin and skull. Collected by: Hans Knorr; collection date: 19 November 1956. Presented/Donated by: ?: Collector Unknown. Dieterlen *et al.* (2013: 294) mention Salung Plateau near Nyembaro, 10 km W of Kolenté, Guinea as locality. Paratype: SMNS 6105: ad, skin and skull. Collected by: Hans Knorr; collection

date: 19 November 1956. Presented/Donated by: ?: Collector Unknown. Dieterlen *et al.* (2013: 294) mention Salung Plateau near Nyembaro, 10 km W of Kolenté, Guinea as locality. Paratype: SMNS 6106: ad, skin and skull. Collected by: Hans Knorr; collection date: 19 November 1956. Presented/Donated by: ?: Collector Unknown. Dieterlen *et al.* (2013: 294) mention Salung Plateau near Nyembaro, 10 km W of Kolenté, Guinea as locality. Paratype: SMNS 6107: ad, skin and skull. Collected by: Hans Knorr; collection date: 19 November 1956. Presented/Donated by: ?: Collector Unknown. Dieterlen *et al.* (2013: 294) mention Salung Plateau near Nyembaro, 10 km W of Kolenté, Guinea as locality. Paratype: SMNS 6108: ad, skin and skull. Collected by: Hans Knorr; collection date: 19 November 1956. Presented/Donated by: ?: Collector Unknown. Dieterlen *et al.* (2013: 294) mention Salung Plateau near Nyembaro, 10 km W of Kolenté, Guinea as locality. Paratype: SMNS 6109: ad, alcoholic (skull not removed). Collected by: Hans Knorr; collection date: 19 November 1956. Presented/Donated by: ?: Collector Unknown. Dieterlen *et al.* (2013: 294) mention Salung Plateau near Nyembaro, 10 km W of Kolenté, Guinea as locality. Paratype: SMNS 6113: ad, skin and skull. Collected by: Hans Knorr; collection date: 19 November 1956. Presented/Donated by: ?: Collector Unknown. Dieterlen *et al.* (2013: 294) mention Salung Plateau near Nyembaro, 10 km W of Kolenté, Guinea as locality. Paratype: ZFMK 1959.0176: ♀, skin and skull. Collected by: Hans Knorr; collection date: 5 October 1956; original number: 29. Presented/Donated by: ?: Collector Unknown. Paratype: ZFMK 1959.0177: ♂, skin and skull. Collected by: Hans Knorr; collection date: 23 November 1956; original number: 137. See Hutterer (1984: 30), Hutterer and Peters (2010: 11). - Etymology: Refers to country from which the type specimen was collected.

? *Rhinolophus guineensis:* (Name Combination, Current Combination)

TAXONOMY:
Meester *et al.* (1986) state that Rosevear (1965) and Kock (1969a) regard *guineensis* Eisentraut, 1960, from Guinea, as subspecifically distinct from *landeri*. Hayman and Hill (1971), on the other hand, consider it a synonym, while Böhme and Hutterer (1979), Csorba *et al.* (2003: 59 - 61) and Simmons (2005: 356) regard it as a distinct species, sympatric with *landeri* and somewhat larger.

COMMON NAMES:
Czech: vrápenec guinejský. English: Guinean Horseshoe Bat (Csorba *et al.*, 2003: 59 - 61; Simmons, 2005), Senegal Horseshoe Bat. French: Rhinolophe de Guinée, Rhinolophe du Sénégal. German: Guinea-Hufeisennase.

SIMILAR SPECIES:
See Csorba *et al.* (2003).

CONSERVATION STATUS:
Global - Listed as Vulnerable (VU B2ab(ii,iii) ver 3.1 (2001)) because its area of occupancy is probably less than 2,000 km^2 (roosting caves), its distribution is severely fragmented, and there is continuing decline in the extent and quality of its forest and cave habitats (Fahr, 2008j; IUCN, 2009).

Assessment History -
2008 - VU B2ab(ii,iii) ver 3.1 (2001) (Fahr, 2008j; IUCN, 2009). 2004 - VU B2ab(iii) ver 3.1 (2001) (Fahr, 2004g; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
Major threats to *Rhinolophus guineensis* include deforestation resulting from logging operations, the conversion of land to agricultural use, and mining activities. There is also a limited threat of overhunting for the bushmeat trade (Fahr, 2008j; IUCN, 2009).

Sagot and Chaverri (2015: 1670) mention roost loss or disturbance, habitat degradation or loss, and hunting as major threats for this species.

CONSERVATION ACTIONS:
Fahr (2008j) [in IUCN (2009)] reported *Rhinolophus guineensis* has been recorded from the Mount Nimba World Heritage Site and the "Massif du Ziama" Biosphere Reserve, both in Guinea. It has also been recorded from a few state forests ("Forets Classees") in Guinea. There is a need to conserve remaining areas of suitable habitat for this species. Further studies are needed to better determine the species range.

GENERAL DISTRIBUTION:
Rhinolophus guineensis is a West African bat that has been patchily recorded from southern Senegal, Guinea, Sierra Leone, Liberia and Côte d'Ivoire. It is a highland species recorded at elevations of 1,400 m asl and over. It may be present in Gambia in remnant patches of forest (Grubb *et al.*, 1998).

Native: Côte d'Ivoire; Guinea (Denys *et al.*, 2013: 281; Decher *et al.*, 2016: 264); Liberia (Simmons, 2005); Senegal; Sierra Leone (Csorba *et al.*, 2003).
Presence uncertain: Gambia (Grubb *et al.*, 1998).

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
See Csorba *et al.* (2003).

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:
See Csorba *et al.* (2003).

DETAILED MORPHOLOGY:
Baculum - Unknown
For a description of the crania, teeth, and noseleaves see Csorba *et al.* (2003).

ECHOLOCATION:
In Guinea, Fahr and Ebigbo (2003) reported the frequency of the CF-component at 85.3 - 85.4 kHz.

In Sierra Leone, one female called with a CF-component at 82.0 kHz (Weber *et al.*, 2019: 21).

HABITAT:
Monadjem *et al.* (2016y: 366) recorded this species from higher altitudes (above 900 m) in the Mount Nimba area.

See also Csorba *et al.* (2003).

HABITS:
See Csorba *et al.* (2003).

ROOST:
Weber and Fahr (2006: 4) indicate that *R. guineensis* largely or exclusively depends on the availability of caves as day roosts in Guinea.

POPULATION:
Structure and Density - *Rhinolophus guineensis* is possibly a rare species overall, although little information is available on the population abundance of this bat (Fahr, 2008j; IUCN, 2009).
Trend - 2008 - Unknown (Fahr, 2008j; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
Weber *et al.* (2019: 21) recorded a pregnant female on 30 March in Sierra Leone.

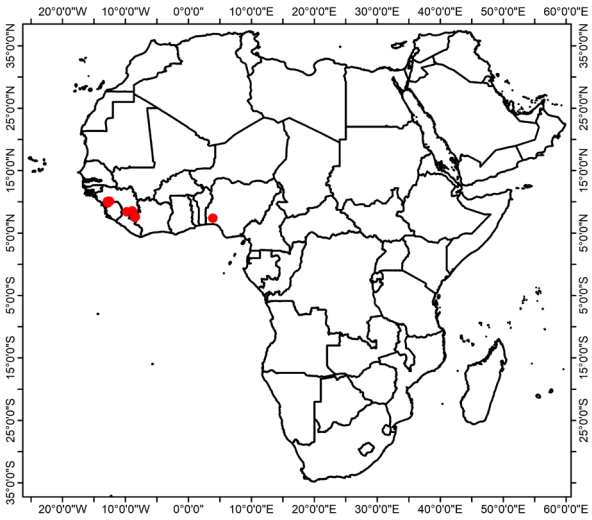

Figure 91. Distribution of *Rhinolophus guineensis*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Guinea, Liberia, Nigeria.

Rhinolophus hildebrandtii Peters, 1878

*1878. *Rhinolophus Hildebrandtii* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, 195, pl. 1, fig. 1, 1a. Type locality: Kenya: Taita district: Ndi [03 14 S 38 30 E, 2 000 m] [Goto Description]. Syntype: BMNH 1879.1.21.1: ad. Turni and Kock (2008: 33). Reject the holotype status for this specimen and consider this also as a possible syntype. Syntype: ZMB 5267: ad ♀, skull and alcoholic. Collected by: Dr. Johann Maria Hildebrandt; collection date: July 1877. See Turni and Kock (2008: 33). Syntype: ZMB 5378: ♂, skin and skull. Collected by: Dr. Johann Maria Hildebrandt; collection date: July 1877. See Turni and Kock (2008: 33). Syntype: ZMB 5379: ♂, skin and skull. Collected by: Dr. Johann Maria Hildebrandt; collection date: July 1877. See Turni and Kock (2008: 33). - Comments: Turni and Kock (2008: 33) reject the holotype status for the BMNH specimen and consider this also as a syntype. - Etymology: In honour of Johannes Maria Hildebrandt (1847 - 1881), a German naturalist, explorer and linguist, who collected a large number of plants and animals in eastern Africa, Madagascar, Comoro islands and Arabia (see Pearl, 1994: 3; Taylor, 2005, Lanza *et al.*, 2015: 101). (Current Combination)
1991. *Rhinolophus hildebrantii:* Avery, Durban Mus. Novit., 16: 1. (Lapsus)
? *Rhinolophus hildebrandti hildebrandti:* (Name Combination, Alternate Spelling)
? *Rhinolophus hildebrandti:* (Name Combination)
? *Rhinolophus hildebrandtii:* (Current Spelling)

TAXONOMY:
See Pearl (1994). Within the *fumigatus* species group (Csorba *et al.*, 2003: 51 - 53; Simmons, 2005: 356). See Csorba *et al.*, 2003: 52) for a review of the taxonomy.

Taylor *et al.* (2010: 297) indicate that cryptic species might be present in the southern African *R. hildebrandtii* complex. These species probably diverged during the late Neogene (Plio-Pleistocene) when more open woodlands replaced the seasonal woodland/forest habitats (Schoeman and Monadjem (2018: 4).

COMMON NAMES:
Afrikaans: Hildebrandt se saalneusvlermuis, Hildebrandt-saalneusvlermuis, Hildebrandtse Vlermuis. Chinese: 希氏菊头蝠. Czech: vrápenec Hildebrandtův. English: Hildebrandt's Horseshoe Bat. French: Rhinolophe d'Hildebrandt, Fer à cheval d'Hildebrant, Fer à cheval du Kenya. German: Hildebrandts Hufeisennase. Italian: Rinòlofo di Hildebrandt; Fèrro di cavàllo di Hildebrandt. Kiluba (DRC): Kasusu. Portuguese: Morcego ferradura de Hildebrandt. Yao: Lichinji (applied to all largish bats).

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
R. hildebrandtii was found in the earlier half of the upper Pleistocene sequence at Border Cave, KwaZulu-Natal, South Africa (Avery, 1991: 6; Taylor, 1998: 35).

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Jacobs, 2008h; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) assessed as *Rhinolophus hildebrandti* (Jacobs, 2008h; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Jacobs, 2004i; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

Regional -
South Africa: 2004 - NT ver 3.1 (2001) (Friedmann and Daly, 2004).

MAJOR THREATS:
Jacobs (2008h) [in IUCN (2009)] reported there appear to be no major threats to *Rhinolophus hildebrantii* as a whole.

CONSERVATION ACTIONS:
Jacobs (2008h) [in IUCN (2009)] reported there appear to be no direct conservation measures in place. In view of the species wide East African and southern African range, it seems probable that the species is present in some protected areas.

GENERAL DISTRIBUTION:
Rhinolophus hildebrantii is largely endemic to East Africa, except for a Central African records from Rwanda and southern Democratic Republic of the Congo, and a single questionable West African record from Nigeria. In East Africa it ranges from Ethiopia and northern Sudan in the north, through Uganda, Kenya and Tanzania (including the island of Pemba [see O'Brien, 2011: 286]), into southern Africa of Zambia, Malawi, Mozambique, Zimbabwe and Botswana, being found as far south as northern South Africa. Taylor (1998: 35) mentioned Pleistocene deposits of this species reported by Avery (1991) from Border Cave, northern Maputaland, KwaZulu-Natal, South Africa. In South Africa, its distribution is mostly affected by precipitation seasonality (Babiker Salata, 2012: 49).

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 946,716 km^2.

Native: Botswana (Monadjem *et al.*, 2010d: 559); Burundi; Congo (The Democratic Republic of the) (Hayman *et al.*, 1966; Ansell, 1974; Monadjem *et al.*, 2010d: 559); Ethiopia (Kruskop *et al.*, 2014: 102 report the first record North of the Rift Valley); Kenya; Malawi (Ansell, 1974; Happold *et al.*, 1988; Happold and Happold, 1997b: 818; Monadjem *et al.*, 2010d: 559); Mozambique (Smithers and Lobão Tello, 1976; Monadjem *et al.*, 2010d: 559; Monadjem *et al.*, 2010c: 379); Rwanda; Somalia; South Africa (Monadjem *et al.*, 2010d: 559); Sudan; Tanzania (Stanley and Goodman, 2011: 42), United Republic of; Uganda (Kityo and Kerbis, 1996: 61); Zambia (Ansell, 1969; Monadjem *et al.*, 2010d: 559); Zimbabwe (Monadjem *et al.*, 2010d: 559).
Presence uncertain: Namibia (Cotterill, 2004a: 261); Nigeria.

ECHOLOCATION:
Taylor *et al.* (2005), using a Pettersson D980, reported three, slightly different maximum frequencies (42.3 (± 0.2) kHz, 43.2 (± 0.1) kHz, 42.4 (0) kHz) from three different localities in Kenya for individuals of *R.* cf. *hildebrandtii*. Jacobs (1996) reported a maximum frequency of 37 - 46 kHz for individuals at Sengwa in Zimbabwe. Aldridge and Rautenbach (1987) reported a maximum frequency of c. 40 kHz for individuals from Pafuri in South Africa. Jacobs *et al.* (2007a) reported a peak frequency of 33.0 ± 0.9 kHz for individuals in South Africa (detector type and localities not reported). From Mozambique

Monadjem *et al.* (2010c: 379) reported that the peak echolocation frequencies ranged between 35 - 40 kHz (ANABAT, Petterson D240x). At Uzungwa Scarp Forest Reserve, Tanzania, Trentin and Rovero (2011: 56) describe the calls as starting at 28.5 kHz, increasing in .5 msecs to 39.8 kHz, and after 5 msecs decreasing to 26.7 kHz. The maximum intensity is at 35.5 kHz.

MOLECULAR BIOLOGY:
DNA - Unknown.
Karyotype - Both Peterson and Nagorsen (1975) and Rautenbach (1986) reported 2*n* = 58, FN = 60, BA = 4, and subtelocentric X and Y chromosomes.
Protein / allozyme - Unknown.

PREDATORS:
Schätti (1984: 337) refers to Broadley (in lit.) who mentions a *R. hildebrandtii* specimen having been swallowed by an African housesnake (*Lamprophis fuliginosus* (Boie, 1827)).

POPULATION:
Structure and Density - This species is quite common in Zambia (Jacobs, 2008h; IUCN, 2009).
Trend - 2008 - Unknown (Jacobs, 2008h; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
A male with abdominal testes was collected in the West Usambara Mountains (Tanzania) on 15 July 1991 (Stanley and Goodman, 2011: 42). Trentin and Rovero (2011: 50) reported two lactating females, and six females with single youngs, netted in December 2005 at Uzungwa Scarp Forest Reserve, Tanzania.

PARASITES:
HAEMOSPORIDA
Schaer *et al.* (2015: 381) found *Nycteria* sp. parasites in *R. hildebrandtii* from Kenya. Lutz *et al.* (2016: 9) found eight out of 14 specimens from East Africa to be infected by *Nycteria* sp. Perkins and Schaer (2016: Suppl.) report on the presence of *Nycteria congolensis* (Garnham, 1966) on bats from the DRC and East Africa as well as of *Nycteria* sp. from Kenya and Malawi or Mozambique.

DIPTERA
Streblidae: *Ascodipteron brevior* Maa 1965, female cysts found at the base of the ears in Congo (Haeselbarth *et al.*, 1966: 106). *Brachytarsina africana* (Walker, 1849) has a wide distribution in sub Saharan Africa (Haeselbarth *et al.*, 1966: 100). *Raymondia intermedia* Jobling, 1936 in the Congo (Haeselbarth *et al.*, 1966: 102). *Raymondia waterstoni* Jobling, 1931 (Haeselbarth *et al.*, 1966: 104), these records may possibly also be associated with *R. smithersii* (see Shapiro *et al.*, 2016: 256). *Raymondia intermedia* Jobling, 1936 (Shapiro *et al.*, 2016: 255).
Theodor (1968) recorded *Raymondia setiloba* (Jobling, 1954) from "*R. hildebrandtii*" in the DRC, but Shapiro *et al.* (2016: 256) indicate that the identify of the host is uncertain, and therefore report it as *Rhinolophus* sp.

Nycteribiidae: *Nycteribia scissa* Speiser; *Nycteribia rotundata* Theodor; *Penicillidia fulvida* (Bigot, 1885) (Haeselbarth *et al.*, 1966: 114).

ACARI
Sarcoptidae: Fain (1959a: 341) reports on *Nycteridocoptes eyndhoveni* Fain, 1959 collected on a bat of this species captured in Lubudi, DRC.
Trombiculidae: Stekolnikov (2018a: 116) found *Trisetica aethiopica* (Hirst, 1926).

VIRUSES:
Coronaviridae
31.3 % (5 out of 16) of the Kenyan bats tested by Tao *et al.* (2017: 3) were positive for CoV.

Rhabdoviridae
Vesiculovirus
Metselaar *et al.* (1969: 183) extracted a new virus (the "Mount Elgon Bat Virus") from the salivary glands of *R. hildebrandtii eloquens*, collected at the Kiminimi caves on the slopes of Mount Elgon, Kenya. Willoughby *et al.* (2017: Suppl.) mentions this virus as "Mount Elgon bat ledantevirus".

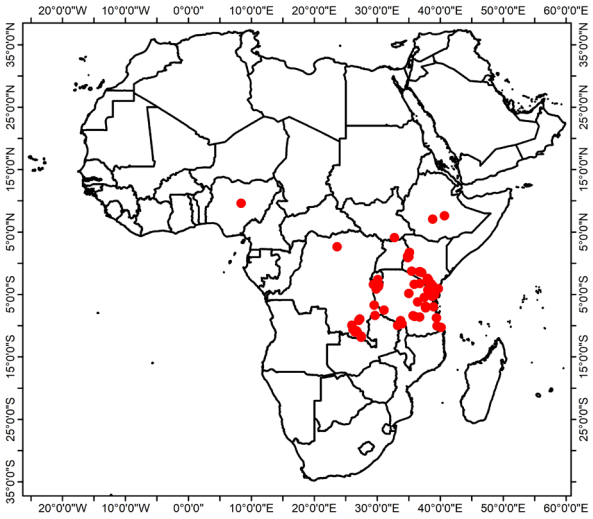

Figure 92. Distribution of *Rhinolophus hildebrandtii*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Burundi, Congo (Democratic Republic of the), Ethiopia, Kenya, Nigeria, South Sudan, Sudan, Tanzania.

Rhinolophus hilli Aellen, 1973

*1973. *Rhinolophus hilli* Aellen, Period. biol., 75 (1): 101. Type locality: Rwanda: Cyangugu province: Uwinka [02 29 S 29 12 E, 2 300 m] [Goto Description]. Holotype: ZMZ 126639: ad ♀, skull and alcoholic. Collected by: U. Goepel; collection date: 25 August 1964. (Current Combination)

TAXONOMY:
Previously recognized as a synonym of *R. ruwenzorii* J. Eric Hill, 1942 but recognized as a separate species by Fahr *et al.* (2002: 108) and Simmons (2005).

COMMON NAMES:
Czech: vrápenec Hillův. English: Hill's Horseshoe Bat. French: Rhinolophe de Hill. German: Hills Hufeisennase.

CONSERVATION STATUS:
Global - Listed as Critically Endangered (CR B1ab(iii,v)+2ab(iii,v) ver 3.1 (2001)) because its extent of occurrence appears to be less than 100 km² and its area of occupancy (presumably cave roosting sites) is probably less than 10 km² (field surveys in the Albertine rift have not found the species elsewhere), all individuals are in a single location (Nyungwe National Park), there is continuing decline in the extent and quality of its habitat, and there is believed to be an ongoing population decline related to over-harvesting for food (Fahr, 2008k; IUCN, 2009).

Assessment History -
2008 - CR B1ab(iii,v)+2ab(iii,v) ver 3.1 (2001) (Fahr, 2008k; IUCN, 2009). 2004 - CR (Fahr, 2004f; IUCN, 2004).

MAJOR THREATS:
Fahr *et al.* (2002) indicate that while there is little information available on this seemingly limited range species, it is probably threatened by habitat destruction (presumably by logging operations and the conversion of land to agricultural use) and direct exploitation (for subsistence food) in their day roosts (see Fahr, 2008k) [in IUCN (2009)]).

CONSERVATION ACTIONS:
Fahr (2008k) [in IUCN (2009)] reported that although *Rhinolophus hilli* is present within the Nyungwe National Park, it seems additional measures are needed to conserve the habitat of this species. There is a need for bat awareness programmes for local people to prevent over-harvesting of the species. Further field surveys are also needed to locate important roosts and to learn more about the natural history of this poorly known species.

GENERAL DISTRIBUTION:
Rhinolophus hilli is known only within the Nyunwe National Park, Rwanda. It has been identified from only two close localities (approximately 8 km apart). Field surveys in surrounding areas of potentially suitable habitat have not found additional populations. It has an elevational range of between 1,750 and 2,512 m asl (Fahr *et al.*, 2002).

Native: Rwanda.

POPULATION:
Structure and Density - There is little information available on the abundance of *Rhinolophus hilli*; colonies of this species have yet to be found but are likely to be small (Fahr *et al.*, 2002).
Trend - 2008 - Decreasing (Fahr, 2008k; IUCN, 2009).

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Rwanda.

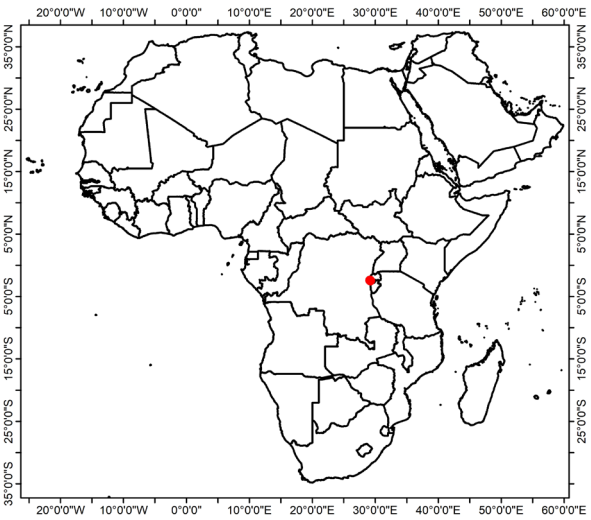

Figure 93. Distribution of *Rhinolophus hilli*

Rhinolophus hillorum Koopman, 1989

*1989. *Rhinolophus clivosus hillorum* Koopman, Am. Mus. Novit., 2946: 4. Publication date: 28 June 1989. Type locality: Liberia: Lofa county: ca 2 mi SW Voinjama, near Zozoma: John

Hegbe farm: (the type lable mentions John's Town) [08 25 N 09 35 W, 500 m] [Goto Description]. Holotype: AMNH 257044: ad ♀, skull and alcoholic. Collected by: Andrew S. Voros; collection date: early October; original number: 5924. Type lable mentions 3 September 1983. - Etymology: In honour of the two (often confused) eminent mammalogists named John E. Hill: J. Eric (1907-1947), and J. Edwards (1928-1997) (see Koopman, 1989b: 5).

? *Rhinolophus hillorum:* (Name Combination, Current Combination)

TAXONOMY:
Considered a synonym of *clivosus* by Koopman (1993a: 164), but see Simmons (2005: 356). See Csorba *et al.* (2003: 131) for remarks on taxonomy.

COMMON NAMES:
Czech: vrápenec západoafrický. English: Upland Horseshoe bat, Hill's Horseshoe bat. French: Rhinolophe de Lofa. German: Hochland-Hufeisennase.

CONSERVATION STATUS:
Global - Listed as Vulnerable (VU A2c ver 3.1 (2001)) because it is suspected that a population decline, estimated to be more than 30 % would be met over the next 10 years, inferred from the loss of montane habitat, especially in northern Liberia and southern Guinea (Jacobs *et al.*, 2008ad; IUCN, 2009).

Assessment History -
2008 - VU A2c ver 3.1 (2001) (Jacobs *et al.*, 2008ad; IUCN, 2009). 2004 - VU A4c; B2ab(iii) ver 3.1 (2001) (Jacobs *et al.*, 2004s; IUCN, 2004).

MAJOR THREATS:
Colonies are threatened by general deforestation, often resulting from logging and mining operations, and overharvesting for the bushmeat trade (Jacobs *et al.*, 2008ad; IUCN, 2009).

CONSERVATION ACTIONS:
Jacobs *et al.* (2008ad) [in IUCN (2009)] reported there appear to be no direct conservation measures in place for *Rhinolophus hillorum*. It is not known if the species is present in any protected areas, but it has been recorded from the Sapoba Forest Reserve in Nigeria and the Bali Forest Reserve in Cameroon (Cotterill, 2002a). There is a need to identify and protect important areas for this species. Further research is needed into the species distribution, including the location of any additional colonies.

GENERAL DISTRIBUTION:
Rhinolphus hillorum is largely endemic to West and Central Africa, with a single questionable record from northern Uganda. It has been recorded from a few small, disjunct, colonies in Liberia (including Voinjama; Tokadeh; and the Wonegizi Mountains), Guinea, Nigeria (Sapoba Forest Reserve) and Cameroon (including Lake Manenguba and the Bali Forest Reserve).

Native: Cameroon; Guinea (Fahr *et al.*, 2006a: 72); Liberia; Nigeria.
Presence uncertain: Uganda.

HABITAT:
Monadjem *et al.* (2016y: 366) recorded five specimens from forested habitats on the Liberian side of Mount Nimba, on altitudes ranging from 780 to 1,200 m.

ROOST:
Monadjem *et al.* (2016y: 366) found a roost in an old mine adit at Mount Tokadeh, Liberia.

POPULATION:
Structure and Density - The species appears to have a small population, but further research is needed to confirm this (Jacobs *et al.*, 2008ad; IUCN, 2009).
Trend - 2008 - Decreasing (Jacobs *et al.*, 2008ad; IUCN, 2009).

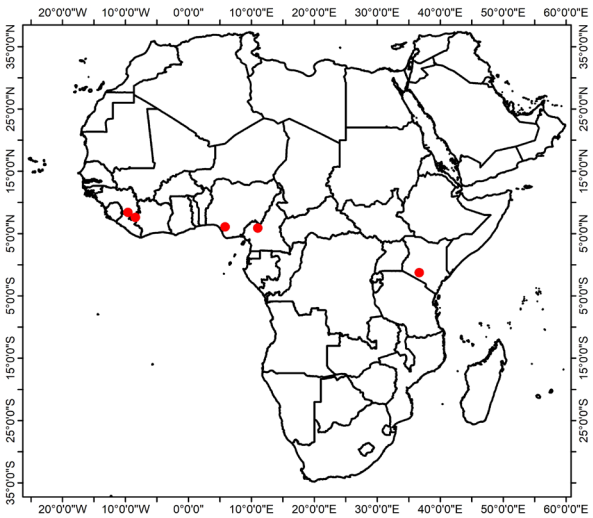

Figure 94. Distribution of *Rhinolophus hillorum*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Cameroon, Guinea, Kenya, Liberia, Nigeria.

Rhinolophus hipposideros (Bechstein, 1800)

1792. *minor* Kerr, in: Linnaeus, Animal Kingdom, 1 (1): xvii, 91. Publication date: February 1792. Type locality: France: "France". - Comments: Preoccupied by *minor* Kerr, 1792: 97 (two pages before this) (see Simmons, 2005).

*1800. *Vespertilio hipposideros* Bechstein, Allgemeine Uebersicht Vierfüssige Thiere, 2: 629. Type locality: France: "France". - Etymology: from the masculine Greek substantive "*ἵππος*" (híppos), meaning "horse" and from the neuter Greek substantive "*σίδηρος*" (síderos), meaning "iron", referring to the occurrence of a fleshy horseshoe-shaped expansion on the muzzle in this species as in all other species of the genus (see Lanza *et al.*, 2015: 104).

1861. *Rhinolophus miminus* Heuglin, Nov. Act. Acad. Cæs. Leop.-Carol., 29 (8): 4, 6. Publication date: 1861. Type locality: Eritrea: Kérén [ca. 15 45 N 38 20 E]. Holotype: SMNS 987: sad ♂, skull and alcoholic. Collected by: Martin Theodor von Heuglin; collection date: 1861. Andersen (1904c: 455) mentions it as an immature, but full-grown specimen and 1862? as collection date. Dieterlen *et al.* (2013: 294) mention "skull and specimen in alcohol" and mention 1861 as collection date.

1870. *Rhinolophus Eggenhöffner* Fitzinger, Sber. k. Akad. Wiss. Wien, math. naturw. Kl., 62 (1): 151. - Comments: This might be an African form, but we do not have any further information.

1905. *Rhinolophus hipposiderus typicus* K. Andersen, Proc. zool. Soc. Lond., 1905, II, I (10): 141. Publication date: 7 October 1905. - Comments: This might be an African form, but we lack any further information.

1918. *[Rhinolophus hipposideros] escaleræ* K. Andersen, Ann. Mag. nat. Hist., ser. 9, 2 (10): 378. Publication date: 1 October 1918. Type locality: Morocco: Mogador [=Essaouira]: Ha-ha [ca. 31 31 N 09 46 W] [Goto Description]. Holotype: BMNH 1910.11.24.2: ♀. Collected by: D. Manuel M. de la Escalera. Presented/Donated by: Michael Rodgers Oldfield Thomas. See Andersen (1918: 378).

1937. *Rhinolophus hipposideros vespa* Laurent, Bull. Soc. Hist. nat. Afr. Nord, 28: 157, text-fig. 1 - 2. Publication date: February 1937. Type locality: Morocco: near Rabat: Oued Korifla [ca. 34 02 N 06 50 W]. Holotype: MNHN 919: ♂, alcoholic (skull not removed). Collected by: Prof. Dr. R. Laurent; collection date: 8 August 1927. Number 181 in Rode (1941: 238). Paratype: MNHN 833: ♂, alcoholic (skull missing). Collected by: Prof. Dr. R. Laurent. Number 181a in Rode (1941: 238).

1978. *eggenhoffner:* Corbet, Mammals Palaearctic region, 43. - Comments: Possibly extralimital. (Lapsus)

? *Rhinolophus hipposideros minimus:* (Name Combination)

? *Rhinolophus hipposideros:* (Name Combination, Current Combination)

TAXONOMY:
Revised by Felten *et al.* (1977). The status of populations around the Mediterranean, on Mediterranean Islands, and on both sides of the Red Sea is unclear (see Horácek *et al.*, 2000: 101). *hipposideros* species group (Csorba *et al.*, 2003: 53 - 55; Simmons, 2005: 356 - 357). See Csorba *et al.* (2003: 54) for review of taxonomy.

Kozhurina (2009: 72) points out that Borkhausen (1797 - Deutsche Fauna, oder kurzgefaßte Naturgeschichte der Thiere Deutschlands. Erster Theil: Säugethiere und Vögel. Frankfurt am Main: 85) was the first to give a scientific name to this species: *Noctilio Hipposideros*.

COMMON NAMES:
Albanian: Lakuriq nate hundpatkua i vogël. Arabian: Khafash abu hadwa saghir, Khaffash. Armenian: Փոքր պայտաքիթ. Azerbaijani: Kiçik nalburun. Basque: Ferra-saguzar txikia. Belarusian: Падкаванос малы. Bosnian: Mali potkovasti šišmiš. Breton: Frigribell vihan. Bulgarian: Малък подковонос. Castilian: Murciélago pequeño de herradura, Rinolofo pequeño de herradura. Catalan: Ratpenat de ferradura petit, Rat penat petit de ferradura, Ratapinyada petita de ferradura. Croatian: Mali potkovnjak. Romanian: Liliacul mic cu potcoavă, Liliac-mic-cupotcoavã. Russian: Подковонос малый [= Podkovonos malyj. Serbian: Мали потковичар [= Mali potkovič ar]. Scottish Gaelic: Crudh-ialtag bheag. Slovak: Podkovár malý. Slovenian: Mali podkovnjak. Swedish: Dvärghästskonäsa. Turkish: Küçük Nalburunlu Yarasa. Ukrainian: Підковик (Підковоніс) малий. Welsh: Ystlum pedol lleiaf.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
R. hipposideros is recorded from the Guenfouda Cave (syn. Ghar Zebouj) in eastern Morocco, dating from the beginning of the Holocene (Neolithic) period (López-García *et al.*, 2012: 51).

Dool *et al.* (2013: 4067) indicate that during the Pleistocene, *R. hipposideros* utilized multiple refugia across the Mediterranean.

Dool *et al.* (2016a: 206) indicate that *R. hipposideros* represents the oldest lineage of the genus and diverged fromthe other species around 16 Mya.

CONSERVATION STATUS:
Global - This species has a large range. Although there have been marked and well-documented declines in some areas, the species remains widespread, fairly common, and apparently stable in other areas. Assessed as Least Concern (LC ver 3.1 (2001)) (Jacobs *et al.*, 2008aq; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Jacobs *et al.*, 2008aq; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Jacobs *et al.*, 2004af; IUCN, 2004). 1996 - VU (Baillie and Groombridge, 1996).

MAJOR THREATS:
Threats include disturbance and loss of underground habitats and attics (conversion of attics in human habitat), agricultural intensification, fragmentation and isolation of habitats, and the use of pesticides in agricultural areas (Jacobs *et al.*, 2008aq; IUCN, 2009).

In Austria, Reiter *et al.* (2012: 283) studied the influence of landscape fragmentation on *R. hipposideros* and found that conservation measures for colonies of lesser horseshoe bats should be undertaken within 2.5 km of the nursery roost. As these bats seem to be unable to adapt their spatial foraging behaviour by shifting from woodland to a degraded landscape, any loss of woodland near the colonial roosts will negatively influence the colony.

R. hipposideros's aerial hawking and its long-distance disperal are considered to be major risk factors in view of climatic change (Sherwin *et al.*, 2012: 174).

CONSERVATION ACTIONS:
According to Jacobs *et al.* (2008aq) [in IUCN (2009)], *Rhinolophus hipposideros* is protected by national legislation in all European range states. There are international legal obligations for protection through Bonn Convention (Eurobats) and Bern Convention, where those apply. Included in Annex II (and IV) of EU Habitats and Species Directive and hence requiring special measures for conservation including designation of Special Areas for Conservation. Some habitat protection through Natura 2000. Recommended conservation measures include protecting maternity roosting sites, hibernation caves and foraging habitats. No specific conservation measures apply in South Asia; more research and monitoring are needed.

GENERAL DISTRIBUTION:
Rhinolophus hipposideros is widely distributed in the western and central Palaearctic. It is found in all the European countries (including the islands) of the Mediterranean region. In North Africa it is recorded from Morocco, Algeria, Tunisia and the eastern part of the Sinai (to Egypt); also occurs in eastern Africa. Also recorded from Anatolia and the countries of the Levant. It occurs from sea level to 2,000 m.

Native: Afghanistan; Albania; Algeria; Andorra; Armenia; Austria; Azerbaijan; Belgium; Bosnia and Herzegovina; Bulgaria; China; Croatia; Cyprus (Benda *et al.*, 2007: 71); Czech Republic; Djibouti (Pearch *et al.*, 2001: 388); Egypt (Sinai); Eritrea; Ethiopia (Lavrenchenko *et al.*, 2004b: 147); France [Corse]; Georgia; Germany; Gibraltar; Greece [Kriti]; Holy See [Vatican City State]; Hungary; India; Iran; Ireland; Islamic Republic of; Iraq; Ireland; Israel; Italy [Sardegna, Sicilia]; Jordan; Kazakhstan; Kyrgyzstan; Lebanon; Luxembourg; Macedonia, the former Yugoslav Republic of; Malta; Moldova; Monaco; Montenegro; Morocco (Benda *et al.*, 2010a: 157, El Ibrahimi and Rguibi Idrissi, 2015: 359); Pakistan; Palestinian Territory,

Occupied (Shehab *et al.*, 2006: 161); Poland; Portugal; Romania; Russian Federation; San Marino; Saudi Arabia; Serbia; Slovakia; Slovenia; Spain [Baleares]; Sudan; Switzerland; Syrian Arab Republic; Tajikistan; Tunisia (Dalhoumi *et al.*, 2014: 53; 2016b: 867); Turkey; Turkmenistan; Ukraine; United Kingdom; Uzbekistan.
Regionally extinct: Liechtenstein; Netherlands.

DETAILED MORPHOLOGY:
Baculum - See Csorba *et al.* (2003: 54).

ECHOLOCATION:
Jones and Siemers (2010: 449 - 450) indicated that females emit pulses with a higher frequency than males, and also that juveniles emit lower frequencies than adults.

Papadatou *et al.* (2008b: 132) report the following data for 5 Greek specimens: F_{start}: 96.6 ± 10.25 kHz, F_{end}: 84.8 ± 4.74 kHz, F_{peak}: 110.6 ± 3.93 kHz, bandwidth: 4.8 ± 1.61 kHz, duration 45.2 ± 6.43 msec and interpulse interval: 98.2 ± 29.10 msec.
For 52 calls of bats from France, Switzerland and the UK, Walters *et al.* (2012: suppl.) report the following figures: duration: 42.47 ± 12.66 msec, F_{max}: 109.76 ± 2.35 kHz, F_{min}: 94.35 ± 3.95 kHz, bandwidth: 15.41 ± 4.26 kHz, F_{peak}: 109.58 ± 2.36 kHz.
The following data for 18 Iranian calls were reported by Benda *et al.* (2012a: 182): F_{start}: 111.2 ± 0.8 (109.9 - 112.2) kHz, F_{end}: 108.5 ± 1.4 (106.2 - 110.7) kHz, F_{peak}: 110.3 ± 0.8 (109.0 - 111.1) kHz, duration: 49.9 ± 1.5 (47.8 - 52.0) msec, interpulse interval: 41.9 ± 3.8 (36.1 - 48.7) msec.

Disca *et al.* (2014: 226) indicate that the type of call is FM-FC-FM in Morocco, with F_{peak}: 116.9 ± 0.2 kHz and duration: 39.7 ± 13.2 msec, whereas Dalhoumi *et al.* (2016b: 866) report a frequency "> 112 kHz" (111.5 - 117.5 kHz).

57 calls were recorded by Hackett *et al.* (2016: 223) from Israel: Pulse duration: 42.28 ± 12.09 msec, F_{start}: 92.54 ± 6.79 (83.9 - 109.3) kHz, F_{end}: 93.37 ± 8.61 (80 - 114.2) kHz, F_{peak}: 107.58 ± 0.49 (103.5 - 109.3) kHz.

Dool *et al.* (2016b: Suppl.) showed that there is a sexual dimorphism in the peak frequencies in Irish bats, with males call on average 4 kHz lower.

MOLECULAR BIOLOGY:
DNA - See Puerma *et al.* (2007).

Karyotype - Capanna *et al.* (1967) reported 2*n* = 56, FN = 60. However, Rushton (1970: 463) reported 2*n* = 58, FN = 60, a metacentric X, and a minute Y. For a female from Jordan, Qumsiyeh and Baker (1985) reported 2*n* = 58, FN = 60, BA = 4. More recently, Puerma *et al.* (2007) reported 2*n* = 54, FN = 62, BA = 10, a submetacentric X and an acrocentric Y for specimens from Spain.

Volleth *et al.* (2013: 55) and Arslan and Zima (2014: 8) indicate that three diploid chromosome numbers are present in Europe: 54, 56, and 58. The specimens with 58 chromosomes occur in Asia Minor and the Middle East, those with 56 chromosomes in the Czech Republic, Slovakia, Italy and Greece, and those with 54 chromosomes in Spain, Germany and (possibly) Switzerland.

Protein / allozyme - Unknown.

DIET:
Andreas *et al.* (2013) using faecal analysis of *R. hipposideros* from southern Slovakia, showed that this species fed only on the small moths (<25mm) (%f = 59; %vol = 87) and this prey category was supplemented with Neuroptera (Hemerobiidae) (%f = 13.8; %vol = 1.5), nematoceran (%f = 20.7; %vol = 10.0) and brachyceran (%f = 6.9; %vol = 1.2) Diptera.

Droppings from northern Algeria were examined by Ahmim and Moali (2013: 175), who found the following prey items: Insecta (93.46 %) and Chilopoda (6.54 %). Among the Insecta, Diptera were mostly encountered (41.58 %), more specifically: Culicidae (15.59%), Chironomidae/Ceratopogonidae (9.68 %) and Tipulidae (6.45 %). Lepidoptera formed the second most important insect order (21.1 %), followed by Hemiptera (11.68 %).

POPULATION:
Structure and Density - According to Jacobs *et al.* (2008aq) [in IUCN (2009)], *Rhinolophus hipposideros*) is an infrequent species in the northern part of its range. In Europe the species forms summer colonies of 10 - 50 individuals (up to 1,500 animals), whereas it is solitary in winter or forms loose aggregations up to 500 animals per roost. Since the 1950s the northern border of the range in western and central Europe has moved to the south. In the Netherlands, northern Belgium and Germany (except for a few colonies in Bavaria, Thüringen, Sachsen and Sachsen-Anhalt) the species went extinct (Fairon *et al.*, 1982; Schofield, 1999). It disappeared from northern and western parts of Bohemia, and much of Poland where 87 % of the hibernating population was lost between 1950 and 1990 (Urbanczyk, 1994; Ohlendorf, 1997). In Switzerland and Austria the distribution became fragmented, as colonies remained only at higher elevations (>400 m) (Stutz and Haffner, 1984; Spitzenberger, 2002), although in Switzerland at least the population has started to slowly recover

over the last 10 years (increasing from 2,200 to 2,500 adults counted in maternity roosts: H. Kraettli *pers. comm.,* 2006). In Spain some colonies have disappeared due to the restoration of buildings, but there are no data on population trend (J. Juste and T. Alcalde *pers. comm.,* 2006), and in France there have been some declines in the north, although large populations in the south are thought to be more stable (EMA Workshop, 2006). In the southwest Asian part of the range it gathers in wintering colonies of up to 40 animals, although it is mainly solitary (K. Tsytsulina *pers. comm.,* 2005). In Turkey it is a commonly reported species, and the population is stable (A. Karatash *pers. comm.,* 2005). It is common in Iran although encountered less frequently than *R. ferrumequinum* (M. Sharifi *pers. comm.,* 2005). It is not known how abundant this species is in Jordan and Syria but it may be more common than the collection reports indicate (Amr, 2000). Size and trends within Africa and South Asia are unknown.
Trend - 2008 - Decreasing (Jacobs *et al.*, 2008aq; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
Tuttle and Stevenson (1982: 120) indicate that some females might attain sexual maturity in as little as three months, whereas other females and males might need 15 months.
At birth, the young has about 34.4 % of the mother's body mass (4.2 g versus 12.3 g) (see Kurta and Kunz, 1987: 82).

POSTNATAL DEVELOPMENT:
In Austria, Reiter (2004: 234) found that the average forearm length at one day of age was 17.5 mm and the average weight 2.0 g. He also found that the growth of both the forearm and weight was almost linear during the first 14 days. In some cases, a loss of weight could be observed between day 15 and 20, which occurred a few days before the first flights took place (at between 18 and 20 days of age). At the time of their first flight, the forearm was 92 % of that the adult female, and weight was 70 % of the adult's.

PARASITES:
Lainson and Naiff (2000: 128) repored *R. hipposideros* as host for *Eimeria hessei* Lavier, 1924 (Apicomplexa).

In Italy, Voyron *et al.* (2011: 193) reported the following fungal entitiy from *R. hipposideros* carcasses: *Mortierella gamsii* Miko, 1974.
Genov *et al.* (1992) reported the presence of the Nematode *Molinostrongylus alatus* (Ortlepp, 1932) in Moldova.

Benda *et al.* (2010b: 234) found the bat fly *Phthiridium integrum* (Theodor and Moscona, 1954) (Nycteribiidae) on *R. hipposideros* in Jordan. They also indicate that *Phthiridium bilobum* (Theodor and Moscona, 1954) was reported before from Palestine, and the fleas *Ischnopsyllus octactenus* (Kolenati, 1856) and *Rhinolophopsylla u. unipectinata* (Taschenberg, 1880) from Turkey.

From Algeria, Bendjeddou *et al.* (2013: 325) reported infestations by *Phthiridium biarticulatum* Hermann, 1804 (Diptera: Nycteribiidae) and *Cimex lectularius* (Linnaeus, 1758) (Hemiptera: Cimicidae). Another Algerian ectoparasite was reported by Bendjeddou *et al.* (2017: 15): Arachnida: *Ixodes ricinus* (Linnaeus, 1758).

VIRUSES:
Coronaviridae
Alphacoronavirus
This virus was reported from Italy by Kohl and Kurth (2014: 3112).
Betacoronavirus
Kohl and Kurth (2014: 3112) reported this virus from Bulgaria, Germany, Slovenia, Italy.

Reoviridae
Orthoreovirus
Reported from Italy by Kohl and Kurth (2014: 3113).

Orthomyxoviridae
Despite sampling and testing of 6 individuals of this species, no evidence of influenza A-like viruses (*Orthomyxoviridae*) were obtained (Fereidouni *et al.*, 2015).

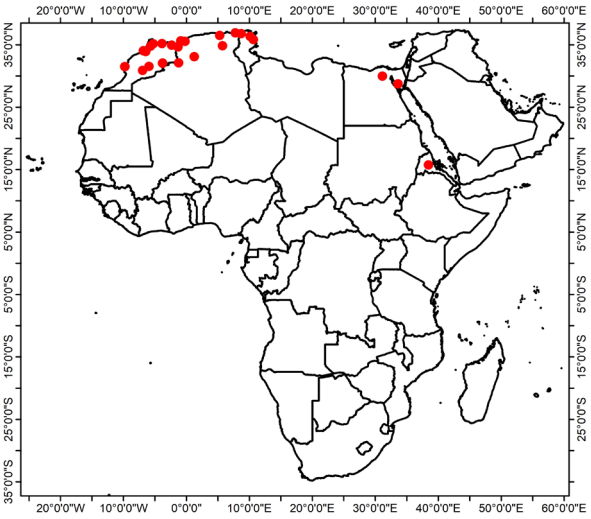

Figure 95. Distribution of *Rhinolophus hipposideros*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Algeria, Angola, Cameroon, Egypt, Eritrea, Ethiopia, Liberia, Morocco, Sudan, Tunisia.

Rhinolophus horaceki Benda and Vallo, 2012

*2012. *Rhinolophus horaceki* Benda and Vallo [Goto Description]. Holotype: NMP 49880: ad ♂, skin and skull. Collected by: Michal Andreas, Petr Benda, Vladimir Hanák, Antonin Reiter and Marcel Uhrin; collection date: 15 May 2002; original number: pb2124. Paratype: NMP 49861: ad ♂, skull and alcoholic. Collected by: Michal Andreas, Petr Benda, Vladimir Hanák, Antonin Reiter and Marcel Uhrin; collection date: 12 May 2002; original number: pb2104. Paratype: NMP 49879: ad ♂, skull and alcoholic. Collected by: Michal Andreas, Petr Benda, Vladimir Hanák, Antonin Reiter and Marcel Uhrin; collection date: 15 May 2002; original number: pb2123. Paratype: NMP 49882: ad ♀, skull and alcoholic. Collected by: Michal Andreas, Petr Benda, Vladimir Hanák, Antonin Reiter and Marcel Uhrin; collection date: 16 May 2002; original number: pb2127. Paratype: NMP 49915: ad ♀, skull and alcoholic. Collected by: Michal Andreas, Petr Benda, Vladimir Hanák, Antonin Reiter and Marcel Uhrin; collection date: 20 May 2002; original number: pb2163. (Current Combination)

TAXONOMY:
Based on cytochrome *b* sequences, Benda and Vallo (2012) were able to distinguish a new species of *Rhinolophus* from northern Libya (Cyrenaica). The cytochrome *b* shares unique base positions with the *ferrumequinum*/*clivosus* complex, but also with the *fumigatus* group.

Benda *et al.* (2014c: 24) indicate that specimens of this species were reported as *R. clivosus* by Qumsiyeh and Schlitter (1982).

COMMON NAMES:
Dutch: Horacekcs hoefijzerneus. German: Lybische Hufeisennase.

GENERAL DISTRIBUTION:
Benda *et al.* (2014c: 22) indicate that *R. horaceki* is an endemic of the Mediterranean part of Cyrenaica, streching about 360 km along the coast, and covering no more than 4,000 km^2.

ROOST:
Benda *et al.* (2014c: 22) found a group of four bats in a cave situated in the northern slope of the side valley of the western part of Wadi Al Kuf (Libya).

DIET:
The diet of this species was determined by Benda *et al.* (2014c: 26). One group of faecal pellets contained 99.8 % by volume medium-sized moths and 0.2 % small nematoceran Diptera. A second group of pellets contained 54 % of medium-size Lepidoptera, 38 % of Blattoidea, 4 % of Formicoidea, 2 % of Auchenorrhyncha and 2 % of Coleoptera.

REPRODUCTION AND ONTOGENY:
Two pregnant females were collected by Benda *et al.* (2014c: 24) on 16 and 20 May 2002.

Rhinolophus kahuzi Fahr and Kerbis Peterhans, 2013

*2013. *Rhinolophus kahuzi* Fahr and Kerbis Peterhans, in: Kerbis Peterhans, Fahr, Huhndorf, Kaleme, Plumptre, Marks and Kizungu, Bonn. Zool. Bull., 62 (2): 192, 194, figs 5, 6. Publication date: November 2013. Type locality: Congo (Democratic Republic of the): Western slope of Mt. Kahuzi [02 15 09 S 28 40 09 E, 2 600 m] [Goto Description]. Holotype: FMNH 219793: ad ♂, skull and alcoholic. Collected by: R. Kizungu; collection date: 28 July 2007; original number: JCK 5406. Presented/Donated by: ?: Collector Unknown. - Etymology: The name refers to the type locality and is used as a noun in apposition (see Kerbis Peterhans *et al.*, 2013: 194). (Current Combination)

COMMON NAMES:
English: Kahuzi horseshoe bat. German: Kahuzi-Hufeisennase.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Congo (Democratic Republic of the).

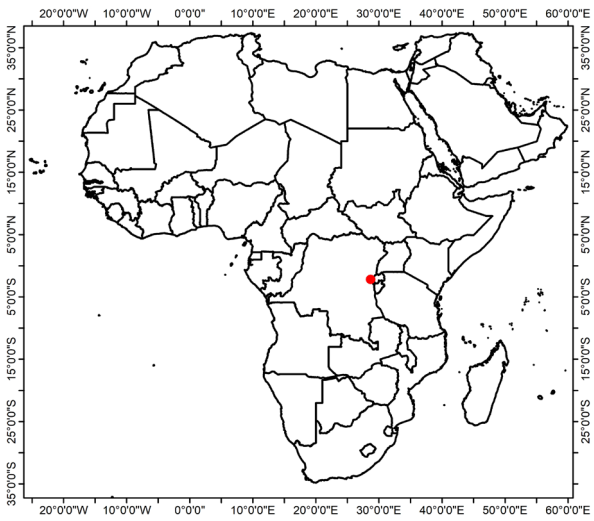

Figure 96. Distribution of *Rhinolophus kahuzi*

Rhinolophus landeri Martin, 1838

*1838. *Rhinolophus landeri* Martin, Proc. zool. Soc. Lond., 1837, V (lviii): 101. Publication date: 25 May 1838. Type locality: Equatorial Guinea: Bioko [formerly Fernando Po] [ca. 03 21 N 08 40 E]. Holotype: BMNH 1855.12.26.250:. - Etymology: Named by Martin after Richard Lemon Lander (1804 - 1834), an English explorer of western Africa (see Rosevear, 1965; Taylor, 2005; Lanza *et al.*, 2015 109). (Current Combination)

1904. *Rhinolophus Dobsoni* Thomas, Ann. Mag. nat. Hist., ser. 7, 14 (80): 156, footnote. Publication date: 1 August 1904. Type locality: Sudan: Kordofan [ca. 13 00 N 30 00 E] [Goto Description]. Holotype: BMNH 1847.5.7.49: ♀.

1917. *Rhinolophus axillaris* Allen, Bull. Am. Mus. Nat. Hist., 37 (18): 429. Publication date: 29 September 1917. Type locality: Congo (Democratic Republic of the): Oriental province: Uele district: Aba [03 53 N 30 17 E] [Goto Description]. Holotype: AMNH 49175: ad ♀, skin and skull. Collected by: Herbert Lang, James Paul Chapin and The American Museum Congo Expedition; collection date: 17 December 1911; original number: 1807. The museum labels indicate it as a female.

? *Rhinolophus landeri dobsoni:* (Name Combination)

? *Rhinolophus landeri landeri:* (Name Combination)

TAXONOMY:

Meester *et al.* (1986) state that Rosevear (1965) and Kock (1969a) regard *guineensis* Eisentraut, 1960, from Guinea, as subspecifically distinct from *landeri*. Hayman and Hill (1971), on the other hand, consider it a synonym, while Böhme and Hutterer (1979, Csorba *et al.* (2003: 59 - 61) and Simmons (2005: 356) regard it as a distinct species, sympatric with *landeri* and somewhat larger.

Other names associated with *landeri* are *dobsoni* Thomas, 1904, which is either a synonym (Kock, 1969a) or a valid subspecies (Koopman, 1975). See Csorba *et al.* (2003: 62) for remarks on taxonomy. *lobatus* Peters, 1852 and *angolensis* Seabra, 1898 were removed by Taylor *et al.* (2018a: 22).

COMMON NAMES:

Afrikaans: Lander se saalneusvlermuis, Lander-saalneusvlermuis. Chinese: 兰德菊头蝠. Czech: vrápenec Landerův. English: Lander's Horseshoe Bat. French: Rhinolophe de Lander. German: Landers Hufeisennase, Kastanienrothe Kammnase, Rundlappigen Kammnase, Lander's Rundblattnase. Italian: Rinòlofo di Lànder. Kiluba (DRC): Kasusu. Portuguese: Morcego ferradura de Lander. Spanish (Castillian): Murciélago de Herradura

CONSERVATION STATUS:

Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Jacobs *et al.*, 2008an; IUCN, 2009).

Assessment History -

2008 - LC ver 3.1 (2001) (Jacobs *et al.*, 2008an; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Jacobs *et al.*, 2004ap; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
There appear to be no major threats to *Rhinolophus landeri* as a whole (Jacobs *et al.*, 2008an; IUCN, 2009).

CONSERVATION ACTIONS:
Jacobs *et al.* (2008an) reported in IUCN (2009) that in view of the wide range of *Rhinolophus landeri* it seems probable that it is present in some protected areas. No direct conservation measures are currently needed for this species as a whole.

GENERAL DISTRIBUTION:
Rhinolophus landeri has been widely reported from much of sub-Saharan Africa. It ranges from Senegal and The Gambia in the west, through most of West and Central Africa to Sudan and Ethiopia in the east. The species had been recorded as far south as eastern South Africa, but all southern and eastern African specimens are now referred to *R. lobatus* (see Taylor *et al.*, 2018a: 24). On Mount Cameroon, they have been taken at an altitude of 1,200 m asl and at 900 m asl on Mount Bintamane in Sierra Leone (Rosevear, 1965).

Native: Benin (Capo-Chichi *et al.*, 2004: 162); Burkina Faso (Kangoyé *et al.*, 2015a: 610); Cameroon; Central African Republic; Congo; Côte d'Ivoire; Equatorial Guinea (including Bioko); Ethiopia; Gabon; Gambia (Emms and Barnett, 2005: 50); Ghana; Guinea (Fahr and Ebigbo, 2003: 128; Decher *et al.*, 2016: 264); Liberia (Monadjem and Fahr, 2007: 47); Niger; Nigeria; Senegal; Sierra Leone; Somalia; Sudan; Togo.

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Menzies (1973) [in Young (1975: 76)] indicates that, in some colonies in northern Nigeria, rufous bats get a grey fur during the molting season, and subsequently change back to rufous.

SEXUAL DIMORPHISM:
Krutzsch (2000: 117) mentions the presence of shoulder glands in the males.

ECHOLOCATION:
In Guinea, Fahr and Ebigbo (2003) reported the frequency of the CF-component as 103.3 kHz. In Kenya, O'Shea and Vaughan (1980) using a Holgate ultrasonic sensor reported a frequency of 55 kHz for individuals at Masalani, later Taylor *et al.* (2005) using a Pettersson D980 reported a maximum frequency of 110 (± 0) kHz for an individual from Bungule.

In Burkina Faso, Kangoyé *et al.* (2015a: 613) recorded one male calling at 108.5 kHz, and a female calling at 105.6 kHz.

In Sierra Leone, two males called at 102.0 (101.5 - 102.5) kHz (Weber *et al.*, 2019: 21).

MOLECULAR BIOLOGY:
DNA - Unknown.
Karyotype - 2*n* = 58, FN = 60, BA = 4, and a submetacentric X chromosome (Rautenbach *et al.*, 1993). Koubínová *et al.* (2010b) agree with Rautenbach *et al.* (1993), and reported for a female from Senegal 2*n*= 58, and a Fna= 64, which contained four pairs of biarmed autosomes three pairs of which were medium to small sized meta- or submetacentrics and one was a medium sized subtelocentric, the remaining 24 pairs were a gradated series of acrocentrics.
Protein / allozyme - Unknown.

HABITAT:
Monadjem *et al.* (2016y: 366) recorded this species in the Mount Nimba area in forested habitats between 550 and 1,000 m.

POPULATION:
Structure and Density - This species is rather common locally, colonies can consist of hundreds of individuals (Jacobs *et al.*, 2008an; IUCN, 2009).
Trend - 2008 - Unknown (Jacobs *et al.*, 2008an; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
Orr and Zuk (2014: 902) refer to Racey (1982) [who in turn refers to Menzies (1973)] and indicated that in *R. landeri* it can take up to two months before the blastocyst gets implanted.

PARASITES:
HAEMOSPORIDA
Adam and Landau (1973a: 5) report on the presence of a protozoan parasite of the genus *Polychromophilus* (Haemoproteidae) in *R. landeri*. About 50 % of the specimens from Congo they examined, were found to be infected. Gametocytes were found year-round. The bats were also infested by the nycteribiids *Penicillidia fulvida* Bigot, 1885 and *Nycteribia schmidlii scotti* Falcoz, 1923, of which the prior was a major carrier of *Polychromophilus* sporozoites. Schaer *et al.* (2013a: 17416) also found this parasite (possibly *N. congolensis* or *N. gabonensis*) in one out of two West African bats they examined.
Polychromophilus ? murinus was reported by Garnham (1973: 237), based on a record by Adam and Landau.

Espinosa-Álvarez *et al.* (2018: Suppl.) reported *Trypanosoma livingstonei* from three bats from Mozambique.

Schaer *et al.* (2015: 381) found *Nycteria* sp, in a bat from Guinea and *Nycteria* cf. *congolensis* in a

R. landeri from Sierra Leone. Perkins and Schaer (2016: Suppl.) reported on *Nycteria congolensis* (Garnham, 1966) from Sierra Leone, and *Nycteria* sp. from Côte d'Ivoire or Guinea. Rosskopf *et al.* (2018: 31) also found *Nycteria* parasites in bats from Gabon.

Justine (1989b: 537, 544) described two new stomach parasites: *Capillaria landauae* and *Capillaria brosseti* (Nematoda) from *R. landeri* from Makokou (Gabon).

Polyctenidae: *Androctenes horvathi* Jordan, 1912 recorded from Congo (Haeselbarth *et al.*, 1966: 17).

Streblidae: *Ascodipteron lophotes* Monticelli 1898 from Kenya (Haeselbarth *et al.*, 1966: 106, but Maa (1965) suggests that these records need verification). *Brachytarsina africana* (Walker, 1849) has a wide distribution in sub Saharan Africa (Haeselbarth *et al.*, 1966: 100). *Penicillidia pachymela* Speiser, 1901, from Somalia, Sudan, Kenya, Tanzania, the Congo, Guinea and the Cameroon Mts (Haeselbarth *et al.*, 1966: 114). *Raymondia intermedia* Jobling, 1936 in Sierra Leone (Haeselbarth *et al.*, 1966: 102), Kenya (Haeselbarth *et al.*, 1966: 102, host referred to as *R. axillaris*), see also Shapiro *et al.* (2016: 255). *Raymondia simplex* Jobling, 1955 at Kasongo, Congo (Haeselbarth *et al.*, 1966: 104; Shapiro *et al.*, 2016: 256). *Raymondia waterstoni* Jobling, 1931 (Shapiro *et al.*, 2016: 256).

VIRUSES:
In their country-wide survey of Kenyan bats, Waruhiu *et al.* (2017) found the following viruses in *Rhinolophus landeri*: Astroviruses and Coronaviruses.

Coronaviridae - Coronaviruses
SARS-CoV - Seven out of 58 (12.1 %) Kenyan bats tested positive for CoV (Tao *et al.*, 2017: Suppl.).

Paramyxoviridae
Drexler *et al.* (2012a: Suppl. Table S1) indicated that the single specimen they examined from Ghana tested negative for *Repirovirus, Henipavirus, Morbillivirus, Rubulavirus* or *Pneumovirus*. In South Africa, however, Mortlock *et al.* (2015: 1841) reported that the only *R. landeri* specimen they examined, tested positive for *Paramyxovirus* sequences.

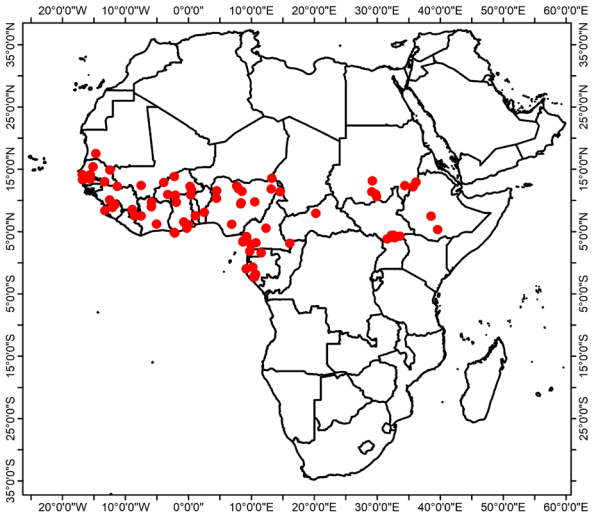

Figure 97. Distribution of *Rhinolophus landeri*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Benin, Burkina Faso, Cameroon, Central African Republic, Côte d'Ivoire, Equatorial Guinea, Ethiopia, Gabon, Ghana, Guinea, Liberia, Mali, Mauritania, Nigeria, Senegal, Sierra Leone, South Sudan, Sudan, The Gambia, Togo.

Rhinolophus lobatus Peters, 1852

1852. *Rhinolophus lobatus* Peters, Naturwissenschaftliche Reise nach Mossambique, Zoologie, Säugethiere, 41, pl. 9; pl. 13, figs 16 - 17. Publication date: 1852. Type locality: Mozambique: S bank Zambesi River, Tette: Sena [17 28 S 35 01 E] [Goto Description]. Syntype: ZMB 24922: ♂, complete skeleton. Collected by: Prof. Wilhelm Carl Hartwig Peters; collection date: between 1843 and 1847. See Turni and Kock (2008). Syntype: ZMB 24927: ♀, complete skeleton. Collected by: Prof. Wilhelm Carl Hartwig Peters; collection date: between 1843 and 1847. See Turni and Kock (2008). Syntype: ZMB 2496: ♀, skull and alcoholic. Collected by: Prof. Wilhelm Carl Hartwig Peters; collection date: between 1843 and 1847. See Turni and Kock (2008). Syntype: ZMB 375: ♀, skin only. Collected by: Prof. Wilhelm Carl Hartwig Peters; collection date: between 1843 and 1847. See Turni and Kock (2008). - Comments: Brown and Dunlop (1997: 1) mention the type locality as "Africa orientalis, Sena, Tette" (=Sena, Mozambique) restricted by Moreau *et al.* (1946: 399). For coordinates: see Ansell and Dowsett (1988: 33). Taylor *et al.* (2018a: 22) situate Sena at -15.679 S, 33.809 E [=15 40 44 S 33 48 32 E]. This is in the Tete province, but north of Tete and 57 km north of the Zambezi River, whereas they also mention the locality to be on the south bank of the Zambezi River. According to Google maps these coordinates point to Muchena, which is on the Revuboe River. We believe

the type locality is the same as "Vila de Sena", which is located at 17 26 30 S 35 01 38 E in the Sofala province, at the south bank of the Zambezi River.

1898. *Rhinolophus angolensis* Seabra, J. Sci. mat. phys. nat., ser. 2, 5: 250. Type locality: Angola: Hanha [12 15 S 13 45 E].

? *Rhinolophus landeri lobatus:* (Name Combination)

TAXONOMY:
Used to be included in *R. landeri* Martin, 1838, but Taylor *et al.* (2018a: 22) found molecular differences which led them to recognize the taxon as a separate species. They also transferred *angolensis* Seabra, 1898, although this taxon might turn out to be a separate species.

CONSERVATION STATUS:
Regional -
South Africa (as *R. landeri*): 2016 - LC ver 3.1 (2001) (Monadjem *et al.*, 2016h). 2004 - NT ver 3.1 (2001) (Friedmann and Daly, 2004). 1986 - Indeterminate (Smithers, 1986).

GENERAL DISTRIBUTION:
For southern African "*R. landeri*", Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 1,008,924 km^2. Taylor *et al.* (2018a: 25) suggest that all savannah populations in southern and eastern Africa might belong to *R. lobatus*.

Native: Angola (Crawford-Cabral, 1989; Monadjem *et al.*, 2010d: 560); Burundi; Congo (The Democratic Republic of the) (Hayman *et al.*, 1966; Dowsett *et al.*, 1991: 259Monadjem *et al.*, 2010d: 560); Kenya; Malawi (Happold *et al.*, 1988; Monadjem *et al.*, 2010d: 560); Mozambique (Smithers and Lobão Tello, 1976; Monadjem *et al.*, 2010d: 560; Monadjem *et al.*, 2010c: 379); Namibia; Rwanda; South Africa (Monadjem *et al.*, 2010d: 560); Tanzania (including Unguja [=Zanzibar] [O'Brien, 2011: 286]); Uganda; Zambia (Ansell, 1969; Ansell, 1978; Monadjem *et al.*, 2010d: 560); Zimbabwe (Cotterill, 2004a: 261; Monadjem *et al.*, 2010d: 560) [All as *R. landeri*].

However, as most of the underlying specimens have not been re-examined, some records from the northeastern DRC and northern Uganda might actually represent *R. landeri*.

ECHOLOCATION:
In South Africa, Aldridge and Rautenbach (1987) reported (as *R. landeri*) a maximum frequency of 110 kHz for individuals from Pafuri, while Jacobs *et al.* (2007a) reported a peak frequency of 107.3 (± 2.1) kHz (detector type and locality not reported). Monadjem *et al.* (2010c: 379) reported from Mozambique that the peak echolocation frequencies for a single female was102.2 kHz (ANABAT), while a single male was recorded at 104 kHz (Pettersson S240x).

Four specimens from Chihalatan and Malashane (Mozambique) had peak frequency of 106.8 ± 0.4 kHz (Taylor *et al.*, 2018a: 24).

PARASITES:
HAEMOSPORIDA
Texeira and Camargo [in Lima *et al.* (2013: 13)] described *Trypanosoma livingstonei* from a "*R. landeri*" specimen collected in Mozambique (see also Barbosa *et al.*, 2016: 215).

DIPTERA
Streblidae: *Raymondia aspera* Maa, 1968 was reported from "*R. landeri*" in Mozambique (Shapiro *et al.*, 2016: 254).

VIRUSES:
Astroviridae
None of the nine Mozabican bats tested by Hoarau *et al.* (2018: 2) was positive for Astroviridae.

Coronaviridae - Coronaviruses
SARS-CoV - Müller *et al.* (2007b) tested between 1986 and 1999, for antibody to SARS-CoV in sera of two "*R. landeri*" specimens from then Limpopo Province, South Africa, neither was positive (0/2).

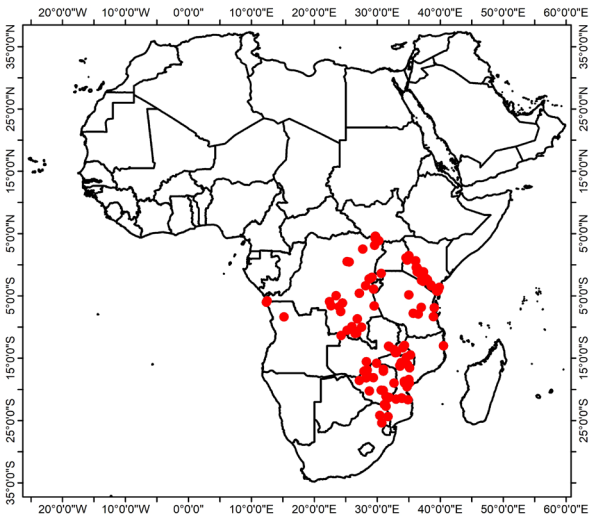

Figure 98. Distribution of *Rhinolophus lobatus*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Angola, Burundi, Congo (Democratic Republic of the), Kenya, Malawi, Mozambique, Rwanda, South Africa, Tanzania, Uganda, Zambia, Zimbabwe.

Rhinolophus mabuensis Taylor, Stoffberg, Monadjem, Schoeman, Bayliss and Cotterill, 2012

*2012. *Rhinolophus mabuensis* Taylor, Stoffberg, Monadjem, Schoeman, Bayliss and Cotterill, PLoS ONE, 7(9): 17. Publication date: 12 September 2012. Type locality: Mozambique: Mt. Mabu [161702S 362353E, 1043 m] [Goto Description]. Holotype: DNSM 10842: ad ♀, skull and alcoholic. Collected by: Michael Curran and Mirjam Kopp; collection date: 13 October 2008. Presented/Donated by: ?: Collector Unknown. Baculum prepared Taylor *et al.* (2012c: 17). Paratype: DNSM 11485: ad ♀, skull and alcoholic. Collected by: J. Bayliss; collection date: 5 September 2009. Presented/Donated by: ?: Collector Unknown. - Etymology: Taylor *et al.* (2012c: 17) selected the specific epithet to draw attention to the serious threats to the unique biodiversity isolated on the montane forest islands in northern Mozambique – notably Mts Mabu and Inago. None of these landforms lie within formally protected areas, and all are undergoing major habitat degradation and destruction from ever-increasing human activities - hunting, fires, timber harvesting and expanding agriculture. - ZooBank: C205928E-D72C-40D5-9647-FDC9391CB1A6. (Current Combination)

TAXONOMY:
Based on mitochondrial and nuclear DNA sequences and morphological and morphometric data, Taylor *et al.* (2012c) found that the *Rhinolophus hildebrandtii* group includes more species than previously recognized.

COMMON NAMES:
English: Mount Mabu Horseshoe Bat. German: Mt Mabu Hufeisennase.

GENERAL DISTRIBUTION:
Known only from two mountains in northern Mozambique but quite possibly extending to nearby Mts. Namuli, Chiperone, Mulanje and the Malawi Rift (Taylor *et al.*, 2012c: 17).

Accurate delimitation of this species' range is subject to further collecting and reappraisal of existing museum material, previously refered to as *R. hildebrandtii*.

Native: Mozambique (Taylor *et al.*, 2012c: 17).

ZOOBANK:
C205928E-D72C-40D5-9647-FDC9391CB1A6

Rhinolophus maclaudi Pousargues, 1898

*1898. *Rhinolophus Maclaudi* Pousargues, Bull. Mus. natn. Hist. nat., Paris, sér 1, 3 (8): 358, f. 1, 2 (for 1897). Publication date: 22 January 1898. Type locality: Guinea: Conakry Island [09 31 N 13 43 W] [Goto Description]. Holotype: MNHN ZM-MO-1897-281: ♀, skull and alcoholic. Collected by: Dr. C. MacLaud. Number 177 in Rode (1941: 237). - Comments: Grubb *et al.* (1998: 78) mention 1898 as year of publication. - Etymology: Named in honour of dr. Maclaud, collector of the holotype (Pousargues, 1897: 361). (Current Combination)
? *Rhinolophus maclaudi:* (Current Spelling)

TAXONOMY:
R. maclaudi is an ecomorphological outlier having long-ears, which traditionally placed it in the *R. philippinensis* group (Andersen, 1905c). Csorba *et al.* (2003: xvii, 63 - 64) state that it is located well inside the Africa clade, in the *maclaudi*-group, and are followed by Simmons (2005: 358). Koopman (1993a: 167) included *ruwenzorii* and *hilli*, but this is revised by Fahr *et al.* (2002), who recognizes

them as distinct species (followed by Csorba *et al.*, 2003 and Simmons, 2005).

COMMON NAMES:
Czech: vrápenec Maclaudův. English: MacLaud's Horseshoe Bat. French: Rhinolophe de MacLaud. German: Maclauds Hufeisennase.

CONSERVATION STATUS:
Global - Listed as Endangered (EN B2ab(iii) ver 3.1 (2001)) because its area of occupancy (cave roosts) is probably less than 500 km², its distribution is severely fragmented through habitat degradation, and the extent of its habitat in the Fouta Djallon Highlands is declining (Fahr, 2008l; IUCN, 2009).

Assessment History -
2008 - EN B2ab(iii) ver 3.1 (2001) (Fahr, 2008l; IUCN, 2009). 2004 - EN B1ab(iii) ver 3.1 (2001) (Fahr, 2004e); IUCN, 2004. 1996 - LR/nt (Baillie and Groombridge, 1996).

MAJOR THREATS:
The relatively limited range of *Rhinolophus maclaudi* is quite densely populated, and it is threatened by habitat loss and degradation of remaining patches of forest, and by overharvesting for the bush meat trade (Fahr *et al.*, 2002).

Sagot and Chaverri (2015: 1670) mention habitat degradation or loss, and hunting as major threats for this species.

CONSERVATION ACTIONS:
Fahr (2008l) [in IUCN (2009)] reported that there appear to be no direct conservation measures in place. It is not known if *Rhinolophus maclaudi* is present in any protected areas. Protection of habitat, further research, and awareness education urgently required.

GENERAL DISTRIBUTION:
Rhinolophus maclaudi is known from a very few localities in eastern Guinea. Fahr *et al.* (2002) report that "apart from the type locality, supposedly Conakry Island, all records are located along the lower, southern slope of the Fouta Djallon region between Kindia and Mamou near the border with Sierra Leone". However, recent surveys have revealed additional localities in the Fouta Djallon Highlands, ranging as far north as the Gessorewoul River in Prefecture Mali (Weber and Fahr, 2007).

Fahr (2007a: 104) re-identified specimens reported from Liberia by Simmons (2005: 358) as *R. ziama*. Specimens from Nigeria reported by Koopman *et al.* (1995: 6, 19), Happold (1987: 60 - 61), and Csorba *et al.* (2003: 64) were re-identified Fahr *et al.* (2002: 99) as *R. hildebrandtii*.

Native: Guinea.
Presence uncertain: Liberia (Simmons (2005: 358); Nigeria (Koopman *et al.*, 1995: 6, 19; Happold, 1987: 60 - 61; Csorba *et al.*, 2003: 64).

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Csorba *et al.* (2003: 63) indicate that *R. maclaudi* is a very large species wiith enormous ears (40.0 - 44.0 mm) and a broad horseshoe, covering almost the whole muzzle. There is also a distinct ridge running on its surface nearly parallel to the outer ridge. There is no secondary horseshoe. The sella is very broad with a broadly rounded summit and parallel margined above. The lancet is long, narrow and cuneate.

ROOST:
For Guinea, Weber and Fahr (2006: 4) indicate that *R. maclaudi* largely or exclusively depends on the availability of caves as day roosts.

POPULATION:
Structure and Density - Little information is available on the population abundance or size of this species. The species roosts singly or in small groups (Fahr *et al.*, 2002).
Trend - 2008 - Decreasing (Fahr, 2008l; IUCN, 2009).

Rhinolophus maendeleo Kock, Csorba and Howell, 2000

*2000. *Rhinolophus maendeleo* Kock, Csorba and Howell, Senckenb. biol., 80 (1/2): 233, 234, figs 1, 4, 7. Publication date: 22 December 2000. Type locality: Tanzania: Tanga district: 2.5 km W of Tanga, Mkulumuzi River Gorge: Amboni Cave Forest [05 05 S 39 02 E, 0 - 80 m] [Goto Description]. Holotype: SMF 79643: ad ♂, skull and alcoholic. Collected by: L. Stubblefield; collection date: 25 February 1992; original number: KMH 7673. Paratype: SMF 66960: ad ♀. Collected by: H. Grossmann; collection date: 29 August 1985; original number: KMH 3216. Presented/Donated by: ?: Collector Unknown. - Etymology: From the Swaihili "*maendeleo*" for progress; a noun in apposition. Named in allusion to the increasing knowledge of the Tanzanian bat fauna (see Kock *et al.* (2000). (Current Combination)

2010. *Rhinolophus cf. maendeleo:* Monadjem, Schoeman, Reside, Pio, Stoffberg, Bayliss, Cotterill, Curran, Kopp and Taylor, Acta Chiropt., 12 (2): 379.

TAXONOMY:
adami species group (Csorba *et al.*, 2003: 5 - 7; Simmons, 2005: 359). See Csorba *et al.* (2003: 6) for remarks on taxonomy.

COMMON NAMES:
Czech: vrápenec tanganjický. English: Maendeleo Horseshoe Bat. French: Rhinolophe de Tanga. German: Tanzania-Hufeisennase.

CONSERVATION STATUS:
Global - Listed as Data Deficient (DD ver 3.1 (2001)) since it has only recently been discovered, and there is still very little information on its extent of occurrence, status and ecological requirements (Jacobs *et al.*, 2008ae; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) (Jacobs *et al.*, 2008ae; IUCN, 2009). 2004 - DD ver 3.1 (2001) (Jacobs *et al.*, 2004r; IUCN, 2004).

MAJOR THREATS:
The threats to *Rhinolophus maendeleo* are not known (Jacobs *et al.*, 2008ae; IUCN, 2009).

CONSERVATION ACTIONS:
Jacobs *et al.* (2008ae) [in IUCN (2009)] reported that while *Rhinolophus maendeleo* is present in the Mazumbai Forest Reserve, further habitat protection is generally needed. Additional field surveys are needed to better determine the true extent of the species geographic range.

GENERAL DISTRIBUTION:
Rhinolophus maendeleo is a poorly known species that has only been recorded from two localities in Tanzania at elevations of up to 1,900 m asl, the type locality of 'Amboni Cave Forest, Mkulumuzi River Gorge, 2.5 km W of Tanga, Tanga District' (Anciaux de Faveaux, 1958) and Mazumbai Forest Reserve in the Usambara Mountains. It has recently been recorded from a single locality in Mozambique. Additional surveys are needed to better determine the range of this recently described species.

Native: Mozambique (Monadjem *et al.*, 2010d: 560; Monadjem *et al.*, 2010c: 379); Tanzania (Kock *et al.*, 2000; Csorba *et al.*, 2003: 6).

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:
Csorba *et al.* (2003: 6) indicate that the skull of *R. maendeleo* has an open foramen infraorbitale (without bony bar).

DETAILED MORPHOLOGY:
Baculum - See Csorba *et al.* (2003: 6).

POPULATION:
Structure and Density - *Rhinolophus maendeleo* is currently known only from two specimens, and there is no information on population sizes or trends (Jacobs *et al.*, 2008ae; IUCN, 2009).
Trend - 2008 - Unknown (Jacobs *et al.*, 2008ae; IUCN, 2009).

Rhinolophus mehelyi Matschie, 1901

*1901. *Rhinolophus mehelyi* Matschie, Sber. Ges. naturf. Freunde Berlin, 225. Type locality: Romania: Ilfov province: Bucharest [44 26 N 26 06 E]. - Etymology: In honour of Lajos Méhely (1862 - 1952) (see Kozhurina, 2002: 16). (Current Combination)

1904. *E[uryalus] barbarus* K. Andersen and Matschie, Sber. Ges. naturf. Freunde Berlin, 79. Type locality: Morocco: Tangiers [35 48 N 05 50 W]. Holotype: ZMB 12967: ♂, skull and alcoholic. Collected by: Kurt Floericke; collection date: 12 March 1898. See Turni and Kock (2008). Paratype: MHNG ♂, skull and alcoholic. Former ZMB 12968, exchanged in 1909; see Turni and Kock (2008: 28). Paratype: MHNG ♂, skull and alcoholic. Former ZMB 12972, exchanged in 1909; see Turni and Kock (2008: 28). Paratype: ZMB 12969: ♂, skull and alcoholic. Collected by: Kurt Floericke. See Turni and Kock (2008: 28). Paratype: ZMB 12970: ♂, skull and alcoholic. Collected by: Kurt Floericke. See Turni and Kock (2008: 28). Paratype: ZMB 12971: ♂, skull and alcoholic. Collected by: Kurt Floericke. See Turni and Kock (2008: 28). Paratype: ZMB 12972: Collected by: Kurt Floericke; collection date: 12 March 1898. Paratype: ZMB 12973: alcoholic (skull missing). Collected by: Dr. Lühe; collection date: 12 March 1898. From cave near Tebourba; see Turni and Kock (2008: 28). Paratype: ZMB 12974: ♂, alcoholic, skull and skeleton. Collected by: Dr. Lühe; collection date: 12 March 1898. From cave near Terbourba, see Turni and Kock (2008: 28) [lost]. Paratype: ZMB 12975: alcoholic (skull missing). Collected by: Dr. Lühe; collection date: 12 March 1898. From cave near Tebourba; see Turni and Kock (2008: 28).

1904. *E[uryalus] meridionalis* K. Andersen and Matschie, Sber. Ges. naturf. Freunde Berlin, 79. Type locality: Algeria: "Algeria". Holotype: ZMB 12976: ♀, skull and alcoholic. Collected by: Verreaux; collection date: undated. See Turni and Kock (2008: 26). Paratype: ZMB 3052: ♀. Collected by: Verreaux; collection date: undated. Number of paratype is 3052, not 12977 as mentioned by Andersen and Matschie (1904: 83): see Turni and Kock (2008: 29).

1955. *Rhinolophus euryale tuneti* Deleuil and Labbé, Bull. Soc. Sci. nat. Tunisie, 8: 52, 53. Type locality: Tunisia: Cap Bon: El Haouaria cave [37 03 N 11 01 E] [Goto Description]. Neotype: USNM 498999: ad ♂, skin and skull. Collected by: Tom Vaughan and Pamela Vaughan; collection date: 4 May 1975; original number: TPV 3244. Presented/Donated by: ?: Collector Unknown. Fisher and Ludwig (2015: 54) mention that a type specimen was not designated by Deleuil and Labbe (1955a), and that the type series has been lost. They also indicate that Cockrum (1976: 868) incorrectly gave the wrong number when assigning the neotype (USNM 498998). - Comments: Horácek *et al.* (2000: 102) consider it a valid subspecies. Dalhoumi *et al.* (2011: 267) indicate that Deleuil and Labbe (1955a) based their description on a specimen belonging to *R. mehelyi* (type) and two belonging to *R. blasii* (paratypes), as was already suggested by Aellen and Strinati (1970: 231) and Cockrum (1976: 685).

1993. *tunetae:* Koopman, in: Wilson and Reeder, Mammal species of the World (2nd Edition): Chiroptera, 167. (Lapsus)

1995. *tunetai:* Pavlinov, Borissenko, Kruskop and Jahonton, Arch. Zool. Mus., Moscow State Univ., 133: 81. (Lapsus)

? *Rhinolophus euryale barbarus:* (Name Combination)

? *Rhinolophus mehelyi mehelyi:* (Name Combination)

? *Rhinolophus mehelyi tuneti:* (Name Combination)

TAXONOMY:
Revised by DeBlase (1972). *euryale* species group (Csorba *et al.*, 2003: 17 - 18; Simmons, 2005: 359). See Csorba *et al.* (2003: 17 - 18) for remarks on taxonomy.

Based on the measurements given by Andersen and Matschie (1904), Puechmaille *et al.* (2012: 216) suggest that *R. barbarus* Andersen et Matschie, 1904 and *R. meridionalis* Andersen et Matschie, 1904 are both synonyms of *R. mehelyi* Matschie, 1901 rather than of *R. euryale* Blasius, 1853.

COMMON NAMES:

Ukrainian: Підковик (Підковоніс) Мегеля. Welsh: Ystlum pedol Mehely.

CONSERVATION STATUS:
Global - The species is declining throughout its range, which is becoming increasingly fragmented. The rate of decline has been estimated as 10 % in the last 10 years in Andalucia (Spain). Elsewhere, declines have not been quantified but appear to have been considerable, with some colonies having been reduced to a fraction of their former size. Overall, declines throughout the global range are thought likely to exceed 30 % over 3 generations (27 years) over a time window including both the past and the future. The species is going extinct in France and is declining in Morocco due to disturbance in caves. The species only roosts in caves and does not use artificial roosts. Hence the species is listed as Vulnerable (VU A4c ver 3.1 (2001)) (Hutson *et al.*, 2008n; IUCN, 2009).

Assessment History -
2008 - VU A4c ver 3.1 (2001) (Hutson *et al.*, 2008n; IUCN, 2009). 1996 - VU A2c ver 2.3 (1994) (Baillie and Groombridge, 1996).

MAJOR THREATS:
Rhinolophus mehelyi is affected by disturbance and loss of underground habitats, changes in foraging habitats, and destruction of caves by tourism. Mortality due to collision with cars is a problem in some areas (e.g., Portugal). The reasons for the declines are not fully understood (Hutson *et al.*, 2008n; IUCN, 2009).

According to Sherwin *et al.* (2012: 174), climatic change will have an inportant impact due to the following risk factors: its small range, roosting in caves or trees, its water stress and aerial hawking feeding style.

Roost loss or disturbance, and habitat degradation or loss are considered the major threats for this species by Sagot and Chaverri (2015: 1670).

CONSERVATION ACTIONS:
Hutson *et al.* (2008n) [in IUCN (2009)] reported that *Rhinolophus mehelyi* is protected by national legislation in all European range states. There are also international legal obligations for its protection through the Bonn Convention (Eurobats) and Bern Convention where those apply. It is included in Annex II (and IV) of EU Habitats and Species Directive, and hence equires special measures for conservation including designation of Special Areas for Conservation. There is some habitat protection through Natura 2000 (some roosts are already protected by national legislation). An EU-LIFE funded project aims to ensure the long-term conservation of the large populations of cave and forest-dwelling bats, including this species, in Spain. There are no specific conservation measures in place in North Africa. Research is required on the causes of the declines across the range.

GENERAL DISTRIBUTION:
Rhinolophus mehelyi is largely restricted to the Mediterranean. It has a discontinuous distribution from north Africa (Morocco, Algeria, Tunisia and Egypt) and southern Europe (southern Portugal and Spain, possibly one occurrence in France, a few places in Italy and the Balkans) through Asia Minor, Anatolia, to Transcaucasia, Iran and Afghanistan (where its exact roost location is not known: Srinivasulu et al., in press). It is patchily distributed in some large and vulnerable colonies. It occurs up to 2,000 m in High and Saharan Atlas mountains, although it is typically found at lower altitudes in other parts of its range (e.g. in Spain it tends to occur below 700 m).

Native: Afghanistan; Algeria (Horácek *et al.*, 2000: 102); Armenia; Azerbaijan; Bosnia and Herzegovina; Bulgaria; Cyprus; Egypt; Georgia; Gibraltar; Greece; Iran, Islamic Republic of; Iraq;

Israel; Italy (Sardegna, Sicilia); Jordan; Libyan Arab Jamahiriya; Macedonia, the former Yugoslav Republic of; Mediterrranean islands; Moldova; Montenegro; Morocco (El Ibrahimi and Rguibi Idrissi, 2015: 359); Palestinian Territory, Occupied; Portugal; Romania; Russian Federation; Serbia; Slovenia; Spain; Syrian Arab Republic; Tunisia (Dalhoumi *et al.*, 2016b: 867); Turkey; Yugoslavia.
Regionally extinct: Croatia.
Presence uncertain: France.

ECHOLOCATION:
Jones and Siemers (2010: 450) indicate that juveniles emit lower frequencies than adults, and that the CF-frequency is positively related to the body condition (mass/forearm length). Puechmaille *et al.* (2014b: 4) demonstrated that the body length and weight for bats caught during the mating season showed a strong positive correlation (which was significant) with the peak frequency in both sexes: larger and heavier bats call at higher frequencies. Females clearly show a preference for higher calling males, and the latter have a larger offspring. Puechmaille *et al.* (2014b: 6) also found that the distribution of the echolocation frequencies was not normally distributed in adults, but left-skewed (meaning that there are more individuals calling at higher frequencies). Furthermore (p. 7), they indicate [referring to Jones and Ransome (1993)] that the peak frequency in horseshoe bats increases with about 0.45 kHz during the first year and an average reduction of 0.09 kHz per year occurs over their lifetime.

For 16 Greek specimens, Papadatou *et al.* (2008b: 132) report a start frequency of 96.2 ± 7.06 kHz, a terminating frequency of 90.3 ± 2.16 kHz, a peak frequency of 109.5 ± 1.44 kHz, and a bandwidth of 5.1 ± 2.62 kHz. The duration of the call is 35.9 ± 12.04 msec, and the interpulse interval is 62.5 ± 23.92 msec.
Walters *et al.* (2012: suppl.) presen the following figures for 41 calls from Bulgarian bats: duration: 27.73 ± 7.12 msec, F_{max}: 108.59 ± 1.51 kHz, F_{min}: 92.61 ± 4.73 kHz, bandwidth: 15.98 ± 4.44 kHz, F_{peak}: 107.78 ± 2.74 kHz. Tunisian bats emitted sounds at 106.11 ± 1.31 kHz (111.5 - 117.5 kHz; Dalhoumi *et al.*, 2016b: 866).

Schuchmann *et al.* (2012: 161) found that both sexes were able to recognize the sex of conspecifics from their echolocation calls.

MOLECULAR BIOLOGY:
DNA - Unknown.

Karyotype - Đulic and Soldatovic (1969) and Rushton (1970 463) reported 2*n* = 58, FN = 64, a submetacentric X chromosome, and an acrocentric Y chromosome. While Baker *et al.* (1974; 1975) reported FN = 60 and BA = 4. Volleth *et al.* (2002: 483) and Volleth and Eick (2012: 166) report 2*n* = 58 and a segment number [= autosomal segments + X] of 44. Arslan and Zima (2014: 8) indicate that different numbers of bi-armed auosomes have been reported, leading to FNa values between 60 and 64.
Đulic and Soldatovic (1969: 5) also reported the type of the autosomes as 4 metacentric, 2 small-sized and 24 acrocentric.

Protein / allozyme - Unknown.

HABITAT:
In south-western Spain, Russo *et al.* (2005: 327) found that *R. meheyli* least preferred open habitats, but was frequently found in a semi-natural oak savanna habitat. Salsamendi *et al.* (2012a: 122) pointed out that this was in an area where both *R. mehelyi* and *R. euryale* occurred, and they reported that *R. mehelyi*, in another area, always foraged in woodlands, preferably in cluttered spaces, but also in less-clutttered/more-open ones, and was avoiding open spaces. They also indicated that the bats foraged generally less than 500 m from water bodies. The bats were using linear landscape elements (tree lines and riparian forests) to travel from their roosts to their feeding areas. Salsamendi *et al.* (2012a: 129) also indicated that habitat types used by males and females in south-western Spain were different: males foraged in riparian forest and broad-leaved woodlands, whereas females foraged in dehesa, scrubland and eucalypt plantations.

HABITS:
Kameneva (1976) [in Pervushina *et al.* (2012: 750)] found that among captive *R. mehelyi* individuals, conflicts took place during foraging flights, although they were primarily friendly or neutral to one another when resting during the day.

ROOST:
Based on data from Sardinia, Russo *et al.* (2014: 9) rule out that *R. euryale* and *R. mehelyi* compete for roosting sites.

DIET:
In the Iberian peninsula, Salsamendi *et al.* (2009: 282) report that Lepidoptera form the most important prey category for this species (from 51.3 to 100.0 volume percent; 90.9 to 100.0 occurrence percentage), followed by Neuroptera, Diptera, Coleoptera, Hemiptera and undefined items. In Iran, Lepidoptera also form the dominant food item, followed by scarabaeid beetles and muscid dipterans (see Benda *et al.*, 2012a: 247).

In the southwestern Iberian peninsula, Arrizabalaga-Escudero *et al.* (2018: Suppl.) identified the following food items from faecal samples of *R. mehelyi* (food items marked with an asterisk were also found in faecal samples of *R. euryale*): Coleoptera (Cerambycidae: *Arhopalus ferus* (Mulsant, 1839)*); Diptera (Tachinidae: unidentified*; Anthomyiidae: *Hylemya* sp.; Muscidae: *Neomyia cornicina* (Fabricius, 1781); Calliphoridae: *Pollenia vagabunda* (Meigen, 1826)); Lepidoptera (Blastobasidae: *Blastobasis phycidella* (Zeller, 1839); Cosmopterigidae: *Eteobalea intermediella* (Riedl, 1966); Crambidae: *Calamotropha paludella* (Hübner, 1824)*; *Ostrinia nubilalis* (Hübner, 1796)*; *Udea ferrugalis* (Hübner, 1796); Erebidae: *Catocala nymphagoga* (Esper, 1787)*; Gelechiidae: *Teleiopsis* sp.*; Geometridae: *Camptogramma bilineata* (Linnaeus, 1758)*; *Ennomos quercaria* (Hübner, 1813)*; *Pachycnemia hippocastanaria* (Hübner, 1799)*; *Rhoptria asperaria* (Hübner, 1817)*; Lasiocampidae: *Malacosoma neustria* (Linnaeus, 1758); Lecithoceridae: *Eurodachtha canigella* (Caradja, 1920); Noctuidae: *Agrotis segetum/trux**; *Agrotis ipsilon* (Hufnagel, 1766)*; *Autographa gamma/pulchrina**; *Calophasia platyptera* (Esper, [1788])*; *Heliothis incarnata* Freyer, 1838; *Mythimna albipuncta* (Denis & Schiffermüller, 1775)*; *Mythimna vitellina* (Hübner, 1808); *Mythimna loreyi/sicula**; *Peridroma saucia* (Hübner, 1808)*; *Polyphaenis sericata* (Esper, 1787)*; *Sesamia nonagrioides* (Lefèbvre, 1827)*; Praydidae: *Prays fraxinella* Bjerkander, 1784*; Pterophoridae: *Crombrugghia laetus* (Zeller, 1847); *Emmelina monodactyla* (Linnaeus, 1758); *Stenoptilia zophodactyla* Duponchel, 1840; Pyralidae: *Pempelia palumbella* (Denis & Schiffermüller, 1775)*; Tortricidae: *Archips xylosteana* (Linnaeus, 1758); *Cnephasia* sp. 1*; *Cnephasia* sp. 2*; Yponomeutidae: *Zelleria oleastrella* (Millière, 1864); Neuroptera (Hemerobiidae: *Wesmaelius nervosus* (Fabricius, 1793); Chrysopidae: *Chrysoperla* sp.*; Myrmeleontidae: *Distoleon tetragrammicus* (Fabricius, 1798)*). Of the 64 prey taxa, 32 (representing over 75 % of all food items) were consumed by both *R. mehelyi* and *R. euryale*.

Benda *et al.* (2014c: 33) analysed 22 faecal pellets from Wadi Darnah (Libya) and found these to consist primarily of Blattoidea (99.1 % by volume) and 0.9 % of Lepidoptera.

POPULATION:
Structure and Density - Hutson *et al.* (2008n) [in IUCN (2009)] indicate that *Rhinolophus mehelyi* is an infrequent species, which is reported to have declined in all parts of its range for which data are available. In Andalucia (Spain), the rate of decline has been estimated at 10 % over the last ten years. The species is close to extinction in France (Rodrigues and Palmeirim, 1999), Romania (Botnariuc and Tatole, 2005), and north-east Spain (J. Juste and T. Alcalde *pers. Comm.,* 2006). In France, only one individual was recorded in 2004 (S. Aulagnier *pers. Comm.,* 2006), and in Romania the population was estimated at 5,000 in the 1950s, but now numbers approximately 100 (Dumitrescu *et al.*, 1962-3, Botnariuc and Tatole, 2005). It is also declining in southern Spain (Franco and Rodrigues de los Santos, 2001), Portugal (Rodrigues *et al.*, 2003), the Russian Federation (K. Tsytsulina *pers. Comm.,* 2005), Georgia, and Morocco (SW Asia Workshop 2005). In Iran mixed-species colonies including *R. mehelyi*, which in the 1970s were estimated to be over 10,000 individuals, now only number a few hundred individuals (M. Sharifi *pers. obs.,* 2005). Summer nursery colonies typically number 30 - 500 individuals (although colonies of up to 3,000 individuals have been recorded, separated in smaller groups within the same cave). Winter clusters consist of up to 5,000 animals.
Trend - 2008 - Decreasing (Hutson *et al.*, 2008n; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
Benda *et al.* (2014c: 30) captured a lactating female on 15 May at Wadi Darnah (Libya).

MATING:
Puechmaille *et al.* (2011b: 40-41) found that during the mating season, females prefer males with higher frequency calls, indicating that this high frequency is probably a signal of good body condition.

POSTNATAL DEVELOPMENT:
In western Iran, Sharifi (2004: 155) determined that Fa and body mass followed a linear pattern of growth until day 14 (resp. 1.55 mm/day and 0.58 g/day) and subsequently decreased to reach a stable level. The length of the gap of the metacarpal-phalangeal joint showed an increase up to 10 days and decreased until it had closed at over 55 days. At about four weeks of age, the young started to fly.

PARASITES:
Beaucournu and Kock (1996) report the presence of the flea *Rhinolophopsylla unipectinata arabs* Jordan and Rothschild, 1921 on specimens from Algeria.

Benda *et al.* (2014c: 33) recorded the following parasites from Libyan *R. mehelyi*:
Ischnopsyllidae: *Rhinolophopsylla unipectinata arabs* Jordan and Rothschild, 1921,
Nycteribiidae: *Phthiridium biarticulatum* (Hermann, 1864),

Streblidae: *Brachytarsina flavipennis* Macquart, 1851

The following ectoparasites were found on Algerian bats by Bendjeddou *et al.* (2017: 15): Nycteribiidae: *Nycteribia (Nycteribia) pedicularia* Latreille, 1805 and *Phthiridium biarticulatum* Hermann, 1804; Streblidae: *Brachytarsina (Brachytarsina) flavipennis* Macquart, 1851; and Arachnida: *Spinturnix myoti* (Kolenati, 1856) and *Eyndhovenia euryalis* (G. Canestrini, 1885).

From Iran, Sharifi *et al.* (2013: 181) mention the presence of the following ectoparasites: *Eyndhovenia* sp. (Acari: Spinturnicidae; on 89.65 % of the 87 bats examined, with 13.79 ind/bat, primarily on wing and tail membranes), *Penicillidia* sp. (Diptera: Nycteribiidae; 66.66 %, 2.31, mainly on fur) and one species from Streblidae (Diptera; 11.49 %, 1.80, on all parts of the body).

In Azerbaijan, Duszynski (2002: 6) mentions *Eimeria mehelyi* Musaev and Gauzer, 1971 (Apicomplexa) as parasite.

VIRUSES:
Coronaviridae - Coronaviruses
Luis *et al.* (2013: suppl.) mention the presence of a SARS coronavirus-related virus.

Alphacoronavirus
This virus was reported from Germany by Kohl and Kurth (2014: 3112).
Betacoronavirus
Kohl and Kurth (2014: 3112) report this virus from Bulgaria and Germany.

Rhinolophus mossambicus Taylor, Stoffberg, Monadjem, Schoeman, Bayliss and Cotterill, 2012

*2012. *Rhinolophus mossambicus* Taylor, Stoffberg, Monadjem, Schoeman, Bayliss and Cotterill, PLoS ONE, 7(9): 19. Publication date: 12 September 2012. Type locality: Mozambique: Nissa Game Reserve: Maputo Camp [121056S 373300E, 489 m] [Goto Description]. Holotype: DNSM 8578: ♂, skull and alcoholic. Collected by: Dr. Ara Monadjem; collection date: 1 July 2006. Presented/Donated by: ?: Collector Unknown. Baculum; skull and mandible in good condition (Taylor *et al.*, 2012c: 19). Paratype: DNSM 11276: ad ♀, skull and alcoholic. Collected by: ?: Collector Unknown. Presented/Donated by: ?: Collector Unknown. Paratype: DNSM 8577: ad ♀, skull and alcoholic. Collected by: ?: Collector Unknown. Presented/Donated by: ?: Collector Unknown. Paratype: DNSM 8579: ad ♂, skull and alcoholic. Collected by: ?: Collector Unknown. Presented/Donated by: ?: Collector Unknown. Baculum. Paratype: DNSM 8580: ad ♂, skull and alcoholic. Collected by: ?: Collector Unknown. Presented/Donated by: ?: Collector Unknown. Baculum. - Etymology: The name denotes the country of origin (Mozambique) of the type specimen of this species (Taylor *et al.*, 2012c: 20). - ZooBank: 0D97DC39-F9CD-415E-A7AE-4DCF70C807B4. (Current Combination)

TAXONOMY:
Based on mitochondrial and nuclear DNA sequences and morphological and morphometric data, Taylor *et al.* (2012c) found that the *Rhinolophus hildebrandtii* group includes more species than previously recognized.

Carr *et al.* (2017) performed some additional analyses, which confirmed that *R. mossambicus* forms a well-defined clade based on mtDNA, but based on nuclear DNA, however, this taxon groups with *R. fumigatus* from Namibia.

COMMON NAMES:
English: Mozambican Horseshoe Bat. German: Mossambique-Hufeisennase.

GENERAL DISTRIBUTION:
Based on genetic data, the species is known from five localities in Mozambique from altitudes of

1,500 m - Chinizuia Forest, Gerhard's Cave, Gorongosa Caves, Namapa, Niassa Game Reserve and one locality, Lutope-Ngolangola Confluence in NW Zimbabwe. These scattered records across the subregion suggest that *R. mossambicus* is widespread across the savanna biome of Zimbabwe and Mozambique (Taylor *et al.*, 2012c: 20).

PARASITES:
DIPTERA:
Streblidae: *Raymondia aspera* Maa, 1968 (Shapiro *et al.*, 2016: 254). *Raymondia waterstoni* Jobling, 1931 (Shapiro *et al.*, 2016: 256).

VIRUSES:
Astroviridae
None of the 20 Mozambican bats tested by Hoarau *et al.* (2018: 2) was positive for this group of viruses.

ZOOBANK:
0D97DC39-F9CD-415E-A7AE-4DCF70C807B4

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Malawi, Mozambique, Zimbabwe.

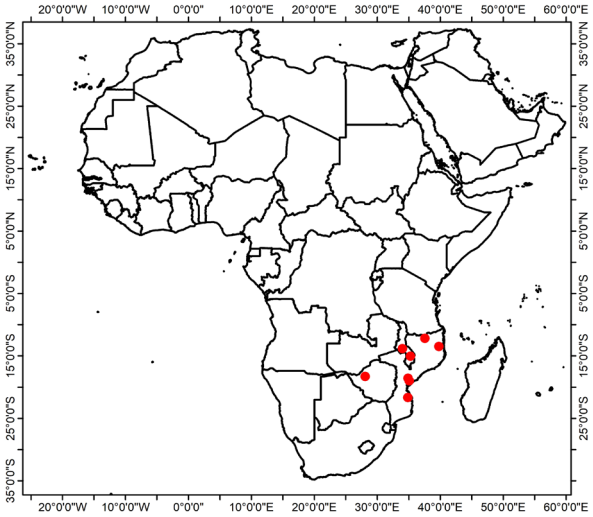

Figure 103. Distribution of *Rhinolophus mossambicus*

Rhinolophus rhodesiae Roberts, 1946

1946. *Rhinolophus swinnyi rhodesiae* Roberts, Ann. Transv. Mus., 20 (4): 304. Type locality: Zimbabwe: Limpopo valley: Bezwe river: a tributary of the Wanetsi (? Nuanetsi) River [ca. 21 22 S 30 45 E] [Goto Description]. Holotype: TM 1325: ad ♀. Collected by: Austin Roberts; collection date: 19 August 1913. Presented/Donated by: ?: Collector Unknown. - Etymology: The name refers to Southern Rhodesia (currently Zimbabwe), the country where the type specimen was collected.

2018. *Rhinolophus rhodisiae:* Hoarau, Le Minter, Joffrin, Schoeman, Lagadec, Ramasindrazana, Dos Santos, Goodman, Gudo, Mavingui, Lebarbenchon, Virology J., 15: Suppl.. Publication date: 30 June 2018. (Lapsus)

ECHOLOCATION:
Taylor *et al.* (2018a: 21) mention a peak frequency ranging from 99 to 102 kHz for eight bats from the Malashane cave (Mozambique).

VIRUSES:
Astroviridae
None of the 31 Mozambican bats tested by Hoarau *et al.* (2018: 2) was positive for this group of viruses.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Congo (Democratic Republic of the), Malawi, Mozambique, South Africa, Tanzania, Zambia, Zimbabwe.

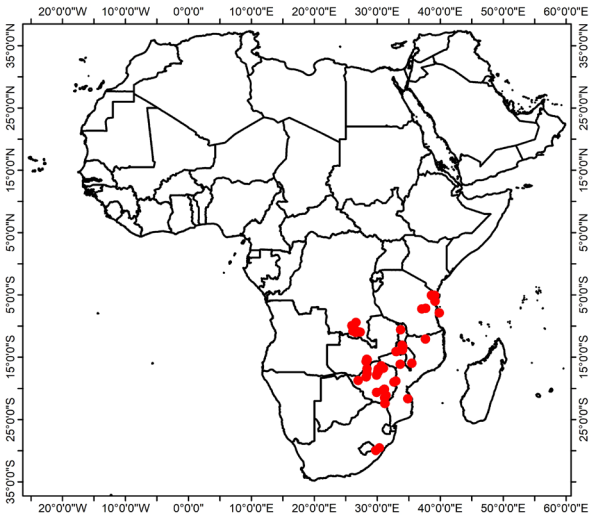

Figure 104. Distribution of *Rhinolophus rhodesiae*

Rhinolophus ruwenzorii J. Eric Hill, 1942

*1942. *Rhinolophus ruwenzorii* J. Eric Hill, Am. Mus. Novit., 1180: 1, fig. 1. Publication date: 28 July 1942. Type locality: Congo (Democratic Republic of the): Kivu province: W slope of

Mount Ruwenzori: Buhatu valley [00 22 N 29 44 E,, 7 500 ft] [Goto Description]. Holotype: AMNH 82394: ad ♀, skull and alcoholic. Collected by: James Paul Chapin, Dewitt L. Sage, Frank P. Mathews and The Ruwenzori-Kivu Expedition; collection date: 24 December 1926. - Comments: Fahr *et al.* (2002: 99) mention "S-side of Butahu Valley, 2286 m, W slope Rwenzori Mts., Congo (K.)." as type locality. - Etymology: Referring to the Ruwenzori mountains, where the type specimen was collected. (Current Combination)

? *Rhinolophus maclaudi ruwenzorii:* (Name Combination)

TAXONOMY:
Included in *maclaudi* by Koopman (1993a: 167), see Smith and Hood (1980: 170); but see Fahr *et al.* (2002), Csorba *et al.* (2003: 65 - 66) and Simmons (2005: 362).

COMMON NAMES:
Czech: vrápenec ruwenzorijský. English: Ruwenzori Horseshoe bat. French: Rhinolophe du Ruwenzori. German: Ruwenzori-Hufeisennase.

CONSERVATION STATUS:
Global - Listed as Vulnerable (VU B1a+2b(ii,iii,iv,v) ver 3.1 (2001)) because its extent of occurrence is less than 20,000 km^2, it is known from fewer than ten locations, and there is continuing decline in the extent and quality of its montane forest habitat, and probable loss of colonies through disturbance of roosting sites (Fahr, 2008m; IUCN, 2009).

Assessment History -
2008 - VU B1a+2b(ii,iii,iv,v) ver 3.1 (2001) (Fahr, 2008m; IUCN, 2009). 2004 - VU A4c; B1ab(iii) ver 3.1 (2001) (Fahr, 2004d; IUCN, 2004); and assessed as *R. hilli* by Fahr (2004f).

MAJOR THREATS:
Rhinolophus ruwenzorii is threatened by the deforestation of its montane habitat, generally through logging and mining activities, and the conversion of forest to farmland. It is dependent on cave habitats for roosting, and it is likely that disturbance of these sites could be an important threat to the species. It may be threatened by overharvesting for subsistence food, and while this needs to be fully confirmed populations are vulnerable to direct exploitation (Fahr, 2008m; IUCN, 2009).

CONSERVATION ACTIONS:
Fahr (2008m) [in IUCN (2009)] reported that *Rhinolophus ruwenzorii* has been recorded from some protected areas, such as the Mount Ruwenzori National Park. There is a need to reduce levels of deforestation within the Albertine Rift region as a whole. There is a need to initiate and develop public awareness programmes in the region, and to reduce the disturbance of roosting localities. Further field surveys are needed to locate additional population of this species.

GENERAL DISTRIBUTION:
Rhinolophus ruwenzorii is restricted to the mountains of the Albertine Rift, where it has been recorded from the countries of the eastern Democratic Republic of the Congo, western Uganda, and Rwanda, at elevations of 1,666 to 2,666 m asl. The distribution includes the Ruwenzori Mountains, Kivu Region and Kibali-Ituri-Forest, Bwindi-Impenetrable Forest and Mutura in northwestern Rwanda (Fahr *et al.*, 2002). Eastern Democratic Republic of the Congo, Western Uganda.

Native: Congo (The Democratic Republic of the) Kityo and Kerbis (1996: 60); Rwanda (Fahr *et al.*, 2002); Uganda Kityo and Kerbis (1996: 60).

POPULATION:
Structure and Density - This species is known only from 36 specimens collected from 13 localities, these total only eight distinct locations (Fahr, 2008m; IUCN, 2009).
Trend - 2008 - Decreasing (Fahr, 2008m; IUCN, 2009).

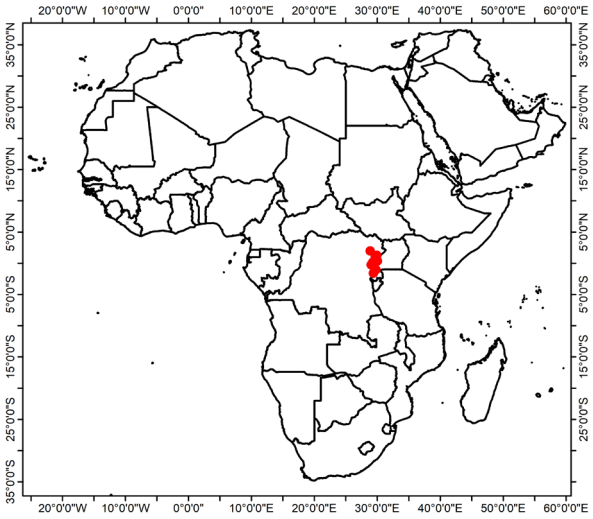

Figure 105. Distribution of *Rhinolophus ruwenzorii*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Congo (Democratic Republic of the), Rwanda, Uganda.

Rhinolophus sakejiensis Cotterill, 2002

*2002. *Rhinolophus sakejiensis* Cotterill, J. Zool., Lond., 256: 166, figs. 2a, 3, 4a, 5a, 6a, 7a. Type locality: Zambia: Mwinilunga district; Ikelenge Pedicle: btw Sakeji/Zambezi rivs,c.11 km NNE source Zambezi: Kavunda [11 17 S 24 21 E, 1 388 m] [Goto Description]. Holotype: NHMZ 29153: ad ♂, skull and alcoholic. Collected by: F.P.D. ("Woody") Cotterill; collection date: 11 October 1990; original number: FWC 1090. Baculum extracted. Paratype: HZM 1.32236: ad ♂, skull and alcoholic. Collected by: F.P.D. ("Woody") Cotterill; collection date: 11 October 1990; original number: FWC 1092. Baculum extracted. Paratype: NHMZ 29154: sad ♂, skull and alcoholic. Collected by: F.P.D. ("Woody") Cotterill; collection date: 11 October 1990; original number: FWC 1091. Baculum extracted. (Current Combination)

TAXONOMY:
Cotterill (2002b: 5) considers it a member of the *ferrumequinum* species group, and is followed by Simmons (2005: 362). See Csorba *et al.* (2003: 132 - 133) for remarks on taxonomy.

COMMON NAMES:
Czech: vrápenec sakežianský. English: Sakeji Horseshoe bat. French: Rhinolophe de Sakeji. German: Sakeji-Hufeisennase.

CONSERVATION STATUS:
Global - Listed as Data Deficient (DD ver 3.1 (2001)) since it has only recently been discovered, and there is still very little information on its extent of occurrence, ecological requirements and threats (Cotterill, 2008a; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) (Cotterill, 2008a; IUCN, 2009). 2004 - DD ver 3.1 (2001) (IUCN, 2004; Cotterill, 2004c).

MAJOR THREATS:
The threats to *Rhinolophus sakejiensis* are not well known, but it is presumably threatened by the loss of roosting sites resulting from logging and the conversion of suitable habitat to agricultural use (Cotterill, 2008a; IUCN, 2009).

CONSERVATION ACTIONS:
Cotterill (2008a) [in IUCN (2009)] reported that it is not known if *Rhinolophus sakejiensis* is present in any protected areas. Further surveys are needed to better determine the extent of the distribution of this species, to gather more information on the species natural history, and to review the threats to this species.

GENERAL DISTRIBUTION:
Rhinolophus sakejiensis is known only from the type locality of Kavunda, between the Sakeji and Zambezi rivers: c. 11 km north-north-east of the source of the Zambezi River in the Ikelenge Pedicle, Mwinilunga District of north-west Zambia (Cotterill, 2002a). It is likely that the species is also present within similar suitable habitat in Angola and the Congo basin (Cotterill, 2002a).

Native: Zambia (Monadjem *et al.*, 2010d: 560).

POPULATION:
Structure and Density - *Rhinolophus sakejiensis* is currently known only from the type collection of three bats, taken from a cluster of six roosting bats (Cotterill, 2008a; IUCN, 2009).
Trend - 2008 - Unknown (Cotterill, 2008a; IUCN, 2009).

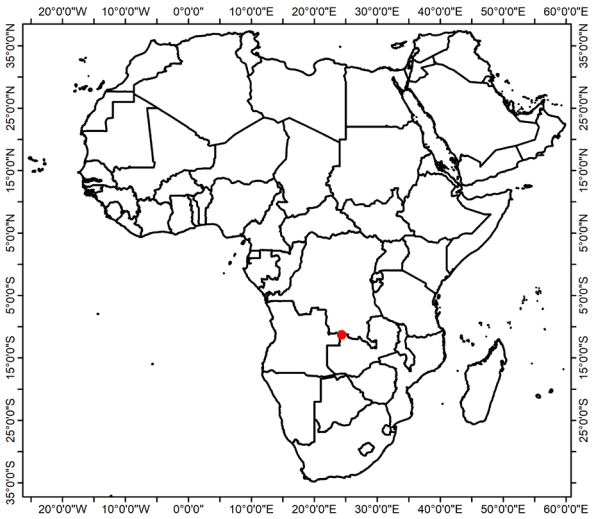

Figure 106. Distribution of *Rhinolophus sakejiensis*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Zambia.

Rhinolophus silvestris Aellen, 1959

*1959. *Rhinolophus silvestris* Aellen, Archs Sci. Genève, 12 (2): 228. Type locality: Gabon: Lastourville: N'Dumbu cave [ca. 00 50 S 12 03 E] [Goto Description]. Holotype: MHNG 965.040: ad ♂, alcoholic (skull not removed). Collected by: Pierre Strinati and Villy Aellen;

collection date: 4 August 1957. - Etymology: From the Latin for forest dweller (see Flannery, 1995a: 321). (Current Combination)

2016. *Rhinolophus sylvestris:* Karadjian, Hassanin, Saintpierre, Gembu Tungaluna, Ariey, Ayala, Landau and Duval, PNAS, 113 (35): 9835. Publication date: 30 August 2016. (Lapsus)

? *Rhinolophus clivosus silvestris:* (Name Combination)

TAXONOMY:
Considered a subspecies of *clivosus* by Hayman and Hill (1971: 23), but Barratt *et al.* (1995: 386), Cotterill (2002a), Csorba *et al.* (2003: 46 - 48) and Simmons (2005: 363), which indicate the relationships of *Rhinolophus deckeni* and *R. silvestris* are unclear, with the forms possibly being conspecific. Considered part of the *ferrumequinum* species group (Cotterill, 2002a; Csorba *et al.*, 2003: 46 - 48; Simmons, 2005: 363).

COMMON NAMES:
English: Forest Horseshoe Bat. French: Rhinolophe sylvestre. German: Wald-Hufeisennase.

CONSERVATION STATUS:
Global - Listed as Data Deficient (DD ver 3.1 (2001)) in view of the absence of sufficient information on its extent of occurrence, natural history, threats and conservation status (Cotterill, 2008b; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) (Cotterill, 2008b; IUCN, 2009). 2004 - VU B2ab(iii) ver 3.1 (2001) (Cotterill, 2004g; IUCN, 2004). 1996 - LR/nt (Baillie and Groombridge, 1996).

MAJOR THREATS:
Rhinolophus silvestris is considered to be threatened by habitat loss through conversion of land to agricultural use and logging operations. Additional threats include general disturbance of cave roost sites and overharvesting of the species for the bushmeat trade (Cotterill, 2008b; IUCN, 2009).

CONSERVATION ACTIONS:
Cotterill (2008b) [in IUCN (2009)] reported that *Rhinolophus silvestris* does not appear to have been recorded from any protected areas. An additional examination of the taxonomic relationship between this species and *Rhinolophus deckeni* is needed. Further field surveys are needed to better determine the distribution, natural history and the extent of threats to this little-known bat.

GENERAL DISTRIBUTION:
Rhinolophus silvestris a poorly known species has only been recorded from three localities in Gabon (Benga; Belinga; and the type locality of Dumbu Cave, Latoursville), and a single site in Congo (Meya-Nzouari).

Native: Congo (Bates *et al.*, 2013: 335); Gabon.

POPULATION:
Structure and Density - *Rhinolophus silvestris* is usually found in small colonies of fewer than 20 bats. It is believed to be in overall decline (Cotterill, 2008b; IUCN, 2009).
Trend - 2008 - Decreasing (Cotterill, 2008b; IUCN, 2009).

PARASITES:
Adam and Landau (1973a: 5) report on the presence of a protozoan parasite of the genus *Polychromophilus* (Haemoproteidae) in *R. clivosus sylvestris*. About 50 % of the specimens from Congo they examined, were found to be infected. Gametocytes were found year-round. The bats were also infested by the nycteribiids *Penicillidia fulvida* Bigot, 1885 and *Nycteribia schmidlii scotti* Falcoz, 1923, of which the prior was a major carrier of *Polychromophilus* sporozoites.

The Haemosporidan *Nycteria gabonensis* Rosin, Landay & Hugot, 1978 was reported by Landau *et al.* (2012: 142), Perkins and Schaer (2016: Suppl.) and Karadjian *et al.* (2016: 9835) from the Republic of Congo and Gabon.

Justine (1989a: 334; 1989b: 553) described two new stomach parasites: *Capillaria chabaudi* and *Capillaria gabonensis* (Nematoda) from *R. silvestris* from Belinga (Gabon).

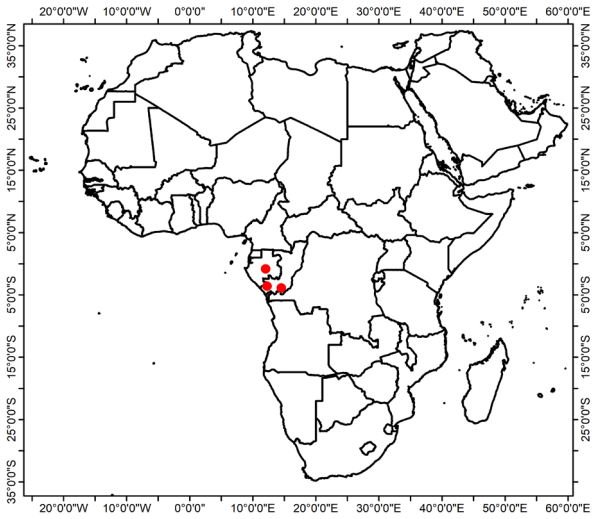

Figure 107. Distribution of *Rhinolophus silvestris*

DISTRIBUTION BASED ON VOUCHER SPECIMENS: "Africa", Congo, Gabon.

Rhinolophus simulator K. Andersen, 1904

*1904. *Rhinolophus simulator* K. Andersen, Ann. Mag. nat. Hist., ser. 7, 14 (83): 384. Publication date: 1 November 1904. Type locality: Zimbabwe: Mashonaland: Mazoe [17 30 S 31 03 E, 4 000 ft] [Goto Description]. Holotype: BMNH 1902.2.7.10: ad ♂, alcoholic (skull not removed). Collected by: J.ff. Darling Esq. - Etymology: From the masculine Latin substantive *simulàtor*, meaning "simulator", as *R. simulator*, according its descriptor, "[...] by quite superficial inspection, could be taken for a curiously small and long-tailed form of [*R. capensis*]." (see Lanza *et al.*, 2015: 115). (Current Combination)

1914. *Rhinolophus bembanicus* Senna, Annuario Mus. Zool. R. Univ. Napoli, (2) 4: no 9, p. 1, 2, text-fig 1, 2. Publication date: 27 March 1914. Type locality: Zimbabwe: Lake Bengueolo [=Lake Bangweulu]. - Comments: Ansell and Dowsett (1988: 34) indicate that *bembanicus* might represent a separable species, but the type specimen no longer exists.

1936. *Rhinolophus alcyone alticolus* Sanborn, Field Mus. Nat. Hist., Zool. Ser., (362) 20 (14): 108. Publication date: 15 August 1936. Type locality: Cameroon: Mount Cameroon [04 13 N 09 11 E, 5 800 ft] [Goto Description]. Holotype: FMNH 42596: ad ♀. Collected by: Rudyerd Boulton and Laura Boulton; collection date: 2 July 1934; original number: 53. - Comments: Fahr (2007a: 103) refers to Csorba *et al.* (2003), who indicate that *alticolus* might possibly represent a separate species.

? *Rhinolophus alticolus:*

? *Rhinolophus simulator alticolus:* (Name Combination)

? *Rhinolophus simulator simulator:* (Name Combination)

TAXONOMY:

Figure 108. *Rhinolophus simulator* from Beneve mine, KwaZulu Natal, South Africa.

Includes *alticolus* and *bembanicus* (see Koopman, 1975: 387; Hayman and Hill, 1971: 25; Koopman, 1993a: 169; Simmons, 2005: 363). Considered part of the *capensis* species group (Csorba *et al.*, 2003: 10 - 12; Simmons, 2005: 363).

Monadjem *et al.* (2016y: 366) refer to Csorba *et al.* (2003), who indicated that *alticolus* might represent a separate species, as their specimens from the Mount Nimba area are about 2,000 km from the nearest records in Nigeria and Cameroon, which, in turn, are again thousands of kilometers from the main distribution area. However, they still retain *alticolus* as a subspecies of *simulator*.

COMMON NAMES:
Afrikaans: Bosveldsaalneusvlermuis, Bosveldvlermuis. Chinese: 布什维尔德菊头蝠. English: Bushveld Horseshoe Bat. French: Rhinolophe de brousse, Rhinolophe du Veld, Rhinolophe du Bushveld. German: Buschveld-Hufeisennase, Buschland-Rundblattnase. Italian: Rinòlofo sirnulatóre, Fèrro di cavàllo simulatóre. Portuguese: Morcego ferradura das savanas.

ETYMOLOGY OF COMMON NAME:
The colloquial name refers to its occurrence in savanna woodland in the subregion (see Taylor, 2005).

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
R. simulator may be present in the late Holocene at Nkupe, South Africa (Avery, 1991: 6).

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Jacobs *et al.*, 2008ao; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Jacobs *et al.*, 2008ao; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Jacobs *et al.*, 2004al; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - LC ver 3.1 (2001) (Jacobs *et al.*, 2016l). 2004 - LC ver 3.1 (2001) (Friedmann and Daly, 2004).

MAJOR THREATS:
Rhinolophus simulator is threatened in parts of its range by cave disturbance and the loss of habitat resulting from the conversion of land to agricultural use and mining operations (Jacobs *et al.*, 2008ao; IUCN, 2009).

CONSERVATION ACTIONS:
Jacobs *et al.* (2008ao) [in IUCN (2009)] reported that there appear to be no direct conservation measures in place. In view of the species East African and southern African distribution, it seems likely that it is present in some protected areas.

GENERAL DISTRIBUTION:
Rhinolophus simulator is widely distributed in sub-Saharan Africa. There are records in West Africa from the Wonegizi Mountains and Mount Nimba (Guinea and Liberia), and from central Nigeria. In Central Africa it has been reported from Cameroon. In East Africa there are many more records, with the species being reported from as far north as Ethiopia and southern Sudan, ranging southwards through Uganda, Kenya and Tanzania to Zambia, Malawi, Mozambique, Zimbabwe, eastern South Africa, Swaziland and southern Botswana. In South Africa, its distribution is strongly associated with the amount of precipitation in the warmest quarter of the year (Babiker Salata, 2012: 49).

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 855,537 km^2.

Native: Botswana (Skinner and Smithers, 1990; Csorba *et al.*, 2003: 12; Monadjem *et al.*, 2010d: 560); Cameroon (Rosevear, 1965; Csorba *et al.*, 2003: 12); Côte d'Ivoire; Ethiopia (Hill and Morris, 1971; Largen *et al.*, 1974; Csorba *et al.*, 2003: 12); Guinea (Brosset, 1985; Csorba *et al.*, 2003: 12: Denys *et al.*, 2013: 282); Kenya (Koopman, 1975; Aggundey and Schlitter, 1984; Csorba *et al.*, 2003: 12); Liberia; Malawi (Ansell and Dowsett, 1988; Happold *et al.*, 1988; Happold and Happold, 1997b: 818; Csorba *et al.*, 2003: 12; Monadjem *et al.*, 2010d: 560); Mozambique (Smithers and Lobão Tello, 1976: 561; Csorba *et al.*, 2003: 12; Monadjem *et al.*, 2010c: 380); Nigeria (Rosevear, 1965 Happold, 1987; Csorba *et al.*, 2003: 12); South Africa (Ellerman *et al.*, 1953; Taylor, 1998; Rautenbach *et al.*, 1984; Maree and Grant, 1997; Csorba *et al.*, 2003: 11; Monadjem *et al.*, 2010d: 561); Sudan (Koopman, 1975; Csorba *et al.*, 2003: 12); Swaziland (Monadjem, 2005: 6; Monadjem *et al.*, 2010d: 561); Tanzania (Aellen, 1957; Csorba *et al.*, 2003: 12; Stanley and Goodman, 2011: 42; Stanley and Goodman, 2011: 42); Uganda; Zambia (Ansell, 1967; Ansell, 1969; Ansell, 1973; Ansell, 1978; Csorba *et al.*, 2003: 12; Cotterill, 2004a: 261; Monadjem *et al.*, 2010d: 561) ; Zimbabwe (Smithers and Wilson, 1979; Csorba *et al.*, 2003: 12; Monadjem *et al.*, 2010d: 561).

ECHOLOCATION:
Jacobs (1996) and Fenton and Bell (1981) reported a maximum frequency of 78 kHz for an individual from Sengwa in Zimbabwe. Monadjem *et al.* (2007a), using an Anabat detector, reported a maximum frequency of 84.1 (± 0.36) kHz for individuals from various localities in Swaziland. Additional parameters from the same country were given by Monadjem *et al.* (2017c: 179): F_{min}: 72.1 ± 2.97 (68.6 - 76.0) kHz, F_{knee}: 83.8 ± 0.18 (83.6 - 84.1) kHz, F_c: 83.4 ± 0.20 (83.7 - 84.2) kHz, and duration: 16.8 ± 4.70 (12.0 - 25.9) msec.

For individuals in South Africa, Taylor (1999b), using a Pettersson D980, reported a maximum frequency at Shongweni of 82.7 (± 0.4) kHz, while Jacobs *et al.* (2007a) reported a peak frequency of

80.6 (± 1.0) kHz (detector type and locality not indicated). Taylor (2000) reported a constant frequency component at 83 kHz.

Mutumi and Jacobs (2013: 108) investigated the peak frequency over the entire distribution range and found that this frequency was not correlated to body size or vegetation index, but in one location (where the mean annual rainfall and temperatures where the highest), they found that the peak frequency was significantly lower. They suggest that this lower frequency was linked with an increased detection range due to the more humid conditions. The resting call frequency was studied by Mutumi *et al.* (2016), who concluded that the acoustic divergence was best predicted by latitude, geography and climate-induced differences in atmospheric attenuation.

Taylor *et al.* (2013b: 19) reported 9 calls from Waterberg, South Africa with the following characteristics: F_{max}: 82.0 ± 0.58 (81.1 - 82.9) kHz, F_{min}: 79.3 ± 1.42 (75.9 - 80.6) kHz, F_{knee}: 80.5 ± 0.46 (79.8 - 81.2) kHz, F_{char}: 81.5 ± 0.47 (80.9 - 82.1) kHz, duration: 12.4 ± 1.71 (9.6 - 14.4) msec. An additional 16 calls from Swaziland had the following parameters: F_{max}: 84.0 ± 0.34 (83.2 - 84.4) kHz, F_{min}: 78.6 ± 3.77 (71.5 - 82.3) kHz, F_{knee}: 83.1 ± 0.83 (80.3 - 83.7) kHz, F_{char}: 83.4 ± 1.20 (79.2 - 84.1) kHz, duration: 13.1 ± 3.66 (7.0 - 18.9) msec.
Linden *et al.* (2014: 40) reported the following parameters from the Soutpansberg range (RSA): F_{min}: 76 - 81 kHz, F_{peak}: 79 - 84 kHz, F_{knee}: 80 - 84 kHz, Slope: 70 - 368 OPS, duration: 7 - 19 msec.
20 calls from Mapungubwe National Park (RSA) recorded by Parker and Bernard (2018: 57) had the following characteristics: F_{char}: 79.70 ± 1.02 kHz, F_{max}: 79.86 ± 0.99 kHz, F_{min}: 75.43 ± 4.93 kHz, F_{knee}: 79.71 ± 1.01 kHz, duration: 37.79 ± 9.97 msec, with 7.46 ± 3.46 calls/sec.

Jacobs (2016: 119) indicates that the second harmonic of this bat coincides with the third harmonic of *R. capensis*.

Molecular Biology:
DNA - Unknown.
Karyotype - Rautenbach (1986) reported 2*n* = 58, FN = 60, BA = 4, and submetacentric X and Y chromosomes.
Protein / allozyme - Unknown.

Roost:
Taylor *et al.* (1999: 70) reported a colony of 50 - 60 bats roosting in the Shongweni Dam tunnel (RSA).

Diet:
From Sudwala (RSA), Jacobs (2000: 201) reported the following proportions of prey: Lepidoptera (57.6 ± 34.9), Coleoptera (18.3 ± 23.0), Isoptera (19.4 ± 29.8), Hymenoptera (1.5 ± 4.1), Diptera (2.2 ± 4.2), Hemiptera (0.2 ± 1.1), Mandotea (0.2 ± 0.7), and unknown (0.6 ± 2.5).

Weier *et al.* (2019b: 6) examined droppings from this species in the Levubu region (Limpopo, RSA) and found DNA sequences of *Nezara viridula* (Linnaeus, 1758) (Hemiptera).

Predators:
Mikula *et al.* (2016: Supplemental data) mention the Bat hawk (*Macheiramphus alcinus* Bonaparte, 1850) as diurnal avian predator.

Population:
Structure and Density - *Rhinolophus simulator* can be locally common. Colonies may consist of a couple of hundred individuals, although these are often quite fragmented because of the species association with caves for breeding (Jacobs *et al.*, 2008ao; IUCN, 2009).
Trend - 2008 - Decreasing (Jacobs *et al.*, 2008ao; IUCN, 2009).

Reproduction and Ontogeny:
Monadjem *et al.* (2010d) [in Weier *et al.* (2018: Suppl.)] reported that births take place around mid November.

Parasites:
Bacteria:
Dietrich *et al.* (2016a: 4) found *Rickettsia* in the faeces of bats from South Africa.

Streblidae:
Brachytarsina africana (Walker, 1849) has a wide distribution in sub Saharan Africa (Haeselbarth *et al.*, 1966: 100). *Raymondia hardyi* Fiedler, 1954 from South Africa (Shapiro *et al.*, 2016: 254). *Raymondia waterstoni* Jobling, 1931 (Haeselbarth *et al.*, 1966: 104; Shapiro *et al.*, 2016: 256).

Viruses:
Polyomaviridae
Carr *et al.* (2017) reported two new virsuses from *R. blasii* from Zambia: *Rhinolophus simulator polyomavirus 4* and *Rhinolophus simulator polyomavirus1*, besides the two already known: *Rhinolophus simulator polyomavirus 2* and *Rhinolophus simulator polyomavirus 3*

Reoviridae
Sasaki *et al.* (2016: 2489) retrieved a VP7 type Rotavirus from a Zambian *R. simulator*: RVA/Bat-wt/ZMB/LUS12-14/2012/G3P[3] (LUS12-14).

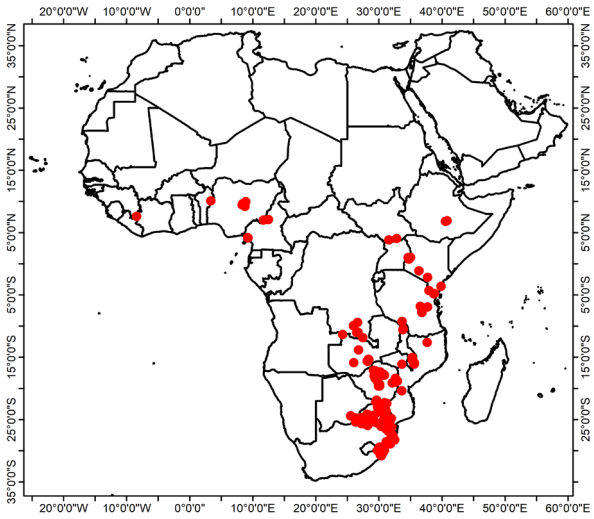

Figure 109. Distribution of *Rhinolophus simulator*

Rhinolophus smithersi Taylor, Stoffberg, Monadjem, Schoeman, Bayliss and Cotterill, 2012

*2012. *Rhinolophus smithersi* Taylor, Stoffberg, Monadjem, Schoeman, Bayliss and Cotterill, PLoS ONE, 7(9): 19. Publication date: 12 September 2012. Type locality: Zimbabwe: Sebungwe: Gokwe Communal Land: Ngolangola Gorge at confluence with Lutope River [181705S 280500E, 1000 m] [Goto Description]. Holotype: NHMZ 33647: ♀, skull and alcoholic. Collected by: F.P.D. ("Woody") Cotterill and Peter John Taylor; collection date: 26 October 2000; original number: FWC 4764. Presented/Donated by: ?: Collector Unknown. Skull and mandible in good condition(Taylor *et al.*, 2012c: 19). Paratype: NHMZ 33652: ♂, skull and alcoholic. Collected by: F.P.D. ("Woody") Cotterill and Peter John Taylor; collection date: 26 October 2000; original number: FWC 4769. Presented/Donated by: ?: Collector Unknown. - Etymology: Taylor *et al.* (2012c: 19) selected the specific epithet in recognition of the late Reay Henry Noble Smithers (1907–1987), former Director of the National Museums of Zimbabwe, prodigious collector and researcher of mammals including bats, and author of important regional texts on the mammalogy of Botswana, Zimbabwe and Mozambique, notably his definitive monograph – The Mammals of the Southern African Subregion subsequently updated and revised. The species name combines the surname Smithers and genitive singular case-ending ‘‘i’’ indicative of masculine gender. - ZooBank: E78B0F44-7534-4991-975A-F176CB668DDE. (Current Combination)

2015. *[Rhinolophus] smthersi:* Kaipf, Rudolphi and Meinig, NABU - Biodiversity Assessment in Kafa, Ethiopia, 13.

TAXONOMY:
Based on mitochondrial and nuclear DNA sequences and morphological and morphometric data, Taylor *et al.* (2012c) found that the *Rhinolophus hildebrandtii* group includes more species than previously recognized.

COMMON NAMES:
English: Smithers's Horseshoe Bat. German: Smithers Hufeisennase.

CONSERVATION STATUS:
Global -

Assessment History

Global - not assessed.

Regional -
South Africa: 2016 - NT D1 ver 3.1 (2001) (Taylor *et al.*, 2016b).

GENERAL DISTRIBUTION:
Known from Lutope-Ngolangola Gorge south of the Zambezi Escarpment in NW Zimbabwe and also from Pafuri in the Limpopo Valley in the foothills of the Soutpansberg Mountains of northern Limpopo Province, South Africa but likely more widespread across savanna woodlands of the Limpopo and Zambezi valleys, and their escarpments (the Gwembe horst, and the

Soutpansberg and Waterberg Mountains, respectively) (Taylor *et al.*, 2012c: 19).

Accurate delimitation of this species' range is subject to further collecting and reappraisal of existing museum material, previously refered to as *R. hildebrandtii*.

Native: South Africa (Taylor *et al.*, 2012c: 19); Zimbabwe (Taylor *et al.*, 2012c: 19); Malawi (tentavively, all of the material previously assigned to *R. hildebrandtii*, but Meredith Happold (pers. comm., 24/02/2019) indicated that two species might be involved).

Kaipf *et al.* (2015: 22) report "*Rhinolophus smithersi* or a new species" from God's Bridge in Ethiopia.

ECHOLOCATION:
For 7 calls from specimens from Blouberg, South Africa, Taylor *et al.* (2013b: 18) recorded the following parameters: Fmax: 45.2 ± 0.17 (44.9 - 45.4) kHz, Fmin: 40.6 ± 1.28 (38.1 - 41.7) kHz, Fknee: 44.7 ± 0.13 (44.5 - 44.8) kHz, Fchar: 44.6 ± 0.13 (44.3 - 44.7) kHz, duration: 34.9 ± 6.69 (26.0 - 46.9) msec. 13 calls from Waterberg resulted in the following parameters: Fmax: 47.8 ± 0.31 (47.0 - 48.4) kHz, Fmin: 45.7 ± 0.91 (44.1 - 44.7) kHz, Fknee: 47.2 ± 0.31 (46.3 - 47.7) kHz, Fchar: 47.3 ± 0.29 (46.4 - 47.7) kHz, duration: 18.2 ± 4.52 (10.9 - 24.8) msec, and 10 calls from Soutpansberg: Fmax: 46.0 ± 0.12 (45.9 - 46.2) kHz, Fmin: 44.8 ± 0.20 (44.4 - 45.0) kHz, Fknee: 45.2 ± 0.07 (45.2 - 45.4) kHz, Fchar: 45.5 ± 0.05 (45.5 - 45.6) kHz, duration: 12.0 ± 2.22 (9.6 - 16.5) msec. 19 calls recorded at the Mapungubwe National Park (RSA) by Parker and Bernard (2018: 57) had the following characteristics: F_{char}: 47.23 ± 1.62 kHz, F_{max}: 47.47 ± 1.50 kHz, F_{min}: 43.27 ± 2.65 kHz, F_{knee}: 47.26 ± 1.54 kHz, duration: 44.74 ± 22.83 msec, with 8.02 ± 3.70 calls/sec.

PARASITES:
DIPTERA:
Streblidae: *Ascodipteron brevior* Maa, 1965, female cysts found at the base of the ears from Namibia and South Africa (Haeselbarth *et al.*, 1966: 106 host referred to as *R. hildebrandtii*). *Raymondia hardyi* Fiedler, 1954 from South Africa (Shapiro *et al.*, 2016: 254; based on a record by Theodor (1968), who mentioned "*R. hildebrandtii*" as host).
Nycteribiidae: *Nycteribia scissa rhodesiensis* Theodor, 1957 from Zimbabwe and Malawi (Haeselbarth *et al.*, 1966: 108, host as *R. hildebrandtii*). *Nycteribia rotundata* Theodor, 1957 from Mazoe, Zimbabwe (Haeselbarth *et al.*, 1966: 110, host referred to as *R. hildebrandtii*). *Penicillidia fulvida* (Bigot, 1885) (Haeselbarth *et al.*, 1966: 114, host referred to as *R. hildebrandtii*).

ZOOBANK:
E78B0F44-7534-4991-975A-F176CB668DDE

Rhinolophus swinnyi Gough, 1908

*1908. *Rhinolophus swinnyi* Gough, Ann. Transv. Mus., 1: 71, 2 text-f. Publication date: April 1908. Type locality: South Africa: Cape province: Ngqeleni district: W Pondoland: "Ngqeleni district" [30 40 S 29 02 E] [Goto Description]. Holotype: TM 1021: ad ♂, skin and skull. Collected by: H.H. Swinny; collection date: 22 February 1908; original number: 153. Paratype: TM 1022: ad ♂, skin and skull. Collected by: H.H. Swinny; collection date: 23 February 1908; original number: 154. Notes: skull found lying loose- may not belong to this specimen [signed A. Roberts]). - Comments: Meester *et al.* (1986: 41) mentioned the type locality as "Ngqeleni district, west of Port St. Johns, Transkei". (Current Combination)

1913. *Rhinolophus swinnyi piriensis* Hewitt, Records Albany Mus., 2: 402. Publication date: 6 February 1913. Type locality: South Africa: E Cape province: near King William's Town: Pirie [32 43 S 27 18 E].

TAXONOMY:
Koopman (1966, 1982) suggests that this species may be conspecific with *denti*. *capensis* species group (Csorba *et al.*, 2003: 12 - 14; Simmons, 2005: 364). See Csorba *et al.* (2003: 11) for remarks on taxonomy.

COMMON NAMES:
Afrikaans: Swinny se saalneusvlermuis, Swinny-saalneusvlermuis, Swinnyse Vlermuis. Czech: vrápenec mosambický. English: Swinny's Horseshoe Bat. French: Rhinolophe de Swinny. German: Swinnys Hufeisennase. Portuguese: Morcego ferradura de Swinny.

ETYMOLOGY OF COMMON NAME:
Named after H.H. Swinny, who collected the original specimens from the Nqqueleni district, Eastern Cape (Taylor, 2005).

CONSERVATION STATUS:
Global - Although *Rhinolophus swinnyi* is known mainly from sparse records from a large area, it is listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large overall population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Cotterill, 2008c; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Cotterill, 2008c; IUCN, 2009). 2004 - NT ver 3.1 (2001) (Cotterill, 2004h; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - VU C2a(i) ver 3.1 (2001) (Jacobs *et al.*, 2016h). 2004 - EN C2a(i) ver 3.1 (2001) (Friedmann and Daly, 2004). 1986 - Indeterminate (Smithers, 1986).

MAJOR THREATS:
Populations may be locally threatened by deforestation, largely resulting from logging operations, local use of timber and firewood, and general conversion of land to agricultural use (Cotterill, 2008c; IUCN, 2009).

CONSERVATION ACTIONS:
Cotterill (2008c) [in IUCN (2009)] reported that *Rhinolophus swinnyi* is present in some protected areas (e.g. Kruger National Park, South Africa). Further studies are needed into the taxonomic status of this species, the distribution and possible threats.

GENERAL DISTRIBUTION:
Rhinolophus swinnyi has been recorded from eastern parts of South Africa, much of Zimbabwe, northwestern Mozambique, with additional scattered records further north in Malawi, Zambia, Democratic Republic of the Congo and Tanzania (including the island of Unguja [=Zanzibar]) (Skinner and Chimimba, 2005; O'Brien, 2011: 286). It may be present in Angola, but this needs confirmation. In South Africa, its distribution is mainly affected by temperature seasonality (Babiker Salata, 2012: 49).

Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 1,054,284 km^2.

Native: Congo (The Democratic Republic of the) (Hayman *et al.*, 1966; Happold *et al.*, 1988; Kock and Howell, 1988; Csorba *et al.*, 2003: 14; Monadjem *et al.*, 2010d: 561); Malawi (Happold and Happold, 1997b: 818; Csorba *et al.*, 2003: 14); Mozambique (Smithers and Lobão Tello, 1976; Skinner and Smithers, 1990; Csorba *et al.*, 2003: 14; Monadjem *et al.*, 2010d: 561; Monadjem *et al.*, 2010c: 380); South Africa (Maree and Grant, 1997; Rautenbach and Espie, 1982; Kock and Howell, 1988; Taylor, 1998; Csorba *et al.*, 2003: 13; Monadjem *et al.*, 2010d: 561); Tanzania (Skinner and Smithers, 1990; Kock and Howell, 1988; Csorba *et al.*, 2003: 14); Zambia (Ansell, 1969; Ansell, 1978; Csorba *et al.*, 2003: 14; Monadjem *et al.*, 2010d: 561); Zimbabwe (Cotterill, 1996a; Cotterill, 2004a: 261; Csorba *et al.*, 2003: 14; Monadjem *et al.*, 2010d: 561).
Presence uncertain: Angola

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:

Figure 111. Clockwise from top lateral, ventral and dorsal skull images of TM 1021, holotype of *Rhinolophus swinnyi* Gough, 1908.

ECHOLOCATION:

Aldridge and Rautenbach (1987) reported a maximum frequency of 115 kHz for individuals from Pafuri in South Africa. Jacobs *et al.* (2007a) reported a slightly different peak frequency of 107.0 (± 0.8) kHz for individuals from South Africa. Monadjem *et al.* (2010c: 380) reported from Mozambique that the peak echolocation frequencies ranged between 99 - 103 kHz (Petterson D240x).

Taylor *et al.* (2018a: 25) mention a mean frequency of 106.6 ± 0.4 kHz for 10 specimens from the Eastern Cape Province and 105.6 ± 0.76 kHz from KwaZulu-Natal.

Mutumi *et al.* (2016) found that acoustic divergence in RF was best predicted by latitude, geography and climate-induced differences in atmospheric attenuation.

Jacobs (2016: 119) indicates that the second harmonic of this bat coincides with the third harmonic of *R. capensis*, which possibly might illustrate "harmonic hopping".

MOLECULAR BIOLOGY:

DNA - Unknown.
Karyotype - Rautenbach (1986) reported 2*n* = 58, FN = 62, BA = 6, a subtelocentric X chromosome and a metacentric Y chromosome.
Protein / allozyme - Unknown.

POPULATION:

Structure and Density - In parts of its range *Rhinolophus swinnyi* is considered to be uncommon, however, Taylor (2000) records that it is fairly common in Zimbabwe. It generally forms small colonies of fewer than ten animals (Cotterill, 2008c; IUCN, 2009).
Trend - 2008 - Unknown (Cotterill, 2008c; IUCN, 2009).

PARASITES:

DIPTERA:
Streblidae: *Raymondia waterstoni* Jobling, 1931 (Shapiro *et al.*, 2016: 256).

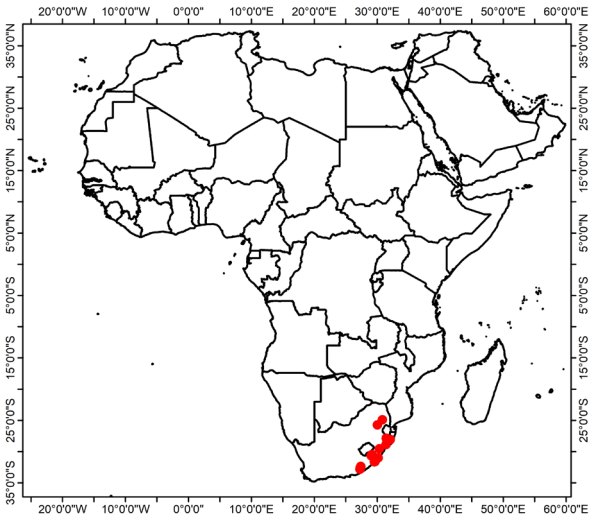

Figure 112. Distribution of *Rhinolophus swinnyi*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:

South Africa.

Rhinolophus willardi Kerbis Peterhans and Fahr, 2013

*2013. *Rhinolophus willardi* Kerbis Peterhans and Fahr, in: Kerbis Peterhans, Fahr, Huhndorf, Kaleme, Plumptre, Marks and Kizungu, Bonn. Zool. Bull., 62 (2): 190, figs 3, 4, 6. Publication date: November 2013. Type locality: Congo (Democratic Republic of the): Misotschi-Kabogo highlands [05 06 19 S 29 03 56 E, 1 880 m] [Goto Description]. Holotype: FMNH 195182: ad ♂, skull and alcoholic. Collected by: A.J. Plumptre and E.A. Mulungu; collection date: 17 February 2007; original number: DCM 1680. Presented/Donated by: ?: Collector Unknown. Paratype: FMNH 195082: ad ♀, skin and skeleton and skull. Collected by: B.D. Marks; collection date: 14 February 2007; original

number: MHH 837. Presented/Donated by: ?: Collector Unknown. From 4 km SW of the village Talama, "Camp 2", 4°59'29''S, 29°04'49''E, 1950 m. Paratype: FMNH 195083: ad ♀, skin and skeleton and skull. Collected by: B.D. Marks; collection date: 14 February 2007; original number: MHH 838. Presented/Donated by: ?: Collector Unknown. Paratype: FMNH 195084: ad ♀, skin and skeleton and skull. Collected by: Prince Kiswele Kaleme; collection date: 16 February 2007; original number: PK 754. Presented/Donated by: ?: Collector Unknown. Paratype: FMNH 198083: ad ♀, complete skeleton. Collected by: B.D. Marks; collection date: 14 February 2007; original number: MHH 838. Presented/Donated by: ?: Collector Unknown. From 4 km SW of the village Talama, "Camp 2", 4°59'29''S, 29°04'49''E, 1950 m. Paratype: FMNH 198084: ad ♀, complete skeleton. Collected by: B.D. Marks; collection date: 16 February 2007; original number: PK 754. Presented/Donated by: ?: Collector Unknown. From 4 km SW of the village Talama, "Camp 2", 4°59'29''S, 29°04'49''E, 1950 m. - Etymology: In honour of Dr. David Willard (Collection Manager, Division of Birds, FMNH) in recognition of his unparalleled 35+ years of service to the Field Museum of Natural History (see Kerbis Peterhans *et al.*, 2013: 191). (Current Combination)

COMMON NAMES:
English: Willards horseshoe bat. German: Willards Hufeisennase.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Congo (Democratic Republic of the).

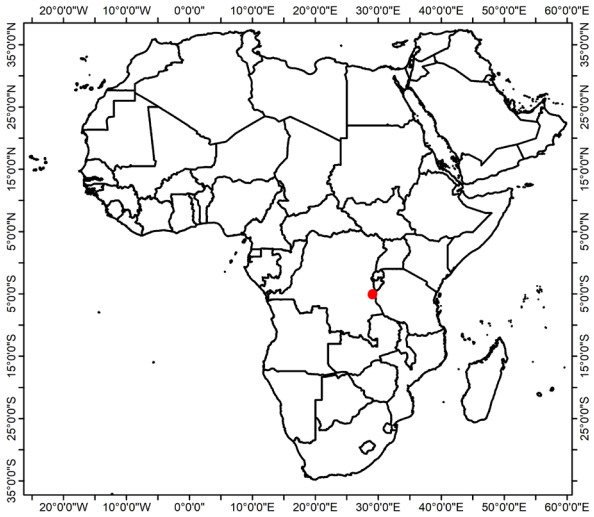

Figure 113. Distribution of *Rhinolophus willardi*

Rhinolophus ziama Fahr, Vierhaus, Hutterer and Kock, 2002

*2002. *Rhinolophus ziama* Fahr, Vierhaus, Hutterer and Kock, Myotis, 40: 102, 109, figs 1 - 7. Type locality: Guinea: Guinée Forestière: border "Réserve Biosphère de la Massif du Ziama": Sérédou, W edge of: near Park Station [ca. 08 23 N 09 17 W] [Goto Description]. Holotype: ZFMK 1999.0934: ad ♂, alcoholic, skull and skeleton. Collected by: Henning Vierhaus; collection date: 12 August 1992; original number: HV 2590. Paratype: AMNH 265708: ad ♂, skull and alcoholic. Collected by: Dr. Robert W. Dickerman; collection date: 4 March 1990; original number: 2144. 7 mi ?, 1 mi E Ziggida, Lofa county, Wonegizi Mts., Liberia: see Fahr *et al.* (2002: 109). - Etymology: In reference to the protected area near the type locality, the "Réserve de la Biosphère du Massif de Ziama", and as a noun in apposition (Fahr *et al.*, 2002: 110). (Current Combination)

TAXONOMY:
maclaudi species group (Fahr *et al.*, 2002; Simmons, 2005: 365).

COMMON NAMES:
Czech: vrápenec liberijský. English: Ziama Horseshoe Bat (first use Simmons, 2005: 365). French: Rhinolophe du Ziama. German: Ziama-Hufeisennase.

CONSERVATION STATUS:
Global - *Rhinolophus ziama* is listed as Endangered (EN B1ab(iii) ver 3.1 (2001)) because its extent of occurrence is less than 5,000 km^2, all individuals appear likely to be in fewer than five

locations, and there is continuing decline in the extent and quality of its habitat (Fahr, 2008n; IUCN, 2009).

Assessment History -
2008 - EN B1ab(iii) ver 3.1 (2001) (Fahr, 2008n; IUCN, 2009). 2004 - EN B1ab(iii) ver 3.1 (2001) (Fahr, 2004c; IUCN, 2004).

MAJOR THREATS:
Rhinolophus ziama is threatened by deforestation of its habitat, largely through logging and mining operations, and conversion of land to agricultural use. It is also considered possible that the species could be threatened by overharvesting for subsistence food in the future (Fahr, 2008n; IUCN, 2009).

CONSERVATION ACTIONS:
Fahr (2008n) [in IUCN (2009)] reported that it is not known if the species is present in any protected areas. There is a need to protect suitable areas of forest habitat for this species, and to initiate appropriate bat conservation awareness programmes among local people. In addition, further studies are needed into the distribution, abundance, natural history, and threats to this species.

GENERAL DISTRIBUTION:
Rhinolophus ziama is a West African bat, known from two localities in the Guinea Highlands (c. 600 m asl) of southeast Guinea (Ziama Forest) and north-west Liberia (Wonegizi Mountains) (Fahr *et al.*, 2002). Surrounding areas have been surveyed but the species has not been found elsewhere.

Native: Guinea; Liberia; Sierra Leone (Decher *et al.*, 2010; Norris *et al.*, 2015: 83)..

POPULATION:
Structure and Density - *Rhinolophus ziama* is known only from four specimens (Fahr, 2008n; IUCN, 2009).
Trend - 2008 - Decreasing (Fahr, 2008n; IUCN, 2009).

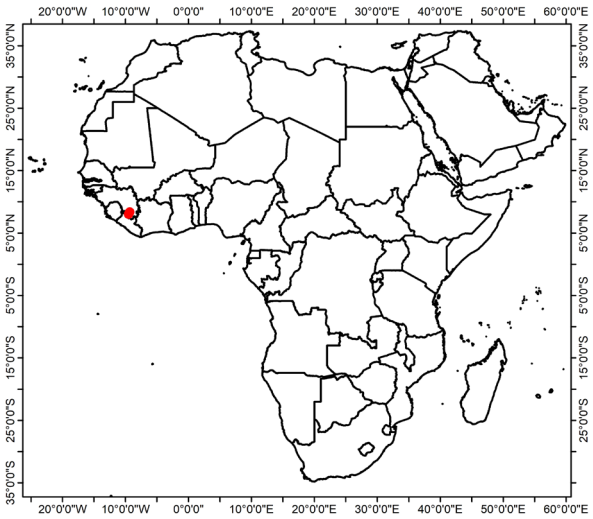

Figure 114. Distribution of *Rhinolophus ziama*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Guinea, Liberia.

Family RHINONYCTERIDAE J. E. Gray, 1866

*1866. *Rhinonycteridae* Gray, Proc. zool. Soc. Lond., 81.
1866. *Rhinonycterina* Gray, Proc. zool. Soc. Lond., 1866, I (vi): 81. Publication date: May 1866. - Comments: Proposed as tribe (?). Type genus: *Rhinonicteris* J. Gray, 1866, and originally included the genus *Rhinonicteris* J. Gray, 1847. Retained as subtribe by Koopman (1994: 68) (see Jackson and Groves, 2015: 251).
*2009. *Triaenopini* Benda and Vallo, Folia Zool., 58 (Mon. 1): 2, 33 [Goto Description]. - Comments: Type genus: *Traenops* Dobson, 1871. Proposed as tribe and originally included the genera *Triaenops* Dobson, 1871 and *Paratriaenops* Benda and Vallo, 2009. Synonymized with *Rhinonycteridae* by Foley *et al.* (2014: 319) (see Jackson and Groves, 2015: 251).
? *Rhinonicteridae* (Alternate Spelling)

TAXONOMY:
Based on the phylogram, the timetree, and a unique retrotransposon insertion, Foley *et al.* (2014: 313) elevated the subtribe Rhinonycterina Gray, 1866 to family level: Rhinonycteridae. They also found (p. 318) that the monophyletic grouping of this family is supported by a unique shared indel in the *THY* gene fragment.

The validity of this family was also confirmed by Amador *et al.* (2016: 3, 6).

Single known subfamily - Rhinonycterinae
Known genera of Rhinonycteridae: †*Archerops* Hand and Kirsch, 2003, †*Brachipposideros* Sigé, 1968, †*Brevipalatus* Hand and Archer, 2005, ***Cloeotis*** Thomas, 1901, ***Paratriaenops*** Benda and Vallo, 2009, *Rhinonicteris* Gray, 1847, ***Triaenops*** Dobson, 1871.

SIMILAR SPECIES:
Key characters for the genera:
Cloeotis – Head and body length is 33 – 50 mm, tail length is 22 – 33 mm (tail completely enclosed by interfermoral membrane and is longer than the femur), and forearm length is 30 – 39 mm. Posterior component of noseleaf with three tall tapering projections. Two upper premolars on each side, M^3 not reduced (four ridges) (Nowak, 1994: 118, Happold, 2013al: 357).
Paratriaenops – Head and body length is 35 – 62 mm, tail length is 20 – 34 mm (tail completely enclosed by interfemoral membrane), and the forearm length is about 49 – 61 mm. Posterior component of noseleaf with three tall tapering projections. Two upper premolars on each side, M^3 not greatly reduced (three ridges).
Rhinonicteris – Head and body length is 45 – 53 mm, tail length is 24 – 28 mm, forearm length is 47 – 50 mm. The complex upper portion of the nose-leaf surmounts the nostrils like a crown. The crown-like portion of the leaf is extensively honeycombed and sculptured (Nowak, 1994: 116).
Triaenops – Head and body length is 35 – 62 mm, tail length is 20 – 34 mm (tail completely enclosed by interfemoral membrane), and forearm length is 45 – 61 mm. Posterior component of noseleaf with three tall tapering projections as in *Cloeotis*. Cranially, *Triaenops* differs from genera in its raised and inflated rostrum and relatively much larger cochleae but resembles *Rhinonycters* in the structure of the anterorbital region and zygoma and in the curiously thickened premaxillae, two upper premolars on each side, M^3 not greatly reduced (three ridges) (Nowak, 1994: 115, Happold, 2013al: 357).

†Genus ***Brachipposideros*** Sigé, 1968

*1968. *Brachipposideros* Sigé, Paleovert., 1 (3): 83.

†Genus ***Brevipalatus*** Hand and Archer, 2005

*2005. *Brevipalatus* Hand and Archer, Palaeontology, 48 (2): 372.

Genus ***Cloeotis*** Thomas, 1901

*1901. *Clœotis* Thomas, Ann. Mag. nat. Hist., ser. 7, 8 (43): 28. Publication date: 1 July 1901 [Goto Description]. - Comments: Type species: *Clœotis percivali* Thomas, 1901. - Etymology: From the Greek "*κλοτός*", meaning collar and "*ούς*" or "*ώτός*", meaning ear, referring to Thomas' statement that "the whole ear is very like a man's 'stand-up' collar with angles in front rounded off." (see Palmer, 1904: 191). Alternatively "*cloeotis*" might simply mean short-eared.
2016. *Cleotis:* Simmons, Seiffert and Gunnell, Am. Mus. Novit., 3857: 42. Publication date: 9 May 2016.
? *Cloeotis:* (Current Spelling)

TAXONOMY:
Reviewed by Hill (1982b).

Known species to the genus *Cloeotis*: ***percivali*** Thomas 1901.

COMMON NAMES:
Czech: jihoafričtí číponosi. English: Short-eared Trident Bats, Short-eared Bats, African Trident Bats, African Trident-nosed Bats, Trident-nosed Bats. French: Cléothes. German: Kleinohr-Dreizackblattnase. Italian: Cloeòtidi.

Cloeotis percivali Thomas, 1901

*1901. *Clœotis Percivali* Thomas, Ann. Mag. nat. Hist., ser. 7, 8 (43): 28. Publication date: 1 July 1901. Type locality: Kenya: Coast province: N of Mombassa: Takaungu [03 42 S 39 51 E,

20 m] [Goto Description]. Holotype: BMNH 1901.5.1.11: ♂. Collection date: 15 February 1901. Presented/Donated by: Arthur Blayney Percival. - Etymology: In honour of Arthur Blayney Percival, game ranger in the former British East Africa, and collector of the type specimen (see Lanza *et al.*, 2015: 133). (Current Combination)

1917. *Clœotis percivali australis* Roberts, Ann. Transv. Mus., 5: 264-5. Publication date: 16 May 1917. Type locality: South Africa: W Transvaal province: Rustenburg district: Mooimeisiesfontein [25 01 S 27 37 E] [Goto Description]. Holotype: TM 1670: ad ♀, skin and skull. Collected by: W. Powell; collection date: 28 May 1915. Paratype: TM 1669: ad ♀, skin and skull. Collected by: W. Powell; collection date: 26 May 1915. Roberts (1917b: 265) called this a "Metatype". Paratype: TM 1671: ad ♀, skin and skull. Collected by: W. Powell; collection date: 27 May 1915. Roberts (1917b: 265) called this a "Metatype". Paratype: TM 1672: ad ♀, skin and skull. Collected by: W. Powell; collection date: 28 May 1915. Roberts (1917b: 265) called this a "Metatype". Paratype: TM 1673: ad ♀, skin and skull. Collected by: W. Powell; collection date: 28 May 1915. Roberts (1917b: 265) called this a "Metatype". Paratype: TM 1674: ad ♂, skin and skull. Collected by: W. Powell; collection date: 26 May 1915. Roberts (1917b: 265) called this a "Metatype". Paratype: TM 1675: ad ♂, skin and skull. Collected by: W. Powell; collection date: 26 May 1915. Roberts (1917b: 265) called this a "Metatype". Paratype: TM 1676: ad ♂, skin and skull. Collected by: W. Powell; collection date: 26 May 1915. Roberts (1917b: 265) called this a "Metatype". - Comments: Considered a valid subspecies by Taylor (1998: 41).

Monadjem *et al.* (2010d: 147) mentioned TM 1690 as type specimen, but Roberts (1917b: 265) indicated TM 1670, which is part of the eight *percivali* specimens collected by W. Powell at Mooimeisjesfontein and mentioned by the author (TM 1669 - 1676).

? *Cloeotis percivali australis:*

? *Cloeotis percivali percivali:* (Name Combination)

? *Cloeotis percivali:* (Current Spelling)

Taxonomy:

Figure 115. *Cloeotis percivali* (TM 46644) from Miggies gat, Mpumalanga, South Africa.

Meester *et al.* (1986: 43 - 44) recognized two subspecies: *percivali* and *australis*.

Common Names:

Afrikaans: Drietand-bladneusvlermuis, Drietand-blaarneusvlermuis. Chinese: 珀氏三叉蝠. Czech: cíponos jihoafrický. English: Percival's Short-eared Trident Bat, Percival's Trident Bat, Short-eared Trident Bat, African Trident Bat, East African Trident Bat. French: Cléothe de Percival, Asellia d'Afrique orientale, Phyllorhine à petites oreilles, Phyllorhine de Percival. German: Percivals Kleinohr-Dreizackblattnase. Italian: Cloeòtide di Pèrcival. Kiluba (DRC): Kasusu. Portuguese: Morcego tridentado. SiSwati: Lilulwane.

Conservation Status:

Global - Although poorly known and with some recorded population declines, it is listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008do; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2008do; IUCN, 2009). 2004 - VU A2bc+A3bc, C1 ver 3.1 (2001) (Mickleburgh *et al.*, 2004db; IUCN, 2004). 1996 - LR/nt (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - E C2a(i) ver 3.1 (2001) (Balona *et al.*, 2016). 2004 - CR A2a ver 3.1 (2001) (Friedmann and Daly, 2004). 1996 - Indeterminate (Smithers, 1986).
Swaziland: 2003 - DD ver 3.1 (2001) (Monadjem *et al.*, 2003).

Major Threats:

There have been seemingly stochastic extinctions of colonies, though it is not known if the animals simply move to new locations. Roost disturbance seems to be an important factor, but there might be others, and there has been speculation that DDT might be a cause of population

disappearances (Mickleburgh *et al.*, 2008do; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008do) [in IUCN (2009)] report that in South Africa, KwaZulu-Natal province they are protected from human disturbance. It might occur in some protected areas. Protection of maternity/breeding and roosting sites from disturbance is important.

GENERAL DISTRIBUTION:
Largely confined to southern Africa, with records from South Africa (KwaZulu-Natal, Limpopo, and Mpumalanga), Swaziland, south-east Botswana, southern Zambia, Zimbabwe (the core of the distribution), and extralimital records from southern Democratic Republic of Congo, Malawi, northwestern Mozambique, and coastal Kenya (Taylor, 2000). Reported from Mafia Island Tanzania, but no vouchers were collected (Kock and Stanley, 2009; O'Brien, 2011: 287).

For southern Africa (south of 8°S), Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 955,464 km^2. In the RSA, its distribution is best predicted by geology (Babiker Salata, 2012: 50).

Native: Botswana (Smithers, 1971, Tiunov, 1986: 536); Congo (The Democratic Republic of the) (Hayman *et al.*, 1966; Monadjem *et al.*, 2010d: 536); Kenya; Mozambique (Smithers and Lobão Tello, 1976; Monadjem *et al.*, 2010d: 536); South Africa (Seamark, 2005c: 3; Monadjem *et al.*, 2010d: 536; Balona, 2016: 5); Swaziland (Monadjem *et al.*, 2005; Monadjem *et al.*, 2010d: 536); Tanzania; Zambia (Ansell, 1969; Ansell, 1986; Monadjem *et al.*, 2010d: 536); Zimbabwe (Monadjem *et al.*, 2010d: 536).

FUNCTIONAL MORPHOLOGY:
Davies *et al.* (2013b: 6) found that this species' cochlea contains a highly modified basal turn compared to the other species they studied, and these modifications are consistent with the tonotopic organisation of the cochlea in which the basal area corresponds to the highest frequencies used by this bat.

ECHOLOCATION:
For an individual from Sengwa in Zimbabwe, Jacobs (1996) and Fenton and Bell (1981) reported a maximum frequency of 212 kHz, the highest frequency pure tone documented from the natural world (Bell and Fenton, 1984 in Thiagavel *et al.*, 2017: 1). Monadjem *et al.* (2007a), using an Anabat detector reported a maximum frequency of 103.4 (± 0.74) kHz for individuals from various localities in Swaziland. While Monadjem *et al.* (2010d: 57) report a maximum frequency of 103.2 (± 0.7) using an Anabat detector. Taylor (1999b) using a Pettersson D980 detector reported a maximum frequency of 104.2 (± 0.4) kHz for *C. percivali* from Jozini in South Africa. Taylor (2000) reported a constant frequency of 104 kHz (fundamental) and 208 kHz (first harmonic). Fenton (2004b: 3) indicates that the calls are dominated by sounds higher than 200 kHz. Monadjem *et al.* (2010d: 144) report HD-CF calls with high peak frequency (207.8 ± 3 kHz, n = 6) and intermediate duration (4.6 ± 1.2 msec, n = 6), with a second harmonic, where the fundamental harmonic is at around 104 kHz.

Monadjem *et al.* (2007a) also reported sexual dimorphism in the call with males calling at a higher frequency than females (males 103.7 ± 0.71 kHz, females 102.9 ± 0.52 kHz).

In Swaziland, Monadjem *et al.* (2017c: 179) recorded the following parameters: F_{min}: 99.2 ± 1.02 (98.1 - 100.1) kHz, F_{knee}: 103.1 ± 0.65 (102.6 - 103.8) kHz, F_c: 102.6 ± 0.51 (102.2 - 103.2) kHz, duration: 2.3 ± 0.04 (2.2 - 2.3) msec.

Three bats (one unknown sex, one female and one male) from the Fikirini caves in Kenya called with F_{max} respectively: 217.1, 225.3, and 219.6 kHz and a duration of 3.9, 4.0 and 4.0 msec (Webala *et al.*, 2019: 15).

MOLECULAR BIOLOGY:
DNA - Eick *et al.* (2005) and Matthee *et al.* (2006).
Karyotype - 2*n* = 40 (Rautenbach *et al.*, 1993).
Protein / allozyme - Unknown.

HABITAT:
Its elevational range is from sea level to 1,000 m (Mickleburgh *et al.*, 2008do).

ROOST:
Caves and mine tunnels for day roosting (Taylor, 2000).

DIET:
It feeds exclusively on moths (Taylor, 2000).

From Zambia, Black (1979: 54) reported the occurrence of the following prey taxa in the stomachs of 55 bats: Lepidoptera (moths): 100, Coleoptera (beetles): 7.3, Diptera (flies): 5.5, Unidentified insects: 3.6, Hemiptera (bugs): 1.8, and Isoptera (termites): 1.8. Only 7 of the 55 bats had eaten prey other than moths.

For South Africa, Jacobs (2000: 201) mentioned the following prey proportions: Lepidoptera (98.7 ± 3.2), Coleoptera (0.3 ± 1.2), Diptera (0.2 ± 0.7), and unknown (0.8 ± 3.1).

PREDATORS:
Mikula *et al.* (2016: Supplemental data) mention the Bat hawk (*Macheiramphus alcinus* Bonaparte, 1850) as diurnal avian predator.

POPULATION:
Structure and Density - Large fluctuations in population numbers are known, and it is prone to local extinctions. It is never found in very large colonies, with the largest known colony (of about 300 individuals) being reported from KwaZulu-Natal, South Africa, on the southern section of its range. However, the current estimated population size of the KwaZulu-Natal colony is only 50 animals. There are no population estimates from elsewhere in its range, although the largest population might be in Zimbabwe (Mickleburgh *et al.*, 2008do; IUCN, 2009).
Trend - 2008 - Unknown (Mickleburgh *et al.*, 2008do; IUCN, 2009). 2004- Unknown (Mickleburgh *et al.*, 2004db; IUCN, 2004).

PARASITES:
Streblidae: *Raymondia alulata* Speiser, 1908 recorded at Kanye, Botswana (Haeselbarth *et al.*, 1966: 102; Shapiro *et al.*, 2016: 253). *Raymondia hardyi* Fiedler, 1954 from South Africa (Shapiro *et al.*, 2016: 254). *Raymondia huberi huberi* Frauenfeld, 1855 (Shapiro *et al.*, 2016: 254). *Raymondia seminuda* Jobling,1954 from southern Botswana (Haeselbarth *et al.*, 1966: 103; Shapiro *et al.*, 2016: 255). *Raymondia waterstoni* Jobling, 1931 (Haeselbarth *et al.*, 1966: 104).

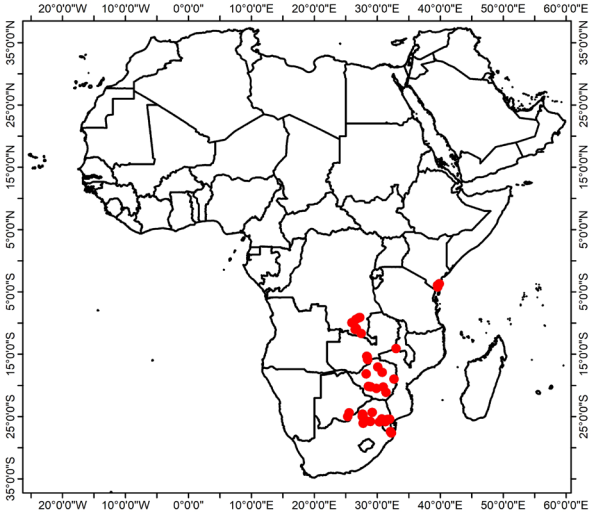

Figure 116. Distribution of *Cloeotis percivali*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Botswana, Congo (Democratic Republic of the), Kenya, South Africa, Swaziland, Zambia, Zimbabwe.

Genus ***Paratriaenops*** Benda and Vallo, 2009

*2009. *Paratriaenops* Benda and Vallo, Folia Zool., 58 (1): 1, 31 [Goto Description]. - Comments: Type species: *Triaenops furcula* Trouessart, 1906. - Etymology: The name refers to close similarity of *Paratriaenops* with the genus *Triaenops*; Greek prefix *para* - means besides, next to. Masculinum.

TAXONOMY:
Differs primarily from *Triaenops* Dobson, 1871 and *Cloeotis* Thomas, 1901 in the shape and morphology of the noseleaf, and lacking of lateral supplementary leaflets (Benda and Vallo, 2009).
Based on a considerable genetic distance (21.6 - 26.2 % in 731 bp sequence of cyt *b*) and substantial morphological differences from the continental forms of *Triaenops* as well as from Malagasy *T. menamena*, Benda and Vallo (2009: 1) propose generic status for the group of Malagasy species, *T. furculus*, *T. auritus*, and *T. pauliani*. They also separate *Paratriaenops* and *Triaenops* from the other hipposiderid bats in the tribus *Triaenopini*.
Ramasindrazana *et al.* (2013: 436) support the recognition of *Paratriaenops* as a separate genus based on an additional character: the inversed sexual dimorphism, where females are larger than males.

Known species of the genus *Paratriaenops*: ***auritus*** (G. Grandidier, 1912); ***furculus*** (Trouessart, 1907); ***pauliani*** (Goodman and Ranivo, 2008).

COMMON NAMES:
Czech: malí cíponosi. German: Madagaskar-Dreizack-Blattnasen.

Paratriaenops auritus (G. Grandidier, 1912)

*1912. *Triænops aurita* G. Grandidier, Bull. Mus. natn. Hist. nat., Paris, sér. 1, 18 (1): 8, fext-fig. Publication date: 25 January 1912. Type locality: Madagascar: extreme N Madagascar: near Diégo-Suarez [=Antsiranana] [ca. 12 16 S 49 17 E] [Goto Description]. Holotype:

MCZ 45080: ♂, skin and skull. Collected by: Dr. Mazières. Body mummified; see Peterson (1987: 81). on label: "envoi du Dr. Mazières, Diégo Suarez - Madag. 1910": see Ranivo and Goodman (2006: 974), Helgen and McFadden (2001: 143).

2009. *Paratriaenops auritus:* Benda and Vallo, Folia Zool., 58: 33. (Name Combination, Current Combination)

? *Triaenops auritus:* (Current Spelling)

TAXONOMY:
Until recently, only known from the holotype (see Peterson *et al.*, 1995: 81), but additional specimens were reported by Ranivo and Goodman (2006: 977). Included in *furculus* (Hayman and Hill, 1971; Koopman, 1993a: 175, 1994), but Peterson *et al.*, 1995: 81), Russ *et al.* (2001), Hutson *et al.* (2001: 18), Ranivo and Goodman (2006: 974) consider it a valid species. Benda and Vallo (2009) placed it in the genus *Paratriaenops*.

COMMON NAMES:
Czech: cíponos zlatý. English: Grandidier's trident bat. French: Triaenops à grandes oreilles. German: Grandidiers Dreizahn-Blattnase.

CONSERVATION STATUS:
Global - This species is listed as Vulnerable (VU B1ab(iii) ver 3.1 (2001)) as it has what appears to be restricted geographic range of less than 20,000 km² in northwestern Madagascar. The habitat is severely fragmented, and there is a continuing decline in the area and quality of habitat mainly due to agricultural activities. Further survey work is needed to help better ascertain the limits of the range of this species (Andriafidison *et al.*, 2008n; IUCN, 2009).

Assessment History -
2008 - VU B1ab(iii) ver 3.1 (2001) [assessed as *Triaenops auritus*] (Andriafidison *et al.*, 2008n; IUCN, 2009). 2000 - DD ver 2.3 (1994) [assessed as *Triaenops auritus*] (IUCN, 2000).

MAJOR THREATS:
As a forest dependent species any decline in extent or quality of the remaining forest poses a threat to this species. In northern Madagascar, forest is lost because of expanding agriculture. There is also the threat of disturbance to cave roosting sites (Andriafidison *et al.*, 2008n; IUCN, 2009).

CONSERVATION ACTIONS:
Andriafidison *et al.* (2008n) [in IUCN (2009)] report that this species is known to occur in three protected areas: Réserve Spéciale d'Ankarana, Réserve Spéciale d'Analamerana and Daraina forest (Ranivo and Goodman, 2006; Russell *et al.*, 2007). Conservation should be focused at the known cave roosts to secure the existing populations and closely monitor seasonal and annual population changes.

GENERAL DISTRIBUTION:
Paratriaenops auritus is endemic to the island of Madagascar where it has a restricted range in the north-western tip of the island, ranging between 50 m and 160 m above sea-level (Ranivo and Goodman, 2006; Robinson *et al.*, 2006; Russell *et al.*, 2007). The Andrafiamena Mountains likely form the southern limit of this species (S. M. Goodman *pers. comm.*).

Native: Madagascar (Ranivo and Goodman, 2006: 963; Robinson *et al.*, 2006; Russell *et al.*, 2007).

BIOGEOGRAPHY:
See Russell *et al.* (2007).

DETAILED MORPHOLOGY:
Baculum:
The only specimen examined by Rakotondramanana and Goodman (2017: 56) had an elongated baculum with a pointed tip and expanded rounded basal lobe; length: 1.78 mm, width: 0.49 mm.

ECHOLOCATION:
Kofoky *et al.* (2009: 380) reported the calls from 10 individuals, which consisted of a distinctive narrowband CF component that ended with short FM sweeps with a maximum energy of 100.3 kHz.

Ramasindrazana *et al.* (2013: 434) mention the following values for 5 ♂♂ specimens: Resting frequency: 107.8 ± 1.51 (106.9 - 109.6) kHz, F_{max}: 108.8 ± 1.48 (106.5 - 110.2) kHz, F_{min}: 106.5 ± 1.59 (104.8 - 108.2) kHz, duration: 11.7 ± 3.65 (7.6 - 17.5) msec, interpulse interval: 28.9 ± 8.02 (19.5 - 38.6) msec, and for 2 ♀♀: Resting frequency: 95.6 (95.1, 96.1) kHz, F_{max}: 96.4 (95.6, 97.2) kHz, F_{min}: 93.9 (93.8, 94.1) kHz, duration: 13.7 (13.5, 14.0) msec, interpulse interval: 25.5 (25.4, 25.7) msec.

MOLECULAR BIOLOGY:
DNA - Russell *et al.* (2007).
Karyotype - Unknown
Protein / allozyme - Unknown

HABITAT:
Dammhahn and Goodman (2013: 108) mention that the bat's foraging habitat is the lower portion of forest.

POPULATION:
Structure and Density - This species is thought to be relatively abundant within a localized area in the northern part of Madagascar. The largest roost recorded was 2,000 individuals in Réserve Spéciale d'Ankarana (S. G. Cardiff *pers. obs.*) and up to 1,000 individuals were recorded from a mine tunnel approximately 5 km from Andavokoera (J. Ranivo *pers. comm.*).
Trend - 2008 - Unknown (Andriafidison *et al.*, 2008n; IUCN, 2009).

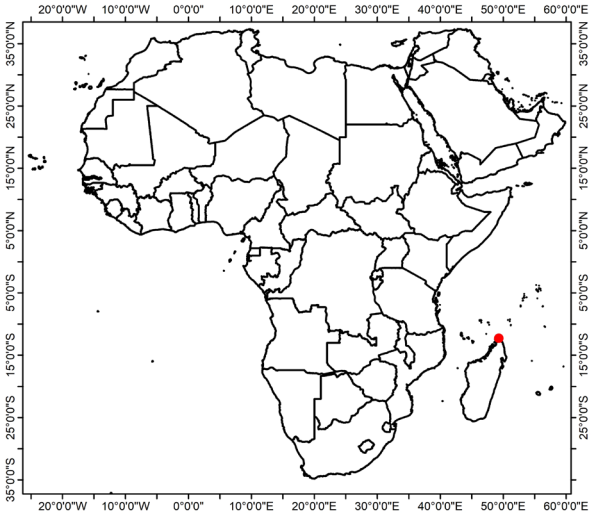

Figure 117. Distribution of *Paratriaenops auritus*

Madagascar.

Paratriaenops furculus (Trouessart, 1907)

*1907. *Triaenops furcula* Trouessart, Bull. Mus. natn. Hist. nat., Paris, sér. 1, 12 (7): 446 (for 1906). Publication date: 26 February 1907. Type locality: Madagascar: Tuléar province: 20 km S Tuléar, St. Augustine Bay: Sarodrana cave [23 33 S 43 45 E]. Holotype: MNHN ZM-MO-1912-40a (186): ♂, alcoholic (skull missing). Collected by: Guillaume Grandidier; collection date: 19 May 1898. - Comments: Issue 12 (7) was for a meeting on 27 November 1906, but was only distributed around 26 February 1907 (see Bull. Vol 13 (2). Trouessart (1907: 446) mentions *Triaenops* in name for the new taxon, but refers to the other taxa as *Triænops*).
2009. *Paratriaenops furculus:* Benda and Vallo, Folia Zool., 58: 33. (Name Combination, Current Combination)
? *Triaenops furculus:* (Current Spelling)

TAXONOMY:
Hayman and Hill (1971: 30) and Koopman (1993a: 175) included *aurita*, but see Peterson *et al.* (1995), Russ *et al.* (2001), Hutson *et al.* (2001: 18), Simmons (2005: 378), Ranivo and Goodman (2006: 963) who consider it a valid species. Benda and Vallo (2009) placed it into the genus *Paratriaenops*.

COMMON NAMES:
Czech: cíponos malý. English: Trouessart's Trident Bat, Trouessart's Triden Bat, Madagascar Leaf-nosed Bat. French: Triaenops malgache, Triaenops de Madagascar, Triaenops de Trouessart. German: Trouessarts Dreizahn-Blattnase.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Sabatier and Legendre (1985: 23) and Gunnell *et al.* (2014: 3) refer to fossils from the Anjohibe, Tsimanampetsotsa, and Andrahomana caves on Madagascar.

CONSERVATION STATUS:
Global - This species is listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution. There is no evidence that this species is declining fast enough to place it in a category of higher threat although its roosting colonies should be monitored especially in areas undergoing habitat change (Andriafidison *et al.*, 2008o; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) [assessed as *Triaenops furculus*] (Andriafidison *et al.*, 2008o; IUCN, 2009).
1996 - VU A2c ver 2.3 (1994) (Baillie and Groombridge, 1996).

MAJOR THREATS:
There may be possible threats from disturbance at the cave sites. This species is tolerant to some degree of forest degradation, but appears to require forested areas to survive (Goodman *et al.*, 2005a) and may therefore be one of the few Malagasy bat species really susceptible to

deforestation and forest fragmentation (Andriafidison *et al.*, 2008o; IUCN, 2009).

CONSERVATION ACTIONS:
Andriafidison *et al.* (2008o) [in IUCN (2009)] report that this species is present in Parc National du Tsingy de Bemaraha, Parc National de Namoroka, Parc National Kirindy-Mite and Parc National Tsimanampetsotsa (Goodman *et al.*, 2005a). Roosting colonies need to be the focus of further conservation and research.

GENERAL DISTRIBUTION:
Paratriaenops furculus is found on Madagascar where it is restricted to lowland (an elevation span of 30 m to 200 m above sea level) areas in the west and south-west (Goodman *et al.*, 2005a; Ranivo and Goodman, 2006: 963). It is also found on Cosmoledo and Aldabra Atolls in the outer Seychelles (von Brandis, 2004: 135; Hutson, 2004a).

Native: Madagascar (Goodman *et al.*, 2005a; Ranivo and Goodman, 2006: 963); Seychelles (Hutson, 2004a).

BIOGEOGRAPHY:
See Russell *et al.* (2007).

DETAILED MORPHOLOGY:
Baculum:
The penis bone is elongated with a slightly pointed tip and triangular basal lobe; length: 1.66 ± 0.154 (1.48 - 1.93) mm, width: 0.37 ± 0.105 (0.22 - 0.53) mm.

ECHOLOCATION:
Kofoky *et al.* (2009: 380) reported the calls from 18 individuals, the pulses were of longer duration than *Triaenops menamena* and consisted of a narrowband CF component that *T. menamena*, began and ended with short FM sweeps with a high duty cycle (52.5%) and with up to two harmonics, with the second harmonic containing the most energy at about 103.4 kHz. The frequency of maximum amplitude (FMA) was reported as 100.2 ± 0.2 kHz (n = 18) by Bambini *et al.* (2011: 84).

Ramasindrazana *et al.* (2013: 434) mention for 6 ♂♂ specimens the following values: Resting frequency: 113.1 ± 1.80 (110.6 - 115.1) kHz, F_{max}: 114.8 ± 1.90 (111.9 - 116.8) kHz, F_{min}: 110.5 ± 2.16 (106.8 - 113.0) kHz, duration: 12.4 ± 2.71 (8.9 - 16.9) msec, interpulse interval: 23.4 ± 8.50 (14.4 - 36.9) msec, and for 10 ♀♀: Resting frequency: 98.2 ± 1.41 (96.8 - 101.2) kHz, F_{max}: 99.5 ± 1.21 (98.1 -102.3) kHz, F_{min}: 95.7 ± 2.20 (91.4 - 99.4) kHz, duration: 16.0 ± 4.55 (8.1 - 22.5) msec, interpulse interval: 37.7 ± 18.00 (13.9 - 68.5) msec.

MOLECULAR BIOLOGY:
DNA - See Hoofer and Van Den Bussche (2003) and Russell *et al.* (2007).
Karyotype - Unknown
Protein / allozyme - Unknown

HABITAT:
Hutson (2004a: 129) reports, that on Madagscar, this bat is essentially a cave inhabitant (often sea caves), but on Aldabra (Seychelles) - where there are no true caves - it might inhabit some vertical solution holes, which are at most about 5m deep, and other small hollows which might provide a limited cave-like environment.

ROOST:
Recorded in a variety of roosts including caves, shallow sea caves, rock overhangs, under bridges, and large road drainage pipes (Goodman and Ranivo, 2008).

DIET:
On Madagascar, Rakotoarivelo *et al.* (2007) found that *Paratriaenops furculus* mainly consumed Lepidoptera. This was confirmed by Bambini *et al.* (2011: 81), who also indicated that Coleoptera were also part of the diet. These two order also made up the major volume percentage of preys found in feacal pellets collected by Ramasindrazana *et al.* (2012: 120-121) in the Tsimanampetsotsa NP: Lepidoptera (65.7 ± 4.8), Coleoptera (27.6 ± 4.6), Psocoptera (1.9 ± 0.5), Diptera (1.9 ± 0.7), Hymenoptera (1.5 ± 0.7), Homoptera/Hemiptera (1.0 ± 0.7), and Neuroptera (0.4 ± 0.3). The percentages of Lepidoptera and Coleoptera were about equal during the dry season (46.0 ± 8.5 versus 47.7 ± 8.3), but differed considerably during the wet season (74.7 ± 3.9 versus 18.3 ± 3.4).

PREDATORS:
Goodman *et al.* (2015c: 78) found the remains of one individual in pellets of Bat Hawk *Macheiramphus alcinus* Bonaparte, 1850 in western central Madagascar.

POPULATION:
Structure and Density - There are few data available on *Paratriaenops furculus*, but it appears to be a relatively rare member of the chiropteran assemblage in western Madagascar as determined by mist netting and acoustic sampling (Kofoky *et al.*, 2007; Rakotoarivelo and Randrianandrianina, 2007). However, it can occur in large colonies and a roost of over 10,000 individuals was reported from the Sept Lacs in southern Madagascar (Olsson *et al.*, 2006). There is no information on population size of *P. furculus*

from Aldabra, but it appears to be rather rare with only a few specimen records (Hutson, 2004a).
Trend - 2008 - Unknown (Andriafidison *et al.*, 2008o; IUCN, 2009).

PARASITES:
Lagadec *et al.* (2012: 1696) and Gomard *et al.* (2016: 5) report the presence of *Leptospira* sp bacteria in this species.

Perkins and Schaer (2016: Suppl.) report the presence of an unidentified haemosporidan. Ramasindrazana *et al.* (2018: Suppl.) identified the haemosporidian *Polychromophilus melanipherus* Dionisi, 1899 from this bat species.

Ramasindrazana *et al.* (2016: 7) report one male specimen (out of five examined) to be infected by an unnamed filarial Nematode.

VIRUSES:
Astroviridae
Lebarbenchon *et al.* (2017: Suppl.) found 11 out of 31 examined bats to test positive for Astroviridae.

Paramyxoviridae
Wilkinson *et al.* (2012: 160) tested 1 individuals from the Madagascar using RT-PCR specific for Respirovirus/Morbillivirus/Henipahvirus (RMH) and Paramyxovirinae (PMV) and found 0 positive results for viral nucleic acids.
Mélade *et al.* (2016b: 4) tested 14 Madagascan specimens, of which one was positive for paramyxoviruses.

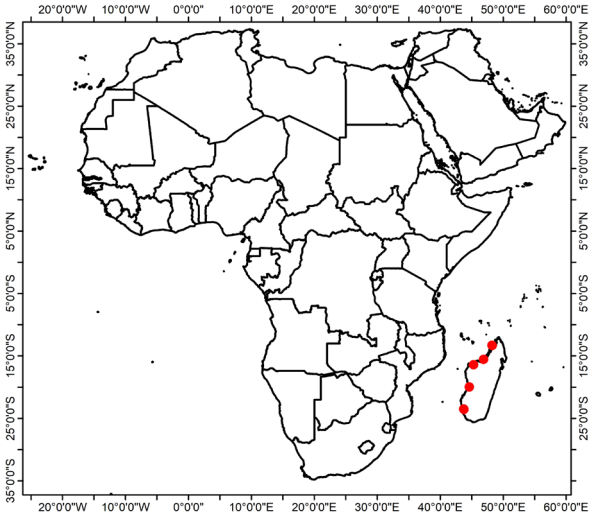

Figure 118. Distribution of *Paratriaenops furculus*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Madagascar.

Paratriaenops pauliani (Goodman and Ranivo, 2008)

1941. *[Triaenops] furinea* Tate, Am. Mus. Novit., 1140: 3. Type locality: Seychelles: Aldabra. - Comments: Goodman and Ranivo (2008: 685) mention that Tate (1941: 3) used the name "*Triaenops furinea* Trouessart" for the species on Aldabra. To their knowledge Trouessart never named the form occurring on Aldabra; the use of "*furinea*" is presumably a misreading of the name furcula and is considered a *nomen nudum* (Hayman and Hill, 1971: 30; Hill, 1982b).

*2008. *Triaenops pauliani* Goodman and Ranivo, Zoosystema, 30 (3): 681, 685, figs 2, 3. Type locality: Seychelles: Aldabra Atoll: Picard Island [c 09 24 S 46 12 E] [Goto Description]. Holotype: BMNH 1913.2.18.1: ad ♂, skull and alcoholic. Collected by: J.C.F. Fryer. Based on the itinerary of the Percy Sladen Trust Expedition to the Seychelles, Fryer was in the western Seychelles (Astove, Cosmoledo, Assumption, and Aldabra) from 13 September1908 to 24 January 1909 (Gardiner *et al.*,1910), see Goodman and Ranivo (2008). Paratype: BMNH 1913.2.18.2: ad ♀, skull and alcoholic. Collected by: J.C.F. Fryer. Paratype: BMNH 1978.185: ad ♀, alcoholic (skull not removed). Collected by: J.J. Whitelaw; collection date: 04 May 1977. Picard Island, Aldabra Station [09 24 04.4 S 46 12 21.4 E, 5 m]. Paratype: CUMZ E5609.A: ad ♀. Collected by: J.C.F. Fryer. Picard Island, between 13 September 1908 and 24 January 1909. Paratype: CUMZ E5609.B: ad ♂. Collected by: J.C.F. Fryer. Picard Island, between 13 September 1908 and 24 January 1909. Paratype: FMNH 185795: sad ♂, skull and alcoholic. Collected by: U. Samedi; collection date: 09 April 2004. Picard Island, Aldabra Station [09 24 04.4 S 46 12 21.4 E, 5 m]. - Etymology: The name *pauliani* is a patronym after the late Prof. Renaud Paulian, who conducted extensive research in the western Indian Ocean islands and was responsible for a major synthesis of the bio-geography of Madagascar and neighbouring islands (Paulian 1961, see Goodman and Ranivo (2008: 685).

2009. *Paratriaenops pauliani:* Benda and Vallo, Folia Zool., 58: 33. (Name Combination, Current Combination)

TAXONOMY:
Benda and Vallo (2009) placed it into the genus *Paratriaenops*.

COMMON NAMES:
Czech: cíponos aldabránský. French: Triaenops de Paulian. German: Aldabra- Dreizahnblattnase.

GENERAL DISTRIBUTION:
Is endemic to the Aldabra Atoll, specifically Picard Island (Goodman and Ranivo, 2008).

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
The noseleafs of *P. pauliani* are shorter than those in individuals of *P. auritus* or *P. furculus*, and the external lancets are shorter than the internal lancet, and outer margins of the external lancets are distinctly arc-shaped, while in members of the *P. auritus*/*furculus* group the external lancets are distinctly spear-shaped and the difference in length of the external and internal lancets is less marked (Goodman and Ranivo, 2008).
In overall external measurements, *P. pauliani* is smaller than *P. auritus*/*furculus* group.

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:
The cranial measurements are similar to those of *P. auritus* and *P. furculus* and fall within the range of size variation of these latter two taxa. There is an elongation of the anterior portion of the upper toothrow, with the I^1-M^3 measurements falling outside the range for *P. furculus* and *P. auritus* (see Goodman and Ranivo, 2008).

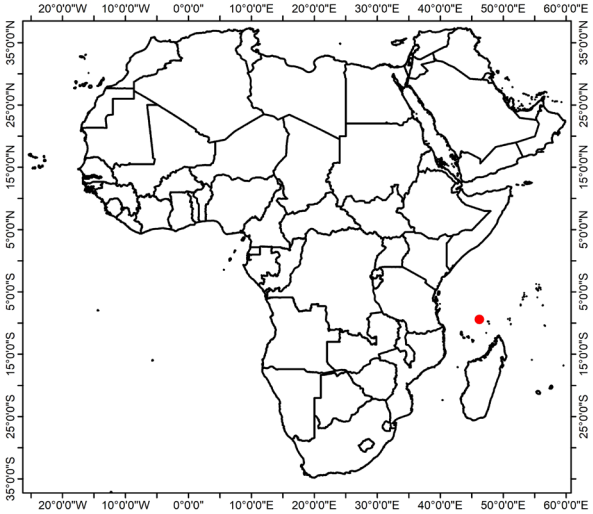

Figure 119. Distribution of *Paratriaenops pauliani*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Seychelles.

Genus ***Triaenops*** Dobson, 1871

*1871. *Triaenops* Dobson, J. Asiatic Soc. Bengal, 40 (2): 455, pl. 28. Publication date: 28 December 1871. - Comments: Type species: *Triænops persicus* Dobson, 1871. - Etymology: From the Greek "*τρίαινα*" (trìaina), meaning trident and "*ώφ*", meaning face (or "*ὄφις*" (ópsis), meaning "aspect, appearance"), referring to the posterior part of the nose-leaf, which terminates in three pointed projections (see Palmer, 1904: 687); Lanza *et al.*, 2015: 155). (Current Combination)
1995. *Triaenopus:* Yoshiyuki, Bull. Nat. Sci. Mus., Tokyo, Ser. A (Zool.), 21 (2): 119. Publication date: 22 June 1995. (Lapsus)
2002. *Trienops:* Paniutina, Plecotus et al., pars spec.: 36. (Lapsus)
? *Triaenops sp.:*

TAXONOMY:
Hill (1982b) and Garbutt (1999) suggested that *T. rufus* and *T. persicus* be synonymized. This is not supported by Russell *et al.* (2007). The Madagascan species are reviewed by Ranivo and Goodman (2006).

Known species of *Triaenops*: †***goodmani*** Samonds, 2007; ***afer*** Peters, 1871; ***menamena*** Goodman and Ranivo, 2009, *parvus* Benda and Vallo, 2009, *persicus* Dobson, 1871.

COMMON NAMES:
Czech: velcí cíponosi. English: Greater Trident Bats, Trident Bats, Trident Leaf-nosed Bats, Triple nose-leaf bats. French: Triaenops. German: Dreizahn-Blattnasen. Italian: Triènopi.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Samonds (2007: 55 - 57) found *Triaenops* sp. Within the deposits (NCC-1 locality) dating estimated as 69,600 to 86,800 years old within the Anjohibe cave, Madagascar.

GENERAL DISTRIBUTION:
Is broadly distributed in Africa, portions of the Middle East, and islands in the western Indian Ocean.

BIOGEOGRAPHY:
Russell *et al.* (2007)'s data reject a single-dispersal hypothesis (single origin hypothesis), which predicts that linages endemic to Madagascar form an exclusive clade. Russell *et al.* (2007) found that Malagasy *Triaenops* are paraphyletic with respect to the mainland African species *T. persicus*, indicating that the distribution of Malagasy and African *Triaenops* involved at least two independent dispersal events.
Russell *et al.* (2008a) estimate that at 2.25 Mya *Triaenops* still formed a single ancestral population between *T. rufus*/*P. auritus*, while the timing of the later *T. rufus* dispersal to Madagascar is less clear (about 148 kya and 660 kya).

†***Triaenops goodmani*** Samonds, 2007

*2007. *Triaenops goodmani* Samonds, Acta Chiropt., 9 (1): 46, fig 3 A-B. Type locality: Madagascar: Anjohibe cave [Goto Description]. Holotype: UADBA 9010:. Partial left dentary: see Samonds (2007: 46). - Etymology: Specific name for Dr. Steven M. Goodman, in recognition of his significant contributions to the field of modern Malagasy bat research (see Samonds, 2007). (Current Combination)

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Samonds (2007: 46 - 49) found samples in deposits (OLD SE) dated at 10,000 yrs old or younger within the Anjohibe cave, Madagascar.

Time frame: Pleistocene.

Triaenops afer Peters, 1877

*1877. *Triænops afer* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, 913 (for 1876). Publication date: 1877. Type locality: Kenya: Mombassa [04 03 S 39 40 E]. Holotype: ZMB 5074: ♂, skull and alcoholic. Collected by: Dr. Johann Maria Hildebrandt. See Turni and Kock (2008: 40). (Current Combination)
1968. *Triaenops persicus majusculus* Aellen and Brosset, Rev. suisse Zool., 75 (14): 450. Type locality: Congo: Loudima: Grotte de Doumboula [04 15 S 13 00 E] [Goto Description]. Holotype: MNHN ZM-MO-1968-412: ad ♂, alcoholic (skull not removed). Collected by: Jean-Paul Adam; collection date: 19 June 1964. 18 paratypes.
2017. *Tr[iaenops] affer:* Waruhiu, Ommeh, Obanda, Agwanda, Gakuya, Ge, Yang, Wu, Zohaib, Hu and Shi, Virol. Sin., 32 (2): 4. Publication date: 6 April 2017. (Lapsus)
2017. *Triaenops affer:* Waruhiu, Ommeh, Obanda, Agwanda, Gakuya, Ge, Yang, Wu, Zohaib, Hu and Shi, Virol. Sin., 32 (2): 5. Publication date: 6 April 2017. (Lapsus)
? *Triaenops afer:* (Current Spelling)
? *Triaenops persicus afer:* (Name Combination)
? *Triaenops persicus:*

TAXONOMY:
Benda and Vallo (2009: 26) found differences in the structure of the skull, baculum and Cyt. *b* of *Triaenops persicus* occurring in the Middle East and those in East Africa.

COMMON NAMES:
Chinese: 非洲三叉蝠. Czech: cíponos africký, vrápenec cíponosý. English: African Trident Bat, Peter's Trident Bat. German: Afrikanische Dreizahn-Blattnase. Italian: Triènope àfro.

GENERAL DISTRIBUTION:
Native: Ethiopia (Kruskop *et al.*, 2016: 58); Mozambique (Monadjem *et al.*, 2010c: 381).

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Lucati and López-Baucells (2016: Suppl.) refers to Howell (1980), who mentioned two piebald (all-white fur/skin patches, eyes always normally coloured) *T. persicus* specimens from a mine in Tanzania.

DETAILED MORPHOLOGY:
Brain:
Adult hippocampal neurogenesis was studied by Chawana R. *et al.* (2016: 1551) [as *Triaenops persicus*].

ECHOLOCATION:
From Mozambique, Monadjem *et al.* (2010c: 381) reported that the echolocation calls are sexually dimorphic, peak frequencies of males ranged

between 71 - 75 kHz (ANABAT) and those of females, between 82 - 85 kHz (ANABAT).

The calls of nine Kenyan bats were reported by Webala *et al.* (2019: 15) with F_{max}: 88.2 - 91.2 kHz (5 ??), 82.5 - 83.9 kHz (2 FF) and 75.2 - 75.7 kHz (2 MM). Three calls of a third male had a F_{max} of 30.1 kHz and a duration of 8.4 - 12.2 msec.

REPRODUCTION AND ONTOGENY:
Martin and Bernard (2000: 32) indicate that the corpus luteum is only present for the first part of the pregnancy after which complete regression occurs.

PARASITES:
BACTERIA
Bartonellae
Bartonella - Kosoy *et al.* (2010: 1877) and Bai and Kosoy (2012: 58) reported a prelevence of *Bartonella* spp. cultered from blood samples of 7/8 (87.5 %) *T. persicus* specimens from Kenya. Seven *Bartonella* spp. *gltA* sequences were identified, and formed a monophyletic geogroup (Kosoy *et al.*, 2010: 1878). See also Kosoy (2010: 719) for further information.

HAEMOSPORIDA
Garnham (1973: 237) refers to Adam and Landau for a record of *Polychromophilus ? murinus* in a "*Triaenops persicus*" from Africa.

SIPHONAPTERA
Ischnopsyllidae: *Araeopsylla scitula* Rothschild, 1909 was reported by Beaucournu and Kock (1996) from "*Triaenops persicus*" bat from Kenya.

DIPTERA:
Streblidae: *Raymondia aspera* Maa, 1968 from Mozambique (Shapiro *et al.*, 2016: 254). *Raymondia huberi huberi* Frauenfeld, 1855 (Shapiro *et al.*, 2016: 254). *Raymondia seminuda* Jobling, 1954 (Shapiro *et al.*, 2016: 255). *Raymondia waterstoni* Jobling, 1931 (Shapiro *et al.*, 2016: 256).

ACARI:
Trombiculidae: Stekolnikov (2018a: 50, 173) found *Whartonia oweni* Vercammen-Grandjean and Brennan, 1957 and *Microtrombicula tanzaniae* Goff, 1982 on "*Triaenops persicus afer*".

VIRUSES:
Astroviridae
These viruses were found by Waruhiu *et al.* (2017) in their country-wide survey of Kenyan bats. Hoarau *et al.* (2018: 2) found them in 35 of the 51 Mozambican bats they tested.

Coronaviridae
Of the 30 *T. afer* specimens Tao *et al.* (2017: 3) tested in Kenay, eight (26.7 %) were positive for CoV.

Paramyxoviridae
Mortlock *et al.* (2015: 1841) reported that 12 out of 16 examined *T. afer* specimens from Kenya tested positive for *Paramyxovirus* sequences.

Rhabdoviridae
Lyssavirus - Rabies related viruses
Horton *et al.* (2014: Table S1) tested 12 Kenyan "*T. persicus*" specimens, but failed to find neutralising antibodies to IKOV (Ikoma lyssavirus).

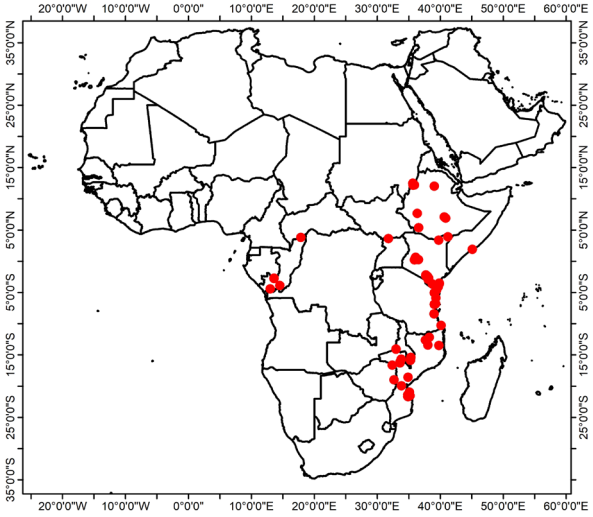

Figure 120. Distribution of *Triaenops afer*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Central African Republic, Congo, Ethiopia, Kenya, Malawi, Mozambique, Somalia, Tanzania, Uganda, Zambia, Zimbabwe.

Triaenops menamena Goodman and Ranivo, 2009

1881. *Triænops Humbloti* A. Milne-Edwards. Type locality: : "Africa": Aden (Yemen) or Somalia.. Holotype: MNHN ZM-MO-1985-836 (184): ♂, alcoholic (skull missing). Collected by: Léon Humblot; collection date: 1880; original number: 184 or 184A. See Peterson *et al.* (1995: 82). The type series (184 and 184A) contains 3 MM + 3 FF) (Peterson *et al.*, 1995). Rode (1941: 239) refers to the holotype (184) and six paratypes (184a). Paratype: MNHN 184A [a]: ♀. Collected by: Léon Humblot; collection date: 1880; original number: 184 or 184A. See Peterson *et al.* (1995: 82). Paratype: MNHN 184A [b]: ♀. Collected by: Léon Humblot; collection date: 1880; original number: 184 or 184A. See Peterson *et al.* (1995: 82).

Paratype: MNHN 184A [c]: ♀. Collected by: Léon Humblot; collection date: 1880; original number: 184 or 184A. See Peterson *et al.* (1995: 82). Paratype: MNHN ZM-MO-1985-838: ♂. Collected by: Léon Humblot; collection date: 1880; original number: 184 or 184A. See Peterson *et al.* (1995: 82). Paratype: MNHN ZM-MO-1985-839: ♂. Collected by: Léon Humblot; collection date: 1880; original number: 184 or 184A. See Peterson *et al.* (1995: 82). - Comments: See Goodman and Ranivo (2009) for futher discussion on the type locality. According to Ranivo and Goodman (2006: 974) the skull of the holotype has been mixed up with the skulls of the paratypes (MNHN 1985-838 and 1985-839). *T. humbloti* is retained as a synonym for both *T. persicus* and *T. menamena* due to the fact that purely taxonomically it is a synonym of *T. persicus*, but most of the specimens from Madagascar were erroneously assigned this name. In general, the authorship for the Madagascan use would be assigned to a subsequent author or to the same author in a later publication, but in this case, the author already made the error in the original publication.

1881. *Triænops rufus* A. Milne-Edwards, C. R. séances Acad. Sci., Paris, 91: 1035. Publication date: 1881. Type locality: "Africa": Aden (Yemen) or Somalia [Goto Description]. Holotype: MNHN ZM-MO-1997-1854 (185): ♀, skull and alcoholic. Collected by: Léon Humblot; collection date: 1880. Presented/Donated by: ?: Collector Unknown. See Peterson *et al.* (1995: 82). Ranivo and Goodman (2006: 974) indicate that the skull is still present, but in very bad shape. Specimen labled "Holotype no. 185" (see Goodman and Ranivo, 2009). Paratype: MNHN ZM-MO-1997-1855 (185A): ♀, alcoholic (skull not removed). Collected by: Léon Humblot; collection date: 1880. Presented/Donated by: ?: Collector Unknown. See Peterson *et al.* (1995). Paratype: MNHN ZM-MO-1997-1856 (185A): ♀, alcoholic (skull missing). Collected by: Léon Humblot; collection date: 1880. Presented/Donated by: ?: Collector Unknown. See Peterson *et al.* (1995). Paratype: MNHN ZM-MO-1997-1857 (185A): ♀, alcoholic (skull missing). Collected by: Léon Humblot; collection date: 1880. Presented/Donated by: ?: Collector Unknown. See Peterson *et al.* (1995). - Comments: (see Goodman and Ranivo, 2009).

*2009. *Triaenops menamena* Goodman and Ranivo, Mammalia, 73 (1): 48, 54, fig 1. Publication date: 31 March 2009. Type locality: Madagascar: Mahajanga province: Réserve Naturelle Intégrale de Namoroka, 4 km SSW Namoroka village: Grotte d'Ampidiranamhaja [16 25.957 S 45 17.180 E, 120 m] [Goto Description]. Holotype: FMNH 178563: ♂, skull and alcoholic. Collected by: Julie Ranivo and Fania H. Ratrimomanarivo; collection date: 25 September 2003; original number: S.M. Goodman 13825. - Etymology: From the Malagasy word "mena" meaning "red", which, in common usage, when repeated twice, means "reddish" (see Goodman and Ranivo, 2009: 54). (Current Combination)

? *Triaenops humbloti:*

? *Triaenops rufus:*

TAXONOMY:

These Madagascan specimens were previously included in *persicus* by Hayman and Hill (1971: 30), Hill (1982b), Koopman (1993a: 175), probably based on the type specimens, which are now believed to be collected either in Yemen or Somalia (see Goodman and Ranivo, 2009: 52). Based on actual Madagascan material, Peterson *et al.* (1995: 82), Russ *et al.* (2001), Hutson *et al.* (2001: 18), Goodman *et al.* (2005a: 158), and Simmons (2005: 379) recognized the specimens as representing a separate species.

See also the phylogentic analysis by Russell *et al.* (2007: 847).

Goodman and Ranivo (2009) extensively discuss the origin of the type specimens of *Triænops Humbloti* Milne-Edwards, 1881 and *Triænops rufus* Milne-Edwards, 1881. Their conclusion is that both forms were not from Madagascar but from Yemen or Somalia. Therefore, from a strict taxonomical view, these two names are synonyms of *Triaenops persicus* Dobson, 1871. However, we are also retaining these names in the synonymy of *Triaenops menamena* Goodman and Ranivo, 2009 since these names were always used to identify Madagascan forms, which are currently assigned to *T. menamena*.

COMMON NAMES:

Czech: cíponos madagaskarský. English: Rufous Trident Bat, Red Madagascan Trident Bat. French: Triaenops roux. German: Rötliche Dreizahn-Blattnase.

CONSERVATION STATUS:

Global - This species is listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution across Madagascar. It can tolerate some degree of habitat transformation, is relatively common, and is not thought to be declining fast enough to

place it in a category of higher threat (Andriafidison *et al.*, 2008p; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) [assessed as *Triaenops rufus*] (Andriafidison *et al.*, 2008p; IUCN, 2009).
2000 - DD ver 2.3 (1994) [assessed as *Triaenops rufus*] (IUCN, 2000).

MAJOR THREATS:
There are no significant threats to this species even though it is occasionally hunted for food (Goodman, 2006) and is often associated with forests that are subject to ongoing degradation (Russell *et al.*, 2007).

CONSERVATION ACTIONS:
Andriafidison *et al.* (2008p) [in IUCN (2009)] report that this species is known to occur in many protected areas: Réserve Spéciale d'Ankarana, Réserve Spéciale d'Analamerana, Parc National du Tsingy de Bemaraha, Parc National de Namoroka, Parc National de Tsimanampetsotsa, Parc National d'Ankarafantsika, Parc National d'Isalo, Réserve Spéciale d'Ambohitantely, Parc National de Masoala and Réserve Naturelle Intégrale de Tsaratanana (Ranivo and Goodman, 2006; Russ *et al.*, 2003; Russell *et al.*, 2007).

GENERAL DISTRIBUTION:
Triaenops menamena is endemic to the island of Madagascar. It is restricted to the western dry habitats and extreme northeastern and southeastern Madagascar in humid habitats (Goodman and Ranivo, 2009).

Papers prior to 2009 refer to *T. rufus*; see taxonomy section above for more details.

Native: Madagascar (Peterson *et al.*, 1995; Russ *et al.*, 2003; Goodman *et al.*, 2005a; Simmons, 2005; Ranivo and Goodman, 2006; Russell *et al.*, 2007; Rakotoarivelo *et al.*, 2007; Goodman and Ranivo, 2009).

BIOGEOGRAPHY:
See Russell *et al.* (2007).

DETAILED MORPHOLOGY:
Baculum:
Rakotondramanana and Goodman (2017: 57) indicate that the baculum is 'stick-like' with a bifid distal tip and straight mid-shaft. Its basal part is triangular with two distinct lateral projections; length: 1.67 ± 0.12 (1.50 - 1.80) mm, width: 0.71 ± 0.07 (0.61 - 0.79) mm.

ECHOLOCATION:
Kofoky *et al.* (2009: 379) reported the calls from 15 individuals, which produced relatively short CF component followed by brief FM components, the duty cycle was high (25.5 %), with the second harmonic generally contained most energy at about 93.2 kHz, a maximum of three harmonics were also observed. Bambini *et al.* (2011: 84) reported the frequency of maximum amplitude (FMA) to be 95.8 ± 0.1 kHz (n = 21).

Ramasindrazana *et al.* (2013: 434) reported the following data for 11 ♂♂: Resting frequency: 82.3 ± 1.43 (79.6 - 84.0) kHz, F_{max}: 83.6 ± 1.26 (81.4 - 85.2) kHz, F_{min}: 79.5 ± 3.21 (72.2 - 82.3) kHz, duration: 7.5 ± 0.97 (5.5 - 9.4) msec, interpulse interval: 38.3 ± 30.15 (9.8 - 107.4) msec, and for 20 ♀♀: Resting frequency: 93.5 ± 1.47 (90.0 - 96.8) kHz, F_{max}: 94.7 ± 1.49 (91.8 - 98.3) kHz, F_{min}: 91.3 ± 2.00 (87.6 - 95.4) kHz; duration: 7.8 ± 1.54 (5.1 - 10.6) msec, interpulse interval: 35.6 ± 24.75 (14.9 - 127.4) msec.

MOLECULAR BIOLOGY:
DNA - Russell *et al.* (2007).
Karyotype - Unknown
Protein / allozyme - Unknown

HABITAT:
There are no significant threats to this species even though it is occasionally hunted for food (Goodman, 2006) and is often associated with forests that are subject to ongoing degradation (Russell *et al.*, 2007).

Dammhahn and Goodman (2013: 108) mention that this species' foraging habitat is the lower portion of forest. Ravelomanantsoa *et al.* (2019: 111) captured this bat near a marshy area near Ambereny.

ROOST:
Wilkinson *et al.* (2012: 160) indicate that caves are the typical roosts for this species on Madagascar.

DIET:
On Madagascar Rakotoarivelo *et al.* (2007) found *T. menamena* (reported as *T. rufus*) mainly consumed Lepidoptera. Bambini *et al.* (2011: 87) reported that *T. menamena* showed a high preference for Hemiptera, and less for Lepidoptera.

The numbers reported by Ramasindrazana *et al.* (2012: 120-121) from the Tsimanampetsotsa NP confirmed that Lepidoptera formed the major food source of this bat with 67.2 ± 4.5 volume percentage. The Coleoptera formed the second food source with 26.9 ± 4.1. The other insect orders contributed only small amounts: Hymenoptera (3.3 ± 1.0), Psocoptera (0.9 ± 0.2), Neuroptera (0.6 ± 0.2), Diptera (0.4 ± 0.2), Homoptera/Hemiptera (0.4 ± 1.9), Blattaria (0.1 ±

0.0); and Aranea (0.1 ± 0.0). During the dry season, however, Coleoptera contributed the most to the bats diet: 69.0 ± 5.1, whereas Lepidoptera counted for 18.7 ± 4.1 volume percentage. During the wet seaon, the Lepidoptera dominated the diet with 90.5 ± 2.1 volume percent versus 6.7 ± 2.0 for the Coleoptera.

Rakotondramanana *et al.* (2015: 77) present the following volume percentages of prey types from the faeces of 16 bats: Coleoptera: 11.6 ± 19.46; Hymenoptera: 11.7 ± 24.20; Lepidoptera: 64.1 ± 32.64; Trichoptera: 0.6 ± 2.25; Isoptera: 11.5 ± 26.32; Homoptera: 0.5 ± 1.55; Arachnida: 0.06 ± 0.25. In frequency percentages, the values are: Coleoptera: 35.0 ± 43.51; Hymenoptera: 42.5 ± 40.58; Lepidoptera: 88.8 ± 30.96; Trichoptera: 3.8 ± 15.00; Isoptera: 17.5 ± 37.86; Homoptera: 3.75 ± 10.88; Arachnida: 1.2 ± 5.00.

POPULATION:
Structure and Density - The species is thought to be locally common in many parts of western Madagascar. A single roost in deciduous forest near the Onilahy River in southern Madagascar contained over 40,000 individuals (Olsson *et al.*, 2006).
Trend - 2008 - Unknown (Andriafidison *et al.*, 2008p; IUCN, 2009).

PARASITES:
Lagadec *et al.* (2012: 1696) reported that 8 out of 10 bats they examined, tested positive for *Leptospira* sp. bacteria, and Gomard *et al.* (2016: 5) found 27 out of 42 bats (64.3 %) to be positive for this bacterium. Dietrich *et al.* (2018a: 3) identified these further as *L. interrogans, L.* sp. and a third form having sequences closely related to *L. borgpetersenii*.

VIRUSES:
Astroviridae
Eight out of 13 specimens tested by Lebarbenchon *et al.* (2017: Suppl.) were positive for Astroviridae.

Paramyxoviridae
Wilkinson *et al.* (2012: 160) tested 10 individuals from the Madagascar using RT-PCR specific for Respirovirus/Morbillivirus/Henipahvirus (RMH) and Paramyxovirinae (PMV) and found 2 positive results for viral nucleic acids. Wilkinson *et al.* (2014) tested 30 individuals from Madagascar with a Respiro-, Morbilli- and Henipavirus specific RT-PCR assay, 19 samples tested positive for paramyxovirus RNA.

In their extensive study, Mélade *et al.* (2016b: 3) found this species to be the most infected by paramyxoviruses of all Madagascan bats (21 out of 42 specimens = 50 %).

Rhabdoviridae
Two out of 11 bats tested by Mélade *et al.* (2016a: 6) showed a seroreaction against *Lagos bat lyssavirus*.

UTILISATION:
Goodman (2006) describes the hunting method used by local inhabitants. See also Jenkins *et al.* (2007b), Goodman *et al.* (2008d) and Jenkins and Racey (2008), who refer to *T. rufus*.

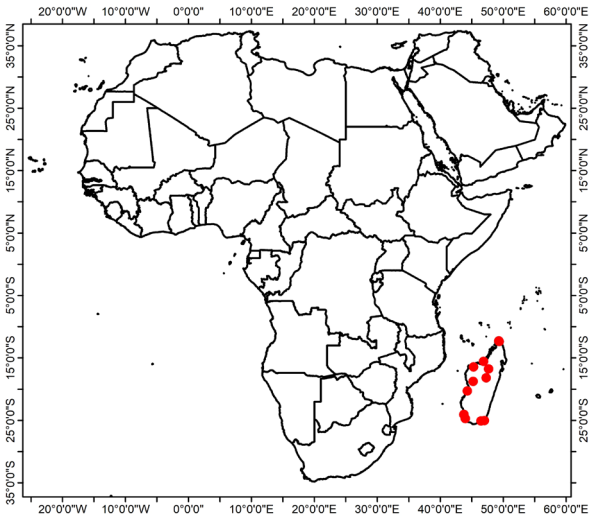

Figure 121. Distribution of *Triaenops menamena*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Madagascar.

Superfamily RHINOPOMATOIDEA Dobson, 1872

*1872. *Rhinopomatoidea* Dobson. - Comments: The name of the Superfamily is based on Rhinopomatidae Dobson, 1872. (Current Combination)

TAXONOMY:
Based on morphological data, the family Rhinopomatidae was placed in the superfamily Rhinopomatoidea by Simmons (1998) and Simmons and Geisler (1998), but more recent molecular studies have contradicted many groupings based on morphological data and, pending resolution of the controversies, for this reason Simmons (2005) did not recognize any chiropteran superfamilies.

Family RHINOPOMATIDAE Dobson, 1872

1838. *Rhinopomina* Bonaparte, Syn. Vert. Syst., in Nuovi Ann. Sci. Nat., Bologna, 2: 111 (sep. p. 7). - Comments: .
*1872. *Rhinopomatidae* Dobson, J. Asiatic Soc. Bengal, 41 (3): 221. (Current Combination)
1907. *Rhinopomidae* Miller, Bull. U.S. natl. Mus., 57: 80. Publication date: 29 June 1907. - Comments: Type genus *Rhinopoma* Geoffroy St.-Hilaire, 1818.

TAXONOMY:
This is a monotypic family, with all extant species belonging to the genus *Rhinopoma*.
Koopman (1993a) and Simmons (2005) assigned the name Rhinopomatidae to Bonaparte, 1838 - Syn. Vert. Syst. In Nuovi Ann. Sci. Nat., Bologna, 2: 111; but see Corbet and Hill (1992: 81) and Van Cakenberghe and De Vree (1994). Miller (1907) proposed the name Rhinopomidae and this was adopted by several authors: however, the original name is most commonly used (Aulagnier, 2013d:409).
The family was reviewed by Hill (1977a) and more recently by Van Cakenberghe and De Vree (1994) and Hulva *et al.* (2007b).

Known genera of the family Rhinopomatidae: †***Qarunycteris*** Gunnell, Simmons and Seiffet, 2008; ***Rhinopoma*** E. Geoffroy, 1818.

COMMON NAMES:
Czech: víkonosovití. Dutch: Langstaartvleermuizen, Muisstaartvleermuizen. English: Mouse-tailed bats. French: Rhinopomes, Chauves-souris à queue de souris, Rhinopomatidés. German: Mausschwanzfledermäuse, Mausschwanz-Fledermäuse. Italian: Rinopormàtidi, Pipistrèlli a códa di tòpo. Norwegian: Langhalete flaggermus, klaffneser.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
The oldest remains of extant rhinopomatids were collected from Egyptian tombs, which have been inhabited by these bats for ca. 3000 years (Aulagnier, 2013d: 410).

The family-level stem and crown ages were calculated by Shi and Rabosky (2015: 1537) to be respectively 51.9 and 26.9 mya.

GENERAL DISTRIBUTION:
The family is distributed from Africa (north of the Equator) to southern Asia through Arabia, the Middle East and India, mainly in semi-arid and arid habitats (Aulagnier, 2013d: 409).

The three species of rhinopomatids occuring in Africa occur in the tropics; two also extend northwards into temperate habitats. In Africa, one species is found in semi-desert vegetation zones, and the remaining two are found in both desert and semi-desert vegetation zones. Two species have also been found in montane habitats (but not above ca. 1200 m) (Aulagnier, 2013d:409-410).

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
These bats of primitive structure are characterized by a tail that is exceptionally long and has at least half of its length projecting beyond the narrow interfemoral membrane, slit-like valvular nostrils that can be closed, and a small triangular nose leaf surmounting a hog-shaped muzzle (that gave the name to the genus) (Aulagnier, 2013d:409).
Rhinopomatids are small to medium-sized with moderately long pelage that is generally more or less sepia grey (but varying in colour and tone across the geographic range), and usually paler ventrally. The face, rump and posterior portion of the abdomen are naked and medium brown. A thickened narial pad is present on the end of the muzzle, surmounted by a distinct ridge-like dermal outgrowth (a rudimentary noseleaf). The ears are more or less triangular and joined across the forehead by a connecting band of skin; each ear has a simple but moderately long and erect tragus. Eyes are relatively large (Aulagnier, 2013d:409).
Wings rather narrow; second finger with two bony phalanges (like all other African families); all of the fingers are shorter, relative to the length of the forearm, than in any other bats. The tip of the wing can be shortened by folding to facilitate cursorial locomotion, but not to the same extent as in the Emballonuridae and Molossidae. This is achieved by the terminal phalanx of the third finger bending round, but not fully, upon the ventral surface of the wing (Rosevear, 1965). The hindlimbs are moderately long; the toes (except the hallux) have three phalanges. The tail has sensitive hairs at its distal end (Aulagnier, 2013d: 409).

DENTAL FORMULA:
$^{1113}/_{2123}$ = 28.
The upper incisor (I^2) is very small, barely emerging from the gum. The canines are conical and simple. The first and second upper molars are lacking distinct hypocones.

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:
The skull is relatively short and broad; there are no postorbital processes. Separate nasal swellings

are present on each side of the rostrum. The sagittal crest is low and sharp. The auditory bullae are rather large. The premaxillae are separate from each other and from the adjacent part of the skull.

DETAILED MORPHOLOGY:
Rhinopomatids can accumulate fat in the lower abdominal region; this is metabolized when food is scarce (Aulagnier, 2013d: 410). Their water metabolism reflects extreme adaptations to desert habitats; the concentration of urea in the blood is high, and the skin is poorly vascularized so that loss of water through evaporation is minimal, even at high temperatures (Aulagnier, 2013d: 410).

FUNCTIONAL MORPHOLOGY:
Their wings are adapted for fast flight in open areas, gliding or rapid wing-flapping, but are poor fliers and tire quickly (Aulagnier, 2013d: 410).

SEXUAL DIMORPHISM:
Sexes similar in colour, and males are often slightly larger than females (Aulagnier, 2013d: 409).

ECHOLOCATION:
When echolocating, ultrasound pulses are emitted through the mouth; the echolocation calls are loud with little modulation of frequency when the bats are foraging, and become more frequency-modulated when the bats are approaching prey or when they are emerging from their day-roosts in groups (Schmidt and Joermann, 1986, Aulagnier, 2013d:410).

ROOST:
Rhinopomatids roost in dry caves, crevices, various underground structures and buildings including tombs and pyramids; their day- roosts are impregnated with a characteristic smell (Aulagnier, 2013d: 409).
They sometimes share day-roosts with other species of bats, including other species of rhinopomatids, but the different species do not roost in exactly the same places (Aulagnier, 2013d: 409). Rhinopomatids sometimes roost in clusters numbering up to many thousands of individuals, but most of the groups are smaller (10 - 100 bats) (Aulagnier, 2013d: 410).

MIGRATION:
Some populations are suspected to migrate (Aulagnier, 2013d: 410).

ACTIVITY AND BEHAVIOUR:
The sexes segregate for at least part of the year (Aulagnier, 2013d: 410).
These bats do not hibernate, but they can remain torpid for several days (Aulagnier, 2013d: 410).

MATING:
Little is known of their breeding habits in Africa (Aulagnier, 2013d: 410).

†Genus ***Qarunycteris*** Gunnell, Simons and Seiffert, 2008

*2008. *Qarunycteris* Gunnell, Simons and Seiffert, J. Vert. Paleont., 28 (1): 6. - Comments: Type species - *Qarunycteris moerisae*. - Etymology: Combination of *Qarun* for Birket Qarun, a large lake near BQ-2 Quarry with *Nykteris*, Greek for bat (Gunnell *et al.*, 2008). (Current Combination)

Genus ***Rhinopoma*** E. Geoffroy St.-Hilaire, 1818

*1818. *Rhinopoma* E. Geoffroy Saint-Hilaire, Description des Mammifères qui se trouve en Egypte, 2: 113. Publication date: 1818. - Comments: Type: *Vespertilio microphyllus* Brünnich, 1782. - Etymology: From the Greek "*ρις*" (rhís) or "*ρινός*" (rhinós), meaning "nose or snout", and "*πώμα*" (pomatòs), meaning "lid, cover", referring to the valvular nostrils, which open through a narrow, transverse slit (see Palmer, 1904: 607; Lanza *et al.*, 2015: 180). (Current Combination)
1821. *Rhynopoma* Bowdich, Anal. Nat. Class. Mamm, : 30. - Comments: Type: Vespertilio microphyllus Brünnich, 1782.
1854. *Rhinopomus:* Gervais, Histoire Naturelle des Mammifères, 202. - Comments: Lapsus (Allen, 1939a: 64). (Lapsus)
2017. *Rhinopona:* Loumassine, Allegrini, Bounaceur, Peyre and Aulagnier, Mammalia, xx (x): xxx. Publication date: 23 February 2017. (Lapsus)

TAXONOMY:
Revised by Hill (1977a) and Van Cakenberghe and De Vree (1994).
Allen (1939a: 64) assigned *Rhinopoma* to Oken, 1816, Lehrbuch d. Naturgesch., pt. 3, zool., Sect. 2, p. 926, but this name was rendered "Not Available" by Opinion 417 (International Commission on Zoological Nomenclature, 1956).

A key of the genus is given in Van Cakenberghe and De Vree (1994: 21).

Known species of the genus *Rhinopoma*: ***cystops*** Thomas, 1903; *hardwickii* Gray, 1831; ***macinnesi*** Hayman, 1937; ***microphyllum*** (Bünnich, 1782); *muscatellum* Thomas, 1903 – United Arab Emirates, Oman, Yeman, southwestern Iran, southern Afghanistan, western Pakistan, southwestern India (Simmons, 2005: 381).

Ethiopian records of *Rhinopoma muscatellum* Thomas, 1903, mentioned by Koopman (1993a) represent *Rhinopoma macinnesi* Hayman, 1937 (see Van Cakenberghe and De Vree, 1994: 20), therefore *R. muscatellum* is no longer included in the list of African species.

COMMON NAMES:
Czech: víkonosi, nosalecové, klaponosové. English: Mouse-tailed bats. French: Rhinopomes. German: Mausschwanz-Fledermäuse. Italian: Rhinopòma.

PARASITES:
Streblidae: *Brachytarsina alluaudi* (Falcoz, 1923) (Haeselbarth *et al.*, 1966: 101).

Rhinopoma cystops Thomas, 1903

1816. *Rhinopoma brevicaudatum* Oken, Lehrbuch Naturgeschichte, Jena, 3 (2): 926. Type locality: Egypt: "Egypt". - Comments: Not available, ICZN Opinion 417, 1956 (Van Cakenberghe and De Vree, 1994: 14).
1866. *Rhinopoma longicaudatum* Fitzinger, in: Heuglin and Fitzinger, Sber. k. Akad. Wiss. Wien, math. naturw. Kl., 54 (1) 10: 547. Type locality: Sudan: Sennaar [15 35 N 33 38 E, 425 m]. - Comments: Nomen nudum: Kock (1969a: 35), Van Cakenberghe and De Vree (1994: 14).
1866. *Rhinopoma sennaariense* Fitzinger, in: Heuglin and Fitzinger, Sber. k. Akad. Wiss. Wien, math. naturw. Kl., 54 (1) 10: 547. Type locality: Sudan: Anglo-Egyptian Sudan, near Roseires: Sennaar and Fazoglo [=Fazughli] [ca. 11 20 N 34 45 E]. - Comments: Type locality restricted to Fazughli by Kock (1969a: 35). Nomen nudum: see Harrison and Bates

(1991: 29), Van Cakenberghe and De Vree (1994: 14). Validated by Kock (1969a) according to Qumsiyeh and Jones (1986: 1).

1868. *Rhinopoma sennarense* Hartmann, Z. Gesel. f. Erdk., 3 (28/29): 44. - Comments: Nomen nudum: Van Cakenberghe and De Vree (1994: 14).

1877. *Rhinopoma senaarense, potius senarense:* Heuglin, Reise in Nordost Afrika, 2: 24. Publication date: 1877. - Comments: Emendation of *sennariense* Fitzinger 1866 (see Kock, 1969a: 35); Lapsus: Van Cakenberghe and De Vree (1994: 14). (Lapsus, Emendation)

*1903. *Rhinopoma cystops* Thomas, Ann. Mag. nat. Hist., ser. 7, 11 (65): 496. Publication date: 1 May 1903. Type locality: Egypt: Qena province: Luxor [25 41 N 32 39 E] [Goto Description]. Holotype: BMNH 1902.1.17.2: ad ♀, skull and alcoholic. Collected by: Nathanial Charles Rothschild. Presented/Donated by: Nathanial Charles Rothschild. See Thomas (1903b: 497); Kock (1969a: 35); Qumsiyeh (1985: 20). Paratype: BMNH 1902.1.17.1: ad ♂. Collected by: Nathanial Charles Rothschild. Presented/Donated by: ?: Collector Unknown. - Etymology: From the Greek substantive "*κύστις*" (kystis) meaning "bladder" and "*ὄφις*" (ópsis) meaning "eye-ball", referring to the large eyes (see Lanza *et al.*, 2015: 182, Lanza *et al.*, 2015: 182). (Current Combination)

1917. *Rhinopoma longicaudum:* Geyr von Scheppenburg, J. Ornithol., 65 (3): 283. Publication date: July 1917. (Lapsus)

1954. *Vespertilio brevicauda* Stresemann, Abh. d. Akad. Wiss., Berlin, 1: 172. Type locality: Egypt: Giza province: Saqqara [29 51 N 31 13 E]. Holotype: ZMB 46211: ♂, skull and alcoholic. Collected by: Friedrich Wilhelm Hemprich and Christian Gottfried Ehrenberg; collection date: April 1821; original number: A.1.6.69. Formerly ZMB 564.3 "Sendung Nr 69-71"; see Kock (1969a: 35); Turni and Kock (2008). Holotype: ZMB 564.c: ♂. Collected by: Friedrich Wilhelm Hemprich and Christian Gottfried Ehrenberg; collection date: April 1821. Presented/Donated by: ?: Collector Unknown. - Comments: Label name from Hemprich, without nomenclatural status, see Kock (1969a: 35), Van Cakenberghe and De Vree (1994: 14).

1954. *Vespertilio ferox* Stresemann, Abh. d. Akad. Wiss., Berlin, 1: 172. Type locality: Egypt: Giza province: Saqqara [29 51 N 31 13 E]. Holotype: ZMB 46210: ♂, skull and alcoholic. Collected by: Friedrich Wilhelm Hemprich and Christian Gottfried Ehrenberg; collection date: April 1821; original number: A.1.6.68. Formerly ZMB 564.2 "Sendung nr 67-68"; see Kock (1969a: 35), Turni and Kock (2008). Holotype: ZMB 564.b: ♂. Collected by: Friedrich Wilhelm Hemprich and Christian Gottfried Ehrenberg; collection date: April 1821. Presented/Donated by: ?: Collector Unknown. - Comments: Label name from Hemprich, without nomenclatural status, see Kock (1969a: 35), Van Cakenberghe and De Vree (1994: 14).

1956. *Rhinopoma hardwichei cystops:* Möhres and Kulzer, Verh. D. zool. Ges., 19: 60. - Comments: Lapsus (see Van Cakenberghe and De Vree, 1994: 15). (Lapsus)

1961. *Rhinopoma lardwickei cystops:* Madkour, Bull. Zool. Soc. Egypt, 16: 50. - Comments: Lapsus (see Kock, 1969a: 35; Van Cakenberghe and De Vree, 1994: 15). (Lapsus)

1969. *Rhinopoma hardwickei sennaariense* Kock, Abh. Senckenberg. naturforsch. Ges., 521: 40, 51. Type locality: Sudan: Blue Nile province: Fazogli [=Fazughli] [11 20 N 34 45 E] [Goto Description]. - Comments: Validation of *sennaariense* Fitzinger, 1866, *nomen nudum*. Hill (1977a) pointed out that *sennaariense* Kock, 1969 is a synonym of *arabium* (see Harrison and Bates, 1991: 30).

1971. *Rhinopoma hardwickei sennaarinese:* Hill and Morris, Bull. Br. Mus. (nat. Hist.) Zool., 21 (2): 30. - Comments: Lapsus (see Van Cakenberghe and De Vree, 1994: 15). (Lapsus)

1975. *Rhinopoma senaariense:* Koopman, Bull. Am. Mus. Nat. Hist., 154 (4): 367. - Comments: Lapsus (see Van Cakenberghe and De Vree, 1994: 15). (Lapsus)

1985. *R[hinopoma] h[ardwickei] sinaariense:* Qumsiyeh, Spec. Publ. Mus. Texas Tech. Univ., 23: 22. - Comments: Lapsus: attributed to Kock (1969a) by Qumsiyeh (1985: 22). (Lapsus)

2015. *Rhinopoma cytops:* Kangoyé, Ouéda, Granjon, Thiombiano, Guenda, and Fahr, Biod. J., 6 (2): 613. Publication date: 30 June 2015. (Lapsus)

2015. *Rhinopoma hardweickei:* Mohammed, Endocrinol. Metab. Synd., 4: 1. Publication date: 5 January 2015. - Comments: *Rhinopoma hardweickei* for *R. harwickei* [= *R. cystops*]. (Lapsus)

? *Rhinopoma hardwickei arabium:* (Alternate Spelling)

? *Rhinopoma hardwickei cystops:* (Name Combination)

? *Rhinopoma hardwickei hardwickei:* - Comments: Only for the African specimens.

? *Rhinopoma hardwickei:*, . - Comments: Emendation of *hardwickii*, since the species was named after Maj. Gen. Hardwicke, but according to Hill (pers. comm.) this was unjustified since Gray latinized the name. Only for the African specimens. (Emendation)
? *Rhinopoma hardwickii arabium:* (Lapsus)
? *Rhinopoma hardwickii cystops:* (Name Combination)
? *Rhinopoma Hardwickii:*, . - Comments: Not of Gray (1831), which is restricted to Asia (see Hulva *et al.*, 2007b), but when used for the African specimens.

TAXONOMY:
See Schlitter and Qumsiyeh (1996, Mammalian Species, 263), Van Cakenberghe and De Vree (1994: 20) as *Rhinopoma hardwickii*.

Hulva *et al.* (2007b) restrict *R. hardwickii* to Asia (Iran to Indonesia) and reinstate *cystops* as the species name for the African and Western Asian representatives.

Ahmim and Tahri (2017: 71) indicate that in Algeria, Niger, and Egypt, two forms of "*R. Hardwickii*" differing in size are known, which casts doubt on the recent taxonomic discrimination of the genus *Rhinopoma*, implying that besides *R. cystops* another small sized species might need to be recognized in northern Africa.

COMMON NAMES:
Arabian: Khafash abu danab saghir, Khaffash. Czech: víkonos africký. Dutch: Kleine klapneusvleermuis. English: Hardwicke's Mouse-tailed Bat, Lesser Mouse-tailed Bat, Small mouse-tailed bat, Lesser Rat-tailed Bat, Egyptian Mouse-tailed bat. French: Petit Rhinopome, Rhinopoma moyen, Rhinopome de Hardwicke, Chauve-souris à queue de souris. German: Hardwickes Mausschwanz-Fledermaus, Kleine Mausschwanzfledermaus. Hebrew: Yaznuv Katan. Italian: Rhinopòma àfro-ovestasiàtico.

CONSERVATION STATUS:
Global - "*Rhinopoma hardwickii*" is listed as least concern because it is a widespread and common species with no major threats (Benda *et al.*, 2008e; IUCN, 2009). Due to the recent status change of *R. cystops*, most of the African data for this taxon were reported under *R. hardwickii*.

Assessment History -
2008 - LC ver 3.1 (2001) [assessed as part of *Rhinopoma hardwickii*] (Benda *et al.*, 2008e; IUCN, 2009). 2004 - LC ver 3.1 (2001) [assessed as part of *Rhinopoma hardwickii*] (Benda, 2004b; IUCN, 2004). 1996 - VU [assessed as *R. hadithaensis*] (Baillie and Groombridge, 1996); LR/lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
Human disturbance in roost sites and pesticide use against locusts are the main threats. In arid areas of Iran which can not support high numbers of colonies, they aggregate in a few large groups which increases their vulnerability (M. Sharifi *pers. comm.,* 2005). These are not thought to be major threats to the species as a whole at present (Benda *et al.*, 2008e; IUCN, 2009).

Aerial hawking and water stress are considered to be the major risk factors related to climatic change (Sherwin *et al.*, 2012: 174 as *Rhinopoma hardwickei*).

CONSERVATION ACTIONS:
Benda *et al.* (2008e) [in IUCN (2009)] reported that no specific measures are known or are in place, but presumably occurs in protected areas across the range. A study on the impacts of pesticides is required, especially ways in which the impact might be minimised.

GENERAL DISTRIBUTION:
Rhinopoma cystops occurs across central and northern Africa; from Morocco to Israel, Palestine, Jordan Iraq and Afghanistan and south to Kenya. Occurs up 1,100 m asl in Morocco and Algeria.

The Kenyan material mentioned by Koopman (1993a) belongs to *R. macinnesi*, see Van Cakenberghe and De Vree (1994: 17 - 18).

Native: Afghanistan; Algeria (Horácek *et al.*, 2000: 97); Burkina Faso (Kangoyé *et al.*, 2015a: 613); Cameroon; Chad; Djibouti (Pearch *et al.*, 2001: 392); Egypt (Sinai; first record; see Benda *et al.*, 2008e: 1; Carpenter *et al.*, 2014: 180); Eritrea; Ethiopia (Lavrenchenko *et al.*, 2004b: 147); India; Iran, Islamic Republic of; Iraq; Israel; Jordan; Kenya (but see note above); Kuwait; Libyan Arab Jamahiriya; Mali; Mauritania (Brito *et al.*, 2010: 452, as *R. hardwickei*, Allegrini *et al.*, 2011: 3); Morocco (Benda *et al.*, 2004d; Benda *et al.*, 2010a: 154; El Ibrahimi and Rguibi Idrissi, 2015: 358, as *R. hardwickei*); Niger; Nigeria; Oman; Saudi Arabia; Somalia; Sudan; Syrian Arab Republic; Tunisia (Horácek *et al.*, 2000: 97; Dalhoumi *et al.*, 2016b: 866); Western Sahara; Yemen (Socotra).

DETAILED MORPHOLOGY:
Mohammed (2015) extensively discuss the pituitary gland of Egyptian "*R. hardwickei*".

SEXUAL DIMORPHISM:
Kangoyé *et al.* (2015a: 613) indicate that most of the average body measurements are larger in females than in males, but that the average cranial measurements are larger in males.

ECHOLOCATION:
Frequency of CF-component (second harmonic) during pursuit of insect (Egypt): 36 - 40 kHz; call-duration 6 - 10 ms; call-repetition rate ca. 10 call/s. Darting flight is accompanied by shortening the signals to 1 ms or less and increasing the call-repetition rate to ca. 100 calls/s; laboratory tests indicated that Doppler shift compensation is probably not used by this species (Simmons *et al.*, 1984). When three individuals flew together in the laboratory, each used a different CF-frequency suggesting that they regulate the CF-frequency to avoid jamming each other (Habersetzer, 1981). After landing, CF calls of mean duration 74 ms are emitted and these have maximum energy in fundamental harmonic; the purpose of these calls (echolocation and/or communication) is not known (ibid.). The first harmonic frequencies (18 - 20 kHz; Simmons *et al.*, 1984) of calls made in a roost in Morocco were audible to humans (Aulagnier and Destre, 1985).

In Jordan, Benda *et al.* (2010b: 204) reported the following parameters for 59 calls: Start frequency: 36.4 ± 1.5 (33.2 - 39.6) kHz, End frequency: 32.5 ± 1.4 (29.5 - 35.8) kHz, Peak frequency: 34.3 ± 1.2 (32.0 - 37.1) kHz, Call duration: 8.0 ± 1.6 (4.5 - 12.0) msec, Inter-pulse interval: 116.0 - 29.9 (60.0 - 210.0) msec.

From Tunisia, Dalhoumi *et al.* (2016b: 866) reported an almost constant frequency with three or four harmonics and maximum energy in the second harmonic (at 32 kHz).

Moores and Brown (2017: 612) recorded the following parameters in southern Morocco: F_{start}: 34.6 ± 0.5 (33.6 - 35.6) kHz, F_{max}: 33.6 ± 0.4 (32.8 - 34.4) kHz, F_{end}: 33.0 ± 0.5 (32.5 - 34.1) kHz, duration: 9.4 ± 0.8 (8.6 - 11.1) msec, interpulse interval: 260 ± 122 (69 - 520) msec.

MOLECULAR BIOLOGY:
DNA - Giannini and Simmons (2005); Ali (2011).
Karyotype - Ray-Chaudhuri *et al.* (1968) and Rushton (1970: 463) reported 2*n* = 36, FN = 68, BA = 34, a submetacentric X chromosome and an acrocentric Y chromosome for specimens from India, this data now relates to *Rhinopoma hardwickii*. Qumsiyeh and Baker (1985) reported an identical karyotype for specimens from Palestine, which are now referred to *Rhinopoma cystops* see Hulva *et al.* (2007a). Sayed (2011: 659) also reported 2*n* = 36 and FN = 68 for *R. hardwickei* specimens from Egypt, with a medium-sized submetacentric X chromosome and an acrocentric Y chromosome. Pairs 13 and 15 show a broad G-negative region around their centromere, and complete heterochromatin in the short and long arm. Pair 5 also shows a broad G-negative region around its centromere, and the Y chromosome has complete heterochromatin.

Protein / allozyme - Unknown.

Mansour *et al.* (2016: 66) examined the occurrence of heavy metals in bats from two caves in the Saqqara region of Egypt and found that cobalt was not detected in any sample analyzed. Cd, Mo, Ni and Pb were found in low concentrations (generally less than 1.0 µg/g tissue). In the livers, moderate concentrations of Ba, Cr, Cu and Mn and very high concentrations of Ca, Fe and Mg were recorded. Liver tissue from males contained much higher levels of Al and Ba than those from females.

ROOST:
In Israel, Levin *et al.* (2015: 1, 3) found that *R. cystops* hibernates during five months in winter in caves that were geothermally heated to a stable temperature of 20 °C, with almost 100 % relative humidity. They also found that the bat's skin temperature was 1 - 3 °C above the average cave temperature, and that during the same period, the outside temperatures fluctuated between 4 and 22 °C. During the hibernation, no period arousal or periods of normothermy were observed.

Benda *et al.* (2014c: 10) observed a colony of about 40 specimens in two ground floor rooms of a ruin of an Italian fortress in the Al Jaghbub oasis (Libya).

DIET:
Benda *et al.* (2014c: 14) examined 40 faecal pellets of *R. cystops* from the Al Jaghbub oasis (Libya). The diet consisted primarily of ants (Hymenoptera: Formicoidea; 81 % of volume) and furthermore of beetles (Coleoptera, mostly of the family Tenebrionidae).

POPULATION:
Structure and Density - Appears to be particularly abundant near oases. However, both distribution and abundance are undoubtedly insufficiently investigated because the roosts and suitable habitats are often unreachable. Colonies range in size from a few individuals up to several hundred. Up to 500 individuals have been reported in colonies in Jordan (Amr, 2000). Loumassine *et al.* (2017c:28) reported on a colony of about 100 animals in an old mine in Algeria.

Occurs with other species in the genus, in Iran it is normally found in low numbers and low densities and it feeds on coleoptera (M. Sharifi pers. comm., 2005). Assumed stable throughout the southwest Asia region (D. Kock *pers. comm.,* 2005). Population information remains unknown for its African distribution (Benda *et al.*, 2008e; IUCN, 2009).

Trend - 2008 - Stable (Benda *et al.*, 2008e; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
Gharaibeh (1997: 47) reported two pregnant females captured in Tunisia on 26 May 1996.

MATING:
Khajuria (1972: 307) report on the mating behaviour of the closely related Indian *R. h. hardwickei*, but whether this is also applicable for *R. cystops* is uncertain.

PARASITES:
TREMATODA
Morsy *et al.* (2018: 319) reported the presence of *Urotrema scabridum* (Braun, 1900) and *Renschetrema indicum* Kifune, 1984 in "*R. hardwickii*" specimens collected in Cairo.

ACARI
Argasidae: *Argas vespertilionis* was reported from Libyan bats by Benda *et al.* (2014c: 15), and two larvae of *Argas confusus* (Argasidae) on *R. cystops* specimens in Jordan (Benda *et al.*, 2010b: 212).

Trombiculidae: *Grandjeana mauritanica* Kalúz and Ševcík, 2014 on *R. cystops* specimens from Mauritania (Kalúz and Ševcík, 2014: 31; Stekolnikov, 2018a: 136).

Bendjeddou *et al.* (2017: 15) reported the following ectoparasites from Algeria: *Nycteribia (Listropoda) schmidlii schmidlii* Schiner, 1853 (Nycteribiidae) and *Argas vespertilionis* (Latreille, 1802) (Arachnida).

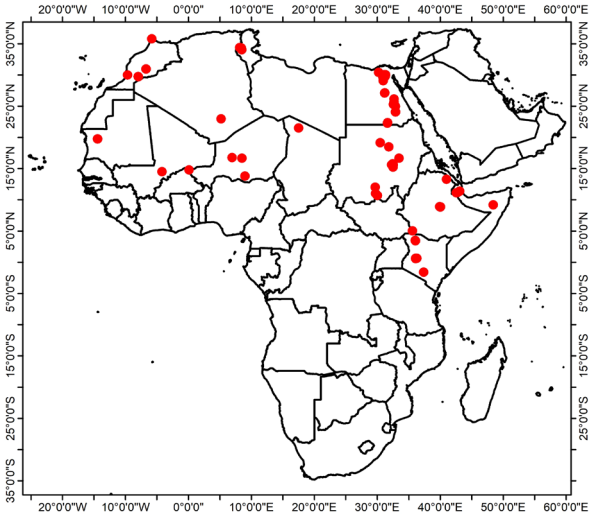

Figure 122. Distribution of *Rhinopoma cystops*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Algeria, Burkina Faso, Chad, Djibouti, Egypt, Ethiopia, Israel, Kenya, Libya, Mali, Mauritania, Morocco, Niger, Senegal, Somalia, South Sudan, Sudan, Tunisia.

Rhinopoma macinnesi Hayman, 1937

*1937. *R[hinopoma] cystops macinnesi* Hayman, in: St. Leger, Ann. Mag. nat. Hist., ser. 10, 19 (113): 530. Publication date: 1 May 1937. Type locality: Kenya: Lake Rudolf, near Central Island: Bat Island [03 27 N 36 04 E, 700 m] [Goto Description]. Holotype: BMNH 1936.11.4.45: ad ♂, skull and alcoholic. Collected by: D.G. MacInnes; collection date: 24 April 1934. - Etymology: In honour of Mr. Donald Gordon MacInnes, eminent English palaeontologist, who worked in eastern Africa and collected of the type specimen (see Lanza *et al.*, 2015: 189).
? *Rhinopoma macinnesi:* (Name Combination, Current Combination)

TAXONOMY:
Considered a synonym of *hardwickei* by Koopman (1993a), but see Van Cakenberghe and De Vree (1994: 20).

COMMON NAMES:
Chinese: 麦氏鼠尾蝠. Czech: víkonos východoafrický. English: MacInnes's Mouse-tailed Bat. French: Rhinopome de MacInnes. German: MacInnes' Mausschwanz-Fledermaus. Italian: Rinopòma di MacÌnnes.

CONSERVATION STATUS:
Global - *Rhinopoma macinnesi* is listed as Data Deficient (DD ver 3.1 (2001)) in view of the absence of sufficient information on its extent of occurrence, natural history, threats and conservation status (Aulagnier, 2008; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) (Aulagnier, 2008; IUCN, 2009). 2004 - VU D1 ver 3.1 (2001) (Aulagnier,

2004a; IUCN, 2004). 1996 - VU (Baillie and Groombridge, 1996).

MAJOR THREATS:
Rhinopoma macinnesi may be threatened by habitat loss, although this requires confirmation (Aulagnier, 2008; IUCN, 2009).

CONSERVATION ACTIONS:
Aulagnier (2008) [in IUCN (2009)] reported that there appear to be no direct conservation measures in place. It is possible that the species is present in some protected areas. Further research is needed into the distribution, natural history and possible threats to this species.

GENERAL DISTRIBUTION:
Rhinopoma macinnesi is endemic to East Africa, where it has mostly been recorded from Kenya with additional records from the eastern edge of Uganda, Somalia, Ethiopia and possibly Eritrea (Aulagnier, 2008; IUCN, 2009).

Native: Ethiopia; Kenya; Somalia; Uganda
Presence uncertain: Eritrea

POPULATION:
Structure and Density - Little information is available on the population abundance or size of this species. It is believed to have a small population as several expeditions to the species range have not collected specimens (Aulagnier, 2008; IUCN, 2009).
Trend - 2008 - Unknown (Aulagnier, 2008; IUCN, 2009).

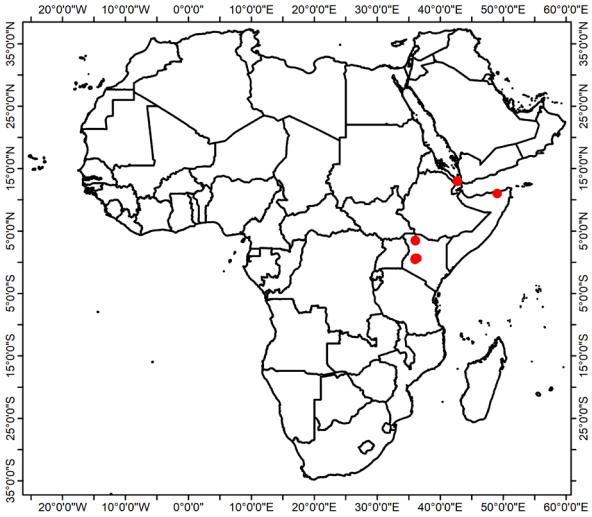

Figure 123. Distribution of *Rhinopoma macinnesi*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Eritrea, Kenya, Somalia.

Rhinopoma microphyllum (Brünnich, 1782)

*1782. *Vespertilio Microphyllus* Brünnich, Dyrenes Historie, 1: 50, pl. 6; figs. 1 - 4. Type locality: Egypt: Giza province: Giza [30 01 N 31 13 E]. Holotype: MNHN A.121/T196: ♀, alcoholic (skull not removed). Number 196 in Rode (1941: 242), who calls this the holotype. Holotype: ZMUC. Collected by: Hasselquist. See Kock (1969a). Paratype: MNHN A.123/196B: ad, alcoholic (skull not removed). Number 196b in Rode (1941: 242). Paratype: MNHN A.124/196C: ad ♀, alcoholic (skull not removed). Number 196c in Rode (1941: 242). Paratype: MNHN A.125/196D: ad ♂, alcoholic (skull not removed). Number 196d in Rode (1941: 242). Allotype: MNHN A.122/196A: ♂, alcoholic (skull not removed). Number 196a in Rode (1941: 242). - Comments: Corbet and Hill (1992: 82) and Horácek *et al.* (2000: 96) mention "Arabia and Egypt" as type locality. Type locality fixed by Koopman (1975: 366) but also Aellen (1957), Anderson and de Winton (1902), Kock (1969a) - See Schlitter and Qumsiyeh (1996: 1). - Etymology: From the Greek "*μικρός*" (mikrós), meaning "small" and "*φύλλον*" (phýllon), meaning "leaf" (see Schlitter and Qumsiyeh, 1996: 4; Lanza *et al.*, 2015: 193).

1820. *Rhinopoma microphylla:* Desmarest, Encyclopédie Méthodique, (Zoologie, Mammalogie), 1: 129. Publication date: 1820. (Current Combination, Alternate Spelling)

1859. *Rhinopoma Lepsianum* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, 222. Publication date: 1859. Type locality: Sudan: Khartoum [15 40 N 32 35 E] [Goto Description]. Lectotype: ZMB 2578: ad ♂, skull and alcoholic. Collected by: Lepsius; collection date: 1844?. Lectotype designated by Kock (1969a: 54, 57); skull extracted in the 1960's by D. Kock (see Turni and Kock (2008: 22). Paralectotype: ZMB A.3243: ad, skull only. Paralectotype designated by Turni and Kock (2008: 22). - Comments: Type locality mentioned as Blue Nile by Kock (1969a: 58); as White Nile by Koopman (1975: 366), Turni and Kock (2008: 22). See Turni and Kock (2008: 22) for a discussion on the fact that Peters possibly used this skull to describe *lepsianum*).

1877. *Rhinopoma cordofanicum* Heuglin, Reise in Nordost Afrika, 2: 24. Publication date: 1877. Type locality: Sudan: Jebel Arashkool: W bank of the White Nile [ca. 14 15 N 32 10 E]. - Comments: Allen (1939a: 64) mentions Heuglin and Fitzinger, 1866. Sitzb. K. Akad. Wiss.

Wien, 54, sec 1, 547 as author. Nomen Nudum. Included in *hardwickei* by Kock (1969a: 35).

1969. *Rhinopoma microphyllum tropicalis* Kock, Abh. Senckenberg. naturforsch. Ges., 521: 58. Type locality: Sudan: Kordofan province: 2 km NE Kadugli: Jebel Talao [11 02 N 29 43 E, 550 m] [Goto Description]. Holotype: SMF 33265: sad ♂, skin and skeleton and skull. Collection date: 12 February 1963. See Kock (1969a: 58): [number 33216 possibly???]. Paratype: SMF 33198: ♂, skull and alcoholic. Collected by: Dr. Dieter Kock; collection date: 6 January 1965. Presented/Donated by: ?: Collector Unknown. Locality: Jebel Talao. Paratype: SMF 33199: ♂, skull and alcoholic. Collected by: Dr. Dieter Kock; collection date: 6 January 1965. Presented/Donated by: ?: Collector Unknown. Locality: Jebel Talao. Paratype: SMF 33200: ♂, skull and alcoholic. Collected by: Dr. Dieter Kock; collection date: 6 January 1965. Presented/Donated by: ?: Collector Unknown. Locality: Jebel Talao. Paratype: SMF 33214: ♂, skull and alcoholic. Collected by: ?: Collector Unknown; collection date: 22 October 1962. Presented/Donated by: ?: Collector Unknown. Locality: Jebel Talao. Paratype: SMF 33215: ♀, skull and alcoholic. Collected by: ?: Collector Unknown; collection date: 16 February 1963. Presented/Donated by: ?: Collector Unknown. Locality: Jebel Talao. - Comments: Most likely a synonym of *R. m. microphyllum*. If a valid subspecies, *lepsianum* or *cordofanicum* may have priority (see Schlitter and Qumsiyeh, 1996: 1).

1985. *Rhinopoma mircophylum kineari:* Bhatnagar and Parveen, Nat. Acad. Sci. Letters, 8 (2): 64. - Comments: Lapsus for *microphyllum*. (Lapsus)

? *Rhinopoma microphyllum microphyllum:* (Name Combination)

? *Rhinopoma microphyllum:* (Name Combination)

Taxonomy:

See Schlitter and Qumsiyeh (1996, Mammalian Species, 542).

Common Names:

Arabian: Khafash abu danab kabir, Khaffash. Bengali: Indur-lenji Chamchika. Czech: víkonos velký, nosalec malolupenný, klaponos egyptský, víkonos, víkonos egyptský, víkonos asijský. Dutch: Grote klapneusvleermuis. English: Larger Mouse-tailed Bat, Long-tailed Bat, Greater Mouse-tailed Bat, Rat-tailed Bat, Brunnich's Mouse-tailed Bat, Larger Rat-tailed Bat, Greater Rat-tailed Bat. French: Grand Rhinopome, Rhinopome microphylle. German: Ägyptische Mausschwanz-Fledermaus. Hebrew: Atalef Yaznuv Gadol. Indonesian: Kelelawar ekor lembing, Kelelawar Ekor-tikus. Italian: Rinopòma microfìllo.

Conservation status:

Global - *Rhinopoma microphyllum* is listed as Least Concern (LC ver 3.1 (2001)) as it is widespread and common in at least parts of its range, with no known major threats (Aulagnier and Palmeirim, 2008b; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Aulagnier and Palmeirim, 2008b; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Aulagnier, 2004b; IUCN, 2004). 1996 - LR: lc (Baillie and Groombridge, 1996).

Major threats:

Human disturbance in roost sites and use of pesticides for locusts affect the species but are not considered major threats at present (Aulagnier and Palmeirim, 2008b; IUCN, 2009).

Conservation actions:

Aulagnier and Palmeirim (2008b) [in IUCN (2009)] reported that no specific measures are known for this species, but presumably it occurs in some protected areas. A study on the impacts of pesticides is required, especially ways in which the impact might be minimised.

General distribution:

The distribution range of *Rhinopoma microphyllum* extends from northern Africa through southwest Asia to Afghanistan, Pakistan and India. In southeast Asia, there are single old records from Thailand and Sumatra. Recorded from sea level in Egypt up to 1,200 m in Morocco (Aulagnier and Palmeirim, 2008b; IUCN, 2009).

Native: Afghanistan; Algeria (Loumassine *et al.*, 2017b: 85); Bangladesh; Benin; Burkina Faso (Kangoyé *et al.*, 2015a: 613); Central African Republic; Chad; Côte d'Ivoire; Djibouti (Pearch *et al.*, 2001: 393); Egypt; Eritrea; Ethiopia; Ghana; Guinea; India; Indonesia; Iran, Islamic Republic of; Iraq; Israel; Jordan; Lebanon; Liberia; Mali; Mauritania (Benda *et al.*, 2004a: 105); Morocco (El Ibrahimi and Rguibi Idrissi, 2015: 358); Myanmar (see Corbet and Hill, 1992); Niger; Nigeria; Oman; Pakistan; Saudi Arabia; Senegal; Sierra Leone; Sudan; Sumatra; Syrian Arab Republic; Togo; Western Sahara; Yemen.
Presence uncertain: Libyan Arab Jamahiriya; Thailand; Tunisia.

ECHOLOCATION:
Search-phase call-shape (locality not given): CF (multiharmonic) (Schmidt and Joermann, 1983). Frequency of CF-component (second harmonic): 27 - 31 kHz (but each individual emits only one frequency); call-duration "long". When flying in a flight-tunnel, this species emits shorter and slightly frequency-modulated calls (as does *R. hardwickii*). However, if 3 individuals fly together in the flight-tunnel, instead of avoiding jamming by changing to three different frequencies (see *R. hardwickii*), the main response of these bats is to greatly increase the intensity of their calls (ibid.). Cvikel *et al.* (2014: 2) showed that *R. microphyllum* doesn't show the classical jamming avoidance response: they altered their signals as if they were responding to a nearby (silent) object. They also found that individuals exhibit sufficient frequency spread to allow individual recognition without any jamming avoidance response.

In Jordan, Benda *et al.* (2010b: 204) recorded the following parameters for 9 calls: F_{start}: 29.6 ± 0.3 (28.9 - 30.0) kHz, F_{end}: 25.7 ± 0.6 (25.2 - 26.7) kHz, F_{peak}: 28.0 ± 0.7 (27.0 - 29.0) kHz, Pulse duration: 11.7 ± 0.8 (10.5 - 13.0) msec, and Inter-pulse Interval: 202.3 ± 46.8 (110.0 - 267.0) msec.

Benda *et al.* (2012a: 182) reported the following values from Iran (hand released): F_{start}: 29.8 ± 0.6 (29.0 - 30.4) kHz, F_{end}: 25.3 ± 0.2 (25.0 - 25.5) kHz, F_{peak}: 27.1 ± 0.4 (26.8 - 27.7) kHz, Pulse duration: 7.9 ± 0.3 (7.6 - 8.3) msec, and inter-pulse interval: 114.6 ± 7.9 (106.5 - 127.2) msec.

From Israel the following parameters were reported by Hackett *et al.* (2016: 223): 116 calls: Pulse duration: 8.37 ± 2.51 msec, F_{start}: 30.21 ± 1.95 (28.0 - 31.2) kHz, F_{end}: 28.99 ± 1.72 (27.0 - 30.2) kHz, F_{peak}: 29.42 ± 1.72 (28.0 - 30.2) kHz.

From Algeria, Loumassine *et al.* (2017b: 87) reported on four harmonics, of which the second one had the most energy: F_{start}: 31.9 - 37.9 Khz, F_{max}: 28.2 - 31.2 kHz, F_{end}: 23.1 - 25.2 kHz, and pulse duration: 3.2 - 6.1 msec.

Davies *et al.* (2013b: Table S8) report a peak-frequency of 28 kHz and a range between 27 and 30 kHz.

Boonman *et al.* (2013b: 6) determined the detection range to be between 2 and 6.5 m at 20 dB and 5.5 and 14 m at 0 dB.

MOLECULAR BIOLOGY:
DNA - Hulva *et al.* (2007a).
Karyotype - Handa and Kaur (1979), and Qumsiyeh and Baker (1985) reported $2n$ = 42, FN = 66, BA = 26, a metacentric X and an acrocentric Y chromosome.
Protein / allozyme - Unknown.

ROOST:
From northern Israel, Levin *et al.* (2013: 1) report that *R. microphyllum* forms sexually-segregated colonies composed of 3,000 to 5,000 individuals during the summer (June to September). At the end of August non-reproductive males left their roost and were occasionally observed in the southern female roosts between September and October.

Also in Israel, Levin *et al.* (2015: 1, 3) found that *R. microphyllum* hibernates during five months in winter in caves that were geothermally heated to a stable temperature of 20 °C, with almost 100 % relative humidity. The bat's skin temperature was 1 - 3 °C above the average cave temperature. During the same period, the outside temperatures fluctuated between 4 and 22 °C.

DIET:
In July from Israel, more than 50 % of the bats diet comprised queen carpenter ants (*Camponotus felah* Dalla Torre, 1893), while other insect groups in the faces comprised mainly Coleoptera and Heteroptera (Levin *et al.*, 2012). This suggests that the gradual increase in the proportion of queen carpenter ants in the diet during summer results from an increase in this insect's availability, combined with a high preference for this prey item.

Benda *et al.* (2012a: 196) analyses faeces from two localities in Iran, and found in the pellets from one of the localities only remains from ants (Hymenoptera, Formicoidea), whereas the other sample contained Coleoptera (60 % of volume), Heteroptera (30 %) and small nematoceran Diptera (10 %).

POPULATION:
Structure and Density - According to Aulagnier and Palmeirim, 2008b) [in IUCN (2009)], *Rhinopoma microphyllum* is uncommon in the western part of the Mediterranean range, but populations probably occur in areas not yet surveyed. Colonies of several thousands have been reported in Egypt. Very rare in Jordan, found in the same caves as *R. hardwickei* but in much lower numbers (Amr, 2000). In Iran the species is common, the most populated cave is in the Mesopotamian plain and has around 20,000 individuals; the total population of Iran is approximately 30,000 and is considered stable (M. Sharifi *pers. comm.,* 2005). In Africa there are large colonies of up to 5,000 individuals in several areas (GMA Africa Workshop, 2004).
Trend - 2008 - Stable (Aulagnier and Palmeirim, 2008b; IUCN, 2009). *R. microphyllum* populations

within the Asia Minor and Levant region are predicted to have a stable population trend, under climate change scenarios (Bilgin *et al.*, 2012: 433).

ACTIVITY AND BEHAVIOUR:
A sharp increase in body mass was observed from mid-July (Levin *et al.*, 2012). Levin *et al.* (2012) also found that the fatty acids composition of *R. micophyllum* body fat reflects the composition of their main prey item-queen carpenter ants. They accumulate significant fat reserves towards the end of summer (Levin *et al.*, 2012). Levin *et al.* (2012) found white adipose tissue accumulates in pre-hibernating *R. micophyllum*.

Cvikel *et al.* (2015: 206) used miniature GPS devices that allowed simultaneous ultrasonic recording and found that one of their tracked bats flew continuously for over 5 hours and that another on flew more than 90 km. All of the bats spent a substantial proportion of their time in high conspecific density. They estimated that bats spent at least 41 ± 14 % of their foraging at less than 150 m from a conspecific and even 8 ± 2 % at less than 12 m from a conspecific

PARASITES:
Hirst (1923: 979) indicates that Kolenati stated that either *R. microphyllum* or *Pteropus ægyptiacus* [=*Rousettus aegyptiacus*] is the host for *Ancystropus zelebori* Kolenati, 1856 (Acari).

In Iran, Benda *et al.* (2012a: 196) found the following parasites to be present: bat flies *Brachytarsina flavipennis* Macquart, 1851 and *B. alluaudi* (Falcoz, 1923) [= *diversa* (Frauenfeld, 1857)]. They also refer to Maa (1965), who reported the presence of streblid bat flies *Ascodipteron namrui* Maa, 1964 and *A. rhinopomatos* Jobling, 1952 from Israel and Egypt, and to Dusbábek (1970), who reported the Macronyssid mites *Macronyssus leucipe* (Domrow, 1959) and *Steatonyssus afer* Radovsky and Yunker, 1963 from Afghanistan (but these came from a mixed collection of *R. microphyllum* and *R. hardwickii*). Furthermore, the presence of the chigger mites *Sasatrombicula rhinopoma* (Vercammen-Grandjean, 1963) and *S. multisternalae* (Vercammen-Grandjean, 1963) was reported from Afghanistan too.

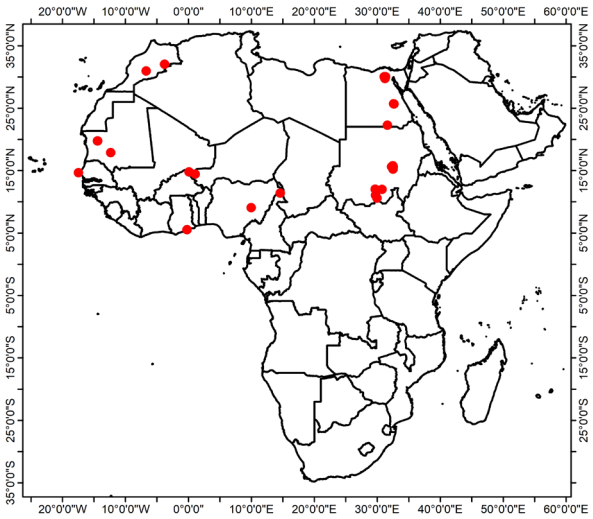

Figure 124. Distribution of *Rhinopoma microphyllum*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Algeria, Burkina Faso, Cameroon, Egypt, Ghana, Mauritania, Morocco, Niger, Nigeria, Senegal, Sudan.

†Family TANZANYCTERIDIDAE Gunnell, Jacobs, Herendeen, Head, Kowalski, Msuya, Mizambwa, Harrison, Habersetzer and Storch, 2003

*2003. *Tanzanycteridida*e Gunnell, Jacobs, Herendeen, Head, Kowalski, Msuya, Mizambwa, Harrison, Habersetzer and Storch, Pal. Electr., 5(3): 3. (Current Combination)
2013. *Tanzanycteridae:* Habersetzer, Engels, Gunnell and Simmons, 16th International Bat Research Conference & 43rd North American Symposium on Bat Research. San José, Costa Rica, 11-15 August 2013, 64. (Lapsus)

TAXONOMY:
Known genera of the family Tanzanycteridida: †***Tanzanycteris*** Gunnell, Jacobs, Herendeen, Head, Kowalski, Msuya, Mizambwa, Harrison, Habersetzer and Storch, 2003.

†Genus ***Tanzanycteris*** Gunnell, Jacobs, Herendeen, Head, Kowalski, Msuya, Mizambwa, Harrison, Habersetzer and Storch, 2003

*2003. *Tanzanycteris* Gunnell, Jacobs, Herendeen, Head, Kowalski, Msuya, Mizambwa, Harrison, Habersetzer and Storch, Pal. Electr., 5(3): 3. (Current Combination)

TAXONOMY:
Using micro-CT scans, Habersetzer *et al.* (2013: 64) examined the inner ear morphology of *T. mannardi* and found that this was very similar to the highly sophisticated echolocation system found in current days *Hipposideros*. They suggest that *Tanzanycteris* might actually be a Hipposiderid rather than a member of a family by its own.

Known species of the genus *Tanzanycteris*: **†*mannardi*** Gunnell, Jacobs, Herendeen, Head, Kowalski, Msuya, Mizambwa, Harrison, Habersetzer and Storch, 2003.

†*Tanzanycteris mannardi* Gunnell, Jacobs, Herendeen, Head, Kowalski, Msuya, Mizambwa, Harrison, Habersetzer and Storch, 2003

*2003. *Tanzanycteris mannardi* Gunnell, Jacobs, Herendeen, Head, Kowalski, Msuya, Mizambwa, Harrison, Habersetzer and Storch, Pal. Electr., 5(3): 5. Type locality: Tanzania: Mahenge: approximately 50 km west of Singida [044750.2S 341554.5E]. Holotype: TNM MP-207: Collected by: ?: Collector Unknown. Presented/Donated by: ?: Collector Unknown. Partial skeleton including skull, axial skeleton anterior to sacrum, partial left and right humeri, and partial left radius. - Etymology: For George W. Mannard who explored the Singida Kimberlite Field and made the first excavation at the type locality in 1957. (Current Combination)

TAXONOMY:
Ravel *et al.* (2011: 403) indicate that the phylogenetic position of *T. mannardi* is still uncertain due to its poor state of preservation, but that it shows many similarities with the Hassianycteridae.

Phillips (2015: 9) refers to Gunnell *et al.* (2003), who identified characters that put *T. mannardi* within the Yinpterochiroptera, more specifically the Rhinolophoidea. These characters include: extremely enlarged cochlea, broadened first rib, and a dorsally flared iliac blade. However, it remains unclear whether *Tanzanycteris* is directly linked to the Rhinolophoidea or to the Yinpterochiroptera (which also include the Pteropodidae). Phillips (2015) estimates the Hard Minimum Age for this taxon to be 45.0 miilion years ago and the Soft Maximum Age at 58.9 mya. Ravel *et al.* (2016: 356) place it in the Middle Eocene.

SUBORDER VESPERTILIONIFORMI Van Cakenberghe, Kearney and Seamark, 2007

1821. *INSECTIVORAE* Gray, 299. - Comments: Proposed as an order of bats, for the same content as that of MICROCHIROPTERA Dobson 1875. Originally included the families Noctilionidae J. Gray, 1821 and Vespertilionidae J. Gray, 1821. Not Insectivora Bowdich, 1821 (Mammalia, Lipotyphla) (see Jackson and Groves, 2015: 252).

1855. *Gymnorhina* Giebel, Die Säugethiere in Zoologischer, anatomischer und palaeontologischer Beziehung umfassend dargestellt., xii, 926. - Comments: Originally included the genera *Furia* F. Cuvier, 1828 [= *Furipterus* Bonaparte, 1837 [1832–1841]]; *Nycticejus* [sic = *Nycticeius*] Rafinesque, 1819; *Vespertilio* Linnaeus, 1758; *Thyroptera* de Spix, 1823; *Dysopes* Illiger, 1811 [= *Molossus* É. Geoffroy, 1805]; *Emballonura* Kuhl [= Temminck, 1838]; *Diclidurus* Wied-Neuwied, 1820; *Noctilio* (Geoff) [= Linnaeus, 1766]; *Taphozous* É. Geoffroy, 1818; and *Mormops* [sic = *Mormoops*] Leach, 1821] (see Jackson and Groves, 2015: 252).

1866. *Entomophaga* A. Murray, The Geographical Distribution of Mammals., xiv. - Comments: Originally included the Istiophora Giebel, 1855 [= Phyllostomidae Gray, 1825] and Gymnorhini Giebel, 1855 [= Yangochiroptera Koopman, 1985; part]. Not Entomophaga Owen, 1839 (Mammalia, Dasyuromorphia [= Marsupialia Illiger, 1811], nor Entomophaga Owen, 1859 (Mammalia, Didelphimorphia) (see Jackson and Groves, 2015: 252).

1866. *ENTOMOPHAGA:* Murray, xiv. - Comments: Not ENTOMOPHAGA Owen 1859, used for didelphoid marsupials.

1979. *PHYLLOSTOMATIA* Van Valen, Evol. Theory, 4 (3): 103, 109. Publication date: July 1979. - Comments: Proposed as infraorder and originally included the superfamilies Rhinopomatoidea Bonaparte, 1838 (containing of the families Rhinopomatidae Bonaparte, 1838, Emballonuridae Gervais, 1855 and Craseonycteridae Hill, 1974); Rhinolophoidea J. Gray, 1825 (containing the families Rhinolophidae J. Gray, 1825, Nycteridae Van der Hoeven, 1855 and Megadermatidae H. Allen, 1864); and Noctilionoidea J. Gray, 1821 (containing the families Noctilionidae J. Gray, 1821, Mormoopidae de Saussure, 1860, Phyllostomatidae Coues and Yarrow, 1875 [= Phyllostomidae J. Gray, 1825] and Desmodontidae Bonaparte, 1845: 5). Jackson and Groves (2015: 252) considered the name as a synonym of the Yangochiroptera Koopman, 1985, but the listing suggests it might rather be a synonym of the Chiroptera.

1979. *VESPERTILIONIA* Van Valen, Evol. Theory, 4 (3): 103, 109. Publication date: July 1979. - Comments: Proposed as infraorder and originally included the superfamily Vespertilionoidea J. Gray, 1821, containing the families Natalidae J. Gray, 1866, Vespertilionidae J. Gray, 1821, Mystacinidae Dobson, 1875 and Molossidae Gervais, 1855 (see Jackson and Groves, 2015: 252).

1985. *YANGOCHIROPTERA* Koopman, Bat Res. News, 25 (3/4): 26. - Comments: Proposed as Infraorder in the suborder Microchiroptera and originally included the superfamilies Phyllostomoidea J. Gray, 1825 and Vespertilionoidea J. Gray, 1821 (see Jackson and Groves (2015: 252).

1995. *VESPERTILIIFORMES* Zagorodniuk, Godovanets, Pokynchereda and Kyseliuk, Rakhiv (Proceed. Intern. Conf. "ACANAP-1995" 18 - 21 October 1995). - Comments: also Zagorodniuk *et al.* (1995); Zagorodniuk and Pokynchereda (1997).

1997. *VESPERTILIFORMES* Zagorodniuk.

1998. *Microchiropteraformes* Simmons and Geisler, Bull. Am. Mus. Nat. Hist., 235: 136. - Comments: Originally included the fossil genus *Eppsinycteris* Hooker, 1996; the fossil families Palaeochiropterygidae Revilliod, 1917 and Hassianycteridae Habersetzer and Storch, 1987; and the suborder Microchiroptera Dobson, 1875 [= Chiroptera Blumenbach, 1779; part] (see Jackson and Groves, 2015: 253).

1998. *Microchiropteramorpha* Simmons and Geisler, Bull. Am. Mus. Nat. Hist., 235: 135, 136. - Comments: Originally included the fossil genus *Australonycteris* Hand et al., 1994; the fossil families Icaronycteridae Habersetzer and Storch, 1987 and Archaeonycteridae Revilliod, 1917; and the unranked Microchiropteraformes (see Jackson and Groves, 2015: 253).

1998. *VESPERTILIONIFORMES* Zagorodnyuk. - Comments: Zagorodnyuk (1998a, b and c); Zagorodniuk (1999, 2001a and b, 2002, 2003a and b, 2004). Jackson and Groves (2015: 228) assigned this name to Hutcheon and Kirsch (2004b: 44), who included the families

Phyllostomidae J. Gray, 1825: 242, Mormoopidae de Saussure, 1860, Noctilionidae J. Gray, 1821, Mystacinidae Dobson, 1875, Emballonuridae Gervais, 1855, Vespertilionidae J. Gray, 1821, Miniopteridae Dobson, 1875, Molossidae Gervais, 1855, Natalidae J. Gray, 1866 and Nycteridae Van der Hoeven, 1855.

2001. *YINPTEROCHIROPTERA* Springer, Teeling, Madsen, Stanhope, and De Jong, Proc. Natl. Acad. Sci. USA, 98 (11): 6423. - Comments: In part.

2004. *VESPERTILIONIFORMES* Hutcheon and Kirsch, J. mamm. Evolut., 11 (1): ???.

*2007. *VESPERTILIONIFORMI* Van Cakenberghe, Kearney and Seamark, African Chiroptera Report. Publication date: July 2007. - Comments: The name of the Infraorder is based on *Vespertilio* Linnaeus, 1758 (type of VESPERTILIONIDAE Gray, 1821). (Current Combination)

2008. *Microcheroptera:* Selim, Nahla, and Shelfeh, Tishreen Univ. J. Res. Sci. Stud. - Biol. Sci. Ser., 30 (1): 247. (Lapsus)

2014. *Vespertilionimorpha* Zagorodniuk, Proc. Theriol. School, 12: 8.

TAXONOMY:
The suborder name follows the typified name used by Zagorodniuk *et al.* (1995) - Vespertiliiformes, Zagorodniuk (1997) - Vespertiliformes, Zagorodniuk and Pokynchereda (1997) - Vespertiliiformes, Zagorodniuk (1998a, 1998b and 1998c) - Vespertilioniformes, Zagorodniuk (1999 (1999, 2001a and 2001b, 2002, 2003a and b, 2004) - Vespertilioniformes and Hutcheon and Kirsch (2004b,2006) - Vespertilioniformes, but with the ending changed to follow the format proposed for standardization of nomenclature of higher taxa by Alonso-Zarazaga (2005). '-formes' indicates ordinal level, while ending '-formi' indicates subordinal level.

Currently three Infraorders are recognized within the suborder VESPERTILIONIFORMI from Africa: **NOCTILIONIFORMACEI** Van Cakenberghe, Kearney and Seamark, 2007; **NYCTERIFORMACEI** Van Cakenberghe, Kearney and Seamark, 2007; **VESPERTILIONIFORMACEI** Van Cakenberghe, Kearney and Seamark, 2007.

MOLECULAR BIOLOGY:
Volleth (2010: 308) found no cytogenetic synapomorphy for Vespertilioniformes [= Vespertilioniformi], which indicates that this group has a monophyletic origin.

INFRAORDER NOCTILIONIFORMACEI Van Cakenberghe, Kearney and Seamark, 2007

*2007. *NOCTILIONIFORMACEI* Van Cakenberghe, Kearney and Seamark, African Chiroptera Report. Publication date: July 2007. - Comments: The name of the Superfamily is based on *Noctilio* Linnaeus, 1766. (Current Combination)

TAXONOMY:
Currently a single superfamily is known from within the Infraorder NOCTILIONIFORMACEI for Africa: **NOCTILIONOIDEA** Gray 1821.

Superfamily NOCTILIONOIDEA Gray, 1821

*? *Noctilionoidea* - Comments: The name of the Superfamily is based on *Noctilio* Linnaeus, 1766. (Current Combination)

TAXONOMY:
The placement of the Family Myzodidae, with in the superfamily Noctilionoidea follows Teeling *et al.* (2005).
Simmons *et al.* (2013: 145) include seven families: Myzopodidae, Mystacinidae, Thyropteridae, Furipteridae, Noctilionidae, Mormoopidae, and Phyllostomidae, which were already distinct by the end of the Eocene.

COMMON NAMES:
Czech: vampýrovci.

Family MYZOPODIDAE Thomas, 1904

*1904. *Myzopodidae* Thomas, Proc. zool. Soc. Lond., 1904, II, I: 5. Publication date: 1 October 1904. - Comments: Type genus: *Myzopoda* A. Milne-Edwards and A. Grandidier, 1878. (Current Combination)

TAXONOMY:
Known extant genera: ***Myzopoda*** Milne-Edwards and Grandidier, 1878.

Known extinct genera: †***Phasmatonycteris*** Gunnell, Simmons and Seiffert, 2014.

COMMON NAMES:
Czech: přísavkovcovití, myzopodovití, netopýrkové ušatí. Dutch: Madagassische hechtschijfvleermuizen. English: Sucker-footed Bats. French: Myzopodidés. German: Madagassische Haftscheibenfledermaus, Madagaskar-Haftscheibenfledermäuse. Norwegian: Sugeskålflaggermus.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Butler (1978: 67) suggests that the Myzopodidae are probably of African mainland origin, but survive only in Madagascar.
Simmons *et al.* (2013: 146) indicate that one fossil species is known in this family.
The family-level stem and crown ages were calculated by Shi and Rabosky (2015: 1537) as 54.1 and 1.1 mya, respectively.

Genus ***Myzopoda*** Milne-Edwards and A. Grandidier, 1878

*1878. *Myzopoda* A. Milne-Edwards and A. Grandidier, Bull. Sci. Soc. Philom. Paris, sér. 7, 2: 220. Publication date: 22 June 1878. - Comments: Type species: *Myzopoda aurita* A. Milne-Edwards and A. Grandidier, 1878. - Etymology: From the Greek "*μύξάω*", meaning to suck (not from "*μύξα*", meaning mucus) and "*πούς*", meaning foot, referring to the sectional disk on the thumbs and feet (see Palmer, 1904: 446). (Current Combination)

1879. *Myxopoda:* Dobson, Proc. zool. Soc. Lond., 1878, IV: 871. Publication date: April 1879. - Comments: Lapsus (see Allen, 1939a: 82; Schliemann and Maas, 1978: 1) or emendation (see Palmer, 1904: 445). - Etymology: From the Greek "*μύξα*", meaning mucus, and "*πούς*", meaning foot, referring to the sectional disk on the thumbs and feet (see Dobson, 1879a: 281; Palmer, 1904: 445). (Lapsus)

TAXONOMY:
Know species of the genus *Myzopoda*: ***aurita*** Miline-Edwards and Grandidier, 1878. ***schliemanni*** Goodman, Rakotondraparany and Kofoky, 2007.

COMMON NAMES:
Czech: přísavkovci, myzopody. English: Sucker-footed Bats. French: Chauves-souris à ventouses. German: Madagaskar-Haftscheibenfledermäuse.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Butler (1978) found a *Myzopoda* sp. at Olduvai, Kenya, in deposits of early Pleistocene age.

CONSERVATION STATUS:
Global - Assessed as *M. aurita* VU (World Conservation Monitoring Centre, 1993); LC ver 3.1 (2001) (Jenkins *et al.*, 2008h; IUCN, 2009).

Russell *et al.* (2008b: 219) suggests that *Myzopoda* sp. may be among the few Malagasy verterbrate species to benefit from rapid deforestation, due to the species utilizing *Ravenala* as a day roost. *Ravenala* is a dominating pioneering species, and dense stands are found in areas of primary lowland forest which have been cleared (Goodman *et al.*, 2007a).

BIOGEOGRAPHY:
Russell *et al.* (2008b) using coalescent analysis places the time of divergence of *M. aurita* and *M. schliemanni* at approximately 73,500 years ago.

DETAILED MORPHOLOGY:
Reproductive system - Carter and Enders (2016: 284) found *Myzopoda* sp. to have a smooth chorioallantois, suggesting that this genus belongs in the emballonurid clade.

†***Myzopoda africana*** Gunnell, Butler, Greenwood and Simmons, 2015

*2015. *Myzopoda africana* Gunnell, Butler, Greenwood and Simmons, Am. Mus. Novit., 3846: 1, 3, figs 2A, 2C, 3. Publication date: 16 December 2015. Type locality: Tanzania: Arusha province: Olduvai Gorge: Bed I, FLK NI, Layer 123. [Goto Description]. - Etymology: The name refers to the African continent as it is the only representative of the genus *Myzopoda* that is found on continental Africa.

SIMILAR SPECIES:
M. africana's humeri are on average 21 % larger than those of its living congeners (Gunnell *et al.*, 2015a: 5).

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Timeframe: Pleistocene.

Myzopoda aurita Milne-Edwards and A. Grandidier, 1878

*1878. *Myzopoda aurita* A. Milne-Edwards and A. Grandidier, Bull. Sci. Soc. Philom. Paris, sér. 7, 2: 220. Publication date: 22 June 1878. Type locality: Madagascar: "Madagascar". Holotype: MNHN ZM-MO-1997-770: alcoholic (skull not removed). Number 223 in Rode (1941); see Peterson *et al.* (1995: 139). (Current Combination)
1879. *Myxopoda aurita:* Dobson, Proc. zool. Soc. Lond., 1878, IV: 879. Publication date: April 1879. (Lapsus)

TAXONOMY:
See Schliemann and Maas (1978: 116).

COMMON NAMES:
Czech: přísavkovec ušatý, netopýrek ušatý, myzopoda ušatá. English: Golden Bat, Old World Sucker-footed Bat, Sucker-footed Bat, Madagascar Sucker-footed Bat, Eastern Sucker-footed Bat. French: Chauve-souris malgache à pieds à ventouses, Chauve-souris à pieds à ventouses de Madagascar, Vespertilion Doré, Myzopoda oreillard. German: Östliche Haftscheibenfledermaus.

CONSERVATION STATUS:
Global - This species is listed as Least Concern (LC ver 3.1 (2001)) because it is widespread, thought to be locally common in areas of anthropogenic disturbance, and there are no obvious major threats (Jenkins *et al.*, 2008h; IUCN, 2009).
Ralisata *et al.* (2010) refute the suggestion that this species is rare (Hutson *et al.*, 2001).

Assessment History -
2008 - LC ver 3.1 (2001) (Jenkins *et al.*, 2008h; IUCN, 2009). 1996 - VU A2c ver 2.3 (1994). 1994 - VU (Groombridge, 1994). 1990 - VU (IUCN, 1990).

MAJOR THREATS:
There are no known major threats to this species. It is occasionally eaten by people when harvesting *Ravenala madagascariensis* plants (Jenkins *et al.*, 2008h; IUCN, 2009). However, Ralisata *et al.* (2015: 95) do point out that this harvesting itself might lead to a loss of roosts, and as such has a negative impact on the bats.

CONSERVATION ACTIONS:
Jenkins *et al.* (2008h) [in IUCN (2009)] reported that *M. aurita* has only been recorded from a few protected areas: Parc National de Marojejy (Pont and Armstrong, 1990), Tampolo littoral forest (Ifticene *et al.*, 2005) and near to Parc National de Masoala (Russ and Bennet, 1999) and Réserve Spéciale d'Analamazaotra (Russ and Bennet, 1999). Additional study is needed to develop an understanding of local population densities and precise habitat requirements.
Ralisata *et al.* (2010) indicate that it used disturbed patches of vegetation and is not therefore threatened by deforestation, although it may be affected by loss of roosts for building materials.

GENERAL DISTRIBUTION:
Myzopoda aurita is endemic to the island of Madagascar (Goodman *et al.*, 2007a). It is found in the humid zone of eastern and north-eastern Madagascar and appears to be most common at elevations lower than 500 m (Schliemann and Goodman, 2003) although it has been recorded at Andasibe (ca. 970 m).

Native: Madagascar.

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
For details, see a.o. Thomas (1904g).

DENTAL FORMULA:
Inc. $^{2-2}/_{4}$, c $^{1-1}/_{1-1}$, pm $^{3-3}/_{3-3}$, m $^{3-3}/_{3-3}$ (see Dobson, 1879a: 872).

DETAILED MORPHOLOGY:
Baculum:
Rakotondramanana and Goodman (2017: 59) described the baculum from two specimens as being a small structure, triangular in shape, without a central shaft (length: 0.21, 0.26 mm; width: 0.15, 0.16 mm). In a third specimen they found a trace of a circular bone structure.

MOLECULAR BIOLOGY:
DNA - See Hoofer and Van Den Bussche (2003) and Russell *et al.* (2008b).
Karyotype - Richards *et al.* (2010) examined two females showing a 2*n*=26 and a Fna=48, with all chromosomes being bi-armed. FISH with *Myotis* probes revealed a X-autosome translocation. However, the autosome translocated to the X chromosome has not been counted for the Fna. The number of autosomal arms would then be 50 instead of 48.
Protein / allozyme - Unknown.

HABITS:
Compositional analysis revealed that *M. aurita* males selected coffee plantations, degraded humid forest and wooded grasslands more than other habitats (Ralisata *et al.*, 2010).

ROOST:
Ralisata *et al.* (2010) found 133 roosts consisting of the partially unfurled leaves of *Ravenala madagascarensis* (Sonn, 1782) and housing between nine and 51 individuals, which changed roosts every 1 - 5 days. Ralisata *et al.* (2015: 95) found that the leaves of the tree became available as roost between one and 19 days after the unfurling started and were inhabited between one and 12 days.

DIET:
Göpfert and Wasserthal (1995) noted that *M. aurita* - based on the analysis of fecal pellets of a single individual from north of Tolagnaro, southeast Madagascar - fed on smaller moths ("microlepidoptera"). Ralisata *et al.* (2010) found the diet comprised mainly of Lepidoptera and Coleoptera. The latter was confirmed by Rasoanoro *et al.* (2015: 64), who mention the following volume percentages: Aranea: 15.4 ± 2.38, Coleoptera: 26.7 ± 4.60, Diptera: 3.6 ± 3.59, Homoptera: 0.3 ± 0.33, Hymenoptera: 8.4 ± 3.58, Lepidoptera: 40.1 ± 7.31, and Neuroptera: 5.5 ± 5.07.

POPULATION:
Structure - See Russell *et al.* (2008b: 219).
Density - Russell *et al.* (2008b) estimated an effective population size of between 100,054 and 132,742 individuals. In some areas, *M. aurita* is locally common (P. A. Racey *pers. comm.*), but it is rarely trapped in large numbers during surveys (Russ and Bennet, 1999; Ifticene *et al.*, 2005; Rakotondraparany and Medard, 2005; Jenkins *et al.*, 2007b). Ralisata *et al.* (2010) caught on average of 5.7 (0 - 15) individuals per mist net night, at Kianjavato, where a total of 138 individiuals were captured on 24 nights of netting.
Trend - 2008 - Unknown (Jenkins *et al.*, 2008h; IUCN, 2009).

ACTIVITY AND BEHAVIOUR:
Ralisata *et al.* (2010) found that the foraging areas used by male bats varied between 7 and 108 ha (100 % minimum convex polygon), where the bats foraged close to the roost for the first hour after emergence, then travelled up to 1.8 km away and returned after 03h00.

REPRODUCTION AND ONTOGENY:
See Carter *et al.* (2008).
Ralisata *et al.* (2010) suggest that juvenile males leave their mothers after weaning and join adult males. During October-November, the testes of males appeared larger than at other times of the year, although seasonal variation was not pronounced (Ralisata *et al.*, 2010).

PARASITES:
Ralisata *et al.* (2010) did not observe any parasties on the 138 individual males captured.

UTILISATION:
In the area around Tampolo forest, people collecting leaves of the Traveller's palm (*Ravenala madagascariensis*) for housing materials often encounter *M. aurita* roosting in the leaves, although no evidence that the bats were deliberately sought, they were collected and taken back to the village where they were cooked and eaten (Jenkins and Racey, 2008).

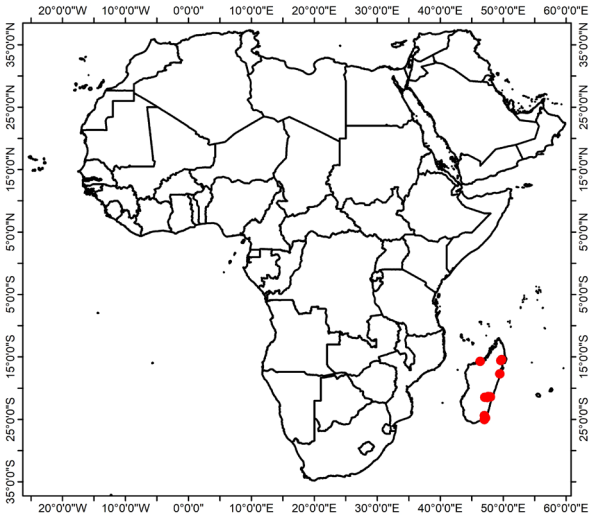

Figure 125. Distribution of *Myzopoda aurita*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Madagascar.

Myzopoda schliemanni Goodman, Rakotondraparany and Kofoky, 2007

*2007. *Myzopoda schliemanni* Goodman, Rakotondraparany and Kofoky, Mamm. biol., 72 (2): 65, 68, figs. 2 - 5. Publication date: 26 March 2007. Type locality: Madagascar: Mahajanga province: Parc National d'Anarafantsika: Ampijoroa, forestry station: Jardin Botanique A [16 19.4 S 46 48.4 E, 160 m] [Goto Description]. Holotype: FMNH 177327: ad ♂, skin and skeleton and skull. Collected by: Steven M. Goodman; collection date: 18 April 2003; original number: SMG-13624. 3 male and 4 female paratypes listed. - Etymology: The species name was chosen to honour Professer Dr. Harald Schliemann, University of Hamburg, in recognition of his long interest in sucker-footed bats, including several important anatomical studies (e.g. Schliemann, 1971; 2003). (Current Combination)

2016. *Myz[opoda] schleimanni:* Cardiff and Jenkins, Less. Conserv., 6: 90. Publication date: January 2016. (Lapsus)

2016. *Myzopoda scliemanni:* Amador, Arévalo, Almeida, Catalano and Giannini, J. mamm. Evolut., 23 (4): Suppl.. (Lapsus)

TAXONOMY:
Described by Goodman *et al.* (2007a) using external measurements and pelage coloration and supported by population genetics (Russell *et al.*, 2008b).

COMMON NAMES:
Czech: přísavkovec bělobřichý. English: Schliemann's Sucker-footed Bat. French: Chauve-souris à ventouses de Schliemann. German: Schliemanns Haftscheibenfledermaus.

ETYMOLOGY OF COMMON NAME:
The species name was chosen to honour Professor Dr. Harald Schliemann, University of Hamburg, in recognition of his long interest in sucker-footed bats, including several important anatomical studies (e.g. Schliemann, 1970, 1971).

CONSERVATION STATUS:
Global - This species is listed as Least Concern (LC ver 3.1 (2001)) as it has a relatively large geographic range and population size, and like other *Myzopoda* is thought to do well in highly modified habitats. It is unlikely to have been negatively impacted by deforestation (Jenkins *et al.*, 2008I; IUCN, 2009).

Assessment Histroy -
2008 - LC ver 3.1 (2001) (Jenkins *et al.*, 2008I; IUCN, 2009). 2004 - Not assessed, but see Goodman *et al.* (2007a), who discuss the possible conservation status.

MAJOR THREATS:
The threats to this species are poorly known because of a lack of information on habitat preferences (Jenkins *et al.*, 2008I; IUCN, 2009). Russell *et al.* (2008b) consider bats of the genus *Myzopoda* to benefit from deforestation.

CONSERVATION ACTIONS:
Myzopoda schliemanni has been trapped in Parc National de Namoroka and Parc National d'Ankarafantsika (Goodman *et al.*, 2007a) as well as a recently created protected area in the Lac Kinkony - Mahavay area (Rakotoarivelo and Randrianandrianina, 2007). Based on current information this is a restricted-range species for which there are few data on natural history or ecology and basic field research is clearly needed to obtain information on the local abundance of this species (Jenkins *et al.*, 2008I; IUCN, 2009).
It was not found during surveys of Parc National du Tsingy de Bemaraha (Kofoky *et al.*, 2007), Parc National de Kirindy-Mité (Goodman *et al.*, 2005a; Andriafidison *et al.*, 2006a) or Kirindy CFPF (Goodman *et al.*, 2005a).

GENERAL DISTRIBUTION:
Myzopoda schliemanni is known from central western Madagascar in lowland areas from Ankaboka in the north (Goodman *et al.*, 2007a) to Andranomanintsy in the south (Russell *et al.*, 2008b). Goodman *et al.* (2007a) suggested that the distribution of range of *M. schliemanni* is broader than currently known and may extend north as far as Ambanja.

Native: Madagascar.

GEOGRAPHIC VARIATION:
See Goodman *et al.* (2007a).

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
See Goodman *et al.* (2007a).

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:
See Goodman *et al.* (2007a).

DETAILED MORPHOLOGY:
Baculum:
Rakotondramanana and Goodman (2017: 59) found in four specimens a triangular-shaped baculum, which was slightly more elongated than in *M. aurita* (length: 0.26 ± 0.078 mm, width: 0.12 ± 0.017 mm) and in a fifth specimen, the baculum was morphologically similar to that of the latter species.

For a description of the crania, teeth, postcranial skeleton, ears and tragus see Goodman *et al.* (2007a).

SEXUAL DIMORPHISM:
Goodman *et al.* (2007a) found there is no sexual dimorphism in *M. schliemanni*.

MOLECULAR BIOLOGY:
DNA - Russell *et al.* (2008b).
Karyotype - Unknown.
Protein / allozyme - Unknown.

HABITAT:
There are few accounts of its foraging habitats, although Rakotoarivelo and Randrianandrianina (2007) mist-netted 16 individuals in relatively disturbed forest.

HABITS:
See Goodman *et al.* (2007a).

ROOST:
Kofoky *et al.* (2006) observed *M. schliemanni* roosting in a cave. There are no other published observations of this species' roosting preferences, although it is assumed to also use broad-leaved plants such as *Ravenala madagascariensis* (Strelitziaceae) (Goodman *et al.*, 2007a; Russell *et al.*, 2008b).

DIET:
Rajemison and Goodman (2007) collected feacal samples from 18 individuals during mid-October from Andranomanitsy Forest, western Madagascar, where they reported four different insect orders. Prey belonging to the orders Lepidoptera and Blattaria were the most common in the samples and were more or less equally represented (Rajemison and Goodman, 2007).

PREDATORS:
Goodman *et al.* (2015c: 78) found the remains of one individual in pellets of Bat Hawk *Macheiramphus alcinus* Bonaparte, 1850 in western central Madagascar.

POPULATION:
Structure - In Andranomanintsy forest, 8 of the 18 bats captured were males indicating a sex ratio of 1 : 1.25 (Goodman *et al.*, 2007a: 312).
Density - Estimated effective population size using demographic models from two sites was between 61,453 and 134,630 individuals (Russell *et al.*, 2008b). A roosting colony of 4 individuals was reported from a cave in Parc National de Namoroka (Kofoky *et al.*, 2006).
Trend - 2008 - Unknown (Jenkins *et al.*, 2008l; IUCN, 2009).

ACTIVITY AND BEHAVIOUR:
Rajemison and Goodman (2007) suggest that *M. schliemanni* is capable of gleaning prey from vegetation (see Diet).

REPRODUCTION AND ONTOGENY:
See Goodman *et al.* (2007a) and Carter *et al.* (2008).

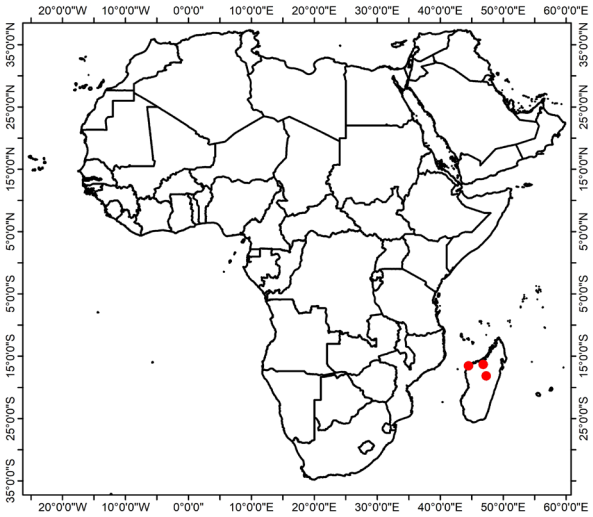

Figure 126. Distribution of *Myzopoda schliemanni*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Madagascar.

†Genus ***Phasmatonycteris*** Gunnell, Simmons and Seiffert, 2014

*2014. *Phasmatonycteris* Gunnell, Simmons and Seiffert, PLoS ONE, 9 (2): e86712: 6. Publication date: 4 February 2014 [Goto Description]. - Etymology: From the Greek "Phasma(to)" for apparition or spectre, in reference to the long ghost lineage connecting Fayum myzopodids with extant forms, and the Greek "Nykteris" for bat (see Gunnell *et al.*, 2014: 7). - ZooBank: 693EEE77-DD52-408B-B404-B689A43706AC. (Current Combination)

TAXONOMY:
Known species for *Phasmatonycteris*: ***butleri*** Gunnell, Simmons and Seiffert, 2014. ***phiomensis*** Gunnell, Simmons and Seiffert, 2014.

ZOOBANK:
693EEE77-DD52-408B-B404-B689A43706AC

†***Phasmatonycteris butleri*** Gunnell, Simmons and Seiffert, 2014

*2014. *Phasmatonycteris butleri* Gunnell, Simmons and Seiffert, PLoS ONE, 9 (2): e86712: 1, 7, figs 3A, 4. Publication date: 4 February 2014. Type locality: Egypt: Western Desert: Fayum Depression: Birket Qarun Formation: Fayum Quarry BQ-2 (23 meter level) [Goto Description]. - Etymology: In honour of Percy Butler, in recognition of his work on fossil bats from Africa and of his 75 year publishing career (see Gunnell *et al.*, 2014: 7). - ZooBank: E6B5FFD8-5250-4C2A-B83F-CC469DD32557. (Current Combination)

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
The type specimen was found in the 23 meter level layer at Fayum Quarry BQ-2. This layer is about 37 million year old (Late Eocene, Priabonian).

GENERAL DISTRIBUTION:
Egypt

ZOOBANK:
E6B5FFD8-5250-4C2A-B83F-CC469DD32557

†***Phasmatonycteris phiomensis*** Gunnell, Simmons and Seiffert, 2014

*2014. *Phasmatonycteris phiomensis* Gunnell, Simmons and Seiffert, PLoS ONE, 9 (2): e86712: 1, 6, figs 2A–D, 3C, E–G. Publication date: 4 February 2014. Type locality: Egypt: Western Desert: Fayum Depression: Fayum Quarry I (242 m level) [Goto Description]. - Etymology: From "Phiom," Greek for the Fayum Region of Egypt's Western Desert (see Gunnell *et al.*, 2014: 7). - ZooBank: 94812861-7911-438E-BD80-AB849541605B. (Current Combination)

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
The type material was found in the 242 meter level Fayum Quarry I, in a layer of about 30 million years old (Early Oligocene, Rupelian).

GENERAL DISTRIBUTION:
Egypt.

ZOOBANK:
94812861-7911-438E-BD80-AB849541605B

INFRAORDER NYCTERIFORMACEI Van Cakenberghe, Kearney and Seamark, 2007

*2007. *NYCTERIFORMACEI* Van Cakenberghe, Kearney and Seamark, African Chiroptera Report. Publication date: July 2007. - Comments: The name of the Infraorder is based on *Nycteris* G. Cuvier and E. Geoffroy, 1797 (type Family NYCTERIDAE Van der Hoeven, 1855). (Current Combination)

GENERAL COMMENTS:
We followed the format proposed for standardization of nomenclature of higher taxa by Alonso-Zarazaga (2005), then for typified names this would be standardized, using the connector -acei and the ending -iformacei. But, for those without typified names there may well be occasions where incertae-sedis is used.

TAXONOMY:
Currently a single superfamily is known from within the Infraorder NYCTERIFORMACEI for Africa: **NYCTEROIDEA** Van der Hoeven, 1855.

Superfamily NYCTEROIDEA Van der Hoeven, 1855

*1855. *Nycteroidea* Van der Hoeven. - Comments: The Superfamily name is based on *Nycteris* G. Cuvier and E. Geoffroy, 1797 (type Family NYCTERIDAE Van der Hoeven, 1855). (Current Combination)

2005. *Emballonuroidea* Teeling, Springer, Madsen, Bates, O'Brien, and Murphy, Science, 307: 581.

TAXONOMY:
This name is used contrary to the superfamily name, EMBALLONURIDEA, used by Teeling *et al.* (2005), Ravel *et al.* (2016: 377), and Amador *et al.* (2016: 22) because, the oldest, typified name is *Nycteris* G. Cuvier and E. Geoffroy, 1795, rather than *Emballonura* Temminck, 1838 (or even Emballonuridae Gervais, 1855).

Family EMBALLONURIDAE Gervais, 1855

*1855. *Emballonuridae* Gervais, in: F. Comte de Castelnau, Exped. Partes Cen. Am. Sud., Zool, (Sec. 7), Vol. 1, pt. 2 (Mammifères): 62 footnote. Publication date: 23 July 1855. - Comments: Type genus: *Emballonura* Temminck. - Etymology: The name of this family is derived from the Greek "*ἐμβάλλω*", meaning to throw in and "*οὐρά*", meaning tail, referring to the tail structure of all its members, which resembles a spear thrown into the ground at an angle (see Palmer, 1904: 257; Taylor, 2005). (Current Combination)

1865. *Brachyura* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, 257. - Comments: Originally included the genera *Mystacina* J. Gray, 1843; *Noctilio* Linnaeus, 1766; *Taphozous* É. Geoffroy, 1818; *Emballonura* Temminck, 1838; *Diclidurus* Wied-Neuwied, 1820; and *Furia* F. Cuvier, 1828 [= *Furipterus* Bonaparte, 1837 [1832–1841] (see Jackson and Groves, 2015: 253). Pavlinov *et al.* (1995: 74) mentioned it "In part". Simmons (*pers. comm.*): "This name is a tough one, no type genus was noted and taxa now placed in 5 families were included. I have left it out because it is not clear just what it would be a junior synonym of. There seems no point in restricting it since it is not the oldest name for any of the family groups now recognized. Fixed".

1866. *Diclidurina* Gray, Ann. Mag. nat. Hist., ser. 3, 17 (98): 92. Publication date: 1 February 1866.

1866. *Emballonurina* Gray, Ann. Mag. nat. Hist., ser. 3, 17 (98): 92. Publication date: 1 February 1866. - Comments: Type genus: *Emballonura* Temminck, 1838. Proposed as tribe, and originally including the genera *Urocryptus* Temminck, 1838 [= *Saccopteryx* Illiger, 1811]; *Diclidurus* Wied-Neuwied, 1820; *Saccopteryx* Illiger, 1811; *Emballonura* Temminck, 1838; *Proboscidea* Spix, 1823 [= *Rhynchonycteris* Peters, 1867]; *Centronycteris* J. Gray, 1838; and *Furia* F. Cuvier, 1828 [= *Furipterus* Bonaparte, 1837 [1832–1841] (see Jackson and Groves, 2015: 253).

1875. *Emballonuridae* Dobson, Ann. Mag. nat. Hist., ser. 4, 16 (95): 349. Publication date: 1 November 1875. - Comments: Type genus: *Emballonura* Temminck, 1838. Originally included the subfamilies Emballonurinae Gervais, 1855 and Molossinae Gervais, 1855 (see Jackson and Groves, 2015: 253).

1893. *Emballonurini* Winge, Samling af Afhandlinger. E Museo Lundii, 2 (1): 24. - Comments: Proposed as tribe (?), and originally including the genera *Mosia* J. Gray, 1843; *Emballonura* Temminck, 1838; *Coleura* Peters, 1867; *Saccopteryx* Illiger, 1811; *Rhynchonycteris* Peters, 1867; *Vespertiliavus* Schlosser, 1887; *Diclidurus* Wied-Neuwied, 1820; and *Taphozous* É. Geoffroy, 1818 (see Jackson and Groves, 2015: 253).

1907. *Diclidurinae* Miller, Bull. U.S. natl. Mus., 57: 94. Publication date: 29 June 1907. - Comments: Type genus: *Diclidurus* Wied, 1819.

1928. *Emballonuroidea* Weber, Die Säugetiere., 154. - Comments: Originally included the families Rhinopomatidae Bonaparte, 1838, Emballonuridae Gervais, 1855 and Noctilionidae J. Gray,

1821. Jackson and Groves (2015: 253) considered this name a synonym of the Emballonuridae.

2013. *Emballanuridae:* Taylor, Sowler, Schoeman and Monadjem, S. Afr. J. Wildl. Res., 43 (1): 18. Publication date: April 2013. (Lapsus)

TAXONOMY:
Koopman (1993a: 156) mentions Gervais, 1856 as author, whereas Corbet and Hill (1992: 83) mention Dobson, 1875e: 349. Simmons (2005) recognises two subfamilies: Emballonurinae (including the African genera *Coleura* and *Emballonura*), and Taphozoinae (including the African genera *Saccolaimus* and *Taphozous*). Goodwin (1942: 120) considers Diclidurinae to be a valid subfamily.

Known extant genera: *Balantiopteryx* Peters, 1867; *Centronycteris* Gray, 1838; ***Coleura*** Peters, 1867; *Cormura* Peters, 1867; *Cyttarops* Thomas, 1913; *Diclidurus* Wied-Neuwied, 1820; *Emballonura* Temminck, 1838; *Mosia* Gray, 1843; ***Paremballonura*** Goodman, Puechmaille, Friedli-Weyeneth, Gerlach, Ruedi, Schoeman, Stanley and Teeling, 2012; *Peropteryx* Peters, 1867; *Rhynchonycteris* Peters, 1867; *Saccopteryx* Illiger, 1811; ***Saccolaimus*** Temminck, 1838; ***Taphozous*** E. Geoffroy, 1818.

COMMON NAMES:
Czech: pochvorepovití, netopýři hladkonosí, embalonurovití. Dutch: Schedestaartvleermuizen. English: Sheath-tailed Bats, Tomb Bats, Sac-winged Bats. Finnish: Hautalepakot. French: Emballonuridés. German: Flattnasenfreischwänze, Sackflügel-Fledermäuse, Glattnasen-Freischwänze. Italian: Emballonùridi. Norwegian: Frihalete flaggermus, gravflaggermus. Russian: Футлярохвостые. Spanish (Castillian): Murciélagos de cola envainada. Vietnamese: Họ dơi bao.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
The Emballonuridae are known from the early Miocene (Butler and Hopwood, 1957; Butler, 1969; 1978).
The stem and crown ages for this family were reported as 52.8 and 47.7 MYA by Shi and Rabosky (2015: 1537), and 51 and 45 MYA by Amador *et al.* (2016: 22).

Ravel *et al.* (2016: 416) indicate that *Chambinycteris pusilli* is the most basal taxon of this family.

PARASITES:
The Old World Emballonuridae are host for the genus *Ugandobia* (Acari: Myobiidae), containing nine species (Fain, 1994: 1280). Two additional species were described from Hipposideridae and Pteropodidae, but Fain (1994: 1280) suggests this was due to contamination of the jars in which they were found, and that the representatives of this genus are actually restricted to the Emballonuridae.

Genus ***Coleura*** Peters, 1867

*1867. *Colëura* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, 479. - Comments: Type species: *Emballonura afra* Peters. - Etymology: From the Greek "*κολεόν*" (coleon), meaning "sheath, scabbard" and "*oúρά*" (urá), meaning tail, referring to the tail being enveloped in the interfemoral membrane as far as the last caudal vertebra (see Palmer, 1904: 195; Lanza *et al.*, 2015: 201).
1939. *Coleura:* Allen, Bull. Mus. comp. Zool., 83: 65. (Current Spelling)

TAXONOMY:
Key provided in Dunlop (1997, Mammalian Species, 566).

Known species of the genus *Coleura*: ***afra*** (Peters, 1852); ***kibomalandy*** Goodman, Puechmaille, Friedli-Weyeneth, Gerlach, Ruedi, Schoeman, Stanley and Teeling, 2012; †***muthokai*** Wesselman, 1984; ***seychellensis*** Peters, 1868.

COMMON NAMES:
Czech: buldočí pochvorepi. English: Sheath-tailed bats, Peters's sheath-tailed bats. French: Chauves-souris à queue gainée. German: Schiebeschwanz-Fledermäuse.

†*Coleura muthokai* Wesselman, 1984

*1984. *Coleura muthokai* Wesselman, Contributions to vertebrate evolution, 7: 52. - Etymology: The taxon is named in honor of Muthoka, son of Kivingo, a Wakamba tribesman from Kikoko, Kenya, who worked with H.B. Wesselman as his assistant during the field seasons of 1972 and 1973 (Wesselman, 1984: 52). (Current Combination)

TAXONOMY:
Closely resembles the extant and larger species *C. afra* (Wesselman, 1984; Lim, 2007).

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Late Pliocene (2.58 Mya) of southwestern Ethiopia (Lim, 2007).

Coleura afra (Peters, 1852)

*1852. *Emballonura afra* Peters, Naturwissenschaftliche Reise nach Mossambique, Zoologie, Säugethiere, 51, pl. 12, pl. 13, fig. 18, 19. Publication date: 1852. Type locality: Mozambique: Lower Zambesi River: Tete [16 10 S 33 35 E, 230 m] [Goto Description]. Syntype: BMNH 1858.6.18.12: ad ♀, alcoholic (skull not removed). Collected by: Prof. Wilhelm Carl Hartwig Peters. See Dobson (1878: 366) and Turni and Kock (2008: 23). Syntype: BMNH 1907.1.1.703:. See Turni and Kock (2008: 23). These latter specimens might possibly be the missing ZMB ones, but I did not find any proof of this (Van Cakenberghe, *pers com*). Syntype: RMCA [number unknown]:. See Jentink (1888b: 196) in Turni and Kock (2008: 23). These latter specimens might possibly be the missing ZMB ones, but I did not find any proof of this (Van Cakenberghe, *pers com*). Syntype: ZMB 429:. See Turni and Kock (2008: 23) [missing]. Syntype: ZMB 430:. See Turni and Kock (2008: 23) [missing]. Syntype: ZMB 54845: skull and alcoholic. (Skull damaged) see Turni and Kock (2008: 23). Syntype: ZMB 571: skull and alcoholic. M + F, see Turni and Kock (2008: 23). Syntype: ZMB 67559: skull and alcoholic. See Turni and Kock (2008: 23). Syntype: ZMB 67561: skull and alcoholic. See Turni and Kock (2008: 23). Syntype: ZMB 67562: skull and alcoholic. See Turni and Kock (2008: 23). Syntype: ZMB 85667: ♂, complete skeleton. See Turni and Kock (2008: 23). Syntype: ZMB 85668: skin only. See Turni and Kock (2008: 23). Syntype: ZMB 85669: ♀. See Turni and Kock (2008). - Etymology: From the feminine Latin adjective *àfra* meaning "African" (see Lanza *et al.*, 2015: 156).

1915. *C[oleura] g[allarum] nilosa* Thomas, Ann. Mag. nat. Hist., 8, 15 (90): 576, 577. Publication date: 1 June 1915. Type locality: Sudan: Upper Nile: Bahr-el-Zeraf, near mouth of [ca. 14 42 N 31 14 E] [Goto Description]. Holotype: BMNH 1915.3.6.76: ad ♂, skin only. Collected by: Willoughby P. Lowe; collection date: 3 February 1914; original number: 77. - Comments: Thorn *et al.* (2009: 41), however, mention 09 25 N 31 10 E for the coordinates. May be valid as a subspecies (Kock, 1969a; Koopman, 1975). In the key presented in the original description on p. 576, the name is given as *C. g. nilosa*, on the description itself (p. 577) it is mentioned as *Coleura gallarum nilosa*.

1915. *C[oleura] gallarum* Thomas, Ann. Mag. nat. Hist., 8, 15 (90): 576, 577. Publication date: 1 June 1915. Type locality: Somalia: Zeyla [=Zsyla] [sea level] [Goto Description]. Holotype: BMNH 1911.8.2.4: ad ♀. Collected by: Dr. Ralph Evelyn Drake-Brockman; collection date: 29 October 1910; original number: 336. Presented/Donated by: Dr. Ralph Evelyn Drake-Brockman. - Comments: In the key presented in the original description on p. 576, the name is given as *C. gallarum*, on the description itself (p. 577) it is mentioned as *Coleura gallarum*.

1939. *Coleura kummeri* Monard, Arq. Mus. Bocage, 10: 55, fig. 1. Publication date: March 1939. Type locality: Guinea-Bissau: Madina Boé [11 45 N 13 13 W] [Goto Description]. Syntype: MHNG 1326.003: Collected by: Dr. Albert Monard. Presented/Donated by: ?: Collector Unknown. Syntype: MNHN ZM-MO-1940-1209 - 201: ♂, alcoholic (skull not removed). Collected by: Dr. Albert Monard. Mentioned ad paratype by Rode (1941: 244). This is either number 879, 884, 886 or 887 from Monard (1939: 55). Syntype: NMBA 5277: ad ♀, alcoholic (skull not removed). Collected by: Dr. Albert Monard; collection date: 5 March 1938; original number: 881. See http://www.nmb.bs.ch/NaturmuseumBasel/LinksNMB/Sammlung/Kataloge/Mammalia.pdf . Syntype: NMBA 5278: ad ♂, alcoholic (skull not removed). Collected by: Dr. Albert Monard; collection date: 5 March 1938; original number: 890. See http://www.nmb.bs.ch/NaturmuseumBasel/LinksNMB/Sammlung/Kataloge/Mammalia.pdf . Syntype: RMCA 15313: ad ♀, alcoholic (skull not removed). Collected by: Dr. Albert Monard; original number: 883. Presented/Donated by: ?: Collector Unknown. - Comments: Monard (1939: 55) used 13 specimens and three skulls for the description on this taxon. The whereabouts of specimens 879 ♂, 880 ♀, 882 ♀, 884 ♂, 886 ♂, 887 ♂, 888 ♀, 889 ♂, 891 ♀, 892 (3 skulls) has not yet been determined, although one of the male specimens is the syntype in the Paris Museum.

? *Coleura gallarum nilosa:* (Name Combination)

TAXONOMY:
See Dunlop (1997, Mammalian Species, 566). The recently discovered population in Madagascar could prove to be a distinct species (Goodman *et al.* (2005a).

Vallo *et al.* (2018: 73) investigated the genetic and morphological variation of various African and Arabian populations and found that specimens from Kenya, Tanzania and Ghana could be assigned to the nominotypical subspecies. The (smaller) specimens from Yemen and Gabon represented two different lineages. Morphologically, these seemed to correspond with *gallarum/nilosa* (NE Africa + Arabia) and *kummeri* (W Africa), but this was not confirmed by their molecular analyses.

COMMON NAMES:
Afrikaans: Skedestertvlermuis. Chinese: 非洲鞘尾蝠. Czech: pochvorep buldočí, netopýr buldočí. English: Southern Sheath-tailed Bat, African Sheath-tailed Bat, Sheath-tailed Bat, Mozambique Sheath-tailed Bat. French: Chauve-souris à queue gainée d'Afrique, Emballonure d'Afrique, Chauve-souris à queue en fourreau d'Afrique. German: Afrikanische Schiebeschwanz-Fledermaus. Italian: Còleura africàna. Portuguese: Morcego de cauda.

ETYMOLOGY OF COMMON NAME:
The colloquial name refers to the peculiar situation of the tail, which is enclosed by the interfemoral membrane between the back legs (Taylor, 2005).

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008dq; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2008dq; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2004h; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
The threats to this species are not well understood. Disturbance of roost sites could potentially be a threat, but the effect of this on the population is not well known (Mickleburgh *et al.*, 2008dq; IUCN, 2009).

Kioko *et al.* (2015: 19) report a roadkill on the Arusha Highway (Tanzania).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008dq) [in IUCN (2009)] indicate that on the African continent, there are no species-specific conservation measures in place, but there are some protected areas within its range. Both of the known sites for this species in Madagascar are within protected areas (the Ankarana Special Reserve and Namoroka National Park).

GENERAL DISTRIBUTION:
Coleura afra is found in much of east and eastern-central Africa, with an isolated record from central Mozambique. It is also found in West Africa, with records from Guinea and Guinea Bissau, Sierra Leone, northern Côte d'Ivoire, Ghana, Togo, Benin, and western Nigeria. There is also a small distribution in western Angola. This species was recently discovered in Madagascar (Goodman *et al.*, 2005a) and is known only from the Ankarana Special Reserve in the north of the island and the Namoroka National Park in the west.

Harrison (1967: 166) reported a specimen collected in the Strait of Bab el Mandeb, at the southern approach of the Red Sea.

Native: Angola (Crawford-Cabral, 1989; Monadjem *et al.*, 2010d: 535; Taylor *et al.*, 2018b: 62); Benin; Burkina Faso (Kangoyé *et al.*, 2012: 6024; 2015a: 614); Cameroon (Lebreton *et al.*, 2014: 2); Central African Republic; Congo (The Democratic Republic of the); Côte d'Ivoire; Djibouti (Pearch *et al.*, 2001: 394); Eritrea; Ethiopia (Lavrenchenko *et al.*, 2004b: 147); Ghana; Guinea; Guinea-Bissau (Monard, 1939; Rainho and Ranco, 2001: 39); Kenya; Madagascar (Goodman *et al.*, 2005a); Mozambique Smithers and Lobão Tello, 1976; Monadjem *et al.*, 2010d: 535) ; Nigeria (Happold, 1987); Sierra Leone (Weber *et al.*, 2019: 25 - first record); Somalia; Sudan; Tanzania (including the island of Pemba [see O'Brien, 2011: 287]); Togo (Capo-Chichi *et al.*, 2004: 161); Uganda; Yemen (Harrison and Bates, 1991: 34; Benda *et al.*, 2011b: 31).

Presence uncertain: Burundi; Rwanda.
Possibly extinct: Congo (Mickleburgh *et al.*, 2008dq; IUCN, 2009).

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Lucati and López-Baucells (2016: Suppl.) report on a piebald (all-white fur/skin patches, eyes always normally coloured) specimen from a cave in Kenya (https://www.inaturalist.org/observations/877909).

DETAILED MORPHOLOGY:
Baculum - Unknown.
Brain - Based on three brains from Kenya, using immunohistochemical methods, Kruger *et al.* (2010a) describe the nuclear organization of the cholinergic, catecholaminergic and serotonergic systems, and Kruger *et al.* (2010b) also describe the distribution of Orexin-A immunoreactive cell bodies and terminal networks.

SEXUAL DIMORPHISM:
Kangoyé *et al.* (2015a: 614) confirm the sexual dimorphism found by Goodman *et al.* (2008b): in both body and cranial measurements, the females are larger than the males.

ECHOLOCATION:
See Pye (1980) and Taylor *et al.* (2005).

Musila *et al.* (2018c: 43) [referring to Monadjem *et al.* (2010d: 246)] mention a narrow band, low-duty pulse call, composed of constant frequency, with peak frequency of 32.9 kHz and a bandwidth of 2.4 kHz.

HABITAT:
In Nigeria, the African sheath-tailed bat is found in localised rocky habitats in southern Guinea savanna (Happold, 1987). Rosevear (1965) stated that they occur in woodland but only where there are acceptable roosting places. It is likely that other colonies occur in suitable rocky habitats in the southern Guinea savanna of western Nigeria (Mickleburgh *et al.*, 2008dq).
On Madagascar this bat taxon appears to be more varied in its habits, with some roost sites typically very dark and others quite close to the cave entrance. The two known sites on Madagascar are within dry deciduous tropical forest on a karst substrate (Goodman *et al.*, 2005a).

ROOST:
On mainland Africa, the African sheath-tailed bat is found in well illuminated caves, rocky crevices and cellars of houses (Rosevear, 1965). It preferentially roosts in caves along the sea and lake shores (Kingdon, 1974).
Lebreton *et al.* (2014: 2) report on a colony of about 5,000 specimens roosting in a cave in a rocky, forest-covered hill in Cameroon, which was also occupied by *Rousettus aegyptiacus*. Kangoyé *et al.* (2015a: 614) observed thousands of individuals in a cave on a hill at Néguéni, Burkina Faso.

MIGRATION:
Some authours suggest that *Coleura afra* migrates (Happold, 1987; Skinner and Smithers, 1990).

PREDATORS:
Mikula *et al.* (2016: Supplemental data) mention the Dark chanting goshawk (*Melierax metabates* Heuglin, 1861) as diurnal avian predator.

POPULATION:
Structure and Density - In the African portion of *Coleura afra* distribution, it roosts in large colonies (in the 1,000s of animals) (Mickleburgh *et al.*, 2008dq; IUCN, 2009). The population and local abundance of this species in Madagascar is not known, but there is a minimum estimate of 500 individuals in one cave complex in Ankarana, Madagascar.
Trend - 2008 - Unknown (Mickleburgh *et al.*, 2008dq; IUCN, 2009). 2004 - Unknown (Mickleburgh *et al.*, 2004h; IUCN, 2004).

REPRODUCTION AND ONTOGENY:
Krutzsch (2000: 113) indicates that *C. afra* is monoestrous in parts of their range and polyoestrous in others. McWilliam (1987b) observed that this species has two reproductive cycles per year in Kenya. He also showed that early postnatal growth rates in *C. afra* were higher during the short rainy season than during the long rainy season which followed an extended dry period. This can be attributed to the poor condition of females following a pregnancy when food resources were low.

PARASITES:
BACTERIA
Bartonellae
Bartonella - Kosoy *et al.* (2010: 1877) and Bai and Kosoy (2012: 58) reported a prelevence of *Bartonella* spp. In *C. afra* from Kenya of 4/9 (44.4 %) cultured from blood samples. Four genotypes of *Bartonella* spp. Identified in *C. afra* differed slightly from one another but clustered tightly within a genogroup (Kosoy *et al.*, 2010: 1878). See also Kosoy (2010: 719) for further information.

ACARI
Fain (1959b: 249, 254) described *Chirnyssus africanus* (Sarcoptidae) from a *C. afra* specimen collected on Mount Wago, near Bukwa, Haut-Ituri, DRC and from a "*Coleura gallarum*" from Moba,

DRC. In a subsequent paper, Fain (1959d: 150, 159) described *Notoedres (Notoedres) benoiti* (Sarcoptidae) from the same hosts and localities.

HEMIPTERA
Polyctenidae: *Eoctenes coleura* Maa, 1964 from Sudan (Haeselbarth *et al.*, 1966: 16, host as *Coleura gallarum*).

DIPTERA
Streblidae: *Raymondia huberi* Frauenfeld, 1856 from Mozambique and Ethiopia (Haeselbarth *et al.*, 1966: 102; Shapiro *et al.*, 2016: 254). *Raymondi seminuda* Jobling, 1954 from Tanzania (Jobling (1954) in Haeselbarth *et al.* (1966: 104)).
Nycteribiidae: *Penicillidia fulvida* (Bigot, 1885) (Haeselbarth *et al.*, 1966: 114, host as *Coleura gallarum*; Obame-Nkoghe *et al.*, 2016: 5, Gabon); *Nycteribia schmidlii scotti* Falcoz, 1923 (Obame-Nkoghe *et al.*, 2016: 5, Gabon), which was infected by the blood parasite *Polychromophilus melanipherus* (Szentiványi *et al.*, 2019; Suppl.).

VIRUSES:
Conrardy *et al.* (2014) tested 2 individuals from Kenya for the presence of adenoviruses, rhabdoviruses and paramyxoviruses, none of which tested positive. Maganga *et al.* (2014b) tested 94 *C. afra* samples collected from the Belinga caves of Gabon of which 14 tested positive to an unclassified paramyxovirus named Belinga bat virus (BelPV), one individual presented with haemorrhagic legions at necropsy.

In their country-wide survey of Kenyan bats, Waruhiu *et al.* (2017) found the following viruses in *Coleura afra*: Adenoviruses, Astroviruses, Paramyxoviruses.

Coronaviridae - Coronaviruses
SARS-CoV - During Febuary 2008, Pfefferle *et al.* (2009) tested 33 fecal samples from two localities in Ghana, and these were negative for coronavirus (CoV) RNA. None of the 85 Kenyan bats tested by Tao *et al.* (2017: Suppl.) were positive for CoV.

Nairoviridae
Orthonairovirus
Six out of 14 *C. afra* specimens from Gabon tested by Müller *et al.* (2016: 3) were positive for Crimean Congo hemorrhagic fever virus (CCHFV).

Paramyxoviridiae
Drexler *et al.* (2012a: 4) report that morbili-related viruses found in *Myotis myotis* in Germany were also found in one *Coleura afra* specimen from Ghana (out of 96 examined).
Maganga *et al.* (2014b) described a new Paramyxovirus (Belinga bat virus, BelPV) from 14 *C. afra* specimens from the Belinga caves (Gabon). One of these bats died due to several hemorrhagic lesions. None of the other bat species inhabiting the same caves were infected by this virus (*Hipposideros* cf. *ruber, Hipposideros gigas, Miniopterus inflatus, Rousettus aegyptiacus, Rhinolophus alcyone*).

Rhabdoviridae
Lyssavirus - Rabies related viruses
Horton *et al.* (2014: Table S1) tested 30 Kenyan *C. afra* specimens, but failed to find neutralising antibodies to IKOV (Ikoma lyssavirus).

In their overview table, Maganga *et al.* (2014a: 8) reported that the following viruses were already found on *C. afra*: Morbillivirus unclassified. Fagre and Kading (2019: 4) also reported that serologic evidence was found for Crimean-Congo Hemorrhagic Fever Virus (CCHF).

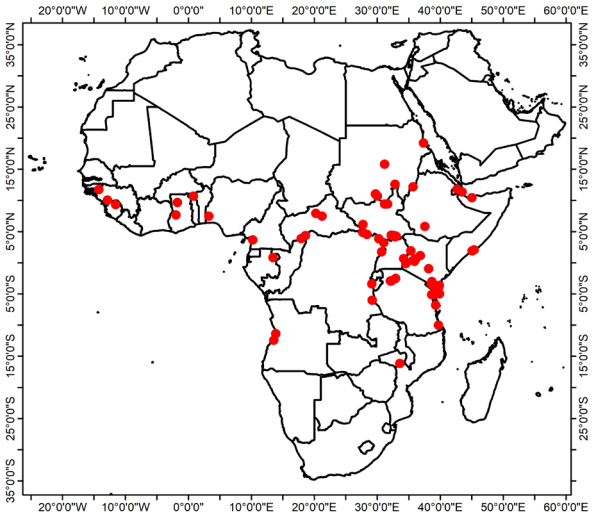

Figure 127. Distribution of *Coleura afra*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Angola, Cameroon, Central African Republic, Congo (Democratic Republic of the), Côte d'Ivoire, Djibouti, Egypt, Ethiopia, Gabon, Ghana, Guinea, Guinea-Bissau, Kenya, Mozambique, Nigeria, Sierra Leone, Somalia, South Sudan, Sudan, Tanzania, Uganda.

Coleura kibomalandy Goodman, Puechmaille, Friedli-Weyeneth, Gerlach, Ruedi, Schoeman, Stanley and Teeling, 2012

*2012. *Coleura kibomalandy* Goodman, Puechmaille, Friedli-Weyeneth, Gerlach, Ruedi, Schoeman, Stanley and Teeling, J. Mamm., 93 (6): 1442, 1446, figs 3, 4. Publication date: December 2012. Type locality: Madagascar: Antsiranana province: Ankarana National

Park, 2.2 km ESE Amboandriky: Ambatoharanana cave (Crocodile cave) [12.98838S 49.02178E, 20 m] [Goto Description]. Holotype: FMNH 213598: ad ♀, skull and alcoholic. Collected by: Steven M. Goodman and Martinus Corrie Schoeman; collection date: 2 November 2010; original number: SMG 16954. Presented/Donated by: ?: Collector Unknown. Paratype: FMNH 183864: ♀, skull and alcoholic. Presented/Donated by: ?: Collector Unknown. Paratype: UADBA 43497: ♂, alcoholic (skull not removed). Collected by: Richard K.B. Jenkins. Presented/Donated by: ?: Collector Unknown. - Etymology: The name *kibomalandy* is derived from a northern Malagasy dialect and means white (*malandy*) and belly (*kibo*) and refers to this species' distinctive underside, which distinguishes it from other described species of *Coleura, Paremballonura*, and *Emballonura* (see Goodman *et al.*, 2012a: 1446). (Current Combination)

TAXONOMY:
Goodman *et al.* (2012a) described a new species of *Coleura* based on morphology and molecular data.

COMMON NAMES:
English: Madagascar Sheath-tailed Bat. French: Emballonure de Madagascar. German: Madagaskar-Schiebeschwanzfledermaus.

CONSERVATION STATUS:
Goodman *et al.* (2012a: 1449) suggest that this is a species of conservation concern due to its restricted distribution and its apparent limited number of individuals.

GENERAL DISTRIBUTION:
This species is known from two sites on Madagascar: the Ankarana National Park and the Namoroka National Park.

DETAILED MORPHOLOGY:
Baculum:
Rakotondramanana and Goodman (2017: 57) described the baculum as a distinctly small structure, which, in dorsal view, has a sort of oblong shape. It is constricted along the mid-shaft and has a rounded tip that is smaller than the rounded basal portion. In lateral view, it tapers from the proximal to distal side, and it also is slightly constricted along the mid-shaft in this view. There is a slight hook to the tip. Length: 0.12 mm, width: 0.09 mm.

ECHOLOCATION:
Goodman *et al.* (2012a: 1448) mention the following parameters: low PF (< 35 kHz), narrow BW (< 7 ms), and short Dur (< 6 ms).

HABITAT:
Dammhahn and Goodman (2013: 108) indicate that the foraging habitat of this species is unknown, but probably is in open areas or in open forests.

POPULATION:
Goodman *et al.* (2012a: 1449) indicate that in July 2004, there were about 500 animals in the Ambatoharanana cave, and that no information is available on the population in the other cave.

PARASITES:
Gomard *et al.* (2016: 5) reported the presence of *Leptospira* bacteria in one out of three tested bats.

VIRUSES:
Mélade *et al.* (2016b: 4) found Paramyxoviruses in two out of six *C. kibomalandy* specimens they tested.

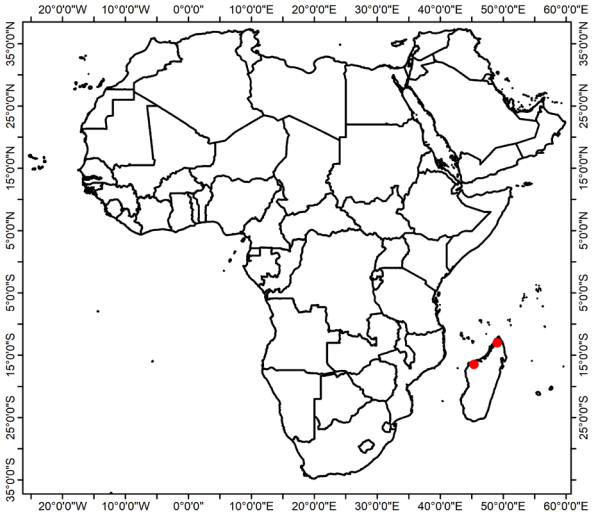

Figure 128. Distribution of *Coleura kibomalandy*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Madagascar.

Coleura seychellensis Peters, 1868

*1868. *Coleura seychellensis* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, 367. Publication date: 1869. Type locality: Seychelles. Syntype: ZMB 3470a: ♂. Presented/Donated by: Prof. Edward Percival Wright. University of Dublin, see Turni and Kock (2008: 22). Syntype: ZMB 3470b: ad ♂. Presented/Donated by: Prof. Edward Percival Wright. University of Dublin, see Turni and Kock (2008: 22). Cotype: BMNH 1869.2.19.2: ad ♂. See Thomas (1915b: 579); Turni and Kock (2008: 22) indicate that the BMNH specimen can not be a (co-)type since Peters only used the ZMB specimens for his description, therefore they also reject Thomas' restriction of the type locality to Mahé Island. - Comments: Allen (1939a: 65) mentions "1869, for 1868". - Etymology: Referring to the island group where the species occurs. (Current Combination)

1915. *C[oleura] silhouettæ* Thomas, Ann. Mag. nat. Hist., 8, 15 (90): 576, 578. Publication date: 1 June 1915. Type locality: Seychelles: Silhouette Island [Goto Description]. Holotype: BMNH 1906.3.18.2: ad ♂, skin and skull. Collected by: Prof. J. Stanley Gardiner. Presented/Donated by: Prof. J. Stanley Gardiner. - Comments: In the key on page 576 mentioned as *C. silhouettæ*, and in the description on p. 578 as *Coleura silhouettæ*.

TAXONOMY:
Two subspecies are recognized *Coleura seychellensis seychellensis* from Mahé and Praslin, and *C. s. silhouettae* from Silhouette and La Digue (Hill, 1971a: 575; Rocamora and Joubert, 2004; Simmons, 2005).

COMMON NAMES:
Creole: Sousouri banann. Czech: pochvorep seychelský, netopýr seychelský. English: Seychelles Sheath-tailed Bat. French: Chauve-souris à queue gainée des Seychelles, Emballonure des Seychelles, Chauve-souris à queue en fourreau des Seychelles. German: Seychellen Schiebeschwanz-Fledermaus.

CONSERVATION STATUS:
Global - Listed as Critically Endangered (CR C2a(i) ver 3.1 (2001)) because its population size is estimated to number fewer than 250 mature individuals, with no subpopulation greater than 50 individuals, and it is experiencing a continuing decline (Gerlach *et al.*, 2008; IUCN, 2009; Jones *et al.*, 2009b: 506). Bambini *et al.* (2005) reported that the bats may have become extinct on the island of Praslin within the first five years of the 21th century.

Assessment History -
2008 - CR C2a(i) ver 3.1 (2001) (Harrison and Lewis, 1961; IUCN, 2009). 2004 - CR C2a(I,ii) ver 3.1 (2001) (IUCN, 2004; Mickleburgh *et al.*, 2004g). 2002 - CR B1+2cde, C2b, D (Mickleburgh *et al.*, 2002a). 1996 - CR (Baillie and Groombridge, 1996). 1994 - EN (Groombridge, 1994). 1993 - EN (World Conservation Monitoring Centre, 1993). 1990 - EN (IUCN 1990). 1988 - EN (IUCN Conservation Monitoring Centre 1988).

Collen *et al.* (2011: 2615) put this species on position 26 of their top 100 mammals that need urgent conservation attention on the basis of a combination of high Evolutionary Distinctivness (ED) and high threat status.

MAJOR THREATS:
Gerlach (2004) reports that the most catastrophic decline of this species probably occurred in the late 1800s and early 1900s when lowland forests were cleared, converting the mosaic of woodland and open gaps to intensively managed coconut plantations with no shrub layer to support the invertebrate diet of this species. Invasive plants including the Kudzu vine (*Pueraria phaseoloides*) and coconut scrub from abandoned plantations threaten remaining suitable habitat for this species. Kudzu vine threatens to overgrow roost cave entrances or to change the temperature gradient within caves (Gerlach and Taylor, 2006). Senior *et al.* (2007: 9) also added that - upon leaving their roosts - all the bats follow the same route, which follows the line with the least vegetation cover. Any encroachment of vegetation will make entry and exit to the roosts more difficult and could be a reason for roost abandonment. The species is sensitive to disturbance of roosting caves and this remains a threat to any active roost sites. Other suggested threats have been the predation of bats by the barn owl, *Tyto alba*, introduced in 1949, and feral cats (Gerlach *et al.*, 2008; IUCN, 2009). Burgess and Lee (2004: 69) mention that pesticide contamination is probably not a significant threat.

CONSERVATION ACTIONS:
Gerlach *et al.* (2008) [in IUCN (2009)] report that Rocamora and Joubert (2004) recommend annual census of individuals along established transects; regular sensitive visits to all known roosting localities with additional surveys to locate any additional sites; reevaluation of the species distribution every three or four years; legal protection of all known roosting sites and their immediate surroundings; control of introduced predators (barn owl *Tyto alba* and cats); habitat protection within known feeding areas; public awareness campaigns; ongoing and additional research into the distribution, ecology and threats to this species. Gerlach and Taylor (2006) also outline the importance of removing invasive vegetation from existing and abandoned roost sites, and restoring lowland forests through the control of coconut and cinnamon, and replanting native vegetation.

GENERAL DISTRIBUTION:
This species is endemic to the Seychelles, and is currently found on the islands of Silhouette, Mahé (in the northwest of the island) and Praslin. It is thought to have become extinct on La Digue island and Praslin since 1980s (Gerlach *et al.*, 2008). Senior *et al.* (2007: 3), however, indicated that these bats were only found on Silhouette and Mahé, and that they were last seen on Praslin in 2001 and on La Dique in 1976.

The Zanzibar record is extremely dubious (Simmons, 2005).

Native: Seychelles,
Presence uncertain: Zanzibar.

SEXUAL DIMORPHISM:
Nicoll and Suttie (1982) [in Ball (2004: 136)] indicate that females are almost 10 % heavier than males: 10.2 grams versus 11.1 grams.

ECHOLOCATION:
Burgess and Lee (2004: 72) report ultrasounds of 28 to 29 kHz, produced when flying in and out the entrances of their roosting caves. Inside the caves, sounds with a frequency between 24 and 26 kHz were produced. However, Clark (2004: 77) mentions sounds at around 30 - 40 kHz. Joubert (2004: 58) indicates that two harmonic bands are present: one at 40 kHz and one at 25 - 30 kHz. Ball (2004: 136) mentions an echolocation range from 20 to 50 kHz, but that it is usually around 30 kHz when flying within the roost.

HABITAT:
This species has been recorded from coastal boulder field caves with stable cool temperatures and access into native palm woodland or marsh habitat (Gerlach and Taylor, 2006).

ROOST:
It appears to need boulder caves with horizontal ceilings; low, stable temperatures; and clear cave flyways not obscured by vegetation (Gerlach and Taylor, 2006). Abandoned roosts have been recorded from all four islands in the species historical distribution. A detailed study of the roosting site at La Passe is provided by Burgess and Lee (2004).

DIET:
Joubert (2004: 61) reports the following percentage of prey eaten by *C. seychellensis*: Diptera (30.5 %), Hymenoptera (25 %), Lepidoptera (19.5 %), Coleoptera (22 %), and Hemiptera (3 %).

PREDATORS:
Mikula *et al.* (2016: Supplemental data) mention *C. seychellensis* to be predated upon by *Falco* sp. and an unidentified species of diurnal avian predator.

POPULATION:
Structure and Density - The species was noted by Wright (1868) to be 'very common in the neighborhood of the town of Port Victoria'. Joubert (2004) mentions that the species was seemingly still abundant up to the 1970s, and that the use of guano deposits as an indicator suggests that the magnitude of decline may have been as high as 90 %. The global population is now clearly very small, and although the precise number is not known, it is believed to be fewer than 100 mature individuals (Rocamora and Joubert, 2004; Gerlach *et al.*, 2008). The roosting cave at La Passe was recorded to contain 32 bats in total in 2003 (Gerlach, 2004; Gerlach *et al.*, 2008). More recently only 27 animals have been recorded roosting at this locality (Gerlach *et al.*, 2008), but Gerlach (2011: 54) mentioned that the size of this colony has increased to 40 in 2009, and that it split up in two parts of approximately 20 individuals in 2010, one remaining at La Passe and the second at Anse Lascars.

Senior *et al.* (2007: 16) indicate that the population might be higher than estimated IF this species has indeed a harem structure as was suggested by Nicoll and Suttie (1982) as non-harem males would not roost with mating groups. However, this might also have a negative influence due to greater levels of inbreeding.

Trend - 2008 - Decreasing (Gerlach *et al.*, 2008; IUCN, 2009). 2004 - Decreasing (Mickleburgh *et al.*, 2004g; IIUCN, 2004).

ACTIVITY AND BEHAVIOUR:
Joubert (2004) and Gerlach and Taylor (2006) provide specific details on the ecological requirements of this rare species.

Smotherman *et al.* (2016: 537) refer to Gerlach (2009b) in describing the song-like structure for *C. seychellensis* as consisting of different syllable types in series.

REPRODUCTION AND ONTOGENY:
Nicoll and Suttie (1982) [in Krutzsch (2000: 113)] indicate that *C. seychellensis* is a polyoestrous species.

MATING:
Burgess and Lee (2004: 69) indicate that a harem structure might exist, but their observations were inconclusive.

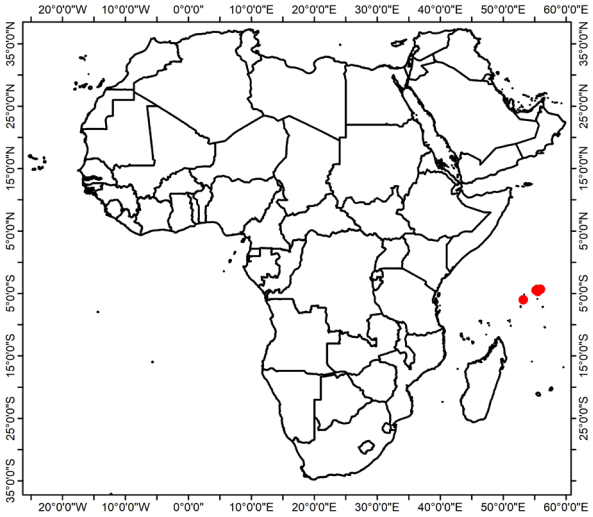

Figure 129. Distribution of *Coleura seychellensis*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Seychelles.

†Genus ***Dhofarella*** Sigé, Thomas, Sen, Gheerbrant, Roger, and Al-Sulaimani, 1985

*1994. *Dhofarella* Sigé, Thomas, Sen, Gheerbrant, Roger and Al-Sulaimani, Munch. Geowiss. Abh, (A) 26: 35 - 48. - Comments: See Gunnell *et al.* (2008: 5). (Current Combination)

TAXONOMY:
Morpholigally considered closer to *Taphozous* than to *Vespertiliavus* (Lim, 2007).

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
The oldest known emballonurid fossils from Africa. Early Oligocene age (33.9 Mya) (Lim, 2007).

Timeframe:
Late Eocene (Priabonian) - Early Oligocene (Rupelian) (33.9 Mya).

GENERAL DISTRIBUTION:
Oman (Sigé *et al.*, 1994; Lim, 2007).

†***Dhofarella sigei*** Gunnell, Simons and Seiffert, 2008

*2008. *Dhofarella sigei* Gunnell, Simons and Seiffert, J. Vert. Paleont., 28 (1): 5, fig. 6. Type locality: Egypt: Fayum Depression: Quarry L-41: Lower Sequence, Jebel Qatrani Formation. Holotype:

CGM 83670:. A left dentary series m1-m3. - Etymology: Named for Bernard Sigé, in recognition of his many contributions to the study of Cenozoic bats (Gunnell *et al.*, 2008). (Current Combination)

TAXONOMY:
See Gunnell *et al.* (2008).

SIMILAR SPECIES:
See Gunnell *et al.* (2008).

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
See Gunnell *et al.* (2008).

Timeframe:
Latest Eocene, Priabonian, Lower Sequence, Jebel Qatrani formation.

GENERAL DISTRIBUTION:
Egypt (Gunnell *et al.*, 2008).

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:
See Gunnell *et al.* (2008).

†***Dhofarella thaleri*** Sigé et al., 1994

*1994. *Dhofarella thaleri* Sigé, Thomas, Sen, Gheerbrant, Roger and Al-Sulaimani, Munich. Geowiss. Abh., (A) 26: 35 - 48. Type locality: Oman. (Current Combination)

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Timeframe:
Early Oligocene (see Lim, 2007).

Genus ***Paremballonura*** Goodman, Puechmaille, Friedli-Weyeneth, Gerlach, Ruedi, Schoeman, Stanley and Teeling, 2012

*2012. *Paremballonura* Goodman, Puechmaille, Friedli-Weyeneth, Gerlach, Ruedi, Schoeman, Stanley and Teeling, J. Mamm., 93 (6): 1445. Publication date: December 2012 [Goto Description]. - Etymology: From the Greek prefix *para-*, meaning close to or besides, and the genus *Emballonura* Temminck, 1838 (see Goodman *et al.*, 2012a: 1445).
2018. *Paraemballonura:* Kemp, López-Baucells, Rocha, Wangensteen, Andriatafika, Nair and Cabeza, Agric. Ecosyst. Environ., 369: 90 (for 2019). Publication date: 1 October 2018. (Lapsus)

TAXONOMY:
Goodman *et al.* (2012a: 1440) found this genus to be paraphyletic, which resulted in the description of a new genus for the Malagasy *Emballonura* clade: *Paremballonura*.

Known species of the genus of *Paremballonura*: ***atrata*** (Peters, 1874); ***tiavato*** (Goodman, Cardiff, Ranivo, Russell, and Yoder, 2006).

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
There are fossil *Paremballonura* (refered to as *Emballonura*) of probable Pleistocene age (1.81 Mya) from Madagascar (McKenna and Bell, 1997; Lim, 2007).

Paremballonura atrata (Peters, 1874)

*1874. *Emballonura atrata* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, 693. Type locality: Madagascar: "Interior of Madagascar". Holotype: ZMB 4692: ♀. Collected by: Alfred Crossley. See Dobson (1878: 363) and Peterson *et al.* (1995: 56). Goodman *et al.* (2006a: 19) mention that the assumption by Peterson *et al.* (1995) that J.M. Hildebrandt is the collector, is wrong. Instead, Alfred Crossley is the collector, and they also indicate that the type locality remains unclear.
2012. *Paremballonura atrata* Goodman, Puechmaille, Friedli-Weyeneth, Gerlach, Ruedi, Schoeman, Stanley and Teeling, J. Mamm., 93(6): 1445. (Name Combination, Current Combination)

TAXONOMY:
Following a recent taxonomic revision based on genetic and morphological comparisons, *Paremballonura atrata* is now confined to the east of Madagascar, with the smaller *P. tiavato* occurring in the west (Goodman *et al.*, 2006a). Reviewed by Peterson *et al.* (1995). *atata* species group Simmons (2005: 388).

COMMON NAMES:
English: Madagascar sheath-tailed bat, Peter's Sheath-tailed Bat, Peters's Sheath-tailed Bat. French: Chauve-souris malgache à queue en fourreau, Emballonure de Madagascar. German: Madagaskar-Freischwanzfledermaus.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Sabatier and Legendre (1985: 23) and Gunnell *et al.* (2014: 3) refer to fossils material from Tsimanampetsotsa, on Madagascar.

CONSERVATION STATUS:
Global - This species is listed as Least Concern (LC ver 3.1 (2001)) because it is relatively widespread in eastern Madagascar and although its population is certainly decreasing as the humid forest is converted into agricultural areas there is no evidence that the decrease has been rapid enough to warrant Near Threatened or threatened status (Jenkins *et al.*, 2008d; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Jenkins *et al.*, 2008d; IUCN, 2009). 1996 - VU A2c ver 2.3 (1994) (IUCN, 1996).

MAJOR THREATS:
Paremballonura atrata is collected by people for bushmeat in one part of eastern Madagascar (D. Andriafidison *pers comm.,* in Jenkins *et al.*, 2008d). Otherwise, forest clearance for expanding agriculture threatens the foraging and roosting sites for this species (Jenkins *et al.*, 2007b; Jenkins *et al.*, 2008d; IUCN, 2009). Jenkins *et al.* (2007b: 219) also point out that fire (started by farmers?) is a potential threat, as traces of fire were found at the entrances of their roosting caves.

CONSERVATION ACTIONS:
Jenkins *et al.* (2008d) [in IUCN (2009)] note that *P. atrata* has been recorded from Parc National de Mantadia (Randrianandriananina *et al.*, 2006) and Parc National de Midongy du Sud (Goodman *et al.*, 2006a) as well as from a network of protected sites around the Baie de Antogil (Goodman *et al.*, 2006a). It probably does not require specific conservation action as long as forest vegetation is protected, but local populations should be monitored at roosting sites (Jenkins *et al.*, 2008d; IUCN, 2009).

GENERAL DISTRIBUTION:
This species is restricted to the humid zone of eastern Madagascar and has been recorded from around Maroantsetra in the north to Tolagnaro (Fort Dauphin) in the south (Goodman *et al.*, 2006a). It is known from a wide elevational range, from as low as 30 m (Goodman *et al.*, 2006a) to at least 900 m (Randrianandriananina *et al.*, 2006).

Native: Madagascar (Goodman *et al.*, 2006a) - Ile Sainte-Marie (Rakotonandrasana and Goodman, 2007: 6).

DETAILED MORPHOLOGY:
Baculum:
The baculum is small and circular in shape (Rakotondramanana and Goodman, 2017: 58); length: 0.09, 0.12 mm; width: 0.09, 0.12 mm.

ECHOLOCATION:
Kofoky *et al.* (2009: 379) reported the call from two individuals flown in a flight cage as FM/CF/FM with the most energy in the second harmonic at 52.9 kHz.

MOLECULAR BIOLOGY:
DNA - See Hoofer and Van Den Bussche (2003) and Goodman *et al.* (2006a).
Karyotype - Unknown.
Protein / allozyme - Unknown.

HABITAT:
It is considered to be dependent on relatively intact forest (Goodman *et al.*, 2005a; 2006a).

ROOST:
Paremballonura atrata is usually found roosting in caves and small crevices in or near to relatively intact humid forest (Goodman *et al.*, 2006a; Randrianandriananina *et al.*, 2006; Kofoky *et al.*, 2007; Jenkins *et al.*, 2007b).

DIET:
Based on droppings from five specimens, Rasoanoro *et al.* (2015: 64) report the following volume percentages of prey types: Coleoptera: 26.7 ± 8.09, Diptera: 40.9 ± 12.55, Hemiptera: 12.0 ± 1.16, and Hymenoptera: 31.3 ± 8.76.

POPULATION:
Structure and Density - There is no information on population size. This species is rarely trapped in flight or detected acoustically and information on populations and distribution is mainly from bats found in caves (Jenkins *et al.*, 2008d). Colony size in caves rarely exceeds 20 individuals (Jenkins *et al.*, 2007b).

Trend - 2008 - Unknown (Jenkins *et al.*, 2008d; IUCN, 2009).

UTILISATION:
Paremballonura atrata is collected by people for bushmeat in one part of eastern Madagascar (D. Andriafidison *pers comm.* in Jenkins *et al.*, 2008d).

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Madagascar.

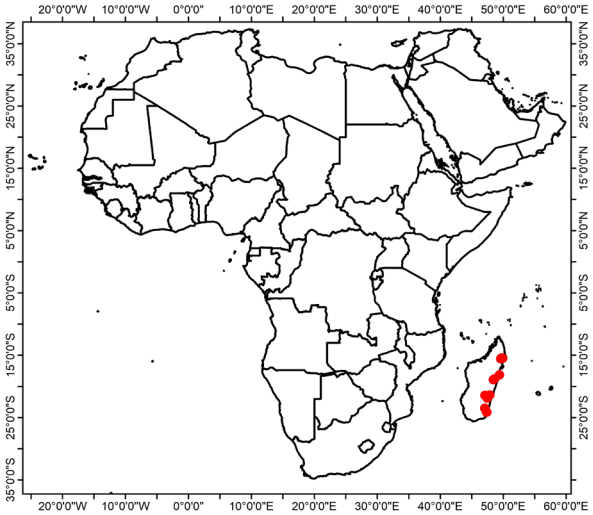

Figure 130. Distribution of *Paremballonura atrata*

Paremballonura tiavato (Goodman, Cardiff, Ranivo, Russell, and Yoder, 2006)

*2006. *Emballonura tiavato* Goodman, Cardiff, Ranivo, Russell and Yoder, Am. Mus. Novit., 3538: 1, 6, figs, 2, 3, 4, 5. Publication date: 19 October 2006. Type locality: Madagascar: Antsiranana province: Réserve Spéciale d'Ankarana, 2.6 km E Andrafiabe: Andrafiabe cave, in forest near [12 55.9 S 49 03.4 E, 50 m] [Goto Description]. Holotype: FMNH 169705: ad ♂, skin and skull. Collected by: Steven M. Goodman; collection date: 22 January 2001; original number: 11923a. - Etymology: From the Malagasy for "like rocks", referring to the tendency of this bat to occur in areas with exposed rock outcrops and caves (see Goodman *et al.*, 2006a: 6).

2012. *Paremballonura tiavato* Goodman, Puechmaille, Friedli-Weyeneth, Gerlach, Ruedi, Schoeman, Stanley and Teeling, J. Mamm., 93(6): 1445. (Name Combination, Current Combination)

TAXONOMY:
Described as a new species in a split from "*Emballonura atrata*" (Goodman *et al.*, 2006a).

COMMON NAMES:
Czech: pochvorep madagaskarský. English: Western Sheath-tailed Bat. French: Emballonure des rochers. German: Tsingy-Freischwanzfledermaus.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) because although this species is declining due to the impacts of ongoing forest loss due to shifting agriculture and logging the reduction of suitable habitat is not thought to be sufficient to warrant listing in a higher category of threat. However, this species is not abundant within its range and requires close population monitoring and a reassessment may be needed in the near future (Jenkins *et al.*, 2008e; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Jenkins *et al.*, 2008e; IUCN, 2009).

MAJOR THREATS:
Paremballonura tiavato is threatened by habitat loss due to slash-and-burn agriculture (tavy) and from charcoal collecting and logging (Jenkins *et al.*, 2008e; IUCN, 2009). Other potential threats come from the disturbance of roosting caves from tourists (Kofoky *et al.*, 2007), fire (Jenkins *et al.*, 2007b) or mining (Cardiff, 2006).

CONSERVATION ACTIONS:
Jenkins *et al.* (2008e) [in IUCN, 2009)] report that it is known from three protected areas, Parc National Tsingy de Bemaraha, Réserve Spéciale d'Ankarana, Réserve Spéciale d'Analamerana (Goodman *et al.*, 2005a).

GENERAL DISTRIBUTION:
Endemic to Madagascar (Goodman *et al.*, 2006a). It is restricted to the karstic lowland areas in the western part of the island, extending from the drier areas in the north in Diana Region to Parc National Tsingy de Bemaraha in the west (Goodman *et al.*, 2005a). A record from Toliara in the extreme south has also been attributed to this species (Peterson *et al.*, 1995), but the specimen was not examined as part of the recent reassessment of *Emballonura*

taxonomy on Madagascar (Goodman *et al.*, 2006a). The distribution of this species would be significantly reduced if the Toliara specimen was omitted. It is currently known to range between 10 and 330 m elevation (Goodman *et al.*, 2006a).

Native: Madagascar (Goodman *et al.*, 2005a; Goodman *et al.*, 2006a) - Nosy Be (Peterson *et al.*, 1995: 57; Rakotonandrasana and Goodman, 2007: 6) and Nosy Komba (Rakotonandrasana and Goodman, 2007: 6).

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
See Goodman *et al.* (2006a).

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:
See Goodman *et al.* (2006a).

DETAILED MORPHOLOGY:
Baculum:
Rakotondramanana and Goodman (2017: 58) indicate that the baculum of this species is more elongated than the rounded form of *P. atrata*; length: 0.09 mm, width: 0.08 mm.

For a description of the crania, teeth, ears and tragus see Goodman *et al.* (2006a).

ECHOLOCATION:
Kofoky *et al.* (2009: 377) reported the call as a FM/CF/FM with up to five harmonics, produced short calls with a medium IPI and a low duty cycle, with a maximum energy at 55.2 kHz.

MOLECULAR BIOLOGY:
DNA - Unknown.
Karyotype - Unknown.
Protein / allozyme - Unknown.

HABITAT:
It appears to be associated with relatively intact forest and is believed to be forest dependent (Goodman *et al.*, 2005a; Goodman *et al.*, 2006a).

Dammhahn and Goodman (2013: 108) indicate that the lower portion of forest is this bat's foraging habitat.

HABITS:
At night it has been observed resting on buildings (Goodman *et al.*, 2006a). It feeds in forest understorey and over small streams with bank side vegetation (Robinson *et al.*, 2006).

ROOST:
Usually found roosting in the entrance to caves and rock overhangs that receive weak sunlight (Cardiff, 2006; Goodman *et al.*, 2006a; Kofoky *et al.*, 2007).

DIET:
Lepidoptera (Razakarivony *et al.*, 2005; Goodman *et al.*, 2006a).

POPULATION:
Structure and Density - Roosting colonies of *E. tiavato* are usually relatively small (< 20 individuals) (Jenkins *et al.*, 2008e; IUCN, 2009).
Trend - 2008 - Unknown (Jenkins *et al.*, 2008e; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
See Goodman *et al.* (2006a).

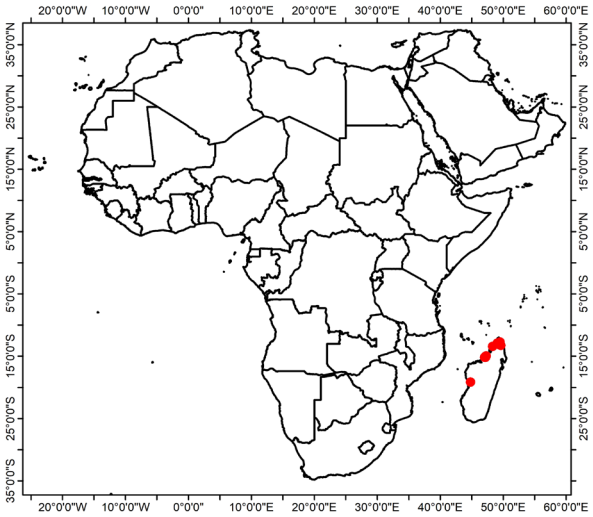

Figure 131. Distribution of *Paremballonura tiavato*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Madagascar.

†Genus *Pseudovespertiliavus* Ravel, 2016

*2016. *Pseudovespertiliavus* Ravel, in: Ravel et al., Geodiversitas, 38 (3): 356, 388. Publication date: 30 September 2016. - Etymology: The name refers to the multiple morphological similarities with the genus Vespertiliavus (see Ravel et al. 2016: 388).

†***Pseudovespertiliavus parva*** Ravel, 2016

*2016. *Pseudovespertiliavus parva* Ravel, in: Ravel et al., Geodiversitas, 38 (3): 356, 388, figs 16, 17. Publication date: 30 September 2016. Type locality: Algeria: Béchar province: Gour Labiz region (Sahara, Hammada du Dra).: Glib Zegdou [29 42 49 N 04 45 58 W] [Goto Description]. - Etymology: From the Latin *parva* meaning small, referring to the small size of this bat (see Ravel *et al.*, 2016: 388).

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS: Timeframe: Late lower Eocene to early middle Eocene.

Subfamily Taphozoinae Jerdon, 1867

1867. *Taphozoinae* Jerdon, Mammals of India, 30. - Comments: Jackson and Groves (2015: 253) mention 1867 as year of publication. Other authors (e.g. Palmer, 1904: 773) mention 1874 or 1877. These latter dates represent reprints of the "Mammals of India", but the name was already published in the 1867 version. Considered a valid subfamily by McKenna and Bell (1997: 302), Simmons (2005: 381), Jackson and Groves (2015: 253).

1988. *Taphozoini* Robbins and Sarich, J. Mamm., 69 (1): 10. Publication date: 25 February 1988. - Comments: Proposed as tribe and originally included the genera *Taphozous* É. Geoffroy, 1818 and *Saccolaimus* Temminck, 1838 (see Jackson and Groves, 2015: 253).

Genus ***Saccolaimus*** Temminck, 1838

*1838. *Saccolaimus* Temminck, in: Van der Hoeven, Tijdschr. Nat. Gesch. Physiol., 5: 14. - Comments: Corbet and Hill (1992: 85), Grubb *et al.* (1998: 72) mention "1838: 6 (and 1841a: 277, 279) [C&H]". Type species: *Taphozous saccolaimus* Temminck, 1838. - Etymology: From the Greek "*σάκκος*", meaning sac and "*λαιμός*", meaning throat, gullet, referring to the well-developed gular sacs of the type species (see Palmer, 1904: 615; Flannery, 1995a: 328; 1995b: 401). (Current Combination)

1876. *Taphonycteris* Dobson, Proc. zool. Soc. Lond., 1875, IV: 548. Publication date: April 1876. - Comments: Type species: *Taphozous saccolaimus* Temminck, 1838, by subsequent designation by Palmer (1904: 661) (see Jackson and Groves, 2015: 254). - Etymology: From the Greek "*τάφος*", meaning grave and "*νυκτερίς*", meaning bat (see Palmer, 1904: 661).

TAXONOMY:
Considered a subgenus of *Taphozous* by Ellerman and Morrison-Scott (1951: 104), Corbet and Hill (1980: 45), Corbet and Hill (1992: 85), and Kock and Dobat (2000: 87), but see Barghoorn (1977: 5), Robbins and Sarich (1988) and Chimimba and Kitchener (1991).
Key to the species provided by Chimimba and Kitchener (1991).

Known species of the genus *Saccolaimus*: †***abitus*** Wesselman, 1984; *flaviventris* Peters, 1867 – Australia (except Tasmania), southeastern New Guinea (Simmons, 2005: 382); *mixtus* Troughton, 1925 – southeastern New Guinea, northeastern Queensland (Australia) (Simmons, 2005: 382); ***peli*** (Temminck, 1853). *saccolaimus* (Temminck, 1838) – Bangladesh, India and Sri Lanka through south east Asia (including Burma, Cambodia, Thailand and the Nicobar Islands) to the Philippines, Sulawesi and Borneo, Sumatra, Java, Bali and Timor (Indonesia); New Guinea; New Britain and Bougainville Islands (Papau New Guinea); northeastern Queensland (Australia); Guadalcanal Island (Solomon Islands) (Simmons, 2005: 382).

COMMON NAMES:
Czech: vakoví hrobkovci. English: Pouched Bats. French: Saccolaime. German: Taschenfledermäuse.

†***Saccolaimus abitus*** (Wesselman, 1984)

*1984. *Taphozous abitus* Wesselman, Contributions to vertebrate evolution, 7: 44. Type locality: Ethiopia: upper member B, Shungura Formation. - Etymology: From the Latin verb *abeo* meaning to go away, the past participle of which is *abitus* meaning vanished or departed (Wesselman, 1984).
2004. *Saccolaimus abitus:* Lim. (Name Combination, Current Combination)
2011. *Saccolaimus abditus:* Gunnell, Eiting and Geraads, N. Jb. Geol. Paläont. Abh., 260 (1): 70. Publication date: January 2011. (Lapsus)

TAXONOMY:
Closest affinity to the extant *Saccolaimus peli* (Wesselman, 1984; Lim, 2007).

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Late Pliocene (2.58 Mya) of southwestern Ethiopia (Wesselman, 1984; Lim, 2007)

Saccolaimus peli (Temminck, 1853)

*1853. *Taphozous peli* Temminck, Esquisses zoologiques sur la Côte de Guiné. 1e partie, les Mammifères, 82. Type locality: Ghana: Boutry River [=Butre river] [ca. 04 49 N 01 55 W] [Goto Description].
? *Saccolaimus peli:* (Name Combination, Current Combination)
? *Taphozous (Saccolaimus) peli:* (Name Combination)

TAXONOMY:
See Simmons (2005).

COMMON NAMES:
Chinese: 贝尔墓蝠. Czech: hrobkovec guinejský. English: Pel's Pouched Bat. French: Saccolaime de Pel, Chauve-souris à queue gainée de Pel. German: Pels Taschenfledermaus.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008bl; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2008bl; IUCN, 2009). 2004 - NT ver 3.1 (2001) (Mickleburgh *et al.*, 2004bn; IUCN, 2004). 1996 - LR/nt (Baillie and Groombridge, 1996).

MAJOR THREATS:
Selective logging of large trees with cavities results in substantial roost destruction. Parts of *S. peli* range are fragmented by agricultural activities, but as it lives in clearings, it is not known whether or not this is having a significant negative impact on the species (Mickleburgh *et al.*, 2008bl; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008bl) [in IUCN (2009)] report that it is found in several protected areas. Research is needed to determine the effects of habitat fragmentation on the species.

GENERAL DISTRIBUTION:
Saccolaimus peli ranges widely through the equatorial forest belt of west and central Africa. In the Upper Guinea region, it occurs in Liberia, Guinea, Côte d'Ivoire and Ghana. Its main range extends from southwestern Nigeria to western Uganda, with isolated records from western Kenya and eastern Angola.

Native: Angola (Crawford-Cabral, 1989; Monadjem *et al.*, 2010d: 535); Cameroon; Congo (The Democratic Republic of the) (Hayman *et al.*, 1966; Monadjem *et al.*, 2010d: 535); Côte d'Ivoire; Equatorial Guinea; Gabon; Ghana; Guinea; Kenya; Liberia; Nigeria (Capo-Chichi *et al.*, 2004: 161); Uganda.
Presence uncertain: Central African Republic; Sierra Leone.

Bates *et al.* (2013: 338) reject the presence of *S. peli* in the Republic of Congo because Malbrant and Maclatchy (1949) only mention it 'likely' to occur in that country.

FUNCTIONAL MORPHOLOGY:
Bahlman *et al.* (2016: 122) indicate that *S. peli* has long, cartilaginous distal phalanges with tendons running to the distal-most portion of the tip of digits IV and V. They speculate that the flexor muscles and tendons not only flex the terminal IP joint, but also may provide some additional curvature along the length of the cartilaginous phalanges.

HABITAT:
R.B. Woosnam [in Thomas, 1910b: 489] reported that vaste numbers were seen in the Congo Forest, but not anywhere else. He also indicated that they were seen hanging in trees, but never in houses.

POPULATION:
Structure and Density - *S. peli* occurs in low densities across its wide range (Mickleburgh *et al.*, 2008bl; IUCN, 2009).
Trend - 2008 - Unknown (Mickleburgh *et al.*, 2008bl; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
Krutzsch (2000: 113) assigned *S. peli* to the group of polyoestous species.

PARASITES:
Nycteribiidae: *Tripselia aequisetosa* Theodor, 1956 from Liberia and Congo (Haeselbarth *et al.*, 1966: 112).

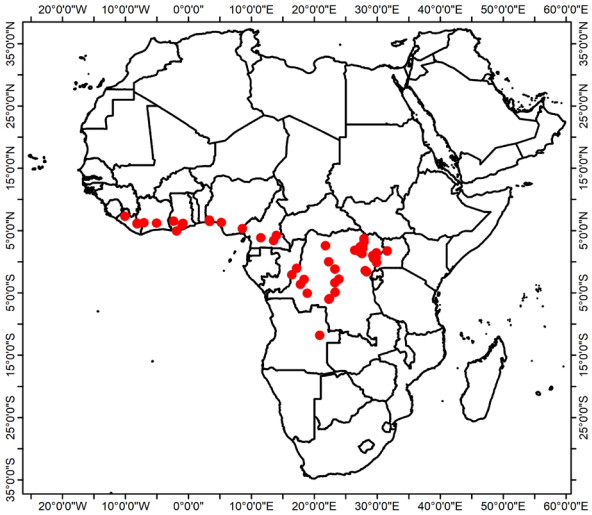

Figure 132. Distribution of *Saccolaimus peli*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Angola, Cameroon, Central African Republic, Congo (Democratic Republic of the), Côte d'Ivoire, Ghana, Liberia, Nigeria, Uganda.

Genus ***Taphozous*** E. Geoffroy St.-Hilaire, 1818

*1818. *Taphozous* E. Geoffroy Saint-Hilaire, Description des Mammifères qui se trouve en Egypte, 2: 113. Publication date: 1818. - Comments: Type species: *Taphozous perforatus* E. Geoffroy, 1818, by monotypy (according to Colket and Wilson, 1998: 1) or subsequent designation by Miller (1907: 93) (according to Jackson and Groves, 2015: 255). Mahoney and Walton (1988a: 116) in Grubb *et al.* (1998: 72) considered the date of Geoffroy's publication to be 1813. Gardner and Hayssen (2004: 12) mention that the correct date should be 1818, not 1813 as mentioned on the publication itself. - Etymology: From the Greek "*τάφος*" (táfos), meaning "grave" or "tomb" and "*ξωός*" (zóos), meaning "living" (see Palmer, 1904: 662). (Current Combination)
1821. *Thaphosores:* Gray, London Med. Repos., 15 (1): 300. - Comments: Jackson and Groves (2015: 256) indicate that this is possibly an incorrect subsequent spelling as Gray refered to "Geoff." as author. Generally, the name is given as "*Taphosores*", but Gray (1821: 300) actually mentioned *Thaphosores*. (Lapsus)
1821. *Thaphozous:* Bowdich, An analysis of the natural classification of mammalia, for the use of students and travellers., 30. (Lapsus)
1822. *Thaphozus:* Fleming, The Phylosophy of Zoology, 179. (Lapsus)
1922. *Liponycteris* Thomas, Ann. Mag. nat. Hist., ser. 9, 9 (51): 267. Publication date: 1 March 1922 [Goto Description]. - Comments: Type species: *Taphozous nudiventris* Cretzschmar, 1830, by original designation (see Colket and Wilson, 1998: 1; Jackson and Groves, 2015: 256). Valid as a subgenus.
1998. *Tapozous:* Yom-Tov and Kadmon, Diversity Distrib., 4: 67. (Lapsus)
2018. *Thapozous:* Leopardi, Holmes, Gastaldelli, Tassoni, Priori, Scaravelli, Zamperin and De Benedictis, Infec. Gen. Evol., 58: 286. Publication date: 30 January 2018. (Lapsus)
? *Taphozous sp.:*

TAXONOMY:
Some authors (e.g. Allen, 1939a: 66) consider Oken (1816), Lehrbuch d. Naturg., pt. 3., zool., sect 2, p. 926 to be the author of this genus.

Meester *et al.* (1986): Barghoorn (1977), followed by Koopman (1982, and in litt.) regard *Saccolaimus* as generically distinct from *Taphozous*, but L.W. Robbins (Abstracts, 4th International Colloquium on Taxonomy and Ecology of African Small Mammals: 33, 1984) states that on the basis of protein electrophoresis and immunology *Taphozous* and *Saccolaimus* are closely related. Simmons (2005:382) recognized two subgenera *Taphozous* and *Liponycteris*. Only

the subgenus *Taphozous*, occurs in Africa and its associated islands.

Includes *Liponycteris* but not *Saccolaimus*; see Hayman and Hill (1971: 15) and Barghoorn (1977: 5), Robbins and Sarich (1988) and Chimimba and Kitchener (1991), though also see Corbet and Hill (1992). Corbet and Hill (1992: 85) include *Saccolaimus* as a subgenus. A key is provided by Colket and Wilson (1998: 1, Mammalian Species, 597).

Known species of the genus *Taphozous*: *achates* Thomas, 1915 – Kei, Savu, Roti, Semau and Nusa Penida Isls (Indonesia) (Simmons, 2005: 382). *australis* Gould, 1854 – northern Queensland (Australia), Torres Strait Isls, southeastern New Guinea (Simmons, 2005: 383). *georgianus* Thomas, 1915 – northern and western Australia (Simmons, 2005: 383). ***hamiltoni*** Thomas, 1920. ***hildegardeae*** Thomas, 1909. *hilli* Kitchener, 1980 – Western Australia, South Australia and Northern Territory (Simmons, 2005: 383). *kapalgensis* McKean and Friend, 1979 – Northern Territory (Australia) (Simmons, 2005: 383). *longimanus* Hardwicke, 1825 – Sri Lanka; India and Bangladesh to Burma, Cambodia and Thailand; Peninsular Malaysia; Sumatra, Borneo, Java, Bali, Sumbawa and Flores (Indonesia) (Simmons, 2005: 383). ***mauritianus*** E. Geoffroy, 1818. *melanopogon* Temminck, 1841 – Sri Lanka; India; Burma; Thailand; Laos; Cambodia; Vietnam; southern China; Malay Peninsula and adjacent islands; Borneo; Sumatra, Java, Lombok, Sumbawa, Moyo, Alor, Timor and Sulawesi (Indonesia), Philippines (Simmons, 2005: 384). ***nudiventris*** Cretzschmar, 1830. ***perforatus*** E. Geoffroy, 1818. *theobaldi* Dobson, 1872 – central India to Vietnam; Java, Borneo and Sulawesi (Simmons, 2005: 385). *troughtoni* Tate, 1952 – northwestern Queensland (Australia) (Simmons, 2005: 385).

COMMON NAMES:
Czech: praví hrobkovci, večerníkové, netopýři bradožlází. English: Tomb Bats, Pouched Bats. French: Chauve-souris des Tombes, Taphiens. German: Grabfledermäuse, Grabflatterer. Italian: Tafozòi, Pipistrèlli délle tómbe.

ETYMOLOGY OF COMMON NAME:
The type species of the genus, *T. perforatus*, was taken from a royal tomb in Egypt (see Taylor, 2005).

PARASITES:
HEMIPTERA
Polyctenidae: *Eoctenes intermedius* (Speiser, 1904) originally described from a *Taphozous* species from Egypt (Haeselbarth *et al.*, 1966: 16).

DIPTERA
Streblidae: *Brachytarsina alluaudi* (Falcoz, 1923) (Haeselbarth *et al.*, 1966: 101).

VIRUSES:
Flaviviridae
Pegivirus (BPgV)
2 out of 2 unidentified *Taphozous* specimens from Cameroon were infected by clade G type *Pegivirus*, and one of them also with clade K type *Pegivirus* (Quan *et al.*, 2013: Table S5).

Paramyxoviridae
Mortlock *et al.* (2015: 1841) reported that three out of 12 examined *Taphozous* sp. specimens from Cameroon tested positive for *Paramyxovirus* sequences.

Rhabdoviridae
Lyssavirus - Rabies related viruses
Horton *et al.* (2014: Table S1) tested 1 Kenyan *Taphozous* sp. specimen, but failed to find neutralising antibodies to IKOV (Ikoma lyssavirus).

†*Taphozous incognita* (Butler & Hopwood, 1957)

*1957. *Saccolaimus incognita* Butler and Hopwood, Fossil Mammals of Africa, Insectivora and Chiroptera from the Miocene rocks of Kenya, 13: 29, fig. 9. Publication date: 1957. Type locality: Kenya: Koru. Holotype: BMGD M.14222:. The left half of a rostrum lacking much of the bone, but showing the interior of the orbit and part of the crowns of P4 and M2.

1978. *Taphozous incognita:* Butler, Evolution of African Mammals, 65. (Name Combination, Current Combination)

TAXONOMY:
Most similar to the extant *Taphozous nudiventris* (Butler and Hopwood, 1957; Butler, 1984; Lim, 2007).

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Early Miocene (23.03 Mya) of the Legete Formation in Kenya (Lim, 2007), Koru (Butler, 1978).

Taphozous hamiltoni Thomas, 1920

*1920. *Taphozous hamiltoni* Thomas, Ann. Mag. nat. Hist., ser. 9, 5 (25): 142. Publication date: 1 January 1920. Type locality: Sudan: Equatoria province: Mongalla [05 10 N 31 50 E, 500 m] [Goto Description]. Holotype: BMNH 1919.12.18.1: ad ♀. Collection date: 13 June 1918. Presented/Donated by: The Wellcome Research Laboratories. Formerly Stevenson Hamilton collection, nr 118 (see Thomas, 1920: 143). - Etymology: In honour of Major James Stevenson-Hamilton (1867 - 1957), eminent British regular soldier and conservationist, born in Ireland, considered father of the Kruger National Park. The species is named in his honor as the type specimen came from his collection (see Lanza *et al.*, 2015: 210). (Current Combination)

? *Taphozous (Liponycteris) hamiltoni:* (Name Combination)

TAXONOMY:
See Simmons (2005).

COMMON NAMES:
Chinese: 苏丹墓蝠. Czech: hrobkovec východoafrický. English: Hamilton's Tomb Bat, Hamilton's Naked-rumped Tomb Bat, Hamilton's Naked-bellied Tomb Bat, Kordofan Sheathtail-bat. French: Taphien de Hamilton. German: Hamiltons Grabfledermaus. Italian: Tafozòo di Hàmilton.

CONSERVATION STATUS:
Global - Listed as Data Deficient (DD ver 3.1 (2001)) in view of continuing uncertainties as to its extent of occurrence, status, trends and ecological requirements (Mickleburgh *et al.*, 2008x; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) (Mickleburgh *et al.*, 2008x; IUCN, 2009). 2004 - NT ver 3.1 (2001) (Mickleburgh *et al.*, 2004x; IUCN, 2004). 1996 - VU (Baillie and Groombridge, 1996).

MAJOR THREATS:
The threats facing this species are unknown. It could be declining due to habitat loss through agriculture, but the data to confirm this are lacking (Mickleburgh *et al.*, 2008x; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008x) [in IUCN (2009)] report that no specific conservation measures are in place. It probably occurs in some protected areas. The distribution and ecological requirements of this species require further investigation.

GENERAL DISTRIBUTION:
Taphozous hamiltoni is not well known, and there are very few records. It is known mainly from east Africa (including records from Sudan, Somalia, Kenya, and Tanzania), and there is one additional record from southern Chad.

Native: Chad; Kenya; Somalia; Sudan; Tanzania; Uganda.

POPULATION:
Structure and Density - There is no information, as there are few records of this species (Mickleburgh *et al.*, 2008x; IUCN, 2009).
Density - 2008- Unknown (Mickleburgh *et al.*, 2008x; IUCN, 2009).

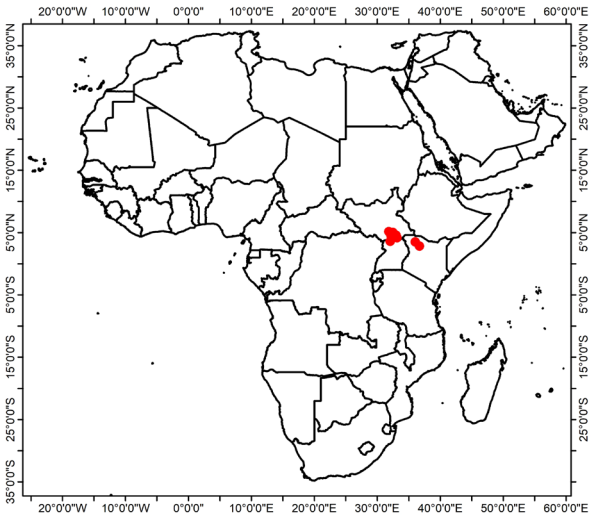

Figure 133. Distribution of *Taphozous hamiltoni*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Kenya, South Sudan, Sudan.

Taphozous hildegardeae Thomas, 1909

*1909. *Taphozous hildegardeæ* Thomas, Ann. Mag. nat. Hist., ser. 8, 4 (20): 98. Publication date: 1 August 1909. Type locality: Kenya: Coast province: near Mombassa: Rabai [700 ft] [Goto Description]. Holotype: BMNH 1909.6.12.7: ad ♂, skull and alcoholic. Original number: 613. Collected and presented by Dr. and Mrs. Hinde, (see Thomas (1909a: 99).

- Etymology: In honour of Mrs. Hildegarde Beatrice Hinde, wife of the Dr. Sydney Hinde, collector of the type specimen (see Colket and Wilson, 1998: 3; Lanza *et al.*, 2015: 213).

? *Taphozous (Taphozous) hildegardeae:* (Name Combination)
? *Taphozous hidegardeae:* (Alternate Spelling)
? *Taphozous hildegardeae:* (Current Combination, Current Spelling)

TAXONOMY:
See Colket and Wilson (1998, Mammalian Species, 597).

COMMON NAMES:
Chinese: 肯尼亚墓蝠. Czech: hrobkovec východoafrický. English: Hildegarde's Tomb Bat. French: Taphien de Hildegarde. German: Hildegardes Grabfledermaus. Italian: Tafozòo di Hildegàrde.

CONSERVATION STATUS:
Global - Listed as Vulnerable (VU B1ab(iii) ver 3.1 (2001)) because its extent of occurrence is less than 20,000 km^2, its distribution is severely fragmented, and there is continuing decline in the extent and quality of its forest habitat (Mickleburgh *et al.*, 2008y; IUCN, 2009).

Assessment History -
2008 - VU B1ab(iii) ver 3.1 (2001) (Mickleburgh *et al.*, 2008y; IUCN, 2009). 2004 - VU C1 ver 3.1 (2001) (Mickleburgh *et al.*, 2004r; IUCN, 2004). 1996 - VU (Baillie and Groombridge, 1996).

MAJOR THREATS:
Disturbance of the caves on which it depends, and loss of forest habitat, could result in population declines (Mickleburgh *et al.*, 2008y; IUCN, 2009).

Sagot and Chaverri (2015: 1670) mention roost loss or disturbance, and habitat degradation or loss as major threats for this species.

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008y) [in IUCN (2009)] report that it probably occurs in some protected areas, but stricter conservation of roosting and nesting sites is needed. Research into the cultural importance of the species is being carried out.

GENERAL DISTRIBUTION:
Taphozous hildegardeae is found on Pemba and Unguja [=Zanzibar] islands (Tanzania), and along the coast of south-east Kenya and north-east Tanzania (from the Lower Tana River south to Dar es Salaam). It has so far been recorded from fewer than ten coastal localities, but is probably present in some places where it has not yet been discovered.

The two central Kenya records collected by Harrison (1962), are questioned due to their location by Kock (1974a), as these points are not along the East African coast. The questioned locations do, however, coincide with coastal vegetation along the Tana River, which could afford this species suitable habitat (Colket and Wilson, 1998).

Native: Kenya; Tanzania.

ROOST:
McWilliam (1982: 208) found *T. hildegardeae* roosting in the larger caves of his study area (coastal Kenya), where they were found in smaller chambers or "erosion domes".

DIET:
In Kenya, McWilliam (1982: 248) reported that *T. hildegardeae* almost exclusively fed on large (> 10 mm) Lepidoptera and Orthoptera.

POPULATION:
Structure and Density - There are no overall population estimates. However, during a survey in Kenya and Tanzania in 1988, population estimates from three caves surveyed yielded more than 1,500 individuals (1,000+, 300+, 130+) (Susan M. Pont, *pers. Obs.,* in Mickleburgh *et al.*, 2008y [in IUCN, 2009]). It seems to be relatively common in caves.
Trend - 2008 - Decreasing (Mickleburgh *et al.*, 2008y; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
For Kenya, McWilliam (1988b: 433) indicates that male *T. hildegardeae* have a bimodal reproductive cycle that corresponds to the rainfall-induced seasonality in the coastal area. He also mentioned, however, that the second period (during the short rains in October-December), did not result in reproduction, indicating that the male cycle might be a relict of ancestral polyoestry.

MATING:
T. hildegardeae has a polygonous mating system, where a successful male can father at least seven young per year (McWilliam, 1982: 258).

PARASITES:
HEMIPTERA
Cimicidae: *Loxaspis miranda* Rothschild, 1912, described from specimens collected at Kilidini,near Mombasa, Kenya, Haeselbarth *et al.* (1966: 9) suggests that these are from *T. hildegardeae*.

DIPTERA
Streblidae: *Brachytarsina alluaudi* (Falcoz, 1923) in Kenya and probably Tanzania (Haeselbarth *et al.*, 1966: 101).

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Kenya, Tanzania.

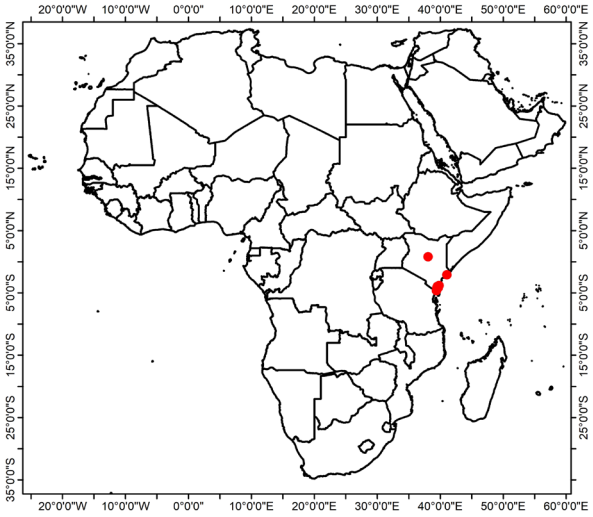

Figure 134. Distribution of *Taphozous hildegardeae*

Taphozous mauritianus E. Geoffroy St.-Hilaire, 1818

*1818. *Taphozous mauritianus* E. Geoffroy Saint-Hilaire, Description des Mammifères qui se trouve en Egypte, 2: 127. Publication date: 1818. Type locality: Mauritius: "Mauritius". Holotype: MNHN A.381 - 199: ad ♀, alcoholic (skull not removed). Presented/Donated by: ?: Collector Unknown. - Comments: Mahoney and Walton (1988a: 116) in Grubb *et al.* (1998: 72) considered the date of Geoffroy's publication to be 1813. Gardner and Hayssen (2004: 12) mention that the correct date should be 1818, not 1813 as mentioned on the publication itself. - Etymology: From the masculine scientific Latin adjective *mauritiànus*, meaning "Maurician", as the type specimen was collected on the island of Mauritius (see Lanza *et al.*, 2015: 215). (Current Combination)

1835. *Taphozous leucopterus* Temminck, Monographies de mammalogie ou description de quelques genres de mammifères, dont les espèces ont été observées dans les différens musées de l'Europe. Tome Seconde, 2: 284, pl. 60, fig. 7. Type locality: South Africa: "Interior of South Africa" [Goto Description]. - Comments: Kock (1969a: 71), Meester *et al.* (1986: 31) and Dengis (1996: 1) mention "1838; Tijdschrift voor natuurlijke geschiedenis en physiologie, Amsterdam 5: 12".

1879. *Taphozous Dobsoni* Jentink, Notes Leyden Mus., 1 (1): 123, note 32. Publication date: April 1879. Type locality: Madagascar: Mohambo [Goto Description]. Holotype: RMNH ?: ♂, alcoholic (skull not removed). Collected by: Jean Baptiste Audebert.

1900. *Taphozous maritianus var. Cinerascens:* Seabra, J. Sci. mat. phys. nat., ser. 2, 6: 77. Publication date: August 1900. Type locality: Angola: Benguela [12 34 S 13 24 E, 160 m]. (Lapsus)

1978. *Taphozous mauvitanius:* Arata and Johnson, Ebola Virus Haemorrhagic Fever, 135. (Lapsus)

2017. *T[aphozous] mauritiana:* Waruhiu, Ommeh, Obanda, Agwanda, Gakuya, Ge, Yang, Wu, Zohaib, Hu and Shi, Virol. Sin., 32 (2): 5. Publication date: 6 April 2017.

? *Taphozous (Taphozous) mauritianus:* (Name Combination)

? *Taphozous mauritianus mauritianus:* (Name Combination)

TAXONOMY:

Figure 135. *Taphozous mauritianus* caught at Sudwala Caves Resort, Mpumalanga, South Africa.

Koopman (1975) believed that a number of subspecies that have been described are of doubtful value.
See Dengis (1996, Mammalian Species, 522).

COMMON NAMES:
Afrikaans: Witlyfvlermuis. Azande (DRC): Fulo. Chinese: 南非墓蝠. Czech: hrobkovec mauricijský, netopýr mauricijský, netopýr hrobkový. English: Mauritian Tomb Bat, Tomb Bat, Taphozous bat of Mauritius. French: Taphien de l'Ile Maurice, Taphien de l'Ile de France, Taphien de Maurice, Chauve-souris mauritienne des tombeaux, Chauve-souris des tombes. German: Mauritius-Grabfledermaus. Italian: Tafozòo mauriziàno. Kenya Ruanda: Mokombe. Kiluba (DRC): Katutu. Kinande (DRC): Kahazo-komule, Kakorokombe. Portuguese: Morcego das sepulturas das Mauricias. Spanish (Castillian): Spa: Murciélago de las Tumbas. Swahili: Popo.

ETYMOLOGY OF COMMON NAME:
The specimen from which the species was described came from the island of Mauritius (see Taylor, 2005: 274).

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Evans and Mourad (2018: 81; Fig. 4, 5) provide images of wall paintings of bats, which look like *Taphozous*, on the walls of an Egyptian tomb at Beni Hassan, dating back from the Middle Kingdom (c. 2050 - 1650 BC).

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, tolerance of a degree of habitat modification, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Hutson *et al.*, 2008f; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Hutson *et al.*, 2008f; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2004bl; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - LC ver 3.1 (2001) (Monadjem *et al.*, 2016u). 2004 - LC ver 3.1 (2001) (Friedmann and Daly, 2004).

MAJOR THREATS:
Overall, this species is not significantly threatened. It is locally hunted (by children) in parts of its range (Hutson *et al.*, 2008f; IUCN, 2009).

CONSERVATION ACTIONS:
Hutson *et al.* (2008f) [in IUCN (2009)] report that this species is known from protected areas within Madagascar including Zombitse National Park and Ankarafantsika National Park, as well as from many protected areas on the African continent.

GENERAL DISTRIBUTION:
Taphozous mauritianus is found throughout much of subsaharan Africa and is also on several islands (including the Tanzanian island of Unguja [=Zanzibar] [see O'Brien, 2011: 287]), Bioko and Pagalu (Equatorial Guinea), and Sao Tomé and Principe). The most northerly records are from the border area between Senegal and Mauritania and at the head of the Nile River in Sudan. It is present throughout southern and eastern Madagascar, but it usually only occurs at lower altitudes and there are no records from the central plateau or above 900 m. It is known from Aldabra (von Brandis (2004: 135), Mauritius, the Comoros and Réunion. Records from the Western Cape region in southern Africa are unverified, with known records extending as far south as Mossel Bay. It is also recorded in an isolated location in the Northern Cape, near Hartwater (Taylor, 2000; Skinner and Chimimba, 2005). In the RSA, the species' distribution is linked with land use/land cover (Babiker Salata, 2012: 50).

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 1,454,841 km^2.

Native: Angola (Crawford-Cabral, 1989; Monadjem *et al.*, 2010d: 532; Taylor *et al.*, 2018b: 62); Benin (Capo-Chichi *et al.*, 2004: 162); Botswana (Archer, 1977; Monadjem *et al.*, 2010d: 535); Cameroon; Central African Republic; Chad; Comoros (Louette, 2004; Goodman *et al.*, 2010c: 125; Hume and Middleton, 2011: 33); Congo (Bates *et al.*, 2013: 335); Congo (The Democratic Republic of the) (Hayman *et al.*, 1966; Dowsett *et al.*, 1991: 259; Monadjem *et al.*, 2010d: 535); Côte d'Ivoire; Equatorial Guinea (Annobón, Bioko);

Ethiopia; Gabon; Gambia (Emms and Barnett, 2005: 50); Ghana; Kenya; Madagascar; Malawi (Happold *et al.*, 1988; Ansell and Dowsett, 1988: 29; Monadjem *et al.*, 2010d: 535); Mauritius; Mayotte (Ramasindrazana *et al.*, 2015a: 109); Mozambique (Smithers and Lobão Tello, 1976; Monadjem *et al.*, 2010d: 535); Namibia (Monadjem *et al.*, 2010d: 535); Nigeria; Réunion; São Tomé and Principe (Juste and Ibáñez, 1993b: 906; Rainho *et al.*, 2010a: 35); Senegal; Seychelles [Aldabra]; Sierra Leone; Somalia; South Africa (Monadjem *et al.*, 2010d: 535); Sudan; Swaziland (Monadjem *et al.*, 2010d: 535); Tanzania; Togo; Uganda; Zambia (Ansell, 1967; Ansell, 1969; Ansell, 1978;Ansell, 1986; Cotterill, 2004a: 260; Monadjem *et al.*, 2010d: 535); Zimbabwe (Monadjem *et al.*, 2010d: 535).
Presence uncertain: Burundi; Guinea; Guinea-Bissau; Liberia; Mali; Mauritania; Rwanda.

GEOGRAPHIC VARIATION:
Krutzsch (2000: 114) [referring to Rosevear (1965), Smithers and Lobão Tello (1976) and Happold (1987)] indicates that geographic variation is evident in the gular sac in this species. In Nigeria and Mozambique, it is only present in males, while in West Africa the males have a functioning sac and females have a vestigial pouch.

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Fenton (1992: 49) indicates that the grizzled dorsal pelage contributes to the bat's camouflage while resting on natural surfaces. In the resting position, the striking white venter is completely concealed.

From western Uganda, Monadjem *et al.* (2011: 30) reported the following data for 2 specimens: Fa: 60.25 mm, mass: 27.0 g, wing loading: 13.3 N/m^2, aspect ratio: 5.8.

ECHOLOCATION:
See Taylor (1999b), and Taylor (2000: 63). Rainho *et al.* (2010a: 21) report the calls of 5 individuals from São Tomé.

For 10 calls of specimens from Soutpansberg and Waterberg, South Africa, Taylor *et al.* (2013b: 18) recorded the following parameters: F_{max}: 29.0 ± 1.17 (27.8 - 31.1) kHz, F_{min}: 25.3 ± 1.49 (22.1 - 27.9) kHz, F_{knee}: 28.3 ± 1.29 (27.0 - 30.2) kHz, F_{char}: 26.2 ± 0.94 (24.9 - 27.9) kHz, duration: 2.9 ± 0.64 (2.0 - 3.6) msec.

From western Uganda, Monadjem *et al.* (2011: 32) report the following values: F_{min}: 13.13 kHz, F_{max}: 13.48 kHz, F_{char}: 13.43 kHz, F_{knee}: 13.18 kHz, duration: 9.1 msec. They also indicate (p. 33) that the F_{peak} of 25.6 [actually 25.9] kHz reported by Schoeman and Jacobs (2008: Table S1) is probably for an harmonic.

Barataud and Giosa (2013: 150) reported on 9 sequences from Réunion with QFC = 39 kHz and QCF/FM = 18.

For Swaziland, Monadjem *et al.* (2017c: 179) recorded the following parameters: F_{min}: 25.1 ± 0.72 (24.3 - 25.9) kHz, F_{knee}: 28.6 ± 0.60 (28.1 - 29.5) kHz, F_c: 25.9 ± 1.20 (24.3 - 27.2) kHz, and duration: 2.7 ± 0.27 (2.4 - 3.0) kHz.

MOLECULAR BIOLOGY:
DNA - Unknown.
Karyotype - Rautenbach *et al.* (1993) reported for specimens from South Africa, 2*n* = 42, FN = 64, BA = 24, a metacentric X chromosome, and a submetacentric Y chromosome.
Protein / allozyme - Unknown.

HABITAT:
Open savanna and forst edges in the wetter northern and eastern parts of the subcontinent (Taylor, 2000: 62).

HABITS:
Fenton and Griffin (1997: 248) recorded one call above 24 kHz, which they attributed to *T. mauritianus* at an altitude of 500 - 550 m above a *Brachystegia* woodland in Zimbabwe.

ROOST:
In the Durban area, Taylor *et al.* (1999: 67) found most of the roosts (72 %) being associated with the outer walls of houses at a height between 2 and 12 metres. The colony size varied from 1 to 5.

In a rural area on Madagascar; Rakotondramanana *et al.* (2017: 133) found a colony roosting on the trunk of a palm tree (*Cocos nucifera*), under dried fronds. They left the roost about 30 minutes after sunset. Ravelomanantsoa *et al.* (2019: 110) report it also roosting in *Tamarindus indica*.

DIET:
They feed primarily on moths (Allen *et al.*, 1917); termite alates such as *Macrotermes falciger* (Happold and Happold, 1988), and other insects (Smithers, 1971). See also (Taylor, 2000: 62; 2005: 275).

PREDATORS:
Demeler (1981: 133) found remains of *T. mauritianus* in pellets of *Bubo africanus* in the Yankari Game Reserve (Nigeria).

Mikula *et al.* (2016: Supplemental data) mention Wahlberg's eagle (*Hieraaetus wahlbergi* (Sundevall, 1851)) as a diurnal avian predator.

Goodman *et al.* (2015c: 78) found the remains of one individual in pellets of Bat Hawk *Macheiramphus alcinus* Bonaparte, 1850 in western central Madagascar.

POPULATION:
Structure and Density - *Taphozous mauritianus* is not rare and is easy to find. It usually roosts under covering vegetation on the outer bark of trees (Hutson *et al.*, 2008f; IUCN, 2009).
Trend - 2008 - Unknown (Hutson *et al.*, 2008f; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
Kaudern (1914: 12) reported that he received a female with a very small fetus from villagers in Fenerive (Madagascar) on 6 January 1912.

Krutzsch (2000: 113) mentioned that *T. mauritianus* is monoestrous in parts of its range and polyoestrous in others.

Monadjem *et al.* (2010d) [in Weier *et al.* (2018: Suppl.)] mentioned births from October to December and f'rom February to March.

PARASITES:
HEMIPTERA
Polyctenidae: *Eoctenes intermedius* (Speiser, 1904) from the Congo (Haeselbarth *et al.*, 1966: 16).

DIPTERA
Nycteribiidae: *Tripselia blainvillii* (Leach, 1817) distributed over the Madagascan region and tropical Africa from west to east between lat. 10° north and south (Haeselbarth *et al.*, 1966: 113). Hutson (2004a: 129) mentions that *Basilia (Tripselia) blainvilli* (Nycteribiidae) is a widespread parasite of *Taphozous mauritianus*. (synonyms: *Nycteribia (Acrocholidia) fryeri*, *Tripselia fryeri*).

SIPHONAPTERA
Ischnopsyllidae: *Chiropteropsylla brockmani* Rothschild, 1915 widespread (Haeselbarth *et al.*, 1966: 192).

VIRUSES:
In their country-wide survey of Kenyan bats, Waruhiu *et al.* (2017) found the following viruses in *Taphozous mauritianus*: Astroviruses, Paramyxoviruses and Rotaviruses.

Coronaviridae - Coronaviruses
SARS-CoV - Müller *et al.* (2007b) tested between 1986 and 1999, for antibody to SARS-CoV in sera in one individual from Limpopo Province, South Africa, none were tested positive (0/1).

In their overview table, Maganga *et al.* (2014a: 8) reported that no viruses were ever found in this bat species.

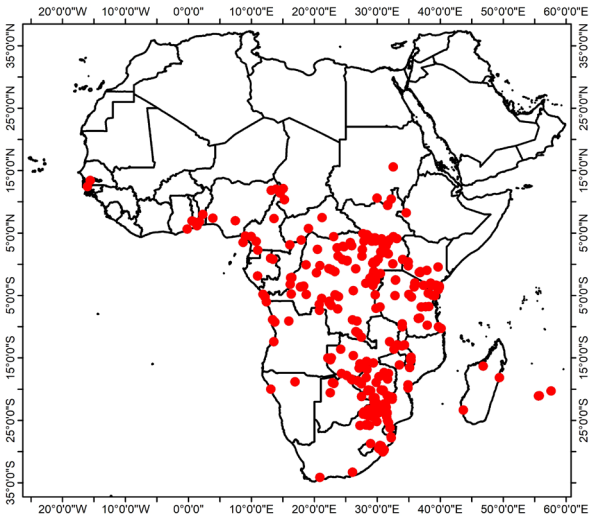

Figure 136. Distribution of *Taphozous mauritianus*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Angola, Benin, Botswana, Burundi, Cameroon, Central African Republic, Chad, Congo, Congo (Democratic Republic of the), Côte d'Ivoire, Equatorial Guinea, Ethiopia, Gabon, Ghana, Guinea-Bissau, Kenya, Madagascar, Malawi, Mauritius, Mozambique, Namibia, Nigeria, Réunion, Rwanda, Senegal, Sierra Leone, South Africa, South Sudan, Sudan, Swaziland, Tanzania, The Gambia, Togo, Uganda, Zambia, Zimbabwe.

Taphozous nudiventris Cretzschmar, 1830

*1830-1831. *Taphozous nudiventris* Cretzschmar, in: Rüppell, Atlas Reise Nördlichen Afrika, Zoologie Säugethiere, 1: 70, pl. 27b. Publication date: 1830-1831. Type locality: Egypt: Giza province: Giza [30 01 N 31 13 E] [Goto Description]. Lectotype: SMF 4310: ad ♂, skin and skull. Collected by: Wilhem Peter Edward Simon Rüppell; collection date: 1824. Old catalog II.J.1.a; see Mertens (1925: 20), Qumsiyeh (1985: 26). - Comments: Kock (1969a: 83) mentioned the type locality as "Egypt, Nubia" and indicates that Giza is the type locality of the lectotype. Corbet and Hill (1992: 87) only mention "Egypt". Allen (1939a: 67) mentioned 1826 as year of description, whereas Kock (1969a: 83) mentioned

1830. Grubb *et al.* (1998: 73) mentions "1830, vel 1831". - Etymology: From the masculine Latin adjective *nùdus*, meaning "naked" and the masculine Latin substantive *vènter*, meaning"belly", as the fur stops short of the end of the body both dorsally and ventrally (see Lanza *et al.*, 2015: 221). (Current Combination)

1838. *Taphozous nudiventer:* Temminck, Monographies de mammalogie ou description de quelques genres de mammifères, dont les espèces ont été observées dans les différens musées de l'Europe. Tome Seconde, 2: 280, pl. 60, figs 10 - 12. Publication date: 1838. - Comments: Lapsus (Allen, 1939a: 67). (Lapsus)

1877. *Nycticejus serratus* Heuglin, Reise in Nordost Afrika, 2: 35. Publication date: 1877. Type locality: Sudan: ?Abyssinia: on the Araschkol and nearby mountains: "Sherq el Aqabah" [14 15 N 32 10 E] [Goto Description]. - Comments: According to Simmons (2005) this is an enigmatic taxon, which is variously referred to either *Taphozous nudiventris* (e.g. Allen, 1939a: 67; Koopman, 1993a) or *Scotophilus nigrita leucogaster* (Allen, 1939a) [implying that it might either be *S. dinganii* or *S. leucogaster*], but which may not represent either of those species. Kock (1969a: 83) includes it with a question mark in the synonymy of *Taphozous nudiventris*, and Happold (2013bm: 434) mentions it as a possible synonym of that species.

1885. *Taphozous perforatus var. assabensis* Monticelli, Ann. Accad. O. Costa de Aspir. Nat. Napoli, ser. 1, 1: 78, pl. 7. Type locality: Eritrea: Assab [13 01 N 42 43 E]. - Comments: Allen (1939a: 67) indicates that Monticelli considered it a synonym of *perforatus*, but Senna (1905), who examined the type, says it is *T. nudiventris*. The type specimen was collected by prof. G.B. Licata.

1964. *T(aphozous) mudiuemtris:* Walker, Mammals of the World, I: 241. (Lapsus)

2013. *Taphozous nudiuentris:* Liu, Wang, Zhang, Li, He, Huang, Jiang, Murphy and Shi, Proc. R. Soc. Lond., B 281 (1776): 20132950 3 (for 2014). Publication date: 18 December 2013. (Lapsus)

? *Liponycteris nudiventris:* (Name Combination)

? *Taphozous (Liponycteris) nudiventris:* (Name Combination)

? *Taphozous nudiventris nudiventris:* (Name Combination)

TAXONOMY:

Simmons (2005) assigns four subspecies to *Taphozous nudiventris*: *T. n. kachhensis* Dobson, 1872; *T. n. magnus* Wettstein 1913; *T. n. nudaster* Thomas, 1915; and *T. n. zayidi* Harrison, 1955. The enigmatic taxon *T. n. serratus* Heuglin, 1877 has been variously referred to either *Taphozous nudiventris* (e.g., Allen, 1939a, Koopman, 1993a) or *Scotophilus leucogaster* (e.g., Allen, 1939a; Koopman, 1993a), although it might not represent either of these species. See Felten (1962), Hayman and Hill (1971), Harrison and Bates (1991), Bates and Harrison (1997) and Barkley (1984) for further information on this taxon.

COMMON NAMES:

Albanian: Pipistreli i varrezave barkzhveshur. Arabian: Khafash Abu Bouz, Khaffash. Armenian: Մերկփոր պարկաթև. Azerbaijani: Ilpaqqarı n mə zar yarasası. Basque: Hilobi-saguzar gibelsoil. Belarusian: Маrільнік галабрухі. Bosnian: Golotrbuš ni grobni šišmiš. Breton: Logodenn-dall kof noazh ar bezioù. Bulgarian: Голокоремен прилеп. Castilian: Murciélago de cola libre y vientre desnudo. Catalan: Ratpenat de tomba de carpó nu. Croatian: Golotrbi grobni šišmiš. Chinese: 裸腹墓蝠. "Congolese": Kubukubo, Papo. Czech: Netopýr lysobřichý, Hrobkovec lysobř chý. Danish: Nø genrumpet gravflagermus. Dutch: Kaalbuikgrafvleermuis. English: Naked-bellied Tomb Bat, Naked-rumped Tomb Bat, Egyptian sheath-tailed bat, Naked-rumped bat, Naked-bellied Taphozous. Estonian: Paljaskõ ht-kääpanahkhiir. Finnish: Arohautalepakko. French: Taphien à croupe nue, Taphien à ventre nu. Frisian: Kealbûktimpelflearmûs. Galician: Morcego de tumba de cú espido. Georgian: შიშველმუცელა ქარქაშკუდა. German: Nacktbäuchige Tempelfledermaus, Nacktbauch-Grabfledermaus. Greek: Άτριχη ταφονυχτερίδα Hebrew: Ashman Gadol. Hungarian: Csupaszhasú sírlakó-denevér. Irish Gaelic: Ialtóg nochtphrompach thuama. Italian: Pipistrello delle tombe a ventre nudo, Tafozòo nudivèntre. Latvian: KailvĒ dera sikspā rnis. Lithuanian: Plikapilvis maiš iasparnis. Luxembourgish: Plakegbauchege Griewerflatterer. Macedonian: Торбокрилест лилјак. Maltese: Farfett il-Lejl Għ ieri. Montenegrin: Golotrbuš ni grobni slijepi miš. Norwegian: Nakengumpflaggermus. Polish: Grobownik goł obrzuchy. Portuguese: Morcego-de-ventre-nú. Rhaeto-Romance: Pipistrel da fossa a venter niv. Romanian: Liliacul cu burtă golaş a. Russian: Мешкокрыл голобрюхий. Serbian: Голотрби гробнички м[ј]ешкокрилаш [= Golotrbi grobnič ki m[j]eš kokrilaš]. Scottish Gaelic: Ialtag nochd-thònach thuaim. Slovak: Hladkonos holobruchý. Slovenian: Golotrebuš ni

mavzolejnik. Swedish: Nakengumpsfladdermus. Tamil: திறந்த ரம்ப்டு கல்லறை வௌவால், Iṟanta Rampṭu Kallaṟai Veḷavā. Turkish: Çı plakkarı nlı Mezar Yarasası. Ukrainian: Мішкокрил голобрюхий. Welsh: Ystlum beddrod tinfoel.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, tolerance of a degree of habitat modification, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Bates *et al.*, 2008; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Bates *et al.*, 2008; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2004bp; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
This species is tolerant of a certain level of human disturbance. Loss of some roosts (e.g., in buildings) and use of pesticides probably impact some populations negatively, but overall it is not significantly threatened (Bates *et al.*, 2008; IUCN, 2009).

CONSERVATION ACTIONS:
Bates *et al.* (2008) [in IUCN (2009)] report that there are international legal obligations for protection through the Bonn Convention (Eurobats) in areas to which this applies. However, through most of its range, no specific conservation measures are place for this species. It occurs in many protected areas across its wide range. A study on the impacts of pesticides is required, especially ways in which the impact might be minimised.

GENERAL DISTRIBUTION:
Taphozous nudiventris has a much larger range than previously believed. It has been recorded throughout the southern desert and sub-desert belt of western and central Palaearctic, from Morocco, through the Saharan region across northern Africa to Egypt and north through the Middle East to southern Turkey, and the more arid areas of the Indian subcontinent. The most southerly record is from northern Tanzania. There are two isolated records from Myanmar (the southernmost locality being in the general vicinity of Bago (Pegu) Yoma (Bates *et al.*, 2000)).
In South Asia this species is presently known from Afghanistan (Kabul, Kandahar and Nangarhar provinces), Bangladesh, India (Andhra Pradesh, Bihar, Delhi, Gujarat, Karnataka, Madhya Pradesh, Maharashtra, Rajasthan, Sikkim, Tamil Nadu, Uttar Pradesh and West Bengal) and Pakistan (Punjab and Sind) (Molur *et al.*, 2002).
It has also been recorded from the Cape Verdian islands (Tranier and de Naurois, 1985: 304)

Native: Afghanistan; Algeria (Horácek *et al.*, 2000: 104); Burkina Faso (Kangoyé *et al.*, 2015a: 614); Chad; Congo (The Democratic Republic of the); Djibouti (Pearch *et al.*, 2001: 396); Egypt; Eritrea (Lavrenchenko *et al.*, 2004b: 138); Ghana; Guinea-Bissau (Castella *et al.*, 2000; Rainho and Ranco, 2001: 38); India; Iran, Islamic Republic of; Iraq; Israel; Jordan; Kenya; Macronesian Islands (Cape Verd islands (Tranier and de Naurois, 1985; de Naurois, 1994; Hazevoet, 1995; Masseti, 2010); Mauritania; Morocco; Myanmar; Niger; Nigeria; Pakistan; Palestinian Territory, Occupied; Saudi Arabia; Senegal; Somalia; Sudan; Syrian Arab Republic; Tanzania; Togo; Turkey; United Arab Emirates (Anonymus, 2008: 38); Yemen.
Presence uncertain: Ethiopia; Kuwait; Libyan Arab Jamahiriya; Oman; Qatar; Tunisia; Uganda; Western Sahara. The records from Lebanon were revoked by Benda and Engelberger (2016: 17).

ECHOLOCATION:
In Jordan, Benda *et al.* (2010b: 204) registered the following parameter for 17 calls: F_{start}: 26.1 ± 1.0 (24.4 - 27.6) kHz, F_{end}: 22.2 ± 0.6 (20.3 - 22.9) kHz, F_{peak}: 24.5 ± 0.5 (23.6 - 25.3) kHz, Pulse duration: 15.4 ± 2.6 (11.0 - 19.5) msec, and Inter-pulse interval: 363.9 ± 115.1 (188.0 - 571.0) msec.

From Israel, Hackett *et al.* (2016: 223) reported the following parameters for 74 calls: Pulse duration: 12.99 ± 3.50 msec, F_{start}: 24.39 ± 1.55 (22.3 - 25.3) kHz, F_{end}: 22.80 ± 1.29 (20.4 - 26.3) kHz, F_{peak}: 23.38 ± 1.31 (21.3 - 26.3) kHz.

MOLECULAR BIOLOGY:
DNA - See Hoofer and Van Den Bussche (2003).

Karyotype - Đulic (1984), Yaseen *et al.* (1994), Hood and Baker (1986), Asan and Albayrak (2007) reported 2*n* = 42, FN = 64, BA = 24. However, Sreepada *et al.* (1995) reported 2*n* = 42, FN = 66, BA = 26 for specimens from India. In Turkey, Karatas and Sözen (2003: 359) and Arslan and Zima (2014: 7) reported 2*n* = 42, FNa = 64, FN = 68, a meta-/submetacentric X and an acrocentric Y chromosome. The autosomal chromosomes consist of 12 metacentric and submetacentric pairs and 8 acrocentric pairs.

Protein / allozyme - Unknown.

HABITS:
Lucan and Šálek (2012: 235) report on the mobbing behaviour of *T. nudiventris* on a barn owl (*Tyto alba*) in the Dakhla Oasis in Egypt. The bats

were able to detect the owl when it was on route to their roost, but it could not be determined how the bats were able to do this. There were no alarm or distress calls from other bats, so possibly visual cues or acoustic signals (e.g. sounds made by the feathers of the flying owl) might be involved.

ROOST:
Davis (2007: 10) found that in the United Arab Emirates, they may roost in groups of 200 to 1,000+ individuals. During late pregnancy and lactation, the females form separate groups.

DIET:
Benda *et al.* (2012a: 282) report that the most important food categories in Syria, Sudan, Oman and Turkey are Coleoptera (Scarabaeidae) and Orthoptera. Desai *et al.* (2012) [in Benda *et al.*, 2012a: 282] found seasonal changes in the food composition of these bats in Gujarat (India): Coleoptera and Orthoptera prevailed in winter, while Isoptera, Lepidoptera, Orthoptera, Neuroptera and Hymenoptera (Vespoidea) were most consumed in summer.

PREDATORS:
In Algeria, Djilali *et al.* (2016: 161) found remains of 2 *T. nudiventris* specimens in 516 preys captured by the Short-eared Owl (*Asio flammeus*).

POPULATION:
Structure and Density - It is common in some places, and less so in others. It is an uncommon species in the western part of its range: colonies in Africa and the Mediterranean region are generally restricted to a few individuals, although large colonies (dozens to hundreds) have been found in eastern Africa (Bates *et al.*, 2008; IUCN, 2009). The species is common in its range in South Asia, however, a declining trend in its population has been observed in recent years (Bates and Harrison, 1997).
Trend - 2008 - Stable (Bates *et al.*, 2008; IUCN, 2009). *T. nudiventris* populations within the Asia Minor and Levant region are predicted to have a stable population trend, under climate change scenarios (Bilgin *et al.*, 2012: 433).

REPRODUCTION AND ONTOGENY:
Kurta and Kunz (1987: 82) report that, at birth, the young has a forearm length of about 34.4 % of that of the mother (27.5 against 80.0 mm).

In the United Arab Emirates, Davis (2007: 10) indicates that they arrive in their summer roosts in March, and a single young is born in mid-April. Young are carried by their mothers until 8 weeks of age.

In Gujarat (India), Desai *et al.* (2012: 33) found that pregnancy lasted for 87 days and parturition occurred in August/September. The young reached their full adult size in nine months, when females become sexually mature. The males only become mature at the age of 20 months.

MATING:
In Gujarat (India), Desai *et al.* (2012: 33) report that copulation and fertilization takes place during the last week of March and the first week of April.

PARASITES:
Duszynski (2002: 20) indicates that *T. nudiventris* might be a host for *Eimeria dukei* Lavier, 1927, but as Cerná and Ryšavý (1976) did not provide any proof about the parasite, the identification might be wrong, given the fact that eimerians are reasonably host specific.

HEMIPTERA
Cimicidae: *Leptocimex vespertilionis* Ferris and Usinger, 1957 known only from the Sudan (Zeidab, Khartoum, Wad Medani) (Haeselbarth *et al.*, 1966: 13).

ACARINA
Dermanyssidae: Zumpt and Till (1954: 49) mentions that Hirst (1926) described *Steatonyssus sudanensis* from a "*Liponycteris nudiventris*" from near Khartoum, Sudan, but that this mite hasn't been found since.

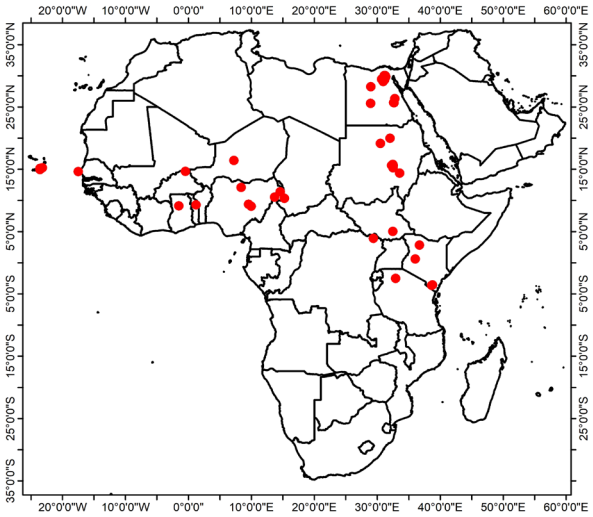

Figure 137. Distribution of *Taphozous nudiventris*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Burkina Faso, Cameroon, Cape Verde, Congo (Democratic Republic of the), Djibouti, Egypt, Ethiopia, Ghana, Kenya, Niger, Nigeria, Senegal, Somalia, South Sudan, Sudan, Tanzania, The Gambia, Togo, Uganda.

Taphozous perforatus E. Geoffroy St.-Hilaire, 1818

*1818. *Taphozous perforatus* E. Geoffroy Saint-Hilaire, Description des Mammifères qui se trouve en Egypte, 2: 126. Publication date: 1818. Type locality: Egypt: Kom Ombo [24 26 N 32 57 E]. Holotype: MNHN A.372: ad, alcoholic (skull not removed). Number 198 in Rode (1941: 243), who indicates the type might be a male. - Comments: Allen (1939a: 66) mentioned "Egypt" only as type locality. Restricted to Ombos (=Kom Ombo), between Edfu and Aswan by Kock (1969a: 74): see Meester *et al.* (1986: 32). Mahoney and Walton (1988a: 116) in Grubb *et al.* (1998: 72) considered the date of Geoffroy's publication to be 1813. Gardner and Hayssen (2004: 12) mention that the correct date should be 1818, not 1813 as mentioned on the publication itself. - Etymology: From the masculine scientific Latin adjective *perforàtus*, meaning "perforated", since the tail, as in all Emballonuridae, seems to perforate the uroparagium (see Lanza *et al.*, 2015: 227). (Current Combination)

1877. *Taphozous maritimus* Heuglin, Reise in Nordost Afrika, 2: 25. Publication date: 1877. Type locality: Sudan: Suakin [19 06 N 37 22 E].

1915. *Taphozous perforatus hædinus* Thomas, J. Bomb. nat. Hist. Soc., 24: 62. Publication date: 30 September 1915. Type locality: Kenya: Northern Guaso Nyiro: Chanler Falls [=Chandler's Falls] [00 47 N 38 04 E, 2 000 ft]. Holotype: BMNH 1912.7.1.46: ad ♂, skin only. Collection date: 3 September 1911; original number: 756.

2014. *Taphozous perforates:* Kohl and Kurth, Viruses, 6 (8): 3115. Publication date: 13 August 2014. (Lapsus)

? *Taphozous (Taphozous) perforatus:* (Name Combination)

? *Taphozous perforatus haedinus:* (Name Combination)

TAXONOMY:
Harrison (1958b, 1962) regards *sudani* as a separate species, but is not followed in this by subsequent authors (Rosevear, 1965; Kock, 1969a; Hayman and Hill, 1971; Koopman, 1975). Hayman and Hill (1971) make no attempt to recognize subspecies within *perforatus*, but Kock (1969a) recognizes three, *perforatus*, *sudani* and *haedinus*. Koopman (1975) does not agree entirely with the geographic limits suggested by Kock, but appears to accept the validity of the names proposed. Simmons (2005) recognized three subspecies: *haedinus* Thomas, 1916; *sudani* Thomas, 1915; and *senegalensis* Desmarest, 1820.

COMMON NAMES:
Afrikaans: Egiptiese witlyfvlermuis. Arabian: Khafash abu bouz saghir, Khaffash. Chinese: 埃及墓蝠. Czech: hrobkovec egyptský, wečerník senegalský, wečerník prowrtaný, netopýr slujový. Dutch: Egyptische grafvleermuis. English: Geoffroy's Tomb Bat, Egyptian Tomb Bat, Tomb Bat, Perforated Taphozous bat, African Taphozous. French: Taphien perforé, Taphien des tombeaux, Chauve-souris des tombes egyptiennes. German: Ägyptische Grabfledermaus. Hebrew: Ashman Katan. Italian: Tafozòo perforàto. Portuguese: Morcego das sepulturas do egipto.

ETYMOLOGY OF COMMON NAME:
The specimen from which this species was described was taken by Geoffroy Saint-Hilaire from a royal tomb in Egypt (see Taylor, 2005).

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Kock *et al.*, 2008d; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Kock *et al.*, 2008d; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2004aa; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - NT D2 ver 3.1 (2001) (Richards *et al.*, 2016b). 1986 - Indeterminate (Smithers, 1986).

MAJOR THREATS:
Kock *et al.* (2008d) [in IUCN (2009)] report that human disturbance has been highlighted as a threat to *T. perforatus*, but overall it is unlikely that this species is significantly threatened across its very wide range. In South Asia it is threatened by clearing of thorn forests for agricultural purposes, from mining and stone quarrying. Roost disturbance due to human interference and development of old buildings for tourism purposes is also considered serious threats (C. Srinivasulu *pers. comm.*, Molur *et al.*, 2002).

In Egypt, Mansour *et al.* (2017: 109) found that liver and kidney tissues of these bats contained

0.39 µg/g wet weights of DDTs (its usage was prohibited in Egypt in 1980) and 0.11 µg/g wet weights of PCBs (banned worldwide in 1990s). These values showed variations between sexes and seasons.

CONSERVATION ACTIONS:
Kock *et al.* (2008d) [in IUCN (2009)] report that this species is present in many protected areas, and no direct conservation measures are currently needed for the species as a whole. The species has not been recorded from any protected areas in Pakistan or India. Being a poorly understood species in the region, more studies on distribution, abundance, reproduction and ecology are recommended (Molur *et al.*, 2002).

GENERAL DISTRIBUTION:
Taphozous perforatus occurs widely throughout northern and sub-Saharan Africa, the Arabian Peninsula, and Asia, east to the Indian Subcontinent. In sub-Saharan Africa, records extend along the Nile and east to Ethiopia and northern Somalia, and west to Mauritania, Senegal, Gambia, Guinea-Bissau, Ghana, Burkina Faso, Benin, Niger, and northern Nigeria, and south to Kenya (including Lamu island), Tanzania, Democratic Republic of Congo, Zimbabwe, and Botswana. In southwest Asia, it has been recorded from Israel, Saudi Arabia, Yemen and Oman. In South Asia, this species is presently known to be widely distributed from southern Pakistan (Roberts, 1977) and western India (Gujarat, Madhya Pradesh and Rajasthan) (Bates and Harrison, 1997, Molur *et al.*, 2002) and recently reported from central Eastern Ghats in Andhra Pradesh (Chakraborty *et al.*, 2004). It has been recorded up to 200 m.

Native: Benin; Botswana (Monadjem *et al.*, 2010d: 535); Burkina Faso (Kangoyé *et al.*, 2015a: 614); Congo (The Democratic Republic of the) (Hayman *et al.*, 1966; Monadjem *et al.*, 2010d: 535) ; Djibouti (Pearch *et al.*, 2001: 394); Egypt (Benda *et al.*, 2008f: 1); Ethiopia (Lavrenchenko *et al.*, 2004b: 147); Gambia; Ghana; Guinea-Bissau (Veiga-Ferreira, 1949; Lopes and Crawford-Cabral, 1992; Rainho and Ranco, 2001: 37); India; Iran, Islamic Republic of; Israel; Kenya; Mali; Mauritania; Mozambique (Smithers and Lobão Tello, 1976; Monadjem *et al.*, 2010d: 535); Niger; Nigeria; Oman; Pakistan; Saudi Arabia; Senegal; Somalia; Sudan; Tanzania; Togo; Uganda; Yemen (Benda *et al.*, 2011b: 30); Zambia (Ansell, 1978; Monadjem *et al.*, 2010d: 535); Zimbabwe (Monadjem *et al.*, 2010d: 535).
Presence uncertain: Angola; Côte d'Ivoire; Eritrea; Guinea; Namibia (Cotterill, 2004a: 260); Palestinian Territory, Occupied; United Arab Emirates; Zambia.

ECHOLOCATION:
In Jordan, Benda *et al.* (2010b: 204) registered the following parameters: F_{start}: 31.4 ± 1.5 (29.6 - 34.4) kHz, F_{end}: 27.6 ± 0.6 (26.6 - 28.8) kHz, F_{peak}: 29.2 ± 0.6 (28.5 - 30.0) kHz, duration: 12.4 ± 4.2 (5.8 - 19.7) msec, and interpulse interval: 225.1 ± 110.4 (58.0 - 426.0) msec.
Two sets of data from Iran were presented by Benda *et al.* (2012a: 182): **1**: F_{start}: 31.4 ± 1.6 (30.0 - 34.2) kHz, F_{end}: 29.1 ± 1.7 (28.1 - 31.8) kHz, and F_{peak}: 30.4 ± 2.1 (28.9 - 33.4) kHz; **2** (hand released): F_{start}: 35.9 ± 0.5 (35.3 - 36.6) kHz, F_{end}: 29.9 ± 0.5 (29.4 - 30.8) kHz, F_{peak}: 32.5 ± 0.3 (32.1 - 33.0) kHz, duration: 4.8 ± 0.3 (4.5 - 5.2) msec, and interpulse interval: 47.3 ± 26.8 (12.5 - 81.3) msec.

Götze *et al.* (2016: 2) mentioned that *T. perforatus* doesn't shift the frequency of their echolocation signals (jamming avoidance response - JAR) in the presence of conspecifics.

MOLECULAR BIOLOGY:
DNA - Unknown.
Karyotype - Đulic (1984) and Yaseen *et al.* (1994) reported 2*n* = 42, FN = 64, BA = 24, a metacentric X chromosome and an acrocentric Y chromosome.
Protein / allozyme - Unknown.

Mansour *et al.* (2016: 66) investigated the presence of heavy metals in bats from two caves in the Saqqara region of Egypt and found that cobalt was not detected in winter and spring, and at very low concentration in the other seasons (ca. 0.01 µg/g tissue). High concentrations were found for Fe, Ca, Mg, and to some extent also Al and Zn, whereas Ba, Cu and Mn were found at relatively lower concentrations, and Cr, Cd, Mo, Ni and Pb were detected at very low concentrations. Ba, Cd, Co, Cr, Mo, Ni and Pb were not detected in kidney tissue. Kidneys of males showed higher concentrations of Mg than those of females.

DIET:
Rydell and Yalden (1997: 72) report that *T. perforatus* mainly feeds on Lepidoptera (moths - 56 % by volume), but also that Isoptera (14 %), Coleoptera (10 %) and Orthoptera (8 %) are major food categories. Furthermore, Hemiptera, Neuroptera, Hymenoptera and Diptera are eaten.

PREDATORS:
Mikula *et al.* (2016: Supplemental data) mention the Fox kestrel (*Falco alopex* (Heuglin, 1861)) and the Lanner falcon (*Falco biarmicus* Temminck, 1825) as avian predators.

POPULATION:
Structure and Density - It is common in parts of its African range, but is less common elsewhere. It is found in small colonies (between six to eight individuals) in the southern African subregion (Skinner and Chimimba, 2005). In South Asia the abundance, population size and trends for this species are not known, and the species has only been recorded from a few localities (Bates and Harrison, 1997).
Trend - 2008 - Stable (Kock *et al.*, 2008d; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
Krutzsch (2000: 113) indicates that *T. perforatus* is a polyoestrous species, although he also mentions (lower on the same page) that it is monoestrous in parts of its range and polyoestrous in others.

PARASITES:
HAEMOSPORIDA
Nycteria medusiformis Garnham and Heisch, 1953 was reported from various countries by Perkins and Schaer (2016: Suppl.).

DIPTERA
From Iran, Benda *et al.* (2012a: 275) report on the presence of *Raymondia huberi* Frauenfeld, 1855 (Streblidae). They also indicate that this bat fly occurs in a broad area from East Africa to the Middle East. Other parasites reported by Benda *et al.* (2012a: 276) from the north African part of the bat's range are: *Argas boueti* Roubaud et Colas-Belcour, 1933, *Chiropteropsylla aegyptia* (Rothschild, 1903), and *C. brockmani* Rothschild, 1915.

VIRUSES:
In bats from Saudi Arabia, Mishra *et al.* (2019: 5) found evidence for the presence of the following viruses: Bat astrovirus, Bat Coronavirus, Bat mastadenovirus, Bat papillomavirus, Chuvirus, Rotavirus.

Bunyaviridae
Willoughby *et al.* (2017: Suppl.) report the presence of Kaeng Khoi orthobunyavirus.

Coronaviridae - Coronaviruses
Gortazar and Segalés (2013: 954) indicate that recently a virus was identified from a Saudi-Arabian *T. perforatus* specimen that showed 100 % nucleotide identity with MERS-CoV (Middle East Respiratory Syndrome) in a conserved portion of its CoV genome, suggesting that this species might be the host for the MERS-CoV virus.

Flaviviridae
Flavivirus
Dakar bat virus was isolated from the pooled bat organs and salivary glands of this species in 1974 (Williams *et al.*, 1964; Kemp *et al.*, 1974). Reported in this species by de Jong *et al.* (2011: 10), Luis *et al.* (2013: Suppl.), Blitvich and Firth (2017: 3), Willoughby *et al.* (2017: Suppl.).

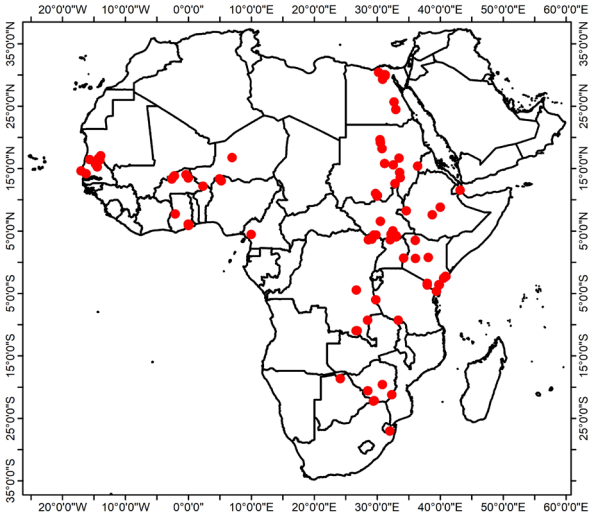

Figure 138. Distribution of *Taphozous perforatus*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Botswana, Burkina Faso, Cameroon, Congo (Democratic Republic of the), Djibouti, Egypt, Ethiopia, Ghana, Kenya, Mauritania, Niger, Nigeria, Senegal, South Africa, South Sudan, Sudan, Tanzania, Togo, Uganda, Zambia, Zimbabwe.

Taphozous perforatus perforatus E. Geoffroy St.-Hilaire, 1818

*1818. *Taphozous perforatus* E. Geoffroy Saint-Hilaire, Description des Mammifères qui se trouve en Egypte, 2: 126. Publication date: 1818. Type locality: Egypt: Kom Ombo [24 26 N 32 57 E]. Holotype: MNHN A.372: ad. Presented/Donated by: ?: Collector Unknown. - Comments: Allen (1939a: 66) mentioned "Egypt" only as type locality. Restricted to Ombos (=Kom Ombo), between Edfu and Aswan by Kock (1969a: 74): see Meester *et al.* (1986: 32). Mahoney and Walton (1988a: 116) in Grubb *et al.* (1998: 72) considered the date of Geoffroy's publication to be 1813. Gardner and Hayssen (2004: 12) mention that the correct date should be 1818, not 1813 as mentioned on the publication itself. - Etymology: From the masculine scientific Latin adjective *perforàtus*, meaning "perforated",

since the tail, as in all Emballonuridae, seems to perforate the uroparagium (see Lanza *et al.*, 2015: 227). (Current Combination)

1820. *Taphozous senegalensis* Desmarest, Encyclopédie Méthodique, (Zoologie, Mammalogie), 1: 130. Publication date: 1820. Type locality: Senegal: "Senegal". - Comments: Based on "le lérot-volant" of Daubenton, Mém. Acad. Paris, p. 366, 1759 (see Allen, 1939a: 66).

1958. *Taphozous perforatus swirae* Harrison, Durban Mus. Novit., 5 (11): 144. Publication date: 15 December 1958. Type locality: Nigeria: N Nigeria: Sokoto [13 02 N 05 16 E]. Holotype: BMNH 1967.1226: ad, skin and skull. Collected by: Mrs. Pamela Swire; collection date: 26 August 1958. Skin made up by D.L. Harrison, formerly in HZM collection 12.2690. - Comments: Grubb *et al.* (1998: 72) mention the locality as Sokoyo. Considered a valid subspecies by Grubb *et al.* (1998: 73), but see Kock (1969a: 80 - 81).

? *Taphozous perforatus perforatus:* (Name Combination, Current Combination)

Taphozous perforatus sudani Thomas, 1915

*1915. *Taphozous Sudani* Thomas, Ann. Mag. nat. Hist., 8, 15 (90): 561. Publication date: 1 June 1915. Type locality: Sudan: Equatoria Province: Upper Nile, N of Lado: Mongalla [05 10 N 31 50 E, 500 m] [Goto Description]. Holotype: BMNH 1902.7.4.2: ad ♂. Collected by: W.L.S. Loat Esq. Presented/Donated by: W.L.S. Loat Esq. - Etymology: Referring to the country where the type specimen was collected.

1962. *Taphozous sudani australis* Harrison, Occ. Pap. Nat. Mus. S. Rhod., 26B: 763. Type locality: Zimbabwe: Junction between Limpopo and Shashi rivers [22 12 S 29 23 E] [Goto Description]. Holotype: [Unknown] ad ♂. Collected by: M.P. Stuart Irwin *et al.*; collection date: 5 May 1960; original number: 9932. Rhodesian School Exploration Society Sentinel Ranch Expedition. - Comments: Homonym of *T. australis* Gould, 1854, from Australia (Harrison, 1964a; Kock, 1969a: 74; Meester *et al.*, 1986: 32; Simmons, 2005).

1964. *Taphozous sudani rhodesiae* Harrison, Arnoldia Rhod., 1 (3): 2. - Comments: Renaming of *australis* Harrison, 1962, preoccupied.

? *Taphozous perforatus sudani:* (Current Combination, Current Spelling)

PARASITES:
Polyctenidae: *Eoctenes intermedius* (Speiser 1904) from the Congo (Haeselbarth *et al.*, 1966: 16).

†Genus ***Vespertiliavus*** Schlosser, 1887

*1887. *Vespertiliavus* Schlosser, Beitr. Pal. Geol. Österr.-Ung., 6: 70; pl. I, figs 37, 40, 44, 45, 47, 48, 50-60,.

†***Vespertiliavus aenigma*** (Ravel, 2016)

*2016. *?Vespertiliavus aenigma* Ravel, in: Ravel et al., Geodiversitas, 38 (3): 356, 384, figs 14, 15. Publication date: 30 September 2016. Type locality: Tunisia: Kassérine governorate: Djebel Chambi National Park: Chambi [35 14 03 N 08 45 29 E, 630 m] [Goto Description]. - Etymology: From the latin *aenigma*, meaning enigma, puzzle or riddle, referring to the original morphology of the specimens, which makes it difficult to assign them systematically (see Ravel *et al.*, 2016: 384).

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS: Late lower Eocene to early middle Eocene. Timeframe:

†***Vespertiliavus kasserinensis*** (Ravel, 2016)

*2016. *Vespertliavus kasserinensis* Ravel, in: Ravel et al., Geodiversitas, 38 (3): 356, 377, figs 11 - 13. Publication date: 30 September 2016. Type locality: Tunisia: Chambi [35 14 03 N 08 45 29 E, 630 m] [Goto Description]. - Etymology: The name refers to the city of Kasserine, at the foot of Djebel Chambi (see Ravel *et al.*, 2016: 377).

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS: Timeframe: Late lower Eocene to early middle Eocene.

Family NYCTERIDAE Van der Hoeven, 1855

*1855. *Nycteridae* Van der Hoeven, Handboek Dierkunde, 2nd ed., 2: 1028. - Comments: Type genus: *Nycteris* Cuvier and Geoffroy, 1795. - Etymology: The family gets its name from the Greek name for a bat, *Nycteris* (see Taylor, 2005). (Current Combination)
1866. *Nyctericina* Gray, Ann. Mag. nat. Hist., ser. 3, 17 (98): 91. Publication date: 1 February 1866.
1910. *Petaliidæ* Miller, Proc. Biol. Soc. Wash., 22: 90 [Goto Description]. - Comments: Type genus: *Nycteris* Cuvier and Geoffroy, 1795. Replacement name for Nycteridae Dobson, 1875, due to the fact that Miller (1910) considered the name for the type genus (*Nycteris* Geoffroy 1803) to be antedated by *Nycteris* Borkhausen, 1797).
1984. *Nycteridídae:* Butler, Palaeovert., 14 (3): 117, 185. Publication date: 15 November 1984. (Emendation)
2015. *Nycteriidae:* Anti, Owusu, Agbenyega, Annan, Badu, Nkrumah, Tschapka, Oppong, Adu-Sarkodie, and Drosten, Emerg. Inf. Dis., 21 (8): 1419. Publication date: August 2015. (Lapsus)
2018. *Nicteridae:* Malekani, Musaba, Gembu, Bugentho, Toengaho, Badjedjea, Ngabu, Mutombo, Laudisoit, Ewango, Van Cakenberghe, Verheyen, Asimonyo, Masudi, Bongo and Ngbolua, Nat. Conserv. Res., 3 (1): 68.. Publication date: January 2018. (Lapsus)

TAXONOMY:
Koopman (1993a) mentions Van der Hoeven (1855) as author whereas Corbet and Hill (1992: 88) mention Dobson (1875e: 348).

Flower (1900: 344), Sclater (1901: 120), Medway (1978: 19), Sigé and Legendre (1982), Kock *et al.* (2002: 82), Hand and Archer (2005: 376), and Lanza *et al.* (2015: 232) use the name Nycteridídae, but we follow Gunnell and Simmons (2005: 212), who state (when referring to the Tanzanycteridae): "This family is a new taxon named by Gunnell *et al.* (2003) for *Tanzanycteris*. They spelled the family name Tanzanycteridídae, but we follow Simmons and Geisler (1998: 133, footnote 13), who argued that all bat family group names based on generic epithets ending with the Greek root -nycteris should be spelled the same way, i.e., -nycteridae rather than -nycteridídae."

Simmons and Geisler (1998: 133) state: "Despite Russell and Sigé (1970)'s argument about the nature of the greek root of -nycteris, we think that it is counterproductive to spell some family-group names in one fashion and others differently. Because Nycteridae is widely accepted as the spelling of the family-group name based on *Nycteris*, we argue that all family-group names based on genera ending in -nycteris should be spelled in the same fashion."

COMMON NAMES:
Afrikaans: Langoor-vlermuise. Czech: rýhonosovití, nykteridovití. Dutch: Spleetneusvleermuizen. English: Slit-faced bats, Hollow-faced bats, Hispid bats, Long-eared bats. Finnish: Valkopäälepakot. French: Nyctéridés. German: Schlitznasenfledermäuse, Schlitznasen-Fledermäuse, Schlitznasen. Norwegian: Hullneser, striflaggermus.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Shi and Rabosky (2015: 1537) calculated the family-level stem age and crown age to be respectively 52.8 and 17.9 MYA.

The split off from the Emballonuridae occurred according to Amador *et al.* (2016: 22) some 51 MYA, and the diversification within the family started about 33 MYA.

Ravel *et al.* (2016: 415, 418) indicate that *Koufechia gunnelli* represents the basal taxon of the Nycteridae. They also suggest that the family originated in Africa in the Lower Eocene and migrated to Europe in the Oligocene, and even more recently to Asia.

†Genus ***Khoufechia*** Ravel, 2016

*2016. *Khoufechia* Ravel, in: Ravel et al., Geodiversitas, 38 (3): 391. Publication date: 30 September 2016. - Etymology: From the Arabian "*Khoufèche*", a term to designate abat (see Ravel *et al.*, 2016: 391).

TAXONOMY:
Ravel *et al.* (2016: 358) indicate that this genus has a basal position within the Nycteridae.

†***Khoufechia gunnelli*** Ravel, 2016

*2016. *Khoufechia gunnelli* Ravel, in: Ravel et al., Geodiversitas, 38 (3): 356, 391, figs 18 - 20. Publication date: 30 September 2016. Type locality: Tunisia: Kassérine governorate: Djebel Chambi National Park: Chambi [35 14 03 N 08 45 29 E, 630 m] [Goto Description]. - Etymology: In honour of Gregg Gunnell for his numerous contributions to the study of African paleogene bats (see Ravel et al., 2016: 394).

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS: Late lower Eocene to early middle Eocene.
Timeframe:

Genus ***Nycteris*** G. Cuvier and E. Geoffroy, 1795

*1795. *Nycteris* G. Cuvier and E. Geoffroy, Mag. Encyclop. , 1 année 2: 186. - Comments: Type: *Vespertilio hispidus* Schreber, 1774. Gray *et al.* (1999: 1) mention Geoffroy and Cuvier, 1795 as authors. - Etymology: From the Greek "*νυκτοριο*", meaning "nocturnal", or from the feminine Greek substantive "*νυκτερίς*" (nykterís), "bats" (see Lanza *et al.*, 2015: 234). (Current Combination)
1803. *Nicteris:* Desmarest, Nouveau Dictionnaire d'Histoire Naturelle, 15: 501. (Lapsus)
1813. *Nycterus:* G. Fischer, Zoognosia, ed. iii, I: 18. (Lapsus)
1838. *Petalia* Gray, Mag. Zool. Bot., Edinburgh, 2 (12): 494. Publication date: 1 February 1838. - Comments: Type species: *Nycteris Javanicus* E. Geoffroy Saint-Hilaire, 1813.
1845. *Nyctoris:* ?, London Encyclopedia, 22: 738. (Lapsus)
1866. *Nycterops* Gray, Proc. zool. Soc. Lond., 1866, I (vi): 83. Publication date: May 1866 [Goto Description]. - Comments: Type species: *Nycterops pilosa* Gray, 1866 (=*Vespertilio hispidus* Schreber, 1774). - Etymology: Derived from Nycteris and the Greek "*οψ*", meaning aspect (see Palmer, 1904: 465).
1866. *Pelatia:* Gray, Proc. zool. Soc. Lond., 1866, I (vi): 83. Publication date: May 1866. (Lapsus)
1977. *Petelia:* Lekagul and McNeeley, Mammals of Thailand, 107. (Lapsus)
1998. *Nyteris:* Van Cakenberghe and De Vree, Bonn. zool. Beitr., 48 (2): 123. (Lapsus)
? *Nycteris sp.:*

TAXONOMY:
Meester *et al.* (1986) state that Andersen (1912b) divided *Nycteris* into four groups, three of which, viz. *hispida*, *aethiopica* (= *macrotis* - Koopman, 1965, 1975) and *thebaica*, occur in Southern Africa. The fourth group (*arge*) is limited to the African forest block.
Ellerman and Morrison-Scott (1951 1: 106), Corbet and Hill (1992: 88) mention *Nycteris* to be a *nomen nudum*, which was validated by Opinion 111 (Anonymus, 1929) [See also Stiles (1914: 66)]. Revised by Van Cakenberghe and De Vree (1985, 1993a, 1993b, 1999a). A key is provided by Gray *et al.* (1999: 1, Mammalian Species, 612).

Known species of the genus *Nycteris*: ***arge*** Thomas, 1903; ***aurita*** (K.Andersen, 1912); ***gambiensis*** (K. Andersen, 1912); ***grandis*** Peters, 1865; ***hispida*** (Schreber, 1775); ***intermedia*** Aellen, 1959; *javanica* E. Geoffroy, 1813 – Java, Nusa Penida (near Bali) and Kangean Isl (Indonesia) (Simmons, 2005: 392); ***macrotis*** Dobson, 1876; ***madagascariensis*** Grandidier, 1937; ***major*** (K. Andersen, 1912); ***nana*** (K. Andersen, 1912); ***parisii*** De Beaux, 1924;

thebaica E. Geoffroy, 1818; *tragata* (K. Andersen, 1912) – Burma, Thailand, western Malaysia, Sumatra, Borneo (Simmons, 2005: 394). ***vinsoni*** Dalquest, 1965; ***woodi*** K. Andersen, 1914.

COMMON NAMES:
Czech: rýhonosi, šerowecové, dutonosecové, nykteridy. English: Hollow-faced bats, Slit-faced bats. French: Nyctères. German: Schlitznasen-Fledermäuse, Schlitznasen. Italian: Nitterìdi, Nicterìdi. Kiluba (DRC): Kasusu. Kiande (DRC): Kakorokombe.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Avery (2007: 619) reported on the presence of *Nycteris* sp. in Pleistocene deposits at Wonderwerk Cave, South Africa. The approximate fossil date for the genus was reported by Shi and Rabosky (2015: 1532) to be about 5.332 million years ago.

MOLECULAR BIOLOGY:
In their study of the *FoxP2* gene, Li *et al.* (2007: 6) found that *Nycteris* shows the highest rate of non-synonymous change at exon 17, which they link with the evolution of nasal emission, multi-harmonic call structure and prey location by passive listening.

PARASITES:
HAEMOSPORIDA
Perkins and Schaer (2016: Suppl.) reported *Nycteria medusiformis* Garnham and Heisch, 1953 from various countries in Africa.

ACARI
Demodecidae: Fain (1960: 84) described *Stomatodex cornett* from a *Nycteris* sp. from Astrida (=Butare), Rwanda.
Myobiidae: Fain (1994: 1280) indicates that one species of *Ewingana* has been reported from a *Nycteris*, but this is possibly due to a museum contamination. Various species of the genus *Nycteris* do harbour one species of the monotypic genus *Nycterimyobia* (also see Fain, 1994: 1280).

DIPTERA
Nycteribiidae: *Penicillida pachymela* Speiser, 1901, from Somalia, Sudan, Kenya, Tanzania, the Congo, Guinea and the Cameroon Mts (Haeselbarth *et al.*, 1966: 114).

VIRUSES:
Coronaviridae
None of the 18 Kenyan bats tested positive for CoV (Tao *et al.*, 2017: Suppl.).

Paramyxoviridae
Mortlock *et al.* (2015: 1841) reported that one of two examined *Nycteris* specimens from Kenya tested positive for *Paramyxovirus* sequences.

Rhabdoviridae
Lyssavirus - Rabies related viruses
Horton *et al.* (2014: Table S1) tested 1 Tanzanian and 1 Kenyan *Nycteris* sp. specimen, but failed to find neutralising antibodies to IKOV (Ikoma lyssavirus).

Nycteris arge Thomas, 1903

*1903. *Nycteris arge* Thomas, Ann. Mag. nat. Hist., ser. 7, 12 (72): 633. Publication date: 1 December 1903. Type locality: Cameroon: SW Cameroon: Efulen [02 46 N 10 42 E] [Goto Description]. Holotype: BMNH 1904.2.8.2: ad ♂, skull and alcoholic. Collected by: George Latimer Bates Esq. - Etymology: From the Greek "*argos*" meaning shiny, bright, nimble, swift, rapid. (Current Combination)
1910. *Petalia arge:* Thomas and Wroughton, Trans. Linn. Soc. Lond., 19 (5) (63): 488. (Name Combination)
2002. *Nycteris argae:* Fenton and Bogdanowicz, Can. J. Zool., 80: 1008. (Lapsus)

TAXONOMY:
Formerly included *intermedia* (Hayman and Hill, 1971: 19), but see Van Cakenberghe and De Vree (1985).

arge species group (Van Cakenberghe and De Vree, 1985; Simmons, 2005: 391).

COMMON NAMES:
Chinese: 淡色凹脸蝠. Czech: rýhonos guinejský. English: Bates's Slit-faced Bat, Nimble Slit-faced Bat. French: Nyctère de Bates. German: Bates' Schlitznasen-Fledermaus. Kiluba (DRC): Katutu. Spanish (Castillian): Murciélago de Cara Hueca.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008bf; IUCN, 2009).

Assessment History -

2008 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2008bf; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2004by; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
It parts of its range it is presumably threatened by conversion of forest to agricultural land, and the logging of roost trees (Mickleburgh *et al.*, 2008bf; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008bf) [in IUCN (2009)] reported that in view of the species wide range, it is presumably present in some protected areas. Further studies are needed into the distribution and threats to this species.

GENERAL DISTRIBUTION:
Nycteris arge is widely distributed over much of West and Central Africa. It ranges from Sierra Leone in the west, through West Africa and the Congo Basin to western Uganda, southern Sudan, western Kenya, northern Tanzania and Burundi. It is distributed as far south as southern parts of the Democratic Republic of the Congo and northern Angola.

Amori *et al.* (2016: 217) [referring to Grubb *et al.* (1998: 74)] pointed out that the record from Togo (reported until ACR, 2015) is actually from Ghana.

Native: Angola (Hayman, 1963; Simmons, 2005: 391; Monadjem *et al.*, 2010d: 547); Burundi; Cameroon (Simmons, 2005: 391); Central African Republic (Lunde *et al.*, 2001: 537); Congo (Bates *et al.*, 2013: 335); Congo (The Democratic Republic of the) (Hayman *et al.*, 1966; Dowsett *et al.*, 1991: 259; Simmons, 2005: 391; Monadjem *et al.*, 2010d: 547); Côte d'Ivoire; Equatorial Guinea [= Bioko] (Simmons, 2005: 391); Gabon; Ghana (Decher and Fahr, 2007: 12 - 13); Guinea (Fahr *et al.*, 2006a: 72); Kenya (Webala *et al.*, 2004: 171; Simmons, 2005: 391); Liberia (Monadjem and Fahr, 2007: 50); Nigeria; Rwanda; Sierra Leone (Simmons, 2005: 391); Sudan (Simmons, 2005: 391); Tanzania; Uganda (Kityo and Kerbis, 1996: 60).

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
From western Uganda, Monadjem *et al.* (2011: 30) reported the following data for 11 specimens: Fa: 45.23 ± 0.880 mm, mass: 10.9 ± 0.94 g, wing loading: 5.9 ± 0.50 N/m^2, aspect ratio: 4.8 ± 0.49.

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:
Eisenberg and Wilson (1978: 743) indicate that *N. arge* has a relatively larger cranial volume than its congeners, which they link to differences in feeding strategy and habitat selection.

DETAILED MORPHOLOGY:
Baculum - The baculum ranges from 3.15 - 4.28 mm in length; the shaft is long, slender, parallel-sided and essentially straight; the base is expanded and round; in lateral profile it is sometimes angled ventrally while the tip is simple, with only a small expansion (Thomas *et al.*, 1994: 19).

ECHOLOCATION:
From western Uganda, Monadjem *et al.* (2011: 32) reported two different sets of data for two calls each: F_{min}: 21.55 kHz, F_{max}: 22.11 kHz, F_{char}: 21.88 kHz, F_{knee}: 21.77 kHz, duration: 4.1 msec; F_{min}: 46.43 kHz, F_{max}: 47.83 kHz, F_{char}: 47.23 kHz, F_{knee}: 47.23 kHz, duration: 5.9 msec. The authors indicate that these different data might represent harmonics.

MOLECULAR BIOLOGY:
DNA - See Hoofer and Van Den Bussche (2003).
Karyotype - Unknown.
Protein / allozyme - Unknown.

HABITAT:
R.B. Woosnam [in Thomas, 1910b: 488] reported it to be flying low over the water of the Aruwimi River.

Monadjem *et al.* (2016y: 367) recorded this species widely from forested habitats between 400 and 1,000 m in the Mount Nimba area.

POPULATION:
Structure and Density - This is a common species (Mickleburgh *et al.*, 2008bf; IUCN, 2009).
Trend - 2008 - Stable (Mickleburgh *et al.*, 2008bf; IUCN, 2009).

PARASITES:
HAEMOSPORIDA
Schaer *et al.* (2015: 381) found *Nycteria* cf. *eradi* parasites in *N. arge* from Sierra Leone. Landau *et al.* (2012: 142) and Perkins and Schaer (2016: Suppl.) mention this parasite as *Nycteria eradi* Rosin, Landau *et al.*, 1978.

HEMIPTERA
Polyctenidae: *Eoctenes nycteridis* (Horváth 1910) from Liberia, Congo, Ruanda-Urundi, Tanzania, Uganda and Eritrea (Haeselbarth *et al.*, 1966: 17).

VIRUSES:
Coronaviridae - Coronaviruses
SARS-CoV - Müller *et al.* (2007b) tested [as *N. argae*] between 1986 and 1999, for antibody to

SARS-CoV in sera in one individual from Oriental Province, DRC, none tested positive (0/1).

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Angola, Burkina Faso, Burundi, Cameroon, Central African Republic, Congo (Democratic Republic of the), Côte d'Ivoire, Equatorial Guinea, Gabon, Ghana, Guinea, Kenya, Liberia, Nigeria, Sierra Leone, South Sudan, Tanzania, Uganda.

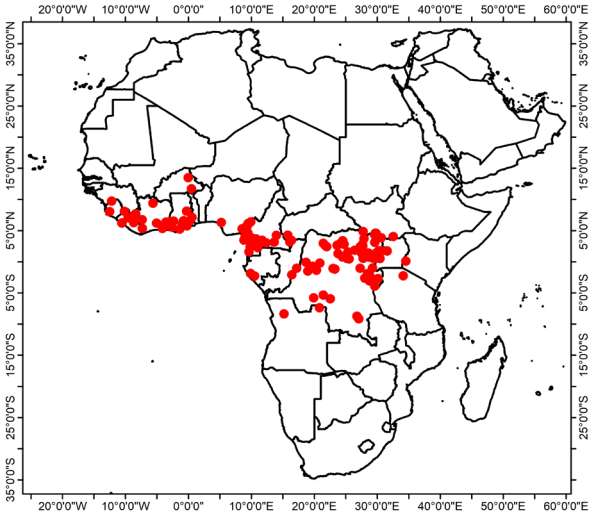

Figure 139. Distribution of *Nycteris arge*

Nycteris aurita (K. Andersen, 1912)

*1912. *Petalia aurita* K. Andersen, Ann. Mag. nat. Hist., ser. 8, 10 (59): 547. Publication date: 1 November 1912. Type locality: Kenya: Kilifi [03 38 N 39 51 E] [Goto Description]. Holotype: BMNH 1889.1.11.1: ad ♀, skull and alcoholic. Collected by: G.D. Trevor-Roper. Presented/Donated by: G.D. Trevor-Roper. - Etymology: From the feminine Latin adjective *aurìta*, meaning "long-eared" (see Lanza *et al.*, 2015: 236).

1924. *Nycteris aurita:* de Beaux, Atti Sic. Lig. Sci. Lett., n.s., 3 (1): ???. (Name Combination, Current Combination)

1957. *Nycteris hispida aurita:* Ansell, Ann. Mag. nat. Hist., ser. 12, 10: ???. (Name Combination)

GENERAL COMMENTS:
Lanza *et al.* (2015: 236) pointed out that we erroneously mentioned Kitui as type locality for this taxon, whereas this should be Kilifi.

TAXONOMY:
Nycteris aurita is often considered as a synonym or subspecies of *N. hispida* (Blyth, 1863: 391), but see Van Cakenberghe and De Vree, 1993b).

hispida species group Van Cakenberghe and De Vree, 1993b; Simmons, 2005: 391).

COMMON NAMES:
Chinese: 安氏凹脸蝠. Czech: rýhonos východoafrický. English: Andersen's Slit-faced Bat. French: Nyctère d'Andersen, Nyctère à longues oreilles. German: Andersens Schlitznasen-Fledermaus. Italian: Nitterìde orecchiùta, Nicterìde orecchiùta.

CONSERVATION STATUS:
Global - Although this species is known mainly from isolated records from a large area, it is listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population (it is common where it has been recorded), and because its savanna habitat is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008r; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2008r; IUCN, 2009). 2004 - DD ver 3.1 (2001) (Mickleburgh *et al.*, 2004n; IUCN, 2004). 1996 - LR/nt (Baillie and Groombridge, 1996).

MAJOR THREATS:
The threats to this species are poorly known, however, it is likely that there are no major threats to the species, as it has been recorded from an extensive habitat that is not severely declining (Mickleburgh *et al.*, 2008r; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008r) [in IUCN (2009)] report that it is not known if there are any direct conservation measures in place, or if the species is present within any protected areas. Further studies are needed into the distribution, natural history and possible threats to this little known species.

GENERAL DISTRIBUTION:
Nycteris aurita is known from scattered records in East Africa. It has been recorded from northern Somalia in the north of its range, through southern

Ethiopia and Sudan, into Kenya and Tanzania in the south.

Native: Ethiopia (Lavrenchenko *et al.*, 2004b: 147; Simmons, 2005: 391); Kenya (Simmons, 2005: 391); Somalia (Simmons, 2005: 391); Sudan; Tanzania (Simmons, 2005: 391), United Republic of; Uganda; Zambia.

POPULATION:
Structure and Density - There is little information available on the abundance of this species, but it seems to be common where it has been recorded (Mickleburgh *et al.*, 2008r; IUCN, 2009).
Trend - 2008 - Unknown (Mickleburgh *et al.*, 2008r; IUCN, 2009).

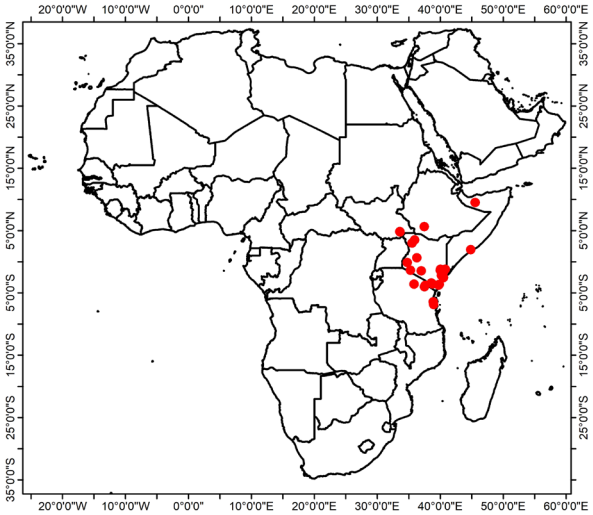

Figure 140. Distribution of *Nycteris aurita*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Ethiopia, Kenya, Somalia, South Sudan, Tanzania.

Nycteris cf. parisii De Beaux, 1924

2016. *Nycteris cf. parisii* Kruskop, Benda, Vasenkov and Lavrenchenko, Lynx, 47: 60.

TAXONOMY:
Due to the lack of molecular genetic analyses, Kruskop *et al.* (2016: 60) indicate that taxonomic composition and species delimitations in the *N. woodi* complex are rather uncertain. Van Cakenberghe and De Vree (1985) suggested that *parisii* and *benuensis* are synonyms of *N. woodi*, but based on bacular morphology, Thomas *et al.* (1994) suggested that *parisii* is specifically different from *woodi*. Kruskop *et al.* (2016: 60) state that the shape of the baculum of the specimens they report on, is more like that of *woodi*, and not like that of *parisii* which would be the species involved if the complex contains more than one species.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Ethiopia.

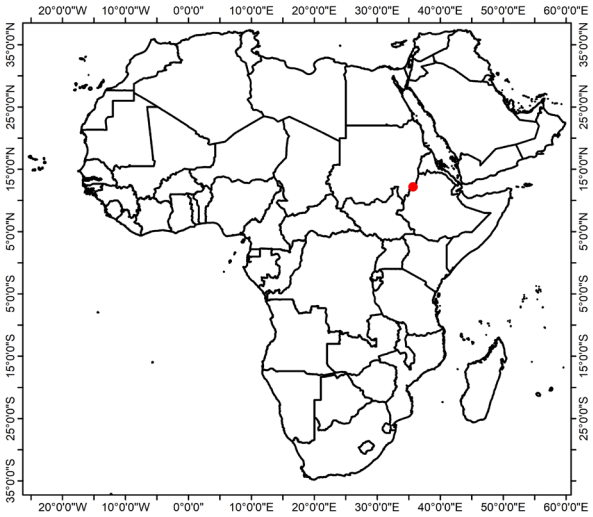

Figure 141. Distribution of *Nycteris* cf. *parisii*

Nycteris gambiensis (K. Andersen, 1912)

*1912. *Petalia gambiensis* K. Andersen, Ann. Mag. nat. Hist., ser. 8, 10 (59): 548. Publication date: 1 November 1912. Type locality: Senegal: Dialocote [13 25 N 13 20 W] [Goto Description]. Holotype: BMNH 1911.6.10.10: ad, skin and skull. Collected by: G.F. Owen; collection date: 7 May 1910; original number: A5.

1923. *P[etalia (Nycteris)] th[ebaica] gambiensis:* de Beaux, Atti Soc. ital. Sci. nat., 62: 96. (Name Combination)

1929. *Nycteris thebaica gambiensis:* Ingoldby, Ann. Mag. nat. Hist., ser. 10, 3: ???. (Name Combination)

1939. *Nycteris gambiensis:* G.M. Allen, Bull. Mus. comp. Zool., 83: 69. (Name Combination, Current Combination)

1975. *[Nycteris] gambianus:* Koopman, Bull. Am. Mus. Nat. Hist., 154 (4): 381. (Lapsus)
2007. *Nycteris cambiensis:* Nel and Markotter, Crit. Rev. Microbiol., 33 (4): 308. (Lapsus)

TAXONOMY:
Reviewed by Van Cakenberghe and De Vree (1999a).

thebaica species group (Van Cakenberghe and De Vree, 1999a; Simmons, 2005: 392).

COMMON NAMES:
Czech: rýhonos západoafrický. English: Gambian Slit-faced Bat. French: Nyctère de Gambie. German: Gambia Schlitznasen-Fledermaus.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Bergmans and Fahr, 2008; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Bergmans and Fahr, 2008; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Bergmans and Fahr, 2004; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
There appear to be no major threats to this species overall. It is threatened in parts of its range by habitat loss, often resulting from conversion of savanna to agricultural use (Bergmans and Fahr, 2008; IUCN, 2009).

CONSERVATION ACTIONS:
Bergmans and Fahr (2008) [in IUCN (2009)] report that there appear to be no direct conservation measures in place for this species, and it is not known if it occurs in any protected areas. There is a need to protect roosts of this species, and to better determine the eastern limits of the species range.

GENERAL DISTRIBUTION:
Nycteris gambiensis is a West African species which ranges from Senegal and the Gambia, through most of West Africa, as far east as central Nigeria. There is a single uncertain record from Cameroon which requires verification.

A record from Sierra Leone is in error (J Fahr *pers. comm.* in Simmons, 2005: 392)

Native: Benin (Simmons, 2005: 392); Burkina Faso (Simmons, 2005: 392; Kangoyé *et al.*, 2015a: 615); Côte d'Ivoire (Simmons, 2005: 392); Gambia (Simmons, 2005: 392); Ghana (Simmons, 2005: 392); Guinea (Simmons, 2005: 392; Decher *et al.*, 2016: 264); Guinea-Bissau (Monard, 1939; Veiga-Ferreira, 1949; Lopes and Crawford-Cabral, 1992; Rainho and Ranco, 2001: 43; Simmons, 2005: 392); Mali; Mauritania; Niger; Nigeria (Simmons, 2005: 392); Senegal (Simmons, 2005: 392); Togo (Simmons, 2005: 392).
Uncertain: Cameroon; Sierra Leone (Simmons, 2005: 392).

DETAILED MORPHOLOGY:
Baculum - The baculum ranges from 2.88-3.42 mm in length; the shaft is slender and parallel-sided; the base is expanded and in lateral view is angled ventrally, while the tip is simple with a slight expansion (Thomas *et al.*, 1994:22).

POPULATION:
Structure and Density - It can be a locally common species (Bergmans and Fahr, 2008; IUCN, 2009).
Trend - 2008 - Unknown (Bergmans and Fahr, 2008; IUCN, 2009).

VIRUSES:
Willoughby *et al.* (2017: Suppl.) report the following viruses: Chobar Gorge virus, Lagos bat lyssavirus, Saboya virus.

Coronaviridae - Coronaviruses
Betacoronavirus
Annan *et al.* (2013: 457) reported that 46 out of 185 (24.9 %) *N.* cf. *gambiensis* specimens tested in Ghana were found to be positive for 2c *Betacoronavirus*. They also found that juvenile bats and lactating females were more likely to be infected than adult males and non-lactating females.

Flaviviridae
Flavivirus
de Jong *et al.* (2011: 10) and Luis *et al.* (2013: suppl.) reported Saboya virus occurring on this species. Calderon *et al.* (2016: 8) also mention Sokuluk virus.

Reoviridae
Orbivirus
Fomede virus - reported in the CDC's Arbovirus Catalogue, to have been isolated in 1978 from the Republic of Guinea, from the brain and internal organs of *N.* cf. *gambiensis*. Reported by de Jong *et al.* (2011: 11) and Luis *et al.* (2013: suppl.).

Rhabdoviridae
Lyssavirus - Rabies related viruses

Lagos bat virus - Isolated in Guinea (Institute Pasteur, 1985).

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Benin, Burkina Faso, Cameroon, Côte d'Ivoire, Ghana, Guinea, Guinea-Bissau, Nigeria, Senegal, The Gambia, Togo.

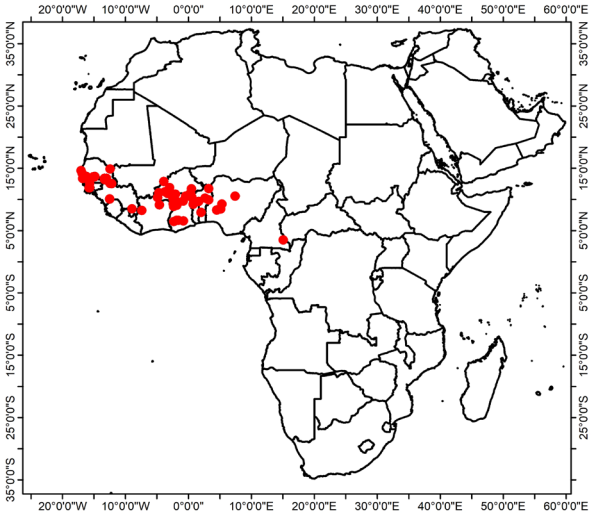

Figure 142. Distribution of *Nycteris gambiensis*

Nycteris grandis Peters, 1865

*1865. *Nycteris grandis* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, 351, 358. Type locality: Ghana: vicinity of Elmina [05 05 N 01 21 W] [Goto Description]. Paralectotype: RMNH MAM.27348: ad, skin only. Collected by: Colonel C.J.M. Nagtglas; collection date: 1863. - Comments: Grubb *et al.* (1998: 76) mention the type locality as 'Usually given as "Guinea" but the type, in the Leiden Museum, was collected in 1863 by Nagtglas, and ascribed to Côte d'Or (Jentink, 1888b: 170). The type locality may be further restricted to the vicinity of Elimina [Ghana] which is the only definite locality Jentink cited for any of the Nagtglas material'. The publicatiion covers a meeting held on 13 July 1865. - Etymology: From the Greek "*grandis*" meaning magnificent (Brown, 1991; Jaeger, 1972, both in Hickey and Dunlop, 2000: 3). (Current Combination)

1866. *Nycteris Baikii* Gray, in: Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, 672 (for 1866). Type locality: "Africa": West Africa: Baikie. - Comments: Meester *et al.* (1986: 34) mention "Gray in Peters" as author. Nomen nudum.

1912. *Petalia grandis:* K. Andersen, Ann. Mag. nat. Hist., ser. 8, 10 (59): ???. (Name Combination)

1923. *Nycteris marica* Kershaw, Ann. Mag. nat. Hist., ser. 9, 12 (70): 534. Publication date: 1 October 1923. Type locality: Tanzania: Kilosa: Tindiga [06 55 S 37 20 E] [Goto Description]. Holotype: BMNH 1923.8.2.1: ad, skin and skull. Collected by: Professor Arthur Loveridge; collection date: 24 January 1922.

1925. *Nycteris proxima* Lönnberg and Gyldenstolpe, Ark. Zool. Stockholm, 17B (9): 1. Publication date: 14 May 1925. Type locality: Congo (Democratic Republic of the): Semliki valley: Kartoushi [00 44 N 29 34 E] [Goto Description]. Holotype: [Unknown] ad ♂. Collection date: 11 March 1921; original number: 813. See Lönnberg and Gyldenstolpe (1925: 2).

1938. *[Nycteris] narica:* Frechkop, Exploration du Parc National Albert, 50. (Lapsus)

1938. *[Nycteris] praxima:* Frechkop, Exploration du Parc National Albert, 50. (Lapsus)

1981. *N[ycteris] g[randis] marica:* Kock, Senckenb. biol., 61 (5/6): 325. (Name Combination)

1991. *Nycteris graudis:* Baker, Honeycutt and Van den Bussche, Bull. Am. Mus. Nat. Hist., 206: 46. (Lapsus)

2016. *Nycteris grande:* Bhatnagar, Smith, Rai and Frahm, Anat. Rec., 299: 495. Publication date: 21 January 2016. (Lapsus)

TAXONOMY:
Reviewed by Van Cakenberghe and De Vree (1993b). *N. marica* is sometimes recognized as a distinct savanna subspecies, but this does not seem justified based on morphology (Van Cakenberghe and De Vree, 1993b; Hickey and Dunlop, 2000; Simmons, 2005: 392).

hispida species group (Van Cakenberghe and De Vree, 1993b; Simmons, 2005: 392).

COMMON NAMES:
Afrikaans: Groot spleetneusvlermuis. Chinese: 魁凹脸蝠. Czech: rýhonos velký, nycteris velká. English: Large Slit-faced Bat. French: Grande nyctère. German: Große Schlitznase, Große Schlitznasen-Fledermaus. Portuguese: Morcego grande orelhudo.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008bg; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2008bg; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2004cd; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
In general, there appear to be no major threats to this species as a whole. It is threatened in parts of its range by habitat loss, particularly the logging of large trees used for roosting. Some populations may be threatened by overharvesting for subsistence food (Mickleburgh *et al.*, 2008bg; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008bg) [in IUCN (2009)] report that in view of the species wide range, it is presumably present in a number of protected areas. No direct conservation measures are currently needed for this species as a whole.

GENERAL DISTRIBUTION:
Nycteris grandis is broadly distributed in sub-Saharan Africa. It ranges from Senegal, through West and Central Africa, to southern Sudan, southeastern Kenya and eastern Tanzania, with scattered records as far south as Zambia, Zimbabwe and Mozambique. Also found on the islands of Zanzibar and Pemba (Simmons, 2005: 392). It is a lowland species.

Native: Benin; Burkina Faso (Kangoyé *et al.* (2012: 6025; 2015a: 615); Cameroon; Central African Republic (Lunde *et al.*, 2001: 537); Congo (Bates *et al.*, 2013: 335); Congo (The Democratic Republic of the) (Hayman *et al.*, 1966; Dowsett *et al.*, 1991: 259; Simmons, 2005: 392; Monadjem *et al.*, 2010d: 547); Côte d'Ivoire; Equatorial Guinea (Fahr and Ebigbo, 2003: 128); Gabon; Ghana; Guinea; Kenya (Simmons, 2005: 392); Liberia (Fahr, 2007a: 103); Malawi (Happold *et al.*, 1988; Happold and Happold, 1997b: 815; Simmons, 2005: 392; Monadjem *et al.*, 2010d: 547); Mozambique (Smithers and Lobão Tello, 1976; Simmons, 2005: 392; Monadjem *et al.*, 2010d: 547; Monadjem *et al.*, 2010c: 381); Nigeria; Senegal (Simmons, 2005: 392); Sierra Leone; Sudan; Tanzania (Stanley and Goodman, 2011: 43) (including the islands of Pemba and Unguja [O'Brien, 2011: 289]); Togo (Capo-Chichi *et al.*, 2004: 162); Uganda (Kityo *et al.*, 2009: 137); Zambia (Ansell, 1969; Ansell, 1986; Monadjem *et al.*, 2010d: 547); Zimbabwe (Simmons, 2005: 392; Monadjem *et al.*, 2010d: 547).

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
See Hickey and Dunlop (2000).

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:
See Hickey and Dunlop (2000).

DETAILED MORPHOLOGY:
Baculum - The baculum ranges from 3.45-3.54 mm in length and is small in relation to body size; the shaft is stout and deep, unlike that of any other *Nycteris* examined, the base is narrow and in lateral profile is usually angled ventrally, while the tip is squared, with a pronounced ventral projection (Thomas *et al.*, 1994: 21).
For a description of the skull, ears and tragus, and wingshape and aspect ratio see Hickey and Dunlop (2000).

SEXUAL DIMORPHISM:
N. grandis is not sexually dimorphic in size (Hickey and Dunlop, 2000: 1).

ECHOLOCATION:
See Taylor (1999b) and Hickey and Dunlop (2000).

Keeley *et al.* (2018: 14) indicate that echolocation calls range between 17 and 114 kHz.

MOLECULAR BIOLOGY:
DNA - Unknown.
Karyotype - Porter *et al.* (2010) reported for a single male Gabonese specimen as $2n = 42$, with 34 biarmed and 6 acrocentric autosomes, with an X as a large subtelocentric and the Y is a small acrocentric.
Protein / allozyme - Unknown.

HABITAT:
This species has been recorded from a variety of lowland habitats, ranging from lowland tropical moist forest (often found near to swampy sites) to drier savanna areas and Miombo woodland (Rosevear, 1965; Fenton *et al.*, 1990; Hickey and Dunlop, 2000; Skinner and Chimimba, 2005). Kangoyé *et al.* (2015a: 615) report it from a gallery forest in Lera, Burkina Faso.

In the Mount Nimba area, Monadjem *et al.* (2016y: 367) recorded this species from forested and forest edge habitats between 400 and 700 m.

HABITS:
See Hickey and Dunlop (2000).

ROOST:
Nycteris grandis generally roosts in hollow trees, but is also found in man made structures such as houses (Fenton *et al.*, 1990; 1993), disused water towers (Fenton *et al.*, 1990; 1993) and culverts (Rosevear, 1965). They may also roost in hollow fallen logs, and holes or small caverns in rocks (Rosevear, 1965; Hickey and Dunlop, 2000).

DIET:
Fenton *et al.* (1981: 463; 1990: 2, 4) found that in the Mana Pools National Park, in Zimbabwe, *N. grandis* primarily fed on frogs (e.g. *Ptychadena anchietae, P. mossambica, P.* spp., *Xenopus laevis*), bats (e.g. *Nycteris thebaica, Rhinolophus* cf *darlingi*, "*Pipistrellus* cf. *nanus*", *Hipposideros* cf. *caffer*), arthropods, but sometimes also captured birds (*Cisticola fulvicapilla, Apalis flavida*) and fish (*Tilapia rendalli*, *Barbus* sp., *Alestes* sp.).

POPULATION:
Structure and Density - It appears to be a rare, or rarely recorded, species. The species occurs in small colonies, but is usually found only as single animals or in pairs (Mickleburgh *et al.*, 2008bg; IUCN, 2009).
Trend - 2008 - Decreasing (Mickleburgh *et al.*, 2008bg; IUCN, 2009).

ACTIVITY AND BEHAVIOUR:
See Hickey and Dunlop (2000).

REPRODUCTION AND ONTOGENY:
Krutzsch (2000: 115), referring to Verschuren (1957), indicates that *N. grandis* is polyoestrous with two or more (continuous) cycles per year, a postpartum oestrus and often no anoestrus.

Stanley and Goodman (2011: 43), referring to Verschuren (1957), report on a pregnant female collected on 31 July 1993 in the East Usambara Mountains (Tanzania).

PARASITES:
Little information is available regarding parasites of *N. grandis* (Hickey and Dunlop, 2000).

HAEMOSPORIDA
Schaer *et al.* (2015: 381) found two different forms of *Nycteria* sp. parasites in *N. grandis* from Sierra Leone. Karadjian *et al.* (2016: 9834) mentioned *Nycteria medusiformis* and *Nycteria* sp. from the DRC.

HEMIPTERA
Polyctenidae: *Eoctenes nycteridis* (Horváth, 1910) from Liberia, Congo, Ruanda-Urundi, Tanzania, Uganda and Eritrea (Haeselbarth *et al.*, 1966: 17).

SIPHONAPTERA
Pulicidae: *Echidnophaga aethiops* Jordon and Rothschild, 1906 locality not mentioned (Haeselbarth *et al.*, 1966: 135).

VIRUSES:
Keymer (1971) reported "broad trypanosomes" from four of six specimens collected from Zambia.

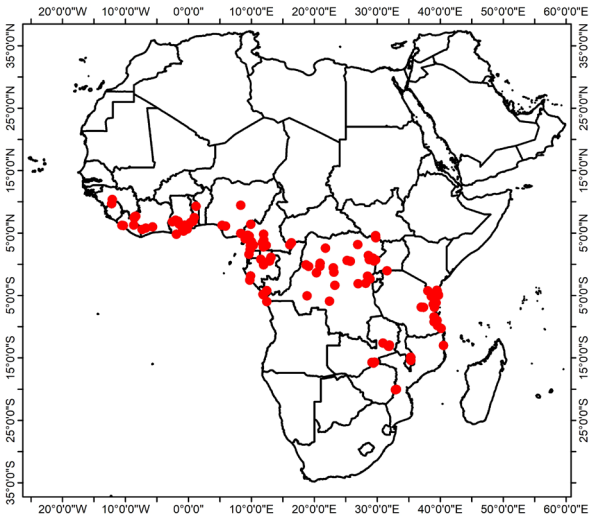

Figure 143. Distribution of *Nycteris grandis*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Cameroon, Central African Republic, Congo, Congo (Democratic Republic of the), Côte d'Ivoire, Equatorial Guinea, Gabon, Ghana, Guinea, Kenya, Liberia, Malawi, Mozambique, Nigeria, Sierra Leone, Tanzania, Togo, Zambia, Zimbabwe.

Nycteris hispida (Schreber, 1774)

*1774. *Vespertilio hispidus* Schreber, Die Säugethiere in Abbildungen nach der Natur mit Beschreibungen, 1 (8): pl. 56 + 1 (9): 169, 188. Publication date: 1774. Type locality: Senegal: "Senegal" [Goto Description]. - Etymology: From the masculine Latin adjective *hìspidus*, meaning "shaggy", referring to the bristly hair around the facial slit (see Lanza *et al.*, 2015: 242).

1813. *Nycteris Daubentonii* E. Geoffroy Saint-Hilaire, Ann. Mus. Hist. nat. Paris, 20: 19. Publication date: August 1813. Type locality: Senegal: "Senegal" [Goto Description].
1840. *Nycteris hispida:* Wagner, in: Schreber, Die Säugethiere in Abbildungen nach der Natur mit Beschreibungen, Suppl. 3: ???. (Name Combination, Current Combination)
1843. *Nycteris poensis* Gray, Catalogue of the species of mammals of the British Museum, 24. Publication date: 13 May 1843. Type locality: Equatorial Guinea: Bioko [formerly Fernando Po] [ca. 03 21 N 08 40 E] [Goto Description]. Holotype: BMNH 1855.12.26.252: ad ♀, skin and skull. Presented/Donated by: Captain E. Downes R.N. Intended specimen = *Rhinolophus martini* Fraser: see Meester *et al.* (1986: 33). - Comments: Considered a nomen nudum by Dobson (1878: 162) and Allen (1939a: 69).
1843. *Rhinolophus Martini* Fraser, Proc. zool. Soc. Lond., 1843, V (cxxi): 25. Publication date: July 1843. Type locality: Equatorial Guinea: Bioko [formerly Fernando Po] [ca. 03 21 N 08 40 E] [Goto Description].
1852. *Nycteris villosa* Peters, Naturwissenschaftliche Reise nach Mossambique, Zoologie, Säugethiere, 48, pl. 11. Publication date: 1852. Type locality: Mozambique: Inhambane [24 00 S 35 28 E] [Goto Description]. Holotype: ZMB 394/85665: ♂, skin and skull. Collected by: Prof. Wilhelm Carl Hartwig Peters; collection date: between 1843 and 1847. See Turni and Kock (2008) [skull: ZMB 394 + skeleton: ZMB 85665]. - Comments: Considered a valid subspecies by Taylor (1998: 33).
1866. *Nycterops pilosa* Gray, Proc. zool. Soc. Lond., 1866, I (vi): 83. Publication date: May 1866. Type locality: "Africa": "Africa".
1878. *Nycteris hispida villosa:* Dobson, Catalogue of the Chiroptera of the collection of the British Museum, 163. (Name Combination)
1883. *Nycteris hispidus:* Rochebrune, Act. Soc. Linn. Bordeaux, 37: ???. (Name Combination)
1910. *Petalia hispida:* Thomas and Wroughton, Trans. Linn. Soc. Lond., 19 (5) (63): 488. (Name Combination)
1917. *Nycteris pallida* J.A. Allen, Bull. Am. Mus. Nat. Hist., 37 (18): 425. Publication date: 29 September 1917. Type locality: Congo (Democratic Republic of the): Oriental province: Uele district: Faradje [03 44 N 29 43 E] [Goto Description]. Holotype: AMNH 49144: ad ♂. Collected by: Herbert Lang, James Paul Chapin and The American Museum Congo Expedition; collection date: 1 March 1912; original number: 1858. Paratype: RMCA 12390: ad ♂, skin and skull. Collected by: Herbert Lang, James Paul Chapin and The American Museum Congo Expedition; collection date: 22 Novermber 1911; original number: formerly AMNH 49119. Presented/Donated by: ?: Collector Unknown. Topotype: MCZ 17226: ♂, alcoholic (skull not removed). Collected by: Herbert Lang, James Paul Chapin and The American Museum Congo Expedition; collection date: 9 March 1912. Presented/Donated by: ?: Collector Unknown.
1935. *[Nycteris hispida] martini:* Braestrup, Vidensk. Meddr dansk naturh. Foren., 99: 88. (Name Combination)
1935. *N[ycteris] h[ispida] pallida:* Braestrup, Vidensk. Meddr dansk naturh. Foren., 99: 88. (Name Combination)
1935. *Nycteris hispida hispida:* Braestrup, Vidensk. Meddr dansk naturh. Foren., 99: 88. (Name Combination)

TAXONOMY:
Koopman (1975: 377, 378) includes *aurita* and *pallida*. Van Cakenberghe and De Vree (1993b) consider *aurita* as a separate species.

hispida species group (Van Cakenberghe and De Vree, 1993b; Simmons, 2005: 392).

COMMON NAMES:
Afrikaans: Harige spleetneusvlermuis, Harige Langoorvlermuis. Chinese: 粗毛凹脸蝠. Czech: rýhonos štětinatý, šerowec senegalský. English: Hairy Slit-faced Bat, Hairy Long-eared Bat. French: Nyctère hérissée, Nyctère hirsute. German: Rauhaarschlitznase, Gemeine Schlitznasen-Fledermaus, Haarige Schlitznasenfledermaus. Italian: Nitterìde irsùta, Nicterìde irsùta, Nitterìde ìspida, Nicterìde ìspida. Kiluba (DRC): Katutu. Portuguese: Morcego orelhudo piloso.

ETYMOLOGY OF COMMON NAME:
Although this species is not hairier than any of the other slit-faced bats, the name is applied to it as a translation of the specific name *hispida*, which is from the Latin *hispidus*, meaning hairy or bristly, refering to the bristly hair around the facial slit (see Taylor, 2005).

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008s; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2008s; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2004m; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - LC ver 3.1 (2001) (Monadjem *et al.*, 2016c). 2004 - NT ver 3.1 (2001) (Friedmann and Daly, 2004).

MAJOR THREATS:
There appear to be no major threats to this species. It is locally threatened in parts of its range by habitat loss, largely through the conversion of forest to agricultural use (Mickleburgh *et al.*, 2008s; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008s) [in IUCN (2009)] report that in view of the species wide range it is presumably present in a number of protected areas (including the Udzungwa Mountains National Park of Tanzania (Stanley *et al.*, 2005b)). No direct conservation measures are currently needed for this species as a whole.

GENERAL DISTRIBUTION:
This species has a wide range, encompassing much of sub-Saharan Africa, with the exception of the Horn of Africa and parts of southern Africa. There is an apparently disjunct population in western Mauritania close to the border with Senegal, and an isolated record from central Mali. Also recorded from the island of Unguja [=Zanzibar] (Simmons, 2005: 392; O'Brien, 2011: 289).

The records from Cape of Good Hope are probably invalid (Cotterill, 1996a).

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 710,458 km^2.

Native: Angola (Crawford-Cabral, 1989; Hayman, 1963; Simmons, 2005: 392; Monadjem *et al.*, 2010d: 547); Benin (Capo-Chichi *et al.*, 2004: 162); Botswana (Archer, 1977; Cotterill, 2004a: 261; Simmons, 2005: 392; Monadjem *et al.*, 2010d: 547); Burkina Faso (Kangoyé *et al.*, 2015a: 615); Burundi; Cameroon; Central African Republic (Lunde *et al.*, 2001: 537); Chad; Congo (Bates *et al.*, 2013: 336); Congo (The Democratic Republic of the) (Hayman *et al.*, 1966; Dowsett *et al.*, 1991: 259; Van Cakenberghe *et al.*, 1999; Monadjem *et al.*, 2010d: 547); Côte d'Ivoire; Equatorial Guinea [= Bioko] (Simmons, 2005: 392); Ethiopia (Lavrenchenko *et al.*, 2004b: 132); Gabon; Gambia (Simmons, 2005: 392; Emms and Barnett, 2005: 50); Ghana; Guinea (Fahr *et al.*, 2006a: 72); Guinea-Bissau (Bocage, 1892a; Monard, 1939; Veiga-Ferreira, 1949; Lopes and Crawford-Cabral, 1992; Rainho and Ranco, 2001: 41); Kenya; Liberia (Fahr, 2007a: 103); Malawi (Happold *et al.*, 1988; Happold and Happold, 1997b: 815; Simmons, 2005: 392; Monadjem *et al.*, 2010d: 547); Mali; Mauritania (Simmons, 2005: 392); Mozambique (Smithers and Lobão Tello, 1976; Simmons, 2005: 392; Monadjem *et al.*, 2010d: 547; Monadjem *et al.*, 2010c: 381); Namibia (Monadjem *et al.*, 2010d: 547); Niger; Nigeria; Rwanda; Senegal (Adam and Hubert, 1976; Simmons, 2005: 392); Sierra Leone; Somalia (Simmons, 2005: 392); South Africa (Monadjem *et al.*, 2010d: 547); Sudan; Tanzania (Stanley *et al.*, 2005b); Togo; Uganda (Kityo and Kerbis, 1996: 60); Zambia (Ansell, 1973; Ansell, 1974; Ansell, 1986; Monadjem *et al.*, 2010d: 547); Zimbabwe (Monadjem *et al.*, 2010d: 547).

DETAILED MORPHOLOGY:
Baculum - The baculum ranges from 3.33 - 4.16 mm in length, the shaft is long, slender and variably ventrally curved, the base is expanded and in lateral profile is angled ventrally, while the tip is sometimes angled ventrally, it has a projection on the ventral aspect varying between individuals from a slight swelling to a pronounced hook (Thomas *et al.*, 1994: 20).

ECHOLOCATION:
See Taylor *et al.* (2005).

MOLECULAR BIOLOGY:
DNA - Unknown.
Karyotype - Lee *et al.* (1989) reported 2*n* = 42, FN = 78, BA = 38, and a metacentric X and Y.
Protein / allozyme - Unknown.

HABITAT:
Nycteris hispida has been recorded from a wide variety of habitats, ranging from lowland tropical moist forest, into moist savanna, dry savanna, papyrus swamps and marsh.

R.B. Woosnam [in Thomas, 1910b: 488] reported it to be most numerous among the acacia trees on the plains around the south end of the Ruwenzori range.

Monadjem *et al.* (2016y: 367) recorded *N. hispida* sparsely in open savanna on the Liberian side of Mount Nimba.

ROOST:
Colonies roost in hollow trees, dense bushes, caves, holes in termite colonies and similar habitats.

PREDATORS:
Mikula *et al.* (2016: Supplemental data) mention *N. hispida* to be taken by the Western marsh harrier (*Circus aeruginosus* (Linnaeus, 1758)).

POPULATION:
Structure and Density - Colonies range in size from individual and pairs of animals to up to 20 bats. This is a very common bat (Mickleburgh *et al.*, 2008s; IUCN, 2009).
Trend - 2008 - Stable (Mickleburgh *et al.*, 2008s; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
Krutzsch (2000: 94) reports that the testes are probably permanently scrotal in *N. hispida*, according to Matthews (1941). The specieis's reproductive cycle is polyoestrous with two or more (continuous) cycles per year, a postpartum oestrus and often no anoestrus. Matthews (1941) also noticed that copulation followed shortly after parturition.

In Burkina Faso, Kangoyé *et al.* (2015a: 615) captured females carrying young during the month of September.

From Sierra Leone, Weber *et al.* (2019: 25) reported a lactating female with a young attached on 25 May.

PARASITES:
Protozoa
Kassahun *et al.* (2015: 168) examined one *N. hispida* specimen from Awash-Methara (Ethiopia) and found it infected by *Leishmania major* Friedlin.

ACARI
Trombiulidae: Vercammen-Grandjean and Fain (1958: 30) described *Trombigastia (Trombigastia) nycteris* from *N. hispida hispida* from the Astrida region (=Butare), Rwanda (Stekolnikov, 2018a: 120).

HEMIPTERA
Polyctenidae: *Eoctenes nycteridis* (Horváth, 1910) from Liberia, Congo, Ruanda-Urundi, Tanzania, Uganda and Eritrea (Haeselbarth *et al.*, 1966: 17).

SIPHONAPTERA
Ischnopsyllidae: *Lagaropsylla idea* Smit, 1957, primary host being molossids but recorded from this taxon (Haeselbarth *et al.*, 1966: 190).

VIRUSES:
Coronaviridae - Coronaviruses
SARS-CoV - One fecal sample was tested by Pfefferle *et al.* (2009) in Ghana in February 2008, and this was found to be negative for coronavirus (CoV) RNA.

Hantaviridae (formerly included in Bunyaviridae)
Hantavirus
Weiss *et al.* (2012b: 160) report the presence of a new hantavirus, named Magboi virus [MGBV], in one *N. hispda* specimen collected at the Magboi River, Gola National Park, Sierra Leone. Arai *et al.* (2019: 2) tentatively included this virus in the genus *Loanvirus*.

Paramyxoviridae
Drexler *et al.* (2012a: Suppl. Table S1) indicated that the single specimen they examined from Ghana did not test positive for *Repirovirus, Henipavirus, Morbillivirus, Rubulavirus* or *Pneumovirus*.

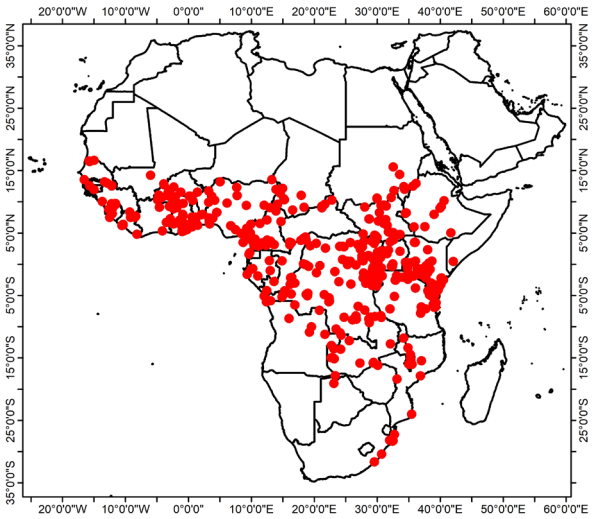

Figure 144. Distribution of *Nycteris hispida*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Angola, Benin, Botswana, Burkina Faso, Burundi, Cameroon, Central African Republic, Chad, Congo, Congo (Democratic Republic of the), Côte d'Ivoire, Equatorial Guinea, Ethiopia, Gabon, Ghana, Guinea, Guinea-Bissau, Kenya, Liberia, Malawi, Mali, Mauritania, Mozambique, Namibia, Nigeria, Rwanda, Senegal, Sierra Leone, Somalia, South Africa, South Sudan, Sudan, Tanzania, The Gambia, Togo, Uganda, Zambia, Zimbabwe.

Nycteris intermedia Aellen, 1959

*1959. *Nycteris intermedia* Aellen, Archs Sci. Genève, 12 (2): 218. Type locality: Côte d'Ivoire: NW of Abidjan: Adiopodoumé [05 19 N 04 08 W, 0 - 30 m] [Goto Description]. Holotype: MHNG 923.094: ad ♀, skull and alcoholic. Collected by: Dr. Villy Aellen; collection date: 20 July 1953; original number: A1437. Paratype: MHNG 923.095: ad ♀, skull and alcoholic. Collected by: Dr. Villy Aellen; collection date: 24 July 1953; original number: A1438. Paratype: MHNG 923.096: ad ♀, skull and alcoholic. Collected by: Dr. Villy Aellen; collection date: 19 August 1953; original number: A1439. Presented/Donated by: ?: Collector Unknown. Paratype: ad ♀; alcoholic and skull; Collector: Villy Aellen; Original number: Collection date:. Paratype: MHNG 923.097: ad ♀, skull and alcoholic. Collected by: Dr. Villy Aellen; collection date: 24 July 1953; original number: A1440. Presented/Donated by: ?: Collector Unknown. - Etymology: Referring to its intermediary size between *Nycteris arge* and *Nycteris nana*. (Current Combination)

TAXONOMY:
Formerly included in *N. arge*, but Van Cakenberghe and De Vree (1985) regard this as a distinct species (Simmons, 2005: 392).

COMMON NAMES:
Czech: rýhonos prostřední. English: Intermediate Slit-faced Bat. French: Nyctère d'Aellen, Nyctère moyen. German: Intermediäre Schlitznasenfledermaus, Intermediäre Schlitznasen-Fledermaus.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, it occurs in some protected areas, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008bh; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2008bh; IUCN, 2009). 2004 - NT ver 3.1 (2001) (Mickleburgh *et al.*, 2004bm; IUCN, 2004). 1996 - LR/nt (Baillie and Groombridge, 1996).

MAJOR THREATS:
The species is threatened in parts of its range by deforestation including loss of roosting trees (Mickleburgh *et al.*, 2008bh; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008bh) [in IUCN (2009)] report that there do not appear to be any direct conservation measures in place, however, the species has been recorded from some protected areas (e.g. Comoe National Park and Tai National Park both in Côte d'Ivoire). Further research is needed into the distribution, natural history and threats to this species.

GENERAL DISTRIBUTION:
Nycteris intermedia is broadly distributed in sub-Saharan Africa, ranging from Liberia in the west, to western Tanzania in the east, with records as far south as northeastern Angola. The species appears to be known from around 27 localities. It is typically a lowland species.

Native: Angola (Van Cakenberghe *et al.*, 1999; Simmons, 2005: 392; Monadjem *et al.*, 2010d: 547); Cameroon; Central African Republic (Lunde *et al.*, 2001: 537); Congo (The Democratic Republic of the); Côte d'Ivoire (Simmons, 2005: 392); Equatorial Guinea; Gabon; Ghana; Guinea (Denys *et al.*, 2013: 282); Liberia (Simmons, 2005: 392); Tanzania (Simmons, 2005: 392).

MOLECULAR BIOLOGY:
Denys *et al.* (2013: 282) report the karyotype for one female from the Guinean Mount Nimba area as: $2n = 34$, NFa = 62, including 15 pairs of large to small metacentric and submetacentric chromosomes and one middle-sized acrocentric pair. The X chromosome is submetacentric.

POPULATION:
Structure and Density - This species appears to be relatively rare. It is usually found as small groups of animals (Mickleburgh *et al.*, 2008bh; IUCN, 2009).
Trend - 2008 - Decreasing (Mickleburgh *et al.*, 2008bh; IUCN, 2009).

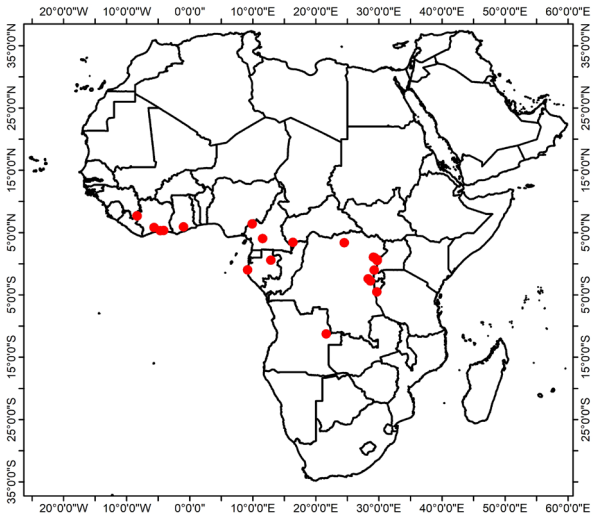

Figure 145. Distribution of *Nycteris intermedia*

DISTRIBUTION BASED ON VOUCHER SPECIMENS: Angola, Cameroon, Central African Republic, Congo (Democratic Republic of the), Côte d'Ivoire, Gabon, Ghana, Guinea, Liberia, Tanzania.

Nycteris macrotis Dobson, 1876

*1876. *Nycteris macrotis* Dobson, Monograph of the Asiatic Chiroptera and catalogue of the species of bats in the collection of the Indian Museum Calcutta, 80. Type locality: Sierra Leone: "Sierra Leone" [Goto Description]. Holotype: BMNH 1866.2.2.2: sad ♂, skull and alcoholic. - Etymology: From the Greeek adjective "*μακρός*" (macròs), meaning "long, large" and the neuter Greek substantive "*οὖς*" (genitive *ώu0964\ός*"; "*ûs*", "*ōtós*"), meaning "ear", although the ear of the species is not of especially outstanding size (see Lanza *et al.*, 2015: 244). (Current Combination)

1878. *Nycteris æthiopica* Dobson, Catalogue of the Chiroptera of the collection of the British Museum, xxxviii, 162, 165, pl. 11, fig. 3. Publication date: June 1878. Type locality: Sudan: Kordofan province: Sennaar [15 35 N 33 38 E, 425 m] [Goto Description]. Holotype: BMNH 1847.5.27.32: ad, skin and skull. Collected by: Theodor Kotschy.

1901. *Nycteris aethiopica aethiopica:* Thomas, Ann. Mag. nat. Hist., ser. 7, 8 (43): 30.

1901. *Nycteris aethiopica luteola* Thomas, Ann. Mag. nat. Hist., ser. 7, 8 (43): 30. Publication date: 1 July 1901. Type locality: Kenya: Kitui [01 22 S 38 01 E, 3 500 ft] [Goto Description]. Holotype: BMNH 1901.5.6.4: ad ♀, skin and skull. Collected by: Dr. Sidney Langford Hinde; collection date: 14 February 1901.

1912. *Petalia aethiopica aethiopica:* K. Andersen, Ann. Mag. nat. Hist., ser. 8, 10 (59): ???.

1912. *Petalia aethiopica luteola:* K. Andersen, Ann. Mag. nat. Hist., ser. 8, 10 (59): ???.

1953. *Nycteris macrotis oriana:* Ellerman, Morrison-Scott and Hayman, Southern African mammals 1758 to 1951, 54. (Name Combination)
1960. *Nycteris macrotis luteola:* Harrison, J. East Afr. Nat. Hist. Soc., 23 (7) (104): 288. Publication date: December 1960. (Name Combination)
1969. *Nycteris macrotis aethiopica:* Kock, Abh. Senckenberg. naturforsch. Ges., 521: 97. (Name Combination)
? *Nycteris aethiopica:* (Alternate Spelling)
? *Nycteris marcrotis oriana:* (Name Combination)

TAXONOMY:
Meester *et al.* (1986) indicate that both Koopman (1965, 1975, 1982) and Kock (1969a) included the extralimital [to southern Africa] *aethiopica* Dobson, 1878, and *luteola* Thomas, 1901, as subspecies in this species. While Hayman and Hill (1971) treat *macrotis* and *aethiopica* as separate species, they confirm that the distinction is by no means certain. *N. macrotis macrotis* Dobson, 1876 may include also *Plecotus aethiopicus* Fitzinger, 1866, from the White Nile, a *nomen nudum* (Kock, 1969a).
Kock (1969a) regards *oriana* as a synonym of the extralimital *luteola*, but Ansell (1978) and Smithers (1983) treat it as a separate subspecies.

Does not include *madagascariensis* Grandidier, 1937 (see Peterson *et al.*, 1995), or *vinsoni* Dalquest, 1965 (see Van Cakenberghe and De Vree, 1999a).

Simmons (2005: 393) recognises three subspecies - *aethiopica* Dobson, 1878; *luteola* Thomas, 1901; and *oriana* Kershaw, 1922.

COMMON NAMES:
Afrikaans: Groter spleetneusvlermuis. Chinese: 大耳凹脸蝠. Czech: rýhonos velkouchý, nykteris velkouchá. English: Large-eared Slit-faced Bat, Greater Slit-faced Bat, Big-eared slit-faced bat. French: Nyctère de Dobson, Nyctère à grandes oreilles. German: Großohrige Schlitznasen-Fledermaus. Italian: Nitterìde di Dòbson; Nicterìde di Dobsòn.

ETYMOLOGY OF COMMON NAME:
Although the specific name *macrotis* is derived from the Greek "*makros*" and "*otis*" meaning large eared, the species' ears are in fact smaller than in species such as the Egyptian slit-faced bat (*N. thebaica*) (see Taylor, 2005).

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008aa; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2008aa; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2004at; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
In general, there are no major threats to this species. In parts of its range it is threatened by general habitat loss, presumably mostly through the conversion of land to agricultural use (Mickleburgh *et al.*, 2008aa; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008aa) [in IUCN (2009)] report that in view of the species wide range it is presumably present in some protected areas. No direct conservation measures are currently needed for this species as a whole.

GENERAL DISTRIBUTION:
Nycteris macrotis is a widespread African species which ranges from Senegal in the west, to Somalia in the east, being recorded as far south as northern Botswana. Found on the island of Zanzibar (Simmons, 2005: 392). It has been recorded between sea level and 2,200 m asl.

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 1,466,326 km^2.

Native: Angola (Hayman, 1963; Van Cakenberghe and De Vree, 1985; Crawford-Cabral, 1989; Monadjem *et al.*, 2010d: 547); Benin (Capo-Chichi

et al., 2004: 162); Botswana (Monadjem *et al.*, 2010d: 547); Burkina Faso (Kangoyé *et al.*, 2015a: 616); Burundi; Cameroon; Central African Republic; Chad; Congo (Bates *et al.*, 2013: 336); Congo (The Democratic Republic of the) (Hayman *et al.*, 1966; Gallagher and Harrison, 1977; Van Cakenberghe and De Vree, 1985; Dowsett *et al.*, 1991: 259; Monadjem *et al.*, 2010d: 547); Côte d'Ivoire; Equatorial Guinea; Ethiopia (Simmons, 2005: 392); Gabon; Gambia (Emms and Barnett, 2005: 50; Simmons, 2005: 392); Ghana; Guinea; Guinea-Bissau (Seabra, 1900a; Monard, 1939; Rainho and Ranco, 2001: 44); Kenya; Liberia (Fahr, 2007a: 103); Malawi (Happold *et al.*, 1988; Van Cakenberghe and De Vree, 1985; Simmons, 2005: 392; Monadjem *et al.*, 2010d: 548); Mali (Meinig, 2000: 105); Mauritania (1st record: Benda *et al.*, 2011a: 267); Mozambique (Lopes and Crawford-Cabral, 1992; Simmons, 2005: 392; Monadjem *et al.*, 2010d: 548; Monadjem *et al.*, 2010c: 381); Niger; Nigeria; Rwanda; Senegal (Simmons, 2005: 392); Sierra Leone; Somalia; Sudan; Tanzania (including the island of Unguja [O'Brien, 2011: 289]); Togo; Uganda (Kityo and Kerbis, 1996: 60); Zambia (Ansell, 1967; Ansell, 1973; Ansell, 1978; Cotterill, 2002b: 6; Monadjem *et al.*, 2010d: 548); Zimbabwe (Simmons, 2005: 392; Monadjem *et al.*, 2010d: 548).

Presence uncertain: Namibia (Cotterill, 2004a: 261).

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Fain (1953b: 102) reported on the exceptional yellowish-orange colour of some specimens from a cave near the Nyumba Mission (Rwanda). Other specimens from the save cave were uniformly orange or somewhat darker, or yellowish-brown with a few grey hairs, brownish-grey with orange-yellowish hairs, and brownish-grey with a pale belly without any yellowish or orange hairs. These colour differences were not found to be linked with either the sexe or the age of the specimens

DETAILED MORPHOLOGY:
Baculum - The baculum ranges from 3.84 to 5.12 mm in length, the shaft is long, parallel-sided and usually straight, thickening towards the base, the base has two basal lobes of varying development, in lateral view it is sometimes angled ventrally, while the tip is expanded and trifid with three variably developed processes (Thomas *et al.*, 1994: 21).

Brain - Based on specimens from Bénin, Amrein *et al.* (2007) reported that proliferating cells, detected with Ki-67 and MCM2, in the subgranular layer of the dentate gyrus was found to be absent. Amrein *et al.* (2007) also reported moderate to ample proliferating cells (Ki-67 positive cells) and migrating young neurons (DCX positive cells) in the rostral migratory stream. Furthermore, Amrein *et al.* (2007) detected few DCX positive cells in the rostral migratory stream and the olfactory bulb. No NeuroD was detected in the hippocampal granule cells (Amrein *et al.*, 2007).

Femur - Louzada *et al.* (2019: 136) provided a detailed description of the femur, which has a well-developed medial ridge that begins on the shaft of the femur, a short and well-developed lateral ridge, and
well-developed trochanters. The latter nearly reach the same level proximally. The femur is greatly sinusoidal and the torsion of the proximal epiphysis is the most conspicuous of all the bat families they examined.

MOLECULAR BIOLOGY:
DNA - Unknown.
Karyotype - There is no published male of this species (only a female), and so Lee *et al.* (1989) described the karyotype as having a diploid number of 2*n* = 40, aFN = 74, BA = 36, X = M, and suggested that the Y chromosome might be a small metacentric as in the other *Nycteris* species.
Protein / allozyme - Unknown.

HABITAT:
Monadjem *et al.* (2016y: 367) reported one specimen from the Mount Nimba area, which was recorded from a disturbed habitat close to a settlement at 500 m.

ROOST:
In the Parc National du 'W' in Niger Republic, 300 km west of Sokoto, they have been found roosting in thatched huts and others were found in abandoned mine shafts (Poché, 1975).
Stanley *et al.* (2007c: 60) refer to Koopman (1975), who mentions that *N. macrotis* is known to roost in burrows in the ground made by aardvarks (*Orycteropus afer*) or porcupines (*Hystrix cristata*).
Weber and Fahr (2006: 4) indicate that *N. macrotis* largely or exclusively depends on the availability of caves as day roosts in Guinea.

POPULATION:
Structure and Density - In the Parc National du 'W' in Niger Republic, 300 km west of Sokoto, they have been found roosting in groups of 10-20 individuals (Poché, 1975). Happold (1987) notes that they are solitary or live in small groups.
Trend - 2008 - Unknown (Mickleburgh *et al.*, 2008aa; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
Krutzsch (2000: 115) indicates that most nycterid species (including *N. aethiopica* = *N. macrotis*) are polyoestrous with two or more (continuous) cycles

per year, a postpartum oestrus and often no anoestrus. In the DRC and Rwanda, Anciaux de Faveaux (1978c) reported copulations in August and October.

Matthews (1937) [in Krutzsch (2000: 115)] noted that male *N. luteola* [= *N. macrotis*] collected at the time of post partum oestrus were reproductively functional. For the same "species", Martin and Bernard (2000: 32) reported that the corpus luteum is only present for the first half of pregnancy. Krutzsch (2000: 94) furthermore reports that the testes are probably permanently scrotal.

PARASITES:

HAEMOSPORIDA

Schaer *et al.* (2015: 381) found *Nycteria* sp. parasites in *N. macrotis* from South Sudan.

HEMIPTERA

Polyctenidae: *Eoctenes nycteridis* (Horváth, 1910) from Liberia, Congo, Ruanda-Urundi, Tanzania, Uganda and Eritrea (Haeselbarth *et al.*, 1966: 17).

ACARI

Trombiculidae: Stekolnikov (2018b: 280) examined one larva of *Trombigastia nycteris* Vercammen-Grandjean and Fain, 1958, which was collected from an unknown locality in Rwanda (the slide label refers to "Ada", which might refer to "Astrida" [=Butare]). Stekolnikov (2018a: 162; 2018b: 284) also reported on three larvae of *Microtrombicula nycteris* (Jadin, Vercammen-Grandjean and Fain, 1955), collected in Butare.

DIPTERA

Streblidae: *Raymondi alulata* Speiser, 1908 from Angola, the Congo, Malawi and Somalia (Haeselbarth *et al.*, 1966: 102). *Raymondia scopigera* Jobling, 1954 in Cameroon (Haeselbarth *et al.*, 1966: 103, host referred to *N. aethiopica*), Senegal and Sierra Leone (Shapiro *et al.*, 2016: 255).

VIRUSES:

Flaviviridae

In Uganda, Kading *et al.* (2018: 3) found neutralizing antibodies against non-specific Flaviviruses.

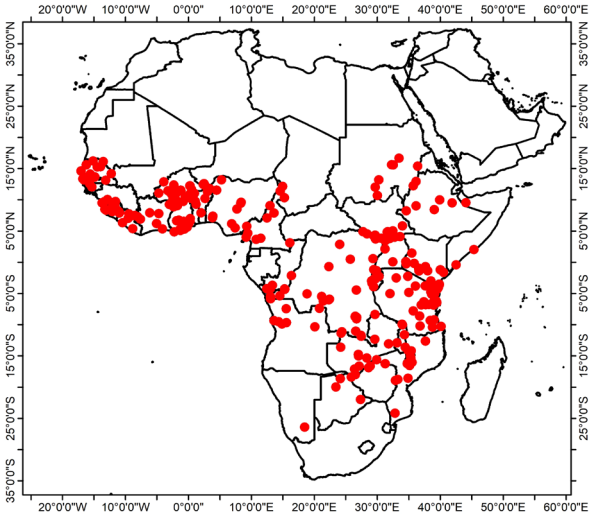

Figure 146. Distribution of *Nycteris macrotis*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:

"Africa", Angola, Benin, Botswana, Burkina Faso, Burundi, Cameroon, Central African Republic, Chad, Congo, Congo (Democratic Republic of the), Côte d'Ivoire, Ethiopia, Ghana, Guinea, Guinea-Bissau, Kenya, Liberia, Malawi, Mali, Mauritania, Mozambique, Namibia, Niger, Nigeria, Rwanda, Senegal, Sierra Leone, Somalia, South Sudan, Sudan, Tanzania, The Gambia, Togo, Uganda, Zambia, Zimbabwe.

Nycteris madagascariensis G. Grandidier, 1937

*1937. *Nycteris madagascariensis* G. Grandidier, Bull. Mus. natn. Hist. nat., Paris, sér. 2, 9: 353. Publication date: November 1937. Type locality: Madagascar: N of Diego-Suarez [=Antsiranana]: Rodo valley, N of Pirkana: Ankarana, near the [12 05 S 49 05 E] [Goto Description]. Holotype: MCZ 45433: ♀, skull and alcoholic. Collection date: June 1910. Formerly Grandidier collection; see Helgen and McFadden (2001: 142). Paratype: MCZ 45434: ad ♀, skull and alcoholic. Formerly Grandidier collection; see Helgen and McFadden (2001: 142). - Etymology: Referring to the island of Madagascar, where the species occurs. (Current Combination)

TAXONOMY:

Earlier included in *thebaica*, but considered a synonym of *macrotis* by Van Cakenberghe and De Vree (1985), Koopman (1993a: 162), but a valid species by Peterson *et al.* (1995: 63), Russ *et al.* (2001), Simmons (2005: 393).

macrotis species group (see Van Cakenberghe and De Vree, 1985).

COMMON NAMES:

Czech: rýhonos madagaskarský. English: Madagascar Slit-faced Bat. French: Nyctère de Madagascar, Chauve-souris malgache balafrée.

German: Madagassische Schlitznasen-Fledermaus.

CONSERVATION STATUS:
Global - This species is listed as Data Deficient (DD ver 3.1 (2001)), as it is only known from two specimens from 1910 in the Irodo River Valley and has not been recorded since. Further extensive surveys are needed for this species, as well as knowledge on its distribution, biology, ecology, and any threats affecting it (Hutson *et al.*, 2008q; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) (Hutson *et al.*, 2008q; IUCN, 2009). 2000 - DD ver 2.3 (1994).

MAJOR THREATS:
The threats to this species are not known (Hutson *et al.*, 2008q; IUCN, 2009).

CONSERVATION ACTIONS:
Hutson *et al.* (2008q) [in IUCN (2009)] report that it is not known if the species is present in any protected areas. Further studies are needed into the distribution, abundance, natural history and threats to this species.

GENERAL DISTRIBUTION:
Nycteris madagascariensis is endemic to Madagascar where it is known only from two specimens caught in northern Madagascar near Analamera in the Irodo River Valley in 1910 (Peterson *et al.*, 1995).

Native: Madagascar (Peterson *et al.*, 1995; Simmons, 2005: 393).

POPULATION:
Structure and Density - It is known only from two specimens and has not been recorded since 1910 (Hutson *et al.*, 2008q; IUCN, 2009).
Trend - 2008 - Unknown (Hutson *et al.*, 2008q; IUCN, 2009).

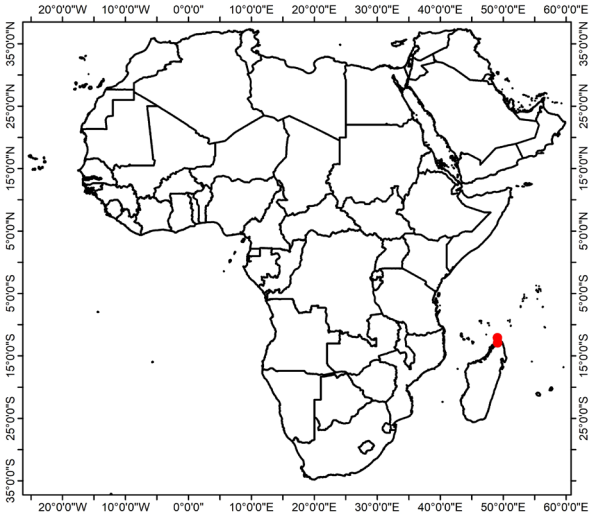

Figure 147. Distribution of *Nycteris madagascariensis*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Madagascar.

Nycteris major (K. Andersen, 1912)

*1912. *Petalia major* K. Andersen, Ann. Mag. nat. Hist., ser. 8, 10 (59): 547. Publication date: 1 November 1912. Type locality: Cameroon: Ja River [ca. 03 00 N 13 00 E] [Goto Description]. Holotype: BMNH 1909.10.2.49: ad ♀, skull and alcoholic. Collected by: George Latimer Bates Esq. Collection date: 23 January 1906. - Etymology: From the Latin "*maior*" (see Kozhurina, 2002: 16).

1917. *Nycteris avakubia* J.A. Allen, Bull. Am. Mus. Nat. Hist., 37 (18): 426, fig. 3. Publication date: 29 September 1917. Type locality: Congo (Democratic Republic of the): Oriental province: Avakubi [01 18 N 27 32 E] [Goto Description]. Holotype: AMNH 49403: ad ♂, skull and alcoholic. Collected by: Herbert Lang, James Paul Chapin and The American Museum Congo Expedition; collection date: September 1913; original number: 2623.

1917. *Nycteris major:* J.A. Allen, Bull. Am. Mus. Nat. Hist., 37 (18): 427. Publication date: 29 September 1917. - Comments: The specimens assigned to this species by Allen (1917), however, belong to *Nycteris macrotis* (see Koopman, 1965). (Name Combination, Current Combination)

TAXONOMY:
Includes *avakubia* J.A. Allen, 1917 (see Koopman, 1965; Van Cakenberghe and De Vree, 1985; Simmons, 2005: 393).

arge species group (Van Cakenberghe and De Vree, 1985; Simmons, 2005: 393).

COMMON NAMES:
Czech: rýhonos kamerunský. English: Ja Slit-faced Bat, Dja Slit-faced Bat; Large Slit-faced Bat. French: Nyctère de Ja. German: Dja-Schlitznasenfledermaus, Dja Schlitznasen-Fledermaus.

SIMILAR SPECIES:
Eisentraut (1956b: 517) indicated that the claws of *N. major* are more robust than those of *N. arge*.

CONSERVATION STATUS:
Global - Listed as Data Deficient (DD ver 3.1 (2001)) in view of the absence of recent information on its extent of occurrence in Central Africa, natural history, and threats. If the species is found to range more widely in Central Africa it is likely to meet the criteria for Least Concern, as the extent and quality of its habitat are probably not declining at a rate sufficient to justify listing in a higher category (Mickleburgh *et al.*, 2008bi; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) (Mickleburgh *et al.*, 2008bi; IUCN, 2009). 2004 - VU A4c ver 3.1 (2001) (Mickleburgh *et al.*, 2004cg; IUCN, 2004). 1996 - VU (Baillie and Groombridge, 1996).

MAJOR THREATS:
The species appears to need rather large trees, and is presumably threatened by deforestation resulting from logging activities and the conversion of forest to agricultural use (Mickleburgh *et al.*, 2008bi; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008bi) [in IUCN (2009)] report that although there appear to be no direct conservation measures in place, it has been recorded from the Tai National Park in Côte d'Ivoire. Further studies are needed into the distribution, natural history and threats to this somewhat enigmatic species. There is a need to monitor to presence of this species at its known localities.

GENERAL DISTRIBUTION:
Nycteris major is distributed in West and Central Africa, where it has been patchily recorded from Guinea, Liberia (at Voinjama) and Côte d'Ivoire in the west, and from Cameroon and the Democratic Republic of the Congo in Central Africa (at Avakubi), with the southern-most record from northern Zambia (close to the border with the Democratic Republic of the Congo).

Native: Benin (Capo-Chichi *et al.*, 2004: 162); Cameroon (Simmons, 2005: 393); Central African Republic; Congo (The Democratic Republic of the) (Simmons, 2005: 393); Côte d'Ivoire (Simmons, 2005: 393); Guinea; Liberia (Simmons, 2005: 393); Zambia (Van Cakenberghe and De Vree, 1985; Simmons, 2005: 393; Monadjem *et al.*, 2010d: 548).

PREDATORS:
Demeler (1981: 133) found remains of *N. major* in pellets of *Bubo africanus* in the Yankari Game Reserve (Nigeria). However, as *N. macrotis* was often mis-identified as *N. major* and the latter species was not yet reported from that area, the bat's identification still needs to be confirmed.

POPULATION:
Structure and Density - This appears to be an extremely rare species, which is only known from a dozen or so specimens. It is not difficult to catch and efforts have been made to locate more specimens (Mickleburgh *et al.*, 2008bi; IUCN, 2009).
Trend - 2008 - Unknown (Mickleburgh *et al.*, 2008bi; IUCN, 2009).

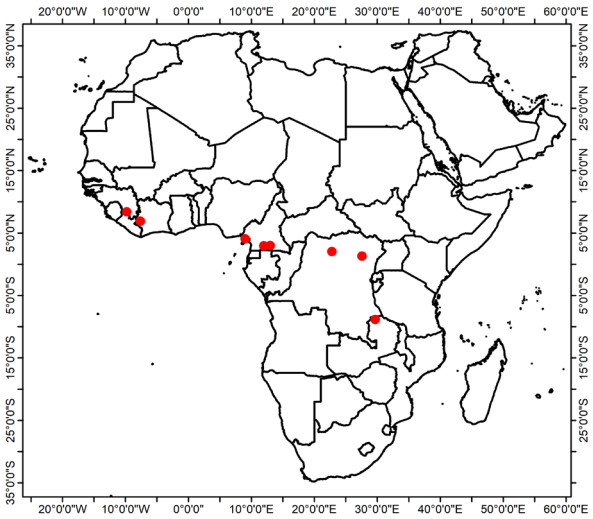

Figure 148. Distribution of *Nycteris major*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Cameroon, Congo (Democratic Republic of the), Côte d'Ivoire, Liberia, Zambia.

Nycteris nana (K. Andersen, 1912)

*1912. *Petalia nana* K. Andersen, Ann. Mag. nat. Hist., ser. 8, 10 (59): 547. Publication date: 1 November 1912. Type locality: Congo: [Rio Muni ?] Benito River [ca. 01 31 N 09 52 E] [Goto Description]. Holotype: BMNH 1900.2.5.46: ad ♂, skull and alcoholic. Collected by: George Latimer Bates Esq.

1926. *Nycteris nana:* Cabrera and Ruxton, Ann. Mag. nat. Hist., ser. 9, 17: xxx. (Name Combination, Current Combination)

1936. *Nycteris nana tristis* G.M. Allen and Lawrence, Bull. Mus. comp. Zool., 79 (3): 47. Publication date: 30 January 1936. Type locality: Kenya: W Nyanza: Kakamega district: Kaimosi [00 08 N 34 51 E, 2 130 m] [Goto Description]. Holotype: MCZ 31156: ad ♀, skin and skull. Collected by: Professor Arthur Loveridge; collection date: 13 February 1934. See Helgen and McFadden (2001: 142). (Name Combination)
1939. *Nycteris nana nana:* G.M. Allen, Bull. Mus. comp. Zool., 83: 70. (Name Combination)

TAXONOMY:
Includes *tristis* Allen and Lawrence, 1936 (Koopman, 1975; Van Cakenberghe and De Vree, 1985; Simmons, 2005: 393).

arge species group (Van Cakenberghe and De Vree, 1985; Simmons, 2005: 393).

COMMON NAMES:
Chinese: 侏凹脸蝠. Czech: rýhonos drobný. English: Dwarf Slit-faced Bat. French: Nyctère naine. German: Kleinste Schlitznasen-Fledermaus, Zwerg-Schlitznasenfledermaus.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008bj; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2008bj; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2004cc; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
The threats to this species are poorly known, but it seems likely to be locally threatened by deforestation in parts of its range (Mickleburgh *et al.*, 2008bj; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008bj) [in IUCN (2009)] report that it is not known if the species is present within any protected areas. Further studies are needed into the distribution, general ecology and threats to this species.

GENERAL DISTRIBUTION:
Nycteris nana has been widely recorded in West and Central Africa, with some records from East Africa. It ranges from Côte d'Ivoire and Ghana in the west, through south Cameroon and Equatorial Guinea (Rio Muni), to the Democratic Republic of the Congo, Rwanda and Burundi, to Uganda and western Kenya. It ranges as far south as northern Angola. Generally, a lowland species, but can be found up to 2,100 m asl.

A record from Tanzania, represents *intermedia* (J. Fahr *pers. comm.* in Simmons, 2005: 393).

Native: Angola (Crawford-Cabral, 1989; Simmons, 2005: 393; Monadjem *et al.*, 2010d: 548); Cameroon; Central African Republic; Congo (The Democratic Republic of the) (Van Cakenberghe and De Vree, 1985; Monadjem *et al.*, 2010d: 548); Côte d'Ivoire (Simmons, 2005: 393); Equatorial Guinea (Simmons, 2005: 393); Ghana; Kenya (Simmons, 2005: 393); Rwanda; Sudan (Simmons, 2005: 393); Togo; Uganda.

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Verschuren (1955) reported on an albino specimen caught in a hollow tree in the DRC.

DETAILED MORPHOLOGY:
Baculum - The baculum ranges from 2.10 to 3.36 mm in length, smaller than that of *N. arge*, the shaft is slender, parallel-sided and essentially straight, the base is expanded and rounded and in lateral profile is often angled ventrally, while the tip is simple, with only a small expansion (Thomas *et al.*, 1994: 20).

POPULATION:
Structure and Density - It is considered to be a rather rare bat, colony sizes tend to be small (Mickleburgh *et al.*, 2008bj; IUCN, 2009).
Trend - 2008 - Unknown (Mickleburgh *et al.*, 2008bj; IUCN, 2009).

PARASITES:
HAEMOSPORIDA
Schaer *et al.* (2015: 381) found *Nycteria* cf. *houini* in *N. nana* from South Sudan. Landau *et al.* (2012: 142) and Perkins and Schaer (2016: Suppl.) mentioned the parasite as *Nycterida houini* Rosin, Landau and Hugot, 1978, and also reported it from the Republic of Congo and Gabon.

VIRUSES:
Reoviridae
Orbivirus
Fomede virus - reported in the CDC's Arbovirus Catalogue, to have been isolated in 1978 from the Republic of Guinea, from the brain and internal organs of *N.* cf. *nana*. Reported by de Jong *et al.* (2011: 11).

Chobar Gorge virus was mentioned by Luis *et al.* (2013: Suppl.) and Willoughby *et al.* (2017: Suppl.).

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Angola, Burundi, Cameroon, Central African Republic, Congo (Democratic Republic of the), Côte d'Ivoire, Equatorial Guinea, Gabon, Ghana, Kenya, South Sudan, Uganda.

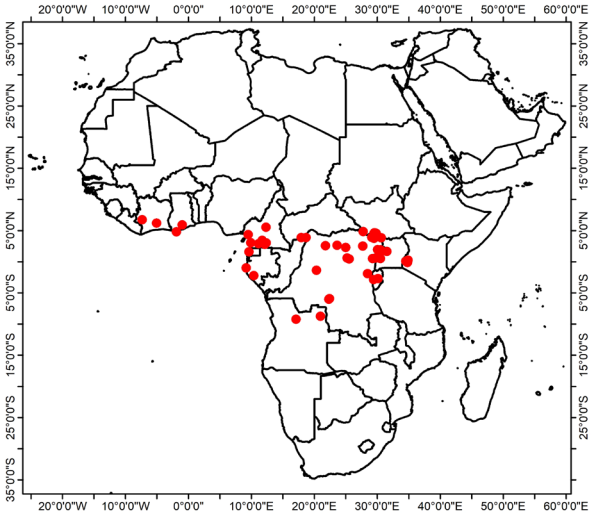

Figure 149. Distribution of *Nycteris nana*

Nycteris parisii (de Beaux, 1924)

*1924. *Petalia parisii* de Beaux, Atti Soc. ital. Sci. nat., 62: 254 (for 1923). Publication date: February 1924. Type locality: Somalia: Balli [=Ballei Uen] [00 42 N 43 04 E] [Goto Description]. Holotype: [Unknown] N 1449: ♀, skull and alcoholic. Collection date: 6 April 1922. See De Beaux (1924: 254), Allen (1939a: 70). - Etymology: In honour of Dr. Bruno Parisi, former head of the zoological section (1921 - 1927) and director (1928 - 1951) of the Museo Civico di Storia Naturale di Milano (see De Beaux, 1924: 255; Lanza *et al.*, 2015: 250).

1930. *Nycteris parisii:* Zammarano, Le colonie Italiane, ???. (Name Combination, Current Combination)

1952. *Nycteris benuensis* Aellen, Mém. Soc. neuchât. Sci. nat., 8: 53. Type locality: Cameroon: Rei Bouba [ca. 08 37 N 14 09 E] [Goto Description].

1971. *N[ycteris] p[arisii] benuensis:* Hayman and Hill, Mammals of Africa: Chiroptera, 18. (Name Combination)

1971. *N[ycteris] p[arisii] parisii:* Hayman and Hill, Mammals of Africa: Chiroptera, 18. (Name Combination)

2015. *[Nycteris] parissi:* Kaipf, Rudolphi and Meinig, NABU - Biodiversity Assessment in Kafa, Ethiopia, 13. (Lapsus)

TAXONOMY:
Included in *woodi* by Van Cakenberghe and De Vree (1985), Koopman (1993a: 162). Thomas *et al.* (1994: 22) elevated it to species rank (Simmons, 2005: 393).

Rosevear (1965: 173) included *N. parisii* in the *aethiopica* group. Included in the *macrotis* group (Simmons (2005: 393) based on Thomas *et al.* (1994: 22) being closely related to *N. macrotis*.

Simmons (2005: 393) recognises one subspecies *benuensis* Aellen, 1952.

COMMON NAMES:
Czech: rýhonos somálský. English: Parisi's Slit-faced Bat, Balli Slit-faced Bat, Parissi's Slit-faced Bat. French: Nyctère de Parisi. German: Parisis Schlitznasen-Fledermaus. Italian: Nitterìde di Parìsi, Nicterìde di Parìsi.

CONSERVATION STATUS:
Global - Listed as Data Deficient (DD ver 3.1 (2001)) in view of the absence of recent information on its extent of occurrence, ecological requirements, threats and conservation status (Mickleburgh *et al.*, 2008ap; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) (Mickleburgh *et al.*, 2008ap; IUCN, 2009). 2004 - DD ver 3.1 (2001) (Mickleburgh *et al.*, 2004bf; IUCN, 2004).

MAJOR THREATS:
The threats to this species are not known (Mickleburgh *et al.*, 2008ap; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008ap) [in IUCN (2009)] report that it is not known if the species is present within

any protected areas. Further studies are needed into the distribution, abundance, general ecology and threats to this species.

GENERAL DISTRIBUTION:
Nycteris parisii has been recorded from southern Somalia, south Ethiopia and from northern Cameroon, close the border with Nigeria. It is a low elevation species.

Nycteris parisii parisii may be distributed in East Africa and *N. p. benuensis* in West Africa.

Native: Cameroon (Aellen, 1952; Simmons, 2005: 393); Ethiopia (Hill, 1975; Simmons, 2005: 393); Somalia (Varty and Hill, 1988; Simmons, 2005: 393); Togo? (Amori *et al.*, 2016: 217).

DETAILED MORPHOLOGY:
Baculum - The shaft is long, parallel-sided and essentially straight, thickening towards the base, the base is expanded, in lateral profile it is angled ventrally, while the tip is expanded and trifid with three variably developed processes (Thomas *et al.*, 1994: 21).

POPULATION:
Structure and Density - The abundance of this species is not known, and only a few specimens have ever been collected. It was last recorded in the 1980s. Presumably this is a consequence of limited survey effort within the species known range (Mickleburgh *et al.*, 2008ap; IUCN, 2009).
Trend - 2008 - Unknown (Mickleburgh *et al.*, 2008ap; IUCN, 2009).

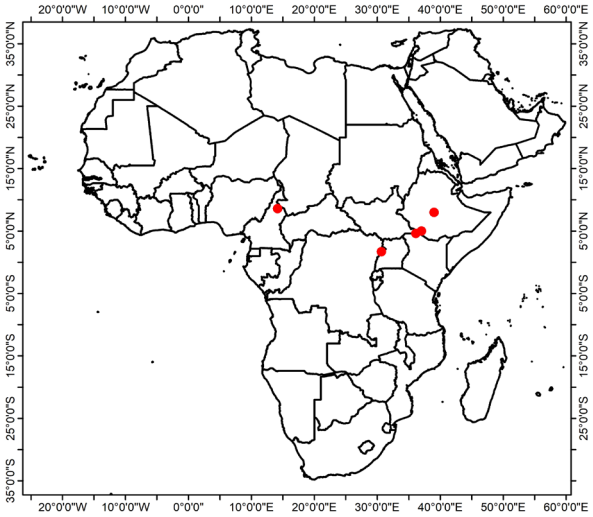

Figure 150. Distribution of *Nycteris parisii*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Cameroon, Congo (Democratic Republic of the), Ethiopia, Somalia.

Nycteris thebaica E. Geoffroy St.-Hilaire, 1818

*1818. *Nycteris Thebaicus* E. Geoffroy Saint-Hilaire, Description des Mammifères qui se trouve en Egypte, 2: 119, pl. 1, No 2. Publication date: 1818. Type locality: Egypt: Qena province: Thebes (near Luxor) [ca.25 41 N 32 39 E] [Goto Description]. Holotype: MNHN 889: ad ♀, skin only. Collected by: Etienne Geoffroy-Saint-Hilaire. Number 172 in Rode (1941: 235), who also mentioned number MNHN 142. - Etymology: From the masculine Latin adjective *thebàicus*, meaning "native or belonging to Thebes", the ancient capital of Upper Egypt, on the site of modern Luxor, the type locality of the species (see Lanza *et al.*, 2015: 254). (Current Combination)

1820. *Nycteris Geoffroyi* Desmarest, Encyclopédie Méthodique, (Zoologie, Mammalogie), 1: 127. Publication date: 1820. Type locality: Senegal: 40 mi (= 60 km) east of Podor [Goto Description]. - Comments: Included in *macrotis* by Kock (1969a: 93) [although with a question mark] and Meester *et al.* (1986: 35).

1829. *Nycteris affinis* A. Smith, Zool. Journ., 4 (16): 434. Publication date: May 1829. Type locality: South Africa: E Cape province: Grahamstown [33 17 S 26 31 E] [Goto Description]. - Comments: Type locality originally as "South Africa", restricted to "Grahamstown, eastern Cape Province, South Africa" by Roberts (1951: 69): see Kock (1969a: 98), Meester *et al.* (1986: 35), Gray *et al.* (1999: 2).

1829. *Nycteris Capensis* A. Smith, Zool. Journ., 4 (16): 434. Publication date: May 1829. Type locality: South Africa: SW Cape province: Swellidam [34 01 S 20 26 E] [Goto Description]. Lectotype: BMNH 1863.2.21.6: ad ♂, skin only. Collected by: A. Smith. Paralectotype: RMNH MAM.J1888-171b: ad, skin and skull. Collected by: Prof. Wilhelm Carl Hartwig Peters. - Comments: The type locality was originally mentioned as "Interior of South Africa, as well as upon the Eastern Coase", and restricted to "Swellidam, SW Cape Province, South Africa" by Roberts (1951: 69): see Kock (1969a: 98), Meester *et al.* (1986: 35), Gray *et al.* (1999: 2). Ansell and Dowsett (1988: 31) mention the locality as "Swellendam"). Considered a valid subspecies by Taylor (1998: 33).

1834. *Nycteris thebaica:* A. Smith, S. Afr. Quart. J., 2: 59. (Current Spelling)

1840. *N[ycteris] albiventer* Wagner, in: Schreber, Die Säugethiere in Abbildungen nach der Natur mit Beschreibungen, Suppl. 1: 439. Type locality: Sudan: Northern province: Dongola [19 10 N 30 27 E] [Goto Description]. - Comments: Type locality originally given as "Nubia" (see Kock, 1969a: 98), restricted to Dongola, Northern Province, Sudan by Koopman (1975): see Gray *et al.* (1999: 2).

1840. *N[ycteris] discolor* Wagner, in: Schreber, Die Säugethiere in Abbildungen nach der Natur mit Beschreibungen, Suppl. 1: 440. Type locality: South Africa: Ecklon [Goto Description]. - Comments: Allen (1939a: 68) mentioned the type locality as "Südspitze von Afrika". Kock (1969a: 98), Meester *et al.* (1986: 35) mention "Southern tip of Africa; Knysna, fide Roberts (1951: 69).").

1852. *Nycteris fuliginosa* Peters, Naturwissenschaftliche Reise nach Mossambique, Zoologie, Säugethiere, 46, pl. 10. Publication date: 1852. Type locality: Mozambique: 12 mi (19 km) NW Quellimane: Boror [17 53 S 36 51 E] [Goto Description]. Syntype: BMNH 1858.6.18.15: ad ♀. See Turni and Kock (2008: 27). Syntype: BMNH 1907.1.1.337: ad ♀, skull and alcoholic. Collected by: Prof. Wilhelm Carl Hartwig Peters. See Turni and Kock (2008: 27). Syntype: ZMB 392: ad ♂, skin and skull. Collected by: Prof. Wilhelm Carl Hartwig Peters; collection date: March 1846. See Turni and Kock (2008: 27). Syntype: ZMB 3954: ad ♂, skull and alcoholic. Collected by: Prof. Wilhelm Carl Hartwig Peters; collection date: March 1846. See Turni and Kock (2008: 27). Syntype: ZMB 562: ad ♀, skull and alcoholic. Collected by: Prof. Wilhelm Carl Hartwig Peters; collection date: March 1846. See Turni and Kock (2008: 27). - Comments: Turni and Kock (2008: 27) refer to Jentink (1888b: 171) in mentioning an additional syntype, which is possibly in the RMNH.

1861. *Nycteris labiata* Heuglin, Nov. Act. Acad. Cæs. Leop.-Carol., 29 (8): 4, 5. Publication date: 1861. Type locality: Eritrea: Bogos: Cheren [=Keren] [ca. 15 45 N 38 20 E] [Goto Description]. Syntype: SMNS 980a: ad ♂, alcoholic (skull not removed). Collected by: Martin Theodor von Heuglin; collection date: 1861. Presented/Donated by: ?: Collector Unknown. See Dieterlen *et al.* (2013: 294). Syntype: SMNS 980b: sad ♂, alcoholic (skull not removed). Collected by: Martin Theodor von Heuglin; collection date: 1861. Presented/Donated by: ?: Collector Unknown. See: Dieterlen *et al.* (2013: 294). Syntype: ZMB 2794a: ♂. Collected by: Martin Theodor von Heuglin; collection date: 1852. Formerly SMNS, see Turni and Kock (2008). Syntype: ZMB 2794b: ♂. Collected by: Martin Theodor von Heuglin; collection date: 1852. Syntype ex SMNS, see Turni and Kock (2008: 27). Paralectotype: RMNH MAM.27231: ad, skin and skull. Collected by: Martin Theodor von Heuglin; collection date: November 1861. See Turni and Kock (2008: 27). Turni (pers. comm., 12.04.2007) indicates that this specimen is possibly a syntype, but its collecting date (November 1861) is very close to the publication date. Turni and Kock (2008: 27) mention three additional syntypes: SMNS 980a-b, and one presumably in the RMNH (for the latter, they refer to Jentink, 1888b: 171).

1866. *Plecotus æthiopicus* Heuglin and Fitzinger, Sber. k. Akad. Wiss. Wien, math. naturw. Kl., 54 (1) 10: 546. Type locality: Sudan: Bahr el Abiat (White Nile) [ca. 14 00 N 33 00 E] [Goto Description]. - Comments: Meester *et al.* (1986: 35) mention Fitzinger only as author. Nomen nudum (see Allen, 1939a: 68). Included in *macrotis* by Kock (1969a: 93), but rejected as nomen nudum.

1868. *Nycteris Geoffroyi Var. Senegalensis* Hartmann, Z. Gesel. f. Erdk., 3 (28/29): 44. Type locality: Sudan: Sennaar [15 35 N 33 38 E, 425 m] [Goto Description].

1871. *Nycteris angolensis* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, 903 , fig. 5 (for 1870). Type locality: Angola: Biballe and Rio Coroca: Caconda [13 42 S 15 05 E, 1 900 m] [Goto Description]. Syntype: BMNH 1879.1.21.2:. Syntype: ZMB 3633: juv ♂, skull and alcoholic. From Rio Corvea, Angola; ex Lisbon Museum; see Turni and Kock (2008). Syntype: ZMB 3637: ♂, skull and alcoholic. Collected by: José Alberto de Oliveira Anchieta. Ex Lisbon Museum; this specimen was collected at Caconda, Biballe (see Turni and Kock (2008)). Peters (1871: 904) mentions Anchieta as collector for the type specimen. - Comments: Type locality restricted by Hill and Carter (1941): see Gray *et al.* (1999: 2). The publication covers a meeting held on 22 December 1870.

1871. *Nycteris damarensis* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, 905, fig. 7 (for 1870). Type locality: Namibia: Damaraland: Otjimbingue [22 15 S 16 10 E] [Goto Description]. Syntype: BMNH 1838.2.8.4: ad, skin and skull. Collected by: Captain Alexander; original number: 1079. Presented/Donated by: ?: Collector Unknown. Syntype: NRM. See Turni and Kock (2008: 27). Syntype: ZMB 3298: ♂, skull and alcoholic. Collected by: Missionary Hahn. See Turni and Kock (2008: 27). Syntype: ZMB 3887: ad ♂, skull and alcoholic.

Collected by: Higgins. See Turni and Kock (2008: 27) [missing]. - Comments: Part of the original series is in the NRM (see Turni and Kock (2008: 27). The publication covers a meeting held on 22 December 1870. Peters (1871: 905) also mentions that the name *damarensis* was already used in the British Museum and in the Catalogue of Mammalia from 1843.

1881. *Nycteris Revoilii* Robin, Bull. Soc. Philom. Paris, (7) 5: 90. Type locality: Somalia: north of 10 ° N [Goto Description]. Holotype: MNHN ZM-MO-1881-4 (174): ad ♂, alcoholic (skull not removed). Collected by: Revoil. Presented/Donated by: ?: Collector Unknown. Paratype: MNHN ZM-MO-1881-1 (174a): ad ♂, alcoholic (skull not removed). Collected by: Revoil. Number 174a in Rode (1941: 236). Paratype: MNHN ZM-MO-1881-3 (174b): ad ♂, alcoholic (skull not removed). Collected by: Revoil. Number 174b in Rode (1941: 236). Cotype: MCZ 14929: ♀, alcoholic (skull not removed). Collected by: Revoil. Presented/Donated by: ?: Collector Unknown. - Comments: Type locality originally "Somalia", restricted to "Somalia, north of 10 °N" by Moreau *et al.* (1946: 399): see Gray *et al.* (1999: 2). Allen (1931: 235) mentions a "cotype" in MCZ (14929), collected by Revoil in Somaliland in 1880.

TAXONOMY:

Figure 151. *Nycteris thebaica* (SMG-15760) caught at Marloth Park, Mpumalanga, South Africa.

Meester *et al.* (1986) state that the subspecies classification of *thebaica* is uncertain. Hayman and Hill (1971), while acknowledging that the species may include valid subspecies, do not attempt to recognize any. Kock (1969a), however, lists seven subspecies, and Koopman (1975), while not providing a complete synonymy of the species, appears to come to broadly similar conclusions to Kock concerning those names that he does consider. Simmons (2005: 393) recognises seven subspecies - *adana* K. Andersen, 1912; *angolensis* Peters, 1870; *brockmani* K. Andersen, 1912; *capensis* A. Smith, 1829; *damarensis* Peters, 1870; *labiata* Heuglin, 1861; and *najdiya* Nader and Kock, 1982.

Van Cakenberghe and De Vree (1999a) suggest that the status of *brockmani* and *damarensis* remains unclear as these forms may represent distinct species (Harrison and Bates, 1991; Gray *et al.*, 1999).

thebaica species group (Van Cakenberghe and De Vree, 1999a; Simmons, 2005: 393).

COMMON NAMES:
Afrikaans: Gewone-spleetneusvlermuis, Egiptiese spleetneusvlermuis, Kaapse Langoorvlermuis. Arabian: Khafash Teiba, Khaffash. Chinese: 非洲凹脸蝠. Czech: rýhonos egyptský, šerowec tébský, dutonosec, netopýr koptový, nykteris egyptská. Dutch: Thebaanse spleetneusvleermuis. English: Egyptian Slit-faced Bat, Common Slit-faced Bat, Geoffroy's Nycteris, Cape Long-eared Bat. French: Nyctère de la Thébaïde, Nyctère égyptienne. German: Großohrhohlnase, Ägyptische Schlitznasen-Fledermaus, Stirngrubenfledermaus. Hebrew: leilan, Leylan. Italian: Nitterìde tebàna, Nicterìde tebàna, Nitterìde di Tèbe, Nicterìde di Tèbe. Portuguese: Morcego orelhudo do Egipto. Kiluba (DRC): Kasusu. Spanish (Castillian): Rinolofo egipcio. Yao: Liputiputi (applied to all small bats).

ETYMOLOGY OF COMMON NAME:
So named because they were first described from tombs in Thebes, Egypt (see Taylor, 2005).

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
N. thebaica was found in upper Pleistocene samples at Border Cave, South Africa (Avery, 1991: 6).

Butler (1984: 185) reported on a distal end of a humerus found at Chamtwara (Kenya).

CONSERVATION STATUS:
Global - This species has a large range and faces no major threats, hence is listed as Least Concern LC ver 3.1 (2001) (Mickleburgh *et al.*, 2008bk; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2008bk; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2004ce; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - LC ver 3.1 (2001) (Monadjem *et al.*, 2016d). 2004 - LC ver 3.1 (2001) (Friedmann and Daly, 2004).

MAJOR THREATS:
Habitat destruction and degradation affect the species. Roost disturbance and degradation are the main threats in the Mediterranean region. These are not considered major threats at present (Mickleburgh *et al.*, 2008bk; IUCN, 2009).

In the Limpopo province, South Africa, Toussaint and McKechnie (2012: 1138) indicate that the cool baobab tree cavities appear to be critical for the presence of *N. thebaica* in that area and may buffer this species from future increases in extreme maximum ambient temperatures.

Aerial hawking and water stress are believed to be the major risk factors linked to climatic change (Sherwin *et al.*, 2012: 174).

Collinson *et al.* (2015: 311) report on two roadkills in the Greater Mapungubwe Transfrontier Conservation Area (GMTFCA), South Africa.

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008bk) [in IUCN (2009)] report that it may occur within some protected areas. No specific conservation measures are known. Protection of the roost sites is required and also legal protection of the species should be improved. Further research is required on the population size and trends.

GENERAL DISTRIBUTION:
Nycteris thebaica is broadly distributed across savanna and riparian zones. Mostly found in sub-Saharan Africa; also found in Morocco, Libya, Egypt (primarily down the Nile River valley, but also into Sinai) and the Middle East (Israel, Palestine and Jordan). Recorded form the islands of Unguja [=Zanzibar] and Pemba [see Simmons (2005: 393), although not from the latter by O'Brien (2011: 289)]. Elevation from sea level to 2,000 m.

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 1,704,632 km^2 (covering 27 % of the total surface). In South Africa, its distribution is mainly affected by the mimimum temperature of the coldest month (Babiker Salata, 2012: 49).

Corbet (1984: 8) states that the inclusion of Corfu (Greece) in the range could be the result of a vagrant specimen from N Africa (for details see Van Cakenberghe and De Vree, 1999a).

Native: Angola (Crawford-Cabral, 1989; Cotterill, 2004a: 261; Monadjem *et al.*, 2010d: 548); Benin (Simmons, 2005: 393); Botswana (Archer, 1977; Monadjem *et al.*, 2010d: 548); Burkina Faso (Simmons, 2005: 393; Kangoyé *et al.*, 2015a: 617); Burundi; Cameroon; Central African Republic; Chad; Congo (The Democratic Republic of the) (Hayman *et al.*, 1966; Monadjem *et al.*, 2010d: 548); Côte d'Ivoire; Djibouti (Pearch *et al.*, 2001: 397; Simmons, 2005: 393); Egypt (Simmons, 2005: 393); Eritrea; Ethiopia (Lavrenchenko *et al.*, 2004b: 133); Gambia; Ghana (Simmons, 2005: 393); Guinea (Konstantinov *et al.*, 2000: 144; Simmons, 2005: 393; Decher *et al.*, 2016: 264); Guinea-Bissau; Israel (Simmons, 2005: 393); Jordan (Al-Omari *et al.*, 2000: 5); Kenya (Simmons, 2005: 393); Libyan Arab Jamahiriya; Malawi (Ansell and Dowsett, 1988: 31; Happold *et al.*, 1988; Monadjem *et al.*, 2010d: 548); Mali (Simmons, 2005: 393); Morocco (Simmons, 2005: 393; Benda *et al.*, 2010a: 157; El Ibrahimi and Rguibi Idrissi, 2015: 358); Mozambique (Smithers and Lobão Tello, 1976; Lopes and Crawford-Cabral, 1992; Monadjem *et al.*, 2010d: 548; Monadjem *et al.*, 2010c: 382); Namibia; Niger (Simmons, 2005: 393; Monadjem *et al.*, 2010d: 548); Nigeria (Simmons, 2005: 393); Palestinian Territory, Occupied; Rwanda; Saudi Arabia; Senegal (Simmons, 2005: 393); Sierra Leone; Somalia (Simmons, 2005: 393); South Africa (Simmons, 2005: 393; Monadjem *et al.*, 2010d: 549); Sudan; Swaziland (Monadjem, 2001, Monadjem, 2006b; Simmons, 2005: 393; Monadjem *et al.*, 2010d: 549); Tanzania (Stanley and Goodman, 2011: 43); Togo (Amori *et al.*, 2016: 218); Uganda (Kityo and Kerbis, 1996: 60); Yemen; Zambia (Ansell, 1969; Ansell, 1973; Ansell, 1978; Ansell, 1986; Monadjem *et al.*, 2010d: 549); Zimbabwe (Monadjem *et al.*, 2010d: 550).

Presence uncertain: Lebanon; Lesotho; Liberia; Mauritania.

Bates *et al.* (2013: 338) reject the presence of *N. thebaica* in the Republic of Congo as the locality (Kemo) mentioned by Pousargues (1896: 259) and Van Cakenberghe and De Vree (1999a: 143) is actually located in the Central African Republic.

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Schoeman and Jacobs (2002: 157) mention the following wing parameters for 8 specimens from the Algeria Forestry Station (RSA): Fa: 48.2 ± 0.8

mm, Wing area: 155.4 ± 7.4 cm^2, Wing span: 28.7 ± 1.1 cm, Wing loading: 8.3 ± 0.9 N/m^2, and aspect ratio: 5.3 ± 0.3.

Four piebald (all-white fur/skin patches, eyes always normally coloured) specimens were reported from a mine in Tanzania (Howell, 1980; Lucati and López-Baucells, 2016: Suppl.).

DETAILED MORPHOLOGY:
Baculum - The baculum ranges from 2.49 to 2.97 mm in length, the shaft is slender and parallel-sided, the base is expanded, in lateral profile it is usually angled ventrally, while the tip is simple with a small expansion (Thomas *et al.*, 1994: 22).

Brain - From specimens collected in Bénin, Amrein *et al.* (2007) reported that proliferating cells, detected with Ki-67 and MCM2, in the subgranular layer of the dentate gyrus was found to be absent. Amrein *et al.* (2007) also reported moderate to ample proliferating cells (Ki-67 positive cells) and migrating young neurons (DCX positive cells) in the rostral migratory stream. Amrein *et al.* (2007) could not detect any antigen in the antibody against DCX, and no NeuroD was detected in the hippocampal granule cells.

Reproduction system - Carter and Enders (2016: 284) found that *N. thebaica* has an extensive smooth chorioallantois, and its luminal epithelium is incomplete.

FUNCTIONAL MORPHOLOGY:
Zhuang *et al.* (2012: 1) showed that the pit in the noseleaf of *Nycteris thebaica* has an effect on focusing the acoustic near field as well as shaping the radiation patterns and therefore enhancing the directionality.

Toussaint *et al.* (2012) investigated the patterns of heterothermy exhibited by *N. thebaica* during the austral winter in a tropical semi-arid environment. They expected that it would use pronounced heterothermy during the warm, dry winter months, but found this not to be the case. As possible reasons for this, they suggest the relatively high risk of predation, the communal roosting, the species' reproduction cycle (although they find this highly unlikely as the results for both sexes were similar), and the relatively long nightly foraging period.

SEXUAL DIMORPHISM:
In Swaziland, Monadjem (2001: 49) found that females were heavier and had longer forearms than males.

ECHOLOCATION:
Schoeman and Waddington (2011: 291) mention a peak frequency of 90.3 ± 0.7 kHz and a duration of 1.7 ± 0.1 msec for specimens from Durban, South Africa. Davies *et al.* (2013b: Table S8) report a peak frequency of 88.23 kHz and a range between 55.97 and 75.5 kHz. However, also in the Durban area, Naidoo *et al.* (2011: 23) mention a peak frequency of 65.8 ± 20.1 kHz, and a duration of 1.7 ± 1.0 msec. From the Algeria Forestry Station (RSA), Schoeman and Jacobs (2002: 157) report the type of call to be "Low duty echolocation dominated by frequency modulated calls", with F_{peak}: 77.4 ± 2.7 kHz, and a low intensity. Parker and Bernard (2018: 57) recorded one call at the Mapungubwe National Park (RSA): F_{char}: 62.50 kHz, F_{max}: 83.40 kHz, F_{min}: 62.40 kHz, F_{knee}: 63.10 kHz, duration: 1.68 msec and 11.63 calls/sec.

Although very common in their study area in Swaziland, Monadjem *et al.* (2017c: 181) were unable to detect this species using an Anabat Express Detector due to its whispering (low db) calls. Even at distances of 0.1 m, they could not detect a call.

For Morocco, Disca *et al.* (2014: 226) recorded the following information: call type: FM multi H, F_{start}: 137.0 ± 1.2 kHz, F_{end}: 19.6 ± 0.5 kHz, F_{peak}: 84.5 ± 3.9 kHz, $F_{max\ all\ harmonics}$: 27.9 ± 0.2 kHz, $F_{max\ first\ harmonic}$: 56.1 ± 0.7 kHz, $F_{max\ third\ harmonic}$: 105.4 ± 3.2 kHz, bandwidth: 117.4 ± 1.5 kHz, duration: 2.4 ± 0.3 msec. This information is based on one single sequence they were not able to identify in hand.

Hackett *et al.* (2016: 223) reported the following values for 13 calls from Israel: Pulse duration: 1.35 ± 0.13 msec, F_{start}: 78.45 ± 3.08 kHz, F_{end}: 63.20 ± 1.99 kHz, F_{peak}: 70.18 ± 2.00 kHz.

MOLECULAR BIOLOGY:
DNA - Unknown.
Karyotype - Both Peterson and Nagorsen (1975) and Rautenbach *et al.* (1993) reported $2n$ = 42, FN = 78, BA = 38, with a submetacentric X chromosome, and a metacentric Y chromosome.
Protein / allozyme - Unknown.

HABITAT:
This species has a wide distribution and is found in most habitats throughout its range.

Cooper-Bohannon *et al.* (2016: Table S2) indicate that - in southern Africa - it occurs primarily in Savanna (63 %) areas, followed by SW arid (18 %) and Afromontane (10 %) habitats.

Based on the study of stable isotope ratios of carbon, nitrogen and hydrogen, Voigt *et al.* (2013: 755) suggest that *N. thebaica* might potentially be

a migratory bat species, as far as elevational migration along the slopes of Mount Kilimandjaro is concerned. However, they also point out that the very low wing loading and aspect ratio is atypical for a migratory species, and therefore still categorize it as a sedentary species. Foord *et al.* (2018: 5), furthermore, indicate that *N. thebaica* moves less than one km per night between its roost and foraging sides.

HABITS:
In Swaziland male *N. thebaica* exhibit less roost site fidelity than females: there is greater roost movement in males than females (Monadjem, 2006b).
Stanley *et al.* (2007b: 209) report on a specimen in a Victor Rat trap, because it probably chased insects attracted to the bait used in the trap.

Thomas and Jacobs (2013: 125) found that, at De Hoop Nature Reserve (South Africa), *N. thebaica* emerged significantly earlier during mid-summer than during early and late summer. They also reported that bats feeding on Lepidoptera (*N. thebaica* and *Rhinolophus capensis*) emerged earlier than bats feeding on Diptera (*Tadarida aegyptiaca*).

ROOST:
Roosting in caves, mine audits and various other hollow sites (Churchill *et al.*, 1997), road culverts (Monadjem, 1998a; 2001; 2006b), under houses (LaVal and LaVal, 1980; Seamark and Bogdanowicz, 2002). Avery *et al.* (1990: 7) indicate that cool and moist caves or cave-like structures are used as daytime roosts.

In Swaziland, Monadjem *et al.* (2015: 15) found that roost switching occurs frequently, with more transitions to roosts where large numbers of bats were staying. They also found that moving to another roost was related to the distance of the new roost from the original one.

MIGRATION:
The species is not known to undergo migration (Monadjem, 2006a), and Laycock (1973) and Wingate (1983) suggest that *N. thebaica* does not have any homing ability. Monadjem (2006b) states that bat numbers vary greatly with season, suggesting that some movement is taking place. Monadjem (2006b) also reported that a banded female in Swaziland was discovered 107 km from where it was originally banded.

DIET:
Casual observations in Israel (Makin, 1979), Sudan (McLellan, 1986) and Namibia (Felten, 1956) reported that scorpions formed a stable part of *N. thebaica* diet. Yerbury and Thomas, 1895) examined cull-parts in Arabia, identifying various species of Orthoptera. Whereas Chapman (1958, in Tanzania), Roer (1975, in Namibia), and LaVal and LaVal (1980, in South Africa) found that Orthoptera, Lepidoptera, and Coleoptera were the primary prey orders consumed by *N. thebaica*. LaVal and LaVal (1980) presented results for early autumn (April), mid-winter (July), spring (November), and summer (January to March), listing a monthly breakdown of all prey orders consumed and finding that Orthoptera predominated in the study. In Zimbabwe, Fenton (1975) combined the results of his wet season collection (November 1969 to March 1970), finding only Orthoptera and Lepidoptera wings. Fenton *et al.* (1977a) and Fenton and Thomas (1980) examined the faeces of *N. thebaica* in Zimbabwe, and found that in the wet season (January and February 1976) Lepidoptera, Diptera and Coleoptera formed the bats' diet, while in the dry season (June 1977) he found only Lepidoptera (100 percent volume). In Zambia, Whitaker and Black (1976) examined the stomach contents of 33 *N. thebaica* which they separated into summer (November to March) and winter (May to September) categories. They found similar prey orders in *N. thebaica* diet, but also found many wingless insects.
At Farm Laatstgevonden, South Africa, Taylor *et al.* (2012b: 62) found the following prey groups: Lepidoptera (31.5 %), Coleoptera (24.75 %), Hemiptera (19.5 %), Orthoptera (12.75 %), and other (11.5 %).
Bowie *et al.* (1999) at Mkuzi Game Reserve, KwaZulu Natal, South Africa, found that the diet consisted mainly of non-volant prey, primarily orthopterans and arachnids.
Feldman *et al.* (2000), in Israel, found they fed on Lepidoptera and Diptera.
Seamark and Bogdanowicz (2002) showed that prey eaten by *N. thebaica* varies significantly by order but not by season, and there was a significant interaction between the prey category and season, suggesting that these two factors are not independent from each other. Coleoptera (49.6 %) in the culled parts, (calculated as percent composition) dominated in spring (September-November), Orthoptera (38.8 %) in summer (December-February), Hemiptera (42.8 %) in autumn (March-May) and Lepidoptera (36.3 %) in winter (June-August). The diet also included a frog and small fish.

From the Algeria Forestry Station (RSA) Schoeman and Jacobs (2002: 157) reported the following prey groups based on 51 faecal pellets from 8 bats (in volume percent): Lepidoptera (34.9 ± 27.3), Orthoptera (23.5 ± 19.6), Coleoptera (21.3 ± 17.6), Arachnida (13.5 ± 27.4), Diptera (3.8 ±

10.6), Hymenoptera (1.6 ± 4.6), and Hemiptera (1.5 ± 4.5).

Weier *et al.* (2019b: 6) examined droppings from this species in the Levubu region (Limpopo, RSA) and found DNA sequences of *Cryptophlebia peltastica* (Meyrick, 1921) (Lepidoptera) and *Nezara viridula* (Linnaeus, 1758) (Hemiptera).

Using Next Generation Sequencing (NGS), (Taylor *et al.* (2017b: 243, 252 - 254) reported on the 28 food items found in faecal pellets in the Limpopo province (RSA): Lepidoptera (occurred in 100 % of analysed pellets - *Toxocampinae tathorhynchus* + *Eutelia polychorda* + *Acanthovalva inconspicuaria* + *Isturgia roraria* + *Scopula rufisalsa* + *Hyblaea puera* + *Sena* sp. + *Sena prompta* + *Enmonodia capensis* + *Leucania BioLep10* + *Pandesma robusta* + *Pericyma atrifusa* + *Argyrogrammatini* sp. + *Thysanoplusia indicator* + *Tycomarptes* sp. + *Garella nilotica* + *Maurilia arcuata* + *Phycitinae* sp. + *Arotrura JFL201* + unmatched), Blattodea (50 % - *Pycnoscelus* + unmatched), Orthoptera (33 %), Coleoptera (17 % - *Cybister tripunctatus* + unmatched); Hemiptera (17 % - *Macrorhaphis acuta* + *Nezara viridula*); Orthoptera (Tettigoninae sp.).

PREDATORS:
Perrin (1982: 16) and Avery *et al.* (2005: 1054) found this species in pellets from *Tyto alba* in South Africa.

Mikula *et al.* (2016: Supplemental data) mention the Bat hawk (*Macheiramphus alcinus* Bonaparte, 1850) as diurnal avian predator.

POPULATION:
Structure - Monadjem (2001: 50) mentions that sex ratio was highly skewed with adult females outnumbering adult males by 2.8:1, even though the sex ratio of juveniles was 1:1. Sex ratios of adults varied seasonally, being highly skewed in July/August, October and December. Monadjem (2001: 50) suggests that this might be due to the females being resident and males joining them in late summer to mate.

Density - Fairly common through most of its range. However, an uncommon species in the Mediterranean region. In Morocco only three small colonies (usually 10 to 30 and occasionally up to 100 individuals) are known (Stéphane Aulagnier *pers. comm.* 2007 in Mickleburgh *et al.*, 2008bk; IUCN, 2009).
Trend - 2008 - Unknown (Mickleburgh *et al.*, 2008bk; IUCN, 2009).

LIFESPAN:
In Swaziland, Monadjem (2006b) found that for both males and females, survivorship was low in the first year, but increased thereafter. While 15 % of females and 10 % of males banded as juveniles in 1998 and 1999 survived to three years of age. Monadjem (2006a) reported the age of *N. thebaica* in Swaziland to reach at least 7 to 8 years. Monadjem *et al.* (2015) studied the effect of time, age and sex class and climatic variables on survival from 1450 marked individuals from 16 roosts over a 10-year period. They found that the annual survival rate was highest in adult males and lowest in juvenile females. Climatological factors did not seem to have an influence.

ACTIVITY AND BEHAVIOUR:
Female *N. thebaica* in Swaziland appear to be resident year-round in the culverts, which suggests that males join females in late summer for the purpose of mating (Monadjem, 2001).
Lindeque (1987) describes the inflight behaviour of mating, where the active pursuit of the female by the male bat can be equated to courtship phase, with the butting phase inducing the female bat to hover and allowing the male to copulate, the brief frontal approach and head-neck biting by the male could be relict of some incomplete behaviour sequence.

Korine *et al.* (2015: 5) mention that the activity of *N. thebaica* could be underestimated because of the whispering nature of its echolocation calls.

REPRODUCTION AND ONTOGENY:
Martin and Bernard (2000: 32) mention that the corpus luteum is only present for the first half of pregnancy, and is subsequently completely regressed (Badwaik and Rasweiler, 2000: 276).

Bernard (1982a) [in Krutzsch (2000: 114)] indicated that this species is monoestrous in the subtropical, temperate regions of South Africa with a longer than usual gestation of five months and a three-month anoestrus. Male and female cycles are synchronized; spermatogenesis commences in late summer and the
epididymides contain mature sperm from autumn to summer (see Bernard, 1976).

A pregnant female was collected on 22 July 1992 in the West Usambara Mountains (Tanzania) (Stanley and Goodman, 2011: 43).

MATING:
Mating system is not known (Monadjem, 2001).

PARASITES:
BACTERIA

Four out of 49 specimens tested at Mlawula (Swaziland) by Dietrich *et al.* (2016b: 3) tested positive for *Bartonella* and one was positive for *Rickettsia*.
Dietrich *et al.* (2016a: 4) found *Leptospira* in the urine of a bat from South Africa, and *Coxiella* in its faeces. For the RSA, these bacteria were further identified as *Leptospira borgpetersenii*, whereas in bats from Swaziland sequences belonging to *L. interrogans* were found.

FUNGI
Brennan *et al.* (2015: 145) found no antibodies against *Pseudogymnoascus destructans* (White-nose syndrome) in blood samples from bats from Botswana.

HAEMOSPORIDA
Schaer *et al.* (2015: 381) found *Nycteria* sp. parasites in *N. thebaica* from South Sudan. Garnham and Heisch (1953: 357) described *Nycteria medusiformis* from a "*Nycteris capensis*".

NEMATODA
Spiruridae: An infection by *Spirura nycterisi* Khalil, 1975 in Tanzania was reported by Peralta-Rodríguez *et al.* (2012: 1006).

DIPTERA
Streblidae: *Raymondia alulata* Speiser, 1908, for which *N. thebaica* is the typical host, occurs in many parts of southern Africa from the Cape northwards to the Kaokoveld in Namibia and eastwards to Bukawayo in Zimbabwe (Haeselbarth *et al.*, 1966: 102). Shapiro *et al.* (2016: 249) reported it for the first time from Swaziland. *Raymondia hardyi* Fiedler, 1954 from South Africa (Shapiro *et al.*, 2016: 254). *Raymondia planiceps* Jobling, 1930 (Haeselbarth *et al.*, 1966: 102). *Raymondia seminuda* Jobling, 1954 from southern Botswana (Haeselbarth *et al.*, 1966: 103; Shapiro *et al.*, 2016: 255).
Nycteribiidae: *Nycteribia scissa rhodesiensis* Theodor, 1957 from Zimbabwe and Malawi (Haeselbarth *et al.*, 1966: 108). *Penicillidia fulvida* (Bigot, 1885) (Haeselbarth *et al.*, 1966: 114).

SIPHONAPTERA
Pulicidae: *Echidnophaga aethiops* Jordan and Rothschild, 1906 described from Klipfontein, Namaqualand, South Africa and also found in Namibia, Botswana, Tanzania, Kenya and Somalia (Haeselbarth *et al.*, 1966: 135).
Ischnopsyllidae: *Oxparius isomalus* (Waterston, 1915) locality not stated (Haeselbarth *et al.*, 1966: 188).

ACARI
Laelapidae: *Metaspinolaelaps aelleni* Till ([May] 1958) was described from *Nycteris thebaica capensis* from Zululand. Till (1960: 223) suggests that this possibly might be a synonym of *Bewsiella fledermaus* Domrow, [March] 1958, but this view doesn't seem to be followed (e.g. https://en.wiki2.org/wiki/Metaspinolaelaps).
Macronyssidae: *Steatonyssus longipes* Radovsky and Yuker, 1953 was described from an Egyptian slit-faced bat (Negm *et al.*, 2018: 728).
Trombiculidae: Vercammen-Grandjean and Fain (1958: 24) mention the presence of *Trombigasta (Trombigastia) mounti* (Radford, 1954) on "*N. capensis damarensis*" in Asmara, Eritrea. Stekolnikov (2018a: 50, 119, 160, 173) reported *Whartonia oweni* Vercammen-Grandjean and Brennan, 1957, *Trombigastia mounti* (Radford, 1954) (from "*N. thebaica damarensis*"), *Microtrombicula minutissima* (Oudemans, 1910) (from "*N. thebaica capensis*"), *Microtrombicula tanzaniae* Goff, 1982.

VIRUSES:
Astroviridae
Four out of 14 Mozambican bats tested by Hoarau *et al.* (2018: 2) were positive for this group of viruses.

Coronaviridae - Coronaviruses
SARS-CoV - Müller *et al.* (2007b) tested between 1986 and 1999, for antibody to SARS-CoV in sera in six individuals from Limpopo Province, South Africa, none were tested positive (0/6).

Paramyxoviridae
Mortlock *et al.* (2015: 1841) reported that one out of twelve examined South African *N. thebaica* specimens tested positive for *Paramyxovirus* sequences.

Rhabdoviridae
Lyssavirus - Rabies related viruses
Duvenhage Virus: In, 1986 Foggin (1988) recovered the Duvenhage (DUVV) virus from a *Nycteris thebaica* in Zimbabwe (see Paweska *et al.*, 2006; Hayman *et al.*, 2011a: 88; van Eeden *et al.*, 2011: 67). Markotter *et al.* (2013: 1000) report on antibodies for DUVV that were recovered from bats from Swaziland.
Rabies: Oelofsen and Smith (1993) tested 12 individual brains, from three localities by means of the "Rapid rabies enzyme immunodiagnosis" (RREID) test (Diagnostic Pasteur), none were tested positive.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Angola, Benin, Botswana, Burkina Faso, Cameroon, Central African Republic, Congo (Democratic Republic of the), Djibouti, Egypt, Eritrea, Ethiopia, Ghana, Guinea, Kenya, Malawi, Mali, Morocco, Mozambique, Namibia, Niger, Nigeria, Rwanda, Senegal, Sierra Leone, Somalia,

South Africa, South Sudan, Sudan, Swaziland, Tanzania, The Gambia, Uganda, Zambia, Zimbabwe.

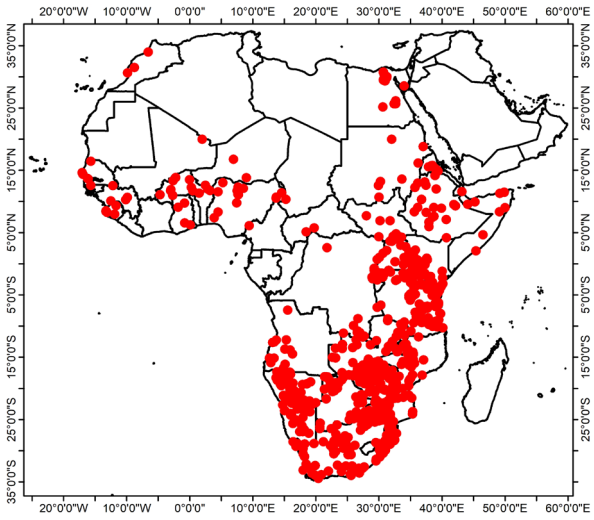

Figure 152. Distribution of *Nycteris thebaica*

Nycteris vinsoni Dalquest, 1965

*1965. *Nycteris vinsoni* Dalquest, J. Mamm., 46 (2): 254, 256. Publication date: May 1965. Type locality: Mozambique: 212 km SSW Beira, S bank Save river: Zinave [21 26 S 33 52 E] [Goto Description]. Holotype: KU 105221: ad ♀, skin and skull. Collected by: Prof. Dr. Walter Woelberg Dalquest; collection date: 8 October 1963; original number: MWUC 18739. Presented/Donated by: ?: Collector Unknown. See Jones and Genoways (1969: 130). - Etymology: In honour of J. Vinson, who sponsored an expedition to Mozambique during which the first specimens were collected (see Dalquest, 1965; Taylor, 2005). (Current Combination)

TAXONOMY:
Bronner *et al.* (2003) state that is was originally described from Mozambique (Dalquest, 1965). Kock (1969a) considered *Nycteris vinsoni* a synonym of *N. macrotis luteola*, based on the size and position of the second lower premolar. Hayman and Hill (1971) suggest that *N. vinsoni* is a variant of *N. aethiopica*, itself considered a member of the *N. macrotis* group (Koopman, 1965; Kock, 1969a). Koopman (1975) argued that the size and position of the second lower premolar is extremely variable, and instead recognised *vinsoni* as a distinct species closely related to *N. thebaica*, based on the presence of a pyriform tragus (and see Koopman, 1982). He later concluded that the tragus of the holotype is actually semilunate and therefore synonymised *vinsoni* under *N. macrotis oriana* (Koopman, 1992, 1993a). Swanepoel *et al.* (1980),Meester *et al.* (1986), Corbet and Hill (1992) and Simmons (2005: 394) retained *vinsoni* as a distinct species, a treatment endorsed by limited morphometric comparisons (Van Cakenberghe and De Vree, 1999a).

thebaica species group (Van Cakenberghe and De Vree, 1999a; Simmons, 2005: 394).

COMMON NAMES:
Afrikaans: Vinson se spleetneusvlermuis. Czech: rýhonos mosambický. English: Vinson's Slit-faced Bat, Mozambian Slit-faced Bat. French: Nyctère de Vinson, Nyctère du Mozambique. German: Vinsons Schlitznasen-Fledermaus.

CONSERVATION STATUS:
Global - Listed as Data Deficient in view of the absence of recent information on its extent of occurrence, ecological requirements, threats and conservation status (Mickleburgh *et al.*, 2008aq; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) (Mickleburgh *et al.*, 2008aq; IUCN, 2009). 2004 - DD ver 3.1 (2001) (Mickleburgh *et al.*, 2004be; IUCN, 2004). 2000 - LR/lc (Hilton-Taylor, 2000); CR (IUCN, 2000). 1996 - CR [assessed as *Nycteris macrotis*] (Baillie and Groombridge, 1996).

MAJOR THREATS:
The threats to this species are not known (Mickleburgh *et al.*, 2008aq; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008aq) [in IUCN (2009)] report that the collection locality appears to be within Zinave National Park, Mozambique. Further studies are needed to better determine the geographic range, natural history and possible threats to this poorly known bat.

GENERAL DISTRIBUTION:
Nycteris vinsoni is known only from the type locality of "the south bank of the Save River, 212 km SSW Beira, Mozambique" (Dalquest, 1965).

Native: Mozambique (Dalquest, 1965; Simmons, 2005: 394).

POPULATION:
Structure and Density - It is known only from the type series of two animals (Mickleburgh *et al.*, 2008aq; IUCN, 2009).
Trend - Unknown (Mickleburgh *et al.*, 2008aq; IUCN, 2009).

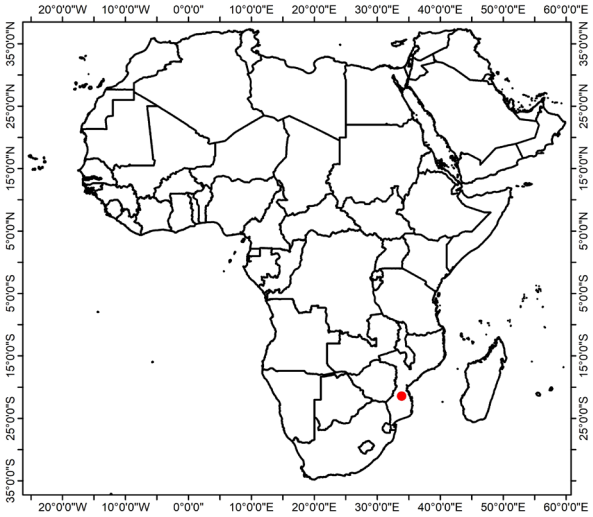

Figure 153. Distribution of *Nycteris vinsoni*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Mozambique.

Nycteris woodi K. Andersen, 1914

*1914. *Nycteris woodi* K. Andersen, Ann. Mag. nat. Hist., ser. 8, 13 (78): 563. Publication date: 1 June 1914. Type locality: Zambia: Chilanga [15 33 S 28 11 E, 4 100 ft] [Goto Description]. Holotype: BMNH 1914.4.22.2: ad, skin and skull. Collected by: Rodney Carrington Wood Esq. Collection date: November 1913. - Etymology: In honour of Rodney C. Wood, a well-known naturalist, who collected the original specimens at Chilanga, near Lusaka, Zambia (see Smithers, 1983: 118; Taylor, 2005). (Current Combination)
1946. *Nycteris woodi sabiensis* Roberts, Ann. Transv. Mus., 20 (4): 304. Type locality: Zimbabwe: Melsetter district: Sabi River: Birchenough Bridge [19 54 S 32 14 E] [Goto Description]. Holotype: TM 8578: ad ♀, skin and skull. Collected by: A.G. White; collection date: 11 January 1938. (Name Combination)
1946. *Nycteris woodi woodi:* Roberts, Ann. Transv. Mus., 20 (4): 304. (Name Combination)
2018. *Nycteris woodii:* Parker and Bernard, Mammalia, 83 (1): 53. Publication date: 14 April 2018. (Lapsus)

TAXONOMY:
Van Cakenberghe and De Vree (1985) included *parisii* and *benuensis*. Thomas *et al.* (1994) elevated *parisii* to full species rank, followed by Simmons (2005: 393), who included *benuensis* as a subspecies of *parisii*.

Simmons (2005: 394) recognised one subspecies *sabiensis* Roberts, 1946.

COMMON NAMES:
Afrikaans: Wood se spleetneusvlermuis, Wood-spleetneusvlermuis, Woodse Langoorvlermuis. Czech: rýhonos jihoafrický. English: Wood's Slit-faced Bat, Wood's Long-eared Bat. French: Nyctère de Wood. German: Woods Schlitznasen-Fledermaus.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, it occurs in some protected areas, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008ab; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2008ab; IUCN, 2009). 2004 - NT ver 3.1 (2001) (Mickleburgh *et al.*, 2004ap; IUCN, 2004). 1996 - LR/nt (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - NT B1ab(ii,iii,iv, v) ver 3.1 (2001) (Schoeman *et al.*, 2016b). 2004 - NT ver 3.1 (2001) (Friedmann and Daly, 2004). 1986 - Indeterminate (Smithers, 1986).

MAJOR THREATS:
It is possibly locally threatened in parts of its range by habitat loss (particularly through conversion of land to cotton farming), pesticide use, and disturbance of roosting sites (Mickleburgh *et al.*, 2008ab; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008ab) [in IUCN (2009)] report that it has been recorded from some protected areas (e.g. Kruger National Park, South Africa). Additional studies are needed into the distribution, natural history and possible threats to this poorly known species.

GENERAL DISTRIBUTION:
Nycteris woodi has been recorded from Zimbabwe, South Africa, to Zambia, north-west Mozambique and Malawi. It may range into southwestern Tanzania, however, it has yet to be recorded in this country. It is generally a lowland species. South of 8° S, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 308,190 km^2.

Native: Malawi (Happold *et al.*, 1988; Ansell and Dowsett, 1988: 30; Monadjem *et al.*, 2010d: 550); Mozambique (Simmons, 2005: 394; Monadjem *et al.*, 2010d: 550); South Africa (Simmons, 2005: 394; Monadjem *et al.*, 2010d: 550); Zambia (Ansell, 1967; Ansell, 1986; Simmons, 2005: 394; Monadjem *et al.*, 2010d: 550); Zimbabwe (Cotterill, 2004a: 261; Monadjem *et al.*, 2010d: 550).
Presence uncertain: Tanzania (Simmons, 2005: 394).

DETAILED MORPHOLOGY:
Baculum - The baculum ranges from 2.49 to 2.73 mm in length, the shaft is straight and parallel-sided, the base is expanded, in lateral profile it is angled ventrally, while the tip is simple and unexpanded, unlike *N. macrotis* and *N. parisii* (Thomas *et al.*, 1994:21).

ECHOLOCATION:
See Taylor (1999b).

MOLECULAR BIOLOGY:
DNA - Unknown.
Karyotype - Rautenbach *et al.* (1993) reported 2*n* = 42, FN = 78, BA = 38, a metacentric X chromosome, and an acrocentric Y chromosome, for a specimen from South Africa.
Protein / allozyme - Unknown.

POPULATION:
Structure and Density - The abundance of this species is not well known. It has been recorded in colonies of a few dozen individuals, otherwise animals have been recorded individually (Mickleburgh *et al.*, 2008ab; IUCN, 2009).
Trend - 2008 - Decreasing (Mickleburgh *et al.*, 2008ab; IUCN, 2009).

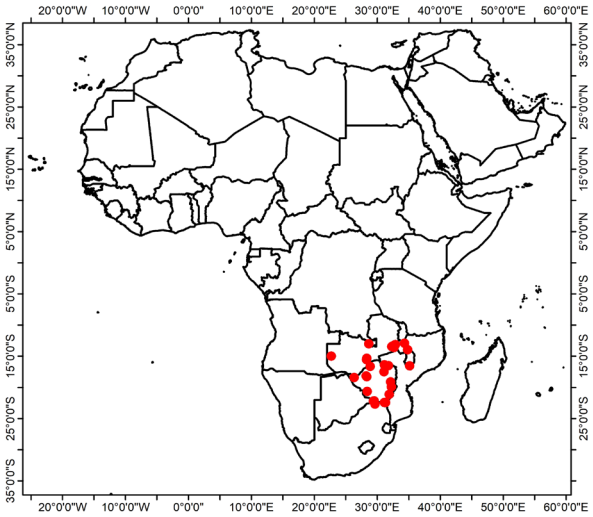

Figure 154. Distribution of *Nycteris woodi*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Malawi, Mozambique, South Africa, Tanzania, Zambia, Zimbabwe.

INFRAORDER VESPERTILIONIFORMACEI Van Cakenberghe, Kearney and Seamark, 2007

*2007. *VESPERTILIONIFORMACEI* Van Cakenberghe, Kearney and Seamark, African Chiroptera Report. Publication date: July 2007. - Comments: The name of the Infraorder is based on *Vespertilio* Linnaeus, 1758 (type of VESPERTILIONIDAE Gray, 1821). (Current Combination)
? *Yangochiroptera*

TAXONOMY:
Currently two superfamily is known from within the Infraorder VESPERTILIONIFORMACEI for Africa: **MOLOSSOIDEA** Gervais, 1856; **VESPERTILIONOIDEA** Gray, 1821.

COMMON NAMES:
Czech: netop ýrotva ří, netopýři.

Superfamily MOLOSSOIDEA Gervais, 1856

*1856. *Molossoidae* Gervais. (Current Combination)
1998. *Molossoidea:* Simmons, Interfamilian relationships in bats, ???. - Comments: Originally included the families Molossidae Gervais, 1855 and Antrozoidae Simmons, 1998 [= Antrozoinae Miller, 1897]. Considered a synonym of Molossidae by Jackson and Groves (2015: 257).

Family MOLOSSIDAE Gervais, 1856

*1856. *Molossidae* Gervais, in: F. Comte de Castelnau, Exped. Partes Cen. Am. Sud., Zool, (Sec. 7), Vol. 1, pt. 2 (Mammifères): 53 footnote. Publication date: 23 July 1856. - Comments: Type genus: *Molossus* E. Geoffroy St. Hillaire, 1805. - Etymology: The name of the family is derived from the Greek "*molossus*", a kind of dog used by Greek shepherds, in ancient times (see Taylor, 2005). (Current Combination)
1865. *Molossi* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, p. 258. - Comments: Type genus: *Molossus* E. Geoffroy, 1805. Originally included the genera *Dysopes* Illiger, 1811 [= *Molossus* É. Geoffroy, 1805]; *Molossus* É. Geoffroy, 1805; *Promops* Gervais, 1855; *Mormopterus* Peters, 1865; *Nyctinomus* É. Geoffroy, 1818 [= *Tadarida*
Rafinesque, 1814]; and *Chiromeles* [= *Cheiromeles*] Horsfield, 1824 (see Jackson and Groves, 2015: 257).
1866. *Molossina* Gray, Ann. Mag. nat. Hist., ser. 3, 17 (98): 93. Publication date: 1 February 1866. - Comments: Type genus: Molossus E. Geoffroy, 1805. Proposed as tribe and originally included the genera *Molossus* É. Geoffroy, 1805; *Promops* Gervais, 1855 and *Nyctinomus* É. Geoffroy, 1818 [= *Tadarida* Rafinesque, 1814] (see Jackson and Groves, 2015: 257).
1872. *Molossidae* Gill, Smiths. Misc. Coll., 11 (1): 17. - Comments: Type genus: *Molossus* E. Geoffroy, 1805. Originally included the genus *Molossus* É. Geoffroy, 1805 (see Jackson and Groves, 2015: 257). (Current Combination)
1889. *Gymnuridae* Ameghino, Actas Acad. Nac. Ciencias, Argentine e Cordoba, p. 351. - Comments: See Taylor (1934).
1893. *Molossini* Winge, Samling af Afhandlinger. E Museo Lundii, 2 (1): 24. - Comments: Type genus: *Molossus* E. Geoffroy, 1805. Proposed as tribe(?) and originally included the genera *Mystacina* J. Gray, 1843; *Nyctinomus* É. Geoffroy, 1818 [= *Tadarida* Rafinesque, 1814]; *Chiromeles* [= *Cheiromeles*] Horsfield, 1824; and *Molossus* É. Geoffroy, 1805 (see Jackson and Groves, 2015: 257).

TAXONOMY:
Koopman (1993a: 232) mentioned Gervais, 1856, whereas Corbet and Hill (1992: 156) and Peterson *et al.* (1995: 142) mentioned Gill 1872: 17 as author for this family.

Revised by Freeman (1981b). For a very different arrangement see Legendre (1984). See also Lamb *et al.* (2011).

Pavlinov *et al.* (1995: 90) recognise two subfamilies: Cheiromelinae and Tadaridinae.

Most recent authors (Hoofer and Van Den Bussche, 2003: 2; Simmons, 2005; Lamb *et al.*, 2011: 1) accept that the Molossidae consists of two subfamilies: Molossinae and Tomopeatinae. The latter subfamily used to be assigned to the Vespertilionidae, but Hoofer and Van Den Bussche (2003: 2) clearly indicate that this subfamily belongs to the Molossidae. Representatives of this subfamily only occur in South America and are therefore not included here.

Based on 102 morphological characters from the skull, dentition, postcrania, external morphology, tongue, and penis, Gregorin and Cirranello (2015: 2) distinguish two clades within the Molossidae, both of which include taxa from the Old and the

New World: One clade is comprised of *Mormopterus, Platymops, Sauromys, Neoplatymops, Molossops, Cynomops, Cheiromeles, Molossus*, and *Promops*, whereas the second includes *Tadarida, Otomops, Nyctinomops, Eumops, Chaerephon*, and *Mops*. The relation of *Myopterus* to these two clades remains unclear. They also found that genera such as *Tadarida, Chaerephon* and *Molossops sensu lato* do not appear to be monophyletic.

Ammerman *et al.* (2012: 12) distinguish 16 - 17 genera, including 110 species worldwide.

Known genera within the family MOLOSSIDAE: *Tomopeas* Miller, 1900; ***Chaerephon*** Dobson, 1874; *Cheiromeles* Horsefield, 1824; *Cynomops* Thomas,1920; *Eumops* Miller, 1906; *Molossops* Peters, 1866; *Molossus* E. Geoffroy, 1805; ***Mops*** Lesson, 1842; ***Mormopterus*** Peters, 1865; ***Myopterus*** E. Geoffroy, 1818; *Nyctinomops* Miller, 1902; ***Otomops*** Thomas, 1913; ***Platymops*** Thomas, 1906; *Promops* Gervais, 1856; ***Sauromys*** Roberts, 1917; ***Tadarida*** Rafinesque, 1814.

COMMON NAMES:
Czech: morousovití, netopýři buldočí, tadaridovití. Dutch: Buldogvleermuizen. English: Free-tailed Bats, Wrinkled-lipped Bats, Bulldog Bats, Mastiff Bats, Bonneted Bats, Wolf-dog Bats. Finnish: Doggilepakot. French: Molossidés. German: Bulldoggfledermäuse, Bulldogg-Fledermäuse. Italian: Molòssidi. Norwegian: Buldoggflaggermus, foldeleppede flaggermus. Russian: Свободнохвостые, Бульдоговые. Spanish (Castillian): Murcielagos cola de raton o de cola libre. Tanoboase (Ghana): afrifraa, frede frede. Vietnamese: Họ dơi thò đuôi.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Lavocat (1961) found an indetermined Molossid species from the Mio-Pliocene at Beni Mellal. While Butler (1978: 66) found four indetermined species from the early Pleistocene at Olduvai, Avery (1991: 6) found the remains of two different sized molossids in the upper Pleistocene at Border Cave, South Africa.

Shi and Rabosky (2015: 1532) report that the approximate fossil date for the Molossidae is 37.2 million years ago. The family-level stem ages/crown ages are respectively 53.8 and 45.2 mya. Ammerman *et al.* (2012: 12) indicate that the split between the Old and New World Molossid bats took place about 29 Mya.

ROOST:
López-Baucells *et al.* (2018: 30) investigated roost selection by molossid bats in rural Madagascar and found that they predominantly roosted in modern public buildings (e.g. schools, offices and libraries), built with cement and bricks. Small, traditional housed made from mud and wood were much less used by molossids, but housed small colonies of vespertilionids.

PREDATORS:
Mikula *et al.* (2016: Supplemental data) mention unidentified Molossidae to be taken by Grey kestrels (*Falco ardosiaceus* Vieillot, 1823) and Dickinson's kestrel (*Falco dickinsoni* Sclater, 1864), Red-necked falcon (*Falco ruficollis* Daudin, 1800), Eastern chanting goshawk (*Melierax poliopterus* (Cabanis, 1868)) [the latter three preying on "*Tadarida*" sp, where they also include *Mops* and *Chaerephon*].

PARASITES:
HEMIPTERA
Cimicidae: *Crassicimex sexualis* Ferris and Usinger, 1957 described from a single female taken 50 miles SE of Torit, Uganda (Haeselbarth *et al.*, 1966: 12, host referenced as a *Tadarida* sp.).

SIPHONAPTERA
Ischnopsyllidae: *Araeopsylla scitula* (Rothschild, 1909) found in southern Africa Cape Province, Lesotho, Natal, Transvaal and Botswana, where it has been collected from Free-tailed bats which are its true host (Haeselbarth *et al.*, 1966: 189). *Lagaropsylla* Jordan and Rothschild, 1921 almost all records of hosts are from Free-tailed Bats (Haeselbarth *et al.*, 1966: 190). *Lagaropsylla hoogstraali* Smit, 1957 from Sudan host recorded as a molossid (Haeselbarth *et al.*, 1966: 190). *Lagaropsylla idea* Smit, 1957 recorded mainly from free-tailed bats, with distributions in tropical Africa (Haeselbarth *et al.*, 1966: 190). *Lagaropsylla oblique* Smit 1957 known to infest molossid species from Sierra Leone, Cameroon and the Congo (Haeselbarth *et al.*, 1966: 191). *Lagaropsylla tauffliebi* Smit 1962 a series was taken from a free-tailed bat (*Tadarida* sp.) near Bangui, Central African Republic (Haeselbarth *et al.*, 1966: 191; host referenced as a *Tadarida* sp.).

Subfamily Molossinae Gervais, 1856

*1856. *Molossinae* Gervais, in: F. Comte de Castelnau, Exped. Partes Cen. Am. Sud., Zool, (Sec. 7), Vol. 1, pt. 2 (Mammifères): 53 footnote. Publication date: 23 July 1856. - Comments: Type genus: *Molossus* E. Geoffroy St. Hilaire, 1805. (Current Combination)

1866. *Molossina* Gray, Ann. Mag. nat. Hist., ser. 3, 17 (98): 93. Publication date: 1 February 1866. - Comments: Type genus: Molossus E. Geoffroy, 1805. Proposed as tribe and originally included the genera *Molossus* É. Geoffroy, 1805; *Promops* Gervais, 1855 and *Nyctinomus* É. Geoffroy, 1818 [= *Tadarida* Rafinesque, 1814] (see Jackson and Groves, 2015: 257).

1984. *Cheiromelinae* Legendre, Rev. suisse Zool., 91 (2): 425. Publication date: June 1984. - Comments: Type genus: *Cheiromeles* Horsfield, 1824. Pavlinov *et al.* (1995: 90) recognise this as a subfamily, but see R(3345: 432) and Jackson and Groves (2015: 257).

1984. *Molossinae:* Legendre, Rev. suisse Zool., 91 (2): 399, 425. Publication date: June 1984. - Comments: Type genus: *Molossus* E. Geoffroy, 1805. Originally included the genera *Molossus* É. Geoffroy, 1805; *Eumops* Miller, 1906; *Molossops* Peters, 1865 [including the subgenera *Cynomops* Thomas, 1920 and *Neoplatymops* Peterson 1965]; *Myopterus* É. Geoffroy, 1818 and *Promops* Gervais, 1855 (see Jackson and Groves, 2015: 258).

1984. *Tadaridinae:* Legendre, Arch. Zool. Mus., Moscow State Univ., 91 (2): 399, 426. - Comments: Type genus: *Tadarida* Rafinesque, 1814. Originally included the genera *Tadarida* Rafinesque, 1814; *Mormopterus* Peters, 1865a; *Nyctinomops* Miller, 1902; *Otomops* Thomas, 1913; and *Rhizomops* Legendre, 1984 [= *Tadarida* Rafinesque, 1814 (see Jackson and Groves, 2015: 257). (Lapsus)

1995. *Tadarinae:* Peterson, Eger and Mitchell, Faune de Madagascar, 84: 143. (Lapsus)

TAXONOMY:
Bronner *et al.* (2003) state that the genera *Mops* and *Chaerephon* have often been included as subgenera of *Tadarida* (Ellerman *et al.*, 1953; Hayman and Hill, 1971; Swanepoel *et al.*, 1980; Meester *et al.*, 1986; Corbet and Hill, 1992). Roberts (1951) elevated these taxa to generic rank, an approach followed by Freeman (1981b), Koopman (1982, 1993a) and Simmons (2005). In southern Africa, *Mops* is therefore represented by two species (*M. midas* and *M. condylurus*); *Chaerephon* by five (*C. bivittata, C. ansorgei, C. nigeriae, C. chapini* and *C. pumilus*); and *Tadarida* by four (*T. aegyptiaca, T. lobata, T. ventralis* and *T. fulminans*). Other African genera are *Mormopterus, Myopterus, Otomops, Platymops* and *Sauromys* (Lamb *et al.*, 2011: 2), with *Myopterus, Platymops* and *Sauromys* being endemic to mainland Africa.

Ammerman *et al.* (2012: 23) suggest that this subfamily should be subdivided into four tribes: Molossini containing the New World taxa (*Molossus, Eumops, Molossops, Cynomops, Neoplatymops, Nyctinomops*, and *Promops*), tribe Tadarini containing Old World taxa (*Tadarida, Chaerephon, Mops, Platymops, Sauromys, Myopterus*, and *Otomops*), tribe Cheiromelini, and tribe Mormopterini.

Based on five nuclear sequence markers, Napier (2013) found strong support for the monophyly of the combined genera *Chaerephon* and *Mops* (with the exception of *C. jobimena*). There was no support for monophyly of either of these genera, suggesting that both should be combined in a single genus. Her study also suggests that a new species of *Otomops* should be names from northeast Africa and Arabia.

COMMON NAMES:
Czech: praví morousi. English: Free-tailed Bats, Wrinkled-lipped Bats, Bulldog Bats, Mastiff Bats, Bonneted Bats, Wolf-dog Bats. French: Molosses.

Genus ***Chaerephon*** Dobson, 1874

*1874. *Nyctinomus (Chaerephon)* Dobson, J. Asiatic Soc. Bengal, 43 (2): 144. Publication date: 17 October 1874. - Comments: Type species: *Molossus (Nyctinomus) johorensis* Dobson, 1873. Not *Chaerephon* Godman in Godman and Salvin, 1900 (Insecta, Lepidoptera, Hesperiidae) (see Jackson and Groves, 2015: 258). - Etymology: From the Greek "*chaerephon*" meaning joyful-sounding. Flannery (1990: 370; 1995a: 404) refers to it as "a proper name, significance unknown". Dobson (1874) in Bouchard (1998: 4) and Lanza *et al.* (2015: 268) indicate that it refers to the friend of Socrates who is depicted as "*Χαιρεφῶν*" ("Chaerephon the bat") in Aristophanes' comedy, *Aves*, maybe alluding to his

nocturnal habits or bony appearance or as suggested by Plato in Apology, to his sudden, excitable nature.

1907. *Chaerephon:* Andersen. (Name Combination, Current Combination)
1917. *Chærephon (Lophomops)* J.A. Allen, Bull. Am. Mus. Nat. Hist., 37 (18): 460, text-fig. 9 - 11. Publication date: 29 September 1917 [Goto Description]. - Comments: Type species: *Chærephon (Lophomops) chapini* J.A. Allen, 1917, by original designation (see Jackson and Groves, 2015: 259).
1938. *Lephomops:* Frechkop, Exploration du Parc National Albert, 48. - Comments: Reported as subgenus of *Chaerephon* by Frechkop (1938: 48), but clearly a lapsus, as furtheron (p. 53) the correct *Lophomops* is used. (Lapsus)
1951. *Tadarida (Chaerephon):* Ellerman and Morrison-Scott. (Name Combination)
1962. *Tadarida (Chaerophoron):* Taufflieb, Bull. Inst. Rech. Sci. Congo, 1: 112. (Lapsus)
1965. *Nyctinimus:* Koopman, Am. Mus. Novit., 2219: 21. Publication date: 22 June1965. (Lapsus)
2004. *Chaeraphon:* Okafor, Igbinosa and Ezenwaji, Anim. Res. Int., 1 (1): 64. Publication date: April 2004. (Lapsus)
2017. *Chaereophon:* Weiss, Dabrowski, Kurth, Leendertz and Leendertz, Virology J., 14 (181): 1. Publication date: 18 September 2017. (Lapsus)
? *Chaerephon sp.:*
? *Chaerophon:* (Lapsus)

TAXONOMY:
Formerly included in *Tadarida*; see Freeman (1981b: 60, 133, 150); see also Legendre (1984). Harrison and Bates (1991: 62) and Ansell and Dowsett (1988: 45), Corbet and Hill (1992: 157), Grubb *et al.* (1998: 93) and Horácek *et al.* (2000: 137) include *Chaerephon* in *Tadarida*. A key is provided by Bouchard (1998: 1, Mammalian Species, 574).

Nyctinomus is considered a valid genus by McFarland (1998: 34), but included in *Tadarida* by Koopman (1993a: 240), Grubb *et al.* (1998: 93), or included in *Chaerephon* by Simmons (2005), or in *Mormopterus* by Jacobs and Fenton (2002, Mammalian Species, 703: 1). Grubb *et al.* (1998: 93) also indicate that Mahoney and Walton (1988a: 148 - 149) considered that *Nyctinomus* was dated from 1813 and was therefore the prior name for the genus *Tadarida* Rafinesque, 1814. Their case is unconvincing, and Grubb *et al.* (1998) do not think it desirable to change the long established usage of *Tadarida*. However, since *Chaerephon* Dobson, 1874 is clearly more recent it might be that *Nyctinomus* should be used instead of *Chaerephon*.

Known species within the genus *Chaerephon*: ***aloysiisabaudiae*** (Festa, 1907); ***ansorgei*** Thomas, 1913; ***atsinanana*** Goodman, Buccas, Naidoo, Ratrimomanarivo, Taylor and Lamb, 2010; ***bemmeleni*** (Jentink, 1879); ***bivittatus*** (Heuglin, 1861); *bregullae* (Felten, 1964) – Vanuatu, Fiji Isls (Simmons, 2005: 433); ***chapini*** J. A. Allen, 1917; ***gallagheri*** (Harrison,1975); *jobensis* (Miller, 1902) – Seram (Moluccas), Yapen Isl (Indonesia), New Guinea, northern and central Australia (Simmons, 2005: 434); *johorensis* (Dobson, 1873) – western Malaysia, Sumatra (Indonesia) (Simmons, 2005: 433); ***leucogaster*** A. Grandidier, 1870; ***major*** (Trouessart, 1897); ***nigeriae*** Thomas, 1913; *plicatus* (Buchannan, 1800) – Indiaand Sri Lanka to southern China, Hong Kong, Cambodiaand Vietnam, southeast through Malyasia to the Philippines, Borneo and Lesser Sunda Isls, Hainan (China), Cocos Keeling Isl (Indian Ocean) (Simmons, 2005: 434); ***pumilus*** (Cretzschmar, 1830-1831); ***russatus*** J. A. Allen, 1917; ***shortridge*** Thomas, 1926; *solomonis* (Troughton, 1931) – Solomon Isls (Simmons, 2005: 435); ***tomensis*** (Juste and Ibañez, 1993).

In their molecular phylogeny study, Lamb *et al.* (2010: 204; 2011: 9) found strong support for the monophyly of the *Chaerephon* + *Mops* taxa (about 17.2 Mya old), but not for either of the genera separated. They also found some indications that certain *Mops* species are ancestral and *Chaerephon* species more derived. Their results suggest that *Chaerephon* should not be considered a subgenus of *Tadarida*, nor a genus on itself. They suggest to combine *Chaerephon* (except *Chaerephon jobimena*) together with *Mops* into a single genus pending a more complete study.

Ammerman *et al.* (2012: 20) also found support for a *Mops* - *Chaerephon* clade, which resulted in paraphyly of *Chaerephon*, and confirm again that *Chaerephon* is distinct from *Tadarida*. A further morphological study by Gregorin and Cirranello (2015: 10) confirmed the paraphyly of *Chaerephon*, but was unable to resolve the relationships within the genus.

COMMON NAMES:
Czech: malí morousi, příšerecové. English: Wrinkle-lipped Bats, Lesser Free-tailed Bats, Lesser Mastiff Bats. French: Tadarides. Italian: Cherefónti.

CONSERVATION STATUS:
IUCN (2004) - assessed *C. shortridgei* as NT ver 3.1 (2001).

BIOGEOGRAPHY:
Taylor *et al.* (2009) investigated patterns in mitochondrial DNA (cytochrome *b* and D-loop) variation in *Chaerephon* spp. specimens from southern Africa and Madagascar, including individuals from Madagascar with distinct phenotypic characters and identified as *C. leucogaster* and *C. pumilus*. Taylor *et al.* (2009) found southern African populations of *C. pumilus* to be paraphyletic, Malagasy *C. leucogaster* to be nested within *C. pumilus* sensu lato, and Malagasy *C. pumilus* forming a sister group to a complex of African *C. pumilus* and Malagasy *C. leucogaster* clades. Goodman *et al.* (2010a) including *C. pusillus* samples from the Comoros (all four islands) and Aladabra, found that on Mayotte and Madagascar individuals that can phenotypically be assigned to *C. leucogaster* and *C. pumilus* sensu lato, are known to occupy the same day roost sites. Morphological and molecular genetics data indicate they act as a good biological species. The individuals from the Comoros and Aldabra formed a monophyletic group, which shows morphological similarity. Comorian individuals, classically assigned to *C. pumilus*, are best considered distinct from African and Madagascan populations, and represent the same taxon occuring in the western Seychelles under the name *C. pusillus*.

PARASITES:
NEMATODA:
Durette-Desset and Chabaud (1975: 317) described *Molinostrongylus bauchoti* from a Madagascan bat belonging to this genus.

ACARI
Trombiculidae: Stekolnikov (2018a: 154) mentioned *Microtrombicula intranasalis* Vercammen-Grandjean, 1965 from *Chaerephon* sp.

VIRUSES:
Of the 13 *Chaerephon* sp. specimens from Kisumu, Kenya, one tested positive for *Adenovirus*, one for *Rhabdovirus* and five for *Polyoma virus* (Conrardy *et al.*, 2014: 259). Of the 16 specimens from Moi University, one tested positive for *Adenovirus*, one for *Paramyxovirus* and two for *Polyomavirus*.

Adenoviridae
Conrardy *et al.* (2014) detected an adenovirus in two individuals out of 35 sampled in Kenya. This virus groups within the *Mastadenovirus* genus.

Coronaviridae - Coronaviruses
SARS-CoV - During February 2008 in Ghana, six fecal samples were tested negative for coronavirus (CoV) RNA by Pfefferle *et al.* (2009) [as *Chaerephon spp.*]. Tong *et al.* (2009) tested several bats collected in Kenya in 2006 positive for the presence of coronavirus RNA in fecal samples. Hu *et al.* (2015: 5) indicate that in Ghana, Kenya and Nigeria novel betacoronaviruses related to SARS-CoV have been detected.
12 of the 113 Kenyan specimens tested by Tao *et al.* (2017: Suppl.) were positive for CoV (10.6 %).

Flaviviridae
Pegivirus (BPgV) - 1 out of 3 Kenyan *Chaerephon* sp specimens was infected by clade K type *Pegivirus* (Quan *et al.*, 2013: Table S5).

Paramyxoviridae
Conrardy *et al.* (2014) detected a paramyxovirus in one out of 35 individuals sampled in Kenya. This virus groups with Morbillivirus-related viruses.

Rhabdoviridae
Conrardy *et al.* (2014) detected a rhabdovirus in one out of 35 individuals sampled in Kenya. This virus groups with the *Tupavirus* genus, with a near identical sequence detected in *Miniopterus africanus*.

Polyomaviruses
Orthopolyomavirus (BPyV) – DNA of two novel polyomaviruses were detected from fecal/oral swabs from *Chaerephon* sp specimens from Kenya (Tao *et al.*, 2012)

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Benin, Burkina Faso, Burundi, Cameroon, Central African Republic, Chad, Congo, Congo (Democratic Republic of the), Ghana, Kenya, Madagascar, Malawi, Namibia, Sierra Leone, South Sudan, Tanzania, Uganda.

Chaerephon aloysiisabaudiae (Festa, 1907)

*1907. *Nyctinomus aloysii-sabaudiae* Festa, Boll. Mus. Zool. Anat. Comp. Univ. Torino, 22 (546): 1. Publication date: 21 January 1907. Type locality: Uganda: Western province: Toro distrirct: East of Ruwenzori: "Toro distrirct" [ca. 00 30 N 30 00 E] [Goto Description]. - Comments: Coordinates mentioned as 01 00 N 30 22 E by Thorn *et al.* (2009: 71). Allen (1939a: 107) mentioned the type locality as "Ruwenzoni". Grubb *et al.* (1998: 84) mention "East of Ruwenzori, Toro district".
1917. *Nyctinomus aloysii-sabaudiæ:* J.A. Allen, Bull. Am. Mus. Nat. Hist., 37 (18): 460. (Name Combination)
1922. *Chaerephon angolensis sabaudiae:* de Beaux, Ann. Mus. civ. Stor. nat. Genova, ser. 3, (O.S. 49) 9: 371. Publication date: 28 August 1922. (Lapsus)
1966. *Tadarida (Chaerephon) cyclotis* Brosset, Biol. gabon., 2 (1): 80. Type locality: Gabon: Bélinga [01 13 N 13 10 E] [Goto Description].
? *Chaerephon aloysiisabaudiae:* (Current Combination, Current Spelling)
? *Tadarida aloysiisabaudiae:* (Name Combination)

TAXONOMY:
See Simmons (2005).

COMMON NAMES:
Czech: morous vévodský. English: Duke of Abruzzi's Wrinkle-lipped Bat, Abruzzi's Wrinkle-lipped Bat, Duke of Abruzzi's Free-tailed Bat. French: Tadaride du Duc des Abruzzes, Molosse du Duc des Abruzzes. German: Fürst von Abruzzen Bulldoggfledermaus.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008bn; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) assessed as *Tadarida aloysiisabaudiae* (Mickleburgh *et al.*, 2008bn; IUCN, 2009). 2004 - NT ver 3.1 (2001) (Mickleburgh *et al.*, 2004bi; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
This species is threatened by deforestation of its habitat by logging activities (Mickleburgh *et al.*, 2008bn; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008bn) [in IUCN (2009)] report that there appear to be no direct conservation measures in place. It is not known if the species is present in any protected areas. Further studies are needed into the distribution, natural history and threats to this species.

GENERAL DISTRIBUTION:
Chaerephon aloysiisabaudiae has been patchily recorded in West and Central Africa. It ranges from Côte d'Ivoire and Ghana in the west, through Cameroon and northern Central Africa, to southern Sudan and western Uganda. It is known from around 50 localities (mostly single specimens).

Native: Cameroon; Central African Republic; Congo (The Democratic Republic of the); Côte d'Ivoire (Beaucournu and Fahr, 2003: 175); Gabon; Ghana; Sudan; Uganda.
Presence uncertain: Ethiopia (Simmons, 2005).

MOLECULAR BIOLOGY:
DNA - Unknown.
Karyotype - Smith *et al.* (1986) reported 2*n* = 48, FN = 66, BA = 20, a submetacentric X chromosome and an acrocentric Y chromosome.
Protein / allozyme - Unknown.

POPULATION:
Structure and Density - This high-flying species is rarely captured. It is found in relatively small groups (Mickleburgh *et al.*, 2008bn; IUCN, 2009).
Trend - 2008 - Decreasing (Mickleburgh *et al.*, 2008bn; IUCN, 2009).

VIRUSES:
Reoviridae
Weiss *et al.* (2017: 1) isolated a new virus belonging to the subfamily Spinareovirinae: Taï Forest reovirus (TFRV) (tentatively assigned to the genus *Coltivirus*) from a bat in Côte d'Ivoire. This was the first bat-borne reovirus in Africa (Weiß, 2013: 65).

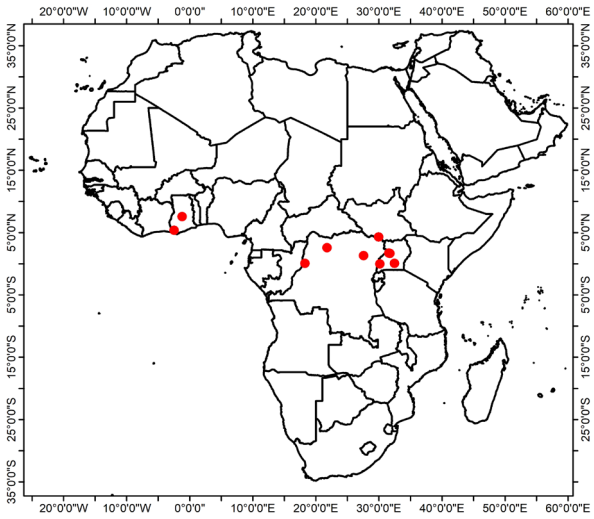

Figure 155. Distribution of *Chaerephon aloysiisabaudiae*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Congo (Democratic Republic of the), Côte d'Ivoire, Ghana, Uganda.

Chaerephon ansorgei (Thomas, 1913)

*1913. *Nyctinomus ansorgei* Thomas, Ann. Mag. nat. Hist., ser. 8, 11 (63): 318. Publication date: 1 March 1913. Type locality: Angola: Malange [=Malanje] [09 32 S 16 20 E, 1 150 m] [Goto Description]. Holotype: BMNH 1910.4.8.4: ad ♂. Collected by: Dr. William John Ansorge; collection date: 17 February 1909; original number: 5. - Etymology: In honour of Dr. William John Ansorge (1850 - 1913), a collector of zoological specimens, who collected the type specimen of this species in Malange, northern Angola (see Taylor, 2005; Lanza *et al.*, 2015: 271).

1946. *Nyctinomus rhodesiae* Roberts, Ann. Transv. Mus., 20 (4): 307. Type locality: Zimbabwe: Bindura district: Masembura Native Reserve: Chikupo caves [17 24 S 31 20 E] [Goto Description]. Holotype: TM 9977: ad ♂, skin and skull. Collected by: H.B. Masterson; collection date: 10 July 1945.

1967. *Tadarida bivittata:* Ansell, Arnoldia Rhod., 2 (38): 25. - Comments: Not of Heuglin, 1861.

? *Chaerephon ansorgei:* (Name Combination, Current Combination)

? *Tadarida (Chaerephon) ansorgei:* (Name Combination)

? *Tadarida ansorgei:* (Name Combination)

TAXONOMY:
Distinct from *bivittata*; see Eger and Peterson (1979: 1889), who revised it.

COMMON NAMES:
Afrikaans: Ansorge se losstertvlermuis, Ansorge-losstertvlermuis. Chinese: 安氏犬吻蝠. Czech: morous Ansorgeův. English: Ansorge's Wrinkle-lipped Bat, Ansorge's Free-tailed Bat. French: Tadaride d'Ansorge, Molosse d'Ansorge, Molosse d'Afrique du Sud. German: Ansorges Bulldoggfledermaus. Italian: Cherefónte di Ansòrge. Portuguese: Morcego de cauda livre de Ansorge.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Hildebrand *et al.* (2010: 281) recorded this species from the Koka site in southern Ethiopia.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, it is likely to occur in a number of protected areas, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008ac; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) [assessed as *Tadarida ansorgei*] (Mickleburgh *et al.*, 2008ac; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2004al; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - LC ver 3.1 (2001) (Monadjem *et al.*, 2016aa). 2008 - LC ver 3.1 (2001)

(Friedmann and Daly, 2004). 1986 - Indeterminate (Smithers, 1986).

MAJOR THREATS:
There appear to be no major threats to this species. In parts of West Africa, some populations may be threatened by overharvesting for subsistence food (Mickleburgh *et al.*, 2008ac; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008ac) [in IUCN (2009)] report that in view of the species wide range it is presumably present in many protected areas (including Comoe National Park, Côte d'Ivoire). No direct conservation measures are currently needed for this species as a whole.

GENERAL DISTRIBUTION:
Chaerephon ansorgei is widely distributed over much of sub-Saharan Africa. It ranges from northeastern Côte d'Ivoire in the west, through much of the northern part of West and Central Africa (north of the Congo basin), to Ethiopia and East Africa, from here southwards as far as northeastern South Africa. It has been recorded between 400 and 2,000 m asl.

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 673,792 km^2.

Native: Angola (Crawford-Cabral, 1989; Monadjem *et al.*, 2010d: 541; Taylor *et al.*, 2018b: 62); Cameroon (Eisentraut, 1968: 171 - 1st record from West Africa); Congo (The Democratic Republic of the) (Hayman *et al.*, 1966; Van Cakenberghe *et al.*, 1999; Monadjem *et al.*, 2010d: 541); Côte d'Ivoire; Ethiopia; Mozambique (Monadjem *et al.*, 2010d: 541: Monadjem *et al.*, 2010c: 382); South Africa (Monadjem *et al.*, 2010d: 541); Sudan; Uganda (Kityo and Kerbis, 1996: 63); Zambia (Ansell, 1978: Monadjem *et al.*, 2010d: 541); Zimbawe (Cotterill, 2004a: 261: Monadjem *et al.*, 2010d: 541).

Presence uncertain: Namibia.

ECHOLOCATION:
Jacobs (1996) and Fenton and Bell (1981) reported a highest frequency of 28 kHz for individuals at Sengwa in Zimbabwe.

Taylor (2000: 67) reported call details as: long duration (15 ms), multi-harmonic (up to two), narrow bandwidth (16 - 28 kHz) shallow-FM calls, with low dominant frequency of 18 kHz, in a field guide to bats of Southern Africa.

For *Chaerephon ansorgei* from Mozambique, Taylor *et al.* (2013b: 18) reported the following parameters for 3 calls: F_{max}: 23.1 ± 3.5 (20.1 - 27.0) kHz, F_{min}: 186. ± 1.5 (16.9 - 19.8) kHz, F_{knee}: 21.5 ± 1.4 (19.9 - 22.6) kHz, F_{char}: 19.8 ± 1.1 (18.5 - 20.5) kHz, duration: 10.6 ± 1.2 (9.4 - 11.9) msec. And for 12 calls from Waterberg, South Africa: F_{max}: 22.1 ± 1.53 (19.5 - 243) kHz, F_{min}: 18.5 ± 0.92 (17.5 - 20.0) kHz, F_{knee}: 20.1 ± 1.05 (18.9 - 21.8) kHz, F_{char}: 19.0 ± 0.94 (17.8 - 20.5) kHz, duration: 6.4 ± 1.51 (4.5 - 9.3) msec.
At Farm Welgevonden (RSA), Taylor *et al.* (2013a: 556) report a F_{knee} value of 20 (19 - 22) kHz.
In the Soutpansberg area (RSA), Linden *et al.* (2014: 40) mentioned the following characteristics for *C.* cf. *ansorgei*: F_{min}: 17 - 20 kHz, F_{char}: 18 - 21 kHz, F_{knee}: 19 - 23, Slope: 24 - 212 OPS, duration: 4 - 12 msec.
20 calls from the Mapungubwe National Park (RSA) were recorded by Parker and Bernard (2018: 57): F_{char}: 18.21 ± 1.01 kHz, F_{max}: 20.92 ± 3.39 kHz, F_{min}: 17.59 ± 1.03 kHz, F_{knee}: 19.38 ± 1.49 kHz, duration: 10.07 ± 3.03 msec with 2.47 ± 1.43 calls/sec.

MOLECULAR BIOLOGY:
DNA - Unknown.
Karyotype - Smith *et al.* (1986) and Rautenbach *et al.* (1993) agreed on 2*n* = 48, and the Y chromosome being acrocentric. However, Smith *et al.* (1986) reported FN = 66, BA = 20, and a subtelocentric X chromosome, whereas Rautenbach *et al.* (1993) reported for specimens from South African, FN = 68, BA = 22, and a submetacentric X chromosome.
Protein / allozyme - Unknown.

PREDATORS:
Mikula *et al.* (2016: Supplemental data) mention the Southern yellow-billed hornbill (*Tockus leucomelas* Lichtenstein, 1842) as diurnal avian predator.

POPULATION:
Structure and Density - It appears to be generally uncommon, although colonies may contain hundreds of bats (Mickleburgh *et al.*, 2008ac; IUCN, 2009).
Trend - 2008 - Stable (Mickleburgh *et al.*, 2008ac; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
Monadjem *et al.* (2010d) [in Weier *et al.* (2018: Suppl.)] mentioned lactating females in November-January and April.

PARASITES:
SIPHONAPTERA

Ischnopsyllidae: *Lagaropsylla anciauxi* Smit, 1957 from Katanga, Congo (Haeselbarth *et al.*, 1966: 190).

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Angola, Cameroon, Congo (Democratic Republic of the), Ethiopia, Kenya, Malawi, Mozambique, Nigeria, Rwanda, South Africa, South Sudan, Uganda, Zimbabwe.

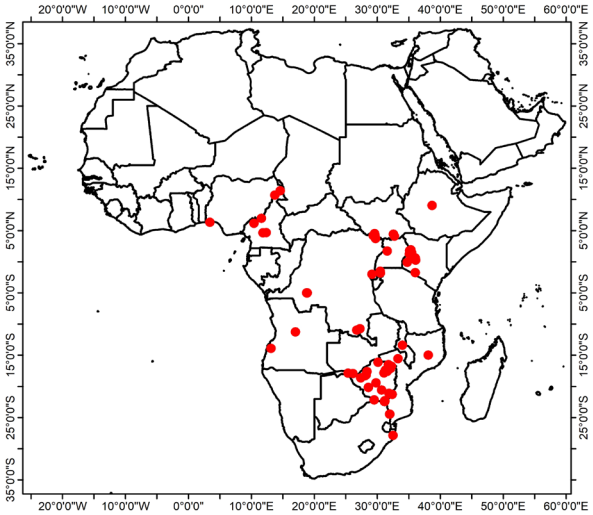

Figure 156. Distribution of *Chaerephon ansorgei*

Chaerephon atsinanana Goodman, Buccas, Naidoo, Ratrimomanarivo, Taylor and Lamb, 2010

*2010. *Chaerephon atsinanana* Goodman, Buccas, Naidoo, Ratrimomanarivo, Taylor and Lamb, Zootaxa, 2551: 21, figs 34, 6A, 7. Publication date: 28 July 2010. Type locality: Madagascar: Fianarantsoa: Farafangana: Collèges d'Enseignement Général (CEG) Fenoarivo [22 49.275 S 47 49.860 E, 10 m] [Goto Description]. Holotype: FMNH 185259: ad ♀, skull and alcoholic. Collected by: Fania H. Ratrimomanarivo; collection date: 26 April 2005. Presented/Donated by: ?: Collector Unknown. Paratype: FMNH 185260: Collected by: ?: Collector Unknown. Presented/Donated by: ?: Collector Unknown. Same locality as the type specimen (see Goodman *et al.*, 2010a: 21). Paratype: FMNH 185261: Collected by: ?: Collector Unknown. Presented/Donated by: ?: Collector Unknown. Same locality as the type specimen (see Goodman *et al.*, 2010a: 21). Paratype: FMNH 185262: Collected by: ?: Collector Unknown. Presented/Donated by: ?: Collector Unknown. Same locality as the type specimen (see Goodman *et al.*, 2010a: 21). Paratype: FMNH 185263: Collected by: ?: Collector Unknown. Presented/Donated by: ?: Collector Unknown. Same locality as the type specimen (see Goodman *et al.*, 2010a: 21). Paratype: FMNH 185264: Collected by: ?: Collector Unknown. Presented/Donated by: ?: Collector Unknown. Same locality as the type specimen (see Goodman *et al.*, 2010a: 21). Paratype: FMNH 185265: Collected by: ?: Collector Unknown. Presented/Donated by: ?: Collector Unknown. Same locality as the type specimen (see Goodman *et al.*, 2010a: 21). Paratype: FMNH 185266: Collected by: ?: Collector Unknown. Presented/Donated by: ?: Collector Unknown. Same locality as the type specimen (see Goodman *et al.*, 2010a: 21). Paratype: FMNH 185267: Collected by: ?: Collector Unknown. Presented/Donated by: ?: Collector Unknown. Same locality as the type specimen (see Goodman *et al.*, 2010a: 21). Paratype: FMNH 185268: Collected by: ?: Collector Unknown. Presented/Donated by: ?: Collector Unknown. Same locality as the type specimen (see Goodman *et al.*, 2010a: 21). - Etymology: The name *atsinanana* is derived from the Malagasy word meaning "from the east" (see Goodman *et al.*, 2010a: 23). (Current Combination)

? *Chaerephon pumilus:*

CONSERVATION ACTIONS:
On Madagascar, it has not been recorded from any protected areas, but it has been recorded from houses close to protected areas as *C. pumilus* (Mickleburgh *et al.* (2008dr) [in IUCN (2009)]).

GENERAL DISTRIBUTION:
Chaerephon atsinanana is known from numerous localities across the eastern half of Madagascar from near sea level to over 1,100 m (see Goodman *et al.*, 2010a: 26).
In Madagascar, the species is restricted to the humid areas of the island (in the north and east) and can be found up to 1,300 m asl. Its southernmost range in Madagascar is not well understood and it has not been recorded south of Moramanga (Goodman and Cardiff, 2004).

Native: Madagascar (Goodman *et al.*, 2010a: 26).

BIOGEOGRAPHY:
Chaerephon atsinanana is common in the mesic eastern portion of Madagascar, across an elevational range from near sea level to 1,100 m a.s.l. (Lamb *et al.*, 2012: 19).

DETAILED MORPHOLOGY:
Baculum:
Rakotondramanana and Goodman (2017: 60) found that the triangular shaped baculum of this species could be subdivided into three morphotypes: morphotype A is more rounded than the flattened morphotype B, and morphotype C is similar to B, but with an indentation in the proximal base. The shaft curvature is more pronounced in types B and C as compared to type A. In all morphotypes, the distal portions are similar, gradually tapering from the midshaft towards a blunt tip. Length: 0.90 ± 0.066 (0.78 - 1.00) mm, width: 0.34 ± 0.056 (0.26 - 0.46) mm.

MOLECULAR BIOLOGY:
DNA - See Goodman *et al.* (2010a).
Karyotype - Unknown.
Protein / allozyme - Unknown.

Napier (2013) hypothesized that this species should show relatively low levels of intraspecific genetic structure as bats are strong fliers and are able to traverse the riverine and mountain barriers. However, she needed to reject this hypothesis as genetic distances of up to 8.14 % were found. She furthermore suggests that these differences are consistent with the existence of female philopatry.

HABITAT:
Goodman *et al.* (2010a: 26) report that all of the sites where this species is found, are in urban or at least rural areas and outside of natural forest. They were also unable to find a natural day-roost of this species. A further analysis by Lamb *et al.* (2012: 29) indicated that the predicted distribution pattern was rather patchy and limited to the Madagascar Lowland Forests ecoregion and furthermore strongly associated with human population centres and transport routes.

ROOST:
Wilkinson *et al.* (2012: 160) indicate that synanthropic structures are the typical roosts for this species on Madagascar.

DIET:
The faeces of five specimens examined by Rasoanoro *et al.* (2015: 64) contained the following volume percentages of prey: Coleoptera: 44.0 ± 5.08, Diptera: 8.3 ± 4.15, Hemiptera: 3.1 ± 1.36, Homoptera: 19.0 ± 4.42, Hymenoptera: 0.3 ± 0.31, and Lepidoptera: 25.4 ± 1.86.

Kemp *et al.* (2018: Suppl.) used DNA metacarcoding to detect insect pest species in the diet of these bats and found the following prey orders (in descending order): Coleoptera, Ephemeroptera, Lepidoptera (*Meyrickiella homosema* (Meyrick, 1887), *Leguminivora* sp., *Mythimna* sp., *Cydia choleropa* (Meyrick, 1913)), Diptera (*Simulium lineatum* (Meigen, 1804), *Culex* MBI-27, *Anopheles squamosus* Theobald, 1901, *Culex annulioris* Theobald, 1901), Orthoptera, Trichoptera, Blattodea, Hemiptera, Sarcoptiformes, Trombidiformes, Odonata, Siphonaptera, Hymenoptera.

POPULATION:
Structure and Density - There are no estimates of its population in Madagascar, but it is thought to be locally common in the eastern zone (Mickleburgh *et al.*, 2008dr; IUCN, 2009, as *C. pumilus*).
Trend - Unknown.

VIRUSES:
Wilkinson *et al.* (2012: 160) tested 20 individuals from the Madagascar using RT-PCR specific for Respirovirus/Morbillivirus/Henipahvirus (RMH) and Paramyxovirinae (PMV) and found 0 positive results for viral nucleic acids.

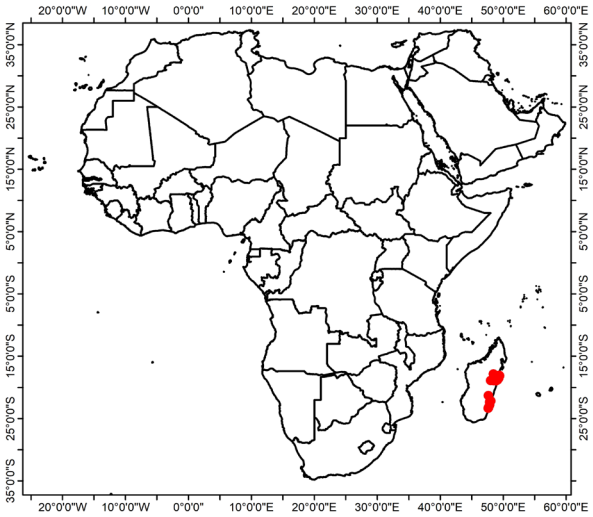

Figure 157. Distribution of *Chaerephon atsinanana*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Madagascar.

Chaerephon bemmeleni (Jentink, 1879)

*1879. *Nyctinomus Bemmeleni* Jentink, Notes Leyden Mus., 1 (1): 125. Publication date: April 1879. Type locality: "Africa": "Liberia ??" [Goto Description]. Holotype: RMNH MAM.21649: ad ♀, skull and alcoholic. Collection date: 1875. - Comments: The type locality was originally mentioned as "Liberia", but see Kuhn (1965: 327), who doubts this, since the type specimen had come from a zoo. - Etymology: In honour of Mr. A.A. van Bemmelen, director of the Zoological Gardens at Rotterdam, who presented the type specimen to the museum (see Jentink, 1879b: 127).
1897. *[Nyctinomus (Nyctinomus)] Vemmeleni:* Trouessart, Catalogus Mammalium tam viventium quam fossilium, nov. ed. 1, pt. 1: 146. Publication date: 1897. (Lapsus)
1903. *Nyctinomus cisturus* Thomas, Ann. Mag. nat. Hist., ser. 7, 12 (71): 502. Publication date: 1 November 1903. Type locality: Sudan: Equatoria province: 25 mi (37.5 km) N Gondokoro: Mangala (=Mongalla) [05 10 N 31 50 E, 500 m] [Goto Description]. Holotype: BMNH 1902.7.4.4: ad ♂. Collected by: W.L.S. Loat Esq. Original number: 2805. Presented/Donated by: W.L.S. Loat Esq.
? *Chaerephon bemmeleni:* (Name Combination, Current Combination)
? *Tadarida bemmeleni cistura:* (Name Combination)
? *Tadarida bemmeleni:* (Name Combination)

TAXONOMY:
Includes *cisturus*; see Koopman (1975: 425).

The data used by Herkt *et al.* (2017: Appendix S9) support the idea that *bemmeleni* includes more than one species. However, genetic tests to confirm this are not yet available, but material from the small overlapping area can clearly be allocated to the ssp. *cisturus*, rendering a large geographic gap between occurrence records of either population: one in West and western Central Africa (*bemmeleni*) and one in East Africa (*cisturus*).

COMMON NAMES:
Chinese: 腺尾犬吻蝠. Czech: morous liberijský. English: Gland-tailed Wrinkle-lipped Bat, Van Bemmelen's Wrinkle-lipped Bat, Gland-tailed Free-tailed Bat. French: Tadaride à glande caudale, Molosse à glandes caudales. German: Schwanzdrüsen-Bulldoggfledermaus, Bemmelens Bulldoggfledermaus.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, it occurs in a number of protected areas, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008am; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) [assessed as *Tadarida bemmeleni*] (Mickleburgh *et al.*, 2008am; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2004ba; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
The species is threatened by habitat loss, largely through logging activities and the conversion of land to agricultural use (Mickleburgh *et al.*, 2008am; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008am) [in IUCN (2009)] report that it is present in Meru National Park, Kenya, and is presumably present in several more protected areas. Further studies are needed into the taxonomy, natural history, threats and distribution of this species.

GENERAL DISTRIBUTION:
Chaerephon bemmeleni is widely distributed in Africa from Sierra Leone in the west, then patchily through West and Central Africa to southern Sudan, Uganda, Kenya and Tanzania in the east. It has been recorded up to 1,700 m asl on Mount Nimba along the border of Côte d'Ivoire and Guinea (J. Fahr *pers. Comm.*, 2004 in Mickleburgh *et al.*, 2008am in IUCN, 2009).

Native: Cameroon; Congo (The Democratic Republic of the); Côte d'Ivoire; Guinea; Kenya (Start, 1969; as *T. cistura*); Liberia; Rwanda; Sierra Leone; Sudan; Tanzania; Uganda.
Presence uncertain: Burkina Faso; Central African Republic; Chad; Ethiopia; Guinea-Bissau; Mali; Nigeria; Senegal.

MOLECULAR BIOLOGY:
DNA - unknown.
Karyotype - Nagorsen *et al.* (1976) reported 2*n* = 48, Fna = 54, BA = 8, a submetacentric X chromosome and an acrocentric Y chromosome.

POPULATION:
Structure and Density - The abundance of *C. bemmeleni* is unclear, in parts of the range it seems to be a rare species that is found in small colonies consisting of a few individuals. In East Africa this species exhibits a clumped distribution,

yet is relatively abundant locally (Webala *et al.*, 2004).
Trend - 2008 - Unknown (Mickleburgh *et al.*, 2008am; IUCN, 2009).

PARASITES:
Lainson and Naiff (2000: 128) and Duszynski (2002: 21) indicate that *C. bemmeleni* is the type host for *Eimeria levinei* Bray, 1958 (Apicomplexa).

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Cameroon, Congo (Democratic Republic of the), Kenya, Liberia, Sierra Leone, South Sudan, Tanzania, Uganda.

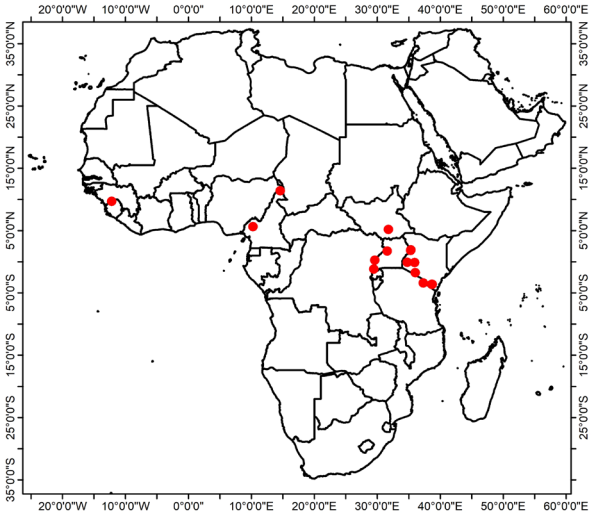

Figure 158. Distribution of *Chaerephon bemmeleni*

Chaerephon bivittatus (Heuglin, 1861)

*1861. *Nyctinomus bivittatus* Heuglin, Nov. Act. Acad. Cæs. Leop.-Carol., 29 (8): 4, 13. Publication date: 1861. Type locality: Eritrea: Kérén [ca. 15 45 N 38 20 E] [Goto Description]. Holotype: RMNH ??:. See Jentink (1888b: 203). Syntype: ZMB 2792a: skull and alcoholic. Collected by: Theodor Von Heuglin. Formerly SMNS, from "Abyssinia, Bogos[land]". See Turni and Kock (2008: 72). Syntype: ZMB 2792b: skull and alcoholic. Collected by: Theodor Von Heuglin. Formerly SMNS, from "Abyssinia, Bogos[land]". See Turni and Kock (2008: 72). Lectotype: SMNS 981: ad ♂, skull and alcoholic. Collected by: Martin Theodor von Heuglin; collection date: 1861. Presented/Donated by: ?: Collector Unknown. Dieterlen *et al.* (2013: 294) indicated this specimen to be the lectotype, referring to ICZN article 74.6, which would indicate that this status was established by Dobson (1878), who called specimen this "'type". However, Dobson (1878: 426) presents the measurements of an adult male, which he called the "type", but since there are two adult males (981 and 981b), it is not clear which of these two specimens was referred to by Dobson (1878). Paralectotype: SMNS 981a: ad ♀, skull and alcoholic. Collected by: Martin Theodor von Heuglin; collection date: 1861. Presented/Donated by: ?: Collector Unknown. See Dieterlen *et al.* (2013: 294). Paralectotype: SMNS 981b: ad ♂, skull and alcoholic. Collected by: Martin Theodor von Heuglin; collection date: 1861. Presented/Donated by: ?: Collector Unknown. See Dieterlen *et al.* (2013: 294), but see also note above. - Etymology: From the masculine scientific Latin adjective *bivittàtus*, meaning "bivittate", as the species is provided with two narrow longitudinal stripes on and behind the head (see Lanza *et al.*, 2015: 273).
1967. *Tadarida bivittata:* Ansell, Arnoldia Rhod., 2 (38): 29. (Name Combination)
2002. *Chaerephon bivittata:* Arroyo-Cabrales, Gregorin, Schlitter and Walker, 22 (2): 386.
2016. *Chaerophon bivittattus:* Simmons, Seiffert and Gunnell, Am. Mus. Novit., 3857: 43. Publication date: 9 May 2016. (Lapsus)
? *Chaerephon bivittatus:* (Name Combination, Current Combination)
? *Tadarida bivittata bivittata:* (Name Combination)

TAXONOMY:
Revised by Eger and Peterson (1979).

COMMON NAMES:
Afrikaans: Gevlekte losstertvlermuis. Chinese: 斑犬吻蝠. Czech: morous skvrnitý. English: Spotted Wrinkle-lipped Bat, Spotted Free-tailed Bat, Spotted Gland-tailed Bat. French: Tadaride tachetée, Molosse tacheté. German: Gefleckte Bulldoggfledermaus, zweistreifige Doggengrämler. Italian: Cherefónte bivittàto. Portuguese: Morcego de cauda livre malhado.

ETYMOLOGY OF COMMON NAME:
So named because of the tiny white, and sometimes barely discernible, flecks on the upper parts of the body (see Taylor, 2005).

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008ad; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) [assessed as *Tadarida bivittata*] (Mickleburgh *et al.*, 2008ad; IUCN, 2009). 2004 - LC ver 3.1 (2001) [assessed as *C. bivittata*] (Mickleburgh *et al.*, 2004an; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
There appear to be no major threats to this species as a whole (Mickleburgh *et al.*, 2008ad; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008ad) [in IUCN (2009)] report that there appear to be no direct conservation measures in place. It is presumably present in some East African protected areas. Further studies are needed into the abundance, distribution and natural history of this bat.

GENERAL DISTRIBUTION:
Chaerephon bivittatus is an East African species ranging from Eritrea and Ethiopia in the north, through southern Sudan, Uganda, Kenya and eastern Tanzania, to Zambia, Zimbabwe and Mozambique in the south.

Native: Eritrea; Ethiopia; Kenya; Malawi (Monadjem *et al.*, 2010d: 541); Mozambique (Crawford-Cabral, 1989; Simmons, 2005); Sudan; Tanzania; Uganda; Zambia (Ansell, 1978; Monadjem *et al.*, 2010d: 541); Zimbabwe (Ansell, 1986; Monadjem *et al.*, 2010d: 541).

MOLECULAR BIOLOGY:
DNA - Unknown.
Karyotype - Peterson and Nagorsen (1975) reported 2*n* = 48, FN = 54, BA = 8, a metacentric X chromosome, and an acrocentric Y chromosome for specimens from Kenya and Zimbabwe.
Protein / allozyme - Unknown.

POPULATION:
Structure and Density - Although there is little information on the abundance of this species, it is common in collections suggesting that it is easily found (Mickleburgh *et al.*, 2008ad; IUCN, 2009).
Trend - 2008 - Stable (Mickleburgh *et al.*, 2008ad; IUCN, 2009).

PARASITES:
Beaucournu and Kock (1996) mentioned the first record for the flea *Lagaropsylla anciauxi* Smit, 1957 on this bat.
Hastriter (2016: 15) described the flea *Araeopsylla smiti* from a *C. bivittatus* collected at Maji Moto, Kenya.

Copeland *et al.* (2011: 363) reported the rediscovery of the "terrible hairy fly" (*Mormotomyia hirsuta* (after 62 years) in guano produced by *C.* cf. *bivittatus* and *T. aegyptiaca* at Ukasi Hill, Kenya.

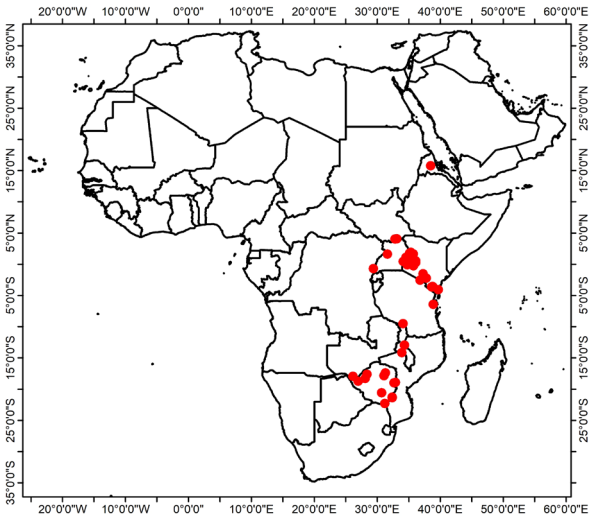

Figure 159. Distribution of *Chaerephon bivittatus*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Congo (Democratic Republic of the), Eritrea, Ethiopia, Kenya, Malawi, Mozambique, South Sudan, Tanzania, Uganda, Zambia, Zimbabwe.

Chaerephon chapini J.A. Allen, 1917

*1917. *Chærephon (Lophomops) chapini* J.A. Allen, Bull. Am. Mus. Nat. Hist., 37 (18): 460, 461, text-fig. 9. Publication date: 29 September 1917. Type locality: Congo (Democratic Republic of the): Oriental province: Uele district: Faradje [03 44 N 29 43 E] [Goto Description]. Holotype: AMNH 48841: ad ♂, skin and skull. Collected by: Herbert Lang, James Paul Chapin and The American Museum Congo Expedition; collection date: 11 November 1912; original number: 1971.

1926. *Chaerephon (Lophomops) shortridgei* Thomas, Proc. zool. Soc. Lond., 1926, I: 289. Publication date: 29 April 1926. Type locality: Namibia: NW Ovamboland: 32 mi NW of Rehoboth Mission Station: Ukualukasi [17 32 S 14 37 E, 3 400 ft] [Goto Description].

Holotype: BMNH 1925.12.4.24: skin and skull. Collected by: Captain Guy Chester Shortridge; original number: 1389. - Comments: Considered a valid species by Peterson *et al.* (1995: 159), Goodman and Cardiff (2004: 236). - Etymology: I have named this striking species in honour of Capt. Shortridge, to whose energy and enthusiasm the great success of the South West African collecting expeditions has been almost wholly due, and who was greatly struck by its remarkable appearance (see Thomas, 1926).

1938. *Chærephon lancasteri* Hayman, Ann. Mag. nat. Hist., ser. 11, 1 (4): 383. Publication date: 1 April 1938. Type locality: Zambia: Loangwa Valley: Lundazi district: Lunzi River [ca. 11 S 33 E] [Goto Description]. Holotype: BMNH 1937.12.8.25: ad ♂, skin and skull. Collected by: D. Gordon Lancaster; collection date: August 1936; original number: 724. Notes: caught in hole in tree. - Comments: Kock (1969a: 140) situates the Lunzi river in Zambia, rather than in Zimbabwe.

2009. *Choerephon (Lopomops) langi:* ACR [Goto Description]. - Comments: *nomen nudum*.

? *Tadarida chapini:* (Name Combination)

TAXONOMY:
Included in *pumilus* by Kock (1969a: 139). See Fenton and Eger (2002).

COMMON NAMES:
Afrikaans: Bleek losstertvlermuis. Chinese: 查平犬吻蝠. Czech: morous chocholatý. English: Long-crested Free-tailed Bat, Chapin's Wrinkle-lipped Bat, Long-crested Wrinkle-lipped Bat, Crested Wrinkle-lipped Bat, Chapin's Free-tailed Bat, Pale Free-tailed Bat, Long-crested Gland-tailed Bat, Crested Free-tail Bat. French: Tadaride de Chapin, Molosse à crinière, Molosse pâle. German: Chapins Bulldoggfledermaus.

ETYMOLOGY OF COMMON NAME:
Named after Mr. James P. Chapin, co-organiser of the American Museum expedition to the former Belgian Congo that resulted in the discovery of the species (Taylor, 2005).

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
No fossils are known (Fenton and Eger, 2002).

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, it occurs in a number of protected areas, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008ae; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) [assessed as *Tadarida chapini*] (Mickleburgh *et al.*, 2008ae; IUCN, 2009). 2004 - DD ver 3.1 (2001) (Mickleburgh *et al.*, 2004ag; IUCN, 2004). NT ver 3.1 (2001) [assessed as *Chaerephon shortridgei*] (Mickleburgh *et al.*, 2004ak; IUCN, 2004). 1996 - LR/nt (Baillie and Groombridge, 1996).

MAJOR THREATS:
There appear to be no major threats to this widespread species as a whole. It may be threatened in parts of its range through habitat loss and degradation (e.g. in northern Zimbabwe and parts of Zambia) (Mickleburgh *et al.*, 2008ae; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008ae) [in IUCN (2009)] report that it has been recorded from Kruger National Park in South Africa, and from Mole National Park in Ghana and Comoe.

GENERAL DISTRIBUTION:
Chaerephon chapini has been widely recorded over much of sub-Saharan Africa. It has been collected from Côte d'Ivoire and Ghana in West Africa, southern Sudan, northeastern Democratic Republic of the Congo, Ethiopia, Uganda and Kenya, ranging south into southern Democratic Republic of the Congo and Congo, Angola, Zimbabwe, Zambia, Botswana and Namibia.

Native: Angola (Monard, 1935; Crawford-Cabral, 1989; Hill and Carter, 1941; Monadjem *et al.*, 2010d: 541); Botswana (Monadjem *et al.*, 2010d: 541); Cameroon (Bol A Anong *et al.*, 2011: 46; Bakwo Fils *et al.*, 2014: 3); Congo (The Democratic Republic of the) (Hayman *et al.*, 1966; Fenton and Eger, 2002: 2; Monadjem *et al.*, 2010d: 541); Ethiopia; Ghana; Kenya (Fenton and Eger, 2002: 2); Namibia (Monadjem *et al.*, 2010d: 541); Sudan (Fenton and Eger, 2002: 2); Uganda;

Zambia (Ansell, 1969; Monadjem *et al.*, 2010d: 541); Zimbabwe (Monadjem *et al.*, 2010d: 541).

Bates *et al.* (2013: 338) reject the occurrence of *C. chapini* in the Republic of Congo as the "Marine Park Nature Reserve" was erroneously located in that country in ACR (2012) rather than in the DRC. The record from Cameroon is probably doubtful (Jakob Fahr, pers. comm.).

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
See Fenton and Eger (2002).

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:
See Fenton and Eger (2002).

DETAILED MORPHOLOGY:
Baculum - Unknown
For a description of the crania, teeth, ears and tragus see Fenton and Eger (2002).

SEXUAL DIMORPHISM:
Sexual dimorphism in the structure of interaural crest, with females having a small crest (3 - 5 mm) and males a long, bicolored one (12 - 15 mm) (Fenton and Eger, 2002). Krutzsch (2000: 128) pointed out that this crest is also odoriferous in the breeding male.

ECHOLOCATION:
Jacobs (1996) and Fenton and Bell (1981) reported a highest frequency of 27 kHz for individuals at Sengwa in Zimbabwe.

MOLECULAR BIOLOGY:
DNA - Unknown.
Karyotype - Rautenbach *et al.* (1993) reported 2*n* = 48, FN = 64, BA = 18, a subtelocentric X chromosome, and an acrocentric Y chromosome, for specimens from Namibia and Zimbabwe.
Protein / allozyme - Unknown.

HABITAT:
See Fenton and Eger (2002).

HABITS:
See Fenton and Eger, 2002).

Fenton and Griffin (1997: 248) recorded echolocation calls from "*Tadarida chapini*" at altitudes between 0 and 450 m above a *Brachystegia* woodland in Zimbabwe.

ROOST:
See Fenton and Eger (2002).

PREDATORS:
Mikula *et al.* (2016: Supplemental data) mention the Bat hawk (*Macheiramphus alcinus* Bonaparte, 1850) as diurnal avian predator.

POPULATION:
Structure and Density - In general there is little information on the abundance of this species over its range (Mickleburgh *et al.*, 2008ae; IUCN, 2009). It can be common in northwestern Zimbabwe, but it is not regularly recorded. The species is found in small colonies, with a single observation of a small group of breeding females.
Trend - 2008 - Unknown (Mickleburgh *et al.*, 2008ae; IUCN, 2009).

ACTIVITY AND BEHAVIOUR:
See Fenton and Eger, 2002).

REPRODUCTION AND ONTOGENY:
See Fenton and Eger (2002).

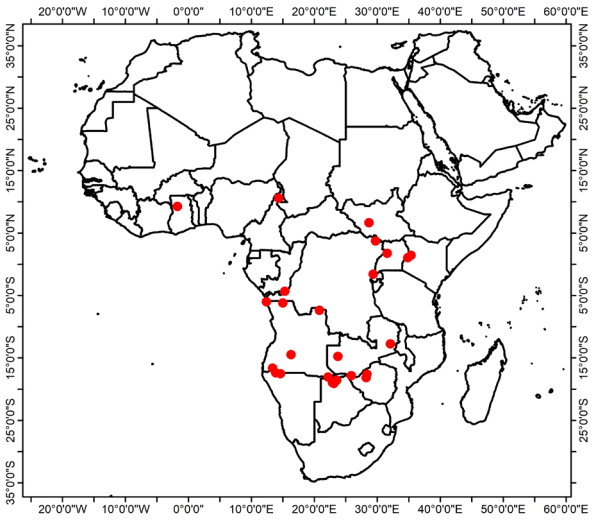

Figure 160. Distribution of *Chaerephon chapini*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Angola, Botswana, Cameroon, Congo (Democratic Republic of the), Ethiopia, Ghana, Kenya, Namibia, Rwanda, South Sudan, Uganda, Zambia, Zimbabwe.

Chaerephon gallagheri (Harrison, 1975)

*1975. *Tadarida (Chaerephon) gallagheri* Harrison, Mammalia, 39 (2): 313. Type locality: Congo (Democratic Republic of the): Kivu province: 30 km SW Kindu: Scierie Forest [03 10 S 25 46 E] [Goto Description]. Holotype: BMNH 1976.207: ad ♂. Collected by: Major Michael D. Gallagher; collection date: 14 November 1974; original number: MDG-3256. Presented/Donated by: ?: Collector Unknown. Formerly HZM 1.7797. Holotype: HZM

1.7797: ♂. Collected by: Major Michael D. Gallagher; collection date: 14 November 1974; original number: MDB-3256. Presented/Donated by: ?: Collector Unknown. - Etymology: In honour of Major M.D. Gallagher, the collector of the type specimen.

? *Chaerephon gallagheri:* (Name Combination, Current Combination)

TAXONOMY:
See Simmons (2005).

COMMON NAMES:
Czech: morous kivuský. English: Gallagher's Wrinkle-lipped Bat, Gallagher's Free-tailed Bat, Zaïre Gland-tailed Bat. French: Tadaride de Gallagher, Molosse du Zaïre. German: Gallaghers Bulldoggfledermaus.

CONSERVATION STATUS:
Global - Listed as Data Deficient (DD ver 3.1 (2001)) in view of the absence of recent information on its extent of occurrence, ecological requirements, threats and conservation status (Mickleburgh *et al.*, 2008ag; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) [assessed as *Tadarida gallagheri*] (Mickleburgh *et al.*, 2008ag; IUCN, 2009). 2004 - CR D ver 3.1 (2001) (Mickleburgh *et al.*, 2004ai; IUCN, 2004). 2002 - CR: B1+2c (Mickleburgh *et al.*, 2002a: 22). 1996 - CE (Baillie and Groombridge, 1996).

MAJOR THREATS:
The threats to this species are unclear. It may be threatened by habitat loss, through the conversion of forest to agricultural use and timber extraction, however, this needs to be confirmed (Mickleburgh *et al.*, 2008ag; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008ag) [in IUCN (2009)] report that there are no direct conservation measures in place for this species. It is not known if the species is present within any protected areas. Additional studies are needed into the distribution, abundance, natural history and threats to this poorly known species.

GENERAL DISTRIBUTION:
Chaerephon gallagheri has only been recorded from the type locality of 'Scierie Forest, 30 km of southwest Kindu, Kivu' in the Democratic Republic of the Congo. It may range more widely distributed, however, other surveys in the general area have not recorded this species.

Native: Congo (The Democratic Republic of the) (Gallagher and Harrison, 1977; Harrison, 1975a).

POPULATION:
Structure and Density - There is little information on the abundance of this species (Mickleburgh *et al.*, 2008ag; IUCN, 2009).
Trend - 2008 - Unknown (Mickleburgh *et al.*, 2008ag; IUCN, 2009).

Chaerephon jobimena Goodman and Cardiff, 2004

*2004. *Chaerephon jobimena* Goodman and Cardiff, Acta Chiropt., 6 (2): 230, fig 2, 3, 4. Type locality: Madagascar: Antsiranana province: Ankarana special reserve, 2.6 km E Andrafiabe: Andrafiaba cave, in forest near [12 55.9 S 49 03.4 E, ca. 50 m] [Goto Description]. Holotype: FMNH 169716: ad ♂, skin and skull. Collected by: Steven M. Goodman; collection date: 23 January 2001; original number: SMG 11932. See Goodman and Cardiff (2004: 230). - Etymology: From the northern dialects of Malagasy, with "*joby*" meaning dark or black and "*mena*" red. The combination refers to the two color morphs of this species (see Goodman and Cardiff, 2004: 230). (Current Combination)

TAXONOMY:
Lamb *et al.* (2011: 9) indicate that, although morphologically similar to other *Chaerephon* taxa, *jobimena* is genetically more similar to *Tadarida*.

COMMON NAMES:
Czech: morous malgašský. English: Black and Red Free-tailed Bat. French: Tadaride rouge ou noir. German: Variable Bulldoggfledermaus.

CONSERVATION STATUS:
Global - This species is listed as Least Concern (LC ver 3.1 (2001)) because although it appears to be rather rare in the few areas where it is known to occur, it is widespread and its population status may not be related to the amount or state of native forest. Additional information are needed on its propensity for roosting in large colonies in synanthropic settings as this will be crucial to a better understanding of its conservation status (Andriafidison *et al.*, 2008l; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) [assessed as *Tadarida jobimena*] (Andriafidison *et al.*, 2008l; IUCN, 2009).

MAJOR THREATS:
The threats to this species are not well known, but it is probably hunted in the south of Madagascar for food (Andriafidison *et al.*, 2008l; IUCN, 2009).

CONSERVATION ACTIONS:
Andriafidison *et al.* (2008l) [in IUCN (2009)] report that this species is known from in or near to four protected areas, but is never as common or as abundant as other sympatric molossid species (Goodman and Cardiff, 2004; Goodman *et al.*, 2005a) and its conservation status should be reviewed in the future when new data are available. In particular, information on its propensity to dwell in buildings is needed.

GENERAL DISTRIBUTION:
Chaerephon jobimena is endemic to Madagascar where it is found from the north-west to the south-west of the island. It is known to occur in areas with dry deciduous or spiny forest from 50 to 870 m above sea level (Goodman and Cardiff, 2004; Goodman *et al.*, 2005a). Although further surveys may reveal that this species is more widespread than currently known, it has yet to be recorded from some sites with extensive limestone caves, from where it would be expected based on habitat preference and distribution (Goodman and Cardiff, 2004; Goodman *et al.*, 2005a; Cardiff, 2006).
Native: Madagascar (Goodman and Cardiff, 2004; Goodman *et al.*, 2005a; Cardiff, 2006).

DETAILED MORPHOLOGY:
Baculum:
Rakotondramanana and Goodman (2017: 61) report the following shape for the baculum of this species: the proximal portion is notably expanded. Its size decreases slightly in the mid-shaft portion, then more notably distally. The distal tip tapers to a rounded point. Length: 1.16 mm, width: 0.37 mm.

HABITAT:
Dammhahn and Goodman (2013: 108) indicate that this species' foraging habitat consists of open areas and the area above the forest canopy.

POPULATION:
Structure and Density - The population and local abundance of this species are not known, but at Ankarana the recorded roost is 1,200 individuals (S. G. Cardiff *pers. obs.*, in Andriafidison *et al.*, 2008l [in IUCN, 2009]). Forty individuals were recorded from a house roughly 10 km from Parc National de Namoroka (A. F. Kofoky *pers. obs.*, in Andriafidison *et al.*, 2008l [in IUCN, 2009]).
Trend - 2008 - Unknown (Andriafidison *et al.*, 2008l; IUCN, 2009).

PARASITES:
Hastriter (2016: 9) described the flea *Araeopsylla goodmani* from a male *C. jobimena* collected at Isalo, 3.8 km NW Ranohira, along Namaza River, Madagascar.

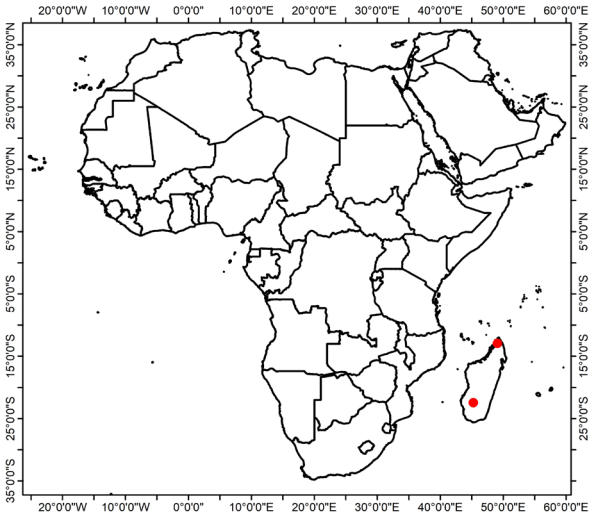

Figure 162. Distribution of *Chaerephon jobimena*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Madagascar.

Chaerephon leucogaster (A. Grandidier, 1869)

*1869. *Nyctinomus leucogaster* A. Grandidier, Rev. Mag. Zool., ser. 2, 21: 337. Publication date: September 1869. Type locality: Madagascar: Mahab (?Mahabo) and Ménabé (E of Morondava) [20 23 S 44 40 E, 50 m] [Goto Description]. Neotype: FMNH 176137: ad ♂, skull and alcoholic. Collected by: Vola Razakarivony; collection date: 11 November 2002. - Comments: Ratrimomanarivo *et al.* (2009a: 28) mention "The only specimen possibly fitting the details of the Grandidier type is MCZ 45094, which is in poor condition and the original specimen label bears the following information: 'Cote Ouest' [= west coast], '*Nyctinomus pumelus* [sic]', 'collection Grandidier', and '1901'. Based on numerous characters, including aspects of external, cranial, and dental measurements as well as pelage and soft part coloration, this animal is referable to *C. leucogaster*. However, the collection details are too ambiguous to clearly conclude that this specimen can be considered the type of *C. leucogaster* described by Grandidier (1869) and, further, the skull is considerably damaged." They also select a neotype (FMNH 176137): "collected in the Menabe Region of western coastal Madagascar, specifically at Belo sur Mer (20°44.139'S, 44°00.266'E) at 10 m above sea level on 11 November 2002 by Vola Razakarivony. This site is approximately 80 km southwest of Mahabo. The animal is an adult male, the body was preserved in formalin and subsequently transferred to 70% ethanol, the skull has been extracted, cleaned, and is in excellent condition.". - Etymology: From the Greek "*leugos*" and "*gaster*" meaning white-bellied (see Kozhurina, 2002: 16).

1908. *Chœrephon websteri* Dollman, Ann. Mag. nat. Hist., ser. 8, 2 (12): 546. Publication date: 1 December 1908. Type locality: Nigeria: N Nigeria, on Bénoué river: Yola [09 12 N 12 29 E]. Holotype: BMNH 1908.10.6.8: ad ♀, skin and skull. Collected by: G.W. Webster; collection date: 27 July 1908; original number: 11.

1917. *Chærephon (Lophomops) cristatus* J.A. Allen, Bull. Am. Mus. Nat. Hist., 37 (18): 463, text-fig. 10 A, B. Publication date: 29 September 1917. Type locality: Congo (Democratic Republic of the): Kinshasa province: near mouth of Congo River: Boma [05 50 S 13 03 E] [Goto Description]. Holotype: AMNH 48844: ad ♂, skin and skull. Collected by: Herbert Lang, James Paul Chapin and The American Museum Congo Expedition; collection date: 26 January 1915; original number: 2628.

1917. *Chærephon frater* J.A. Allen, Bull. Am. Mus. Nat. Hist., 37 (18): 456. Publication date: 29 September 1917. Type locality: Congo (Democratic Republic of the): Kinshasa province: near Boma: Malela [05 57 S 12 38 E, 30 m] [Goto Description]. Holotype: AMNH 49275: ad ♀, skull and alcoholic. Collected by: Herbert Lang, James Paul Chapin and The American Museum Congo Expedition; collection date: 8 July 1915; original number: 2613. Topotype: MCZ 17219: ♀, alcoholic (skull not removed). Collected by: Herbert Lang, James Paul Chapin and The American Museum Congo Expedition; collection date: 8 July 1915. Presented/Donated by: ?: Collector Unknown. Topotype: MCZ 17221: ♀, alcoholic (skull not removed). Collected by: Herbert Lang, James Paul Chapin and The American Museum Congo Expedition; collection date: 8 July 1915. Presented/Donated by: ?: Collector Unknown.

1928. *Chærophon (Lophomops) nigri* Hatt, Bull. Soc. zool. France, 53: 374, text-fig. B. Publication date: 10 December 1928. Type locality: Mali: Timbuctu district: on Niger River: Bourem [16 59 N 00 20 W] [Goto Description]. Holotype: MNHN 736a: ad ♂, alcoholic (skull not removed). Collected by: Th. Monod; collection date: 6 January 1928. Paratype: AMNH 90390: ad ♂, skin and skull. Collected by: Th. Monod; collection date: 6 January 1928; original number: M.S.A.D. 736b. See AMNH website.

? *Tadarida websteri:* (Name Combination)

TAXONOMY:
Included in *pumilus* by Koopman (1993a: 233), Bouchard (1998: 1).
Considered a valid species in the genus *Tadarida (C.)* by Peterson *et al.* (1995: 152) and Russ *et al.* (2001). Considered a valid species in the genus *Chaerephon* by Hutson *et al.* (2001: 33), Goodman and Cardiff (2004: 227), Lavrenchenko *et al.* (2004b: 141), and Simmons (2005).
Russ *et al.* (2001) distinguish it from *C. pumilus* on smaller size and different echolocation calls. Ammerman *et al.* (2012: 23) indicate that the separation between *leucogaster* and *pumilus* took place less than 2 million years ago.

COMMON NAMES:
Czech: morous bělobřichý. English: Grandidier's Free-tailed Bat, Madagascan white-bellied Free-tailed Bat. French: Tadaride de Madagascar à ventre blanc, Tadaride à ventre blanc, Petite tadaride de Madagascar. German: Grandidiers Bulldoggfledermaus.

CONSERVATION STATUS:
Global - DD ver 2.3 (1994).

GENERAL DISTRIBUTION:
Ethiopia to Ghana, Nigeria, Cameroon (Bol A Anong *et al.*, 2011: 46; Bakwo Fils *et al.*, 2014: 4), Congo (Bates *et al.*, 2013: 336), Congo (Democratic Republic of the Congo?), Mali, Madagascar (Russ *et al.*, 2001), Nosy Be and Nosy Komba (Rakotonandrasana and Goodman, 2007: 6).

O'Brien (2011: 288) reports it further from the Comoros, and the Tanzanian islands of Pemba, Unguja [=Zanzibar], and Mafia.

BIOGEOGRAPHY:
Chaerephon leucogaster is found across an elevational range of 0 - 920 m a.s.l., and is confined almost exclusively to the more extensive and drier western portion of Madagascar (Lamb *et al.*, 2012: 19).

DETAILED MORPHOLOGY:
Baculum:
Rakotondramanana and Goodman (2017: 61) describe the baculum of *C. leucogaster* as "Eiffel tower shaped", with a bifurcated proximal tip that tapers abruptly to a distal point; length: 0.78 ± 0.072 (0.65 - 0.89) mm, width: 0.47 ± 0.055 (0.37 - 0.58) mm.

HABITAT:
Lamb *et al.* (2012: 29) indicate that the highly suitable habitat for this species was associated with low annual rainfall, high mean annual temperature, and high human influence.

Dammhahn and Goodman (2013: 108) indicate that this species' foraging habitat consists of open areas and the area above the forest canopy.

ROOST:
Ravelomanantsoa *et al.* (2019: 111) indicated that *Chaerephon leucogaster* uses human constructions for roosting.

PREDATORS:
Goodman *et al.* (2015c: 78) found the remains of four individuals in pellets of Bat Hawk *Macheiramphus alcinus* Bonaparte, 1850 in western central Madagascar.

PARASITES:
BACTERIA
Gomard *et al.* (2016: 5) found 1 out of 94 tested bats to be positive for *Leptospira*.

SIPHONAPTERA
Ischnopsyllidae: *Lagaropsylla consularis* Smit, 1957 from Ethiopia, Kenya, Uganda, Congo and Congo (Democratic Republic of), Angola, Zimbabwe and Mozambique (Haeselbarth *et al.*, 1966: 190, host referred to as *Tadarida frater*).

VIRUSES:
Paramyxoviridae
Specimens from this species tested by Wilkinson *et al.* (2014: 8270) were found to be positive for paramyxoviruses.
Mélade *et al.* (2016b: 4) tested 94 Madagascan specimens, of which 6 were found positive for paramyxoviruses.

Rhabdoviridae
Mélade *et al.* (2016a: 6) tested 28 bats for *Duvenhage lyssavirus* and foud seroreactivlty in nine of them.

UTILISATION:
See Goodman *et al.* (2008d).

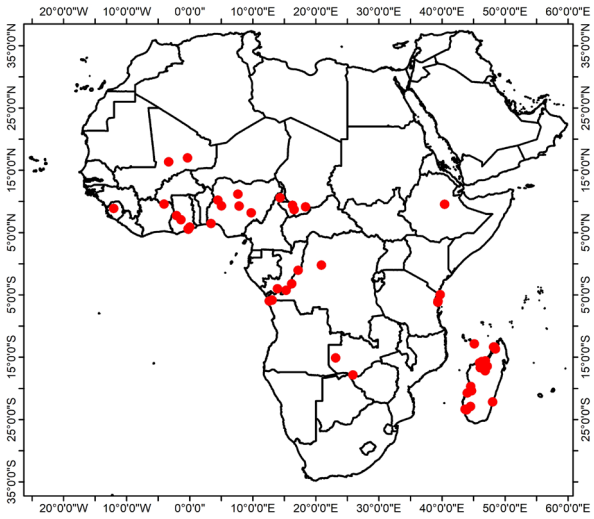

Figure 163. Distribution of *Chaerephon leucogaster*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Cameroon, Central African Republic, Chad, Congo, Congo (Democratic Republic of the), Côte d'Ivoire, Ethiopia, Ghana, Madagascar, Mali, Mayotte, Nigeria, Sierra Leone, Tanzania, Zambia.

Chaerephon major (Trouessart, 1897)

*1897. *[Nyctinomus (Nyctinomus) pumilus] Var. Major* Trouessart, Catalogus Mammalium tam viventium quam fossilium, nov. ed. 1, pt. 1: 146. Publication date: 1897. Type locality: Sudan: N Sudan: 5th Cataract of the Nile [18 32 N 33 41 E] [Goto Description]. Holotype: BMNH 1849.2.8.36: Collected by: Sir Francis Galton. - Comments: Kock (1969a: 148) mentions "Nilus super = 5. Nil-Katarakt, nördlich Berber, Sudan" as original type locality. He also states that de Winton (1901a: 40) changed the type locality in "erster Kakarakt der Nil".). - Etymology: From the Latin "*maior*" (see Kozhurina, 2002: 16).

1901. *Nyctinomus Emini* de Winton, Ann. Mag. nat. Hist., ser. 7, 7 (37): 40. Publication date: 1 January 1901. Type locality: Tanzania: "Mosambiro" [=Usambiro] [03 00 S 32 34 E] [Goto Description]. Holotype: BMNH 1890.6.8.15: ad ♂, skin and skull. Collection date: 9 September 1889. Notes: Local name - 'Katunke'. - Comments: See Thorn *et al.* (2009: 72).

1917. *Chærephon (Lophomops) abæ* J.A. Allen, Bull. Am. Mus. Nat. Hist., 37 (18): 464, text-fig. 11. Publication date: 29 September 1917. Type locality: Congo (Democratic Republic of the): Oriental province: Uele district: Aba [03 53 N 30 17 E] [Goto Description]. Holotype: AMNH 48887: ad ♀, skin and skull. Collected by: Herbert Lang, James Paul Chapin and The American Museum Congo Expedition; collection date: 17 December 1911; original number: 1823.

1967. *Tadarida (Chaerephon) pumila:* Happold, Sudan Notes & Records, 48: 122. - Comments: Preoccupied by *pumilus* Cretzschmar, 1830 (see Simmons, 2005). Attribution to *major* seems strange.

? *Chaerephon abae:* (Alternate Spelling)

? *Chaerephon major:* (Name Combination, Current Combination)

? *Tadarida (Chaerephon) major:* (Name Combination)

? *Tadarida abae:* (Name Combination)

? *Tadarida major:* (Name Combination)

TAXONOMY:
See Simmons (2005).

COMMON NAMES:
Chinese: 垂耳犬吻蝠. Czech: morous nubijský. English: Large Wrinkle-lipped Bat, Lappet-eared Wrinkle-lipped Bat, Lappet-eared Free-tailed Bat, Giant gland-tailed bat. French: Tadaride à oreillettes, Grand molosse à glandes caudales. German: Stirnlappen-Bulldoggfledermaus.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008ah; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) [assessed as *Tadarida major*] (Mickleburgh *et al.*, 2008ah; IUCN, 2009).
2004 - LC ver 3.1 (2001) (Mickleburgh *et al.*,

2004am; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
There are no major threats to this species. Some populations are threatened by general habitat loss and disturbance of old buildings (Mickleburgh *et al.*, 2008ah; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008ah) [in IUCN (2009)] report that the species has a wide range, and likely occurs in some protected areas, although this needs to be confirmed. No direct conservation measures are currently needed for this species as a whole.

GENERAL DISTRIBUTION:
Chaerephon major is a lowland species is found throughout much of West Africa (including Senegal, Liberia, Côte d'Ivoire, Mali, Burkina, Ghana, Togo, Benin, Niger, and Nigeria), as well as a narrow distribution following the Nile from northern Sudan to Uganda. A second population is known from the east of Lake Victoria in eastern Uganda, western Kenya, and north-western Tanzania. A third, apparently disjunct, population is present in southeastern Kenya and northeastern Tanzania.

The records from Liberia should be re-examined as they may represent a different species, while the record from Malawi is doubtful (J. Fahr *pers. comm.* 2004 in Mickleburgh *et al.*, 2008ah in IUCN, 2009).

Native: Benin (Capo-Chichi *et al.*, 2004: 163); Burkina Faso (Kangoyé *et al.*, 2015a: 617); Cameroon (Bakwo Fils *et al.*, 2014: 4); Congo (The Democratic Republic of the); Côte d'Ivoire; Ghana; Guinea; Kenya; Liberia; Mali; Niger; Nigeria; Senegal; Sudan; Tanzania; Togo; Uganda (Kityo and Kerbis, 1996: 63); Zambia (Monadjem *et al.*, 2010d: 541).

ECHOLOCATION:
From Maroua, Cameroon, Manga Mongombe (2012: 79) and Bakwo Fils *et al.* (2018: 4) reported for 16 calls a call type of FM and the following parameters: F_{max}: 39.3 ± 6.9 (31.9 - 53.1) kHz, F_{min}: 37.4 ± 6.7 (25.9 - 49.0) kHz, F_{mean}: 36.4 ± 6.7 (28.7 - 51.0) kHz, F_{knee}: 38.2 ± 7.3 (29.9 - 53.1) kHZ, F_{char}: 33.7 ± 7.3 (26.2 - 49.0) kHz, and duration: 1.66 ± 0.40 (0.85 - 2.73) msec.

POPULATION:
Structure and Density - This is a relatively common species, found in fairly small colonies (Mickleburgh *et al.*, 2008ah; IUCN, 2009).
Trend - 2008 - Stable (Mickleburgh *et al.*, 2008ah; IUCN, 2009).

PARASITES:
Beaucournu and Kock (1996) reported the first record for the flea *Lagaropsylla anciauxi* Smit, 1957 on "*Tadarida major*" from Burkina Faso.

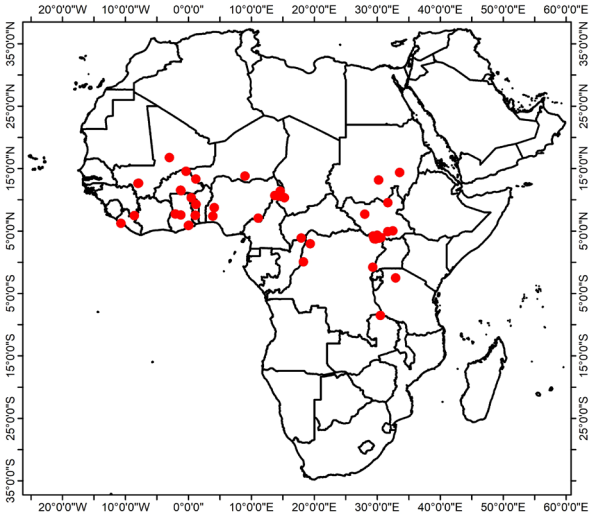

Figure 164. Distribution of *Chaerephon major*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Burkina Faso, Cameroon, Central African Republic, Congo (Democratic Republic of the), Ghana, Liberia, Mali, Niger, Nigeria, South Sudan, Sudan, Tanzania, Togo, Uganda, Zambia, Zimbabwe.

Chaerephon nigeriae Thomas, 1913

*1913. *Chærephon nigeriæ* Thomas, Ann. Mag. nat. Hist., ser. 8, 11 (63): 319. Publication date: 1 March 1913. Type locality: Nigeria: Northern region: Zaria province [ca. 11 01 N 07 44 E] [Goto Description]. Holotype: BMNH 1911.3.22.1: ad ♀. Collected by: A.C. Francis Esq. Presented/Donated by: A.C. Francis Esq. - Etymology: From the genitive scientific Latin feminine substantive *nigèriae*, meaning "from Nigeria", as the species was described from a Nigerian specimen (see Lanza *et al.*, 2015: 277).
1957. *Tadarida (Chearephon) spillmani:* Ansell, Ann. Mag. nat. Hist., ser. 12 (10): 539. (Lapsus)

2004. *Tadarida (Chaeraphon) nigeriae:* Okafor, Igbinosa and Ezenwaji, Anim. Res. Int., 1 (1): 64. Publication date: April 2004. (Name Combination, Lapsus)

? *Chaerephon nigerae:* (Lapsus)
? *Chaerephon nigeriae:* (Current Spelling)
? *Tadarida (Chaerephon) nigeriae nigeriae:* (Name Combination)
? *Tadarida nigeriae nigeriae:* (Name Combination)
? *Tadarida nigeriae:* (Name Combination)

TAXONOMY:
See Willis *et al.* (2002, Mammalian Species, 710).

This may be a complex of two distinct species, with *Chaerephon nigeriae* in the north of the known distribution and *C. spillmanni* in the south. We follow Simmons (2005) in currently recognizing *spillmanni* Monard, 1933 as a subspecies of *C. nigeriae*.

Herkt *et al.* (2017: Appendix S9) found that the localities in the southern part of the distribution area suggest rather different ecological niches than those for the northern part, which would suggest that more than one species might be included.

COMMON NAMES:
Afrikaans: Nigeriese losstertvlermuis. Azande (DRC): Fulo. Czech: morous nigerijský. English: Nigerian Free-tailed Bat, Nigerian Wrinkle-lipped Bat. French: Tadaride du Nigeria, Molosse du Nigéria. German: Nigeria-Bulldoggfledermaus. Italian: Cherefónte nigeriàno.

ETYMOLOGY OF COMMON NAME:
The species was originally described from a specimen from Nigeria (see Taylor, 2005).

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008ai; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) [assessed as *Tadarida nigeriae*] (Mickleburgh *et al.*, 2008ai; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2004af; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

Regional -
South Africa: 2004 - considered a vagrant not assessed, not recorded in SA (Friedmann and Daly, 2004).

MAJOR THREATS:
There appear to be no major threats to this species (Mickleburgh *et al.*, 2008ai; IUCN, 2009). The ability of the species to exploit buildings as roosts, and its association with cleared rainforest in Nigeria, suggests that it is relatively resistant to anthropogenic impacts (Willis *et al.*, 2002).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008ai) [in IUCN (2009)] report that in view of the species wide range, it is presumably present in some protected areas. No direct conservation measures are currently needed for this species as a whole.

GENERAL DISTRIBUTION:
Chaerephon nigeriae is widely distributed over much of sub-Saharan Africa. It ranges from Sierra Leone in the west to Ethiopia in the east, being recorded as far south as Angola, Botswana and Zimbabwe. There are some additional records from the Arabian Peninsula in Yemen and western Saudi Arabia. The species has been found at elevations of up to 1,000 m asl, and possibly occur higher.

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 1,133,308 km^2.

Native: Angola (Crawford-Cabral, 1989; Al-Jumaily, 2002: 55; Monadjem *et al.*, 2010d: 541; Taylor *et al.*, 2018b: 60); Botswana (Archer, 1977; Al-Jumaily, 2002: 55; Monadjem *et al.*, 2010d: 541); Burkina Faso (Kangoyé *et al.*, 2012: 6024; 2015a: 618); Burundi; Cameroon; Central African Republic (Al-Jumaily, 2002: 55); Chad (Al-Jumaily, 2002: 55); Congo; Congo (The Democratic Republic of the) (Hayman *et al.*, 1966; Al-Jumaily, 2002: 55; Monadjem *et al.*, 2010d: 541); Côte d'Ivoire (Beaucournu and Fahr, 2003: 157; but see Al-Jumaily, 2002); Ethiopia (Al-Jumaily, 2002: 55); Ghana (Al-Jumaily, 2002: 55); Guinea (Al-Jumaily, 2002: 55); Malawi (Happold and Happold, 1997b: 823; Al-Jumaily, 2002: 55); Mali (Al-Jumaily, 2002: 55); Mozambique; Namibia (Al-Jumaily, 2002: 55; Monadjem *et al.*, 2010d: 541); Niger (Al-Jumaily, 2002: 55); Nigeria (Al-Jumaily, 2002: 55); Saudi Arabia (Nader and Kock, 1980); Sierra Leone (Al-Jumaily, 2002: 55); Sudan; Tanzania (Al-Jumaily, 2002: 55); Uganda (Al-Jumaily, 2002: 55); Yemen (Al-Jumaily, 2002: 55; Benda *et al.*, 2011b: 46); Zambia (Ansell, 1957; Ansell and Ansell, 1973; Cotterill, 2004a: 261; Al-Jumaily, 2002: 55; Monadjem *et al.*, 2010d: 541); Zimbabwe (Al-Jumaily, 2002: 55; Monadjem *et al.*, 2010d: 542).

Presence uncertain: Togo (Al-Jumaily, 2002: 55).

ECHOLOCATION:
See Taylor (1999b).

MOLECULAR BIOLOGY:
DNA - Unknown.
Karyotype - Rautenbach *et al.* (1993) reported 2*n* = 48, FN = 62, BA = 16, a submetacentric X chromosome, and an acrocentric Y chromosome, for specimens from Namibia and Zimbabwe

PREDATORS:
Mikula *et al.* (2016: Supplemental data) mention the Bat hawk (*Macheiramphus alcinus* Bonaparte, 1850) as diurnal avian predator.

POPULATION:
Structure and Density - This species is typically found in small groups of 10 to 15 animals, with maternity roosts being formed of up to 25 bats (Mickleburgh *et al.*, 2008ai; IUCN, 2009).
Trend - 2008 - Unknown (Mickleburgh *et al.*, 2008ai; IUCN, 2009).

PARASITES:
BACTERIA
Bartonellae
Kamani *et al.* (2014: 628) tested 16 Nigerian *C. nigeriae* animals, and found 2 of them testing positive for *Bartonella* DNA.

Helminths
Okafor *et al.* (2004: 64) investigated the helminth parasite load of 857 *C. nigeriae* specimens from Nigeria and found 658 (76.78 %) of them to be infected by 9 species: Nematodes: *Rictularia chaerephoni, Histostrongylus coronatus, Capillaria annulosa* Dujardin, 1845, *Cheiropteronema globocephala* Sandground, 1929, *Litosoma pujoli* Bain, 1966; Trematodes: *Posthodendrium panouterus, Castroia nyctali* Gvosdev, 1954; Cestodes: *Hymenolepis kerivoulae* (Prudhoe and Manger, 1969), *Oochoristica agamae* Bayliss, 1919.

? *Tadarida (Chærephon) spillmani:* (Name Combination, Alternate Spelling)

GENERAL DISTRIBUTION:
Southern Africa (Angola (Horácek *et al.*, 2000: 137), Namibia (Willis *et al.*, 2002: 2), Botswana (Willis *et al.*, 2002: 2), Zimbabwe (Wilson and La Val, 1974: 2), Zambia (Willis *et al.*, 2002: 2), S Democratic Republic of the Congo (Willis *et al.*, 2002: 2), Tanzania (Horácek *et al.*, 2000: 137).

PARASITES:
SIPHONAPTERA
Ischnopsyllidae: *Lagaropsylla lipsi* Smit,1957 known only from the vicinity of Elisabethville, Katanga, Congo (Haeselbarth *et al.*, 1966: 191).

Chaerephon pumilus (Cretzschmar, 1826)

*1826. *Dysopes pumilus* Cretzschmar, in: Rüppell, Atlas Reise Nördlichen Afrika, Zoologie Säugethiere, 1: 69, pl. 27a. Type locality: Eritrea: Massawa [15 37 N 39 26 E] [Goto Description]. Lectotype: SMF 4311: ♀, skin and skull. Collected by: Wilhem Peter Edward Simon Rüppell; collection date: 1825. Old catalog II.K.3.a: see Mertens (1925: 20). - Comments: The publication date of Cretzschmar's work is sometimes indicated as "1826" (as mentioned on the title page), but also as "1827", "1828", "1830-1831". - Etymology: From the masculine Latin adjective *pùmilus*, meaning "of short stature, dwarf or pygmy" as the species is a particularly small African molossid (see Lanza *et al.*, 2015: 282).
1838. *Nyctinomus pusilus:* Lesson, Compléments de Buffon, ed. 2, Paris, 1: 328. Publication date: 1838. (Lapsus)
1852. *Dysopes dubius* Peters, Naturwissenschaftliche Reise nach Mossambique, Zoologie, Säugethiere, 60, pl. 15, fig. 2. Publication date: 1852. Type locality: Mozambique: South bank of Zambezi River: Sena [17 28 S 35 01 E] [Goto Description]. Holotype: ZMB 85539: juv, skull only. Collected by: Prof. Wilhelm Carl Hartwig Peters; collection date: between 1843 and 1847. Pullus specimen; see Turni and Kock (2008: 72). - Comments: Preoccupied by *dubius* A. Smith, 1833 (see Simmons, 2005). Allen (1939a: 111) also mentioned *Nyctinomus dubius* A. Smith, 1833 as a separate species. Turni and Kock (2008: 72) state that no other African molossid collected was ever identified with *D. dubius* until Ellerman *et al.* (1953: 68) synonymized it without any comment. Peters´ species description on the *pullus* specimen ZMB 85539 is very questionable, so they conclude that *dubius* is a *nomen dubium*.
1852. *Dysopes limbatus* Peters, Naturwissenschaftliche Reise nach Mossambique, Zoologie, Säugethiere, 56, pl. 14. Publication date: 1852. Type locality: Mozambique: Mozambique Island [15 03 S 40 46 E] [Goto Description]. Syntype: BMNH 1907.1.1.704:. Syntype: ZMB 537/85520: ad ♂, skin and skull. Collected by: Prof. Wilhelm Carl Hartwig Peters; collection date: between 1843 and 1847. See Turni and Kock (2008) [skin: ZMB 537 / skull: ZMB 85520]. Syntype: ZMB 538/85519: ad ♀, skin and skull. Collected by: Prof. Wilhelm Carl Hartwig Peters; collection date: between 1843 and 1847. See Turni and Kock (2008) [skin: ZMB 538 + skull: ZMB 85519]. Syntype: ZMB 539: juv, skin only. Collected by: Prof. Wilhelm Carl Hartwig Peters; collection date: between 1843 and 1847. See Turni and Kock (2008). - Comments: Peters (1852: 56) mentions "Africa orientalis, Insula Mozambique, Sena at 15° ad 17° Let. Aust.", and Roberts (1951: 98) "Mozambique Island and Sena"). Possibly valid as a subspecies. Considered a valid species by Peterson *et al.* (1995: 159).
1877. *Nyctinomus [(Nyctinomus)] limbatus:* Dobson, Proc. zool. Soc. Lond., 1876, IV: 724. Publication date: April 1877. (Name Combination)

1877. *Nyctinomus [(Nyctinomus)] pumilus:* Dobson, Proc. zool. Soc. Lond., 1876, IV: 723. Publication date: April 1877. (Name Combination)

1878. *Nyctinomus limbatus:* Dobson, Catalogue of the Chiroptera of the collection of the British Museum, 428. - Comments: . (Name Combination)

1901. *Nyctinomus gambianus* de Winton, Ann. Mag. nat. Hist., ser. 7, 7 (37): 39. Publication date: 1 January 1901. Type locality: The Gambia: "Gambia" [Goto Description]. Holotype: BMNH 1889.10.7.3:.

1904. *Nyctinomus hindei* Thomas, Ann. Mag. nat. Hist., ser. 7, 13 (75): 210. Publication date: 1 March 1904. Type locality: Kenya: Fort Hall [=Muranga] [00 43 S 37 09 E, 4 000 ft] [Goto Description]. Holotype: BMNH 1903.3.2.4: ad ♂. Collected by: Mrs. Hildegarde Hinde; collection date: 1 January 1903; original number: 134. Presented/Donated by: Mrs. Hildegarde Hinde. - Comments: Possibly valid as a subspecies. Considered a valid species by Peterson *et al.* (1995: 159). Thomas (1904a: 210) mentions 2 specimens.

1916. *Chaerephon pumilus naivashæ* Hollister, Smiths. Misc. Coll., 66 (1) (2406): 4. Publication date: 10 February 1916. Type locality: Kenya: Naivasha Station [00 43 S 36 26 E] [Goto Description]. Holotype: USNM 166658: ad ♂, skull and alcoholic. Collected by: John Alden Loring; collection date: 7 August 1909; original number: 6955. Topotype: ROM 36466: ad ♂, skin and skull. Collected by: John George Williams; collection date: 10 July 1965. Presented/Donated by: ?: Collector Unknown. Topotype: ROM 36467: ad ♀, skin and skull. Collected by: John George Williams; collection date: 17 July 1965. Presented/Donated by: ?: Collector Unknown. Topotype: ROM 36468: ad ♀, skin and skull. Collected by: John George Williams; collection date: 17 July 1965. Presented/Donated by: ?: Collector Unknown. Topotype: ROM 36469: ad ♀, skin and skull. Collected by: John George Williams; collection date: 17 July 1965. Presented/Donated by: ?: Collector Unknown. Topotype: ROM 36470: ad ♂, skin and skull. Collected by: John George Williams; collection date: 17 July 1965. Presented/Donated by: ?: Collector Unknown. Topotype: ROM 36471: ad ♀, skin and skull. Collected by: John George Williams; collection date: 10 August 1965. Presented/Donated by: ?: Collector Unknown. Topotype: ROM 36472: ad ♀, skin and skull. Collected by: John George Williams; collection date: 10 August 1965. Presented/Donated by: ?: Collector Unknown. Topotype: ROM 41842: juv ♂, alcoholic (skull not removed). Collected by: Randolph L. Peterson, John George Williams and Robert M. Glen; collection date: 9 August 1967. Presented/Donated by: ?: Collector Unknown. Topotype: ROM 41843: juv ♀, alcoholic (skull not removed). Collected by: Randolph L. Peterson, John George Williams and Robert M. Glen; collection date: 9 August 1967. Presented/Donated by: ?: Collector Unknown. Topotype: ROM 41844: juv ♂, alcoholic (skull not removed). Collected by: Randolph L. Peterson, John George Williams and Robert M. Glen; collection date: 9 August 1967. Presented/Donated by: ?: Collector Unknown. Topotype: ROM 41845: juv ♂, alcoholic (skull not removed). Collected by: Randolph L. Peterson, John George Williams and Robert M. Glen; collection date: 9 August 1967. Presented/Donated by: ?: Collector Unknown. Topotype: ROM 41846: juv ♂, alcoholic (skull not removed). Collected by: Randolph L. Peterson, John George Williams and Robert M. Glen; collection date: 9 August 1967. Presented/Donated by: ?: Collector Unknown. Topotype: ROM 41847: juv ♂, alcoholic (skull not removed). Collected by: Randolph L. Peterson, John George Williams and Robert M. Glen; collection date: 9 August 1967. Presented/Donated by: ?: Collector Unknown. Topotype: ROM 41848: juv ♀, alcoholic (skull not removed). Collected by: Randolph L. Peterson, John George Williams and Robert M. Glen; collection date: 9 August 1967. Presented/Donated by: ?: Collector Unknown. Topotype: ROM 41849: juv ♀, alcoholic (skull not removed). Collected by: Randolph L. Peterson, John George Williams and Robert M. Glen; collection date: 9 August 1967. Presented/Donated by: ?: Collector Unknown. Topotype: ROM 41850: ad ♂, alcoholic (skull not removed). Collected by: Randolph L. Peterson, John George Williams and Robert M. Glen; collection date: 9 August 1967. Presented/Donated by: ?: Collector Unknown. Topotype: ROM 41851: ad ♀, alcoholic (skull not removed). Collected by: Randolph L. Peterson, John George Williams and Robert M. Glen; collection date: 9 August 1967. Presented/Donated by: ?: Collector Unknown. Topotype: ROM 41852: ad ♀, alcoholic (skull not removed). Collected by: Randolph L. Peterson, John George Williams and Robert M. Glen; collection date: 9 August 1967. Presented/Donated by: ?: Collector Unknown. Topotype: ROM 41853: ad ♂, alcoholic (skull not removed). Collected by: Randolph L. Peterson, John George Williams and Robert M. Glen; collection

date: 9 August 1967. Presented/Donated by: ?: Collector Unknown. Topotype: ROM 41854: ad ♂, alcoholic (skull not removed). Collected by: Randolph L. Peterson, John George Williams and Robert M. Glen; collection date: 9 August 1967. Presented/Donated by: ?: Collector Unknown. Topotype: ROM 41855: ad ♀, alcoholic (skull not removed). Collected by: Randolph L. Peterson, John George Williams and Robert M. Glen; collection date: 9 August 1967. Presented/Donated by: ?: Collector Unknown. Topotype: ROM 41856: ad ♀, alcoholic (skull not removed). Collected by: Randolph L. Peterson, John George Williams and Robert M. Glen; collection date: 9 August 1967. Presented/Donated by: ?: Collector Unknown. TAXONOMY:

Figure 166. *Chaerephon pumilus*.

See Bouchard (1998, Mammalian Species, 574). Formerly included *pusillus*; see Hayman and Hill (1971: 64), but see Goodman and Ratrimomanarivo (2007: 391). The description date is sometimes mentioned as "1830 or 1831" (see Happold and Happold (1997b: 823). Peterson *et al.* (1995: 162) consider *pumilus* not to include most of the forms occurring on Madagascar. Horácek *et al.* (2000: 136) include *pumilus* in the genus *Tadarida*, subgenus *Chaerephon*. Taylor (1999b), Aspetsberger *et al.* (2003: 250; 252) indicate that cryptic species might exist within the genus *Chaerephon* (more specifically in *pumilus*), but find it premature to identify them already. Jacobs *et al.* (2004ar: 17)

identified five haplotypes, but indicate they represent only one species.

Naidoo *et al.* (2013c: 134) indicate that southeast African *C. pumilus s.l.* contains several well-suported sympatric genetic lineages (they identified three clades), which exibit paraphyly with the Malagasy *C. leucogaster*. They were not able to to distinguish these clades based on echolocation characteristics (p. 137), but suggest that these stable sympatric lineages might be the result of female philopatry or roost faithfulness.

Naidoo *et al.* (2016) used cyt *b*, control region, and Rag2 data on a large number of representatives from the *Chaerephon pumilus* species complex from islands in the western Indian Ocean, and eastern and southeastern Africa. They found that *Chaerephon pumilus* s.s. (Eritrea and Yemen) is specifically distinct from the following taxa/samples: *C. pumilus* from southeastern Africa, the syntype of *C. limbatus*, the holotypes of *C. elphicki* and *C. langi*, and the topotype of *C. naivashae*. They suggest (p. 642) that additional evidence from more variable nuclear markers is necessary to resolve the issue of the number of species present in this complex. The genetic differentiation is probably the result of habitat fragmentation during glacial maxima when the ancestral population was separated over isolated subtropical forests (Schoeman and Monadjem, 2018: 4).

COMMON NAMES:
Afrikaans: Klein losstertvlermuis. Chinese: 小犬吻蝠. Czech: morous malý, tadarida malá. English: Little Free-tailed Bat, Lesser Free-tailed Bat, Little Wrinkle-lipped Bat, White-bellied Free-tailed Bat. French: Petite tadaride, Petit molosse à glandes caudales, Tadaride bornée. German: Kleine Bulldoggfledermaus, Zwerg-Doggengrämler, Sena-Doggengrämler, Gesäumte Doggengrämler. Italian: Cherefónte pigmèo. Kiluba (DRC): Kasusu. Nyungwe: Kalemawalema (Malawi; but not specific). Portuguese: Morcego pequeno de cauda livre.

ETYMOLOGY OF COMMON NAME:
From the Latin "*pumilus*" meaning dwarf, because it is the smallest of the molossids occuring in the (southern African sub)region (see Taylor, 2005).

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, tolerance of a broad range of habitats, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008dr; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) assessed as *Tadarida pumila* (Mickleburgh *et al.*, 2008dr; IUCN, 2009).
2004 - LC ver 3.1 (2001) assessed as *Chaerephon pumila* (Mickleburgh *et al.*, 2004ah; IUCN, 2004).
1996 - LR/lc (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - LC ver 3.1 (2001) (Monadjem *et al.*, 2016a). 2004 - LC ver 3.1 (2001) (Friedmann and Daly, 2004).

MAJOR THREATS:
There are no major threats to the species. In some parts of its range, it is threatened from persecution as a pest, especially since it roosts in buildings (Mickleburgh *et al.*, 2008dr; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008dr) [in IUCN (2009)] report that in view of its wide range it seems probable that this species is present in some protected areas.

GENERAL DISTRIBUTION:
This widespread species is found from Senegal in the west of its range, eastwards to Yemen and southwestern Saudi Arabia, and as far south as South Africa, where Babiker Salata (2012: 49) found that its distribution is stongly associated with the mean temperature of the coldest quarter. It has been recorded from the island of Bioko and the Annobon Islands (Equatorial Guinea), Pemba and Zanzibar (Tanzania).

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 809,867 km^2.

Records from Western Cape Province are rejected by Jacobs and Fenton (2001), since these represent *Sauromys petrophilus*.
Records from the Seychelles [Aldabra] (Hutson, 2004a) and the Comoros (Louette, 2004; Goodman, 2007; ACR, 2006, 2007, 2008, 2009, 2010) are rejected by Goodman *et al.* (2010a) since these represent *C. pusillus*.
Records from Madagascar (Bouchard, 1998; Russ *et al.*, 2001; Goodman and Cardiff, 2004; ACR, 2006, 2007, 2008, 2009,2010) are now assigned to *Chaerephon atsinanana* (Goodman *et al.*, 2010a).

Native:
Angola (Crawford-Cabral, 1989; Monadjem *et al.*, 2010d: 542; Taylor *et al.*, 2018b: 62); Benin (Capo-Chichi *et al.*, 2004: 164); Botswana (Archer, 1977; Monadjem *et al.*, 2010d: 542); Burkina Faso (Kangoyé *et al.*, 2015a: 618); Burundi; Cameroon (Bakwo Fils *et al.*, 2014: 4): Chad; Congo (Bates

et al., 2013: 336); Congo (The Democratic Republic of the) (Allen, 1917; Schouteden, 1944; Hayman *et al.*, 1966; Dowsett *et al.*, 1991: 259; Monadjem *et al.*, 2010d: 542); Côte d'Ivoire; Equatorial Guinea [Annobón, Bioko]; Eritrea; Ethiopia (Lavrenchenko *et al.*, 2004b: 132); Gambia (Emms and Barnett, 2005: 50); Ghana; Guinea; Guinea-Bissau (Monard, 1939; Veiga-Ferreira, 1949; Lopes and Crawford-Cabral, 1992; Rainho and Ranco, 2001: 73); Kenya; Liberia (Fahr, 2007a: 104); Malawi (Happold *et al.*, 1988; Ansell and Dowsett, 1988: 46; Monadjem *et al.*, 2010d: 542); Mali (Meinig, 2000: 105); Mozambique (Smithers and Lobão Tello, 1976; Lopes and Crawford-Cabral, 1992; Monadjem *et al.*, 2010d: 542; Monadjem *et al.*, 2010c: 382); Namibia (Monadjem *et al.*, 2010d: 542); Niger; Nigeria; Rwanda; Sao Tomé and Principe [Sâo Tomé] (Juste and Ibáñez, 1993b: 906; Rainho *et al.*, 2010a: 37); Saudi Arabia; Senegal; Sierra Leone; Somalia; South Africa (De Graaf, 1960; Monadjem *et al.*, 2010d: 542); Sudan; Swaziland (Monadjem *et al.*, 2010d: 543); Tanzania; Togo; Uganda (Kityo and Kerbis, 1996: 62); Yemen (Benda *et al.*, 2011b: 47); Zambia (Ansell, 1969; Ansell, 1973; Ansell, 1978; Monadjem *et al.*, 2010d: 543); Zimbabwe (Cotterill, 2004a: 261; Monadjem *et al.*, 2010d: 543).

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
From western Uganda, Monadjem *et al.* (2011: 30) reported the following data: Fa: 38.95 mm, mass: 10.5 g, wing loading: 12.4 N/m^2, aspect ratio: 7.3.

DETAILED MORPHOLOGY:
Baculum - Unknown
Brain - Amrein *et al.* (2007) from specimens collected from Bénin reported moderate proliferating cell activity, detected with Ki-67 and MCM2, in the subgranular layer of the dentate gyrus, with doublecortin (DCX) they detected young migrating neuron in the subgrannular layer of the hippocampus. Amrein *et al.* (2007) also reported moderate to ample proliferating cells (Ki-67 positive cells) and migrating young neurons (DCX positive cells) in the rostral migratory stream. No NeuroD was detected in the hippocampal granule cells (Amrein *et al.*, 2007). Kruger *et al.* (2010a) describe, based on three brains from Kenya, using immunohistochemical methods, the nuclear organization of the cholinergic, catecholaminergic and serotonergic systems. Kruger *et al.* (2010b) describes, based on three brains from Kenya, the distribution of Orexin-A immunoreactive cell bodies and terminal networks.

SEXUAL DIMORPHISM:
Chaverri *et al.* (2018: 1944) [referring to Bouchard, 2001b] indicates that the sexes can be distinguished by scent produced from the interaural and muzzle glandular areas.

ECHOLOCATION:
Frequency modulated call. In Kenya, Taylor *et al.* (2005) reported a peak frequency of 25.6 (1.7) kHz from Kivoko. In Tanzania, Aspetsberger *et al.* (2003) reported a maximum frequency of 22.7 (3.3) kHz from Amani Nature Reserve. In Swaziland, Taylor (1999b) reported a maximum frequency of 32.9 (4.5) kHz from Mlawula, and maximum frequencies at three different localities around Durban in South Africa of 43.0 (1.0) kHz, 28.7 (1.8) kHz and 28.7 (2.5) kHz. Fenton *et al.* (2004) reported a highest frequency of 29 (4.6) kHz for a locality in Durban, South Africa. Rainho *et al.* (2010a: 21) reports the calls [as *Tadarida pumila*] of 32 individuals from Sao Tomé. Bohmann *et al.* (2011: 1) [referring to Monadjem *et al.* (2010d)] mention peak frequencies between 25 - 40 kHz. Schoeman and Waddington (2011: 291) mention a peak frequency of 28.2 ± 1.5 kHz and a duration of 10.8 ± 0.2 msec for specimens from Durban, South Africa. From the Durban area, Naidoo *et al.* (2011: 23) report F_{peak} = 24.7 ± 1.0 kHz and a duration of 12.4 ± 0.9 msec.

Taylor *et al.* (2013b: 18) recorded the following parameters for 8 calls from specimens from Swaziland: F_{max}: 27.7 ± 4.40 (23.0 - 32.8) kHz, F_{min}: 23.3 ± 2.38 (20.9 - 27.4) kHz, F_{knee}: 26.2 ± 3.34 (22.6 - 30.8) kHz, F_{char}: 24.3 ± 2.91 (21.5 - 28.1) kHz, duration: 8.3 ± 2.10 (5.3 - 11.9) msec, and for 6 calls from KwaZulu-Natal, South Africa: F_{max}: 31.6 ± 4.05 (24.6 - 36.7) kHz, F_{min}: 24.5 ± 1.55 (21.7 - 26.5) kHz, F_{knee}: 28.9 ± 2.51 (24.4 - 31.3) kHz, F_{char}: 25.6 ± 1.57 (22.7 - 27.3) kHz, duration: 8.4 ± 1.71 (6.6 - 11.0) msec. From Swaziland also, Monadjem *et al.* (2017c: 179) reported the following values: F_{min}: 23.3 ± 1.41 (20.8 - 26.5) kHz, F_{knee}: 26.1 ± 2.09 (22.5 - 29.6) kHz, F_c: 24.0 ± 1.53 (21.3 - 27.2) kHz and duration: 9.0 ± 2.10 (3.9 - 12.6) msec. They were able to detect these calls up to a distance of 15 m.

At Farm Welgevonden, South Africa, Taylor *et al.* (2013a: 556) report a F_{knee} value of 29 (24 - 31) kHz.
Linden *et al.* (2014: 40) mentioned the following parameters for the Soutpansberg area (RSA): F_{min}: 21 - 27 kHz, F_{char}: 22 - 28 kHz, F_{knee}: 23 - 31 Khz, Slope:13 - 124 OPS, duration: 5 - 12 msec.
20 calls from Mapungubwe National Park (RSA) were recorded by Parker and Bernard (2018: 57) with the following characteristics: F_{char}: 26.65 ± 2.53 kHz, F_{max}: 34.87 ± 5.75 kHz, F_{min}: 24.67 ± 2.68 kHz, F_{knee}: 29.72 ± 3.05 kHz, duration: 8.80 ± 2.65 msec, with 4.24 ± 1.89 calls/sec.

Monadjem *et al.* (2011: 32) reported values for two calls from a *Chaerephon* cf. *pumilus* from western Uganda: F_{min}: 24.95 kHz, F_{max}: 27.78 kHz, F_{char}: 25.22 kHz, F_{knee}: 75.61 kHz, and duration 8.4 msec.

Two calls from specimens from the Aberdares Range in Kenya were reported by Eisenring *et al.* (2016: SI 2) with PF: 26.3 ± 2.8 (24.4 - 28.3), HF: 32.6 ± 1.2 (31.8 - 33.5), LF: 20.9 ± 0.4 (20.6 - 21.1), DT: 0.1 ± 0.1 (0.0 - 0.1), DF: 11.8 ± 1.5 (10.7 - 12.9).

From Maroua, Cameroon, Manga Mongombe (2012: 79) reported for 3 calls a call type of FM and the following parameters: F_{max}: 44.2 ± 3.4 (40.4 - 47.0) kHz, F_{min}: 38.2 ± 2.6 (35.3 - 40.4) kHz, F_{mean}: 41.2 ± 3.0 (37.9 - 43.7) kHz, F_{knee}: 44.1 ± 3.4 (40.4 - 47.0) kHZ, F_{char}: 39.1 ± 2.4 (36.5 - 41.2) kHz, and duration: 1.32 ± 0.11 (1.26 - 1.45) msec.

Two calls by bats from the Kalahari Desert had the following characteristics: F_{char}: 22.9 ± 0.3 kHz, F_{max}: 25.0 ± 0.1 kHz, Fmin: 22.4 ± 0.4 kHz and duration: 5.6 ± 1.5 msec (Adams and Kwiecinski, 2018: 4).

MOLECULAR BIOLOGY:
DNA - See Hoofer and Van Den Bussche (2003).
Karyotype - Đulic and Mutere (1973a), Smith *et al.* (1986), Rautenbach *et al.* (1993) and Sreepada *et al.* (2008) all reported 2*n* = 48, and an acrocentric Y chromosome. However, while Đulic and Mutere (1973a) and Smith *et al.* (1986) reported FN = 58, BA = 12, Rautenbach *et al.* (1993) reported FN = 66, BA = 20. And, while Đulic and Mutere (1973a) and Rautenbach *et al.* (1993) reported a metacentric X chromosome, Smith *et al.* (1986) reported a submetacentric X chromosome. The work of Rautenbach *et al.* (1993) included specimens from the Western Cape that have subsequently been reidentified as *Sauromys petrophilus* (Jacobs and Fenton, 2001: 134), hence these karyotypic variations should be viewed with caution.

Reddy (2008: ii) used the cytochrome *b* (845 nucleotides) and D-loop (314 nucleotides) regions of the mitochondrial DNA to assess the phylogenetic relationships within *C. pumilus* (southern Africa) and in relation to *Chaerephon* species from Madagascar (*C. pumilus, C. leucogaster*). The result indicates the possibility of cryptic species in southern African *C. pumilus*, which are closer related to the Malagasy *C. leucogaster* than to the Malagasy *C. pumilus*.

In South Africa, Naidoo *et al.* (2015b) were able to retrieve a strong mitochondrial structure, but only little nuclear genetic structure, which suggests a single interbreeding population. They found these data to be consistent with female philopatry, secondary contact between diverged genetic lineages and introgression.

Protein / allozyme - Unknown.

HABITAT:
Noer *et al.* (2012: 1) found that *C. pumilus* prefered to forage over sugarcane fields rather than over savanna, riparian forest and urban areas. To reach their foraging grounds, they traveled up to 4.2 km from their roost, and their mean activity area encompases 976 to 1319 ha.

HABITS:
Bouchard (2001b: 109) found that, in scent-choise-experiments, only males were able to distinguish the gender of conspecifics as well as the difference between roostmates and strangers. Females did not show any preference during these experiments.

ROOST:
Taylor *et al.* (1999: 67) found these bats to be roosting in a variety of roofs in the Durban area: from corrugated iron to tiles, between the tiles and the plastic lining underneath, or in any convenient crevices between rafters and brickwork. These roofs were located at a height of 3 to 12 m.

In the Mount Nimba area, Monadjem *et al.* (2016y: 367) found a roost in the roof of a school at 540 m.

DIET:
Based on DNA analysis of 59 fecal pellets collected between April and May (austral summer) in the Simunye region of Swaziland, Bohmann *et al.* (2011) reported insects from 24 families (belonging to seven orders) being taken as prey. The highest frequency of occurrence was for Lepidoptera (52.5 %), Diptera (40.7 %), and Hemiptera (18.6 %). Within the Lepidoptera, Noctuidae (Owlet moths - 25.4 %), Nymphalidae (Brush-footed butterflies 30.5 %) and Crambidae (Grass moths - 10.2 %) were found the most. Within the Diptera, it were representatives of the Culicidae (Mosquitoes - 27.1 %), which occurred most frequently, followed by the Tephritidae (Fruit flies and kin - 10.2 %). In the Hemiptera, both Lygaeidae (Chinch bugs and seed bugs) and Pentatomidae (Stink bugs) were found in 10.2 % of the fecal pellets.

Naidoo *et al.* (2011: 26) reported the following volume percentages in the bat's diet at Umbilo River (KwaZulu Natal, RSA): in summer: Lepidoptera (9.9 ± 9.5), Coleoptera (47.7 ± 30.5), Hemiptera (32.8 ± 6.9), Diptera (5.4 ± 8.3), and Trichoptera (4.2 ± 7.2); in winter: Lepidoptera (30.3

± 16.0), Coleoptera (19.5 ± 16.5), Hemiptera (8.0 ± 7.4), Diptera (24 ± 7.7), Trichoptera (6.5 ± 10.4), and Hymenoptera (11.8 ± 11.1).

In the Limpopo province (RSA), Taylor *et al.* (2017b: 246, 252 - 254) found the diet to contain 21 prey items, covering five insect orders: Coleoptera (unmatched), Hemiptera (*Macrorhaphis acuta* + *Nezara viridula* + unmatched), Lepidoptera (*Toxocampinae tathorhynchus* + *Isturgia roraria* + *Sena* sp. + *Sena prompta* + *Cortyta canescens* + *Enmonodia capensis* + *Leucania imperfecta* + *Pericyma atrifusa* + *Rhesala moestalis* + *Spodoptera exigua* + *Maurilia arcuata* + *Stenoptilia* sp. + unmatched), Orthoptera (Tettigoniinae + unmatched) and Blattodea (unmatched). They also remarked that the diet of *C. pumilus* varies geographically.

From Maroua (Cameroon), and based on fecal analyses, Bol A Anong (2013: 31) reported the diet to include Hemiptera (35.60%), Coleoptera (34.81%), Lepidoptera (17.00%), Diptera (10.22%), Hymenoptera (1.55%) and Orthoptera (0.02%).

PREDATORS:
At the Kruger Park, Rautenbach *et al.* (1990: 17) reported that "*Tadarida pumila*" was regularly taken as prey by a pair of African goshawks (*Accipiter tachiro* (Daudin, 1800)). On some occasions, 1 to 5 bats were taken per evening (see Kemp and Rautenbach, 1987).
Mikula *et al.* (2016: Supplemental data) mention the following avian predators for "*Tadarida pumila*": African goshawk (*Accipiter tachiro* (Daudin, 1800)), Fox kestrel (*Falco alopex* (Heuglin, 1861)), Lanner falcon (*Falco biarmicus* Temminck, 1825), Eurasian hobby (*Falco subbuteo* Linnaeus, 1758), Common kestrel (*Falco tinnunculus* Linnaeus, 1758), Wahlberg's eagle (*Hieraaetus wahlbergi* (Sundevall, 1851)), Bat hawk (*Macheiramphus alcinus* Bonaparte, 1850), Black kite (*Milvus migrans* (Boddaert, 1783)).

POPULATION:
Structure and Density - The colonies of this species range from a few animals (between 5 and 20) to hundreds of individuals (Mickleburgh *et al.*, 2008dr; IUCN, 2009).
Trend - 2008 Unknown (Mickleburgh *et al.*, 2008dr; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
van der Merwe *et al.* (1986: 355) indicate that in Transvaal *C. pumilus* has an extended breeding of 8 months. They found females to be polyoestrous and could have up to three pregnancies (one young) per breeding season. Implantation only occurs in the right uttering horn and the gestation period was about 60 days. The young are weaned before 21 days of age and females become sexually mature at the age of 5 to 12 months.

Happold and Happold (1989b: 133) found that in Malawi, *Tadarida pumila* can have up to 5 births per year, all followed by a post-partum oestrus.

Krutzsch (2000: 95) refers to Marshall and Corbet (1959), who pointed out that in Uganda spermatogenesis was not continuous in all males (as *Tadarida (Chaerephon) hindei*). They also indicated that it is one of the best known virtually continuous breeding molossids.

le Grange *et al.* (2011: 173 - 174) indicate that *C. pumilus* is a seasonal polyoestrous bat, which reduces the number of reproductive cycles per season with increasing latitute.

In Ethiopia, Kruskop *et al.* (2016: 61) found a maternity colony with both pregnant and lactating females (one even in both stages) on 9 November 2012.

Monadjem *et al.* (2010d) [in Weier *et al.* (2018: Suppl.)] mentioned births in early November, late January and April.

MATING:
McWilliam (1988a) and McCracken and Wilkinson (2000: 331) indicate that there is a correlation between the male body size and the harem size, where larger males have larger harems, consisting of up to 21 females). McWilliam (1988a) also suggests that the harem might be kin groups.

PARASITES:
BACTERIUM
Gram-negative bacterium - Cassel-Béraud and Richard (1988), Cassel-Beraud *et al.* (1989: 234), and Sara (2002: 41) reported *Alkalescens dispar*, *Aeromonas hydrophila*, *Citrobacter freundii*, *Enterbacter aerogens*, *Enterobacter agglomerans*, *Enterobacter cloacae*, *Enterobacter intermedius*, *Enterobacter* sp., *Escherichia coli*, *Hafnia alvei*, *Klebsiella oxytoca*, *Klebsiella pneumoniae*, *Kluyvera* sp., *Koserella trabulsii*, *Proteus mirabilis*, *Proteus morganii*, *Proteus rettgeri*, *Proteus vulgaris*, *Providencia* sp., *Pseudomonas* spp., *Salmonella enterica* subsp. *enterica*, *Salmonella enteritidis*, and *Serratia marcescens*.

APICOMPLEXA
Lainson and Naiff (2000: 128) and Duszynski (2002: 20) indicate that "*Nyctinomus limbatus / C. pumila*" is the type host of *Eimeria dukei* Lavier, 1927.

ACARI

Laelapidae: Taufflieb (1962: 112) reported *Chelanyssus aethiopious* Hirst, 1921 from "*Tadarida limbata*" from Brazzaville, Congo.
Sarcoptidae: Fain (1959d: 149) described *Notoedres (Notoedres) tadaridae* from "*Tadarida (Chaerephon) faini*" from Mount Wago, near Blukwa, Haut-Ituri, DRC.
Trombiculidae: Stekolnikov (2018a: 163) reported *Microtrombicula nyctinomi* (Taufflieb, 1960) from a bat from Brazzaville, Congo.

HEMIPTERA
Cimicidae: Haeselbarth *et al.* (1966: 9) found a great number of *Loxaspis barbara* (Roubaud, 1913) in a roost, near Mopti, Former French Sudan (Haute Senegal-Niger). *Loxaspis miranda* Rothschild, 1912 recorded in Uganda (Haeselbarth *et al.*, 1966: 10, host referred to as *Tadarida limbata*).
Polyctenidae: *Hypoctenes clarus* Jordan, 1922, from Congo (Haeselbarth *et al.*, 1966: 18, host referred to as *Tadarida limbata*).

DIPTERA
Streblidae: *Raymondia seminuda* Jobling, 1954 in Nairobi, Kenya (Haeselbarth *et al.*, 1966: 103, host referred to as *Tadarida faini*).
Nycteribiidae: *Basilia ansifera* Theodor, 1956 mainly a West African species, reaching Lake Victoria in the east and Lake Nyasa in the south, nearly all localities lie between 15° latitude north and south (Haeselbarth *et al.*, 1966: 110). *Dipseliopoda biannulate* (Oldroyd, 1953) distributed over the tropical parts of Africa and recorded from localities in Nigeria, Cameroon, the Congo and the Sudan and Kenya (Haeselbarth *et al.*, 1966: 116, host referred to as *Tadarida faini*).

SIPHONAPTERA
Ischnopsyllidae: *Lagaropsylla consularis* Smit, 1957 from Ethiopia, Kenya, Uganda, Congo and Congo (Democratic Republic of), Angola, Zimbabwe and Mozambique (Haeselbarth *et al.*, 1966: 1990, host referred to as *Tadarida limbata*), Malawi (Beaucournu and Kock, 1996), Madagascar (Hastriter, 2016: 16). *Lagaropsylla idae* Smit ,1957 widespread in tropical Africa (Haeselbarth *et al.*, 1966: 190, host referred to both *C. pumilus* as well as *Tadarida limbata*). *Lagaropsylla oblique* Smit, 1957 from Sierra Leone, Cameroon and the Congo (Haeselbarth *et al.*, 1966: 191, host referred to as *Tadarida limbata*).

NEMATODA
Durette-Desset and Chabaud (1975: 315) described *Molinostrongylus benexae* from a "*Chaerophon limbatus*" from Périnet, Madagascar.

TREMATODA
Prosthodendrium (Prosthodendrium) chilostomum madagascariense was described by Richard (1966: 423) from a "*Chaerophon limbatus*" from Périnet, Madagascar.

VIRUSES:
Conrardy *et al.* (2014) tested 6 bats sampled in Kenya for the presence of adenoviruses, rhabdoviruses and paramyxoviruses, all samples tested negative.

In their country-wide survey of Kenyan bats, Waruhiu *et al.* (2017) found the following viruses in *Chaerephon pumilus*: Astroviruses and Coronaviruses.

In Uganda, Kading *et al.* (2018: 3) found neutralizing antibodies against dengue 2 virus (DENV-2) and non-specific Flaviviruses.

Coronaviridae - Coronaviruses
SARS-CoV - Müller *et al.* (2007b) tested between 1986 to 1999, for antibody to SARS-CoV in sera in 35 individuals from Limpopo Province, South Africa, none were tested positive (0/35) and 18 individuals from Mpumalanga Province, South Africa, none tested positive (0/18) and one individual from Bandundu Province, DRC, not tested positive (0/1). Tong *et al.* (2009) report the detection of coronavirus RNA from fecal material of this species in Kenya and was found to be distantly related to the human coronavirus 229E.
Anthony *et al.* (2017b: Suppl.) mention the alpha-coronavirus: Charephon_CoV_KY22

Filoviridae
Ebolavirus:
EFSA AHAW Panel (EFSA Panel on Animal Health and W (2017: 5) refer to Swanepoel *et al.* (1996), who experimentally inoculated the virus in this bat.

Goldstein *et al.* (2018: 1084) described a new *Ebolavirus* from three Sierra Leonan *C. pumilus* and one *Mops condylurus*: Bomali virus (BOMV). They were sampled in human dwellings in small villages in the Bomali district. This virus might infect humans, but it is not known (yet) whether it is virulent in humans too.

Flaviviridae
Flavivirus
Bukalasa bat virus - Williams *et al.* (1964) report the isolation of the virus in Uganda, 1964, from the salivary glands of *Chaerephon pumilus*. Reported by de Jong *et al.* (2011: 10) and Luis *et al.* (2013: suppl).
Dakar bat virus - Kemp *et al.* (1974) report the isolation of the virus from Nigeria, 1974, from the salivary glands and organ pools of *Chaerephon*

pumilus. Reported by de Jong *et al.* (2011: 10) and Luis *et al.* (2013: suppl).
Entebbe bat virus. - Peat and Bell (1970) report the isolation of the virus in Uganda, 1957, from the salivary glands of *Chaerephon pumilus*. Reported by de Jong *et al.* (2011: 10).
Zika virus (ZIKV) - Malmlov *et al.* (2019: 2) refer to Shepherd and Williams (1964) who examined 44 *pumilus* specimens in Uganda, of which 16 had antibodies against ZIKV.

Rhabdoviridae
Lyssavirus - Rabies related viruses
Horton *et al.* (2014: Table S1) tested 25 Tanzanian *Chaerephon pumilus* specimens but failed to find neutralising antibodies to IKOV (Ikoma lyssavirus). Kia *et al.* (2014: 1) tested 33 specimens from Kanke (Nigeria), and found one of them to test positive for Lagos bat virus and one for Shimoni bat virus.

Togaviridae
Alphavirus
de Jong *et al.* (2011: 10) reported Chikungunya virus occurring on *C. pumilus*. Luis *et al.* (2013: suppl.) also reported this virus, but used *Tadarida pumila* as name for the bat.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Angola, Benin, Botswana, Burkina Faso, Burundi, Cameroon, Central African Republic, Chad, Comoros, Congo, Congo (Democratic Republic of the), Côte d'Ivoire, Egypt, Equatorial Guinea, Eritrea, Ethiopia, Gabon, Ghana, Guinea, Kenya, Madagascar, Malawi, Mali, Mayotte, Mozambique, Namibia, Niger, Nigeria, Rwanda, Senegal, Seychelles, Sierra Leone, Somalia, South Africa, South Sudan, Sudan, Swaziland, Tanzania, The Gambia, Togo, Uganda, Zambia, Zimbabwe.

2007. *Chaerephon pusillus:* Goodman and Ratrimomanarivo. (Name Combination, Current Combination)
? *Chaerephon pumila:*
? *Chaerephon pumilus:*

TAXONOMY:
Included in *pumilus* by most other authors, but its status has been revised by Goodman and Ratrimomanarivo (2007: 391) and Goodman *et al.* (2010a: 21).

COMMON NAMES:
Czech: morous seychelský. English: Seychelles Free-tailed bat. French: Tadaride des Seychelles. German: Seychellen Bulldoggfledermaus.

GENERAL DISTRIBUTION:
C. pusillus was restricted to the Seychelles, but recent molecular work (Goodman *et al.*, 2010a) indictes that the populations on the Comore Islands should assigned to *C. pusillus* and not *C. pumilus*.
Louette (2004) recorded as *Tadarida pumilus* occurs on at least three of the Comore Islands (Grande Comore, Anjouan, and Mayotte. Goodman *et al.* (2010c: 126) also recorded *Charephon pusillus* from Moheli. Its known elevational range is 15 to 250 m on Grande Comore, 5 to 410 m on Anjouan, 5 to 10 m on Moheli, and 10 to 90 m on Mayotte (Goodman *et al.*, 2010c: 126).

Native: Comoros (Louette, 2004; Goodman *et al.*, 2010c: 126); Seychelles (Goodman *et al.*, 2010c: 126).

ROOST:
On the Comoros, Goodman *et al.* (2010c: 127) did not find a single roost in a natural location, but rather all were synanthropic (see also Wilkinson *et al.*, 2012: 160). The roosts sites were often in the attics of public buildings (schools, civic centers, and hospitals).

MIGRATION:
Goodman *et al.* (2010c: 128) interviewing a director of a primary school on Mitsamiouli mentioned that the presence of bats in the school attic is very seasonal, and as the cold season approaches the site is abanodoned.

POPULATION:
Structure and Density - On Aldabra, the population might be fewer than 250 animals (Mickleburgh *et al.*, 2008dr; IUCN, 2009, as *C. pumilus*).
Trend - Unknown.

REPRODUCTION AND ONTOGENY:
Goodman *et al.* (2010c: 126) provide data that indicates possible inter island seasonal variation in breeding in the Comoros. On 14 November 2006, all of the 10 individuals caught in a colony in central Moroni were female and all reaching term in their pregnancy with single embryos measuring 17 - 20 mm. The same colony was visited on the 28 March 2007, an additional 10 individuals were captured, all of which were females of which five had placental scars, four assumed to be sub-adults without placental scars, and one had a tiny embryo. Juste (unpublished data in Goodman *et al.* (2010c: 127)) report that the site was visited in December 2005, and all of the 20 individuals caught were female. As no males were caught on the two visits with a 5 month difference, Goodman *et al.* (2010c: 127) presumes that this site is a maternity colony.

Between 20 November and 26 November 2006, Goodman *et al.* (2010c: 127) visited five different *C. pusillus* colonies on Anjouan and in contrast to the Moroni site, these colonies contained both males and females. At three of the sites on Anjouan, females out numbered males with a consistent sex ratio in each case of 0.5, and at one site the sex ratio was 1.0, and the fifth site it was 1.6. Goodman *et al.* (2010c: 127) found at all the colonies, the breeding females were reaching term, with embryos ranging in crown-rump length from 17 - 23 mm, and at one site neonates were present. Of the 25 males captured at the Anjoun sites, all were adult, only seven (28 %) had scrotal testes and convoluted epididymides. The only evidence of non-synchronized breeding in *C. pusillus* on Anjouan was a free-flying animal captured at Patsi on 20 November with a single embryo measuring 1 mm in crown rump length.

Goodman *et al.* (2010c: 127) report on a visit between 28 November and 2 December 2006 that two separate colonies on Moheli were visited and both male and females were captured and the sex ratios were 0.57 and 0.66. At the first colony visited 28 November, of the seven females captured, four had recently given birth and were lactating and three had single embryos measuring 24 mm in crown-rump length. At the second site visited on the 2 December, all of the females were still pregnant with single embryos and with crown-rump length of 19 - 22 mm. Of the males handled from these two colonies, three of 12 (25 %) were in breeding condition with largely scrotal testes with enlarged epididymides.

On Mayotte, between 27 February and 1 March 2007, two colonies were visited and both had males and females, not one of the females showed signs of active reproduction, in serveral cases the females had remaining lactation tissue and placental scars or large mammae and placental scars, indicating that they had recently terminated a breeding period, also none of the males caugth were in reproductive condition (Goodman *et al.*, 2010c). Four different colonies were visted on Grande Comore between 29 March and 1 April 2007, and in all cases, both sexes were found in each and the sex ratio varied from 0.15 to 2.3, with one exeption none of the individuals showed active signs of reproduction, although many of the females had large mammae and placental scars. The exeption was a female captued on the 29 March in estrous (Goodman *et al.*, 2010c: 127).

PARASITES:
Lagadec *et al.* (2012: 1696) found this species to be infected by *Leptospira* bacteria.

Hutson (2004a: 130) mentions an endemic ectoparasitic polyctenid bug, *Hypoctenes hutsoni* Maa, 1970.

VIRUSES:
Astroviridae
Hoarau *et al.* (2018: 1) tested 58 bats from the Comoros, found none of them to test positive for this group of viruses.

Paramyxoviridae
Wilkinson *et al.* (2012: 160) tested 20 individuals from the Comoros using RT-PCR specific for Respirovirus/Morbillivirus/Henipahvirus (RMH) and Paramyxovirinae (PMV) and found 0 positive results for viral nucleic acids.

Rhabdoviridae
Of the 19 bats from Anjouan that were tested by Mélade *et al.* (2016a: 6), two showed seroreactivity to *Lagos bat lyssavirus*, and two of seven other bats showed the same reaction to *Duvenhage lyssavirus*. On Mayotte, one out of three were positive for these two viruses.

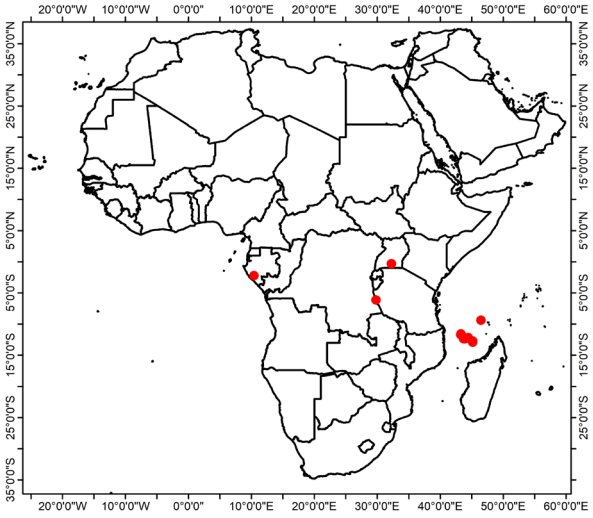

Figure 168. Distribution of *Chaerephon pusillus*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Comoros, Gabon, Mayotte, Seychelles, Tanzania, Uganda.

Chaerephon russatus J.A. Allen, 1917

*1917. *Chærephon russatus* J.A. Allen, Bull. Am. Mus. Nat. Hist., 37 (18): 458, text fig. 25. Publication date: 29 September 1917. Type locality: Congo (Democratic Republic of the): Oriental province: Medje [02 25 N 27 18 E, 800 m] [Goto Description]. Holotype: AMNH 48925: ad ♂, skin and skull. Collected by: Herbert Lang, James Paul Chapin and The American Museum Congo Expedition; collection date: 8 September 1910; original number: 993. Topotype: MCZ 17386: ♀, skin and skull. Collected by: ?: Collector Unknown; collection date: 8 September 1910. Presented/Donated by: ?: Collector Unknown. Topotype: MCZ 17387: ♀, skin and skull. Collected by: ?: Collector Unknown; collection date: 8 September 1910. Presented/Donated by: ?: Collector Unknown.
? *Chaerephon russata:* (Alternate Spelling)
? *Chaerephon russatus:* (Current Combination, Current Spelling)
? *Tadarida russata:* (Name Combination)

TAXONOMY:
See Simmons (2005).

Gregorin and Cirranello (2015: 10) suggest that *Chaerephon russatus* is the basalmost branch of the *Chaerephon* + *Mops* clade within the Molossidae.

COMMON NAMES:
Chinese: 赤犬吻蝠. Czech: morous guinejský. English: Russet Wrinkle-lipped bat, Russet Free-tailed Bat. French: Tadaride rousse. German: Rostfarbene Bulldoggfledermaus.

CONSERVATION STATUS:
Global - Listed as Data Deficient (DD ver 3.1 (2001)) in view of the absence of sufficient information on its extent of occurrence, natural history, threats and conservation status (Mickleburgh *et al.*, 2008bu; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) assessed as *Tadarida russata* (Mickleburgh *et al.*, 2008bu; IUCN, 2009). 2004 - NT ver 3.1 (2001) assessed as *C. russata* (Mickleburgh *et al.*, 2004aj; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
It is presumably threatened by habitat loss in parts of its West African range, although further studies are needed to confirm this (Mickleburgh *et al.*, 2008bu; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008bu) [in IUCN (2009)] report that there appear to be no direct conservation measures in place. The species has been recorded from the Hell's Gate National Park in Kenya and Tai National Park in Côte d'Ivoire. Further studies are needed into the distribution, natural history and threats to this species.

GENERAL DISTRIBUTION:
Chaerephon russatus has only been recorded from a dozen or so, widely dispersed, localities. It has been recorded from the Tai National Park in Côte d'Ivoire in the west to the Hell's Gate Canyon National Park in Kenya.

Native: Cameroon; Congo (The Democratic Republic of the); Côte d'Ivoire (Beaucournu and Fahr, 2003: 157); Ghana; Guinea (1st record: Decher *et al.*, 2016: 275); Kenya.

POPULATION:
Structure and Density - It is believed to be a quite rare species that occurs in small colonies (Mickleburgh *et al.*, 2008bu; IUCN, 2009).

Trend - 2008 - Unknown (Mickleburgh *et al.*, 2008bu; IUCN, 2009).

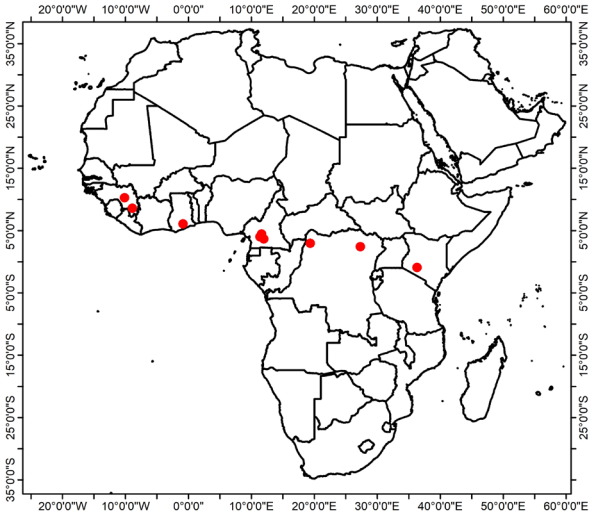

Figure 169. Distribution of *Chaerephon russatus*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Cameroon, Congo (Democratic Republic of the), Côte d'Ivoire, Ghana, Guinea, Kenya.

Chaerephon tomensis (Juste and Ibáñez, 1993)

*1993. *Tadarida (Chaerephon) tomensis* Juste and Ibáñez, J. Mamm., 74 (4): 901, figs 1 - 2. Publication date: November 1993. Type locality: São Tomé and Principé: São Tomé Island: 3 km NW Guadalupe: Praia das Conchas [00 24 N 06 37 E] [Goto Description]. Holotype: EBD MAM 18256: ♀, complete skeleton. Collected by: Javier Juste and Antonio Ayong; collection date: 22 April 1988; original number: B7085. Paratype: EBD MAM 17371: ♀. Collected by: Javier Juste and Carlos J. Ibáñez Uargui; collection date: 11 April 1988. From Agua Izé. Paratype: EBD MAM 17734: ♀. Collected by: Javier Juste and Antonio Ayong; collection date: 22 April 1988. - Etymology: Referring to the island of São Tomé, where the species occurs.
? *Chaerephon tomensis:* (Name Combination, Current Combination)
? *Tadarida tomensis:* (Name Combination)

TAXONOMY:
See Simmons (2005).

COMMON NAMES:
Czech: morous tomášský. English: São Tomé Free-tailed Bat. French: Tadaride de São Tomé. German: São Tomé-Bulldoggfledermaus.

CONSERVATION STATUS:
Global - Listed as Endangered (EN B1ab(iii) ver 3.1 (2001)) because its extent of occurrence is less than 1000 km^2, all individuals are in a single location (the island of São Tomé), and there is continuing decline in the extent and quality of its lowland habitat (Mickleburgh *et al.*, 2008dl; IUCN, 2009).

Assessment History - 2008 - EN B1ab(iii) ver 3.1 (2001) [assessed as *Tadarida tomensis*] (Mickleburgh *et al.*, 2008dl; IUCN, 2009). 2004 - CR B1ab(I,iii) ver 3.1 (2001) (Mickleburgh *et al.*, 2004cy; IUCN, 2004). 1996 - VU (Baillie and Groombridge, 1996).

MAJOR THREATS:
The species is believed to be threatened by general habitat loss resulting from coastal development, including tourism activities, conversion of land to agricultural use and possible port construction. The species may be competing with the much more abundant species *Chaerephon pumilus* (J. Juste *pers. comm.,* 2008 in Mickleburgh *et al.*, 2008dl in IUCN, 2009), with further studies into this relationship needed (Mickleburgh *et al.*, 2008dl; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008dl) [in IUCN (2009)] report that there appear to be no direct conservation measures in place. It is not known if the species is present in any protected areas. Further research is needed into the distribution, natural history and threats to this species.

GENERAL DISTRIBUTION:
Chaerephon tomensis has been recorded from two lowland localities, Praia das Conchas (3 km NW of Guadalupe) and Agua Izé, in the northern part of São Tomé Island, of São Tomé and Príncipe. Extensive surveys have not located the species elsewhere on the island.

Native: São Tomé and Principe [São Tomé] (Rainho *et al.*, 2010a: 40).

POPULATION:
Structure and Density - It seems to be a very rare species that, despite considerable trapping effort, is currently only known from the type series of three specimens (J. Juste *pers. comm.,* 2008 in Mickleburgh *et al.*, 2008dl [in IUCN, 2009]).

Trend - 2008 - Decreasing (Mickleburgh *et al.*, 2008dl; IUCN, 2009).

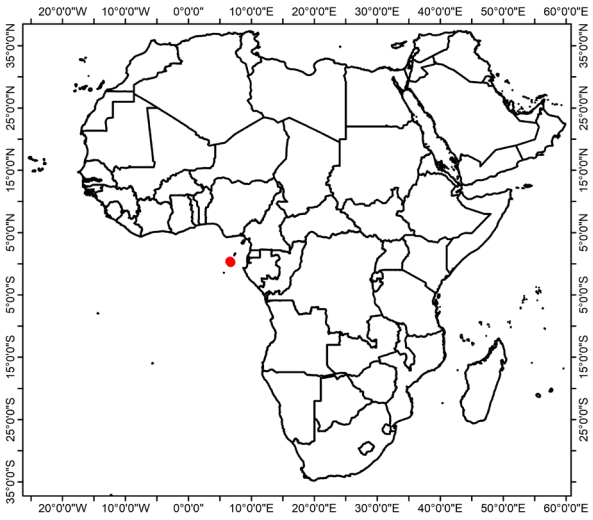

Figure 170. Distribution of *Chaerephon tomensis*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
São Tomé and Principé.

Genus ***Mops*** Lesson, 1842

*1842. *Mops* Lesson, Nouv. Tabl. Regn. Anim. Mammifères, 18. Publication date: 1842. - Comments: Type species: *Mops indicus* Lesson, 1842 (=*Molossus mops* de Blainville, 1840; Genotype *Mops indicus* Lesson = *Dysopes mops* F. Cuvier; listed in synonymy of *Nyctinomus* by Miller, 1907, Bull. U.S. Nat. Mus., 57, p. 251; but listed as a genus with distinct characters by Thomas, 1913, J. Bombay Nat. Hist. Soc., 22, p. 91). - Etymology: From the masculine German substantive *Mops*, meaning "pug", a small companion dog resembling a bulldog, corresponding to the French "carlin" and the Italian "carlino"; the name refers to the wrinkled lips characteristic of the genus *Mops* and the family Molossidae. According to one seemingly erroneous interpretation, from the Malaysian substantive *mòps*, meaning "bat" (see Lanza *et al.*, 2015: 293). (Current Combination)

TAXONOMY:
Formerly included in *Tadarida*; for synonyms see Freeman (1981b: 158). See also Legendre (1984). Harrison and Bates (1991: 64), Ansell and Dowsett (1988: 45), Corbet and Hill (1992: 157), Grubb *et al.* (1998: 93) and Horácek *et al.* (2000: 137), who include *Mops* as subgenus in *Tadarida*. A key is provided by Dunlop (1999: 1, Mammalian Species, 615).

In their molecular phylogeny study, Lamb *et al.* (2011: 9) found strong support for the monophyly of the *Chaerephon* + *Mops* taxa, but not for either of the genera separated. They also found some indications that certain *Mops* species are ancestral and *Chaerephon* species more derived. Their results suggest that *Chaerephon* should not be considered a subgenus of *Tadarida*, nor a genus on itself. They suggest combining *Chaerephon* (except *Chaerephon jobimena*) together with *Mops* into a single genus pending a more complete study.

The morphological study by Gregorin and Cirranello (2015: 10) was unable to resolve the relations within the genus *Mops*, but it supports the monophyly of the genus.

Known species within the genus *Mops*: †***rusingae*** Arroyo-Cabrales, Gregorin, Schlitter and Walker, 2002; ***bakarii*** Stanley, 2009; ***brachypterus*** (Peters, 1852); ***condylurus*** (A. Smith, 1833); ***congicus*** J. A. Allen, 1917; ***demonstrator*** (Thomas, 1903); ***leucostigma*** G. M. Allen, 1918; ***midas*** (Sundevall, 1843); *mops* (de Blainville, 1840) – western Malaysia, Sumatra, Borneo perhaps Java (Simmons, 2005: 443); ***nanulus*** J. A. Allen, 1917; ***niangarae*** J. A. Allen, 1917; ***niveiventer*** Cabrera and Ruxton, 1926; ***petersoni*** (El Rayah, 1981); *sarasinorum* (A. Meyer, 1899) –

Sulawesi (Indonesia) and adjacent small islands, Philippines (Simmons, 2005: 443); ***spurrelli*** (Dollman, 1911); ***thersites*** (Thomas, 1903); ***trevori*** J. A. Allen, 1917.

COMMON NAMES:
Czech: velcí morousi. English: Mops Bats, Greater Free-tailed Bats, Mops Free-tailed Bats. French: Tadarides. Italian: Pipistrèllo carlìno.

SEXUAL DIMORPHISM:
El-Rayah (1980: 163) confirmed the sexual dimorphism in the premolar size reported earlier: in males the first lower premolar is larger at the base than the second lower premolar, whereas in females this is the opposite.

†***Mops rusingae*** (Arroyo-Cabrales, Gregorin, Schlitter and Walker, 2002)

*2002. *Tadarida rusingae* Arroyo-Cabrales, Gregorin, Schlitter and Walker, J. Vert. Paleont., 22 (2): 382. Type locality: Kenya: Rusinga Island, west; KNM Locality 114 [00 20 S 34 06 E] [Goto Description]. - Comments: Hiwegi formation; late Early Miocene, ca. 17.5 - 18.0 Ma. - Etymology: The species name is derived from the specific locality where the holotype was collected, Rusinga Island (see Arroyo-Cabrales *et al.*, 2002).
2003. *Tadarida (Mops) rusingae:* Czaplewski, Morgan and Naeher, Acta Chiropt., 5 (1): 65. (Name Combination)
2008. *Mops rusingae:* Van Cakenberghe and Seamark, African Chiroptera Report. Publication date: July 2008. (Name Combination, Current Combination)

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
The holotype was found in the Hiwegi formation; late Early Miocene deposits, dating between 17.5 to 18.0 Mya (Arroyo-Cabrales *et al.*, 2002).

Subgenus *Mops (Mops)* Lesson, 1842

*1842. *Mops* Lesson, Nouv. Tabl. Regn. Anim. Mammifères, 18. Publication date: 1842. - Comments: Type species: *Mops indicus* Lesson, 1842 (=*Molossus mops* de Blainville, 1840; Genotype *Mops indicus* Lesson = *Dysopes mops* F. Cuvier; listed in synonymy of *Nyctinomus* by Miller, 1907, Bull. U.S. Nat. Mus., 57, p. 251; but listed as a genus with distinct characters by Thomas, 1913, J. Bombay Nat. Hist. Soc., 22, p. 91). - Etymology: From the masculine German substantive *Mops*, meaning "pug", a small companion dog resembling a bulldog, corresponding to the French "carlin" and the Italian "carlino"; the name refers to the wrinkled lips characteristic of the genus *Mops* and the family Molossidae. According to one seemingly erroneous interpretation, from the Malaysian substantive *mòps*, meaning "bat" (see Lanza *et al.*, 2015: 293). (Current Combination)
1917. *Allomops* J.A. Allen, Bull. Am. Mus. Nat. Hist., 37 (18): 470, text-fig. 12 - 15. Publication date: 29 September 1917 [Goto Description]. - Comments: Type species: *Chærephon (Allomops) osborni* Allen, 1917 (=*Nyctinomus condylurus* A. Smith, 1833).
1951. *Tadarida (Mops):* Ellerman and Morrison-Scott. (Name Combination)
? *Mops (Mops):* (Name Combination)

Mops (Mops) condylurus (A. Smith, 1833)

*1833. *Nyctinomus Condylurus* A. Smith, S. Afr. Quart. J., ser. 2, 1 (2): 54. Publication date: November 1833. Type locality: South Africa: KwaZulu-Natal: Port Natal [=Durban], near [29 52 S 31 00 E] [Goto Description]. - Etymology: From the masculine scientific Latin adjective made up of the masculine Greek substantive "*κονδύλς*" (kóndylos), meaning "knob, knuckle" and the feminine Green substantive "*ούρά*" (urá), meaning "tail" as, according to Smith (1833: 54) the tail is "[…] enlarged and wrinkled at the point" (see Lanza *et al.* (2015: 298).
1864. *Dysopes hepaticus* Heuglin, Nov. Act. Acad. Cæs. Leop.-Carol., 31 (7): 14. Type locality: Sudan: Bahr-el-Ghazal province: Country of the Req natives: Djur River [Goto

Description]. - Comments: Meester *et al.* (1986: 74): "Allen (1939a), who regards it as a synony of *bivittata*. Hayman and Hill (1971) regard it as unidentifiable, but point out that Kock (in litt) believes that it probably represents *condylurus*. The latter view is expressed also by Kock (1969a) and Koopman (1975)".

1870. *Nyctinomus angolensis* Peters, J. Sci. mat. phys. nat., ser. 1, 3 (10): 124. Publication date: December 1870. Type locality: Angola: Quenza river [= Quanza River] [09 20 S 13 00 E] [Goto Description]. Holotype: ZMB 4904: ad ♂, skull and alcoholic. Collected by: Toulson (Museum Bocage). Formerly Mus. Bocage; see Turni and Kock (2008: 70). - Comments: Considered a synonym of *leucostigma* by Peterson *et al.* (1995: 168). Roberts (1951: 97), and Ansell and Dowsett (1988: 47) assigned it to Gunther, 1870, 1871. According to Meester *et al.* (1986: 74) "Günther 1871, Zoological Record (1870): 8. Quenza River [="?Cuanza River], Angola. Usually wrongly attributed to Peters, 1870, but see Cabrera and Ruxton, Ann. Mag. Nat. Hist., (9) 17: 595, 1926." According to Peterson *et al.* (1995)? "Kaudern, 1915: Ark. Zool., 9 (18): 77", but Peters, 1870 according to Simmons (2005).

1911. *Chærephon emini* Wroughton, Ann. Mag. nat. Hist., ser. 8, 8 (46): 458. Publication date: 1 October 1911. Type locality: Sudan: Rosieres [11 52 N 34 23 E]. - Comments: Not of de Winton, 1901: see Meester *et al.* (1986: 74).

1917. *Chærephon (Allomops) osborni:* J.A. Allen, Bull. Am. Mus. Nat. Hist., 37 (18): 470. Publication date: 29 September 1917. (Name Combination, Lapsus)

1917. *Mops (Allomops) osborni* J.A. Allen, Bull. Am. Mus. Nat. Hist., 37 (18): 470, 473, text-fig. 12 - 14, 26. Publication date: 29 September 1917. Type locality: Congo (Democratic Republic of the): Kinshasa (near Leopoldville) [04 18 S 15 18 E, 350 m] [Goto Description]. Holotype: AMNH 49230: ad ♂, skull and alcoholic. Collected by: Herbert Lang, James Paul Chapin and The American Museum Congo Expedition; collection date: 22 December 1914; original number: 2570. Paratype: AMNH 49244: ad ♀. Collected by: Herbert Lang, James Paul Chapin and The American Museum Congo Expedition. Presented/Donated by: ?: Collector Unknown.

1936. *Mops angolensis wonderi* Sanborn, Field Mus. Nat. Hist., Zool. Ser., (362) 20 (14): 114. Publication date: 15 August 1936. Type locality: Mali: 7 km E Bamako: Sotuba [12 36 N 07 55 W] [Goto Description]. Holotype: FMNH 42138: ad ♀, skin and skull. Collected by: Frank C. Wonder; collection date: 13 April 1934; original number: 814. - Comments: Considered a valid subspecies by Grubb *et al.* (1998: 93).

1939. *Mops osborni occidentalis* Monard, Arq. Mus. Bocage, 10: 78. Publication date: March 1939. Type locality: Guinea-Bissau: Mansoa [12 04 N 15 19 W] [Goto Description]. Syntype: NMBA 5268: ♂, alcoholic (skull not removed). Collected by: Dr. Albert Monard; collection date: 11-12 December 1937; original number: 226. See Oakeley (1998: 2). From Mansoa (see Monard, 1939: 78). Syntype: NMBA 5269: ♂, alcoholic (skull not removed). Collected by: Dr. Albert Monard; collection date: 11-12 December 1937; original number: 275. See Oakeley (1998: 2). From Mansoa (see Monard, 1939: 78). Syntype: RMCA 15307: ♂, alcoholic (skull not removed). Collected by: Dr. Albert Monard; collection date: 1937; original number: 223. From Mansoa (see Monard, 1939: 78). Syntype: RMCA 15308: ♀, alcoholic (skull not removed). Collected by: Dr. Albert Monard; original number: 498. From Contubo-el (see Monard, 1939: 78). - Comments: The type locality is either Mansoa [12 04 N 15 19 W], Contubo-el [12 22 N 14 34 W] or Pitche [12 20 N 13 57 W]. Monard (1939: 78) does not mention a holotype, but a series of specimens from Mansoa (14), Cotubo-el (5) and Pitche (9).

1939. *Mops osborni occidentalis f. fulva* Monard, Arq. Mus. Bocage, 10: 80. Publication date: March 1939. Type locality: Guinea-Bissau: Mansoa [12 04 N 15 19 W] [Goto Description]. Syntype: NMBA 5270: ♀, alcoholic (skull not removed). Collected by: Dr. Albert Monard; collection date: 11-12 December 1937; original number: 232. Monard (1939: 80) mentions a series of 10 specimens (nrs 228 to 237, 5 MM + 5 FF) from Mansoa and 1 M (nr 781) from Pitche. Syntype: RMCA 15309: ♂, alcoholic (skull not removed). Collected by: Dr. Albert Monard; original number: 229. Monard (1939: 78) mentions a larger series: nrs 215 to 227, 275 (13 MM + 1 F from Mansoa); 494 to 498 (1 M + 4 FF) from Contubo-el; 77. - Comments: The type locality is either Mansoa [12 04 N 15 19 W] or Pitche [12 20 N 13 57 W]. Grubb *et al.* (1998: 93) indicate that Monard's quadrinominal name was validated, in accordance with International Code of Zoological Nomenclature Articke 45 (g)(ii)(1), by its use as a trinomial (Freeman (1981b: 159). Monard (1939: 80) mentions a series of 10 specimens (nrs 228 to 237, 5 ♂♂ + 5 ♀♀) from Mansoa and 1 ♂ (nr 781) from Pitche.

1942. *Mops angolensis orientis* G.M. Allen and Loveridge, Bull. Mus. comp. Zool., 89 (4): 151, 166. Publication date: February 1942. Type locality: Tanzania: SE Tanzania, Mtwara, Rovuma river: Kitaya [300 ft] [Goto Description]. Holotype: MCZ 38829: ad ♂, skin and skull. Collected by: Professor Arthur Loveridge; collection date: 3 April 1939. See Allen and Loveridge (1942: 166). Helgen and McFadden (2001: 146) also mention 9 paratypes (MCZ 38826 - 38828, 38830 - 38835 (4 FF+ 5 MM, skin and skull): see Helgen and McFadden (2001: 145). Paratype: MCZ 38826: Collected by: Professor Arthur Loveridge. Presented/Donated by: ?: Collector Unknown. Paratype: MCZ 38827: Collected by: Professor Arthur Loveridge. Presented/Donated by: ?: Collector Unknown. Paratype: MCZ 38828: Collected by: Professor Arthur Loveridge. Presented/Donated by: ?: Collector Unknown. Paratype: MCZ 38830: Collected by: Professor Arthur Loveridge. Presented/Donated by: ?: Collector Unknown. Paratype: MCZ 38831: Collected by: Professor Arthur Loveridge. Presented/Donated by: ?: Collector Unknown. Paratype: MCZ 38832: Collected by: Professor Arthur Loveridge. Presented/Donated by: ?: Collector Unknown. Paratype: MCZ 38833: Collected by: Professor Arthur Loveridge. Presented/Donated by: ?: Collector Unknown. Paratype: MCZ 38834: Collected by: Professor Arthur Loveridge. Presented/Donated by: ?: Collector Unknown. Paratype: MCZ 38835: Collected by: Professor Arthur Loveridge. Presented/Donated by: ?: Collector Unknown. - Comments: Possibly valid as a subspecies.

TAXONOMY:

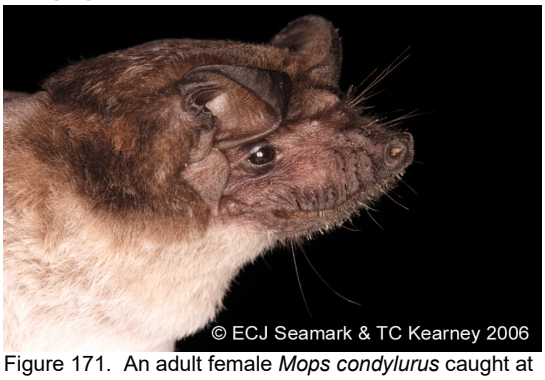

Figure 171. An adult female *Mops condylurus* caught at Mlawula-NR, Swaziland.

Includes *angolensis* and *leucostigma*, but see Peterson *et al.* (1995: 168).

In their analyses, Ammerman *et al.* (2012: 20) found that *Mops condylurus* from clusters with *M. leucostigma* from Madagascar when present, and these two form a close relationship with African *Chaerephon* and not other *Mops*. They also indicate that the two species separated from one another less than 2 million years ago (Ammerman *et al.*, 2012: 23).

COMMON NAMES:

Afrikaans: Angola-losstertvlermuis, Angolase Losstervlermuis. Chinese: 安哥拉犬吻蝠. Czech: morous angolský. English: Angolan Mops Bat, Knob-tailed Mops Bat, Angolan Free-tailed Bat, Knob-tailed Nyctinome. French: Tadaride d'Angola, Molosse d'Angola. German: Angola-Bulldoggfledermaus, Centralafrikanische Doggengrämler. Italian: Carlìno condilùro. Portuguese: Morcego de cauda livre.

ETYMOLOGY OF COMMON NAME:

Originally described from the former Natal province, it might more appropriately have been called the Natal free-tailed bat, but this name is taken by *Mormopterus acetabulosus*.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Gunnell *et al.* (2015a: 20) report on a right distal humerus from a Pleistocene deposit at Olduvai Gorge (Tanzania), which they assigned to *Mops* cf. *M. condylurus*.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008af; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) [assessed as *Tadarida condylura*] (Mickleburgh *et al.*, 2008af; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2004aq; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - LC ver 3.1 (2001) (Monadjem *et al.*, 2016b). 2004 - LC ver 3.1 (2001) (Friedmann and Daly, 2004).

MAJOR THREATS:
There are no major threats to this species. Some colonies roosting within buildings are possibly threatened by general persecution (Mickleburgh *et al.*, 2008af; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008af) [in IUCN (2009)] report that this species is present in a number of protected areas. No direct conservation actions are currently needed for the species as a whole.

GENERAL DISTRIBUTION:
Mops condylurus is widely distributed over much of sub-Saharan Africa. It ranges from Senegal, the Gambia and Mali in the west, to the Sudan, Ethiopia and Somalia in the east; from here it ranges southwards through much of eastern and southern Africa, as far south as eastern South Africa and Swaziland. The species appears to be largely absent from the Congo Basin.

Monadjem *et al.* (2010d) does not record any specimens occuring in Namibia.

Besides *Mops condylurus*, Taylor *et al.* (2018b: 63) also mention *Mops* cf. *condylurus* from Angola, whose echolocation calls do not match any known species.

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 1,057,626 km^2. In the RSA, Babiker Salata (2012: 49) found that its distribution is stongly associated with the mean temperature of the coldest quarter.

Native: Angola (Lopes and Crawford-Cabral, 1992; Monadjem *et al.*, 2010d: 543; Taylor *et al.*, 2018b: 62); Benin (Capo-Chichi *et al.*, 2004: 163); Botswana (Monadjem *et al.*, 2010d: 543); Burkina Faso (Kangoyé *et al.* (2012: 6025; 2015a: 618); Burundi; Cameroon (Bakwo Fils *et al.*, 2014: 4); Congo (Bates *et al.*, 2013: 336); Congo (The Democratic Republic of the) (Allen, 1917; Hayman *et al.*, 1966; Dowsett *et al.*, 1991: 259; Van Cakenberghe *et al.*, 1999; Monadjem *et al.*, 2010d: 543); Côte d'Ivoire; Ethiopia (Lavrenchenko *et al.*, 2004b: 141); Gambia (Emms and Barnett, 2005: 50); Ghana; Guinea (Fahr *et al.*, 2006b: 245; Decher *et al.*, 2016: 275); Guinea-Bissau (Seabra, 1900a; Monard, 1939; Veiga-Ferreira, 1949; Lopes and Crawford-Cabral, 1992; Rainho and Ranco, 2001: 75); Kenya; Liberia (Fahr, 2007a: 104); Malawi (Happold *et al.*, 1988; Happold and Happold, 1997b: 823; Monadjem *et al.*, 2010d: 543); Mali; Mozambique (Smithers and Lobão Tello, 1976; Monadjem *et al.*, 2010d: 543; Monadjem *et al.*, 2010c: 382); Namibia; Niger; Nigeria; Rwanda; Senegal; Sierra Leone; Somalia; South Africa (De Graaf, 1960; Monadjem *et al.*, 2010d: 544); Sudan; Swaziland (Monadjem *et al.*, 2010d: 544); Tanzania; Togo; Uganda (Kityo and Kerbis, 1996: 62); Zambia (Monadjem *et al.*, 2010d: 544); Zimbabwe (Cotterill, 2004a: 260; Monadjem *et al.*, 2010d: 3422).

Presence uncertain: Madagascar.

DENTAL FORMULA:
Dorst (1949: 47-48, fig 2) discussed the milk dentition of this species (as *Mops angolensis*) and indicated that the incisors are quite different from both the canines and premolars, as the prior are tricuspid and the latter are peg-like.

DETAILED MORPHOLOGY:
Baculum - Unknown
Brain - Amrein *et al.* (2007) from specimens collected from Bénin reported sparse proliferating cell activity, detected with Ki-67 and MCM2, in the subgranular layer of the dentate gyrus, with doublecortin (DCX) they detected young migrating neuron in the subgrannular layer of the hippocampus. Amrein *et al.* (2007) also reported moderate to ample proliferating cells (Ki-67 positive cells) and migrating young neurons (DCX positive cells) in the rostral migratory stream. No NeuroD was detected in the hippocampal granule cells (Amrein *et al.*, 2007).

FUNCTIONAL MORPHOLOGY:
Maloney *et al.* (1999: 385) indicate that *M. condylurus* is well adapted to tolerated high

ambivalent temperatures, which may enable them to exploit thermally challenging roost sites and allow them to survive in habitats where less stressful roosts are limited.

Buffenstein *et al.* (1999: 15) found that urine voided prior to feeding in summer was 22% more concentrated than that in autumn, suggesting that periods of exposure to high temperatures were more stressful. The urine produced was up to eight times more concentrated than plasma.

SEXUAL DIMORPHISM:
Chaverri *et al.* (2018: 1944) [referring to Bouchard, 2001b] indicates that the sexes can be distinguished by scent produced from the interaural and muzzle glandular areas.

ECHOLOCATION:
5.Bohmann *et al.* (2011: 1) [referring to Monadjem *et al.* (2010d)] mention peak frequencies between 26 - 35 kHz. Schoeman and Waddington (2011: 291) mention a peak frequency of 24.8 ± 1.5 kHz and a duration of 15.7 ± 2.1 msec for specimens from Durban, South Africa. From the same area, Naidoo *et al.* (2011: 23) mention a F_{peak} of 25.8 ± 0.5 kHz and a duration of 6.8 ± 1.8 msec.

In Swaziland, Taylor *et al.* (2013b: 18) recorded the following parameters for 6 calls: F_{max}: 34.8 ± 2.78 (31.5 - 38.6) kHz, F_{min}: 25.8 ± 1.79 (23.9 - 28.2) kHz, F_{knee}: 30.2 ± 2.16 (27.4 - 32.4) kHz, F_{char}: 27.3 ± 1.98 (24.9 - 29.3) kHz, duration: 5.5 ± 1.40 (3.4 - 7.2) msec. Additional values reported by Monadjem *et al.* (2017c: 179) are: F_{min}: 25.1 ± 1.68 (23.5 - 26.1) kHz, F_{knee}: 30.1 ± 2.03 (28.1 - 32.1) kHz, F_c: 27.3 ± 1.56 (25.9 - 28.8) kHz and duration: 4.3 ± 2.08 (2.2 - 6.4) msec. These calls could be detected up to 30 m away.

At Farm Welgevonden, South Africa, Taylor *et al.* (2013a: 556) report a F_{knee} value of 30 (27 - 32) kHz.
Linden *et al.* (2014: 40) reported the following parameters from the Soutpansberg range (RSA): F_{min}: 24 - 28 kHz, F_{char}: 25 - 29 kHz, F_{knee}: 27 - 32 kHz, Slope: 40 - 160 OPS, duration: 3 - 7 msec. From the Mapungubwe National Park (RSA), Parker and Bernard (2018: 57) recorded 6 calls with: F_{char}: 29.12 ± 0.70 kHz, F_{max}: 30.72 ± 1.52 kHz, F_{min}: 28.45 ± 0.50 kHz, F_{knee}: 29.82 ± 0.97, duration: 15.44 ± 3.78 msec, at 5.57 ± 1.11 calls/sec.

From Maroua, Cameroon, Manga Mongombe (2012: 79) and Bakwo Fils *et al.* (2018: 4) reported for 12 calls a call type of FM and the following parameters: F_{max}: 37.8 ± 3.8 (33.9 - 41.6) kHz, F_{min}: 34.2 ± 4.9 (30.1 - 40.0) kHz, F_{mean}: 36.4 ± 4.5 (31.0 - 41.0) kHz, F_{knee}: 38.2 ± 4.7 (33.9 - 41.5) kHZ, F_{char}: 33.67 ± 5.1 (30.1 - 40.0) kHz, and duration: 0.78 ± 0.89 (0.57 - 0.88) msec.

MOLECULAR BIOLOGY:
DNA - See Hoofer and Van Den Bussche (2003).
Karyotype - Đulic and Mutere (1973a) described the karyotype as having a diploid number of 2*n* = 48, aFN = 56, BA = 10, X = SM, Y = A. While Smith *et al.* (1986) found that the fundamental number was aFN = 66, BA = 20, this is supported by Rautenbach *et al.* (1993). Koubínová (2013: 7) mentioned: 2*n* = 48 and FN = 54.
Protein / allozyme - Unknown.

HABITAT:
Noer *et al.* (2012: 1) indicate that *M. condylurus* prefers to forage over sugarcane fields rather than over savanna, riparian forest and urban areas. They also indicated that the bats travel up to 4.8 km from their roosts during their foraging trips. Their activity area ranges from 1,190 to 1,437 ha.

HABITS:
Bouchard (2001b: 109) found that, in scent-choise-experiments, both males and females were able to distinguish the gender of conspecifics as well as the difference between roostmates and strangers. Chaverri *et al.* (2018: 1944) [referring to Ravel *et al.*, 2010] further indicate that there is an inverse relation between the number of individuals that can be recognized based on olfactory cues and the size of the colony. This would suggest that recognition is based on individual signatures rather than on group signatures.

ROOST:
In the Mount Nimba area, Monadjem *et al.* (2016y: 368) found a roost in the roof of a school at 540 m.

Bronner *et al.* (1999: 1) investigated the roost microclimates in three man-made structures in South Africa. The ambient temperature in these varied from below 10°C to over 40°C, but the bats preferred zones where the temperature was between 35 and 40°C, where they could maintain their basal metabolic rate.

DIET:
Based on DNA analysis of 30 fecal pellets collected between April and May (austral summer) in the Simunye region of Swaziland, Bohmann *et al.* (2011) reported insects from 24 families (belonging to seven orders) being taken as prey. The highest frequency of occurrence was for Lepidoptera (47.6 %), Diptera (26.7 %), and Hemiptera (20 %). Within the Lepidoptera, Noctuidae (Owlet moths - 23.3 %), Nymphalidae (Brush-footed butterflies - 17.6 %) and Geometridae (Geometer moths - 10 %) were found the most. Within the Diptera, it were primarly

representatives of Drosophilidae (Pomace flies - 6.5 %) and Muscidae (House flies and alike - 6.5 %). Within the Hemiptera, Lygaeidae (Chinch bugs and seed bugs) and Pentatomidae (Stink bugs) were found in 6.7 % of the pellets.

From Maroua (Cameroon), and based on fecal analyses, Bol A Anong (2013: 32) reported the diet to include Coleoptera (63.49%), Hemiptera (27.64%), Diptera (7.42%), Lepidoptera (0.05%) and Hymenoptera (0.40%).

PREDATORS:
Mikula *et al.* (2016: Supplemental data) mention "*Tadarida condylura*" to be preyed upon by: African goshawk (*Accipiter tachiro* (Daudin, 1800)), Eurasian hobby (*Falco subbuteo* Linnaeus, 1758), Wahlberg's eagle (*Hieraaetus wahlbergi* (Sundevall, 1851)), Bat hawk (*Macheiramphus alcinus* Bonaparte, 1850).

Bronner *et al.* (1999: 8) reported on the presence of an Eastern Tiger Snake (*Telescopus semiannulatus semiannulatus* Smith, 1849) in a colony of *M. condylurus*.

POPULATION:
Structure and Density - This is a common species (Mickleburgh *et al.*, 2008af; IUCN, 2009).
Trend - 2008 - Unknown (Mickleburgh *et al.*, 2008af; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
Mutere (1968, 1973b: 271) reported that "*T. condylura*" has a bimodal breeding rhythm in Uganda (pregnancies during December-March and June-September and births in March and September), which is correlated with the rainfall pattern (April-May and October-November), and that the gestation period for this species is about two months. He also indicated [in Krutzsch (2000: 95)] that the testicular position (intra-abdominal or scrotal) showed no significant seasonal variation in sperm production.

Happold and Happold (1989b: 133) indicate that "*Tadarida condylura*" is monotocous in Malawi, where it has two births per year. They also found that the interval between births decreases with increasing latitude.

Mutere (1973b) mentioned that the pattern of reproduction is not followed by a postpartum oestrous, whereas Happold and Happold (1989b) mention the opposite.

Wyant and Adams (2007) present data on prenatal growth, development, and skeletal ossification, by intergrating data from changes in body size, wing area, and skeletogenesis, from specimens collected from east African countries.

Monadjem *et al.* (2010d) [in Weier *et al.* (2018: Suppl.)] mentioned births between early September and early May.

PARASITES:
Lima *et al.* (2012: 858) described a new species of *Trypanosoma* from Mozambican *Mops condylurus*: *T. (Schizotrypanum) erneyi*. This parasite was also found in two unidentified *Tadarida* specimens.

Höhne *et al.* (1975: 505) found *Listeria monocytogenes* bacteria in two out of 234 "*Tadarida condylura*" specimens from Lomé, Togo.

HEMIPTERA
Cimicidae: *Loxaspis miranda* Rothschild, 1912 were found in the hollow trunk of a *Borassus* palm containing many dead *T. condylura*, at the Fambani river, near mouth of Zambesi, in Mozambique (Haeselbarth *et al.*, 1966: 10).

SIPHONAPTERA
Ischnopsyllidae: *Lagaropsylla idea* Smit, 1957 widespread in tropical Africa (Haeselbarth *et al.*, 1966: 1990; Beaucournu and Kock, 1996). *Lagaropsylla leleupi* Smit, 1957 from Bugesera, Burindi (Haeselbarth *et al.*, 1966: 191). *Lagaropsylla obliqua* Smit, 1957 from Sierra Leone, Cameroon and the Congo (Haeselbarth *et al.*, 1966: 191).

Lagaropsylla incerta (Rothschild, 1900) was reported from Madagascar by Beaucournu and Kock (1996).

ACARI
Laelapidae: Taufflieb (1962: 112) reported *Chelanyssus aethiopious* Hirst, 1921 from a "*Tadarida angolensis* [=*Mops osborni*]".
Sarcoptidae: *Notoedres tadaridae* Fain, 1959 was found by Fain and Aellen (1994: 64) on a "*Tadarida condylura*" specimen from Tandara, DRC.
Trombiculidae: Stekolnikov (2018a: 69, 172) reported *Holubicula toroensis* Daniel and Vercammen-Grandjean, 1985 on a bat from Uganda, and *Microtrombicula tadarida* Vercammen-Grandjean, 1965 on a bat from Rwanda.

VIRUSES:
Astroviridae
Viruses belonging to this family were recorded by Waruhiu *et al.* (2017) from these bats in Kenya, and in one (out of 52) tested by Hoarau *et al.* (2018: 2) in Mozambique.

Bunyaviridae
Sudi *et al.* (2018: 3) refer to Krüger *et al.* (2015), who reported the presence of Lompole virus (LMPV) in *Mops condylurus* from the DRC (although the latter authors didn't identify the bats involved).

Caliciviridae
Viruses belonging to this family were recorded by Waruhiu *et al.* (2017) from these bats in Kenya.

Coronaviridae - Coronaviruses
SARS-CoV - Müller *et al.* (2007b) tested between 1986 and 1999, for antibody to SARS-CoV in sera in 19 individuals from Limpopo Province, South Africa, three were tested positive (3/19, 15.8 %) and 96 individuals from Mpumalanga Province, South Africa, 11 tested positive (11/96, 11.9 %) (14/115, 12.2 %).
Anthony *et al.* (2017b: Suppl.) mention the alpha-coronavirus Charephon_CoV_KY22.

Filoviridae - Filo viruses
Ebolavirus
Muyembe-Tamfum *et al.* (2012: 9) refer to Pourrut *et al.* (2005) who found ZEBOV-specific antibodies in this species.
Saéz *et al.* (2014) indicate that the two-year old boy, who was patient zero for the 2014 Ebola outbreak in West Africa may have been infected while playing in a hollow tree housing a colony of *M. condylurus*. However, Wood *et al.* (2015: 9-10) find "the suggestion that *Mops condylurus* was the source of infection in the index human case in Guinea noteworthy if somewhat speculative."

Goldstein *et al.* (2018: 1084) described a new *Ebolavirus* from three Sierra Leonan *C. pumilus* and one *Mops condylurus*: Bomali virus (BOMV). They were sampled in human dwellings in small villages in the Bomali district. This virus might infect humans, but it is not known (yet) whether it is virulent in humans too.
Forbes *et al.* (2019: 955) reported this virus from one *M.condylurus* from Kenya (out of 16 *M. condylurus* + 92 other bats collected).

Flaviviridae
Flavivirus
de Jong *et al.* (2011: 10) reported Bukalasa bat virus, Dakar bat virus, Entebbe bat virus. The latter two are also reported by Luis *et al.* (2013: suppl.), Blitvich and Firth (2017: 3). In Uganda, Kading *et al.* (2018: 3) found neutralizing antibodies against Dengue 2 virus (DENV-2) and non-specific Flaviviruses.
Dakar virus - Kemp (1975: 616) mentions that this virus was isolated in Nigeria on *M. condylurus* for the first time on 25 January 1966.

Zika virus (ZIKV) - Malmlov *et al.* (2019: 2) refer to Shepherd and Williams (1964) who examined 36 Ugandan *condylurus* specimens of which 26 had antibodies against ZIKV.

Pegivirus (BPgV)
1 of 10 specimens from the Democratic Republic of Congo examined by Quan *et al.* (2013: Table S5) (10.0 %) was infected by clade G type *Pegivirus*. Of the same 10 specimens, 2 were infected by clade K type

Paramxoviridae
Viruses belonging to this family were recorded by Waruhiu *et al.* (2017) from these bats in Kenya.

Peribunyaviridae
Orthobunyavirus
Fagre and Kading (2019: 4) report that Bunyamwera virus (BUNV) was found either by virus isolation or molecular/serologic evidence.

In their overview tables, Maganga *et al.* (2014a: 8) and Willoughby *et al.* (2017: Suppl.) reported that the following viruses were already found on *M. condylurus*: Bukalasa bat virus, Dakar bat virus, Entebbe bat virus, Coronavirus (SARS-CoV), Bunyamwera orthobunyavirus, West Nile virus, Yellow fever virus, Zaïre Ebola, Zika virus.

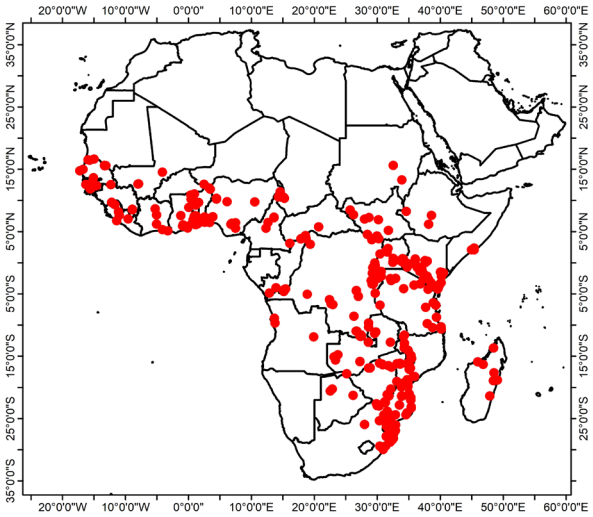

Figure 172. Distribution of *Mops* (*Mops*) *condylurus*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Angola, Benin, Botswana, Burundi, Cameroon, Central African Republic, Congo, Congo (Democratic Republic of the), Côte d'Ivoire, Equatorial Guinea, Ethiopia, Gabon, Ghana, Guinea, Guinea-Bissau, Kenya, Liberia, Madagascar, Malawi, Mali, Mauritania, Mozambique, Namibia, Niger, Nigeria, Rwanda, Senegal, Sierra Leone, Somalia, South Africa, South Sudan, Sudan, Swaziland, Tanzania, The Gambia, Togo, Uganda, Zambia, Zimbabwe.

Mops (Mops) congicus J.A. Allen, 1917

*1917. *Mops congicus* J.A. Allen, Bull. Am. Mus. Nat. Hist., 37 (18): 467, pl. 55. Publication date: 29 September 1917. Type locality: Congo (Democratic Republic of the): Oriental province: Medje [02 25 N 27 18 E, 800 m] [Goto Description]. Holotype: AMNH 48893: ad ♀, skin and skull. Collected by: Herbert Lang, James Paul Chapin and The American Museum Congo Expedition; collection date: 8 September 1910; original number: 966.
? *Mops (Mops) congicus:* (Name Combination, Current Combination)
? *Mops congica:* (Alternate Spelling)
? *Tadarida congica:* (Name Combination)

TAXONOMY:
Does not include *trevori*; see Peterson (1972).

COMMON NAMES:
Czech: morous konžský. English: Medje Mops Bat, Medje Free-tailed Bat, Medje Greater Free-tailed Bat. French: Tadaride de Medje. German: Kongo-Bulldoggfledermaus, Medje-Bulldoggfledermaus.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008bp; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) [assessed as *Tadarida congica*] (Mickleburgh *et al.*, 2008bp; IUCN, 2009). 2004 - NT ver 3.1 (2001) (Mickleburgh *et al.*, 2004bx; IUCN, 2004). 1996 - LR/nt (Baillie and Groombridge, 1996).

MAJOR THREATS:
It is threatened in parts of its range by habitat loss, largely resulting from logging activities and conversion of land to agricultural use (Mickleburgh *et al.*, 2008bp; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008bp) [in IUCN (2009)] report that it is not known if the species is present in any protected areas. Further studies are needed into the distribution, abundance, natural history, and threats to this poorly known species.

GENERAL DISTRIBUTION:
Mops congicus has been patchily recorded in Central Africa. It is found from southern Cameroon, east into the northern part of the Democratic Republic of the Congo and western Uganda.

Earlier records of this species from Ghana and Nigeria are now allocated to *Mops trevori* (Simmons, 2005).

Native: Cameroon; Congo (The Democratic Republic of the); Uganda.

POPULATION:
Structure and Density - The species has been rarely collected. While a single large colony of approximately several dozen bats has been reported, it is suspected to generally occur in much smaller roosts (Mickleburgh *et al.*, 2008bp; IUCN, 2009).
Trend - 2008 - Unknown (Mickleburgh *et al.*, 2008bp; IUCN, 2009).

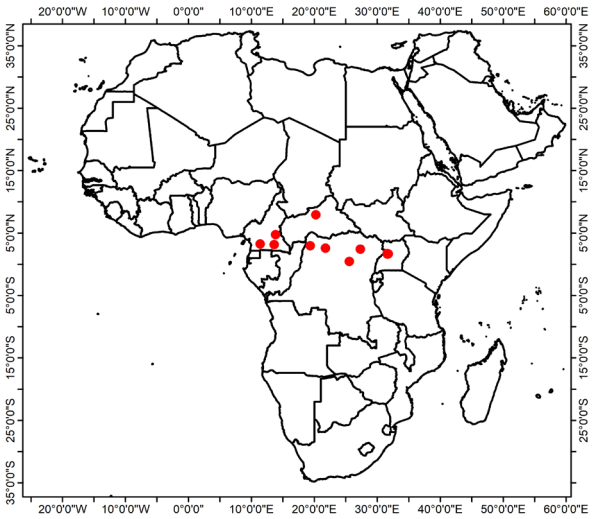

Figure 173. Distribution of *Mops* (*Mops*) *congicus*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Cameroon, Central African Republic, Congo (Democratic Republic of the), Uganda.

Mops (Mops) demonstrator (Thomas, 1903)

*1903. *Nyctinomus demonstrator* Thomas, Ann. Mag. nat. Hist., ser. 7, 12 (71): 504. Publication date: 1 November 1903. Type locality: Sudan: Equatoria province: 25 mi (37 km) N of

Gondokoro: Mongalla [05 10 N 31 50 E, 500 m] [Goto Description]. Holotype: BMNH 1902.7.4.3: ad ♂. Collected by: W.L.S. Loat Esq. Presented/Donated by: W.L.S. Loat Esq.

1917. *Mops (Allomops) faradjius* J.A. Allen, Bull. Am. Mus. Nat. Hist., 37 (18): 476. Publication date: 29 September 1917. Type locality: Congo (Democratic Republic of the): Oriental province: Uele district: Faradje [03 44 N 29 43 E] [Goto Description]. Holotype: AMNH 49222: ad ♂, skull and alcoholic. Collected by: Herbert Lang, James Paul Chapin and The American Museum Congo Expedition; collection date: 1 November 1913; original number: 3015. - Comments: One of the skull labels mentions 12 January 1913, which probably is an error.

? *Mops (Mops) demonstrator:* (Name Combination, Current Combination)

? *Mops demonstrator:* (Name Combination)

? *Mops demostrator:* (Lapsus)

? *Tadarida (Mops) demonstrator:* (Name Combination)

? *Tadarida demonstrator:* (Name Combination)

TAXONOMY:
See Simmons (2005).

COMMON NAMES:
Czech: morous mongallanský. English: Mongalla Mops Bat, Mongallan Mops Bat, Mongalla Free-tailed Bat. French: Tadaride de Mongalla. German: Mongalla-Bulldoggfledermaus.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008bs; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) [assessed as *Tadarida demonstrator*] (Mickleburgh *et al.*, 2008bs; IUCN, 2009). 2004 - NT ver 3.1 (2001) (Mickleburgh *et al.*, 2004az; IUCN, 2004). 1996 - LR/nt (Baillie and Groombridge, 1996).

MAJOR THREATS:
In part of its range this species is threatened by habitat loss, mostly the cutting of larger roosting trees from savanna. It may also be threatened by encroaching desertification in the northern limits of its range (Mickleburgh *et al.*, 2008bs; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008bs) [in IUCN (2009)] report that this species has been recorded from the Garamba National Park in the Democratic Republic of the Congo (Freeman, 1981b), and may be present in additional protected areas. There is a need to protect suitable large roosting trees in savanna. Further research is needed to better understand the distribution, natural history and major threats to this species.

GENERAL DISTRIBUTION:
Mops demonstrator has been patchily recorded from West Africa (Côte d'Ivoire, Ghana and Burkina Faso) and Central to East Africa (Cameroon, eastern Democratic Republic of the Congo, western Uganda and Sudan).

A record from the Gambia appears to be in error (Koopman, 1989b; Grubb *et al.*, 1998).

Native: Burkina Faso (Kangoyé *et al.*, 2015a: 618); Cameroon; Congo (The Democratic Republic of the); Côte d'Ivoire; Ghana; Sudan; Uganda.

MOLECULAR BIOLOGY:
DNA - Unknown.
Karyotype - Smith *et al.* (1986) reported 2*n* = 48, FN = 54, BA = 8, a submetacentric X chromosome and an acrocentric Y chromosome.
Protein / allozyme - Unknown.

PREDATORS:
Mikula *et al.* (2016: Supplemental data) mention the Bat hawk (*Macheiramphus alcinus* Bonaparte, 1850) as diurnal avian predator.

POPULATION:
Structure and Density - This species is rarely recorded. Animals are usually found singly or as small groups of up to 12 bats (Mickleburgh *et al.*, 2008bs; IUCN, 2009).
Trend - 2008 - Decreasing (Mickleburgh *et al.*, 2008bs; IUCN, 2009).

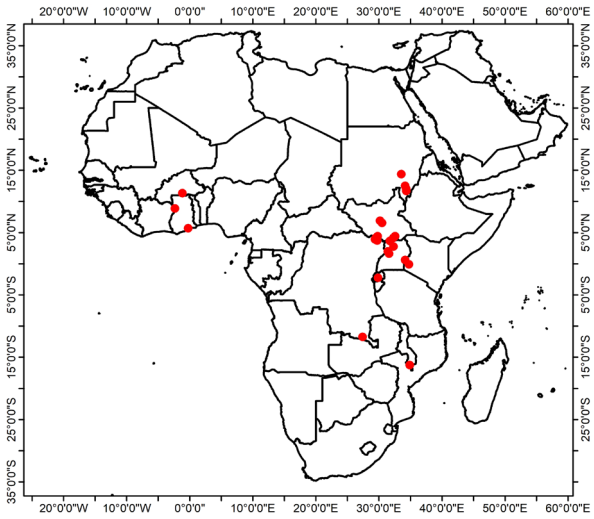

Figure 174. Distribution of *Mops* (*Mops*) *demonstrator*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Burkina Faso, Congo (Democratic Republic of the), Côte d'Ivoire, Ghana, Kenya, Malawi, Rwanda, South Sudan, Sudan, Uganda.

Mops (Mops) leucostigma (G.M. Allen, 1918)

*1918. *Chaerephon leucostigma* G.M. Allen, Bull. Mus. comp. Zool., 61 (14): 513. Publication date: 27 February 1918. Type locality: Madagascar: Tananarive [=Antananarivo] [18 55 S 47 31 E, 1 300 m]. Holotype: MCZ 16344: ad ♀, skin and skull. Collected by: Dr. Frederik Roelker Wulsin; collection date: December 1915. See Peterson *et al.* (1995: 168); Helgen and McFadden (2001: 145). Paratype: MCZ 16345: ♂, skin and skull. See Helgen and McFadden (2001: 145). - Comments: Ratrimomanarivo *et al.* (2008: 66 - 67) mentions the following: "In his description of *Mops leucostigma*, Allen (1918) cited two specimens - the holotype (MCZ 16344), which was sexed as a 'female' and the paratype (MCZ 16345), which was sexed as a 'male' (also see Helgen & McFadden, 2001). We examined these two specimens. In Allen's description he specifically states, 'The skull is provided with a prominent sagittal crest, which in the type, though partly broken, must have been at least a millimetre high.' This is an accurate description of the MCZ 16344. In members of the genus *Mops* in general (Freeman, 1981) and in *M. leucostigma* specifically (this study), adult males are distinctly larger than adult females and have a prominent and more developed occipital and sagittal crests. Based on size, skull shape, and the development of the occipital and sagittal crests, the holotype is a male and the paratype a female. Given that all of the collection data for the holotype (MCZ 16344) and paratype (MCZ 16345) are identical, we strongly suspect that the museum labels for these two specimens have been accidentally exchanged before the publication of Allen (1918).".

2018. *Mops leucogaster:* Kemp, López-Baucells, Rocha, Wangensteen, Andriatafika, Nair and Cabeza, Agric. Ecosyst. Environ., 269: 88 (for 2019). Publication date: 1 October 2018. (Lapsus)

? *Mops condylura leucostigma:* (Name Combination, Alternate Spelling)

? *Mops leucostigma:* (Name Combination)

? *Tadarida (Mops) leucostigma:* (Name Combination)

? *Tadarida leucostigma:* (Name Combination)

TAXONOMY:
Included in *condylurus* by Koopman (1993a: 236), but considered a valid species in *Tadarida (M.)* by Peterson *et al.* (1995: 152) and Russ *et al.* (2001). Considered a valid species in the genus *Mops* by Hutson *et al.* (2001: 34), Goodman and Cardiff (2004: 227), Simmons (2005).

COMMON NAMES:
Czech: morous běloskvrnný. English: Madagascar White-bellied Free-tailed Bat, Malagasy White-bellied Free-tailed Bat, White-shouldered bat. French: Tadaride à queue libre de Madagascar. German: Gefleckte Bulldoggfledermaus.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Gunnell *et al.* (2014: 3) refer to fossils material from the Andrahomana cave on Madagascar.

CONSERVATION STATUS:
Global - This species is listed as Least Concern (LC ver 3.1 (2001)) in view of its large distribution range, and its ability both to tolerate persecution and to persist in a variety of habitats in many parts of its range (Andriafidison *et al.*, 2008m; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) [assessed as *Tadarida leucostigma*] (Andriafidison *et al.*, 2008m; IUCN, 2009). 2000 - DD ver 2.3 (1994).

MAJOR THREATS:
In some areas it is hunted for food (Goodman *et al.*, 2008d) or persecuted, but these are not thought to be serious threats (Andriafidison *et al.*, 2008m; IUCN, 2009).

CONSERVATION ACTIONS:
Andriafidison *et al.* (2008m) [in IUCN (2009)] report that this species is known from Kirindy CFPF and Parc National de Zombitse-Vohibasia (Goodman *et al.*, 2005a). It is also common in villages adjacent to several protected areas (Goodman *et al.*, 2005a; Russ *et al.*, 2003).

GENERAL DISTRIBUTION:
Mops leucostigma is known from Madagascar and the Comoros archipelago (Mohéli and Anjouan islands). On Madagascar it is found from the north to the southwest of the island (Eger and Mitchell, 2003; Peterson *et al.*, 1995) including the islands of Nosy Be and Nosy Komba (Rakotonandrasana and Goodman, 2007: 6). Recorded at an elevation span of 5 to 1,300 m above sea level (Allen, 1918b; Eger and Mitchell, 2003).

Native: Madagascar (Eger and Mitchell, 2003; Peterson *et al.*, 1995; Rakotonandrasana and Goodman, 2007: 6); Comoros (Ratrimomanarivo *et al.*, 2008: 57).

DETAILED MORPHOLOGY:
Baculum:
Rakotondramanana and Goodman (2017: 62) describe the baculum as displaying a distinct "m"-shape; length: 0.75 ± 0.097 (0.56 - 0.86) mm, width: 1.09 ± 0.137 (0.83 - 1.35) mm.

HABITAT:
Dammhahn and Goodman (2013: 108) indicate that this species' foraging habitat consists of open areas and the area above the forest canopy.

MIGRATION:
Reher *et al.* (2019: 121) found that *M. leucostigma* was only present in the Vintany Cave (southwestern Madagascar) during the rainy season, whereas other species such as *Triaenops menamena* and *Miniopterus mahafaliensis* were present in both the dry and wet season.

DIET:
Rakotondramanana *et al.* (2015: 78) report the following insect orders (by volume percent, by frequency percent): Coleoptera (64.0, 100.0); Lepidoptera (30.0, 100.0); Trichoptera (6.0, 60.0).

Kemp *et al.* (2018: Suppl.) used DNA metacarcoding to detect insect pest species in the diet of these bats and found the following prey orders (in descending order): Coleoptera, Diptera (*Simulium lineatum* (Meigen, 1804)), Lepidoptera (*Anthozela* sp., *Celsumaria elongata* Brown, 2017, *Spodoptera mauritia* (Boisduval, 1833)), Blattodea, Hemiptera (*Yanga guttulata* (Signoret, 1860)), Ephemeroptera, Sarcoptiformes, Orthoptera, Hymenoptera, Mesostigmata, Trombidiformes, Trichoptera.

PREDATORS:
Goodman *et al.* (2015c: 78) found the remains of two individuals in pellets of Bat Hawk *Macheiramphus alcinus* Bonaparte, 1850 in western central Madagascar.

POPULATION:
Structure and Density - The population and local abundance of this species are not known (Andriafidison *et al.*, 2008m; IUCN, 2009).
Trend - 2008 - Unknown (Andriafidison *et al.*, 2008m; IUCN, 2009).

VIRUSES:
Paramyxoviridae
Specimens from this species tested by Wilkinson *et al.* (2014: 8270) were found to be positive for paramyxoviruses.
11 out of 68 Madagascan specimens tested by Mélade *et al.* (2016b: 4) were positive for paramyxoviruses.

Rhabdoviridae
Mélade *et al.* (2016a: 6) tested 20 bats for *Lagos bat lyssavirus* and found positive reactions in two of them.

UTILISATION:
See Goodman *et al.* (2008d).

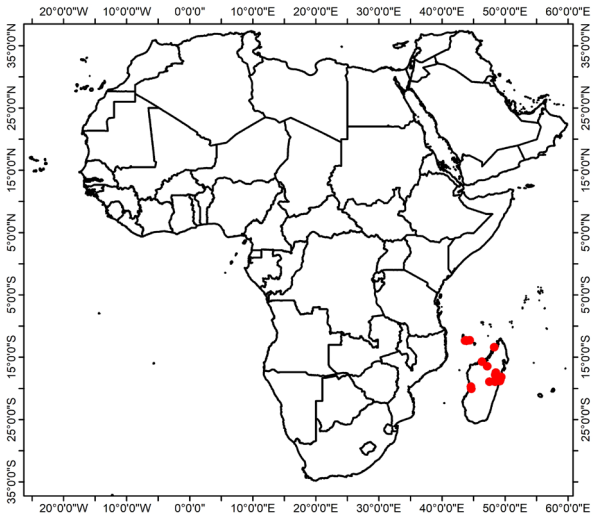

Figure 175. Distribution of *Mops* (*Mops*) *leucostigma*

DISTRIBUTION BASED ON VOUCHER SPECIMENS: Comoros, Madagascar.

Mops (Mops) midas (Sundevall, 1843)

*1843. *Dysopes midas*Sundevall, Kongl. Svenska Vet.-Akad. Hand., ser. 3, 30: 207, pl. 2, fig. 7 [for 1842]. Publication date: 1843. Type locality: Sudan: Blue Nile Province: E-bank White Nile: Valid Sohey [= Wad Shala]: restricted by Turni and Kock (2008: 68). [14 34 N 13 48 E]. Syntype: BMNH 1846.6.2.20: ad ♂, skin and skull. Formerly Stockholm Museum (ZSM no. 523), locality: Bahr el Abiad. See Turni and Kock (2008: 68). Syntype: ZMB 535: skin only. Collected by: Hedenborg; collection date: 1831 - 1835. From [Dar] Sennar, Sudan; see Turni and Kock (2008: 68). Syntype: ZSM. Collected by: Hedenborg; collection date: 1846. See Turni and Kock (2008: 68). Syntype: ZSM, skin only. Collected by: Hedenborg; collection date: 1836. See Turni and Kock (2008: 68). - Comments: Horácek *et al.* (2000: 137) mention "Bahr-el-Abiad, White Nile" as type locality. Meester *et al.* (1986: 73): "Bahr-el-Abiad (White Nile), Sudan. Kock (1969a: 154) suggests that the type locality is at Jebel el Funj, between the White and Blue Nile, and Koopman (1975, and in litt.) restricts it to the east (not west, as shown in 1975: 429) bank of the White Nile at 11 45 N 33 30 E, Blue Nile Province, Sudan."). El-Rayah (1980: 264) believes the restriction to Jebel el Funj is incorrect as Sundevall described the type locaility as Bahr el-Abiad which is the area south of Omdurman (15 19 N 32 29 E) and commonly known as Bahar Abiad and restricts the type locality to the vicinity of Jebel Aulia (15 19 N 32 31 'E). For a deeper discussion on the type locality, see Turni and Kock (2008: 68). - Etymology: According to a legend the mythological King Midas of Phrygia offended Apollo, so the god turned Midas' ears into those of a donkey, i.e. in very long ears; which in this species are relatively large (see Lanza *et al.*, 2015: 304).

? *Tadarida (Mops) midas:* (Name Combination)

? *Tadarida midas:* (Name Combination)

TAXONOMY:

Figure 176. A female *Mops midas* (TM 48104) caught at Makalali Game Reserve, Limpopo Province, South Africa.

Dunlop (1999), following Koopman (1994), recognizes two subspecies: *M. m. midas* (Sundevall 18437) occuring over most of the range and *M. m. miarensis* (Grandidier, 1869) occuring in Madagascar (Peterson *et al.* (1995). Although *miarensi* has previously been considered a subspecies endemic to the island of Madagascar (Simmons (2005), Ratrimomanarivo *et al.* (2007) found no distinctive or taxonomically definitive differences between populations of *Mops midas*

occurring on the African continent and Madagascar.

COMMON NAMES:
Afrikaans: Midas se losstertvlermuis, Midas-losstertvlermuis. Chinese: 米达犬吻蝠. Czech: morous oslí. English: Midas Mops Bat, Midas Bat, Midas Free-tailed Bat, Sundevall's Free-tailed Bat, Midas Groove-cheeked Bat. French: Tadaride Midas, Molosse Midas, Tadarida de Midas, Molosse de Midas. German: Midas-Bulldoggfledermaus, Sennaarische Doggengrämler. Italian: Carlìno Mìda.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
No known fossils (Dunlop, 1999).

CONSERVATION STATUS:
Global - This species is listed as Least Concern (LC ver 3.1 (2001)) in view of its widespread but patchy distribution. The species is locally hunted and persecuted, but it is not thought to be declining fast enough to place it in a higher category of threat (Jenkins *et al.*, 2008a; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) [assessed as *Tadarida midas*] (Jenkins *et al.*, 2008a; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2004ax; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

Regional -
South Africa: 2016 - LC ver 3.1 (2001) (Taylor *et al.*, 2016a). 2004 - LC ver 3.1 (2001) (Friedmann and Daly, 2004). 1986 - Indeterminate (Smithers, 1986).

MAJOR THREATS:
This species is thought to be locally threatened by general persecution, collection for food and habitat loss (Jenkins *et al.*, 2008a; IUCN, 2009).

CONSERVATION ACTIONS:
Jenkins *et al.* (2008a) [in IUCN (2009)] report that there is a need to protect large trees and other known roosting sites for this species (this does not apply to populations on Madagascar). In Madagascar, it is known from Beza Mahafaly and Zombitse-Vohibasia National Parks.

GENERAL DISTRIBUTION:
Mops midas is a widespread lowland, savanna species ranging from West Africa eastwards to East Africa and southwards into southern Africa. It has been recorded from the Arabian Peninsula. It is present on Madagascar (including the island of Nosy Be), where it is generally distributed in the drier western and southern habitats of the island below 150 m asl (Ratrimomanarivo *et al.*, 2007). In South Africa, the species' distribution is mostly affected by precipitation seasonality (Babiker Salata, 2012: 49). Taylor *et al.* (2018b: 63) predict that the species might also occur in Angola.

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 441,324 km^2.

Native: Benin; Botswana (Archer, 1977; Monadjem *et al.*, 2010d: 544); Burkina Faso (Kangoyé *et al.*, 2015a: 618); Burundi; Central African Republic; Chad; Congo (The Democratic Republic of the); Eritrea (Lavrenchenko *et al.*, 2004b: 133); Ethiopia; Gambia; Ghana; Kenya; Madagascar (Peterson *et al.*, 1995; Rakotonandrasana and Goodman, 2007: 6); Malawi (Ansell and Dowsett, 1988: 47; Monadjem *et al.*, 2010d: 544); Mali; Mozambique; Namibia (Cotterill, 2004a: 260; Monadjem *et al.*, 2010d: 544); Niger; Nigeria; Rwanda; Saudi Arabia; Senegal; South Africa (Monadjem *et al.*, 2010d: 544); Sudan; Swaziland (Shapiro and Monadjem, 2015: "1")): Tanzania; Togo; Uganda; Zambia (Ansell, 1973; Cotterill, 2004a: 260; Monadjem *et al.*, 2010d: 544); Zimbabwe (Monadjem *et al.*, 2010d: 544).

BIOGEOGRAPHY:
Samonds *et al.* (2012: 5356) indicate that *M. midas* seems to have migrated multiple times between the African continent and Madagascar.

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
See Dunlop (1999).

GENERAL DESCRIPTION OF CRANIAL AND DENTAL MORPHOLOGY:
See Dunlop (1999).

DETAILED MORPHOLOGY:
Baculum:
Rakotondramanana and Goodman (2017: 62) describe the baculum as an elongated rod, which has a notable twist to the mid-shaft in a lateral view. The distal tip is rounded, and the proximal tip terminates in a blunt point length: 1.90 ± 0.091 (1.80 - 2.05) mm, width: 0.39 ± 0.058 (0.32 - 0.46) mm.

For a description of the crania, teeth, ears and tragus, and wingshape and aspect ratio see Dunlop (1999).

SEXUAL DIMORPHISM:
Sexual dimorphism in *M. midas* occurs primarily in the stronger development of the sagittal and lambdoidal crests (Kingdon, 1974; Smithers, 1983; Dunlop, 1999), as well as the greater length and width of the skull (Peterson *et al.*, 1995) in males.

ECHOLOCATION:
See Dunlop (1999) and Taylor (1999b).

In Waterberg, South Africa, Taylor *et al.* (2013b: 18) recorded the following parameters for 6 calls: F_{max}: 14.5 ± 1.45 (12.7 - 16.2) kHz, F_{min}: 12.8 ± 0.82 (11.7 - 13.7) kHz, F_{knee}: 13.8 ± 1.02 (12.5 - 15.0) kHz, F_{char}: 13.1 ± 0.88 (12.0 - 14.0) kHz, duration: 10.3 ± 2.89 (7.8 - 15.8) msec.
At Farm Welgevonden, South Africa, Taylor *et al.* (2013a: 556) report a F_{knee} value of 14 (12 - 15) kHz.
Linden *et al.* (2014: 40) reported the following parameters from the Souhpansberg range (RSA): F_{min}: 12 - 14 kHz, F_{char}: 12 - 14 kHz, F_{knee}: 12 - 15 kHz, Slope: 32 - 66 OPS, duration: 8 - 16 msec.
At the Mapungubwe National Park (RSA), Parker and Bernard (2018: 57) recorded 13 calls: F_{char}: 13.11 ± 1.04 kHz, F_{max}: 14.66 ± 1.46 kHz, F_{min}: 12.33 ± 1.42 kHz, F_{knee}: 13.71 ± 0.98 kHz, duration: 14.79 ± 3.78 msec, with 4.29 ± 2.73 calls/sec.

From Swaziland, the following values were reported by Monadjem *et al.* (2017c: 179): F_{min}: 11.8 ± 0.50 (11.3 - 12.5) kHz, F_{knee}: 13.1 ± 1.08 (11.9 - 14.5) kHz, F_c: 12.3 ± 0.72 (11.6 - 13.4) kHz and duration: 14.2 ± 3.89 (9.0 - 20.7) msec.

MOLECULAR BIOLOGY:
DNA - Unknown.
Karyotype - Smith *et al.* (1986) described the karyotype as having a diploid number of 2*n* = 48, aFN = 66, BA = 20, X = SM, Y = A, this is supported by Rautenbach *et al.* (1993).
Protein / allozyme - Unknown.

HABITAT:
See Dunlop (1999).

HABITS:
See Dunlop, 1999).

ROOST:
See Dunlop (1999).

MIGRATION:
May make local migrations, as they only appear in parts of their range (northeastern Congo) at the end of the dry season (Allen *et al.*, 1917; Dunlop, 1999).

DIET:
In the Limpopo province (RSA), Taylor *et al.* (2017b: 246, 252 - 254) found 93 prey items spread over seven insect orders: Lepidoptera (100 % [found in all faecal pellets] and covering 17 families: *Synemon austera* + *Talanga sexpunctalis* + *Antaeotricha* sp. + *Elachista* sp. + *Araeopteron* sp. + *Dyops subdifferens* + *Eublemma* sp. + *Peridrome orbicularis* + *Spargaloma sexpunctata* + *Eutelia polychorda* + *Lophoptera* sp. + *Phlegetonia callichroma* + *Acanthovalva inconspicuaria* + *Achrosis pyrrhularia* + *Aethalura punctulata* + *Cabera AH02SA* + *Chiasmia interrupta* + *Ennominae* sp. + *Eupithecia* sp. + *Isturgia arizeloides* + *Isturgia roraria* + *Isturgia pulinda* + *Scopula atricapilla* + *Hyblaea puera* + *Gonometa postica* + *Sena* sp. + *Sena prompta* + *Xenopseustis* sp. + *Acronicta psi* + *Adisura marginalis* + *Athetis ignava* + *Bastilla torrida* + *Bryophila AH01Pe* + *Chasmina lispodes* + *Chasmina* sp. + *Condica parista* + *Copitarsia* + *Cortyta canescens* + *Enmonodia capensis* + *Grammodes stolida* + *Harrisimemna trisignata* + *Heterochroma BioLep767* + *Hypotacha* sp. + *Leucania BioLep10* + *Leucania BioLep162* + *Leucania multilinea* + *Leucania Poole05* + *Leucania porphyrodes* + *Mythimna consanguis* + *Mythimna convecta* + *Mythimna impura* + *Mythimna oxygala* + *Mythimna nigrisparsa* + *Mythimna obsoleta* + *Mythimna* sp. + *Niphonyx segregata* + *Hadenini* sp. + *Ophiusa tirhaca* + *Pandesma robusta* + *Paratrachea laches* + *Pericyma atrifusa* + *Polia piniae* + *Rhesala moestalis* + *Spodoptera exigua* + *Tycomarptes* sp. + *Xanthodes malvae* + *Garella nilotica* + *Maurilia arcuata* + *Meganola dentata* + *Meganola baracoana* + *Pseudosomera noctuiformis* + *Stenoptilia* sp. + *Phycitinae* + *Copaxa lavendera* + *Pseudautomeris irene* + *Agrius convolvuli* + *Cochylidia implicitana* + *Platphalonidia felix* + unmatched), Coleoptera (67 % - *Cybister tripunctatus* + unmatched), Hemiptera (29 % - *Macrorhaphis acuta* + *Nezar viridula* + unmatched), Diptera, Orthoptera (Tettigoniinae), Blattodea (25 % - *Pycnoscelus* sp. + unmatched) and Neuroptera (29 % - unmatched).

POPULATION:
Structure - Verschuren (1957) found females outnumbered males in the roost at a ratio of four to one.
Density - Smithers, 1983) reported *M. midas* roosting in groups of up to several hundred; however, Verschuren, 1957) only recorded groups of 10-20 individuals leaving roosts. In Madagascar, no large colonies have been found and it is thought to be a locally common species with a patchy distribution. The maximum recorded colony was near Amboasary of 600 individuals (Jenkins *et al.*, 2008a; IUCN, 2009).
Trend - 2008 - Decreasing (Jenkins *et al.*, 2008a; IUCN, 2009).

ACTIVITY AND BEHAVIOUR:
See Dunlop (1999).

REPRODUCTION AND ONTOGENY:
See Dunlop (1999).

Krutzsch (2000: 127) indicates that this species is polyoestrous.

Monadjem *et al.* (2010d) [in Weier *et al.* (2018: Suppl.)] suggest that the birth season runs from December to March.

MATING:
See Dunlop (1999).

PARASITES:
Several mites have been recorded for this species, including *Chelanyssus aethiopicus* (Family Macronyssidae) and *Nycteriglyhus tadaridae* (Family Rosensteiniidae) (Anciaux de Faveaux, 1971; 1976a). Bat fleas (Siphonaptera) have also been recorded (Dunlop, 1999). *Lagaropsylla hoogstraali* (Ischnopsyllidae: Ischnopsyllinae) was found amongst a batch of fleas taken from *M. midas* in the Kruger National Park, South Africa in the Pafuri area (Segerman and Braack, 1988).

SIPHONAPTERA
Ischnopsyllidae: *Lagaropsylla hoogstraali* Smit, 1957 from Rwanda (Haeselbarth *et al.*, 1966: 190), and Madagascar (Hastriter, 2016: 17).

VIRUSES:
Coronaviridae - Coronaviruses
SARS-CoV - Müller *et al.* (2007b) tested between 1986 and 1999, for antibody to SARS-CoV in sera in 15 individuals from Limpopo Province, South Africa, none were tested positive (0/15).
One out of two specimens tested by Geldenhuys *et al.* (2013: 517) in Makhado, Limpopo, RSA was found to be positive for CoV.

Paramyxoviridae
Mélade *et al.* (2016b: 4) tested 19 Madagascan specimens of which one was positive for paramyxoviruses.

UTILISATION:
In Madagascar, Goodman *et al.* (2008d) found that these bats were caught, cooked and then fed to domestic pigs.

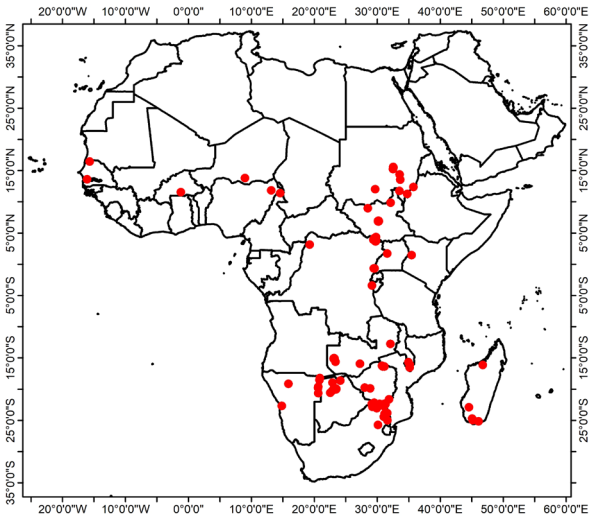

Figure 177. Distribution of *Mops* (*Mops*) *midas*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Botswana, Burkina Faso, Cameroon, Congo (Democratic Republic of the), Ethiopia, Kenya, Madagascar, Malawi, Namibia, Niger, Nigeria, Senegal, South Africa, South Sudan, Sudan, Uganda, Zambia, Zimbabwe.

Mops (Mops) midas miarensis (A. Grandidier, 1869)

*1869. *Nyctinomus Miarensis* A. Grandidier, Rev. Mag. Zool., ser. 2, 21: 337. Publication date: September 1869. Type locality: Madagascar: between Soua-haze and Soua-hané [sic]: Miari [probably Miary near Tuléar] [Goto Description]. Holotype: MNHN 29: ad ♀. Presented/Donated by: ?: Collector Unknown. Holotype: MNHN ZM-MO-1997-1851: ad ♀, alcoholic (skull not removed). Collected by: Alfred Grandidier. See Peterson *et al.* (1995: 174). Number 229 in Rode (1941).
1870. *Nyctinomus unicolor* A. Grandidier, Rev. Mag. Zool., ser. 2, 22: 49. Publication date: February 1870. Type locality: Madagascar: "Madagascar" [Goto Description].
? *Mops (Mops) midas miarensis:* (Name Combination, Current Combination)
? *Mops miarensis:* (Name Combination)
? *Mops midas miarensis:* (Name Combination)

GENERAL DISTRIBUTION:
E, SW, S Madagascar.

Mops (Mops) midas midas (Sundevall, 1843)

*1843. *Dysopes midas*Sundevall, Kongl. Svenska Vet.-Akad. Hand., ser. 3, 30: 207, pl. 2, fig. 7 [for 1842]. Publication date: 1843. Type locality: Sudan: Blue Nile Province: E-bank White Nile: Valid Sohey [= Wad Shala]: restricted by Turni and Kock (2008: 68). [14 34 N 13 48

E]. Syntype: BMNH 1846.6.2.20: ad ♂, skin and skull. Formerly Stockholm Museum (ZSM no. 523), locality: Bahr el Abiad. See Turni and Kock (2008: 68). Syntype: ZMB 535: skin only. Collected by: Hedenborg; collection date: 1831 - 1835. From [Dar] Sennar, Sudan; see Turni and Kock (2008: 68). Syntype: ZSM. Collected by: Hedenborg; collection date: 1846. See Turni and Kock (2008: 68). Syntype: ZSM, skin only. Collected by: Hedenborg; collection date: 1836. See Turni and Kock (2008: 68). - Comments: Horácek *et al.* (2000: 137) mention "Bahr-el-Abiad, White Nile" as type locality. Meester *et al.* (1986: 73): "Bahr-el-Abiad (White Nile), Sudan. Kock (1969a: 154) suggests that the type locality is at Jebel el Funj, between the White and Blue Nile, and Koopman (1975, and in litt.) restricts it to the east (not west, as shown in 1975: 429) bank of the White Nile at 11 45 N 33 30 E, Blue Nile Province, Sudan."). El-Rayah (1980: 264) believes the restriction to Jebel el Funj is incorrect as Sundevall described the type locaility as Bahr el-Abiad which is the area south of Omdurman (15 19 N 32 29 E) and commonly known as Bahar Abiad and restricts the type locality to the vicinity of Jebel Aulia (15 19 N 32 31 'E). For a deeper discussion on the type locality, see Turni and Kock (2008: 68). - Etymology: According to a legend the mythological King Midas of Phrygia offended Apollo, so the god turned Midas' ears into those of a donkey, i.e. in very long ears; which in this species are relatively large (see Lanza *et al.*, 2015: 304).

? *Mops midas midas:* (Name Combination)
? *Tadarida midas midas:* (Name Combination)

GENERAL DISTRIBUTION:
Continental Africa; Arabia.

Mops (Mops) niangarae J.A. Allen, 1917

*1917. *Mops niangaræ* J.A. Allen, Bull. Am. Mus. Nat. Hist., 37 (18): 468. Publication date: 29 September 1917. Type locality: Congo (Democratic Republic of the): Oriental province: Uele district: Niangara [03 24 N 27 52 E] [Goto Description]. Holotype: AMNH 48901: ad ♂, skin and skull. Collected by: Herbert Lang, James Paul Chapin and The American Museum Congo Expedition; collection date: 12 December 1910; original number: 1313. - Etymology: Referring to the locality where the type specimen was found.

? *Mops (Mops) niangarae:* (Name Combination, Current Combination)
? *Mops niangarae:* (Current Spelling)
? *Tadarida congica niangarae:* (Name Combination)

TAXONOMY:
Peterson (1972) and Thorn *et al.* (2009: 68) included this species in *trevori*. Hayman and Hill (1971) listed it as a subspecies of *Tadarida congica* (=*Mops congicus*). Freeman (1981b: 111, 159) considered it a distinct species pending collection of additional specimens.

Additional studies are needed into the systematic status of *Mops niangarae*, especially with regards to its relationship to *M. trevori* (see Hayman and Hill, 1971; Peterson, 1972; Freeman, 1981b; Simmons, 2005).

COMMON NAMES:
Czech: morous niangaranský. English: Niangara Mops Bat, Niangaran Mops Bat, Niangara Free-tailed Bat. French: Tadaride du Niangara. German: Niangara-Bulldoggfledermaus.

CONSERVATION STATUS:
Global - Listed as Data Deficient (DD ver 3.1 (2001)) in view of continuing problems with its taxonomy, and lack of recent information on its extent of occurrence, ecological requirements and threats (Mickleburgh *et al.*, 2008bq; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) [assessed as *Tadarida niangarae*] (Mickleburgh *et al.*, 2008bq; IUCN, 2009). 2004 - DD ver 3.1 (2001) (Mickleburgh *et al.*, 2004bj; IUCN, 2004). 2002 - CR B1+2c (Mickleburgh *et al.*, 2002a: 22). 1996 - DD (Baillie and Groombridge, 1996).

MAJOR THREATS:
The threats to this species are currently unknown (Mickleburgh *et al.*, 2008bq; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008bq) [in IUCN (2009)] report that it is not known if the species is present in any protected areas. Additional studies are needed into the distribution, natural history and threats to this little-known bat.

GENERAL DISTRIBUTION:
Mops niangarae is known only from the holotype collected from "Niangara, northeastern Belgian Congo" (Democratic Republic of the Congo near the border with Sudan) (Allen *et al.*, 1917; Lang and Chapin, 1917a).

Native: Congo (The Democratic Republic of the) (Allen *et al.*, 1917; Lang and Chapin, 1917a).

POPULATION:
Structure and Density - It is known only from the holotype.
Trend - 2008 - Unknown (Mickleburgh *et al.*, 2008bq; IUCN, 2009).

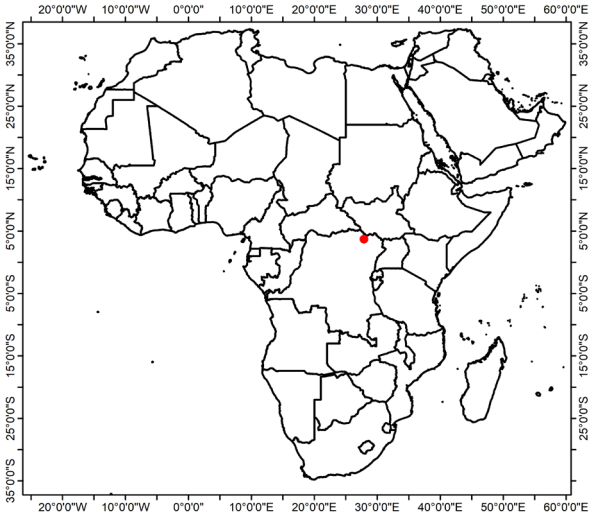

Figure 178. Distribution of *Mops* (*Mops*) *niangarae*

Mops (Mops) niveiventer Cabrera and Ruxton, 1926

*1926. *Mops angolensis niveiventer* Cabrera and Ruxton, Ann. Mag. nat. Hist., ser. 9, 17 (103): 594. Publication date: 1 May 1926. Type locality: Congo (Democratic Republic of the): Kasai Occidental province: St. Joseph de Luluabourg [=Kananga] [ca. 05 53 S 22 26 E, 610 m] [Goto Description]. Holotype: BMNH 1926.7.6.109: ♀, skin and skull. Collection date: 16 April 1924; original number: 409.
1937. *Mops chitauensis* J.Eric Hill, Am. Mus. Novit., 916: 2, 3, text-fig. 1. Publication date: 17 April 1937. Type locality: Angola: Malange district: Chitau [11 15 S 17 01 E, 4 930 ft] [Goto Description]. Holotype: AMNH 88116: ad ♂, skin and skull. Collected by: Lee S. Bradley and the Phipps-Bradley Expedition; collection date: 10 February 1933; original number: 676.
1975. *Tadarida nivieventer:* Fenton, Life Sci. Occ. Pap., R. Ont. Mus., 104: 23. (Lapsus)
? *Mops (Mops) niveiventer:* (Name Combination, Current Combination)
? *Mops niveiventer:* (Name Combination)
? *Tadarida (Mops) niveiventer:* (Name Combination)
? *Tadarida niveiventer:* (Name Combination)

TAXONOMY:
Koopman (1993a) suggested that *niveiventer* is possibly a subspecies of *demonstrator*. Here considered a distinct species following Simmons (2005).

COMMON NAMES:
Czech: morous sněhobílý. English: White-bellied Mops Bat, White-bellied Free-tailed Bat. French: Tadaride à ventre blanc. German: Weißbauch-Bulldoggfledermaus. Portuguese: Morcego de cauda livre de ventre branco.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, tolerance of a degree of habitat modification, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Cotterill, 2008f; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) [assessed as *Tadarida niveiventer*] (Cotterill, 2008f; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Cotterill, 2004f; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
This species is locally threatened in parts of its range, often through general deforestation and the conversion of suitable habitat by shifting agricultural practices (Cotterill, 2008f; IUCN, 2009).

CONSERVATION ACTIONS:
Cotterill (2008f) [in IUCN (2009)] report that there appear to be no direct conservation measures in place for this species. It is not known if the species is present within any protected areas. Further studies are needed into the distribution and systematics of this species.

GENERAL DISTRIBUTION:
Mops niveiventer is present in Central Africa and parts of Southern Africa. It has been recorded from eastern Angola, southern Democratic Republic of the Congo, northern Zambia, Rwanda, northern Mozambique and possibly from Malawi.

For southern Africa, Cooper-Bohannon *et al.* (2016: Table S2) calculated a potential distribution area of 722,774 km^2.

Records from Botswana and Madagascar are definitely *condylurus* (see Hayman and Hill, 1971: 61; Meester *et al.*, 1986: 74; Simmons, 2005).

Native: Angola (Monadjem *et al.*, 2010d: 544); Burundi; Cameroon (Bol A Anong *et al.*, 2011: 48; Bakwo Fils *et al.*, 2014: 4); Congo (The Democratic Republic of the) (Hayman *et al.*, 1966; Van Cakenberghe *et al.*, 1999; Monadjem *et al.*, 2010d: 544); Mozambique (Monadjem *et al.*, 2010d: 544); Rwanda; Tanzania; Zambia (Ansell, 1973; Monadjem *et al.*, 2010d: 544).
Presence uncertain: Malawi.

The record from Cameroon is probably doubtful (Jakob Fahr, pers. comm.).

DENTAL FORMULA:
Dorst (1957b: 134) indicated the milk dentition of *Mops angolensis niveiventer* shows some differences with the dentition of *Mops angolensis* he described previously (Dorst, 1949), a fact he attributed to it being a different geographic race. However, the latter form is currently considered to belong to a separate species: *Mops (Mops) condylurus*. The upper milk toothrow of *niveiventer* consists of three functional teeth wich are reduced to pegs, and two additional, vestigial teeth. In the lower toothrow there are three incisors of different shape and a remarkably developed canine. There is also one premolar, which is clearly developed, but not functional as it doesn't erupt through the gum. This tooth is resorbed in the young.

ECHOLOCATION:
From Maroua, Cameroon, Manga Mongombe (2012: 79) and Bakwo Fils *et al.* (2018: 4) reported a FM call type for 10 calls and the following parameters: F_{max}: 37.7 ± 2.9 (32.2 - 40.8) kHz, F_{min}: 34.1 ± 2.6 (29.9 - 37.6) kHz, F_{mean}: 35.9 ± 2.8 (31.1 - 39.3) kHz, F_{knee}: 37.6 ± 2.7 (32.1 - 40.8) kHZ, F_{char}: 34.1 ± 2.6 (30.1 - 37.6) kHz, and duration: 0.74 ± 0.10 (0.65 - 0.95) msec.

DIET:
In fecal pellets from Maroua (Cameroon), Bol A Anong (2013: 32) found Coleoptera (64.75%), Hemiptera (25.00%), Diptera (9.53%) and Lepidoptera (0.23%).

POPULATION:
Structure and Density - This is a locally common species that can be found in large colonies of up to hundreds of individuals within buildings, but is more often present in smaller numbers (Cotterill, 2008f; IUCN, 2009).
Trend - 2008 - Unknown (Cotterill, 2008f; IUCN, 2009).

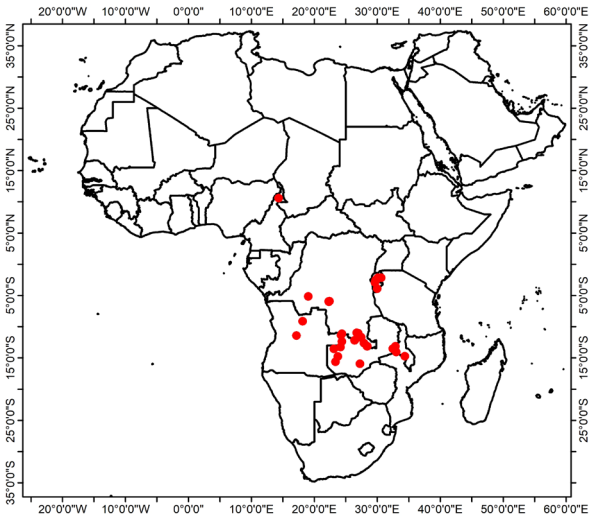

Figure 179. Distribution of *Mops* (*Mops*) *niveiventer*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Angola, Burundi, Cameroon, Congo (Democratic Republic of the), Mozambique, Rwanda, Zambia, Zimbabwe.

Mops (Mops) trevori J.A. Allen, 1917

*1917. *Mops trevori* J.A. Allen, Bull. Am. Mus. Nat. Hist., 37 (18): 469, pl. 48, fig. 2. Publication date: 29 September 1917. Type locality: Congo (Democratic Republic of the): Oriental province: Uele district: Faradje [03 44 N 29 43 E] [Goto Description]. Holotype: AMNH 49250: ad ♀, skull and alcoholic. Collected by: Herbert Lang, James Paul Chapin and The American Museum Congo Expedition; collection date: 29 September 1912; original number: 1954. - Etymology: In honour of John B. Trevor, a Trustee of the American

Museum of Natural History and Chairman of the Committee on African Exploration, whose enthousiasm and generosity in support of the Congo Expedition contributed to its success (see Allen, 1917: 469).

1996. *Mops trevoli:* Kityo and Kerbis, J. East Afr. Nat. Hist., 85: 63. (Lapsus)

? *Mops (Mops) trevori:* (Name Combination, Current Combination)

? *Tadarida trevori:* (Name Combination)

TAXONOMY:
Formerly included in *niangarae*; see Freeman (1981b: 111, 159).

COMMON NAMES:
Czech: morous Trevorův. English: Trevor's Mops Bat, Trevor's Free-tailed Bat, Trevor´s Bat. French: Tadaride d'Allen, Tadaride de Trevor. German: Trevors Bulldoggfledermaus.

CONSERVATION STATUS:
Global - Listed as Data Deficient (DD ver 3.1 (2001)) since, although it has been recorded over a very wide area, there are only very few records, and very little is known about its status, threats and habitat requirements (Mickleburgh *et al.*, 2008bv; IUCN, 2009).

Assessment History -
2008 - DD ver 3.1 (2001) [assessed as *Tadarida trevori*] (Mickleburgh *et al.*, 2008bv; IUCN, 2009). 2004 - VU A4c ver 3.1 (2001) (Mickleburgh *et al.*, 2004aw; IUCN, 2004). 1996 - LR/nt (Baillie and Groombridge, 1996).

MAJOR THREATS:
This species is generally threatened by habitat loss, resulting from the conversion of land to agricultural use, and the extraction of firewood and timber (Mickleburgh *et al.*, 2008bv; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008bv) [in IUCN (2009)] report that there appear to be no direct conservation measures in place, however, it has been recorded from some protected areas. Further studies are needed into the distribution, natural history and threats to this little-known bat.

GENERAL DISTRIBUTION:
Mops trevori has been patchily recorded in parts of West and Central Africa. In West Africa It has been recorded from Guinea, Côte d'Ivoire, Comoe in Ghana, and Agege in Nigeria. In Central Africa it has been recorded from the Central African Republic, parts of eastern Democratic Republic of the Congo and western Uganda.

Native: Central African Republic; Congo (The Democratic Republic of the); Côte d'Ivoire; Ghana; Guinea; Nigeria; Sierra Leone (Weber *et al.*, 2019: 28 - first record); Sudan; Uganda (Kityo and Kerbis, 1996: 63).

POPULATION:
Structure and Density - Little is known about the abundance of this apparently rare species, but it is presumed that colony size is likely to be small (Mickleburgh *et al.*, 2008bv; IUCN, 2009).
Trend - 2008 - Decreasing (Mickleburgh *et al.*, 2008bv; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
One of two females reported from Sierra Leone by Weber *et al.* (2019: 28) was pregnant on 25 March.

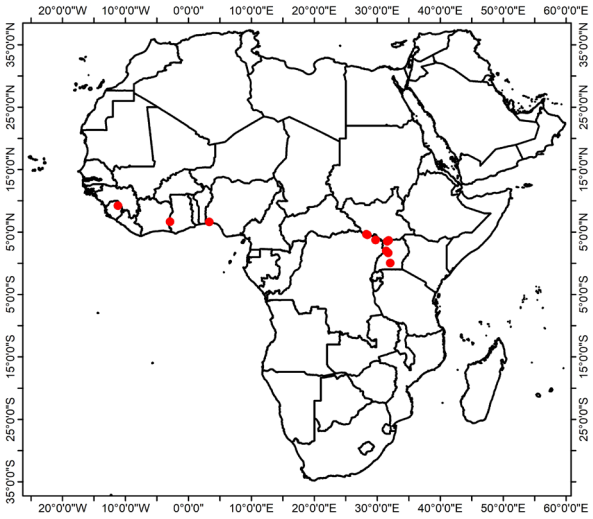

Figure 180. Distribution of *Mops* (*Mops*) *trevori*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:

Mops (Xiphonycteris) bakarii Stanley, 2009

*2008. *Mops bakarii* Stanley, Acta Chiropt., 10(2): 184, Figs 2 -6. Publication date: December 2008. Type locality: Tanzania: Pemba Island, Kipangani Village: in attic of hospital [4.96487 S 39.71456 E, 12m]. Holotype: FMNH 192895: ad ♂, skin and skull. Collected by: William ("Bill") T. Stanley; collection date: 5 August 2006; original number: WTS 7307. Paratype: FMNH 192824: ad ♂. Collected by: William ("Bill") T. Stanley; collection date: 5 - 6 August 2006; original number: WTS 7312. Paratype: FMNH 192825: ad ♂. Collected by: William ("Bill") T. Stanley; collection date: 5 - 6 August 2006; original number: WTS 7313. Paratype: FMNH 192826: ad ♂. Collected by: William ("Bill") T. Stanley; collection date: 5 - 6 August 2006; original number: WTS 7327. Paratype: FMNH 192827: ad ♂. Collected by: William ("Bill") T. Stanley; collection date: 5 - 6 August 2006; original number: WTS 7328. Paratype: FMNH 192828: ad ♂. Collected by: William ("Bill") T. Stanley; collection date: 5 - 6 August 2006; original number: WTS 7329. Paratype: FMNH 192829: ad ♂. Collected by: William ("Bill") T. Stanley; collection date: 5 - 6 August 2006; original number: WTS 7335. Paratype: FMNH 192830: ad ♂. Collected by: William ("Bill") T. Stanley; collection date: 5 - 6 August 2006; original number: WTS 7336. Paratype: FMNH 192831: ad ♂. Collected by: William ("Bill") T. Stanley; collection date: 5 - 6 August 2006; original number: WTS 7337. Paratype: FMNH 192832: ad ♀. Collected by: William ("Bill") T. Stanley; collection date: 5 - 6 August 2006; original number: WTS 7338. Paratype: FMNH 192833: ad ♀. Collected by: William ("Bill") T. Stanley; collection date: 5 - 6 August 2006; original number: WTS 7339. Paratype: FMNH 192834: ad ♂. Collected by: William ("Bill") T. Stanley; collection date: 5 - 6 August 2006; original number: WTS 7345. Paratype: FMNH 192835: ad ♂. Collected by: William ("Bill") T. Stanley; collection date: 5 - 6 August 2006; original number: WTS 7347. Paratype: FMNH 192836: ad ♂. Collected by: William ("Bill") T. Stanley; collection date: 5 - 6 August 2006; original number: WTS 7348. Paratype: FMNH 192894: ad ♂. Collected by: William ("Bill") T. Stanley; collection date: 5 - 6 August 2006; original number: WTS 7306. Paratype: FMNH 192896: ad ♂. Collected by: William ("Bill") T. Stanley; collection date: 5 - 6 August 2006; original number: WTS 7308. Paratype: FMNH 192897: ad ♂. Collected by: William ("Bill") T. Stanley; collection date: 5 - 6 August 2006; original number: WTS 7322. Paratype: FMNH 192898: ad ♂. Collected by: William ("Bill") T. Stanley; collection date: 5 - 6 August 2006; original number: WTS 7331. Paratype: FMNH 192899: ad ♂. Collected by: William ("Bill") T. Stanley; collection date: 5 - 6 August 2006; original number: WTS 7332. Paratype: FMNH 192900: ad ♂. Collected by: William ("Bill") T. Stanley; collection date: 5 - 6 August 2006; original number: WTS 7333. Paratype: FMNH 192901: ad ♂. Collected by: William ("Bill") T. Stanley; collection date: 5 - 6 August 2006; original number: WTS 7334. - Etymology: In honour of Dr. Bakari Asseid, director of the Department of Commercial Crops, Fruits and Forestry, Zanzibar, to recognize his significant contributions to the conservation of natural habitats and biota of Zanzibar (including both Pemba and Unguja Islands) (see Stanley, 2008: 185).

? *Mops (Xiphonycteris) bakarii:* (Name Combination, Current Combination)

COMMON NAMES:
Czech: morous Stanleyův. German: Bakaris Bulldoggfledermaus, Pemba-Bulldoggfledermaus.

GENERAL DISTRIBUTION:
O'Brien (2011: 288) reports it from Pemba.

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
Tanzania.

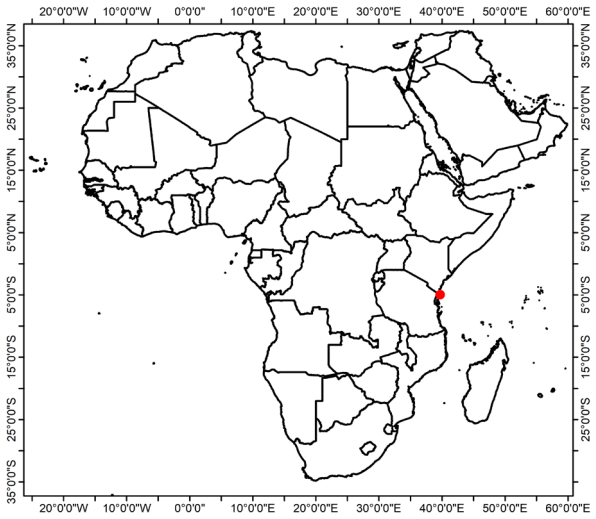

Figure 181. Distribution of *Mops* (*Xiphonycteris*) *bakarii*

Mops (Xiphonycteris) brachypterus (Peters, 1852)

*1852. *Dysopes brachypterus* Peters, Naturwissenschaftliche Reise nach Mossambique, Zoologie, Säugethiere, 59, pl. 15, fig. 1. Publication date: 1852. Type locality: Mozambique: Mozambique Island [15 03 S 40 46 E] [Goto Description]. Holotype: ZMB 536/85537: ad ♂, skin and skull. Collected by: Prof. Wilhelm Carl Hartwig Peters; collection date: between 1843 and 1847. See Turni and Kock (2008) [skin: ZMB 536 + skull: ZMB 85537 (=An 16356)]. Neotype: ROM 46721: ad ♂, skin and skull. Collected by: Terence Michael Shortt and A.E. Williams; collection date: 24 June 1968; original number: SG301. Presented/Donated by: ?: Collector Unknown. - Etymology: From the Greek adjective "*βρᾰχύς*" (brakhìs), meaning "short" and the Greek neuter substantive "*πτερόν*" (pteròn), meaning "wing"; but actually the species' wings are not particularly short (see Lanza *et al.*, 2015: 295).

1877. *Nyctinomus [(Nyctinomus)] brachypterus:* Dobson, Proc. zool. Soc. Lond., 1876, IV: 722. Publication date: April 1877. (Name Combination)

1908. *Nyctinomus leonis* Thomas, Ann. Mag. nat. Hist., ser. 8, 2 (10): 373. Publication date: 1 October 1908. Type locality: Sierra Leone: "Sierra Leone" [Goto Description]. Holotype: BMNH 1862.12.23.3: ad ♂, skin and skull. Presented/Donated by: J. Brown Esq. (Specimen "c" of Dobson's catalogue).

1917. *Nyctinomus ochraceus* J.A. Allen, Bull. Am. Mus. Nat. Hist., 37 (18): 455. Publication date: 29 September 1917. Type locality: Congo (Democratic Republic of the): Oriental province: Medje [02 25 N 27 18 E, 800 m] [Goto Description]. Holotype: AMNH 48821: ad ♀, skin and skull. Collected by: Herbert Lang, James Paul Chapin and The American Museum Congo Expedition; collection date: 16 March 1910; original number: 745.

1980. *Tadarida (Mops) brachyptera:* El-Rayah, Systematics of African molossid bats of the subgenus *Xiphonycteris* of the genus *Tadarida* (Molossidae: Chiroptera) - PhD Thesis - University of Toronto:, 231.

? *Chaerephon leonis ochraeus:*

? *Mops (Xiphonycteris) brachypterus:* (Name Combination, Current Combination)

? *Mops brachypterus leonis:* (Name Combination)

? *Mops brachypterus ochraceus:* (Name Combination)

? *Mops brachypterus:* (Name Combination)

? *Tadarida brachyptera leonis:* (Name Combination)

? *Tadarida brachyptera:* (Name Combination)

? *Tadarida leonis leonis:*

? *Tadarida leonis ochraeus:*

? *Tadaride brachyptera:* (Name Combination)

? *Xiphonycteris leonis:*

TAXONOMY:
Includes *leonis*; see El-Rayah (1981: 6). Stanley (2008: 190) points out that *brachypterus* is in need of revision, since the dental features (e.g. size of upper canines and first upper premolar) differ between for the holotype and continental specimens attributed to it.

Monadjem *et al.* (2016y: 368) and Herkt *et al.* (2017: Appendix S9) found differences in the ecological niches and a clear geographic gap between the distribution areas of *brachypterus* and *leonis* sensu stricto, but as genetic tests evaluating the distinct species status are still lacking, they are still considered to represent the same species.

COMMON NAMES:
Chinese: 短翼犬吻蝠. Czech: morous krátkokřídlý. English: Sierra Leone Mops Bat, Short-winged Mops Bat, Sierra Leone Free-tailed Bat, White-fingered Free-tailed Bat. French: Tadaride de Peters, Tadaride à doigts blancs. German: Kurzflügel-Bulldoggfledermaus, Kurzflügeligen Doggengrämler. Italian: Carlìno brachìttero. Spanish (Castillian): Murciélago Guanero

CONSERVATION STATUS:
Global - Listed as Least Concern in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008bo; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) [assessed as *Tadarida brachyptera*] (Mickleburgh *et al.*, 2008bo; IUCN, 2009). 2004 - LC ver 3.1 (2001) [assessed as *Mops brachypterus*] (Mickleburgh *et al.*, 2004bo; IUCN, 2004).

MAJOR THREATS:
The species is threatened in parts of its range by deforestation, presumably mostly through logging and mining activities and the conversion of land to agricultural use (Mickleburgh *et al.*, 2008bo; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008bo) [in IUCN (2009)] report that it is not known if the species is present in any protected areas. Further studies are needed into the taxonomy, distribution, natural history, and threats to this species.

GENERAL DISTRIBUTION:
Mops brachypterus ranges widely from West Africa to the East African coast. In West Africa, it is distributed from the Gambia and Sierra Leone in the west, through to Nigeria and Cameroon in the east. From Cameroon, it occurs patchily eastwards through the Congo Basin to Uganda, and to coastal parts of Kenya, Tanzania (including the islands of Unguja [=Zanzibar] [where its presence is questioned according to O'Brien (2011: 289)] and Mafia) and Mozambique in the south.

Native: Cameroon; Central African Republic; Congo (The Democratic Republic of the) (Hayman *et al.*, 1966; Monadjem *et al.*, 2010d: 543); Côte d'Ivoire; Equatorial Guinea; Gabon; Ghana; Guinea (Simons *et al.*, 2014: 284); Kenya; Liberia; Mozambique (Smithers and Lobão Tello, 1976; Monadjem *et al.*, 2010d: 543); Nigeria; Sierra Leone; Tanzania; Togo.

Presence uncertain: Zanzibar (Stanley, 2008: 191).

Bates *et al.* (2013: 339) reject the presence of this species in the Republic of Congo.

MOLECULAR BIOLOGY:
DNA - Unknown.
Karyotype - Smith *et al.* (1986) described the karyotype as having a diploid number of 2*n* = 48, aFN = 54, BA = 8, and a presumably submetacentric X (one female studied).

HABITAT:
Monadjem *et al.* (2016y: 368) captured this bat flying over small forest streams in the Mount Nimba area, at altitudes between 450 and 550 m.

PREDATORS:
Mikula *et al.* (2016: Supplemental data) mention the Bat hawk (*Macheiramphus alcinus* Bonaparte, 1850) as diurnal avian predator.

POPULATION:
Structure and Density - This is a common species (Mickleburgh *et al.*, 2008bo; IUCN, 2009).
Trend - 2008 - Unknown (Mickleburgh *et al.*, 2008bo; IUCN, 2009).

? *Mops nanulus:* (Name Combination)

? *Tadarida nanula calabarensis:* (Name Combination)

? *Tadarida nanula:* (Name Combination)

TAXONOMY:
Distinction from *spurrelli* not certain; see Koopman (1989a).

COMMON NAMES:
Chinese: 侏犬吻蝠. Czech: morous trpasličí. English: Dwarf Mops Bat, Dwarf Free-tailed Bat. French: Tadaride naine. German: Zwerg-Bulldoggfledermaus.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be

declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008w; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) [assessed as *Tadarida nanula*] (Mickleburgh *et al.*, 2008w; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2004o; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
In general, there are no threats to this widespread and somewhat adaptable species. In parts of its range it is locally threatened by habitat loss, primarily deforestation resulting from logging operations and the conversion of land to agricultural use (Mickleburgh *et al.*, 2008w; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008w) [in IUCN (2009)] report that it is not known if the species is present in any protected areas. Further studies are needed into the distribution, abundance, natural history, and threats to this species.

GENERAL DISTRIBUTION:
Mops nanulus is widely, but patchily, recorded in West, Central and East Africa. It ranges from Sierra Leone and Guinea in the west, through West Africa to Cameroon, and from here east to southern Sudan, Uganda, and western Kenya with an additional record from western Ethiopia and as far south as the southern portion of the Democratic Republic of the Congo. Start (1969: 222) suggests that the species' range might have been more continuous during the Pleistocene when there was a higher degree of rainfall, resulting in a continuous belt of lowland forest between Congo and Kenya.

Native: Benin (Capo-Chichi *et al.*, 2004: 163); Cameroon; Congo (The Democratic Republic of the) (Van Cakenberghe *et al.*, 1999; Monadjem *et al.*, 2010d: 544); Côte d'Ivoire; Ethiopia; Gambia (Emms and Barnett, 2005: 50; Simmons, 2005); Ghana; Guinea (Fahr *et al.*, 2006a: 73; Decher *et al.*, 2016: 276); Kenya (Start, 1969: 220); Liberia (Fahr, 2007a: 104); Nigeria; Sierra Leone; Sudan; Uganda.

GENERAL DESCRIPTION OF EXTERNAL MORPHOLOGY:
Start (1969: 221) indicates that there appears to be a general cline from pale-winged red forms in the west to dark-winged brown ones in the east, although this is not absolute.

MOLECULAR BIOLOGY:
DNA - Unknown.
Karyotype - Smith *et al.* (1986) reported 2*n* = 48, FN = 54, BA = 8, a submetacentric X chromosome and an acrocentric Y chromosome.
Protein / allozyme - Unknown.

POPULATION:
Structure and Density - This is a common species (Mickleburgh *et al.*, 2008w; IUCN, 2009).
Trend - 2008 - Unknown (Mickleburgh *et al.*, 2008w; IUCN, 2009).

REPRODUCTION AND ONTOGENY:
Start (1969: 221) reports on six female specimens collected in West Pokot (Kenya) between 25 and 29 August 1967, of which five were carrying well developed embryos, whereas the sixth was lactating.

Weber *et al.* (2019: 28) reported one pregnant female from Sierra Leone on 26 March.

Krutzsch (2000: 127) indicates that "*Tadarida (Mops) nanulus*" is polyoestrous.

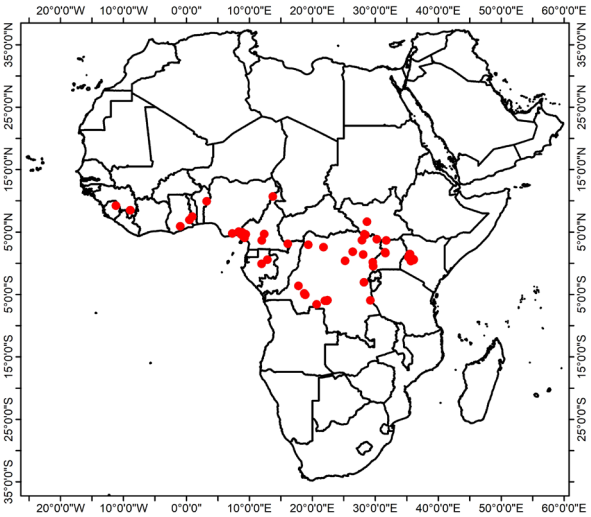

Figure 183. Distribution of *Mops* (*Xiphonycteris*) *nanulus*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Benin, Cameroon, Central African Republic, Congo (Democratic Republic of the), Côte d'Ivoire, Ethiopia, Gabon, Ghana, Guinea, Kenya, Nigeria, Sierra Leone, South Sudan, Togo, Uganda.

Mops (Xiphonycteris) petersoni (El Rayah, 1981)

*1981. *Tadarida [(Xiphonycteris)] petersoni* El Rayah, Life Sci. Occ. Pap., R. Ont. Mus., 36: 3, figs 1 - 2. Publication date: 11 December 1981. Type locality: Cameroon: Kumba, 15 km S

[04 39 N 09 26 E] [Goto Description]. Holotype: ROM 55813: ad ♂, skull and alcoholic. Collected by: Randolph L. Peterson; collection date: 27 January 1970; original number: 0364. See: 3). Paratype: AMNH 236332: ♂, skin and skull. Collected by: ?: Collector Unknown. Presented/Donated by: ?: Collector Unknown. 6 km SE Eseka(03°35'N 10°44'E) (See El-Rayah, 1981: 3). Paratype: AMNH 236333: ♂, skin and skull. Collected by: ?: Collector Unknown. Presented/Donated by: ?: Collector Unknown. 6 km SE Eseka(03°35'N 10°44'E) (see: El-Rayah, 1981: 3). Paratype: AMNH 241075: ♂, skin and skull. Collected by: ?: Collector Unknown. Presented/Donated by: ?: Collector Unknown. Near Okola (04°00'N 11°33'E) (see El-Rayah, 1981: 3). Paratype: AMNH 241076: ♂, skin and skull. Collected by: ?: Collector Unknown. Presented/Donated by: ?: Collector Unknown. 30 km E Nanga Emboko (04°38'N 12°21'E) (see El-Rayah, 1981: 3). Paratype: AMNH 241078: ♀, skin and skull. Collected by: ?: Collector Unknown. Presented/Donated by: ?: Collector Unknown. 30 km E Nanga Emboko (04°38'N 12°21'E) (see El-Rayah, 1981: 3). - Etymology: In honour of Randolph L. Peterson, collector of the type specimen.

? *Mops (Xiphonycteris) petersoni:* (Name Combination, Current Combination)

? *Mops petersoni:* (Name Combination)

? *Tadarida petersoni:* (Name Combination)

TAXONOMY:
Described in *Tadarida (Xiphonycteris)*, but see comments under *Tadarida* and *Mops*.

COMMON NAMES:
Czech: morous kamerunský. English: Peterson's Mops Bat, Peterson's Free-tailed Bat. French: Tadaride de Peterson. German: Petersons Bulldoggfledermaus.

CONSERVATION STATUS:
Global - Listed as Vulnerable (VU A4c ver 3.1 (2001)) because it is suspected that a population decline, estimated to be more than 30% would be met over a ten-year period which is ongoing from the recent past to the near future, inferred from the loss of its primary forest habitat (Mickleburgh *et al.*, 2008bt; IUCN, 2009).

Assessment History -
2008 - VU A4c ver 3.1 (2001) [assessed as *Tadarida petersoni*] (Mickleburgh *et al.*, 2008bt; IUCN, 2009). 2004 - VU A4c ver 3.1 (2001) (Mickleburgh *et al.*, 2004av; IUCN, 2004). 1996 - LR/nt (Baillie and Groombridge, 1996).

MAJOR THREATS:
The species is considered to be threatened by loss and degradation of forest habitats within its known range, largely through the conversion of land to agricultural use and the extraction of firewood and timber (Mickleburgh *et al.*, 2008bt; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008bt) [in IUCN (2009)] report that there appear to be no direct conservation measures in place for this species. It is not known if the species is present within any protected areas. There is a need to maintain areas of suitable forest within the range of this species. Further studies are needed into the distribution, abundance, breeding biology and general ecology of this species.

GENERAL DISTRIBUTION:
Mops petersoni has only been recorded from Ghana and Cameroon (with type locality at '15 km S Kumba'), with no records from the intervening countries of Togo, Benin and Nigeria. Koopman (1993a) included "perhaps Sierra Leone" as part of the distribution, however, J. Fahr (*pers. comm.*, 2004 in Mickleburgh *et al.*, 2008bt; IUCN, 2009) indicates that there is no evidence of the species' presence.

Native: Cameroon; Ghana.
Presence uncertain: Sierra Leone (Koopman, 1993a).

MOLECULAR BIOLOGY:
DNA - Unknown.
Karyotype - Smith *et al.* (1986) reported $2n = 48$, FN = 54, BA = 8, a submetacentric X chromosome and an acrocentric Y chromosome.
Protein / allozyme - Unknown.

POPULATION:
Structure and Density - It is considered to be a very rare species (Mickleburgh *et al.*, 2008bt; IUCN, 2009).
Trend - 2008 - Unknown (Mickleburgh *et al.*, 2008bt; IUCN, 2009).

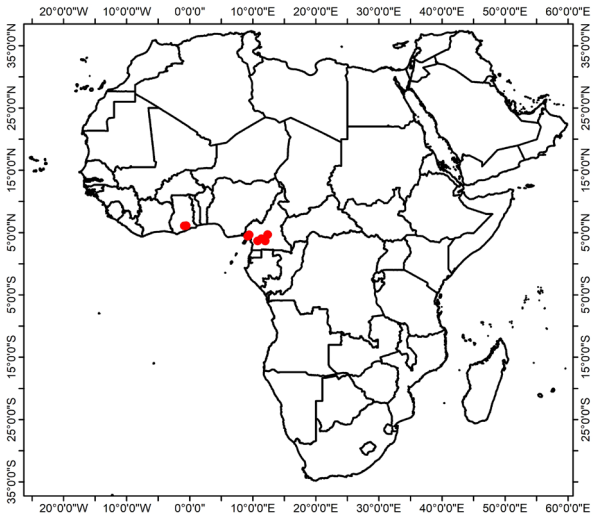

Figure 184. Distribution of *Mops* (*Xiphonycteris*) *petersoni*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Cameroon, Ghana.

Mops (Xiphonycteris) spurrelli (Dollman, 1911)

*1911. *Xiphonycteris spurrelli* Dollman, Ann. Mag. nat. Hist., ser. 8, 7 (38): 211. Publication date: 1 February 1911. Type locality: Ghana: Western province: 60 mi (90 km) W Kumasi: Bibianaha [=Bibiani] [06 28 N 02 20 W, 720 ft] [Goto Description]. Holotype: BMNH 1911.1.11.1: ad ♂. Collected by: Dr. H.G.F. Spurrell; collection date: 8 December 1910; original number: 34. - Etymology: In honour of dr. H.G.F. Spurrell, who collected the type specimen, and provided many rare and unique West-African mammals to National Collection (see Dollman, 1911: 211).

? *Mops (Xiphonycteris) spurrelli:* (Name Combination, Current Combination)
? *Mops spurrelli:* (Name Combination)
? *Tadarida spurelli:* (Lapsus)
? *Tadarida spurrelli:* (Name Combination)

TAXONOMY:
See Simmons (2005).

COMMON NAMES:
Czech: morous sahelský. English: Spurrell's Mops Bat, Spurrell's Free-tailed Bat. French: Tadaride de Spurell. German: Spurrells Bulldoggfledermaus.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008dm; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) [assessed as *Tadarida spurrelli*] (Mickleburgh *et al.*, 2008dm; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2004cm; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
The species is locally threatened by deforestation, often through conversion of land to agricultural use or by extraction of timber and firewood (Mickleburgh *et al.*, 2008dm; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008dm) [in IUCN (2009)] report that there appear to be no direct conservation measures in place for this species, and it is not known if the species is present within any protected areas. There is a need to maintain areas of suitable forest habitat for this species. Additional studies are needed into the distribution of this species.

GENERAL DISTRIBUTION:
Mops spurrelli ranges through parts of West and Central Africa. It occurs from Sierra Leone in the

west, through Liberia, Guinea, Côte d'Ivoire and Togo, to Cameroon, Equatorial Guinea (Bioko and Rio Muni), the Central African Republic with a record from the eastern part of The Democratic Republic of the Congo. It is possibly present in other countries, such as Benin, Nigeria and Congo, however, this needs to be confirmed.

Native: Cameroon; Central African Republic; Congo (The Democratic Republic of the); Côte d'Ivoire; Equatorial Guinea (Bioko); Ghana; Guinea (Fahr and Ebigbo, 2003: 128); Liberia; Sierra Leone; Togo.

Presence uncertain: Benin; Congo; Nigeria.

MOLECULAR BIOLOGY:
DNA - Unknown.
Karyotype - Smith *et al.* (1986) reported 2*n* = 48, FN = 64, BA = 18, a submetacentric X chromosome for a female.
Protein / allozyme - Unknown.

HABITAT:
At Mount Nimba, Monadjem *et al.* (2016y: 368) recorded this species over small streams and swamps at altitudes between 450 and 600 m.

POPULATION:
Structure and Density - Within Central Africa this is a very common species and is believed to have quite large colonies (Mickleburgh *et al.*, 2008dm; IUCN, 2009).
Trend - 2008 - Unknown (Mickleburgh *et al.*, 2008dm; IUCN, 2009).

Mops (Xiphonycteris) thersites (Thomas, 1903)

*1903. *Nyctinomus thersites* Thomas, Ann. Mag. nat. Hist., ser. 7, 12 (72): 634. Publication date: 1 December 1903. Type locality: Cameroon: Efulen [02 46 N 10 42 E] [Goto Description]. Holotype: BMNH 1904.2.8.4: ad ♂. Collected by: George Latimer Bates Esq. 3 specimens: see Thomas (1903e: 635). - Etymology: Thersites was one of the members of the Greek army against Troy. He tried to stir up the army against its leaders, for which he got beaten by Odysseus. His name is a scorn: naughty boy. He was an excessive thwaddler, with deformed legs, feet, and bent over shoulders, a pointed head and thin flaky hair.
1917. *Mops (Allomops) occipitalis* J.A. Allen, Bull. Am. Mus. Nat. Hist., 37 (18): 474, text-fig. 15. Publication date: 29 September 1917. Type locality: Congo (Democratic Republic of the): Oriental province: Avakubi [01 18 N 27 32 E] [Goto Description]. Holotype: AMNH 48851: ad ♂, skin and skull. Collected by: Herbert Lang, James Paul Chapin and The American Museum Congo Expedition; collection date: 13 February 1914; original number: 2487.

TAXONOMY:
See Simmons (2005).

COMMON NAMES:
Chinese: 无畏犬吻蝠. Czech: morous spílavý. English: Railer Mops Bat, Railer Bat. French: Tadaride de Railer. German: Thersites'

Bulldoggfledermaus. Portuguese: Morcego de railer.

PALAEONTOLOGICAL OR ARCHAEOLOGICAL RECORDS:
Gunnell *et al.* (2015a: 22) report on a number of humeri from a Pleistocene deposit at Olduvai Gorge (Tanzania), which they assigned to *Mops* cf. *M. thersites*.

CONSERVATION STATUS:
Global - Listed as Least Concern (LC ver 3.1 (2001)) in view of its wide distribution, tolerance of a degree of habitat modification, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category (Mickleburgh *et al.*, 2008dn; IUCN, 2009).

Assessment History -
2008 - LC ver 3.1 (2001) [assessed as *Tadarida thersites*] (Mickleburgh *et al.*, 2008dn; IUCN, 2009). 2004 - LC ver 3.1 (2001) (Mickleburgh *et al.*, 2004cl; IUCN, 2004). 1996 - LR/lc (Baillie and Groombridge, 1996).

MAJOR THREATS:
It is locally threatened by habitat destruction, often through conversion of land to agricultural use or timber extraction (Mickleburgh *et al.*, 2008dn; IUCN, 2009).

CONSERVATION ACTIONS:
Mickleburgh *et al.* (2008dn) [in IUCN (2009)] report that there appear to be no direct conservation measures in place for this species. It is not known if the species is present within any protected areas. Additional studies are needed into the distribution of this species.

GENERAL DISTRIBUTION:
Mops thersites has been recorded from much of Western and Central Africa. It ranges from Sierra Leone in the west, through West Africa (where it has been recorded from most countries) to Cameroon, and from here south into southern parts of the Democratic Republic of the Congo, and east into Uganda, Rwanda and western Kenya. It is present on Bioko Island, Equatorial Guinea.

Native: Cameroon; Central African Republic; Congo (The Democratic Republic of the) (Schouteden, 1944; Van Cakenberghe *et al.*, 1999; Monadjem *et al.*, 2010d: 544); Côte d'Ivoire; Equatorial Guinea [Bioko]; Gabon; Ghana; Guinea (Fahr *et al.*, 2006b: 245; Denys *et al.*, 2013: 284); Kenya; Liberia (Fahr, 2007a: 104); Nigeria; Rwanda; Sierra Leone; Uganda.

Presence uncertain: Mozambique and Zanzibar.

Bates *et al.* (2013: 339) reject the presence of this species in the Republic of Congo as Malbrant and Maclatchy (1949) only suggested it might occur in that country and subsequent authors did not provide supporting records.

MOLECULAR BIOLOGY:
Denys *et al.* (2013: 284) report the karyotype for a single female specimen from the Guinean Mount Nimba area attributed to this species as: 2*n* = 48, NFa = 70, including four pairs of metacentric, eight pairs of subtelocentric, 11 pairs of acrocentric autosomes and a middle-sized submetacentric X chromosome.

HABITAT:
This species was captured by Monadjem *et al.* (2016y: 368) in the Mount Nimba area above water in forested and open habitats between 450 and 880 m.

POPULATION:
Structure and Density - It appears to be quite abundant in parts of its range (Mickleburgh *et al.*, 2008dn; IUCN, 2009).
Trend - Stable (Mickleburgh *et al.*, 2008dn; IUCN, 2009).

PARASITES:
Polyctenidae: *Hypoctenes clarus* Jordan, 1922, from near Kribi, Cameroon (Haeselbarth *et al.*, 1966: 18).

SIPHONAPTERA
Ischnopsyllidae: *Lagaropsylla oblique* Smit, 1957 from Sierra Leone, Cameroon and the Congo (Haeselbarth *et al.*, 1966: 191).

VIRUSES:
Filoviridae - File viruses
Marburgvirus
Weiß (2013: 58, 66) found antibodies against MARV in one *M. thersites* from the Taï National Park (Côte d'Ivoire).

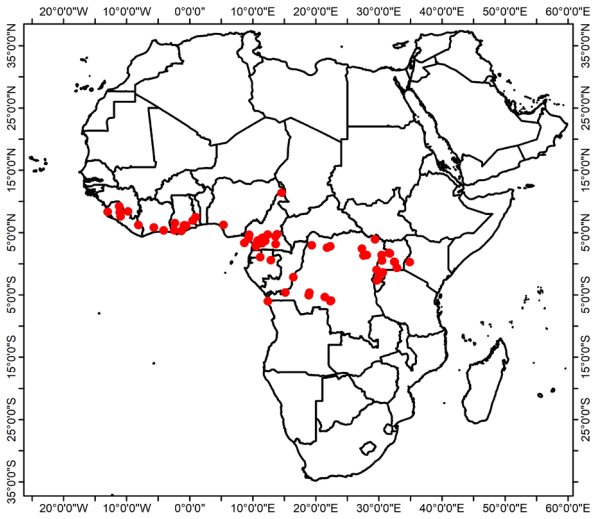

Figure 186. Distribution of *Mops* (*Xiphonycteris*) *thersites*

DISTRIBUTION BASED ON VOUCHER SPECIMENS: Cameroon, Congo (Democratic Republic of the), Côte d'Ivoire, Equatorial Guinea, Gabon, Ghana, Guinea, Kenya, Liberia, Nigeria, Rwanda, Sierra Leone, Togo, Uganda.

Genus ***Mormopterus*** Peters, 1865

*1865. *Mormopterus* Peters, Monatsb. k. preuss. Akad. Wiss. Berlin, 258. - Comments: Type species: *Nyctinomus (Mormopterus) jugularis* Peters, 1865. - Etymology: From the Greek "*mormopterus*" meaning phantom- or ghost-winged or winged goblin (Flannery, 1990: 367; 1995a: 408). (Current Combination)

? *Tadarida (Mormopterus):* (Name Combination)

TAXONOMY:

Meester *et al.* (1986) state that this treatment of *Mormopterus* is provisional; it has been regarded as a subgenus of *Tadarida* (Hayman and Hill, 1971) or as a vaild genus that includes *Platymops* and *Sauromys* as subgenera (Freeman, 1981b; Legendre, 1984), and the extralimital *Micronomus* as either a subgenus (Legendre loc. cit.) or a synonym (Freeman, 1981b; Peterson, 1985).

Bronner *et al.* (2003) mention that the status of *Sauromys*, described as a monotypic subgenus of the extralimital (to southern Africa) *Platymops* for the South African flat-headed free-tailed bat, remains unclear. Peterson (1965) raised it to generic rank, a treatment endorsed by many subsequent authors, and corroborated by a limited multivariate analysis of wing bone and cranial characteristics (Peterson, 1985). However, morphometric studies by Freeman (1981b) and Legendre (1984) concluded that it is a subgenus of *Mormopterus*, a position followed by Koopman (1993a, 1994). Simmons (2005) retains *Sauromys* as a valid genus in the 3rd Edition of Mammal Species of the World, a treatment we favour because of the unique ecology and morphology of *S. petrophilus*. The separation between *Mormopterus* and *Sauromys* is also supported by the analysis of the Rag2 data by Ammerman *et al.* (2013: 309).

Meester *et al.* (1986) furthermore state that it was originally described as a subgenus, but this genus was regarded as a synonym of *Platymops* by Shortridge (1942), Roberts (1951) and Ellerman *et al.* (1953). Harrison (1962) retains it as a subgenus, while Peterson (1965) raises it to generic rank, in which he is followed by Hayman and Hill (1971), Smithers (1971), Corbet and Hill (1980) and Rautenbach (1982). However, Freeman (1981b), followed by Koopman (1982) and Legendre (1984), conclude that both *Sauromys* and *Platymops* are subgenera of *Mormopterus*. We take the view that both *Platymops* and *Sauromys* are valid genera.

From their molecular study, Lamb *et al.* (2010: 203; 2011: 10) found that *M. jugularis* and *M. francoismoutoui* form a monophyletic clade (dated about 31.2 MYR), whereas a third member of the genus (the New World *M. kalinowskii*) seems more related to the South American *Nyctinomops laticaudatus* and *Nyctinomops aurispinosus*.

The analysis of the recombination activating gene 2 (Rag2) sequence data led Ammerman *et al.* (2013: 307) to conclude that the genus *Cheiromeles* is the most basal lineage within the Molossinae, and that *Mormopterus* is a sistergroup of the rest of the Molossinae.

Key in Jacobs and Fenton (2002, Mammalian Species, 703).

Known species within the genus *Mormopterus*: ***acetabulous*** (Hermann, 1804); *beccarii* Peters, 1881 – Molucca Isls, New Guinea, adjacent small islands, northern Australia (Simmons, 2005: 444); *doriae* K. Andersen, 1907 – Sumatra (Indonesia) (Simmons, 2005: 445); ***francoismoutoui*** Goodman, Jansen Van Vuuren, Ratrimomanarivo, Probst and Bowie, 2008; ***jugularis*** (Peters, 1865); *kalinowskii* (Thomas, 1893) – Peru, northern Chile (Simmons, 2005: 445); *loriae* Thomas, 1897 – northern Australia; New Guinea (Simmons, 2005: 445); *mimutus* (Miller, 1899) – Cuba (Simmons, 2005: 445); *norfolkensis* (Gray, 1840) – Norfolk Isl, southeastern Queensland, eastern New South Wales (Australia) (Simmons, 2005: 445); *phrudus* (Handley, 1956) – Peru (Simmons, 2005: 4435); *planiceps* (Peters, 1866) – southern and central Australia (Simmons, 2005: 446).

COMMON NAMES:
Czech: Petersovi morousi. English: Phantom-winged Bats, Little Bulldog Bats, Little Mastiff Bats, Little Goblin Bats, Flat-headed Bats, Flat-headed Bulldog Bats, Goblin bats. French: Tadarides. German: Mastino-Fledermäuse.

UTILISATION:
See Goodman *et al.* (2008d).

Mormopterus acetabulosus (Hermann, 1804)

*1804. *V[espertilio] acetabulosus* Hermann, Obs. Zool. , 19. Publication date: 31 August 1804. Type locality: Mauritius: Port Louis [Goto Description]. Holotype: MNHN ZM-MO-1984-368: ad? ♀. Collected by: M. Desjardins; collection date: 1829; original number: A488. Goodman *et al.* (2008c: 1324) incidcate that the specimen is labeled as type, but was collected 25 years after Hermann (1804) described it. Neotype: FMNH 187489: Collected by: Steven M. Goodman and V. Florens; collection date: 29 October 2006. Mauritius, Black River District, Palma, Palma Cave, 20 16'40.5"S 57 27'14.7"E. Goodman *et al.* (2008c: 1327) designated this as the neotype. Cheke (2009b) rejects the assignment of the neotype by Goodman *et al.* (2008c), based on article 73.1.4 and 75.8 (rules of Nomenclature - ICZN 1999). - Comments: Cheke (2009b: 1) rejects the assignment of the neotype, based on article 73.1.4 (rules of Nomenclature - ICZN 1999), which indicates that Paul Jossigny's drawings made of the specimen that Commerson once had before him in Mauritius should be considered the holotype of Hermann's *Vespertilio acetabulosus*, and that the designation of a neotype by Goodman *et al.* (2008c: 1324) is invalidated by article 75.8. The drawings on which Commerson based himself (and which were referred to by Hermann, 1804: 19) are to be found amongst the Commerson papers, in the folder of other similar drawings at MS 282(II), labelled No. 51 (Moutou, 1982, pers. obs. 2006) in the archives of the Bibiothèque du Muséum; the folder is described in paragraph 73 of Laissus's (1974) catalogue.
1820. *Nyctinomus acetabulosus:* Desmarest, Mammalogie, 117. (Name Combination)
1877. *Nyctinomus [(Mormopterus)] acetabulosus:* Dobson, Proc. zool. Soc. Lond., 1876, IV: 734. Publication date: April 1877. (Name Combination)
? *Molossus acetabulosus:* Commerson. - Comments: Dobson (1877: 734) refers for this combination to Peters (1869a: 402), and suggests it is only a manuscript name. (Name Combination)
? *Mormopterus acetabulosus:* (Name Combination, Current Combination)
? *Tadarida acetabulosus natalensis:* (Name Combination)

TAXONOMY:
See Simmons (2005: 444) and Goodman *et al.* (2008c).

Cheke (2009a: 115) indicates that Jossigny's drawing used by Hermann to describe the species in 1804 is to be considered as the lectotype of the species, which would overrule the need for a neotype as designated by Goodman *et al.* (2008c: 1324).

COMMON NAMES:
Afrikaans: Natalse losstertvlermuis. Czech: morous mauricijský. English: Natal Flat-headed Bat, Natal Wrinkle-lipped Bat, Natal Free-tailed Bat. French: Sauromys du Natal, Tadaride à lèvres ridées, Petit molosse de Port Louis. German: Mauritius Mastino-Fledermaus, Maurizische Doggengrämler.

CONSERVATION STATUS:
Global - Listed as Vulnerable (VU D2 ver 3.1 (2001)) because it is known from fewer than five locations, and it is plausible that it will decline as a result of disturbance to its cave roosting sites (Hutson and Bergmans, 2008; IUCN, 2009).

Assessment History -
2008 - VU D2 ver 3.1 (2001) (Hutson and Bergmans, 2008; IUCN, 2009). 2004 - VU D2 ver 3.1 (2001) (Hutson and Bergmans, 2004; IUCN, 2004). 1996 - VU (Baillie and Groombridge, 1996).

Regional -
South Africa: 2004 -considered a vagrant not assessed, known from single locality (Friedmann and Daly, 2004). 1986 - Indeterminate (Smithers, 1986).

MAJOR THREATS:
It is threatened by disturbance of roosting caves, and the removal of protective grills over the caves for landfill purposes Hutson and Bergmans, 2008; IUCN, 2009).

CONSERVATION ACTIONS:
Hutson and Bergmans (2008) [in IUCN (2009)] report that it is not known if the species is present in any protected areas. There is a need to protect cave roosts of this species in Mauritius by re-grilling important sites.

GENERAL DISTRIBUTION:
Mormopterus acetabulosus is endemic to the Mascarene Islands (Mauritius) (see Goodman *et al.*, 2008c: 1316; O'Brien, 2011: 288). Records from Réunion should be assigned to *Mormopterus francoismoutoui*).

There is a single doubtful record for Madagascar (Peterson *et al.*, 1995: 150). Taylor (1998: 60) mentioned a specimen from South Africa (Durban) collected by Andrew Smith in 1833, but also states that no further specimens have been collected since. An old record from between the district of Shoa and Lake Rudolph in southern Ethiopia (Hayman and Hill, 1971: 59), most probably should be attributed to *M. francoismoutoui* (Goodman *et al.*, 2008c: 1325). Furthermore, it is now considered most likely that specimens taken outside of the Mascarene Islands were vagrants.

Monadjem *et al.* (2010d) did not retain this species for south Central Africa, but did mention the specimen from Durban, South Africa in the appendix (p. 545).

Native: Mauritius (Smith, 1833: 54; Meester *et al.*, 1986: 67; Simmons, 2005: 444; Goodman *et al.*, 2008c: 1316).

Presence uncertain: Madagascar (Dobson, 1878; Allen, 1939a; Hayman and Hill, 1971; Meester *et al.*, 1986: 67; Peterson *et al.*, 1995: 150; Simmons, 2005: 444); South Africa (Meester *et al.*, 1986: 67; Taylor, 1998: 60; Taylor, 2000: 75; Simmons, 2005: 444; Monadjem *et al.*, 2010d: 545); Sudan (Freeman, 1981b: 75).

Presence incorrectly assigned: Ethiopia (Hayman and Hill, 1971: 59; Simmons, 2005: 444; Kaipf *et al.*, 2015: 13); Réunion.

ROOST:
Middleton (1998: 91) mention large colonies occurring in two caves in the Plaine des Roches area (Mauritius), and indicate that elsewhere the colonies seldom reach 2,000 animals.

POPULATION:
Structure and Density - The largest known day roost colony on La Réunion (at Trois Bassins), with estimates from 25,000 to 10,000 individuals, is abandoned in austral winter, and it is not known where these bats spend the winter (Devaux, 2006; Issartel, 2004; Probst, 2003; Goodman *et al.*, 2008c: 1325).
Trend - 2008 - Unknown (Hutson and Bergmans, 2008; IUCN, 2009).

PARASITES:
Dietrich *et al.* (2018a: 3) reported the presence of sequences closely related to the bacterium *Leptospira borgpetersenii*.

Laudisoit *et al.* (2012: 739) indicate that the type host for *Araeopsylla martialis* (Rothschild, 1903) (Siphonaptera; Ischnopsyllidae) was originally mentioned as "*Nyctinomus acetabulosus*", but this should actually be *Mormopterus francoismoutoui*.

VIRUSES:
Paramyxoviridae
Wilkinson *et al.* (2012: 160) tested 55 individuals from the Mauritius using RT-PCR specific for Respirovirus/Morbillivirus/Henipahvirus (RMH) and Paramyxovirinae (PMV) and found 1 positive results for viral nucleic acids.

Rhabdoviridae
Of 31 specimens tested against *Lagos bat lyssavirus* and *Duvenhage lyssavirus* by Mélade *et al.* (2016a: 6), respectively five and six showed a seroreaction. This was also the case for one out of eight bats tested for *European bat lyssavirus 1*.

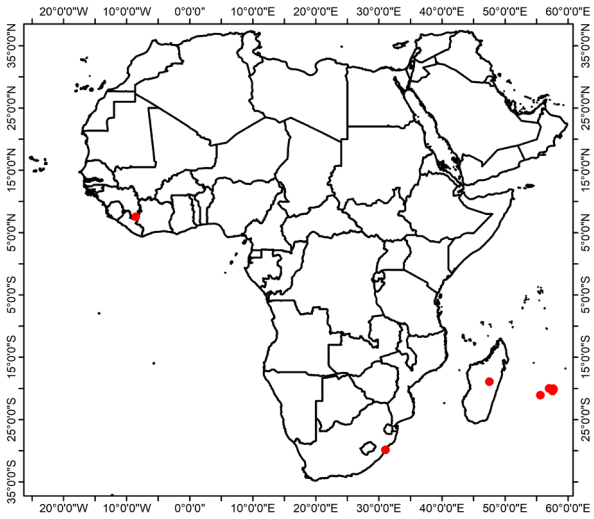

Figure 187. Distribution of *Mormopterus acetabulosus*

DISTRIBUTION BASED ON VOUCHER SPECIMENS:
"Africa", Ethiopia, Liberia, Madagascar, Mauritius, South Africa.

Mormopterus acetabulosus acetabulosus (Hermann, 1804)

*1804. *V[espertilio] acetabulosus* Hermann, Obs. Zool. , 19. Publication date: 31 August 1804. Type locality: Mauritius: Port Louis [Goto Description]. Holotype: MNHN ZM-MO-1984-368: ad? ♀. Collected by: M. Desjardins; collection date: 1829; original number: A488. Goodman *et al.* (2008c: 1324) incidcate that the specimen is labeled as type, but was collected 25 years after Hermann (1804) described it. Neotype: FMNH 187489: Collected by: Steven M. Goodman and V. Florens; collection date: 29 October 2006. Mauritius, Black River District, Palma, Palma Cave, 20 16'40.5"S 57 27'14.7"E. Goodman *et al.* (2008c: 1327) designated this as the neotype. Cheke (2009b) rejects the assignment of the neotype by Goodman *et al.* (2008c), based on article 73.1.4 and 75.8 (rules of Nomenclature - ICZN 1999). - Comments: Cheke (2009b: 1) rejects the assignment of the neotype, based on article 73.1.4 (rules of Nomenclature - ICZN 1999), which indicates that Paul Jossigny's drawings made of the specimen that Commerson once had before him in Mauritius should be considered the holotype of Hermann's *Vespertilio acetabulosus*, and that the designation of a neotype by Goodman *et al.* (2008c: 1324) is invalidated by article 75.8. The drawings on which Commerson based himself (and which were referred to by Hermann, 1804: 19) are to be found amongst the Commerson papers, in the folder of other similar drawings at MS 282(II), labelled No. 51 (Moutou, 1982, pers. obs. 2006) in the archives of the Bibiothèque du Muséum; the folder is described in paragraph 73 of Laissus's (1974) catalogue.

1823-1824. *Nyctinomus mauritianus* Horsfield, Zoological Research in Java, Part 5, 9th page of text in account of *N. tenuis*. Publication date: 1823 - 1824. Type locality: Mauritius: Port Louis.

? *Mormopterus acetabulosus acetabulosus:* (Name Combination, Current Combination)

ROOST:
On Mauritius, these bats use caves as typical roosting sites (see Wilkinson *et al.*, 2012: 160).

VIRUSES:
Wilkinson *et al.* (2012: 160) found one specimen out of 55 examined on Mauritius, that tested positive for Respirovirus / Morbillivirus / Henipahvirus (RMH) and Paramyxovirinae (PMV)

Mormopterus acetabulosus natalensis (A. Smith, 1847)

1833. *Nyctinomus dubius* A. Smith, S. Afr. Quart. J., ser. 2, 1 (2): 54. Publication date: November 1833. Type locality: South Africa: Cape Province and Natal, between [Goto Description].

*1847. *Dysopes natalensis* A. Smith, Illustrated Zoology of South African Mammals, pl. 49 and text. Publication date: December 1847. Type locality: South Africa: KwaZulu-Natal: Port Natal [=Durban], near [ca. 29 52 S 31 00 E]. - Comments: Dobson (1877: 734) mentions that the original name used by Smith (1847: pl. 49) was *Nyctinomus natalensis*, but this could not be checked yet. If this isn't the case, then this combination should probably be attributed to Dobson (1877). - Etymology: The name reflects the two specimens collected in KwaZulu-Natal.

? *Mormopterus acetabulosus natalensis:* (Name Combination, Current Combination)

TAXONOMY:
Allen (1939a) tentatively treats *dubius* as a species of *Nyctinomus* (= *Tadarida*), remarking that its status is uncertain; Roberts (1951), without giving reasons, regards it as a prior name for *natalensis*. Ellerman *et al.* (1953) are doubtful whether or not the two names are synonymous, and although they list *dubius* in the synonymy of *natalensis* they suggest that it may be necessary to discard the name as not being certainly identifiable. Hayman and Hill (1971: 65) list *dubius* as *incertae sedis*.

Mormopterus francoismoutoui Goodman, Jansen Van Vuuren, Ratrimomanarivo, Probst, Bowie, 2008

*2008. *Mormopterus francoismoutoui* Goodman, Jansen Van Vuuren, Ratrimomanarivo, Probst and Bowie, J. Mamm., 89 (5): 1318, figs. 2 - 6. Type locality: Réunion: Commune de La Possession: Pont de Balthazar [2056.732S 5519.848E, 40m] [Goto Description]. Holotype: FMNH 193986: ad ♂, skull and alcoholic. Collected by: Steven M. Goodman and Jean-Michel Probst; collection date: 25 September 2006; original number: SMG 15310. Paratype: FMNH 193982: ♂, skull only. Collected by: Steven M.
